NPRM proposed a level of barrier removal expenditures at which qualified small businesses would be deemed to have met their readily achievable barrier removal obligations for certain tax years. This safe harbor would have provided some protection from litigation because compliance could be assessed easily. Such a rule, the Department believed, also could further accessibility, because qualified small businesses would have an incentive to incorporate barrier removal into short- and long-term planning. The Department recognized that a qualified small business safe harbor would be a significant change to the Department's title III enforcement scheme. Accordingly, the Department sought comment on whether such an approach would further the aims underlying the statute's barrier removal provisions, and, if so, the appropriate parameters of the provision.

After consideration of the many comments received on this issue, the Department has decided not to include a qualified small business safe harbor in the final rule. This decision is discussed more fully below.

Element-by-element safe harbor for public accommodations. Public accommodations have a continuing obligation to remove certain architectural, communications, and transportation barriers in existing facilities to the extent readily achievable. 42 U.S.C. 12182(b)(2)(A)(iv). Because the Department uses the ADA Standards as a guide to identifying what constitutes an architectural barrier, the 2010 Standards, once they become effective, will provide a new reference point for assessing an entity's barrier removal obligations. The 2010 Standards introduce technical and scoping specifications for many elements that were not included in the 1991 Standards. Accordingly, public accommodations will have to consider these supplemental requirements when evaluating whether there are covered barriers in existing facilities, and, if so, remove them to the extent readily achievable. Also included in the 2010 Standards are revised technical and scoping requirements for elements that were addressed in the 1991 Standards. These incremental changes were made to address technological changes that have occurred since the promulgation of the 1991 Standards, to reflect additional study by the Access Board, and to harmonize ADAAG requirements with the model codes.

In the NPRM, the Department sought input on a safe harbor in proposed § 36.304(d)(2) intended to address concerns about the practical effects of the incremental changes on public accommodations' readily achievable barrier removal obligations. The proposed element-by-element safe harbor provided that in existing facilities elements that are, as of the effective date of the 2010 Standards, fully compliant with the applicable technical and scoping requirements in the 1991 Standards, need not be modified or retrofitted to meet the 2010 Standards, until and unless those elements are altered. The Department posited that it would be an inefficient use of resources to require covered entities that have complied with the 1991 Standards to retrofit already compliant elements when the change might only provide a minimal improvement in accessibility. In addition, the Department was concerned that covered entities would have a strong disincentive for voluntary compliance if every time the applicable standards were revised covered entities would be required once again to modify elements to keep pace with new requirements. The Department recognized that revisions to some elements might confer a significant benefit on some individuals with disabilities and because of the safe harbor these benefits would be unavailable until the facility undergoes alterations.

The Department received many comments on this issue from the business and disability communities. Business owners and operators, industry groups and trade associations, and business advocacy organizations strongly supported the element-by-element safe harbor. By contrast, disability advocacy organizations and individuals commenting on behalf of the disability community were opposed to this safe harbor with near una-

nimity.

Businesses and business groups agreed with the concerns outlined by the Department in the NPRM, and asserted that the element-by-element safe harbor is integral to ensuring continued good faith compliance efforts by covered entities. These commenters argued that the financial cost and business disruption resulting from retrofitting elements constructed or previously modified to comply with 1991 Standards would be detrimental to nearly all businesses and not readily achievable for most. They contended that it would be fundamentally unfair to place these entities in a position where, despite full compliance with the 1991 Standards, the entities would now, overnight, be vulnerable to barrier removal litigation. They further contended that public accommodations will have little incentive to undertake large barrier removal projects or incorporate barrier removal into long-term planning if there is no assurance that the actions taken and money spent for barrier removal would offer some protection from litigation. One commenter also pointed out that the proposed safe harbor would be consistent with practices under other Federal accessibility standards, including the Uniform Federal Accessibility Standards (UFAS) and the ADAAG.

Some business commenters urged the Department to expand the element-by-element safe harbor to include supplemental requirements. These commenters argued that imposing the 2010 Standards on existing facilities will provide a strong incentive for such facilities to eliminate some elements entirely, particularly where the element is not critical to the public accommodation's business or operations (*e.g.,* play areas in fast food restaurants) or the cost of retrofitting is significant. Some of these same commenters urged the Department to include within the safe harbor those elements not covered by the 1991 Standards, but which an entity had built in compliance with State or local accessibility laws. Other commenters requested safe harbor protection where a business had attempted barrier removal prior to the establishment of technical and scoping requirements for a particular element (*e.g*., play area equipment) if the business could show that the element now covered by the 2010 Standards was functionally accessible.

Other commenters noted ambiguity in the NPRM as to whether the element-by-element safe harbor applies only to elements that comply fully with the 1991 Standards, or also encompasses elements that comply with the 1991 Standards to the extent readily achievable. Some commenters proposed that the safe harbor should exist in perpetuity— that an element subject to a safe harbor at one point in time also should be afforded the same protection with respect to all future revisions to the ADA Standards (as with many building codes). These groups contended that allowing permanent compliance with the 1991 Standards will ensure readily accessible and usable facilities while also mitigating the need for expensive and time-consuming documentation of changes and maintenance.

A number of commenters inquired about the effect of the element-by-element safe harbor on elements that are not in strict compliance with the 1991 Standards, but conform to the terms of settlement agreements or consent decrees resulting from private litigation or Federal enforcement actions. These commenters noted that litigation or threatened litigation often has resulted in compromise among parties as to what is readily achievable. Business groups argued that facilities that have made modifications subject to those negotiated agreements should not be subject to the risk of further litigation as a result of the 2010 Standards.

Lastly, some business groups that supported the element-by-element safe harbor nevertheless contended that a better approach would be to separate barrier removal altogether from the 2010 Standards, such that the 2010 Standards would not be used to determine whether access to an existing facility is impeded by architectural barriers. These commenters argued that application of the 2010 Standards to barrier removal obligations is con-

trary to the ADA's directive that barrier removal is required only where ''easily accomplishable and able to be carried out without much difficulty or expense,'' 42 U.S.C. 12181(9).

Nearly all commenters from the disability community objected to the proposed element-by-element safe harbor. These commenters asserted that the adoption of this safe harbor would permit and sanction the retention of outdated access standards even in cases where retrofitting to the 2010 Standards would be readily achievable. They argued that title III's readily achievable defense is adequate to address businesses' cost concerns, and rejected the premise that requiring businesses to retrofit currently compliant elements would be an inefficient use of resources where readily achievable to do so. The proposed regulations, these commenters asserted, incorporate advances in technology, design, and construction, and reflect congressional and societal understanding that accessibility is not a static concept and that the ADA is a civil rights law intended to maximize accessibility. Additionally, these commenters noted that since the 2004 revision of the ADAAG will not be the last, setting a precedent of safe harbors for compliant elements will have the effect of preserving and protecting layers of increasingly outdated accessibility standards.

Many commenters objected to the Department's characterization of the requirements subject to the safe harbor as reflecting only incremental changes and asserted that many of these incremental changes will result in significantly enhanced accessibility at little cost. The requirement concerning side-reach ranges was highlighted as an example of such requirements. Commenters from the disability community argued that the revised maximum side-reach range (from 54 inches to 48 inches) will result in a substantial increase in accessibility for many persons with disabilities—particularly individuals of short stature, for whom the revised reach range represents the difference between independent access to many features and dependence—and that the revisions should be made where readily achievable to do so. Business commenters, on the other hand, contended that application of the safe harbor to this requirement is critical because retrofitting items, such as light switches and thermostats often requires work (*e.g.,* rewiring, patching, painting, and re-wallpapering), that would be extremely burdensome for entities to undertake. These commenters argued that such a burden is not justified where many of the affected entities already have retrofitted to meet the 1991 Standards.

Some commenters that were opposed to the element-by-element safe harbor proposed that an entity's past efforts to comply with the 1991 Standards might appropriately be a factor in the readily achievable analysis. Several commenters proposed a temporary 5- year safe harbor that would provide reassurance and stability to covered entities that have recently taken proactive steps for barrier removal, but would also avoid the problems of preserving access deficits in perpetuity and creating multiple standards as subsequent updates are adopted.

After consideration of all relevant information presented on this issue during the comment period, the Department has decided to retain the proposed element-by-element safe harbor. Title III's architectural barrier provisions place the most significant requirements of accessibility on new construction and alterations. The aim is to require businesses to make their facilities fully accessible at the time they are first constructing or altering those facilities, when burdens are less and many design elements will necessarily be in flux, and to impose a correspondingly lesser duty on businesses that are not changing their facilities. The Department believes that it would be consistent with this statutory structure not to change the requirements for design elements that were specifically addressed in our prior standards for those facilities that were built or altered in full compliance with those standards. The Department similarly believes it would be consistent with the statutory scheme not to change the requirements for design

elements that were specifically addressed in our prior standards for those existing facilities that came into full compliance with those standards. Accordingly, the final rule at § 36.304(d)(2)(i) provides that elements that have not been altered in existing facilities on or after March 15, 2012 and that comply with the corresponding technical and scoping specifications for those elements in the 1991 Standards are not required to be modified in order to comply with the requirements set forth in the 2010 Standards. The safe harbor adopted is consistent in principle with the proposed provision in the NPRM, and reflects the Department's determination that this approach furthers the statute's barrier removal provisions and promotes continued good-faith compliance by public accommodations.

The element-by-element safe harbor adopted in this final rule is a narrow one. The Department recognizes that this safe harbor will delay, in some cases, the increased accessibility that the incremental changes would provide and that for some individuals with disabilities the impact may be significant. This safe harbor, however, is not a blanket exemption for every element in existing facilities. Compliance with the 1991 Standards is determined on an element-by-element basis in each existing facility.

Section 36.304(d)(2)(ii)(A) provides that prior to the compliance date of the rule March 15, 2012, noncompliant elements that have not been altered are obligated to be modified to the extent readily achievable to comply with the requirements set forth in the 1991 Standards or the 2010 Standards. Section 36.304(d)(2)(ii)(B) provides that after the date the 2010 Standards take effect (18 months after publication of the rule), noncompliant elements that have not been altered must be modified to the extent readily achievable to comply with the requirements set forth in the 2010 Standards. Noncomplying newly constructed and altered elements may also be subject to the requirements of § 36.406(a)(5).

The Department has not expanded the scope of the element-by-element safe harbor beyond those elements subject to the incremental changes. The Department has added § 36.304(d)(2)(iii), explicitly clarifying that existing elements subject to supplemental requirements for which scoping and technical specifications are provided for the first time in the 2010 Standards (*e.g.,* play area requirements) are not covered by the safe harbor and, therefore, must be modified to comply with the 2010 Standards to the extent readily achievable. Section 36.304(d)(2)(iii) also identifies the elements in the 2010 Standards that are not eligible for the element-by-element safe harbor. The safe harbor also does not apply to the accessible routes not previously scoped in the 1991 standards, such as those required to connect the boundary of each area of sport activity, including soccer fields, basketball courts, baseball fields, running tracks, skating rinks, and areas surrounding a piece of gymnastic equipment. *See* Advisory note to section F206.2.2 of the 2010 Standards. The resource and fairness concerns underlying the element-by-element safe harbor are not implicated by barrier removal involving supplemental requirements. Public accommodations have not been subject previously to technical and scoping specifications for these supplemental requirements. Thus, with respect to supplemental requirements, the existing readily achievable standard best maximizes accessibility in the built environment without imposing unnecessary burdens on public accommodations.

The Department also has declined to expand the element-by-element safe harbor to cover existing elements subject to supplemental requirements that also may have been built in compliance with State or local accessibility laws. Measures taken to remove barriers under a Federal accessibility provision logically must be considered in regard to Federal standards, in this case the 2010 Standards. This approach is based on the Department's determination that reference to ADA Standards for barrier removal will promote certainty, safety, and good design while still permitting slight deviations through readily achievable alternative meth-

ods. The Department continues to believe that this approach provides an appropriate and workable framework for implementation of title III's barrier removal provisions. Because compliance with State or local accessibility codes is not a reliable indicator of effective access for purposes of the ADA Standards, the Department has decided not to include reliance on such codes as part of the safe harbor provision.

Only elements compliant with the 1991 Standards are eligible for the safe harbor. Thus, where a public accommodation attempted barrier removal but full compliance with the 1991 Standards was not readily achievable, the modified element does not fall within the scope of the safe harbor provision. A public accommodation at any point in time must remove barriers to the extent readily achievable. For existing elements, for which removal is not readily achievable at any given time, the public accommodation must provide its goods, services, facilities, privileges, advantages, or accommodations through alternative methods that are readily achievable. *See* 42 U.S.C. 12182(b)(2)(A)(iv), (v).

One-time evaluation and implementation of the readily achievable standard is not the end of the public accommodation's barrier-removal obligation. Public accommodations have a continuing obligation to reevaluate barrier removal on a regular basis. For example, if a public accommodation identified barriers under the 1991 Standards but did not remove them because removal was not readily achievable based on cost considerations, it has a continuing obligation to remove these barriers if the economic considerations for the public accommodation change. The fact that the public accommodation has been providing its goods or services through alternative methods does not negate the continuing obligation to assess whether removal of the barrier at issue has become readily achievable. Public accommodations should incorporate consideration of their continuing barrier removal obligations in both short-term and long-term business planning.

The Department notes that commenters across the board expressed concern with recordkeeping burdens implicated by the element-by-element safe harbor. Businesses noted the additional costs and administrative burdens associated with identifying elements that fall within the element-by-element safe harbor, as well as tracking, documenting, and maintaining data on installation dates. Disability advocates expressed concern that varying compliance standards will make enforcement efforts more difficult, and urged the Department to clarify that title III entities bear the burden of proof regarding entitlement to safe harbor protection. The Department emphasizes that public accommodations wishing to benefit from the element-by-element safe harbor must demonstrate their safe harbor eligibility. The Department encourages public accommodations to take appropriate steps to confirm and document the compliance of existing elements with the 1991 Standards. Finally, while the Department has decided not to adopt in this rulemaking the suggestion by some commenters to make the protection afforded by the element-by-element safe harbor temporary, the Department believes this proposal merits further consideration. The Department, therefore, will continue to evaluate the efficacy and appropriateness of a safe harbor expiration or sunset provision.

Application to specific scenarios raised in comments. In response to the NPRM, the Department received a number of comments that raised issues regarding application of the element-by-element safe harbor to particular situations. Business commenters requested guidance on whether the replacement for a broken or malfunctioning element that is covered by the 1991 Standards would have to comply with the 2010 Standards. These commenters expressed concern that in some cases replacement of a broken fixture might necessitate moving a number of other accessible fixtures (such as in a bathroom) in order to comply with the fixture and space requirements of the 2010 Standards. Others questioned the effect of the new

standards where an entity replaces an existing element currently protected by the safe harbor provision for water or energy conservation reasons. The Department intends to address these types of scenarios in technical guidance.

Effective date for barrier removal. Several commenters expressed concern that the NPRM did not propose a transition period for applying the 2004 ADAAG to barrier removal in existing facilities in cases where the safe harbors do not apply. These commenters argued that for newly covered elements, they needed time to hire attorneys and consultants to assess the impact of the new requirements, determine whether they need to make additional retrofits, price those retrofits, assess whether the change actually is ''readily achievable,'' obtain approval for the removal from owners who must pay for the changes, obtain permits, and then do the actual work. The commenters recognized that there may be some barrier removal actions that require little planning, but stated that other actions cost significantly more and require more budgeting, planning, and construction time.

Barrier removal has been an ongoing requirement that has applied to public accommodations since the original regulation took effect on January 26, 1992. The final rule maintains the existing regulatory provision that barrier removal does not have to be undertaken unless it is ''readily achievable.'' The Department has provided in § 36.304(d)(2)(ii)(B) that public accommodations are not required to apply the 2010 Standards to barrier removal until 18 months after the publication date of this rule. It is the Department's view that 18 months is a sufficient amount of time for application of the 2010 Standards to barrier removal for those elements not subject to the safe harbor. This is also consistent with the compliance date the Department has specified for applying the 2010 Standards to new construction and alterations.

Reduced scoping for play areas and other recreation facilities.

Play areas. The Access Board published final guidelines for play areas in October 2000. 65 FR 62498 (Oct. 18, 2000). The guidelines include requirements for ground-level and elevated play components, accessible routes connecting the components, accessible ground surfaces, and maintenance of those surfaces. They have been referenced in Federal playground construction and safety guidelines and in some State and local codes and have been used voluntarily when many play areas across the country have been altered or constructed.

In adopting the 2004 ADAAG (which includes the play area guidelines published in 2000), the Department acknowledges both the importance of integrated, full access to play areas for children and parents with disabilities as well as the need to avoid placing an untenable fiscal burden on businesses. Consequently, the Department asked seven questions in the NPRM related to existing play areas. Two questions related to safe harbors: one on the appropriateness of a general safe harbor for existing play areas and another on public accommodations that have complied with State or local standards specific to play areas. The others related to reduced scoping, limited exemptions, and whether there is a ''tipping point'' at which the costs of compliance with supplemental requirements would be so burdensome that a public accommodation would shut down a program rather than comply with the new requirements. In the nearly 100 comments received on title III play areas, the majority of commenters strongly opposed all safe harbors, exemptions, and reductions in scoping, and questioned the feasibility of determining a tipping point. A smaller number of commenters advocated for a safe harbor from compliance with the 2004 ADAAG play area requirements along with reduced scoping and exemptions for both readily achievable barrier removal and alterations.

Commenters were split as to whether the Department should exempt owners and operators of public accommodations from compliance with the supplemental requirements for play areas and rec-

reation facilities and instead continue to determine accessibility in these facilities on a case-by-case basis under existing law. Many commenters were of the view that the exemption was not necessary because concerns of financial burden are addressed adequately by the defenses inherent in the standard for what constitutes readily achievable barrier removal. A number of commenters found the exemption inappropriate because no standards for play areas previously existed. Commenters also were concerned that a safe harbor applicable only to play areas and recreation facilities (but not to other facilities operated by a public accommodation) would create confusion, significantly limit access for children and parents with disabilities, and perpetuate the discrimination and segregation individuals with disabilities face in the important social arenas of play and recreation—areas where little access has been provided in the absence of specific standards. Many commenters suggested that instead of an exemption, the Department should provide guidance on barrier removal with respect to play areas and other recreation facilities.

Several commenters supported the exemption, mainly on the basis of the cost of barrier removal. More than one commenter noted that the most expensive aspect of barrier removal on existing play areas is the surfaces for the accessible routes and use zones. Several commenters expressed the view that where a play area is ancillary to a public accommodation (*e.g.,* in quick service restaurants or shopping centers), the play area should be exempt from compliance with the supplemental requirements because barrier removal would be too costly, and as a result, the public accommodation might eliminate the area.

The Department has been persuaded that the ADA's approach to barrier removal, the readily achievable standard, provides the appropriate balance for the application of the 2010 Standards to existing play areas. Thus, in existing playgrounds, public accommodations will be required to remove barriers to access where these barriers can be removed without much difficulty or expense.

The NPRM asked if there are State and local standards specifically regarding play and recreation area accessibility and whether facilities currently governed by, and in compliance with, such State and local standards or codes should be subject to a safe harbor from compliance with similar applicable requirements in the 2004 ADAAG. The Department also requested comments on whether it would be appropriate for the Access Board to consider the implementation of guidelines that would extend such a safe harbor to play and recreation areas undertaking alterations. In response, no comprehensive State or local codes were identified, and commenters generally noted that because the 2004 ADAAG contained comprehensive accessibility requirements for these unique areas, public accommodations should not be afforded a safe harbor from compliance with them when altering play and recreation areas. The Department is persuaded by these comments that there is insufficient basis to apply a safe harbor for readily achievable barrier removal or alterations for play areas built in compliance with State or local laws.

In the NPRM, the Department requested that public accommodations identify a ''tipping point'' at which the costs of compliance with the supplemental requirements for existing play areas would be so burdensome that the entity simply would shut down the playground. In response, no tipping point was identified. Some commenters noted, however, that the scope of the requirements may create the choice between wholesale replacement of play areas and discontinuance of some play areas, while others speculated that some public accommodations may remove play areas that are merely ancillary amenities rather than incur the cost of barrier removal under the 2010 Standards. The Department has decided that the comments did not establish any clear tipping point and therefore that no regulatory response is appropriate in this area.

The NPRM also asked for comment about the potential effect of exempting existing play areas of less than 1,000 square feet in size from the re-

quirements applicable to play areas. Many trade and business associations favored exempting these small play areas, with some arguing that where the play areas are only ancillary amenities, the cost of barrier removal may dictate that they be closed down. Some commenters sought guidance on the definition of a 1,000-square-foot play area, seeking clarification that seating and bathroom spaces associated with a play area are not included in the size definition. Disability rights advocates, by contrast, overwhelmingly opposed this exemption, arguing that these play areas may be some of the few available in a community; that restaurants and day care facilities are important places for socialization between children with disabilities and those without disabilities; that integrated play is important to the mission of day care centers and that many day care centers and play areas in large cities, such as New York City, have play areas that are less than 1,000 square feet in size; and that 1,000 square feet was an arbitrary size requirement.

The Department agrees that children with disabilities are entitled to access to integrated play opportunities. However, the Department is aware that small public accommodations are concerned about the costs and efforts associated with barrier removal. The Department has given careful consideration as to how best to insulate small entities from overly burdensome costs and undertakings and has concluded that the existing readily achievable standard, not a separate exemption, is an effective and employable method by which to protect these entities. Under the existing readily achievable standard, small public accommodations would be required to comply only with the scoping and technical requirements of the 2010 Standards that are easily accomplishable and able to be carried out without much difficulty or expense. Thus, concerns about prohibitive costs and efforts clearly are addressed by the existing readily achievable standard. Moreover, as evidenced by comments inquiring as to how 1,000- square-foot play areas are to be measured and complaining that the 1,000-square-foot cutoff is arbitrary, the exemption posited in the NPRM would have been difficult to apply. Finally, a separate exemption would have created confusion as to whether, or when, to apply the exemption or the readily achievable standard. Consequently, the Department has decided that an exemption, separate and apart from the readily achievable standard, is not appropriate or necessary for small private play areas.

In the NPRM, the Department requested public comment as to whether existing play areas should be permitted to substitute additional ground-level play components for the elevated play components that they otherwise would have been required to make accessible. Most commenters opposed this substitution because the guidelines as well as considerations of ''readily achievable barrier removal'' inherently contain the flexibility necessary for a variety of situations. Such commenters also noted that the Access Board adopted extensive guidelines with ample public input, including significant negotiation and balancing of costs. In addition, commenters advised that including additional ground level play components might result in higher costs because more accessible route surfaces might be required. A limited number of commenters favored substitution. The Department is persuaded by these comments that the proposed substitution of elements may not be beneficial. The current rules applicable to readily achievable barrier removal will be used to determine the number and type of accessible elements appropriate for a specific facility.

In the NPRM, the Department requested public comment on whether it would be appropriate for the Access Board to consider issuing guidelines for alterations to play and recreation facilities that would permit reduced scoping of accessible components or substitution of ground level play components in lieu of elevated play components. The Department received little input on this issue, and most commenters disfavored the suggestion. One commenter that supported this approach con-

jectured that it would encourage public accommodations to maintain and improve their playgrounds as well as provide more accessibility. The Department is persuaded that it is not necessary to ask the Access Board to revisit this issue.

The NPRM also asked whether only one play area of each type should be required to comply at existing sites with multiple play areas and whether there are other select requirements applicable to play areas in the 2004 ADAAG for which the Department should consider exemptions or reduced scoping. Some commenters were opposed to the concept of requiring compliance at one play area of each type at a site with multiple play areas, citing lack of choice and ongoing segregation of children and adults with disabilities. Other commenters who supported an exemption and reduced scoping for alterations noted that the play equipment industry has adjusted to, and does not take issue with, the provisions of the 2004 ADAAG; however, they asked for some flexibility in the barrier removal requirements as applied to play equipment, arguing that augmentation of the existing equipment and installation of accessible play surfacing equates to wholesale replacement of the play equipment. The Department is persuaded that the current rules applicable to readily achievable barrier removal should be used to decide which play areas must comply with the supplemental requirements presented in the 2010 Standards.

Swimming pools, wading pools, saunas, and steam rooms. Section 36.304(d)(3)(ii) in the NPRM specified that for measures taken to comply with the barrier removal requirements, existing swimming pools with at least 300 linear feet of swimming pool wall would need to provide only one accessible means of entry that complies with section 1009.2 or section 1009.3 of the 2004 ADAAG, instead of the two means required for new construction. Commenters opposed the Department's reducing the scoping from that required in the 2004 ADAAG. The following were among the factors cited in comments: that swimming is a common therapeutic form of exercise for many individuals with disabilities; that the cost of a swimming pool lift or other options for pool access is readily achievable and can be accomplished without much difficulty or expense; and that the readily achievable standard already provides public accommodations with a means to reduce their scoping requirements. A few commenters cited safety concerns resulting from having just one accessible means of access, and stated that because pools typically have one ladder for every 75 linear feet of pool wall, they should have more than one accessible means of egress. Other commenters either approved or did not oppose providing one accessible means of access for larger pools so long as a lift was used.

Section 36.304(d)(4)(ii) of the NPRM proposed to exempt existing swimming pools with fewer than 300 linear feet of swimming pool wall from the obligation to provide an accessible means of entry. Most commenters strongly opposed this provision, arguing that aquatic activity is a safe and beneficial form of exercise that is particularly appropriate for individuals with disabilities. Many argued that the readily achievable standard for barrier removal is available as a defense and is preferable to creating an exemption for pool operators for whom providing an accessible means of entry would be readily achievable. Commenters who supported this provision apparently assumed that providing an accessible means of entry would be readily achievable and that therefore the exemption is needed so that small pool operators do not have to provide an accessible means of entry.

The Department has carefully considered all the information available to it as well as the comments submitted on these two proposed exemptions for swimming pools owned or operated by title III entities. The Department acknowledges that swimming provides important therapeutic, exercise, and social benefits for many individuals with disabilities and is persuaded that exemption of the vast majority of privately owned or operated pools from the 2010 Standards is neither appropriate nor necessary. The Department

agrees with the commenters that title III already contains sufficient limitations on private entities' obligations to remove barriers. In particular, the Department agrees that those public accommodations that can demonstrate that making particular existing swimming pools accessible in accordance with the 2010 Standards is not readily achievable are sufficiently protected from excessive compliance costs. Thus, the Department has eliminated proposed § 36.304(d)(3)(ii) and (d)(4)(ii) from the final rule.

Proposed § 36.304(d)(4)(iii) would have exempted existing saunas and steam rooms that seat only two individuals from the obligation to remove barriers. This provision generated far fewer comments than the provisions for swimming pools. People who commented were split fairly evenly between those who argued that the readily achievable standard for barrier removal should be applied to all existing saunas and steam rooms and those who argued that all existing saunas and steam rooms, regardless of size, should be exempt from any barrier removal obligations. The Department considered these comments and has decided to eliminate the exemption for existing saunas and steam rooms that seat only two people. Such an exemption for saunas and steam rooms that seat only two people is unnecessary because the readily achievable standard provides sufficient protection against barrier removal that is overly expensive or too difficult. Moreover, the Department believes barrier removal likely will not be readily achievable for most of these small saunas because the nature of their prefabricated forms, which include built-in seats, make it either technically infeasible or too difficult or expensive to remove barriers. Consequently a separate exemption for saunas and steam rooms would have been superfluous. Finally, employing the readily achievable standard for small saunas and steam rooms is consistent with the Department's decisions regarding the proposed exemptions for play areas and swimming pools.

Several commenters also argued in favor of a specific exemption for existing spas. The Department notes that the technically infeasible and readily achievable defenses are applicable equally to existing spas and declines to adopt such an exemption.

The Department also solicited comment on the possibility of exempting existing wading pools from the obligation to remove barriers where readily achievable. Most commenters stated that installing a sloped entry in an existing wading pool is not likely to be feasible. Because covered entities are not required to undertake modifications that are not readily achievable or that would be technically infeasible, the Department believes that the rule as drafted provides sufficient protection from unwarranted expense to the operators of small existing wading pools. Other existing wading pools, particularly those large wading pools found in facilities such as water parks, must be assessed on a case-by-case basis. Therefore, the Department has not included an exemption for wading pools in its final rule.

The Department received several comments recommending that existing wave pools be exempt from barrier removal requirements. The commenters pointed out that existing wave pools often have a sloped entry, but do not have the handrails, level landings, or edge protection required for accessible entry. Because pool bottom slabs are structural, they could be subject to catastrophic failure if the soil pressure stability or the under slab dewatering are not maintained during the installation of these accessibility features in an already constructed pool. They also argue that the only safe design scenario is to design the wheelchair ramp, pool lift, or transfer access in a side cove where the mean water level largely is unaffected by the wave action, and that this additional construction to an existing wave pool is not readily achievable. If located in the main pool area, the handrails, stanchions, and edge protection for sloped entry will become underwater hazards when the wave action is pushing onto pool users, and the use of a pool lift will not be safe without a means of

stabilizing the person against the forces of the waves while using the lift. They also pointed out that a wheelchair would pose a hazard to all wave pool users, in that the wave action might push other pool users into the wheelchair or push the wheelchair into other pool users. The wheelchair would have to be removed from the pool after the user has entered (and has transferred to a flotation device if needed). The commenters did not specify if these two latter concerns are applicable to all wave pools or only to those with more aggressive wave action. The Department has decided that the issue of modifications to wave pools is best addressed on a case-by-case basis, and therefore, this rule does not contain barrier removal exemptions applicable to wave pools.

The Department also received comments suggesting that it is not appropriate to require two accessible means of entry to wave pools, lazy rivers, sand bottom pools, and other water amusements that have only one point of entry. The Department agrees. The 2010 Standards (at section 242.2, Exception 2) provide that only one means of entry is required for wave pools, lazy rivers, sand bottom pools, and other water amusement where user access is limited to one area.

Other recreation facilities. In the NPRM, the Department asked about a number of issues relating to recreation facilities, such as team or player seating areas, areas of sport activity, exercise machines, boating facilities, fishing piers and platforms, golf courses, and miniature golf courses. The Department asked for public comment on the costs and benefits of applying the 2004 ADAAG to these spaces and facilities. The discussion of the comments received by the Department on these issues and the Department's response to those comments can be found in either the section entitled ''Other Issues'' of Appendix A to this final rule.

Safe harbor for qualified small businesses. Section 36.304(d)(5) of the NPRM would have provided that a qualified small business would meet its obligation to remove architectural barriers where readily achievable for a given year if, during that tax year, the entity spent at least 1 percent of its gross revenue in the preceding tax year on measures undertaken in compliance with barrier removal requirements. Proposed § 36.304(d)(5) has been omitted from the final rule. The qualified small business safe harbor was proposed in response to small business advocates' requests for clearer guidance on when barrier removal is, and is not, readily achievable. According to these groups, the Department's approach to readily achievable barrier removal disproportionately affects small business for the following reasons: (1) Small businesses are more likely to operate in older buildings and facilities; (2) the 1991 Standards are too numerous and technical for most small business owners to understand and determine how they relate to State and local building or accessibility codes; and (3) small businesses are vulnerable to title III litigation and often are compelled to settle because they cannot afford the litigation costs involved in proving that an action is not readily achievable.

The 2010 Standards go a long way toward meeting the concern of small businesses with regard to achieving compliance with both Federal and State accessibility requirements, because the Access Board harmonized the 2004 ADAAG with the model codes that form the basis of most State and local accessibility codes. Moreover, the element-by-element safe harbor will ensure that unless and until a small business engages in alteration of affected elements, the small business will not have to retrofit elements that were constructed in compliance with the 1991 Standards or, with respect to elements in an existing facility, that were retrofitted to the 1991 Standards in conjunction with the business's barrier removal obligation prior to the rule's compliance date.

In proposing an additional safe harbor for small businesses, the Department had sought to promulgate a rule that would provide small businesses a level of certainty in short-term and long-term planning with respect to barrier removal. This in turn would benefit individuals with disabilities in

that it would encourage small businesses to consider and incorporate barrier removal in their yearly budgets. Such a rule also would provide some protection, through diminished litigation risks, to small businesses that undertake significant barrier removal projects.

As proposed in the NPRM, the qualified small business safe harbor would provide that a qualified small business has met its readily achievable barrier removal obligations for a given year if, during that tax year, the entity has spent at least 1 percent of its gross revenue in the preceding tax year on measures undertaken to comply with title III barrier removal requirements. (Several small business advocacy organizations pointed out an inconsistency between the Department's description of the small business safe harbor in the Section-by- Section Analysis for § 36.304 and the proposed regulatory text for that provision. The proposed regulatory text sets out the correct parameters of the proposed rule. The Department does not believe that the error substantively affected the comments on this issue. Some commenters noted the discrepancy and commented on both; others commented more generally on the proposal, so the discrepancy was not relevant.) The Department noted that the efficacy of any proposal for a small business safe harbor would turn on the following two determinations: (1) The definition of a qualified small business, and (2) the formula for calculating what percentage of revenue is sufficient to satisfy the readily achievable presumption.

As proposed in § 36.104 in the NPRM, a ''qualified small business'' is a business entity defined as a small business concern under the regulations promulgated by the Small Business Administration (SBA) pursuant to the Small Business Act. *See* 15 U.S.C. 632; 13 CFR part 121. The Department noted that under section 3(a)(2)(C) of the Small Business Act, Federal departments and agencies are prohibited from prescribing a size standard for categorizing a business concern as a small business unless the department or agency has been authorized specifically to do so or has proposed a size standard in compliance with the criteria set forth in the SBA regulations, has provided an opportunity for public notice and comment on the proposed standard, and has received approval from the Administrator of the SBA to use the standard. *See* 15 U.S.C. 632(a)(2)(C). The Department further noted that Federal agencies or departments promulgating regulations relating to small businesses usually use SBA size criteria, and they otherwise must be prepared to justify how they arrived at a different standard and why the SBA's regulations do not satisfy the agency's program requirements. *See* 13 CFR 121.903. The ADA does not define ''small business'' or specifically authorize the Department to prescribe size standards.

In the NPRM, the Department indicated its belief that the size standards developed by the SBA are appropriate for determining which businesses subject to the ADA should be eligible for the small business safe harbor provisions, and proposed to adopt the SBA's size standards to define small businesses for purposes of the qualified small business safe harbor. The SBA's small business size standards define the maximum size that a concern, together with all of its affiliates, may be if it is to be eligible for Federal small business programs or to be considered a small business for the purpose of other Federal agency programs. Concerns primarily engaged in the same kind of economic activity are classified in the same industry regardless of their types of ownership (such as sole proprietorship, partnership, or corporation). Approximately 1200 industries are described in detail in the North American Industry Classification System—United States, 2007. For most businesses, the SBA has established a size standard based on average annual receipts. The majority of places of public accommodation will be classified as small businesses if their average annual receipts are less than $6.5 million. However, some will qualify with higher annual receipts. The SBA small business size standards should be familiar

to many if not most small businesses, and using these standards in the ADA regulation would provide some certainty to owners, operators, and individuals because the SBA's current size standards can be changed only after notice and comment rulemaking.

The Department explained in the NPRM that the choice of gross revenue as the basis for calculating the safe harbor threshold was intended to avoid the effect of differences in bookkeeping practices and to maximize accessibility consistent with congressional intent. The Department recognized, however, that entities with similar gross revenue could have very different net revenue, and that this difference might affect what is readily achievable for a particular entity. The Department also recognized that adopting a small business safe harbor would effect a marked change to the Department's current position on barrier removal. Accordingly, the Department sought public comment on whether a presumption should be adopted whereby qualifying small businesses are presumed to have done what is readily achievable for a given year if, during that tax year, the entity spent at least 1 percent of its gross revenue in the preceding tax year on barrier removal, and on whether 1 percent is an appropriate amount or whether gross revenue would be the appropriate measure.

The Department received many comments on the proposed qualified small business safe harbor. From the business community, comments were received from individual business owners and operators, industry and trade groups, and advocacy organizations for business and industry. From the disability community, comments were received from individuals, disability advocacy groups, and nonprofit organizations involved in providing services for persons with disabilities or involved in disability-related fields. The Department has considered all relevant matter submitted on this issue during the 60-day public comment period.

Small businesses and industry groups strongly supported a qualified small business safe harbor of some sort, but none supported the structure proposed by the Department in the NPRM. All felt strongly that clarifications and modifications were needed to strengthen the provision and to provide adequate protection from litigation.

Business commenters' objections to the proposed qualified small business safe harbor fell generally into three categories: (1) That gross revenue is an inappropriate and inaccurate basis for determining what is readily achievable by a small business since it does not take into account expenses that may result in a small business operating at a loss; (2) that courts will interpret the regulation to mean that a small business must spend 1 percent of gross revenue each year on barrier removal, *i.e.,* that expenditure of 1 percent of gross revenue on barrier removal is always ''readily achievable''; and (3) that a similar misinterpretation of the 1 percent gross revenue concept, *i.e.,* that 1 percent of gross revenue is always ''readily achievable,'' will be applied to public accommodations that are not small businesses and that have substantially larger gross revenue. Business groups also expressed significant concern about the recordkeeping burdens they viewed as inherent in the Department's proposal.

Across the board, business commenters objected to the Department's proposed use of gross revenue as the basis for calculating whether the small business safe harbor has been met. All contended that 1 percent of gross revenue is too substantial a trigger for safe harbor protection and would result in barrier removal burdens far exceeding what is readily achievable or ''easily accomplishable and able to be carried out without much difficulty or expense.'' 42U.S.C. 12181(9). These commenters further pointed out that gross revenue and receipts vary considerably from industry to industry depending on the outputs sold in each industry, and that the use of gross revenue or receipts would therefore result in arbitrary and inequitable burdens on those subject to the rule. These commenters stated that the readily achievable analysis, and thus the safe harbor threshold, should be premised

on a business's net revenue so that operating expenses are offset before determining what amount might be available for barrier removal. Many business commenters contended that barrier removal is not readily achievable if an entity is operating at a loss, and that a spending formula premised on net revenue can reflect more accurately businesses' ability to engage in barrier removal.

There was no consensus among the business commenters as to a formula that would reflect more accurately what is readily achievable for small businesses with respect to barrier removal. Those that proposed alternative formulas offered little in the way of substantive support for their proposals. One advocacy organization representing a large cross-section of small businesses provided some detail on the gross and net revenue of various industry types and sizes in support of its position that for nearly all small businesses, net revenue is a better indicator of a business's financial ability to spend money on barrier removal. The data also incidentally highlighted the importance and complexity of ensuring that each component in a safe harbor formula accurately informs and contributes to the ultimate question of what is and is not readily achievable for a small business.

Several business groups proposed that a threshold of 0.5 percent (or one-half of 1 percent) of gross revenue, or 2.5 percent of net revenue, spent on ADA compliance might be a workable measure of what is ''readily achievable'' for small businesses. Other groups proposed 3 to 5 percent of net revenue as a possible measure. Several commenters proposed affording small businesses an option of using gross or net revenue to determine safe harbor eligibility. Another commenter proposed premising the safe harbor threshold on a designated percentage of the amount spent on renovation in a given year. Others proposed averaging gross or net revenue over a number of years to account for cyclical changes in economic and business environments. Additionally, many proposed that an entity should be able to roll over expenditures in excess of the safe harbor for inclusion in safe harbor analysis in subsequent years, to facilitate barrier removal planning and encourage large-scale barrier removal measures.

Another primary concern of many businesses and business groups is that the 1 percent threshold for safe harbor protection would become a de facto ''floor'' for what is readily achievable for any small business entity. These commenters urged the Department to clarify that readily achievable barrier removal remains the standard, and that in any given case, an entity retains the right to assert that barrier removal expenditures below the 1 percent threshold are not readily achievable. Other business groups worried that courts would apply the 1 percent calculus to questions of barrier removal by businesses too large to qualify for the small business safe harbor. These commenters requested clarification that the rationale underlying the Department's determination that a percentage of gross revenue can appropriately approximate readily achievable barrier removal for small businesses does not apply outside the small business context.

Small businesses and business groups uniformly requested guidance as to what expenses would be included in barrier removal costs for purposes of determining whether the safe harbor threshold has been met. These commenters contended that any and all expenses associated with ADA compliance—*e.g.,* consultants, architects, engineers, staff training, and recordkeeping— should be included in the calculation. Some proposed that litigation-related expenses, including defensive litigation costs, also should be accounted for in a small business safe harbor. Additionally, several commenters urged the Department to issue a small business compliance guide with detailed guidance and examples regarding application of the readily achievable barrier removal standard and the safe harbor. Some commenters felt that the Department's regulatory efforts should be focused on clarifying the readily achievable standard rather than on introducing a safe harbor based on a set spending level.

Businesses and business groups expressed con-

cern that the Department's proposed small business safe harbor would not alleviate small business vulnerability to litigation. Individuals and advocacy groups were equally concerned that the practical effect of the Department's proposal likely would be to accelerate or advance the initiation of litigation. These commenters pointed out that an individual encountering barriers in small business facilities will not know whether the entity is noncompliant or entitled to safe harbor protection. Safe harbor eligibility can be evaluated only after review of the small business's barrier removal records and financial records. Individuals and advocacy groups argued that the Department should not promulgate a rule by which individuals must file suit to obtain the information needed to determine whether a lawsuit is appropriate in a particular case, and that, therefore, the rule should clarify that small businesses are required to produce such documentation to any individual upon request.

Several commenters noted that a small business safe harbor based on net, rather than gross, revenue would complicate exponentially its efficacy as an affirmative defense, because accounting practices and asserted expenses would be subject to discovery and dispute. One business advocacy group representing a large cross-section of small businesses noted that some small business owners and operators likely would be uncomfortable with producing detailed financial information, or could be prevented from using the safe harbor because of inadvertent recordkeeping deficiencies.

Individuals, advocacy groups, and nonprofit organizations commenting on behalf of the disability community uniformly and strongly opposed a safe harbor for qualified small businesses, saying it is fundamentally at odds with the intent of Congress and the plain language of the ADA. These commenters contended that the case-specific factors underlying the statute's readily achievable standard cannot be reconciled with a formulaic accounting approach, and that a blanket formula inherently is less fair, less flexible, and less effective than the current case-by-case determination for whether an action is readily achievable. Moreover, they argued, a small business safe harbor for readily achievable barrier removal is unnecessary because the statutory standard explicitly provides that a business need only spend what is readily achievable—an amount that may be more or less than 1 percent of revenue in any given year.

Several commenters opined that the formulaic approach proposed by the Department overlooks the factors that often prove most conducive and integral to readily achievable barrier removal—planning and prioritization. Many commenters expressed concern that the safe harbor creates an incentive for business entities to forego large-scale barrier removal in favor of smaller, less costly removal projects, regardless of the relative access the measures might provide. Others commented that an emphasis on a formulaic amount rather than readily achievable barrier removal might result in competition among types of disabilities as to which barriers get removed first, or discrimination against particular types of disabilities if barrier removal for those groups is more expensive.

Many commenters opposed to the small business safe harbor proposed clarifications and limiting rules. A substantial number of commenters were strongly opposed to what they perceived as a vastly overbroad and overly complicated definition of ''qualified small business'' for purposes of eligibility for the safe harbor, and urged the Department to limit the qualified small business safe harbor to those businesses eligible for the ADA small business tax credit under section 44 of the Tax Code. Some commenters from the disability community contended that the spending level that triggers the safe harbor should be cumulative, to reflect the continuing nature of the readily achievable barrier obligation and to preclude a business from erasing years of unjustifiable inaction or insufficient action by spending up to the safe harbor threshold for one year. These commenters also sought explicit clarification that the small business safe harbor is an affirmative defense.

A number of commenters proposed that a busi-

ness seeking to use the qualified small business safe harbor should be required to have a written barrier removal plan that contains a prioritized list of significant access barriers, a schedule for removal, and a description of the methods used to identify and prioritize barriers. These commenters argued that only spending consistent with the plan should count toward the qualified small business threshold.

After consideration of all relevant matter presented, the Department has concluded that neither the qualified small business safe harbor proposed in the NPRM nor any of the alternatives proposed by commenters will achieve the Department's intended results. Business and industry commenters uniformly objected to a safe harbor based on gross revenue, argued that 1 percent of gross revenue was out of reach for most, if not all, small businesses, and asserted that a safe harbor based on net revenue would better capture whether and to what extent barrier removal is readily achievable for small businesses. Individuals and disability advocacy groups rejected a set formula as fundamentally inconsistent with the case-specific approach reflected in the statute.

Commenters on both sides noted ambiguity as to which ADA-related costs appropriately should be included in the calculation of the safe harbor threshold, and expressed concern about the practical effect of the proposed safe harbor on litigation. Disability organizations expressed concern that the proposal might increase litigation because individuals with disabilities confronted with barriers in places of public accommodation would not be able to independently assess whether an entity is noncompliant or is, in fact, protected by the small business safe harbor. The Department notes that the concerns about enforcement-related complexity and expense likely would increase exponentially with a small business safe harbor based on net revenue.

The Department continues to believe that promulgation of a small business safe harbor would be within the scope of the Attorney General's mandate under 42 U.S.C. 12186(b) to issue regulations to carry out the provisions of title III. Title III defines ''readily achievable'' to mean ''easily accomplishable and able to be carried out without much difficulty or expense,'' 42 U.S.C. 12181(9), and sets out factors to consider in determining whether an action is readily achievable. While the statutory factors reflect that whether an action is readily achievable is a fact-based determination, there is no inherent inconsistency with the Department's proposition that a formula based on revenue and barrier removal expenditure could accurately approximate the high end of the level of expenditure that can be considered readily achievable for a circumscribed subset of title III entities defined, in part, by their maximum annual average receipts. Moreover, the Department's obligation under the SBREFA to consider alternative means of compliance for small businesses, *see* 5 U.S.C. 603(c), further supports the Department's conclusion that a well-targeted formula is a reasonable approach to implementation of the statute's readily achievable standard. While the Department ultimately has concluded that a small business safe harbor should not be included in the final rule, the Department continues to believe that it is within the Department's authority to develop and implement such a safe harbor.

As noted above, the business community strongly objected to a safe harbor premised on gross revenue, on the ground that gross revenue is an unreliable indicator of an entity's ability to remove barriers, and urged the Department to formulate a safe harbor based on net revenue. The Department's proposed use of gross revenue was intended to offer a measure of certainty for qualified small businesses while ensuring that those businesses continue to meet their ongoing obligation to remove architectural barriers where doing so is readily achievable.

The Department believes that a qualified small business safe harbor based on net revenue would be an unreliable indicator of what is readily achievable and would be unworkable in practice.

Evaluation of what is readily achievable for a small business cannot rest solely on a business's net revenue because many decisions about expenses are inherently subjective, and in some cases a net loss may be more beneficial (in terms of taxes, for example) than a small net profit. The Department does not read the ADA's readily achievable standard to mean necessarily that architectural barrier removal is to be, or should be, a business's last concern, or that a business can claim that every barrier removal obligation is not readily achievable. Therefore, if a qualified small business safe harbor were to be premised on net revenue, assertion of the affirmative defense would trigger discovery and examination of the business's accounting methods and the validity or necessity of offsetting expenses. The practical benefits and legal certainty intended by the NPRM would be lost.

Because there was little to no support for the Department's proposed use of gross revenue and no workable alternatives are available at this time, the Department will not adopt a small business safe harbor in this final rule. Small business public accommodations are subject to the barrier removal requirements set out in § 36.304 of the final rule. In addition, the Department plans to provide small businesses with more detailed guidance on assessing and meeting their barrier removal obligations in a small business compliance guide.

Section 36.308 Seating in Assembly Areas

In the 1991 rule, § 36.308 covered seating obligations for public accommodations in assembly areas. It was bifurcated into (a) existing facilities and (b) new construction and alterations. The new construction and alterations provision, § 36.308(b), merely stated that assembly areas should be built or altered in accordance with the applicable provisions in the 1991 Standards. Section 36.308(a), by contrast, provided detailed guidelines on what barrier removal was required.

The Department explained in the preamble to the 1991 rule that § 36.308 provided specific rules on assembly areas to ensure that wheelchair users, who typically were relegated to inferior seating in the back of assembly areas separate from their friends and family, would be provided access to seats that were integrated and equal in quality to those provided to the general public. Specific guidance on assembly areas was desirable because they are found in many different types of places of public accommodation, ranging from opera houses (places of exhibition or entertainment) to private university lecture halls (places of education), and include assembly areas that range in size from small movie theaters of 100 or fewer seats to 100,000-seat sports stadiums.

In the NPRM, the Department proposed to update § 36.308(a) by incorporating some of the applicable assembly area provisions from the 2010 Standards. Upon further review, however, the Department has determined that the need to provide special guidance for assembly areas in a separate section no longer exists, except for specialty seating areas, as discussed below. Since enactment of the ADA, the Department has interpreted the 1991 Standards as a guide for determining the existence of barriers. Courts have affirmed this interpretation. *See, e.g., Colorado Cross Disability Coalition v. Too, Inc.,* 344 F. Supp. 2d 707 (D. Colo. 2004); *Access Now, Inc. v. AMH CGH, Inc.*, 2001 WL 1005593 (S.D. Fla. 2001); *Pascuiti v. New York Yankees*, 87 F. Supp. 2d 221 (S.D.N.Y. 1999).

The 2010 Standards now establish detailed guidance for newly constructed and altered assembly areas, which is provided in § 36.406(f), and these Standards will serve as a new guide for barrier removal. Accordingly, the former § 36.308(a) has been replaced in the final rule. Assembly areas will benefit from the same safe harbor provisions applicable to barrier removal in all places of public accommodations as provided in § 36.304(d)(2) of the final rule.

The Department has also decided to remove proposed § 36.308(c)(2) from the final rule. This provision would have required assembly

areas with more than 5,000 seats to provide five wheelchair spaces with at least three designated companion seats for each of those five wheelchair spaces. The Department agrees with commenters who asserted that group seating already is addressed more appropriately in ticketing under § 36.302(f).

The Department has determined that proposed § 36.308(c)(1), addressing specialty seating in assembly areas, should remain as § 36.308 in the final rule with additional language. This paragraph is designed to ensure that individuals with disabilities have an opportunity to access specialty seating areas that entitle spectators to distinct services or amenities not generally available to others. This provision is not, as several commenters mistakenly thought, designed to cover luxury boxes and suites. Those areas have separate requirements outlined in section 221 of the 2010 Standards.

Section 36.308 requires only that accessible seating be provided in each area with distinct services or amenities. To the extent a covered entity provides multiple seating areas with the same services and amenities, each of those areas would not be distinct and thus all of them would not be required to be accessible. For example, if a facility has similar dining service in two areas, both areas would not need to be made accessible; however, if one dining service area is open to families, while the other is open only to individuals over the age of 21, both areas would need to be made accessible. Factors distinguishing specialty seating areas generally are dictated by the type of facility or event, but may include, for example, such distinct services and amenities as access to wait staff for in-seat food or beverage service; availability of catered food or beverages for pre-game, intermission, or post-game events; restricted access to lounges with special amenities, such as couches or flat-screen televisions; or access to team personnel or facilities for team-sponsored events (*e.g.,* autograph sessions, sideline passes, or facility tours) not otherwise available to other spectators.

The NPRM required public accommodations to locate wheelchair seating spaces and companion seats in each specialty seating area within the assembly area. The Department has added language in the final rule stating that public accommodations that cannot place wheelchair seating spaces and companion seats in each specialty area because it is not readily achievable to do so may meet their obligation by providing specialty services or amenities to individuals with disabilities and their companions at other designated accessible locations at no additional cost. For example, if a theater that only has barrier removal obligations provides wait service to spectators in the mezzanine, and it is not readily achievable to place accessible seating there, it may meet its obligation by providing wait service to patrons with disabilities who use wheelchairs and their companions at other designated accessible locations at no additional cost. This provision does not obviate the obligation to comply with applicable requirements for new construction and alterations, including dispersion of accessible seating.

Section 36.309 Examinations and Courses

Section 36.309(a) sets forth the general rule that any private entity that offers examinations or courses relating to applications, licensing, certification, or credentialing for secondary or postsecondary education, professional, or trade purposes shall offer such examinations or courses in a place and manner accessible to persons with disabilities or offer alternative accessible arrangements for such individuals. In the NPRM preamble and proposed regulatory amendment and in this final rule, the Department relied on its history of enforcement efforts, research, and body of knowledge of testing and modifications, accommodations, and aids in detailing steps testing entities should take to ensure that persons with disabilities receive appropriate modifications, accommodations, or auxiliary aids in examination and course settings as required by the ADA. The Department received comments from disability rights groups, organi-

zations that administer tests, State governments, professional associations, and individuals on the language appearing in the NPRM preamble and amended regulation and has carefully considered these comments.

The Department initially set out the parameters of appropriate documentation requests relating to examinations and courses covered by this section in the 1991 preamble at 28 CFR part 36, stating that ''requests for documentation must be reasonable and must be limited to the need for the modification or aid requested.'' *See* 28 CFR part 36, app. B at 735 (2009). Since that time, the Department, through its enforcement efforts pursuant to section 309, has addressed concerns that requests by testing entities for documentation regarding the existence of an individual's disability and need for a modification or auxiliary aid or service were often inappropriate and burdensome. The Department proposed language stating that while it may be appropriate for a testing entity to request that an applicant provide documentation supporting the existence of a disability and the need for a modification, accommodation, or auxiliary aid or service, the request by the testing entity for such documentation must be reasonable and limited. The NPRM proposed that testing entities should narrowly tailor requests for documentation, limiting those requests to materials that will allow the testing entities to ascertain the nature of the disability and the individual's need for the requested modification, accommodation, or auxiliary aid or service. This proposal codified the 1991 rule's preamble language regarding testing entities' requests for information supporting applicants' requests for testing modifications or accommodations.

Overall, most commenters supported this addition to the regulation. These commenters generally agreed that documentation sought by testing entities to support requests for modifications and testing accommodations should be reasonable and tailored. Commenters noted, for example, that the proposal to require reasonable and tailored documentation requests ''is not objectionable. Indeed, it largely tracks DOJ's long-standing informal guidance that 'requests for documentation must be reasonable and limited to the need for the modification or aid requested.' '' Commenters including disability rights groups, State governments, professional associations, and individuals made it clear that, in addition to the proposed regulatory change, other significant problems remain for individuals with disabilities who seek necessary modifications to examinations and courses. These problems include detailed questions about the nature of documentation materials submitted by candidates, testing entities' questioning of documentation provided by qualified professionals with expertise in the particular disability at issue, and lack of timeliness in determining whether to provide requested accommodations or modifications. Several commenters expressed enthusiasm for the preamble language addressing some of these issues, and some of these commenters recommended the incorporation of portions of this preamble language into the regulatory text. Some testing entities expressed concerns and uncertainty about the language in the preamble and sought clarifications about its meaning. These commenters focused most of their attention on the following language from the NPRM preamble:

Generally, a testing entity should accept without further inquiry documentation provided by a qualified professional who has made an individualized assessment of the applicant. Appropriate documentation may include a letter from a qualified professional or evidence of a prior diagnosis, or accommodation, or classification, such as eligibility for a special education program. When an applicant's documentation is recent and demonstrates a consistent history of a diagnosis, there is no need for further inquiry into the nature of the disability. A testing entity should consider an applicant's past use of a particular auxiliary aid or service. 73 FR 34508, 34539 (June 17, 2008).

Professional organizations, State governments, individuals, and disability rights groups fully sup-

ported the Department's preamble language and recommended further modification of the regulations to encompass the issues raised in the preamble. A disability rights group recommended that the Department incorporate the preamble language into the regulations to ensure that ''documentation demands are strictly limited in scope and met per se when documentation of previously provided accommodations or aids is provided.'' One professional education organization noted that many testing corporations disregard the documented diagnoses of qualified professionals, and instead substitute their own, often unqualified diagnoses of individuals with disabilities. Commenters confirmed that testing entities sometimes ask for unreasonable information that is either impossible, or extremely onerous, to provide. A disability rights organization supported the Department's proposals and noted that private testing companies impose burdensome documentation requirements upon applicants with disabilities seeking accommodations and that complying with the documentation requests is frequently so difficult, and negotiations over the requests so prolonged, that test applicants ultimately forgo taking the test. Another disability rights group urged the Department to ''expand the final regulatory language to ensure that regulations accurately provide guidance and support the comments made about reducing the burden of documenting the diagnosis and existence of a disability.''

Testing entities, although generally supportive of the proposed regulatory amendment, expressed concern regarding the Department's proposed preamble language. The testing entities provided the Department with lengthy comments in which they suggested that the Department's rationale delineated in the preamble potentially could limit them from gathering meaningful and necessary documentation to determine whether, in any given circumstance, a disability is presented, whether modifications are warranted, and which modifications would be most appropriate. Some testing entities raised concerns about individuals skewing testing results by falsely claiming or feigning disabilities as an improper means of seeking advantage on an examination. Several testing entities raised concerns about and sought clarification regarding the Department's use of certain terms and concepts in the preamble, including ''without further inquiry,'' ''appropriate documentation,'' ''qualified professional,'' ''individualized assessment,'' and ''consider.'' These entities discussed the preamble language at length, noting that testing entities need to be able to question some aspects of testing applicants' documentation or to request further documentation from some candidates when the initial documentation is unclear or incomplete. One testing entity expressed concern that the Department's preamble language would require the acceptance of a brief note on a doctor's prescription pad as adequate documentation of a disability and the need for an accommodation. One medical examination organization stated that the Department's preamble language would result in persons without disabilities receiving accommodations and passing examinations as part of a broad expansion of unwarranted accommodations, potentially endangering the health and welfare of the general public. Another medical board ''strenuously objected'' to the ''without further inquiry'' language. Several of the testing entities expressed concern that the Department's preamble language might require testing companies to accept documentation from persons with temporary or questionable disabilities, making test scores less reliable, harming persons with legitimate entitlements, and resulting in additional expense for testing companies to accommodate more test takers.

It remains the Department's view that, when testing entities receive documentation provided by a qualified professional who has made an individualized assessment of an applicant that supports the need for the modification, accommodation, or aid requested, they shall generally accept such documentation and provide the accommodation.

Several commenters sought clarifications on what types of documentation are acceptable to

demonstrate the existence of a disability and the need for a requested modification, accommodation, or aid. The Department believes that appropriate documentation may vary depending on the nature of the disability and the specific modification or aid requested, and accordingly, testing entities should consider a variety of types of information submitted. Examples of types of information to consider include recommendations of qualified professionals familiar with the individual, results of psycho-educational or other professional evaluations, an applicant's history of diagnosis, participation in a special education program, observations by educators, or the applicant's past use of testing accommodations. If an applicant has been granted accommodations post-high school by a standardized testing agency, there is no need for reassessment for a subsequent examination.

Some commenters expressed concern regarding the use of the term ''letter'' in the proposed preamble sentence regarding appropriate documentation. The NPRM preamble language stated that ''[a]ppropriate documentation may include a letter from a qualified professional or evidence of a prior diagnosis, accommodation, or classification, such as eligibility for a special education program.'' 73 FR 34508, 34539 (June 17, 2008). Some testing entities posited that the preamble language would require them to accept a brief letter from a doctor or even a doctor's note on a prescription pad indicating ''I've been treating (student) for ADHD and he/she is entitled to extend time on the ACT.'' The Department's reference in the NPRM preamble to letters from physicians or other professionals was provided in order to offer examples of some types of acceptable documentation that may be considered by testing entities in evaluating the existence of an applicant's disability and the need for a certain modification, accommodation, or aid. No one piece of evidence may be dispositive in make a testing accommodation determination. The significance of a letter or other communication from a doctor or other qualified professional would depend on the professional's relationship with the candidate and the specific content of the communication, as well as how the letter fits in with the totality of the other factors used to determine testing accommodations under this rule. Similarly, an applicant's failure to provide results from a specific test or evaluation instrument should not of itself preclude approval of requests for modifications, accommodations, or aids if the documentation provided by the applicant, in its entirety, is sufficient to demonstrate that the individual has a disability and requires a requested modification, accommodation, or aid on the relevant examination. This issue is discussed in more detail below.

One disability rights organization noted that requiring a 25-year old who was diagnosed in junior high school with a learning disability and accommodated ever since ''to produce elementary school report cards to demonstrate symptomology before the age of seven is unduly burdensome.'' The same organization commented that requiring an individual with a long and early history of disability to be assessed within three years of taking the test in question is similarly burdensome, stating that ''[t]here is no scientific evidence that learning disabilities abate with time, nor that Attention Deficits abate with time * * *.'' This organization noted that there is no justification for repeatedly subjecting people to expensive testing regimens simply to satisfy a disbelieving industry. This is particularly true for adults with, for example, learning disabilities such as dyslexia, a persistent condition without the need for retesting once the diagnosis has been established and accepted by a standardized testing agency.

Some commenters from testing entities sought clarification regarding who may be considered a ''qualified professional.'' Qualified professionals are licensed or otherwise properly credentialed and possess expertise in the disability for which modifications or accommodations are sought. For example, a podiatrist would not be considered to be a qualified professional to diagnose a learning disability or support a request for testing accom-

modations on that basis. Types of professionals who might possess the appropriate credentials and expertise are doctors (including psychiatrists), psychologists, nurses, physical therapists, occupational therapists, speech therapists, vocational rehabilitation specialists, school counselors, and licensed mental health professionals. Additionally, while testing applicants should present documentation from qualified professionals with expertise in the pertinent field, it also is critical that testing entities that review documentation submitted by prospective examinees in support of requests for testing modifications or accommodations ensure that their own reviews are conducted by qualified professionals with similarly relevant expertise.

Commenters also sought clarification of the term individualized assessment. The Department's intention in using this term is to ensure that documentation provided on behalf of a testing candidate is not only provided by a qualified professional, but also reflects that the qualified professional has individually and personally evaluated the candidate as opposed to simply considering scores from a review of documents. This is particularly important in the learning disabilities context, where proper diagnosis requires face-to-face evaluation. Reports from experts who have personal familiarity with the candidate should take precedence over those from, for example, reviewers for testing agencies, who have never personally met the candidate or conducted the requisite assessments for diagnosis and treatment.

Some testing entities objected to the NPRM preamble's use of the phrase ''without further inquiry.'' The Department's intention here is to address the extent to which testing entities should accept documentation provided by an applicant when the testing entity is determining the need for modifications, accommodations, or auxiliary aids or services. The Department's view is that applicants who submit appropriate documentation, *e.g.*, documentation that is based on the careful individual consideration of the candidate by a professional with expertise relating to the disability in question, should not be subjected to unreasonably burdensome requests for additional documentation. While some testing commenters objected to this standard, it reflects the Department's longstanding position. When an applicant's documentation demonstrates a consistent history of a diagnosis of a disability, and is prepared by a qualified professional who has made an individualized evaluation of the applicant, there is little need for further inquiry into the nature of the disability and generally testing entities should grant the requested modification, accommodation, or aid.

After a careful review of the comments, the Department has decided to maintain the proposed regulatory language on the scope of appropriate documentation in § 36.309(b)(1)(iv). The Department has also added new regulatory language at § 36.309(b)(1)(v) that provides that testing entities shall give considerable weight to documentation of past modifications, accommodations, or auxiliary aids or services received in similar testing situations as well as such modifications, accommodations, or related aids and services provided in response to an Individualized Education Program (IEP) provided under the Individuals with Disabilities Education Act (IDEA) or a plan providing services pursuant to section 504 of the Rehabilitation Act of1973, as amended (often referred to as a Section 504 Plan). These additions to the regulation are necessary because the Department's position on the bounds of appropriate documentation contained in Appendix B, 28 CFR part 36, app. B (2009), has not been implemented consistently and fully by organizations that administer tests.

The new regulatory language clarifies that an applicant's past use of a particular modification, accommodation, or auxiliary aid or service in a similar testing setting or pursuant to an IEP or Section 504 Plan provides critical information in determining those examination modifications that would be applicable in a given circumstance. The addition of this language and the appropriate weight to be accorded it is seen as important by the Department because the types of accommoda-

tions provided in both these circumstances are typically granted in the context of individual consideration of a student's needs by a team of qualified and experienced professionals. Even though these accommodations decisions form a common sense and logical basis for testing entities to rely upon, they are often discounted and ignored by testing entities.

For example, considerable weight is warranted when a student with a Section 504 Plan in place since middle school that includes the accommodations of extra time and a quiet room for testing is seeking these same accommodations from a testing entity covered by section 309 of the Act. In this example, a testing entity receiving such documentation should clearly grant the request for accommodations. A history of test accommodations in secondary schools or in post-secondary institutions, particularly when determined through the rigors of a process required and detailed by Federal law, is as useful and instructive for determining whether a specific accommodation is required as accommodations provided in standardized testing situations.

It is important to note, however, that the inclusion of this weight does not suggest that individuals without IEPs or Section 504 Plans are not also entitled to receive testing accommodations. Indeed, it is recommended that testing entities must consider the entirety of an applicant's history to determine whether that history, even without the context of a IEP or Section 504 Plan, indicates a need for accommodations. In addition, many students with learning disabilities have made use of informal, but effective accommodations. For example, such students often receive undocumented accommodations such as time to complete tests after school or at lunchtime, or being graded on content and not form or spelling of written work. Finally, testing entities shall also consider that because private schools are not subject to the IDEA, students at private schools may have a history of receiving accommodations in similar settings that are not pursuant to an IEP or Section 504 Plan.

Some testing entities sought clarification that they should only be required to consider particular use of past modifications, accommodations, auxiliary aids or services received by testing candidates for prior testing and examination settings. These commenters noted that it would be unhelpful to consider the classroom accommodations for a testing candidate, as those accommodations would not typically apply in a standardized test setting. The Department's history of enforcement in this area has demonstrated that a recent history of past accommodations is critical to an understanding of the applicant's disability and the appropriateness of testing accommodations.

The Department also incorporates the NPRM preamble's ''timely manner'' concept into the new regulatory language at § 36.309(b)(1)(vi). Under this provision, testing entities are required to respond in a timely manner to requests for testing accommodations in order to ensure equal opportunity for persons with disabilities. Testing entities are to ensure that their established process for securing testing accommodations provides applicants with a reasonable opportunity to supplement the testing entities' requests for additional information, if necessary, and still be able to take the test in the same testing cycle. A disability rights organization commented that testing entities should not subject applicants to unreasonable and intrusive requests for information in a process that should provide persons with disabilities effective modifications in a timely manner, fulfilling the core objective of title III to provide equal access. Echoing this perspective, several disability rights organizations and a State government commenter urged that testing entities should not make unreasonably burdensome demands for documentation, particularly where those demands create impediments to receiving accommodations in a timely manner. Access to examinations should be offered to persons with disabilities in as timely a manner as it is offered to persons without disabilities. Failure by a testing entity to act in a timely manner,

coupled with seeking unnecessary documentation, could result in such an extended delay that it constitutes a denial of equal opportunity or equal treatment in an examination setting for persons with disabilities.

Section 36.311 Mobility Devices

Section 36.311 of the NPRM clarified the scope and circumstances under which covered entities are legally obligated to accommodate various ''mobility devices.'' Section 36.311 set forth specific requirements for the accommodation of mobility devices, including wheelchairs, manually-powered mobility aids, and other power-driven mobility devices.

In both the NPRM and the final rule, § 36.311(a) states the general rule that in any areas open to pedestrians, public accommodations shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, including walkers, crutches, canes, braces, or similar devices. Because mobility scooters satisfy the definition of ''wheelchair'' (*i.e.,* ''a manually-operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor, or of both indoor and outdoor locomotion''), the reference to them in § 36.311(a) of the final rule has been omitted to avoid redundancy.

Most business commenters expressed concern that permitting the use of other power-driven mobility devices by individuals with mobility disabilities would make such devices akin to wheelchairs and would require them to make physical changes to their facilities to accommodate their use. This concern is misplaced. If a facility complies with the applicable design requirements in the 1991 Standards or the 2010 Standards, the public accommodation will not be required to exceed those standards to accommodate the use of wheelchairs or other power-driven mobility devices that exceed those requirements.

Legal standard for other power-driven mobility devices. The NPRM version of § 36.311(b) provided that a public accommodation ''shall make reasonable modifications in its policies, practices, and procedures to permit the use of other power-driven mobility devices by individuals with disabilities, unless the public accommodation can demonstrate that the use of the device is not reasonable or that its use will result in a fundamental alteration in the nature of the public accommodation's goods, services, facilities, privileges, advantages, or accommodations.'' 73 FR 34508, 34556 (June 17, 2008). In other words, public accommodations are by default required to permit the use of other power-driven mobility devices; the burden is on them to prove the existence of a valid exception. Most commenters supported the notion of assessing whether the use of a particular device is reasonable in the context of a particular venue. Commenters, however, disagreed about the meaning of the word ''reasonable'' as it is used in § 36.311(b) of the NPRM. Virtually every business and industry commenter took the use of the word ''reasonable'' to mean that a general reasonableness standard would be applied in making such an assessment. Advocacy and nonprofit groups almost universally objected to the use of a general reasonableness standard with regard to the assessment of whether a particular device should be allowed at a particular venue. They argued that the assessment should be based on whether reasonable modifications could be made to allow a particular device at a particular venue, and that the only factors that should be part of the calculus that results in the exclusion of a particular device are undue burden, direct threat, and fundamental alteration.

A few commenters opposed the proposed provision requiring public accommodations to assess whether reasonable modifications can be made to allow other power-driven mobility devices, preferring instead that the Department issue guidance materials so that public accommodations would not have to incur the cost of such analyses. Another commenter noted a ''fox guarding the hen house''-type of concern with regard to public

accommodations developing and enforcing their own modification policy. In response to comments received, the Department has revised § 36.311(b) to provide greater clarity regarding the development of legitimate safety requirements regarding other power-driven mobility devices. The Department has not retained the proposed NPRM language stating that an other power-driven mobility device can be excluded if a public accommodation can demonstrate that the use of the device is not reasonable or that its use fundamentally alters the nature of the goods, services, facilities, privileges, advantages, or accommodations offered by the public accommodation because the Department believes that these exceptions are covered by the general reasonable modification requirement contained in § 36.302.

Assessment factors. Section 36.311(c) of the NPRM required public accommodations to ''establish policies to permit the use of other power-driven mobility devices'' and articulated four factors upon which public accommodations must base decisions as to whether a modification is reasonable to allow the use of a class of other power-driven mobility devices by individuals with disabilities in specific venues (*e.g.,* doctors' offices, parks, commercial buildings, etc.). 73 FR 34508, 34556 (June 17, 2008).

The Department has relocated and modified the NPRM text that appeared in § 36.311(c) to new paragraph § 36.311(b)(2) to clarify what factors the public accommodation shall use in determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification. Section 36.311(b)(2) now states that ''[i]n determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification under (b)(1), a public accommodation shall consider'' certain enumerated factors. The assessment factors are designed to assist public accommodations in determining whether allowing the use of a particular other power-driven mobility device in a specific facility is reasonable. Thus, the focus of the analysis must be on the appropriateness of the use of the device at a specific facility, rather than whether it is necessary for an individual to use a particular device.

The NPRM proposed the following specific assessment factors: (1) The dimensions, weight, and operating speed of the mobility device in relation to a wheelchair; (2) the potential risk of harm to others by the operation of the mobility device; (3) the risk of harm to the environment or natural or cultural resources or conflict with Federal land management laws and regulations; and (4) the ability of the public accommodation to stow the mobility device when not in use, if requested by the user.

Factor 1 was designed to help public accommodations assess whether a particular device was appropriate, given its particular physical features, for a particular location. Virtually all commenters said the physical features of the device affected their view of whether a particular device was appropriate for a particular location. For example, while many commenters supported the use of an other power-driven mobility device if the device were a Segway® PT, because of environmental and health concerns they did not offer the same level of support if the device were an off-highway vehicle, all-terrain vehicle (ATV), golf car, or other device with a fuel-powered or combustion engine. Most commenters noted that indicators such as speed, weight, and dimension really were an assessment of the appropriateness of a particular device in specific venues and suggested that factor 1 say this more specifically.

The term ''in relation to a wheelchair'' in the NPRM's factor 1 apparently created some concern that the same legal standards that apply to wheelchairs would be applied to other power-driven mobility devices. The Department has omitted the term ''in relation to a wheelchair'' from § 36.311(b)(2)(i) to clarify that if a facility that is in compliance with the applicable provisions of the 1991 Standards or the 2010 Standards grants per-

mission for an other power-driven mobility device to go on-site, it is not required to exceed those standards to accommodate the use of other power-driven mobility devices. In response to requests that NPRM factor 1 state more specifically that it requires an assessment of an other power-driven mobility device's appropriateness under particular circumstances or in particular venues, the Department has added several factors and more specific language. In addition, although the NPRM made reference to the operation of other power-driven mobility devices in ''specific venues,'' the Department's intent is captured more clearly by referencing ''specific facility'' in paragraph (b)(2). The Department also notes that while speed is included in factor 1, public accommodations should not rely solely on a device's top speed when assessing whether the device can be accommodated; instead, public accommodations should also consider the minimum speeds at which a device can be operated and whether the development of speed limit policies can be established to address concerns regarding the speed of the device. Finally, since the ability of the public accommodation to stow the mobility device when not in use is an aspect of its design and operational characteristics, the text proposed as factor 4 in the NPRM has been incorporated in paragraph (b)(2)(iii).

The NPRM's version of factor 2 provided that the ''potential risk of harm to others by the operation of the mobility device'' is one of the determinants in the assessment of whether other power-driven mobility devices should be excluded from a site. With this language, the Department intended to incorporate the safety standard found in § 36.301(b), which provides that public accommodations may ''impose legitimate safety requirements that are necessary for safe operation'' into the assessment. However, several commenters indicated that they read this language, particularly the phrase 'potential risk of harm'' to mean that the Department had adopted a concept of risk analysis different from that which is in the existing standards. The Department did not intend to create a new standard and has changed the language in paragraphs (b)(1) and (b)(2) to clarify the applicable standards, thereby avoiding the introduction of new assessments of risk beyond those necessary for the safe operation of the public accommodation.

While all applicable affirmative defenses are available to public accommodations in the establishment and execution of their policies regarding other power-driven mobility devices, the Department did not explicitly incorporate the direct threat defense into the assessment factors because § 36.301(b) provides public accommodations the appropriate framework with which to assess whether legitimate safety requirements that may preclude the use of certain other power-driven mobility devices are necessary for the safe operation of the public accommodation. In order to be legitimate, the safety requirement must be based on actual risks and not mere speculation regarding the device or how it will be operated. Of course, public accommodations may enforce legitimate safety rules established for the operation of other-power driven mobility devices (*e.g.*, reasonable speed restrictions). Finally, NPRM factor 3 concerning environmental resources and conflicts of law has been relocated to paragraph (b)(2)(v).

As a result of these comments and requests, NPRM factors 1, 2, 3, and 4 have been revised and renumbered within paragraph 36.311(b)(2) in the final rule.

Several commenters requested that the Department provide guidance materials or more explicit concepts of which considerations might be appropriate for inclusion in a policy that allows the use of other power-driven mobility devices. A public accommodation that has determined that reasonable modifications can be made in its policies, practices, or procedures to allow the use of other power-driven mobility devices should develop a policy that clearly states the circumstances under which the use of other power-driven mobility devices by individuals with a mobility disability will be permitted. It also should include clear, concise

statements of specific rules governing the operation of such devices. Finally, the public accommodation should endeavor to provide individuals with disabilities who use other power-driven mobility devices with advanced notice of its policy regarding the use of such devices and what rules apply to the operation of these devices.

For example, the U.S. General Services Administration (GSA) has developed a policy allowing the use of the Segway® PT and other EPAMDs in all Federal buildings under GSA's jurisdiction. *See* General Services Administration, *Interim Segway® Personal Transporter Policy* (Dec. 3, 2007), available at *http://www.gsa.gov/graphics/pbs/Interim_Segway_Policy_121007.pdf* (last visited June 24, 2010). The GSA policy defines the policy's scope of coverage by setting out what devices are and are not covered by the policy. The policy also sets out requirements for safe operation, such as a speed limit, prohibits the use of EPAMDs on escalators, and provides guidance regarding security screening of these devices and their operators.

A public accommodation that determines that it can make reasonable modifications to permit the use of an other power-driven mobility device by an individual with a mobility disability might include in its policy the procedure by which claims that the other power-driven mobility device is being used for a mobility disability will be assessed for legitimacy (*i.e.,* a credible assurance that the device is being used for a mobility disability, including a verbal representation by the person with a disability that is not contradicted by observable fact, or the presentation of a disability parking space placard or card, or State-issued proof of disability); the type or classes of other power-driven mobility devices are permitted to be used by individuals with mobility disabilities; the size, weight, and dimensions of the other power-driven mobility devices that are permitted to be used by individuals with mobility disabilities; the speed limit for the other power-driven mobility devices that are permitted to be used by individuals with mobility disabilities; the places, times, or circumstances under which the use of the other power-driven mobility devices is or will be restricted or prohibited; safety, pedestrian, and other rules concerning the use of the other power-driven mobility devices; whether, and under which circumstances, storage for the other power-driven mobility devices will be made available; and how and where individuals with a mobility disability can obtain a copy of the other power-driven mobility device policy.

Public accommodations also might consider grouping other power-driven mobility devices by type (*e.g.*, EPAMDs, golf cars, gasoline-powered vehicles, and other devices). For example, an amusement park may determine that it is reasonable to allow individuals with disabilities to use EPAMDs in a variety of outdoor programs and activities, but that it would not be reasonable to allow the use of golf cars as mobility devices in similar circumstances. At the same time, the entity may address its concerns about factors such as space limitations by disallowing use of EPAMDs by members of the general public who do not have mobility disabilities.

The Department anticipates that in many circumstances, public accommodations will be able to develop policies that will allow the use of other power-driven mobility devices by individuals with mobility disabilities without resulting in a fundamental alteration of a public accommodation's goods, services, facilities, privileges, advantages, or accommodations. Consider the following examples:

Example 1: Although individuals who do not have mobility disabilities are prohibited from operating EPAMDs at a theme park, the park has developed a policy allowing individuals with mobility disabilities to use EPAMDs as their mobility device at the park. The policy states that EPAMDs are allowed in all areas of the theme park that are open to pedestrians as a reasonable modification to its general policy on EPAMDs. The public accommodation has determined that the facility provides adequate space for a taller device, such as an EPAMD, and that it does not fundamentally

alter the nature of the theme park's goods and services. The theme park's policies do, however, require that EPAMDs be operated at a safe speed limit. A theme park employee may inquire at the ticket gate whether the device is needed due to the user's disability or may request the presentation of a valid, State-issued, disability parking placard (though presentation of such a placard is not necessary), or other State-issued proof of disability or a credible assurance that the use of the EPAMD is for the individual's mobility disability. The park employee also may inform an individual with a disability using an EPAMD that the theme park's policy requires that it be operated at or below the park's designated speed limit.

Example 2: A shopping mall has developed a policy whereby EPAMDs may be operated by individuals with mobility disabilities in the common pedestrian areas of the mall if the operator of the device agrees to the following: to operate the device no faster than the speed limit set by the policy; to use the elevator, not the escalator, to transport the EPAMD to different levels; to yield to pedestrian traffic; not to leave the device unattended unless it can stand upright and has a locking system; to refrain from using the device temporarily if the mall manager determines that the volume of pedestrian traffic is such that the operation of the device would interfere with legitimate safety requirements; and to present the mall management office with a valid, State-issued, disability parking placard (though presentation of such a placard is not necessary), or State-issued proof of disability, as a credible assurance that the use of the EPAMD is for the individual's mobility disability, upon entry to the mall.

Inquiry into the use of other power-driven mobility device. Section 36.311(d) of the NPRM provided that a ''public accommodation may ask a person using a power-driven mobility device if the mobility device is required because of the person's disability. A public accommodation shall not ask a person using a mobility device questions about the nature and extent of the person's disability.'' 73 FR 34508, 34556 (June 17, 2008).

While business commenters did not take issue with applying this standard to individuals who use wheelchairs, they were not satisfied with the application of this standard to other power-driven mobility devices. Business commenters expressed concern about people feigning mobility disabilities to be able to use other power-driven mobility devices in public accommodations in which their use is otherwise restricted. These commenters felt that a mere inquiry into whether the device is being used for a mobility disability was an insufficient mechanism by which to detect fraud by other power-driven mobility device users who do not have mobility disabilities. These commenters believed they should be given more latitude to make inquiries of other power-driven mobility device users claiming a mobility disability than they would be given for wheelchair users. They sought the ability to establish a policy or method by which public accommodations may assess the legitimacy of the mobility disability. They suggested some form of certification, sticker, or other designation. One commenter suggested a requirement that a sticker bearing the international symbol for accessibility be placed on the device or that some other identification be required to signal that the use of the device is for a mobility disability. Other suggestions included displaying a disability parking placard on the device or issuing EPAMDs, like the Segway® PT, a permit that would be similar to permits associated with parking spaces reserved for those with disabilities.

Advocacy, nonprofit, and several individual commenters balked at the notion of allowing any inquiry beyond whether the device is necessary for a mobility disability and encouraged the Department to retain the NPRM's language on this topic. Other commenters, however, were empathetic with commenters who had concerns about fraud. At least one Segway® PT advocate suggested it would be permissible to seek documentation of the mobility disability in the form of a simple

sign or permit.

The Department has sought to find common ground by balancing the needs of businesses and individuals with mobility disabilities wishing to use other power-driven mobility devices with the Department's longstanding, well-established policy of not allowing public accommodations or establishments to require proof of a mobility disability. There is no question that public accommodations have a legitimate interest in ferreting out fraudulent representations of mobility disabilities, especially given the recreational use of other power-driven mobility devices and the potential safety concerns created by having too many such devices in a specific facility at one time. However, the privacy of individuals with mobility disabilities and respect for those individuals are also vitally important.

Neither § 36.311(d) of the NPRM nor § 36.311(c) of the final rule permits inquiries into the nature of a person's mobility disability. However, the Department does not believe it is unreasonable or overly intrusive for an individual with a mobility disability seeking to use an other power-driven mobility device to provide a credible assurance to verify that the use of the other power-driven mobility device is for a mobility disability. The Department sought to minimize the amount of discretion and subjectivity exercised by public accommodations in assessing whether an individual has a mobility disability and to allow public accommodations to verify the existence of a mobility disability. The solution was derived from comments made by several individuals who said they have been admitted with their Segway® PTs into public entities and public accommodations that ordinarily do not allow these devices onsite when they have presented or displayed State-issued disability parking placards. In the examples provided by commenters, the parking placards were accepted as verification that the Segway® PTs were being used as mobility devices.

Because many individuals with mobility disabilities avail themselves of State programs that issue disability parking placards or cards and because these programs have penalties for fraudulent representations of identity and disability, utilizing the parking placard system as a means to establish the existence of a mobility disability strikes a balance between the need for privacy of the individual and fraud protection for the public accommodation. Consequently, the Department has decided to include regulatory text in § 36.311(c)(2) of the final rule that requires public accommodations to accept the presentation of a valid, State-issued disability parking placard or card, or State-issued proof of disability, as verification that an individual uses the other power-driven mobility device for his or her mobility disability. A ''valid'' disability placard or card is one that is presented by the individual to whom it was issued and is otherwise in compliance with the State of issuance's requirements for disability placards or cards. Public accommodations are required to accept a valid, State-issued disability parking placard or card, or State-issued proof of disability, as a credible assurance, but they cannot demand or require the presentation of a valid disability placard or card, or State-issued proof of disability, as a prerequisite for use of an other power-driven mobility device, because not all persons with mobility disabilities have such means of proof. If an individual with a mobility disability does not have such a placard or card, or State-issued proof of disability, he or she may present other information that would serve as a credible assurance of the existence of a mobility disability.

In lieu of a valid, State-issued disability parking placard or card, or State-issued proof of disability, a verbal representation, not contradicted by observable fact, shall be accepted as a credible assurance that the other power-driven mobility device is being used because of a mobility disability. This does not mean, however, that a mobility disability must be observable as a condition for allowing the use of an other power-driven mobility device by an individual with a mobility disability, but rather that if an individual represents that a device is be-

ing used for a mobility disability and that individual is observed thereafter engaging in a physical activity that is contrary to the nature of the represented disability, the assurance given is no longer credible and the individual may be prevented from using the device.

Possession of a valid, State-issued disability parking placard or card or a verbal assurance does not trump a public accommodation's valid restrictions on the use of other power-driven mobility devices. Accordingly, a credible assurance that the other power-driven mobility device is being used because of a mobility disability is not a guarantee of entry to a public accommodation because notwithstanding such a credible assurance, use of the device in a particular venue may be at odds with the legal standard in § 36.311(b)(1) or with one or more of the § 36.311(b)(2) factors. Only after an individual with a disability has satisfied all of the public accommodation's policies regarding the use of other power-driven mobility devices does a credible assurance become a factor in allowing the use of the device. For example, if an individual seeking to use an other power-driven mobility device fails to satisfy any of the public accommodation's stated policies regarding the use of other power-driven mobility devices, the fact that the individual legitimately possesses and presents a valid, State-issued disability parking placard or card, or State-issued proof of disability, does not trump the policy and require the public accommodation to allow the use of the device. In fact, in some instances, the presentation of a legitimately held placard or card, or State-issued proof of disability, will have no relevance or bearing at all on whether the other power-driven mobility device may be used, because the public accommodation's policy does not permit the device in question on-site under any circumstances (*e.g.,* because its use would create a substantial risk of serious harm to the immediate environment or natural or cultural resources). Thus, an individual with a mobility disability who presents a valid disability placard or card, or State-issued proof of disability, will not be able to use an ATV as an other power-driven mobility device in a mall or a restaurant if the mall or restaurant has adopted a policy banning their use for any or all of the above-mentioned reasons.

However, an individual with a mobility disability who has complied with a public accommodation's stated policies cannot be refused use of the other power-driven mobility device if he or she has provided a credible assurance that the use of the device is for a mobility disability.

Subpart D—New Construction and Alterations

Subpart D establishes the title I requirements applicable to new construction and alterations. The Department has amended this subpart to adopt the 2004 ADAAG, set forth the effective dates for implementation of the 2010 Standards, and make related revisions as described below.

Section 36.403 Alterations: Path of Travel

In the NPRM, the Department proposed one change to Sec. 36.403 on alterations and path of travel by adding a path of travel safe harbor. Proposed Sec. 36.403(a)(1) stated that if a private entity has constructed or altered required elements of a path of travel in accordance with the 1991 Standards, the private entity is not required to retrofit such elements to reflect incremental changes in the 2010 Standards solely because of an alteration to a primary function area served by that path of travel.

A substantial number of commenters objected to the Department's creation of a safe harbor for alterations to required elements of a path of travel that comply with the current 1991 Standards. These commenters argued that if a public accommodation already is in the process of altering its facility, there should be a legal requirement that individuals with disabilities are entitled to increased accessibility provided by the 2004 ADAAG for path of travel work. These comment-

ers also stated that they did not believe there was a statutory basis for "grandfathering" facilities that comply with the 1991 Standards. Another commenter argued that the updates incorporated into the 2004 ADAAG provide very substantial improvements for access, and that since there already is a 20 percent cost limit on the amount that can be expended on path of travel alterations, there is no need for a further limitation.

Some commenters supported the safe harbor as lessening the economic costs of implementing the 2004 ADAAG for existing facilities. One commenter also stated that without the safe harbor, entities that already have complied with the 1991 Standards will have to make and pay for compliance twice, as compared to those entities that made no effort to comply in the first place. Another commenter asked that the safe harbor be revised to include pre-ADA facilities that have been made compliant with the 1991 Standards to the extent "readily achievable" or, in the case of alterations, " to the maximum extent feasible," but that are not in full compliance with the 1991 Standards.

The final rule retains the safe harbor for required elements of a path of travel to altered primary function areas for private entities that already have complied with the 1991 Standards with respect to those required elements. As discussed with respect to Sec. 36.304, the Department believes that this safe harbor strikes an appropriate balance between ensuring that individuals with disabilities are provided access to buildings and facilities and mitigating potential financial burdens on existing places of public accommodation that are undertaking alterations subject to the 2010 Standards. This safe harbor is not a blanket exemption for facilities. If a private entity undertakes an alteration to a primary function area, only the required elements of a path of travel to that area that already comply with the 1991 Standards are subject to the safe harbor. If a private entity undertakes an alteration to a primary function area and the required elements of a path of travel to the altered area do not comply with the 1991 Standards, then the private entity must bring those elements into compliance with the 2010 Standards.

Section 36.405 Alterations: Historic Preservation

In the 1991 rule, the Department provided guidance on making alterations to buildings or facilities that are eligible for listing in the National Register of Historic Places under the National Historic Preservation Act or that are designated as historic under State or local law. That provision referenced the 1991 Standards. Because those cross-references to the 1991 Standards are no longer applicable, it is necessary in this final rule to provide new regulatory text. No substantive change in the Department's approach in this area is intended by this revision.

Section 36.406 Standards for New Construction and Alterations

Applicable standards. Section 306 of the ADA, 42 U.S.C. 12186, directs the Attorney General to issue regulations to implement title III that are consistent with the guidelines published by the Access Board. As described in greater detail elsewhere in this Appendix, the Department is a statutory member of the Access Board and was involved significantly in the development of the 2004 ADAAG. Nonetheless, the Department has reviewed the standards and has determined that additional regulatory provisions are necessary to clarify how the Department will apply the 2010 Standards to places of lodging, social service center establishments, housing at a place of education, assembly areas, and medical care facilities. Those provisions are contained in Sec. 36.406(c)-(g). Each of these provisions is discussed below.

Section 36.406(a) adopts the 2004 ADAAG as part of the 2010 Standards and establishes the compliance date and triggering events for the application of those standards to both new construction and alterations. Appendix B of this final rule (Analysis and Commentary on the 2010

ADA Standards for Accessible Design) provides a description of the major changes in the 2010 Standards (as compared to the 1991 ADAAG) and a discussion of the public comments that the Department received on specific sections of the 2004 ADAAG. A number of commenters asked the Department to revise certain provisions in the 2004 ADAAG in a manner that would reduce either the required scoping or specific technical accessibility requirements. As previously stated, the ADA requires the Department to adopt standards consistent with the guidelines adopted by the Access Board. The Department will not adopt any standards that provide less accessibility than is provided under the guidelines contained in the 2004 ADAAG because the guidelines adopted by the Access Board are " minimum guidelines." 42 U.S.C. 12186(c).

In the NPRM, the Department specifically proposed amending Sec. 36.406(a) by dividing it into two sections. Proposed Sec. 36.406(a)(1) specified that new construction and alterations subject to this part shall comply with the 1991 Standards if physical construction of the property commences less than six months after the effective date of the rule. Proposed Sec. 36.406(a)(2) specified that new construction and alterations subject to this part shall comply with the proposed standards if physical construction of the property commences six months or more after the effective date of the rule. The Department also proposed deleting the advisory information now published in a table at Sec. 36.406(b).

Compliance date. When the ADA was enacted, the compliance dates for various provisions were delayed in order to provide time for covered entities to become familiar with their new obligations. Titles II and III of the ADA generally became effective on January 26, 1992, six months after the regulations were published. *See* 42 U.S.C. 12131 note; 42 U.S.C. 12181 note. New construction under title II and alterations under either title II or title III had to comply with the design standards on that date. *See* 42 U.S.C. 12131 note; 42 U.S.C. 12183(a)(2). For new construction under title III, the requirements applied to facilities designed and constructed for first occupancy after January 26, 1993--18 months after the 1991 Standards were published by the Department. *See* 42 U.S.C. 12183(a)(1).

The Department received numerous comments on the issue of effective date, many of them similar to those received in response to the ANPRM. A substantial number of commenters advocated a minimum of 18 months from publication of the final rule to the effective date for application of the standards to new construction, consistent with the time period used for implementation of the 1991 Standards. Many of these commenters argued that the 18-month period was necessary to minimize the likelihood of having to redesign projects already in the design and permitting stages at the time that the final rule is published. According to these commenters, large projects take several years from design to occupancy, and can be subject to delays from obtaining zoning, site approval, third-party design approval (*i.e.,* architectural review), and governmental permits. To the extent the new standards necessitate changes in any previous submissions or permits already issued, businesses might have to expend significant funds and incur delays due to redesign and resubmission.

Some commenters also expressed concern that a six-month period would be hard to implement given that many renovations are planned around retail selling periods, holidays, and other seasonal concerns. For example, hotels plan renovations during their slow periods, retail establishments avoid renovations during the major holiday selling periods, and businesses in certain parts of the country cannot do any major construction during parts of the winter.

Some commenters argued that chain establishments need additional time to redesign their "master facility" designs for replication at multiple locations, taking into account both the new standards and applicable State and local accessibility

requirements.

Other commenters argued for extending the effective date from six months to a minimum of 12 months for many of the same reasons, and one commenter argued that there should be a tolling of the effective date for those businesses that are in the midst of the permitting process if the necessary permits are delayed due to legal challenges or other circumstances outside the business's control.

Several commenters took issue with the Department's characterization of the 2004 ADAAG and the 1991 Standards as two similar rules. These commenters argued that many provisions in the 2004 ADAAG represent a "substantial and significant" departure from the 1991 Standards and that it will take a great deal of time and money to identify all the changes and implement them. In particular, they were concerned that small businesses lacked the internal resources to respond quickly to the new changes and that they would have to hire outside experts to assist them. One commenter expressed concern that regardless of familiarity with the 2004 ADAAG, since the 2004 ADAAG standards are organized in an entirely different manner from the 1991 Standards, and contain, in the commenter's view, extensive changes, it will make the shift from the old to the new standards quite complicated.

Several commenters also took issue with the Department's proffered rationale that by adopting a six-month effective date, the Department was following the precedent of other Federal agencies that have adopted the 2004 ADAAG for facilities whose accessibility they regulate. These commenters argued that the Department's title III regulation applies to a much broader range and number of facilities and programs than the other Federal agencies (*i.e.,* Department of Transportation and the General Services Administration) and that those agencies regulate accessibility primarily in either governmental facilities or facilities operated by quasi-governmental authorities.

Several commenters representing the travel, vacation, and golf industries argued that the Department should adopt a two-year effective date for new construction. In addition to many of the arguments made by commenters in support of an 18-month effective date, these commenters also argued that a two-year time frame would allow States with DOJ-certified building codes to have the time to amend their codes to meet the 2004 ADAAG so that design professionals can work from compatible codes and standards.

Several commenters recommended treating alterations differently than new construction, arguing for a one-year effective date for alterations. Another commenter representing building officials argued that a minimum of a six-month phase-in for alterations was sufficient, since a very large percentage of alteration projects "are of a scale that they should be able to accommodate the phase-in."

In contrast, many commenters argued that the proposed six-month effective date should be retained in the final rule.

The Department has been persuaded by concerns raised by some of the commenters that the six month compliance date proposed in the NPRM for application of the 2010 Standards may be too short for certain projects that are already in the midst of the design and permitting process. The Department has determined that for new construction and alterations, compliance with the 2010 Standards will not be required until 18 months from the date the final rule is published. This is consistent with the amount of time given when the 1991 regulation was published. Since many State and local building codes contain provisions that are consistent with 2004 ADAAG, the Department has decided that public accommodations that choose to comply with the 2010 Standards as defined in Sec. 36.104 before the compliance date will still be considered in compliance with the ADA. However, public accommodations that choose to comply with the 2010 Standards in lieu of the 1991 Standards prior to the compliance date described in this rule must choose one or the other

standard, and may not rely on some of the requirements contained in one standard and some of the requirements contained in the other standard.

Triggering event. In the NPRM, the Department proposed using the start of physical construction as the triggering event for applying the proposed standards to new construction under title III. This triggering event parallels that for the alterations provisions (*i.e.,* the date on which construction begins), and would apply clearly across all types of covered public accommodations. The Department also proposed that for prefabricated elements, such as modular buildings and amusement park rides and attractions, or installed equipment, such as ATMs, the start of construction means the date on which the site preparation begins. Site preparation includes providing an accessible route to the element.

The Department's NPRM sought public comment on how to define the start of construction and the practicality of applying commencement of construction as a triggering event. The Department also requested input on whether the proposed definition of the start of construction was sufficiently clear and inclusive of different types of facilities. The Department also sought input about facilities subject to title III for which commencement of construction would be ambiguous or problematic.

The Department received numerous comments recommending that the Department adopt a two-pronged approach to defining the triggering event. In those cases where permits are required, the Department should use "date of permit application'' as the effective date triggering event, and if no permit is required, the Department should use "start of construction.'' A number of these commenters argued that the date of permit application is appropriate because the applicant would have to consider the applicable State and Federal accessibility standards in order to submit the designs usually required with the application. Moreover, the date of permit application is a typical triggering event in other code contexts, such as when jurisdictions introduce an updated building code. Some commenters expressed concern that using the date of " start of construction'' was problematic because the date can be affected by factors that are outside the control of the owner. For example, an owner can plan construction to start before the new standards take effect and therefore use the 1991 Standards in the design. If permits are not issued in a timely manner, then the construction could be delayed until after the effective date, and then the project would have to be redesigned. This problem would be avoided if the permit application date was the triggering event. Two commenters expressed concern that the term "start of construction'' is ambiguous, because it is unclear whether start of construction means the razing of structures on the site to make way for a new facility or means site preparation, such as regrading or laying the foundation.

One commenter recommended using the "signing date of a construction contract," and an additional commenter recommended that the new standards apply only to "buildings permitted after the effective date of the regulations."

One commenter stated that for facilities that fall outside the building permit requirements (ATMs, prefabricated saunas, small sheds), the triggering event should be the date of installation, rather than the date the space for the facility is constructed.

The Department is persuaded by the comments to adopt a two-pronged approach to defining the triggering event for new construction and alterations. The final rule states that in those cases where permits are required, the triggering event shall be the date when the last application for a building permit application or permit extension is certified to be complete by a State, county, or local government, or in those jurisdictions where the government does not certify completion of applications, the date when the last application for a building permit or permit extension is received by the State, county, or local government. If no permits are required, then the triggering event shall be the "start of physical construction or alterations.'' The Department has also added clarifying

language related to the term "start of physical construction or alterations'' to make it clear that "start of physical construction or alterations'' is not intended to mean the date of ceremonial groundbreaking or the date a structure is razed to make it possible for construction of a facility to take place.

Amusement rides. Section 234 of the 2010 Standards provides accessibility guidelines for newly designed and constructed amusement rides. The amusement ride provisions do not provide a "triggering event'' for new construction or alteration of an amusement ride. An industry commenter requested that the triggering event of "first use'' as noted in the Advisory note to section 234.1 of the 2004 ADAAG be included in the final rule. The Advisory note provides that "[a] custom designed and constructed ride is new upon its first use, which is the first time amusement park patrons take the ride.'' The Department declines to treat amusement rides differently than other types of new construction and alterations and under the final rule, they are subject to Sec. 36.406(a)(3). Thus, newly constructed and altered amusement rides shall comply with the 2010 Standards if the start of physical construction or the alteration is on or after 18 months from the publication date of this rule. The Department also notes that section 234.4.2 of the 2010 Standards only applies where the structural or operational characteristics of an amusement ride are altered. It does not apply in cases where the only change to a ride is the theme.

Noncomplying new construction and alterations. The element-by-element safe harbor referenced in Sec. 36.304(d)(2) has no effect on new or altered elements in existing facilities that were subject to the 1991 Standards on the date that they were constructed or altered, but do not comply with the technical and scoping specifications for those elements in the 1991 Standards. Section 36.406(a)(5) of the final rule sets forth the rules for noncompliant new construction or alterations in facilities that were subject to the requirements of this part. Under those provisions, noncomplying new construction and alterations constructed or altered after the effective date of the applicable ADA requirements and before March 15, 2012 shall, before March 15, 2012, be made accessible in accordance with either the 1991 Standards or the 2010 Standards. Noncomplying new construction and alterations constructed or altered after the effective date of the applicable ADA requirements and before March 15, 2012, shall, on or after March 15, 2012, be made accessible in accordance with the 2010 Standards.

Section 36.406(b) Application of Standards to Fixed Elements

The final rule contains a new Sec. 36.406(b) that clarifies that the requirements established by this section, including those contained in the 2004 ADAAG, prescribe the requirements necessary to ensure that fixed or built-in elements in new or altered facilities are accessible to individuals with disabilities. Once the construction or alteration of a facility has been completed, all other aspects of programs, services, and activities conducted in that facility are subject to the operational requirements established elsewhere in this final rule. Although the Department has often chosen to use the requirements of the 1991 Standards as a guide to determining when and how to make equipment and furnishings accessible, those coverage determinations fall within the discretionary authority of the Department.

The Department is also clarifying that the advisory notes, appendix notes, and figures that accompany the 1991 and 2010 Standards do not establish separately enforceable requirements unless otherwise specified in the text of the standards. This clarification has been made to address concerns expressed by ANPRM commenters who mistakenly believed that the advisory notes in the 2004 ADAAG established requirements beyond those established in the text of the guidelines (*e.g.,* Advisory 504.4 suggests, but does not require, that covered entities provide visual contrast on stair tread nosings to make them more visible to individuals with low vision). The Department received

no comments on this provision in the NPRM.

Section 36.406(c) Places of Lodging

In the NPRM, the Department proposed a new definition for public accommodations that are "places of lodging" and a new Sec. 36.406(c) to clarify the scope of coverage for places of public accommodation that meet this definition. For many years the Department has received inquiries from members of the public seeking clarification of ADA coverage of rental accommodations in timeshares, condominium hotels, and mixed-use and corporate hotel facilities that operate as places of public accommodation (as that term is now defined in Sec. 36.104). These facilities, which have attributes of both residential dwellings and transient lodging facilities, have become increasingly popular since the ADA's enactment in 1990 and make up the majority of new hotel construction in some vacation destinations. The hybrid residential and lodging characteristics of these new types of facilities, as well as their ownership characteristics, complicate determinations of ADA coverage, prompting questions from both industry and individuals with disabilities. While the Department has interpreted the ADA to encompass these hotel-like facilities when they are used to provide transient lodging, the regulation previously has specifically not addressed them. In the NPRM, the Department proposed a new Sec. 36.406(c), entitled "Places of Lodging," which was intended to clarify that places of lodging, including certain timeshares, condominium hotels, and mixed-use and corporate hotel facilities, shall comply with the provisions of the proposed standards, including, but not limited to, the requirements for transient lodging in sections 224 and 806 of the 2004 ADAAG.

The Department's NPRM sought public input on this proposal. The Department received a substantial number of comments on these issues from industry representatives, advocates for persons with disabilities, and individuals. A significant focus of these comments was on how the Department should define and regulate vacation rental units in timeshares, vacation communities, and condo-hotels where the units are owned and controlled by individual owners and rented out some portion of time to the public, as compared to traditional hotels and motels that are owned, controlled, and rented to the public by one entity.

Scoping and technical requirements applicable to "places of lodging." In the NPRM, the Department asked for public comment on its proposal in Sec. 36.406(c) to apply to places of lodging the scoping and technical requirements for transient lodging, rather than the scoping and technical requirements for residential dwelling units.

Commenters generally agreed that the transient lodging requirements should apply to places of lodging. Several commenters stated that the determination as to which requirements apply should be made based on the intention for use at the time of design and construction. According to these commenters, if units are intended for transient rentals, then the transient lodging standards should apply, and if they are intended to be used for residential purposes, the residential standards should apply. Some commenters agreed with the application of transient lodging standards to places of lodging in general, but disagreed about the characterization of certain types of facilities as covered places of lodging.

The Department agrees that the scoping and technical standards applicable to transient lodging should apply to facilities that contain units that meet the definition of "places of lodging."

Scoping for timeshare or condominium hotels. In the NPRM, the Department sought comment on the appropriate basis for determining scoping for a timeshare or condominium-hotel. A number of commenters indicated that scoping should be based on the usage of the facility. Only those units used for short-term stays should be counted for application of the transient lodging standards, while units sold as residential properties should be treated as residential units not subject to the ADA.

One commenter stated that scoping should be based on the maximum number of sleeping units available for public rental. Another commenter pointed out that unlike traditional hotels and motels, the number of units available for rental in a facility or development containing individually owned units is not fixed over time. Owners have the right to participate in a public rental program some, all, or none of the time, and individual owner participation changes from year to year.

The Department believes that the determination for scoping should be based on the number of units in the project that are designed and constructed with the intention that their owners may participate in a transient lodging rental program. The Department cautions that it is not the number of owners that actually exercise their right to participate in the program that determines the scoping. Rather it is the units that could be placed into an on-site or off-site transient lodging rental program. In the final rule, the Department has added a provision to Sec. 36.406(c)(3), which states that units intended to be used exclusively for residential purposes that are contained in facilities that also meet the definition of place of lodging are not covered by the transient lodging standards. Title III of the ADA does not apply to units designed and constructed with the intention that they be rented or sold as exclusively residential units. Such units are covered by the Fair Housing Act (FHAct), which contains requirements for certain features of accessible and adaptable design both for units and for public and common use areas. All units designed and constructed with the intention that they may be used for both residential and transient lodging purposes are covered by the ADA and must be counted for determining the required number of units that must meet the transient lodging standards in the 2010 Standards. Public use and common use areas in facilities containing units subject to the ADA also must meet the 2010 Standards. In some developments, units that may serve as residential units some of the time and rental units some of the time will have to meet both the FHAct and the ADA requirements. For example, all of the units in a vacation condominium facility whose owners choose to rent to the public when they are not using the units themselves would be counted for the purposes of determining the appropriate number of units that must comply with the 2010 Standards. In a newly constructed condominium that has three floors with units dedicated to be sold solely as residential housing and three floors with units that may be used as residences or hotel units, only the units on the three latter floors would be counted for applying the 2010 Standards. In a newly constructed timeshare development containing 100 units, all of which may be made available to the public through an exchange or rental program, all 100 units would be counted for purposes of applying the 2010 Standards.

One commenter also asked the Department for clarification of how to count individually owned "lock-off units." Lock-off units are units that are multi-bedroom but can be "locked off" into two separate units, each having individual external access. This commenter requested that the Department state in the final rule that individually owned lock-off units do not constitute multiple guest rooms for purposes of calculating compliance with the scoping requirements for accessible units, since for the most part the lock-off units are used as part of a larger accessible unit, and portions of a unit not locked off would constitute both an accessible one-bedroom unit or an accessible two-bedroom unit with the lock-off unit.

It is the Department's view that lock-off units that are individually owned that can be temporarily converted into two units do not constitute two separate guest rooms for purposes of calculating compliance with the scoping requirements.

One commenter asked the Department how developers should scope units where buildings are constructed in phases over a span of years, recommending that the scoping be based on the total number of units expected to be constructed at the project and not on a building-by-building basis or

on a phase-by-phase basis. The Department does not think scoping should be based on planned number of units, which may or may not be actually constructed over a period of years. However, the Department recognizes that resort developments may contain buildings and facilities that are of all sizes from single-unit cottages to facilities with hundreds of units. The Department believes it would be appropriate to allow designers, builders, and developers to aggregate the units in facilities with 50 or fewer units that are subject to a single permit application and that are on a common site or that are constructed at the same time for the purposes of applying the scoping requirements in table 224.2. Facilities with more than 50 units should be scoped individually in accordance with the table. The regulation has been revised to reflect this application of the scoping requirements.

One commenter also asked the Department to use the title III regulation to declare that timeshares subject to the transient lodging standards are exempt from the design and construction requirements of the FHAct. The coverage of the FHAct is set by Congress and interpreted by regulations issued by the Department of Housing and Urban Development. The Department has no authority to exempt anyone from coverage of the FHAct.

Application of ADA to places of lodging that contain individually owned units. The Department believes that regardless of ownership structure for individual units, rental programs (whether they are on- or off-site) that make transient lodging guest rooms available to the public must comply with the general nondiscrimination requirements of the ADA. In addition, as provided in Sec. 36.406(c), newly constructed facilities that contain accommodations intended to be used for transient lodging purposes must comply with the 2010 Standards.

In the NPRM, the Department asked for public comment on several issues related to ensuring the availability of accessible units in a rental program operated by a place of lodging. The Department sought input on how it could address a situation in which a new or converted facility constructs the required number of accessible units, but the owners of those units choose not to participate in the rental program; whether the facility has an obligation to encourage or require owners of accessible units to participate in the rental program; and whether the facility developer, the condominium association, or the hotel operator has an obligation to retain ownership or control over a certain number of accessible units to avoid this problem.

In the NPRM, the Department sought public input on how to regulate scoping for a timeshare or condominium-rental facility that decides, after the sale of units to individual owners, to begin a rental program that qualifies the facility as a place of lodging, and how the condominium association, operator, or developer should determine which units to make accessible.

A number of commenters expressed concerns about the ability of the Department to require owners of accessible units to participate in the rental program, to require developers, condo associations, or homeowners associations to retain ownership of accessible units, and to impose accessibility requirements on individual owners who choose to place inaccessible units into a rental program after purchase. These commenters stated that individuals who purchase accessible vacation units in condominiums, individual vacation homes, and timeshares have ownership rights in their units and may choose lawfully to make their units available to the public some, all, or none of the time. Commenters advised the Department that the Securities and Exchange Commission takes the position that if condominium units are offered in connection with participation in a required rental program for any part of the year, require the use of an exclusive rental agent, or impose conditions otherwise restricting the occupancy or rental of the unit, then that offering will be viewed as an offering of securities in the form of an investment (rather than a real estate offering). SEC Release No. 33-5347, Guidelines as to

the Applicability of the Federal Securities Laws to Offers and Sales of Condominiums or Units in a Real Estate Development (Jan. 4, 1973). Consequently, most condominium developers do not impose such restrictions at the time of sale. Moreover, owners who choose to rent their units as a short-term vacation rental can select any rental or management company to lease and manage their unit, or they may rent them out on their own. They also may choose never to lease those units. Thus, there are no guarantees that at any particular time, accessible units will be available for rental by the public. According to this commenter, providing incentives for owners of accessible units to place their units in the rental program will not work, because it does not guarantee the availability of the requisite number of rooms dispersed across the development, and there is not any reasonable, identifiable source of funds to cover the costs of such incentives.

A number of commenters also indicated that it potentially is discriminatory as well as economically infeasible to require that a developer hold back the accessible units so that the units can be maintained in the rental program year-round. One commenter pointed out that if a developer did not sell the accessible condominiums or timeshares in the building inventory, the developer would be subject to a potential ADA or FHAct complaint because persons with disabilities who wanted to buy accessible units rather than rent them each year would not have the option to purchase them. In addition, if a developer held back accessible units, the cost of those units would have to be spread across all the buyers of the inaccessible units, and in many cases would make the project financially infeasible. This would be especially true for smaller projects. Finally, this commenter argued that requiring units to be part of the common elements that are owned by all of the individual unit owners is infeasible because the common ownership would result in pooled rental income, which would transform the owners into participants in a rental pool, and thus turn the sale of the condominiums into the sale of securities under SEC Release 33-5347.

Several commenters noted that requiring the operator of the rental program to own the accessible units is not feasible either because the operator of the rental program would have to have the funds to invest in the purchase of all of the accessible units, and it would not have a means of recouping its investment. One commenter stated that in Texas, it is illegal for on-site rental programs to own condominium units. Another commenter noted that such a requirement might lead to the loss of on-site rental programs, leaving owners to use individual third-party brokers, or rent the units privately. One commenter acknowledged that individual owners cannot be required to place their units in a rental pool simply to offer an accessible unit to the public, since the owners may be purchasing units for their own use. However, this commenter recommended that owners who choose to place their units in a rental pool be required to contribute to a fund that would be used to renovate units that are placed in the rental pool to increase the availability of accessible units. One commenter argued that the legal entity running the place of lodging has an obligation to retain control over the required number of accessible units to ensure that they are available in accordance with title III.

A number of commenters also argued that the Department has no legal authority to require individual owners to engage in barrier removal where an existing development adds a rental program. One commenter stated that Texas law prohibits the operator of on-site rental program from demanding that alterations be made to a particular unit. In addition, under Texas law, condominium declarations may not require some units and not others to make changes, because that would lead to unequal treatment of units and owners, which is not permissible.

One commenter stated that since it was not possible for operators of rental programs offer-

ing privately owned condominiums to comply with accessible scoping, the Department should create exemptions from the accessible scoping, especially for existing facilities. In addition, this commenter stated that if an operator of an on-site rental program were to require renovations as a condition of participation in the rental program, unit owners might just rent their units through a different broker or on their own, in which case such requirements would not apply.

A number of commenters argued that if a development decides to create a rental program, it must provide accessible units. Otherwise the development would have to ensure that units are retrofitted. A commenter argued that if an existing building is being converted, the Department should require that if alterations of the units are performed by an owner or developer prior to sale of the units, then the alterations requirements should apply, in order to ensure that there are some accessible units in the rental pool. This commenter stated that because of the proliferation of these type of developments in Hawaii, mandatory alteration is the only way to guarantee the availability of accessible units in the long run. In this commenter's view, since conversions almost always require makeover of existing buildings, this will not lead to a significant expense.

The Department agrees with the commenters that it would not be feasible to require developers to hold back or purchase accessible units for the purposes of making them available to the public in a transient lodging rental program, nor would it be feasible to require individual owners of accessible units to participate in transient lodging rental programs.

The Department recognizes that places of lodging are developed and financed under myriad ownership and management structures and agrees that there will be circumstances where there are legal barriers to requiring compliance with either the alterations requirements or the requirements related to barrier removal. The Department has added an exception to Sec. 36.406(c), providing that in existing facilities that meet the definition of places of lodging, where the guest rooms are not owned or substantially controlled by the entity that owns, leases, or operates the overall facility and the physical features of the guest room interiors are controlled by their individual owners, the units are not subject to the alterations requirement, even where the owner rents the unit out to the public through a transient lodging rental program. In addition, the Department has added an exception to the barrier removal requirements at Sec. 36.304(g) providing that in existing facilities that meet the definition of places of lodging, where the guest rooms are not owned or substantially controlled by the entity that owns, leases, or operates the overall facility and the physical features of the guest room interiors are controlled by their individual owners, the units are not subject to the barrier removal requirement. The Department notes, however, that there are legal relationships for some timeshares and cooperatives where the ownership interests do not convey control over the physical features of units. In those cases, it may be the case that the facility has an obligation to meet the alterations or barrier removal requirements or to maintain accessible features.

Section 36.406(d) Social Service Center Establishments

In the NPRM, the Department proposed a new Sec. 36.406(d) requiring group homes, halfway houses, shelters, or similar social service center establishments that provide temporary sleeping accommodations or residential dwelling units to comply with the provisions of the 2004 ADAAG that apply to residential facilities, including, but not limited to, the provisions in sections 233 and 809.

The NPRM explained that this proposal was based on two important changes in the 2004 ADAAG. First, for the first time, residential dwelling units are explicitly covered in the 2004 ADAAG in section 233. Second, the 2004

ADAAG eliminates the language contained in the 1991 Standards addressing scoping and technical requirements for homeless shelters, group homes, and similar social service center establishments. Currently, such establishments are covered in section 9.5 of the transient lodging section of the 1991 Standards. The deletion of section 9.5 creates an ambiguity of coverage that must be addressed.

The NPRM explained the Department's belief that transferring coverage of social service center establishments from the transient lodging standards to the residential facilities standards would alleviate conflicting requirements for social service providers. The Department believes that a substantial percentage of social service providers are recipients of Federal financial assistance from the Department of Housing and Urban Development (HUD). The Department of Health and Human Services (HHS) also provides financial assistance for the operation of shelters through the Administration for Children and Families programs. As such, they are covered both by the ADA and section 504. UFAS is currently the design standard for new construction and alterations for entities subject to section 504. The two design standards for accessibility--the 1991 Standards and UFAS--have confronted many social service providers with separate, and sometimes conflicting, requirements for design and construction of facilities. To resolve these conflicts, the residential facilities standards in the 2004 ADAAG have been coordinated with the section 504 requirements. The transient lodging standards, however, are not similarly coordinated. The deletion of section 9.5 of the 1991 Standards from the 2004 ADAAG presented two options: (1) Require coverage under the transient lodging standards, and subject such facilities to separate, conflicting requirements for design and construction; or (2) require coverage under the residential facilities standards, which would harmonizes the regulatory requirements under the ADA and section 504. The Department chose the option that harmonizes the regulatory requirements: coverage under the residential facilities standards.

In the NPRM, the Department expressed concern that the residential facilities standards do not include a requirement for clear floor space next to beds similar to the requirement in the transient lodging standards; as a result, the Department proposed adding a provision that would require certain social service center establishments that provide sleeping rooms with more than 25 beds to ensure that a minimum of 5 percent of the beds have clear floor space in accordance with section 806.2.3 of the 2004 ADAAG.

The Department requested information from providers who operate homeless shelters, transient group homes, halfway houses, and other social service center establishments, and from the clients of these facilities who would be affected by this proposed change. In the NPRM, the Department asked to what extent conflicts between the ADA and section 504 have affected these facilities and what the effect would be of applying the residential dwelling unit requirements to these facilities, rather than the requirements for transient lodging guest rooms.

Many of the commenters supported applying the residential facilities requirements to social service center establishments stating that even though the residential facilities requirements are less demanding, in some instances, the existence of one clear standard will result in an overall increased level of accessibility by eliminating the confusion and inaction that are sometimes caused by the current existence of multiple requirements. One commenter stated that the residential facilities guidelines were more appropriate because individuals housed in social service center establishments typically stay for a prolonged period of time, and guests of a transient lodging facility typically are not housed to participate in a program or receive services.

One commenter opposed to the proposed section argued for the application of the transient

lodging standards to all social service center establishments except those that were "intended as a person's place of abode," referencing the Department's question related to the definition of place of lodging in the title III NPRM. A second commenter stated that the use of transient lodging guidelines would lead to greater accessibility.

The Department continues to be concerned about alleviating the challenges for social service providers that are also subject to section 504 and that would likely be subject to conflicting requirements if the transient lodging standard were applied. Thus, the Department has retained the requirement that social service center establishments comply with the residential dwelling standards. The Department did not receive comments regarding adding a requirement for bathing options, such as a roll-in shower, in social service center establishments operated by public accommodations. The Department did, however, receive comments in support of adding such a requirement regarding public entities under title II. The Department believes that social service center establishments that provide emergency shelter to large transient populations should be able to provide bathing facilities that are accessible to persons with mobility disabilities who need roll-in showers. Because of the transient nature of the population of these large shelters, it will not be feasible to modify bathing facilities in a timely manner when faced with a need to provide a roll-in shower with a seat when requested by an overnight visitor. As a result, the Department has added a requirement that social service center establishments with sleeping accommodations for more than 50 individuals must provide at least one roll-in shower with a seat that complies with the relevant provisions of section 608 of the 2010 Standards. Transfer-type showers are not permitted in lieu of a roll-in shower with a seat, and the exceptions in sections 608.3 and 608.4 for residential dwelling units are not permitted. When separate shower facilities are provided for men and for women, at least one roll-in shower must be provided for each group. This supplemental requirement to the residential facilities standards is in addition to the supplemental requirement that was proposed in the NPRM for clear floor space in sleeping rooms with more than 25 beds.

The Department also notes that while dwelling units at some social service center establishments are also subject to FHAct design and construction requirements that require certain features of adaptable and accessible design, FHAct units do not provide the same level of accessibility that is required for residential facilities under the 2010 Standards. The FHAct requirements, where also applicable, should not be considered a substitute for the 2010 Standards. Rather, the 2010 Standards must be followed in addition to the FHAct requirements.

The Department also notes that while in the NPRM the Department used the term "social service establishment," the final rule uses the term " social service center establishment." The Department has made this editorial change so that the final rule is consistent with the terminology used in the ADA. *See* 42 U.S.C. 12181(7)(K).

Section 36.406(e) Housing at a Place of Education

The Department of Justice and the Department of Education share responsibility for regulation and enforcement of the ADA in postsecondary educational settings, including architectural features. Housing types in educational settings range from traditional residence halls and dormitories to apartment or townhouse-style residences. In addition to title III of the ADA, universities and schools that are recipients of Federal financial assistance also are subject to section 504, which contains its own accessibility requirements currently through the application of UFAS. Residential housing, including housing in an educational setting, is also covered by the FHAct, which requires newly constructed multifamily housing

to include certain features of accessible and adaptable design. Covered entities subject to the ADA must always be aware of, and comply with, any other Federal statutes or regulations that govern the operation of residential properties.

Although the 1991 Standards mention dormitories as a form of transient lodging, they do not specifically address how the ADA applies to dormitories and other types of residential housing provided in an educational setting. The 1991 Standards also do not contain any specific provisions for residential facilities, allowing covered entities to elect to follow the residential standards contained in UFAS. Although the 2004 ADAAG contains provisions for both residential facilities and transient lodging, the guidelines do not indicate which requirements apply to housing provided in an educational setting, leaving it to the adopting agencies to make that choice. After evaluating both sets of standards, the Department concluded that the benefits of applying the transient lodging standards outweighed the benefits of applying the residential facilities standards. Consequently, in the NPRM, the Department proposed a new Sec. 36.406(e) that provided that residence halls or dormitories operated by or on behalf of places of education shall comply with the provisions of the proposed standards for transient lodging, including, but not limited to, the provisions in sections 224 and 806 of the 2004 ADAAG.

Private universities and schools covered by title III as public accommodations are required to make their programs and activities accessible to persons with disabilities. The housing facilities that they provide have varied characteristics. College and university housing facilities typically provide housing for up to one academic year, but may be closed during school vacation periods. In the summer, they often are used for short-term stays of one to three days, a week, or several months. Graduate and faculty housing often is provided year-round in the form of apartments, which may serve individuals or families with children. These housing facilities are diverse in their layout. Some are double-occupancy rooms with a shared toilet and bathing room, which may be inside or outside the unit. Others may contain cluster, suite, or group arrangements where several rooms are located inside a defined unit with bathing, kitchen, and similar common facilities. In some cases, these suites are indistinguishable in features from traditional apartments. Universities may build their own housing facilities or enter into agreements with private developers to build, own, or lease housing to the educational institution or to its students. Academic housing may be located on the campus of the university or may be located in nearby neighborhoods.

Throughout the school year and the summer, academic housing can become program areas in which small groups meet, receptions and educational sessions are held, and social activities occur. The ability to move between rooms--both accessible rooms and standard rooms--in order to socialize, to study, and to use all public use and common use areas is an essential part of having access to these educational programs and activities. Academic housing also is used for short-term transient educational programs during the time students are not in regular residence and may be rented out to transient visitors in a manner similar to a hotel for special university functions.

The Department was concerned that applying the new construction requirements for residential facilities to educational housing facilities could hinder access to educational programs for students with disabilities. Elevators generally are not required under the 2004 ADAAG residential facilities standards unless they are needed to provide an accessible route from accessible units to public use and common use areas, while under the 2004 ADAAG as it applies to other types of facilities, multistory private facilities must have elevators unless they meet very specific exceptions. In addition, the residential facilities standards do not require accessible roll-in showers in bathrooms, while the transient lodging requirements require some of the accessible units to be served by bath-

rooms with roll-in showers. The transient lodging standards also require that a greater number of units have accessible features for persons with communication disabilities. The transient lodging standards provide for installation of the required accessible features so that they are available immediately, but the residential facilities standards allow for certain features of the unit to be adaptable. For example, only reinforcements for grab bars need to be provided in residential dwellings, but the actual grab bars must be installed under the transient lodging standards. By contrast, the residential facilities standards do require certain features that provide greater accessibility within units, such as usable kitchens and an accessible route throughout the dwelling. The residential facilities standards also require 5 percent of the units to be accessible to persons with mobility disabilities, which is a continuation of the same scoping that is currently required under UFAS and is therefore applicable to any educational institution that is covered by section 504. The transient lodging standards require a lower percentage of accessible sleeping rooms for facilities with large numbers of rooms than is required by UFAS. For example, if a dormitory has 150 rooms, the transient lodging standards would require 7 accessible rooms, while the residential standards would require 8. In a large dormitory with 500 rooms, the transient lodging standards would require 13 accessible rooms, and the residential facilities standards would require 25. There are other differences between the two sets of standards, including requirements for accessible windows, alterations, kitchens, an accessible route throughout a unit, and clear floor space in bathrooms allowing for a side transfer.

In the NPRM, the Department requested public comment on how to scope educational housing facilities, and it asked whether the residential facilities requirements or the transient lodging requirements in the 2004 ADAAG would be more appropriate for housing at places of education and asked how the different requirements would affect the cost of building new dormitories and other student housing. *See* 73 FR 34508, 34545 (June 17, 2008).

The Department received several comments on this issue under title III. One commenter stated that the Department should adopt the residential facilities standards for housing at a place of education. In the commenter's view, the residential facilities standards are congruent with overlapping requirements imposed by HUD, and the residential facilities requirements would ensure dispersion of accessible features more effectively. This commenter also argued that while the increased number of required accessible units for residential facilities as compared to transient lodging may increase the cost of construction or alteration, this cost would be offset by a reduced need later to adapt rooms if the demand for accessible rooms exceeds the supply. The commenter also encouraged the Department to impose a visitability (accessible doorways and necessary clear floor space for turning radius) requirement for both the residential facilities and transient lodging requirements to allow students with mobility impairments to interact and socialize in a fully integrated fashion. Another commenter stated that while dormitories should be treated like residences as opposed to transient lodging, the Department should ensure that "all floors are accessible," thus ensuring community integration and visitability. Another commenter argued that housing at a place of education is comparable to residential housing, and that most of the housing types used by schools do not have the same amenities and services or function like transient lodging and should not be treated as such.

Several commenters focused on the length of stay at this type of housing and suggested that if the facilities are subject to occupancy for greater than 30 days, the residential standards should apply. Another commenter supported the Department's adoption of the transient lodging standards, arguing this will provide greater accessibility and therefore increase opportunities for students with

disabilities to participate. One commenter, while supporting the use of transient lodging standards in this area, argued that the Department also should develop regulations relating to the usability of equipment in housing facilities by persons who are blind or visually impaired. Another commenter argued that the Department should not impose the transient lodging requirements on K-12 schools because the cost of adding elevators can be prohibitive, and because there are safety concerns related to evacuating students in wheelchairs living on floors above the ground floor in emergencies causing elevator failures.

The Department has considered the comments recommending the use of the residential facilities standards and acknowledges that they require certain features that are not included in the transient lodging standards and that should be required for housing provided at a place of education. In addition, the Department notes that since educational institutions often use their academic housing facilities as short-term transient lodging in the summers, it is important that accessible features be installed at the outset. It is not realistic to expect that the educational institution will be able to adapt a unit in a timely manner in order to provide accessible accommodations to someone attending a one-week program during the summer.

The Department has determined that the best approach to this type of housing is to continue to require the application of transient lodging standards but, at the same time, to add several requirements drawn from the residential facilities standards related to accessible turning spaces and work surfaces in kitchens, and the accessible route throughout the unit. This will ensure the maintenance of the transient lodging standard requirements related to access to all floors of the facility, roll-in showers in facilities with more than 50 sleeping rooms, and other important accessibility features not found in the residential facilities standards, but also will ensure usable kitchens and access to all the rooms in a suite or apartment.

The Department has added a new definition to Sec. 36.104, "Housing at a Place of Education," and has revised Sec. 36.406(e) to reflect the accessible features that now will be required in addition to the requirements set forth under the transient lodging standards. The Department also recognizes that some educational institutions provide some residential housing on a year-round basis to graduate students and staff that is comparable to private rental housing but contains no facilities for educational programming. Section 36.406(e)(3) exempts from the transient lodging standards apartments or townhouse facilities that are provided with a lease on a year-round basis exclusively to graduate students or faculty and that do not contain any public use or common use areas available for educational programming; instead, such housing must comply with the requirements for residential facilities in sections 233 and 809 of the 2010 Standards.

The regulatory text uses the term "sleeping room" in lieu of the term "guest room," which is the term used in the transient lodging standards. The Department is using this term because it believes that for the most part, it provides a better description of the sleeping facilities used in a place of education than "guest room." The final rule states in Sec. 36.406(e) that the Department intends the terms to be used interchangeably in the application of the transient lodging standards to housing at a place of education.

Section 36.406(f) Assembly Areas

In the NPRM, the Department proposed Sec. 36.406(f) to supplement the assembly area requirements of the 2004 ADAAG, which the Department is adopting as part of the 2010 Standards. The NPRM proposed at Sec. 36.406(f)(1) to require wheelchair spaces and companion seating locations to be dispersed to all levels of the facility that are served by an accessible route. The Department received no significant comments on this paragraph and has decided to adopt the proposed language with minor modifications.

Section 36.406(f)(1) ensures that there is greater

dispersion of wheelchair spaces and companion seats throughout stadiums, arenas, and grandstands than would otherwise be required by sections 221 and 802 of the 2004 ADAAG. In some cases, the accessible route may not be the same route that other individuals use to reach their seats. For example, if other patrons reach their seats on the field by an inaccessible route (*e.g.*, by stairs), but there is an accessible route that complies with section 206.3 of the 2004 ADAAG that could be connected to seats on the field, wheelchair spaces and companion seats must be placed on the field even if that route is not generally available to the public.

Regulatory language that was included in the 2004 ADAAG advisory, but that did not appear in the NPRM, has been added by the Department in Sec. 36.406(f)(2). Section 36.406(f)(2) now requires an assembly area that has seating encircling, in whole or in part, a field of play or performance area, such as an arena or stadium, to place wheelchair spaces and companion seats around the entire facility. This rule, which is designed to prevent a public accommodation from placing wheelchair spaces and companion seats on one side of the facility only, is consistent with the Department's enforcement practices and reflects its interpretation of section 4.33.3 of the 1991 Standards.

In the NPRM, the Department proposed Sec. 36.406(f)(2), which prohibits wheelchair spaces and companion seating locations from being "located on (or obstructed by) temporary platforms * * *." 73 FR 34508, 34557 (June 17, 2008). Through its enforcement actions, the Department discovered that some venues place wheelchair spaces and companion seats on temporary platforms that, when removed, reveal conventional seating underneath, or cover the wheelchair spaces and companion seats with temporary platforms on top of which they place risers of conventional seating. These platforms cover groups of conventional seats and are used to provide groups of wheelchair seats and companion seats.

Several commenters requested an exception to the prohibition of the use of temporary platforms for public accommodations that sell most of their tickets on a season-ticket or other multi-event basis. Such commenters argued that they should be able to use temporary platforms because they know, in advance, that the patrons sitting in certain areas for the whole season do not need wheelchair spaces and companion seats. The Department declines to adopt such an exception. As it explained in detail in the NPRM, the Department believes that permitting the use of movable platforms that seat four or more wheelchair users and their companions have the potential to reduce the number of available wheelchair seating spaces below the level required, thus reducing the opportunities for persons who need accessible seating to have the same choice of ticket prices and amenities that are available to other patrons in the facility. In addition, use of removable platforms may result in instances where last minute requests for wheelchair and companion seating cannot be met because entire sections of accessible seating will be lost when a platform is removed. *See* 73 FR 34508, 34546 (June 17, 2008). Further, use of temporary platforms allows facilities to limit persons who need accessible seating to certain seating areas, and to relegate accessible seating to less desirable locations. The use of temporary platforms has the effect of neutralizing dispersion and other seating requirements (*e.g.,* line of sight) for wheelchair spaces and companion seats. *Cf. Independent Living Resources v. Oregon Arena Corp.,* 1 F. Supp. 2d 1159, 1171 (D. Or. 1998) (holding that while a public accommodation may "infill" wheelchair spaces with removable seats when the wheelchair spaces are not needed to accommodate individuals with disabilities, under certain circumstances "[s]uch a practice might well violate the rule that wheelchair spaces must be dispersed throughout the arena in a manner that is roughly proportionate to the overall distribution of seating"). In addition, using temporary platforms to

convert unsold wheelchair spaces to conventional seating undermines the flexibility facilities need to accommodate secondary ticket market exchanges as required by Sec. 36.302(f)(7) of the final rule.

As the Department explained in the NPRM, however, this provision was not designed to prohibit temporary seating that increases seating for events (*e.g.*, placing temporary seating on the floor of a basketball court for a concert). Consequently, the final rule, at Sec. 36.406(f)(3), has been amended to clarify that if an entire seating section is on a temporary platform for a particular event, then wheelchair spaces and companion seats may also be in that seating section. However, adding a temporary platform to create wheelchair spaces and companion seats that are otherwise dissimilar from nearby fixed seating and then simply adding a small number of additional seats to the platform would not qualify as an "entire seating section" on the platform. In addition, Sec. 36.406(f)(3) clarifies that facilities may fill in wheelchair spaces with removable seats when the wheelchair spaces are not needed by persons who use wheelchairs.

The Department has been responsive to assembly areas' concerns about reduced revenues due to unused accessible seating. Accordingly, the Department has reduced scoping requirements significantly—by almost half in large assembly areas—and determined that allowing assembly areas to in-fill unsold wheelchair spaces with readily removable temporary individual seats appropriately balances their economic concerns with the rights of individuals with disabilities. *See* section 221.1 of the 2010 Standards.

For stadium-style movie theaters, in Sec. 36.406(f)(4) of the NPRM the Department proposed requiring placement of wheelchair seating spaces and companion seats on a riser or cross-aisle in the stadium section of the theater that satisfies at least one of the following criteria: (1) It is located within the rear 60 percent of the seats provided in the auditorium; or (2) It is located within the area of the auditorium where the vertical viewing angles are between the 40th and 100th percentile of vertical viewing angles for all seats in that theater as ranked from the first row (1st percentile) to the back row (100th percentile). The vertical viewing angle is the angle between a horizontal line perpendicular to the seated viewer's eye to the screen and a line from the seated viewer's eye to the top of the screen.

The Department proposed this bright-line rule for two reasons: (1) the movie theater industry petitioned for such a rule; and (2) the Department has acquired expertise in the design of stadium-style theaters during its litigation with several major movie theater chains. *See United States. v. AMC Entertainment, Inc.*, 232 F. Supp.2d 1092 (C.D. Cal. 2002), *rev'd in part*, 549 F.3d 760 (9th Cir. 2008); *United States v. Cinemark USA, Inc.*, 348 F.3d 569 (6th Cir. 2003). Two industry commenters—at least one of whom otherwise supported this rule—requested that the Department explicitly state that this rule does not apply retroactively to existing theaters. Although this provision on its face applies to new construction and alterations, these commenters were concerned that the rule could be interpreted to apply retroactively because of the Department's statements in the NPRM and ANPRM that this bright line rule, although newly articulated, is not a new standard but "merely codifi[es] longstanding Department requirement[s]," 73 FR 34508, 34534 (June 17, 2008), and does not represent a "substantive change from the existing line-of-sight requirements" of section 4.33.3 of the 1991 Standards, 69 FR 58768, 58776 (Sept. 30, 2004).

Although the Department intends for Sec. 36.406(f)(4) of this rule to apply prospectively to new construction and alterations, this rule is not a departure from, and is consistent with, the line-of-sight requirements in the 1991 Standards. The Department has always interpreted the line-of-sight requirements in the 1991 Standards to require viewing angles provided to patrons who use wheelchairs to be comparable to those afforded

to other spectators. Section 36.406(f)(4) merely represents the application of these requirements to stadium-style movie theaters.

One commenter from a trade association sought clarification whether Sec. 36.406(f)(4) applies to stadium-style theaters with more than 300 seats, and argued that it should not since dispersion requirements apply in those theaters. The Department declines to limit this rule to stadium-style theaters with 300 or fewer seats; stadium-style theaters of all sizes must comply with this rule. So, for example, stadium-style theaters that must vertically disperse wheelchair spaces and companion seats must do so within the parameters of this rule.

The NPRM included a provision that required assembly areas with more than 5,000 seats to provide at least five wheelchair spaces with at least three companion seats for each of those five wheelchair spaces. The Department agrees with commenters who asserted that group seating is better addressed through ticketing policies rather than design and has deleted that provision from this section of the final rule.

Section 36.406(g) Medical Care Facilities

In the 1991 title III regulation, there was no provision addressing the dispersion of accessible sleeping rooms in medical care facilities. The Department is aware, however, of problems that individuals with disabilities face in receiving full and equal medical care when accessible sleeping rooms are not adequately dispersed. When accessible rooms are not fully dispersed, a person with a disability is often placed in an accessible room in an area that is not medically appropriate for his or her condition, and is thus denied quick access to staff with expertise in that medical specialty and specialized equipment. While the Access Board did not establish specific design requirements for dispersion in the 2004 ADAAG, in response to extensive comments in support of dispersion it added an advisory note, Advisory 223.1 General, encouraging dispersion of accessible rooms within the facility so that accessible rooms are more likely to be proximate to appropriate qualified staff and resources.

In the NPRM, the Department sought additional comment on the issue, asking whether it should require medical care facilities, such as hospitals, to disperse their accessible sleeping rooms, and if so, by what method (by specialty area, floor, or other criteria). All of the comments the Department received on this issue supported dispersing accessible sleeping rooms proportionally by specialty area. These comments from individuals, organizations, and a building code association, argued that it would not be difficult for hospitals to disperse rooms by specialty area, given the high level of regulation to which hospitals are subject and the planning that hospitals do based on utilization trends. Further, comments suggest that without a requirement, it is unlikely that hospitals would disperse the rooms. In addition, concentrating accessible rooms in one area perpetuates segregation of individuals with disabilities, which is counter to the purpose of the ADA.

The Department has decided to require medical care facilities to disperse their accessible sleeping rooms in a manner that is proportionate by type of medical specialty. This does not require exact mathematical proportionality, which at times would be impossible. However, it does require that medical care facilities disperse their accessible rooms by medical specialty so that persons with disabilities can, to the extent practical, stay in an accessible room within the wing or ward that is appropriate for their medical needs. The language used in this rule (“in a manner that is proportionate by type of medical specialty’’) is more specific than that used in the NPRM (“in a manner that enables patients with disabilities to have access to appropriate specialty services’’) and adopts the concept of proportionality proposed by the commenters. Accessible rooms should be dispersed throughout all medical specialties, such as obstet-

28 CFR Part 36
clinics, orthopedics, pediatrics, and cardiac care.

Subpart F—Certification of State Laws or Local Building Codes

Subpart F contains procedures implementing section 308(b)(1)(A)(ii) of the ADA, which provides that on the application of a State or local jurisdiction, the Attorney General may certify that a State or local building code or similar ordinance meets or exceeds the minimum accessibility requirements of the Act. In enforcement proceedings, this certification will constitute rebuttable evidence that the law or code meets or exceeds the ADA's requirements. In its NPRM, the Department proposed three changes in subpart F that would streamline the process for public entities seeking certification, all of which are adopted in this final rule.

First, the Department proposed deleting the existing § 36.603, which establishes the obligations of a submitting authority that is seeking certification of its code, and issue in its place informal regulatory guidance regarding certification submission requirements. Due to the deletion of § 36.603, §§ 36.604 through 36.608 are renumbered, and § 36.603 in the final rule is modified to indicate that the Assistant Attorney General for the Civil Rights Division (Assistant Attorney General) shall make a preliminary determination of equivalency after ''receipt and review of all information relevant to a request filed by a submitting official for certification of a code.'' Second, the Department proposed that the requirement in renumbered § 36.604 (previously § 36.605) that an informal hearing be held in Washington, DC, if the Assistant Attorney General makes a preliminary determination of equivalency be changed to a requirement that the hearing be held in the State or local jurisdiction charged with administration and enforcement of the code. Third, the Department proposed adding language to renumbered § 36.606 (previously § 36.607) to explain the effect of the 2010 Standards on the codes of State or local jurisdictions that were determined in the past to meet or exceed the 1991 Standards. Once the 2010 Standards take effect, certifications issued under the 1991 Standards would not have any future effect, and States and local jurisdictions with codes certified under the 1991 Standards would need to reapply for certification under the 2010 Standards. With regard to elements of existing buildings and facilities constructed in compliance with a code when a certification of equivalency was in effect, the final rule requires that in any enforcement action this compliance would be treated as rebuttable evidence of compliance with the standards then in effect. The new provision added to § 36.606 may also have implications in determining an entity's eligibility for the element-by-element safe harbor.

No substantive comments were received regarding the Department's proposed changes in subpart F, and no other changes have been made to this subpart in the final rule. The Department did receive several comments addressing other issues raised in the NPRM that are related to subpart F. Because the 2010 Standards include specific design requirements for recreation facilities and play areas that may be new to many title III facilities, the Department sought comments in the NPRM about how the certification review process would be affected if the State or local jurisdiction allocates the authority to implement the new requirements to State or local agencies that are not ordinarily involved in administering building codes. One commenter, an association of building owners and managers, suggested that because of the increased scope of the 2010 Standards, it is likely that parts of covered elements in the new standards will be under the jurisdiction of multiple State or local agencies. In light of these circumstances, the commenter recommended that the Department allow State or local agencies to seek certification even if only one State or local regulatory agency requests certification. For example, if a State agency that regulates buildings seeks certification of its building code, it should be able to

do so, even if another State agency that regulates amusement rides and miniature golf courses does not seek certification.

The Department's discussion of this issue in the NPRM contemplated that all of a State or local government's accessibility requirements for title III facilities would be the subject of a request for certification. Any other approach would require the Department to certify only part of a State or local government's accessibility requirements as compared to the entirety of the revised ADA standards. As noted earlier, the Attorney General is authorized by section 308(b)(1)(A)(ii) of the ADA to certify that a State or local building code meets or exceeds the ADA's minimum accessibility requirements, which are contained in this regulation. The Department has concluded that this is a decision that must be made on a case-by-case basis because of the wide variety of enforcement schemes adopted by the States. Piecemeal certification of laws or codes that do not contain all of the minimum accessibility requirements could fail to satisfy the Attorney General's responsibility to ensure that a State or local building code meets or exceeds the minimum accessibility requirements of the Act before granting certification. However, the Department wants to permit State and local code administrators to have maximum flexibility, so the Department will leave open the possibility for case-by-case review to determine if a State has successfully met the burden of demonstrating that its accessibility codes or other laws meet or exceed the ADA requirements.

The commenter representing building owners and managers also urged the Department to extend the proposed effective date for the final rule. The commenter explained that a six-month phase-in period is inadequate for States to begin and complete a code amendment process. The commenter asserted that the inadequate phase-in period will place entities undertaking new construction and alterations, particularly in those States with certified codes, in a difficult position because State officials will continue to enforce previously certified State or local accessibility requirements that may be in conflict with the new 2010 Standards. The Department received numerous comments on the issue of the effective date, many of them similar to the concerns expressed above, in response to both the NPRM and the ANPRM. *See* Appendix A discussion of compliance dates for new construction and alterations (§ 36.406). The Department has been persuaded by the concerns raised by many commenters addressing the time and costs related to the design process for both new construction and alterations, and has determined that for new construction and alterations, compliance with the 2010 Standards will not be required until 18 months from the date the final rule is published. For more information on the issue of the compliance date, refer to subpart D—New Construction and Alterations.

One commenter, an association of theater owners, recommended that the Department establish a training program for State building inspectors for those States that receive certification to ensure more consistent ADA compliance and to facilitate the review of builders' architectural plans. The commenter also recommended that State building inspectors, once trained, review architectural plans, and after completion and inspection of facilities, be authorized to certify that the inspected building or facility meets both the certified State and the Federal accessibility requirements. Although supportive of the idea of additional training for State and local building code officials regarding ADA compliance, the Department believes that the approach suggested by the commenter of allowing State and local code officials to determine if a covered facility is in compliance with Federal accessibility requirements is not consistent with or permissible under the statutory enforcement scheme established by the ADA. As the Department stated in the NPRM, certification of State and local codes serves, to some extent, to mitigate the absence of a Federal mechanism for conducting at the national level a review of all architectural plans and inspecting all covered build-

ings under construction to ensure compliance with the ADA. In this regard, certification operates as a bridge between the obligation to comply with the 1991 Standards in new construction and alterations, and the administrative schemes of State and local governments that regulate the design and construction process. By ensuring consistency between State or local codes and Federal accessibility standards, certification has the additional benefit of streamlining the regulatory process, thereby making it easier for those in the design and construction industry to satisfy both State and Federal requirements. The Department notes, however, that although certification has the potential to increase compliance with the ADA, this result, however desirable, is not guaranteed. The ADA contemplated that there could be enforcement actions brought even in States with certified codes, and it provided some protection in litigation to builders who adhered to the provisions of the code certified to be ADA-equivalent. The Department's certification determinations make it clear that to get the benefit of certification, a facility must comply with the applicable code requirements—without relying on waivers or variances. The certified code, however, remains within the authority of the adopting State or local jurisdiction to interpret and enforce: Certification does not transform a State's building code into Federal law. Nor can certification alone authorize State and local building code officials implementing a certified code to do more than they are authorized to do under State or local law, and these officials cannot acquire authority through certification to render binding interpretations of Federal law. Therefore, the Department, while understanding the interest in obtaining greater assurance of compliance with the ADA through the interpretation and enforcement of a certified code by local code officials, declined in the NPRM to confer on local officials the authority not granted to them under the ADA to certify the compliance of individual facilities. The Department in the final rule finds no reason to alter its position on this issue in response to the comments that were received.

The commenter representing theater owners also urged the Department to provide a safe harbor to facilities constructed in compliance with State or local building codes certified under the 1991 Standards. With regard to elements of facilities constructed in compliance with a certified code prior to the effective date of the 2010 Standards, and during the period when a certification of equivalency was in effect, the Department noted in the NPRM that its approach would be consistent with the approach to the safe harbor discussed in subpart C, § 36.304 of the NPRM, with respect to elements in existing facilities constructed in compliance with the 1991 Standards. For example, elements in existing facilities in States with codes certified under the 1991 Standards would be eligible for a safe harbor if they were constructed in compliance with an ADA-certified code. In this scenario, compliance with the certified code would be treated as evidence of compliance with the 1991 Standards for purposes of determining the application of the safe harbor provision to those elements. For more information on safe harbor, refer to subpart C, § 36.304 of the final rule.

One commenter, an advocacy group for the blind, suggested that, similar to the procedures for certifying a State or local building code, the Department should establish a program to certify an entity's obligation to make its goods and services accessible to persons with sensory disabilities. The Department believes that this commenter was suggesting that covered entities should be able to request that the Department review their business operations to determine if they have met their ADA obligations. As noted earlier, subpart F contains procedures implementing section 308(b)(1)(A)(ii) of the ADA, which provides that on the application of a State or local jurisdiction, the Attorney General may certify that a State or local building code or similar ordinance meets or exceeds the minimum accessibility requirements of the ADA. The only mechanism through which the Department is authorized to ensure a covered

entity's compliance with the ADA is the enforcement scheme established under section 308(b)(1)(A)(i) of the ADA. The Department notes, however, that title III of the ADA and its implementing regulation, which includes the standards for accessible design, already require existing, altered, and newly constructed places of public accommodation, such as retail stores, hotels, restaurants, movie theaters, and stadiums, to make their facilities readily accessible to and usable by individuals with disabilities, which includes individuals with sensory disabilities, so that individuals with disabilities have a full and equal opportunity to enjoy the benefits of a public accommodation's goods, services, facilities, privileges and advantages.

Other Issues

Questions Posed in the NPRM Regarding Costs and Benefits of Complying With the 2010 Standards

In the NPRM, the Department requested comments on various cost and benefit issues related to eight requirements in the Department's Initial RIA, that were projected to have incremental costs that exceeded monetized benefits by more than $100 million when using the 1991 Standards as a comparative baseline, *i.e.,* side reach, water closet clearances in single-user toilet rooms with in-swinging doors, stairs, elevators, location of accessible routes to stages, accessible attorney areas and witness stands, assistive listening systems, and accessible teeing grounds, putting greens, and weather shelters at golf courses. 73 FR 34508, 34512 (June 17, 2008). The Department was particularly concerned about how these costs applied to alterations. The Department noted that pursuant to the ADA, the Department does not have statutory authority to modify the 2004 ADAAG and is required instead to issue regulations implementing the ADA that are consistent with the Board's guidelines. In that regard, the Department also requested comment about whether any of these eight elements in the 2010 Standards should be returned to the Access Board for further consideration, in particular as applied to alterations. Many of the comments received by the Department in response to these questions addressed both titles II and III. As a result, the Department's discussion of these comments and its response are collectively presented for both titles.

Side reach. The 1991 Standards at section 4.2.6 establish a maximum side-reach height of 54 inches. The 2010 Standards at section 308.3.1 reduce that maximum height to 48 inches. The 2010 Standards also add exceptions for certain elements to the scoping requirement for operable parts. The vast majority of comments the Department received were in support of the lower side-reach maximum of 48 inches in the 2010 Standards. Most of these comments, but not all, were received from individuals of short stature, relatives of individuals of short stature, or organizations representing the interests of persons with disabilities, including individuals of short stature. Comments from individuals with disabilities and disability advocacy groups stated that the 48-inch side reach would permit independence in performing many activities of daily living for individuals with disabilities, including individuals of short stature, persons who use wheelchairs, and persons who have limited upper body strength. In this regard, one commenter who is a business owner pointed out that as a person of short stature there were many occasions when he was unable to exit a public restroom independently because he could not reach the door handle. The commenter said that often elevator control buttons are out of his reach, and, if he is alone, he often must wait for someone else to enter the elevator so that he can ask that person to press a floor button for him. Another commenter, who is also a person of short stature, said that he has on several occasions pulled into a gas station only to find that he was unable to reach the credit card reader on the gas pump. Unlike other customers who can reach the card reader, swipe their credit or debit cards, pump their gas, and leave the station, he must use an-

other method to pay for his gas. Another comment from a person of short stature pointed out that as more businesses take steps to reduce labor costs—a trend expected to continue—staffed booths are being replaced with automatic machines for the sale, for example, of parking tickets and other products. He observed that the ''ability to access and operate these machines becomes ever more critical to function in society,'' and, on that basis, urged the Department to adopt the 48-inch side-reach requirement. Another individual commented that persons of short stature should not have to carry with them adaptive tools in order to access building or facility elements that are out of their reach, any more than persons in wheelchairs should have to carry ramps with them in order to gain access to facilities.

Many of the commenters who supported the revised side-reach requirement pointed out that lowering the side-reach requirement to 48 inches would avoid a problem sometimes encountered in the built environment when an element was mounted for a parallel approach at 54 inches, only to find afterwards that a parallel approach was not possible. Some commenters also suggested that lowering the maximum unobstructed side-reach to 48 inches would reduce confusion among design professionals by making the unobstructed forward and side-reach maximums the same (the unobstructed forward reach in both the 1991 and 2010 Standards is 48 inches maximum). These commenters also pointed out that the ICC/ANSI A117.1 Standard, which is a private sector model accessibility standard, has included a 48-inch maximum high side-reach requirement since 1998. Many jurisdictions have already incorporated this requirement into their building codes, which these commenters believed would reduce the cost of compliance with the 2010 Standards. Because numerous jurisdictions have already adopted the 48-inch side-reach requirement, the Department's failure to adopt the 48-inch side-reach requirement in the 2010 Standards, in the view of many commenters, would result in a significant reduction in accessibility, and would frustrate efforts that have been made to harmonize private sector model construction and accessibility codes with Federal accessibility requirements. Given these concerns, they overwhelmingly opposed the idea of returning the revised side-reach requirement to the Access Board for further consideration.

The Department also received comments in support of the 48-inch side-reach requirement from an association of professional commercial property managers and operators and from State governmental entities. The association of property managers pointed out that the revised side-reach requirement provided a reasonable approach to ''regulating elevator controls and all other operable parts'' in existing facilities in light of the manner in which the safe harbor, barrier removal, and alterations obligations will operate in the 2010 Standards. One governmental entity, while fully supporting the 48-inch side-reach requirement, encouraged the Department to adopt an exception to the lower reach range for existing facilities similar to the exception permitted in the ICC/ANSI A117.1 Standard. In response to this latter concern, the Department notes that under the safe harbor, existing facilities that are in compliance with the 1991 Standards, which required a 54-inch side-reach maximum, would not be required to comply with the lower side-reach requirement, unless there is an alteration. *See* § 36.304(d)(2)(i).

A number of commenters expressed either concern with, or opposition to, the 48-inch side-reach requirement and suggested that it be returned to the Access Board for further consideration. These commenters included trade and business associations, associations of retail stores, associations of restaurant owners, retail and convenience store chains, and a model code organization. Several businesses expressed the view that the lower side-reach requirement would discourage the use of their products and equipment by most of the general public. In particular, concerns were expressed by a national association of pay phone service providers regarding the possibility that pay

telephones mounted at the lower height would not be used as frequently by the public to place calls, which would result in an economic burden on the pay phone industry. The commenter described the lower height required for side reach as creating a new ''barrier'' to pay phone use, which would reduce revenues collected from pay phones and, consequently, further discourage the installation of new pay telephones. In addition, the commenter expressed concern that phone service providers would simply decide to remove existing pay phones rather than incur the costs of relocating them at the lower height. With regard to this latter concern, the commenter misunderstood the manner in which the safe harbor and barrier removal obligations under § 36.304 willoperate in the revised title III regulation for elements that comply with the 1991 Standards.

The Department does not anticipate that wholesale relocation of pay telephones in existing facilities will be required under the final rule where the telephones in existing facilities already are in compliance with the 1991 Standards. If the pay phones comply with the 1991 Standards, the adoption of the 2010 Standards does not require retrofitting of these elements to reflect incremental changes in the 2010 Standards. *See* § 36.304(d)(2). However, pay telephones that were required to meet the 1991 Standards as part of new construction or alterations, but do not in fact comply with those standards, will need to be brought into compliance with the 2010 Standards as of 18 months from the publication date of this final rule. *See* § 36.406(a)(5).

The Department does not agree with the concerns expressed by the commenter about reduced revenues from pay phones mounted at lower heights. The Department believes that while given the choice some individuals may prefer to use a pay phone that is at a higher height, the availability of some phones at a lower height will not deter individuals from making needed calls.

The 2010 Standards will not require every pay phone to be installed or moved to a lowered height. The table accompanying section 217.2 of the 2010 Standards makes clear that where one or more telephones are provided on a floor, level, or an exterior site, only one phone per floor, level, or exterior site must be placed at an accessible height. Similarly, where there is one bank of phones per floor, level, or exterior site, only one phone per floor, level, or exterior site must be accessible. And if there are two or more banks of phones per floor, level, or exterior site, only one phone per bank must be placed at an accessible height.

Another comment in opposition to the lower reach range requirement was submitted on behalf of a chain of convenience stores with fuel stops. The commenter expressed the concern that the 48-inch side reach ''will make it uncomfortable for the majority of the public,'' including persons of taller stature who would need to stoop to use equipment such as fuel dispensers mounted at the lower height. The commenter offered no objective support for the observation that a majority of the public would be rendered uncomfortable if, as required in the 2010 Standards, at least one of each type of fuel dispenser at a facility was made accessible in compliance with the lower reach range. Indeed, the Department received no comments from any individuals of tall stature expressing concern about accessible elements or equipment being mounted at the 48-inch height.

Several retail, convenience store, restaurant, and amusement park commenters expressed concern about the burden the lower side-reach requirement would place on their businesses in terms of self-service food stations and vending areas if the 48-inch requirement were applied retroactively. The cost of lowering counter height, in combination with the lack of control businesses exercise over certain prefabricated service or vending fixtures, outweighed, they argued, any benefits to persons with disabilities. For this reason, they suggested the lower side-reach requirement be referred back to the Access Board.

These commenters misunderstood the safe har-

bor and barrier removal obligations that will be in effect under the 2010 Standards. Those existing self-service food stations and vending areas that already are in compliance with the 1991 Standards will not be required to satisfy the 2010 Standards unless they engage in alterations. With regard to prefabricated vending machines and food service components that will be purchased and installed in businesses after the 2010 Standards become effective, the Department expects that companies will design these machines and fixtures to comply with the 2010 Standards in the future, as many have already done in the 10 years since the 48- inch side-reach requirement has been a part of the model codes and standards used by many jurisdictions as the basis for their construction codes.

A model code organization commented that the lower side-reach requirement would create a significant burden if it required entities to lower the mounting height for light switches, environmental controls, and outlets when an alteration did not include the walls where these elements were located, such as when ''an area is altered or as a path of travel obligation.'' The Department believes that the final rule adequately addresses those situations about which the commenter expressed concern by not requiring the relocation of existing elements, such as light switches, environmental controls, and outlets, unless they are altered. Moreover, under § 36.403 of the 1991 rule, costs for altering the path of travel to an altered area of primary function that exceed 20 percent of the overall costs of the alteration will continue to be deemed disproportionate.

The Department has determined that the revised side-reach requirement should not be returned to the Access Board for further consideration based in large part on the views expressed by a majority of thecommenters regarding the need for, and importance of, the lower side-reach requirement to ensure access for persons with disabilities.

Alterations and water closet clearances in single-user toilet rooms with in-swinging doors. The 1991 Standards allow a lavatory to be placed a minimum of 18 inches from the water closet centerline and a minimum of 36 inches from the side wall adjacent to the water closet, which precludes side transfers. The 1991 Standards do not allow an in-swinging door in a toilet or bathing room to overlap the required clear floor space at any accessible fixture. To allow greater transfer options, section 604.3.2 of the 2010 Standards prohibits lavatories from overlapping the clear floor space at water closets, except in certain residential dwelling units. Section 603.2.3 of the 2010 Standards maintains the prohibition on doors swinging into the clear floor space or clearance required for any fixture, except that they permit the doors of toilet or bathing rooms to swing into the required turning space, provided that there is sufficient clearance space for the wheelchair outside the door swing. In addition, in single-user toilet or bathing rooms, exception 2 of section 603.2.3 of the 2010 Standards permits the door to swing into the clear floor space of an accessible fixture if a clear floor space that measures at least 30 inches by 48 inches is available outside the arc of the door swing.

The majority of commenters believed that this requirement would increase the number of toilet rooms accessible to individuals with disabilities who use wheelchairs or mobility scooters, and will make it easier for them to transfer. A number of commenters stated thatthere was no reason to return this provision to the Access Board. Numerous commenters noted that this requirement is already included in other model accessibility standards and many State and local building codes and that the adoption of the 2010 Standards is an important part of harmonization efforts.

Other commenters, mostly trade associations, opposed this requirement, arguing that the added cost to the industry outweighs any increase in accessibility. Two commenters stated that these proposed requirements would add two feet to the width of an accessible single-user toilet room; however, another commenter said the drawings in the proposed regulation demonstrated that there

would be no substantial increase in the size of the toilet room. Several commenters stated that this requirement would require moving plumbing fixtures, walls, or doors at significant additional expense. Two commenters wanted the permissible overlap between the door swing and clearance around any fixture eliminated. One commenter stated that these new requirements will result in fewer alterations to toilet rooms to avoid triggering the requirement for increased clearances, and suggested that the Department specify that repairs, maintenance, or minor alterations would not trigger the need to provide increased clearances. Another commenter requested that the Department exempt existing guest room bathrooms and single-user toilet rooms that comply with the 1991Standards from complying with the increased clearances in alterations.

After careful consideration of these comments, the Department believes that the revised clearances for single-user toilet rooms will allow safer and easier transfers for individuals with disabilities, and will enable a caregiver, aide, or other person to accompany an individual with a disability into the toilet room to provide assistance. The illustrations in Appendix B to this final rule, ''Analysis and Commentary on the 2010 ADA Standards for Accessible Design,''describe several ways for public entities and public accommodations to make alterations while minimizing additional costs or loss of space. Further, in any isolated instances where existing structural limitations may entail loss of space, the public entity and public accommodation may have a technical infeasibility defense for that alteration. The Department has, therefore, decided not to return this requirement to the Access Board.

Alterations to stairs. The 1991 Standards only require interior and exterior stairs to be accessible when they provide access to levels that are not connected by an elevator, ramp, or other accessible means of vertical access.In contrast, section 210.1 of the 2010 Standards requires all newly constructed stairs that are part of a means of egress to be accessible. However, exception 2 of section 210.1 of the 2010 Standards provides that in alterations, stairs between levels connected by an accessible route need not be accessible, except that handrails shall be provided. Most commenters were in favor of this requirement for handrails in alterations, and stated that adding handrails to stairs during alterations was not only feasible and not cost prohibitive, but also provided important safety benefits. One commenter stated that making all points of egress accessible increased the number of people who could use the stairs in an emergency. A majority of the commenters did not want this requirement returned to the Access Board for further consideration. The International Building Code (IBC), which is a private sector model construction code, contains a similar provision, and most jurisdictions enforce a version of the IBC as their building code, thereby minimizing the impact of this provision on public entities and public accommodations. The Department believes that by requiring only the addition of handrails to altered stairs where levels are connected by an accessible route, the costs of compliance for public entities and public accommodations are minimized, while safe egress for individuals with disabilities is increased. Therefore, the Department has decided not to return this requirement to the Access Board.

Alterations to elevators. Under the 1991 Standards, if an existing elevator is altered, only that altered elevator must comply with the new construction requirements for accessible elevators to the maximum extent feasible. It is therefore possible that a bank of elevators controlled by a single call system may contain just one accessible elevator, leaving an individual with a disability with no way to call an accessible elevator and thus having to wait indefinitely until an accessible elevator happens to respond to the call system. In the 2010 Standards, when an element in one elevator is altered, section 206.6.1 will require the same element to be altered in all elevators that are programmed to respond to the same call button as the altered elevator. Almost all commenters

favored the proposed requirement. This requirement, according to these commenters, is necessary so a person with a disability need not wait until an accessible elevator responds to his or her call. One commenter suggested that elevator owners also could comply by modifying the call system so the accessible elevator could be summoned independently. One commenter suggested that this requirement would be difficult for small businesses located in older buildings,and one commenter suggested that this requirement be sent back to the Access Board.

After considering the comments, the Department agrees that this requirement is necessary to ensure that when an individual with a disability presses a call button, an accessible elevator will arrive. The IBC contains a similar provision, and most jurisdictions enforce a version of the IBC as their building code, minimizing the impact of this provision on public entities and public accommodations. Public entities and small businesses located in older buildings need not comply with this requirement where it is technically infeasible to do so. Further, as pointed out by one commenter, modifying the call system so the accessible elevator can be summoned independently is another means of complying with this requirement in lieu of altering all other elevators programmed to respond to the same call button. Therefore, the Department has decided not to return this requirement to the Access Board.

Location of accessible routes to stages. The 1991 Standards, at section 4.33.5, require an accessible route to connect the accessible seating and the stage, as well as other ancillary spaces used by performers. The 2010 Standards, at section 206.2.6, provide in addition that where a circulation path directly connects the seating area and the stage, the accessible route must connect directly the accessible seating and the stage, and, like the 1991 Standards, an accessible route must connect the stage with the ancillary spaces used by performers.

In the NPRM, the Department asked operators of auditoria about the extent to which auditoria already provide direct access to stages and whether there were planned alterations over the next 15 years that included accessible direct routes to stages. The Department also asked how to quantify the benefits of this requirement for persons with disabilities, and invited commenters to provide illustrative anecdotal experiences about the requirement's benefits.

The Department received many comments regarding the costs and benefits of this requirement. Although little detail was provided, many industry and governmental entity commenters anticipated that the costs of this requirement would be great and that it would be difficult to implement. They noted that premium seats may have to be removed and that load-bearing walls may have to be relocated. These commenters suggested that the significant costs would deter alterations to the stage area for a great many auditoria. Some commenters suggested that ramps to the front of the stage may interfere with means of egress and emergency exits. Several commenters requested that the requirement apply to new construction only, and one industry commenter requested an exemption for stages used in arenas or amusement parks where there is no audience participation or where the stage is a work area for performers only. One commenter requested that the requirement not apply to temporary stages.

The final rule does not require a direct accessible route to be constructed where a direct circulation path from the seating area to the stage does not exist. Consequently, those commenters who expressed concern about the burden imposed by the revised requirement *(i.e.,* where the stage is constructed with no direct circulation path connecting the general seating and performing area) should note that the final rule will not require the provision of a direct accessible route under these circumstances. The final rule applies to permanent stages, as well as ''temporary stages,'' if there is a direct circulation path from the seating area to the stage. However, the Department recognizes

that in some circumstances, such as an alteration to a primary function area, the ability to provide a direct accessible route to a stage may be costly or technically infeasible, and the auditorium owner is not precluded by the revised requirement from asserting defenses available under the regulation. In addition, the Department notes that since section 4.33.5 of the 1991 Standards requires an accessible route to a stage, the safe harbor will apply to existing facilities whose stages comply with the 1991 Standards.

Several governmental entities supported accessible auditoria and the revised requirement. One governmental entity noted that its State building code already required direct access, that it was possible to provide direct access, and that creative solutions had been found to do so.

Many advocacy groups and individual commenters strongly supported the revised requirement, discussing the acute need for direct access to stages, as such access has an impact on a great number of people at important life events, such as graduations and awards ceremonies, at collegiate and competitive performances and other school events, and at entertainment events that include audience participation. Many commenters expressed the belief that direct access is essential for integration mandates to be satisfied, and that separate routes are stigmatizing and unequal. The Department agrees with these concerns.

Commenters described the impact felt by persons in wheelchairs who are unable to access the stage at all when others are able to do so. Some of these commenters also discussed the need for the performers and production staff who use wheelchairs to have direct access to the stage, and they provided a number of examples that illustrated the importance of the rule proposed in the NPRM. Personal anecdotes were provided in comments and at the Department's public hearing on the NPRM. One mother spoke passionately and eloquently about the unequal treatment experienced by her daughter, who uses a wheelchair, at awards ceremonies and band concerts. Her daughter was embarrassed and ashamed to be carried by her father onto a stage at one band concert. When the venue had to be changed for another concert to an accessible auditorium, the band director made sure to comment that he was unhappy with the switch. Rather than endure the embarrassment and indignities, her child dropped out of band the following year.

Another father commented about how he was unable to speak from the stage at a PTA meeting at his child's school. Speaking from the floor limited his line of sight and his participation. Several examples were provided of children who could not participate on stage during graduation, awards programs, or special school events, such as plays and festivities. One student did not attend his college graduation because he would not be able to get on stage. Anotherstudent was unable to participate in the class Christmas programs or end-of-year parties unless her father could attend and lift her onto the stage. These commenters did not provide a method to quantify the benefits that would accrue by having direct access to stages. One commenter stated, however, that''the cost of dignity and respect is without measure.''

Many industry commenters and governmental entities suggested that the requirement be sent back to the Access Board for further consideration. One industry commenter mistakenly noted that some international building codes do not incorporate the requirement and that, therefore, there is a need for further consideration. However, the Department notes that both the 2003 and 2006 editions of the IBC include scoping provisions that are almost identical to this requirement and that these editions of the model code are the most frequently used. Many individuals and advocacy group commenters requested that the requirement be adopted without further delay. These commenters spoke of the acute need for direct access to stages and the amount of time it would take to resubmit the requirement to the Access Board. Several commenters noted that the 2004 ADAAG tracks recent model codes, and that there is thus

no need for further consideration. The Department agrees that no further delay is necessary and therefore has decided it will not return the requirement to the Access Board for further consideration.

Assistive listening systems. The 1991 Standards at sections 4.33.6 and 4.33.7 require assistive listening systems (ALS) in assembly areas and prescribe general performance standards for ALS systems. In the NPRM, the Department proposed adopting the technical specifications in the 2004 ADAAG for ALS that are intended to ensure better quality and effective delivery of sound and information for persons with hearing impairments, especially those using hearing aids. The Department noted in the NPRM that since 1991, advancements in ALS and the advent of digital technology have made these systems more amenable to uniform standards, which, among other things, should ensure that a certain percentage of required ALS systems arehearing-aid compatible. 73 FR 34508, 34513 (June 17, 2008). The 2010 Standards at section 219 provide scoping requirements and at section 706 address receiver jacks, hearing aid compatibility, sound pressure level, signal-to-noise ratio, and peak clipping level. The Department requested comments specifically from arena and assembly area administrators on the cost and maintenance issues associated with ALS, and asked generally about the costs and benefits of ALS, and asked whether, based upon the expected costs of ALS, the issue should be returned to the Access Board for further consideration.

Commenters from advocacy organizations noted that persons who develop significant hearing loss often discontinue their normal routines and activities, including meetings, entertainment, and large group events, due to a sense of isolation caused by the hearing loss or embarrassment. Individuals with longstanding hearing loss may never have participated in group activities for many of the same reasons. Requiring ALS may allow individuals with disabilities to contribute to the community by joining in government and public events, and through increased economic activity associated with community activities and entertainment. Making public events and entertainment accessible to persons with hearing loss also brings families and other groups that include persons with hearing loss into more community events and activities, thus exponentially increasing the benefit from ALS.

Many commenters noted that when a person has significant hearing loss, that person may be able to hear and understand information in a quiet situation with the use of hearing aids or cochlear implants; however, as background noise increases and the distance between the source of the sound and the listener grows, and especially where there is distortion in the sound, an ALS becomes essential for basic comprehension and understanding. Commenters noted that among the 31 million Americans with hearing loss, and with a projected increase to over 78 million Americans with hearing loss by 2030, the benefit from ALS is huge and growing. Advocates for persons with disabilities and individuals commented that they appreciated the improvements in the 2004 ADAAG standards for ALS, including specifications for the ALS systems and performance standards. They noted that providing neckloops that translate the signal from the ALS transmitter to a frequency that can be heard on a hearing aid or cochlear implant are much more effective than separate ALS system headsets, which sometimes create feedback, often malfunction, and may create distractions for others seated nearby. Comments from advocates and users of ALS systems consistently noted that the Department's regulation should, at a minimum, be consistent with the 2004 ADAAG. Although there were requests for adjustments in the scoping requirements from advocates seeking increased scoping requirements, and from large venue operators seeking fewer requirements, there was no significant concern expressed by commenters about the technical specifications for ALS in the 2004 ADAAG.

Some commenters from trade associations and

large venue owners criticized the scoping requirements as too onerous, and one commenter asked for a remand to the Access Board for new scoping rules. However, one State agency commented that the 2004 ADAAG largely duplicates the requirements in the 2006 IBC and the 2003 ANSI codes,which means that entities that comply with those standards would not incur additional costs associated with ADA compliance.

According to one State office of the courts, the costs to install either an infrared system or an FM system at average-sized facilities, including most courtrooms covered by title II, would be between $500 and $2,000, which the agency viewed as a small price in comparison to the benefits of inclusion. Advocacy organizations estimated wholesale costs of ALS systems at about $250 each, and individual neckloops to link the signal from the ALS transmitter to hearing aids or cochlear implants at less than $50 per unit.Many commenters pointed out that if a facility already is using induction neckloops, it would already be in compliance already and would not have any additional installation costs. One major city commented that annual maintenance is about $2,000 for the entire system of performance venues in the city. A trade association representing very large venues estimated annual maintenance and upkeep expenses, including labor and replacement parts, to be at most about $25,000 for a very large professionalsports stadium.

One commenter suggested that the scoping requirements for ALS in the 2004 ADAAG were too stringent and that the Department should refer them back to the Access Board for further review and consideration. Others commented that the requirement for new ALS systems should mandate multichannel receivers capable of receiving audio description for persons who are blind, in addition to a channel for amplification for persons who are hard of hearing. Some commenters suggested that the Department should require a set schedule and protocol of mandatory maintenance. Department regulations already require maintenance of accessible features at § 36.211(a) of the title III regulation, which obligates a title III entity to maintain ALS in good working order. The Department recognizes that maintenance of ALS is key to its usability. Necessary maintenance will vary dramatically from venue to venue based upon a variety of factors including frequency of use, number of units, quality of equipment, and other items. Accordingly, the Department has determined that it is not appropriate to mandate details of maintenance, but notes that failure to maintain ALS would violate § 36.211(a) of this rule.

The NPRM asked whether the Department should return the issue of ALS requirements to the Access Board for further review. The Department has received substantial feedback on the technical and scoping requirements for ALS and is convinced that these requirements are reasonable—especially in light of the fact that the requirements largely duplicate those in the 2006 IBC and the 2003 ANSI codes already adopted in many States—and that the benefits justify the requirements. In addition, the Department believes that the new specifications will make ALS work more effectively for more persons with disabilities, which, together with a growing population of new users, will increase demand for ALS, thus mooting criticism from some large venue operators about insufficient demand. Thus, the Department has determined that it is unnecessary to refer this issue back to the Access Board for reconsideration.

Accessible teeing grounds, putting greens, and weather shelters. The Department's NPRM sought public input on the proposed requirements for accessible golf courses. These requirements specifically relate to accessible routes within the boundaries of the courses, as well as the accessibility of golfing elements (*e.g.,* teeing grounds, putting greens, weather shelters).

In the NPRM, the Department sought information from the owners and operators of golf courses, both public and private, on the extent to which their courses already have golf car passages, and, if so, whether they intended to avail themselves

of the proposed accessible route exception for golf car passages. 73 FR 34508, 34513 (June 17, 2008).

Most commenters expressed support for the adoption of an accessible route requirement that includes an exception permitting golf car passage as all or part of an accessible route. Comments in favor of the proposed standard came from golf course owners and operators, individuals, organizations, and disability rights groups, golf course requirements generally came from golf courses and organizations representing the golf course industry.

The majority of commenters expressed the general viewpoint that nearly all golf courses provide golf cars and have either well-defined paths or permit golf cars to drive on the course where paths are not present—and thus meet the accessible route requirement. Several commenters disagreed with the assumption in the Initial RIA that virtually every tee and putting green on an existing course would need to be regraded in order to provide compliant accessible routes. According to one commenter, many golf courses are relatively flat with little slope, especially those heavily used by recreational golfers. This commenter concurred with the Department that it is likely that most existing golf courses have a golf car passage to tees and greens, thereby substantially minimizing the cost of bringing an existing golf course into compliance with the proposed standards. One commenter reported that golf course access audits found that the vast majority of public golf courses would have little difficulty in meeting the proposed golf course requirements. In the view of some commenters, providing access to golf courses would increase golf participation by individuals with disabilities.

The Department also received many comments requesting clarification of the term ''golf car passage.'' For example, one commenter requesting clarification of the term ''golf car passage'' argued that golf courses typically do not provide golf car paths or pedestrian paths onto the actual teeing grounds or greens, many of which are higher or lower than the car path. This commenter argued that if golf car passages were required to extend onto teeing grounds and greens in order to qualify for an exception, then some golf courses would have to substantially regrade teeing grounds and greens at a high cost.

After careful consideration of the comments, the Department has decided to adopt the 2010 Standards specific to golf facilities. The Department believes that in order for individuals with mobility disabilities to have an opportunity to play golf that is equal to golfers without disabilities, it is essential that golf courses provide an accessible route or accessible golf car passage to connect accessible elements and spaces within the boundary of the golf course, including teeing grounds, putting greens, and weather shelters.

Public Comments on Other NPRM Issues

Equipment and furniture. Equipment and furniture are covered under the Department's ADA regulations, including under the provision requiring modifications in policies, practices, and procedures and the provision requiring barrier removal. *See* 28 CFR 36.302,36.304. The Department has not issued specific regulatory guidance on equipment and furniture, but proposed such regulations in 1991. The Department decided not to establish specific equipment requirements at that time because the requirements could be addressed under other sections of the regulation and because there were no appropriate accessibility standards applicable to many types of equipment at that time. *See* 28 CFR part 36, app. B (2009) (''Proposed Section 36.309 Purchase of Furniture and Equipment'').

In the NPRM, the Department announced its intention not to regulate equipment, proposing instead to continue with the current approach. The Department received numerous comments objecting to this decision and urging the Department to issue equipment and furniture regulations. Based

on these comments, the Department has decided that it needs to revisit the issuance of equipment and furniture regulations, and it intends to do so in future rulemaking.

Among the commenters' key concerns, many from the disability community objected to the Department's earlier decision not to issue equipment regulations, especially for medical equipment. These groups recommended that the Department list by name certain types of medical equipment that must be accessible, including exam tables (that lower to 15 inches above the floor or lower), scales, medical and dental chairs, and radiologic equipment (including mammography equipment). These commenters emphasized that the provision of medically-related equipment and furniture also should be specifically regulated since they are not included in the 2004 ADAAG (while depositories, change machines, fuel dispensers, and ATMs are) and because of their crucial role in the provision of healthcare. Commenters described how the lack of accessible medical equipment negatively affects the health of individuals with disabilities. For example, some individuals with mobility disabilities do not get thorough medical care because their health providers do not have accessible examination tables or scales.

Commenters also said that the Department's stated plan to assess the financial impact of free-standing equipment on businesses was not necessary, as any regulations could include a financial balancing test. Other commenters representing persons who are blind or have low vision urged the Department to mandate accessibility for a wide range of equipment— including household appliances (stoves, washers, microwaves, and coffee makers), audiovisual equipment (stereos and DVD players), exercise machines, vending equipment, ATMs, computers at Internet cafes or hotel business centers, reservations kiosks at hotels, and point-of-sale devices— through speech output and tactile labels and controls. They argued that modern technology allows such equipment to be made accessible at minimal cost. According to these commenters, the lack of such accessibility in point-of-sale devices is particularly problematic because it forces blind individuals to provide personal or sensitive information (such as personal identification numbers) to third parties, which exposes them to identity fraud. Because the ADA does not apply directly to the manufacture of products, the Department lacks the authority to issue design requirements for equipment designed exclusively for use in private homes. *See* Department of Justice, Americans with Disabilities Act, *ADA Title III Technical Assistance Manual Covering Public Accommodations and Commercial Facilities,* III–4.4200, available at *http://www.ada.gov/taman3.html.* To the extent that equipment intended for such use is used by a covered entity to facilitate a covered service or activity, that covered entity must make the equipment accessible to the extent that it can. *See id.*: 28 CFR part 36, app. B (2009) (''Proposed Section 36.309 Purchase of Furniture and Equipment'').

Some commenters urged the Department to require swimming pool operators to provide aquatic wheelchairs for the use of persons with disabilities when the swimming pool has a sloped entry. If there is a sloped entry, a person who uses a wheelchair would require a wheelchair designed for use in the water in order to gain access to the pool since taking a personal wheelchair into water would rust and corrode the metal on the chair and damage any electrical components of a power wheelchair. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs or other mobility aids.

Additionally, many commenters urged the Department to regulate the height of beds in accessible hotel guest rooms and to ensure that such beds have clearance at the floor to accommodate a mechanical lift. These commenters noted that in recent years, hotel beds have become higher as hotels use thicker mattresses, thereby making it difficult or impossible for many individuals who

use wheelchairs to transfer onto hotel beds. In addition, many hotel beds use a solid-sided platform base with no clearance at the floor,which prevents the use of a portable lift to transfer an individual onto the bed. Consequently, individuals who bring their own lift to transfer onto the bed cannot independently get themselves onto the bed. ome commenters suggested various design options that might avoid these situations.

The Department intends to provide specific guidance relating to both hotel beds and aquatic wheelchairs in a future rulemaking. For the present, the Department reminds covered entities that they have the obligation to undertake reasonable modifications to their current policies and procedures and to undertake barrier removal or provide alternatives to barrier removal to make their facilities accessible to persons with disabilities. In many cases, providing aquatic wheelchairs or adjusting hotel bed heights may be necessary to comply with those requirements.

Commenters from the business community objected to the lack of clarity from the NPRM as to which equipment must be accessible and how to make it accessible. Several commenters urged the Department to clarify that equipment located in a public accommodation need not meet the technical specifications of ADAAG so long as the service provided by the equipment can be provided by alternative means, such as an employee. For example, the commenters suggested that a self-service check-in kiosk in a hotel need not comply with the reach range requirement so long as a guest can check in at the front desk nearby. Several commenters argued that the Department should not require that point-of-sale devices be accessible to individuals who are blind or have low vision (although complying with accessible route and reach range was acceptable), especially until the Department adopts specific standards governing such access.

The Department has decided not to add specific scoping or technical requirements for equipment and furniture in this final rule. Other provisions of the regulation, including those requiring reasonable modifications of policies, practices, or procedures, readily achievable barrier removal, and effective communication will require the provision of accessible equipment in appropriate circumstances. Because it is clear that many commenters want the Department to provide additional specific requirements for accessible equipment, the Department plans to initiate a rulemaking to address these issues in the near future.

Accessible golf cars. An accessible golf car means a device that is designed and manufactured to be driven on all areas of a golf course, is independently usable by individuals with mobility disabilities, has a hand-operated brake and accelerator, carries golf clubs in an accessible location, and has a seat that both swivels and raises to put the golfer in a standing or semi-standing position. The 1991 regulation contained no language specifically referencing accessible golf cars. After considering the comments addressing the ANPRM's proposed requirement that golf courses make at least one specialized golf car available for the use of individuals with disabilities, and the safety of accessible golf cars and their use on golf course greens, the Department stated in the NPRM that it would not issue regulations specific to golf cars.

The Department received many comments in response to its decision to propose no new regulation specific to accessible golf cars. The majority of commenters urged the Department to require golf courses to provide accessible golf cars. These comments came from individuals, disability advocacy and recreation groups, a manufacturer of accessible golf cars, and representatives of local government. Comments supporting the Department's decision not to propose a new regulation came from golf course owners, associations, and individuals.

Many commenters argued that while the existing title III regulation covered the issue, the Department should nonetheless adopt specific regulatory language requiring golf courses to provide accessible golf cars. Some commenters noted

that many local governments and park authorities that operate public golf courses have already provided accessible golf cars. Experience indicates that such golf cars may be used without damaging courses. Some argued that having accessible golf cars would increase golf course revenue by enabling more golfers with disabilities to play the game. Several commenters requested that the Department adopt a regulation specifically requiring each golf course to provide one or more accessible golf cars. Other commenters recommended allowing golf courses to make ''pooling'' arrangements to meet demands for such cars. A few commenters expressed support for using accessible golf cars to accommodate golfers with and without disabilities. Commenters also pointed out that the Departments of the Interior and Defense have already mandated that golf courses under their jurisdictional control must make accessible golf cars available unless it can be demonstrated that doing so would change the fundamental nature of the game.

While an industry association argued that at least two models of accessible golf cars meet the specifications recognized in the field, and that accessible golf cars cause no more damage to greens or other parts of golf courses than players standing or walking across the course, other commenters expressed concerns about the potential for damage associated with the use of accessible golf cars. Citing safety concerns, golf organizations recommended that an industry safety standard be developed.

Although the Department declines to add specific scoping or technical requirements for golf cars to this final rule, the Department expects to address requirements for accessible golf cars in future rulemaking. In the meantime, the Department believes that golfers with disabilities who need accessible golf cars are protected by other existing provisions in the title III regulation, including those requiring reasonable modifications of policies, practices, or procedures, and readily achievable barrier removal.

Web site accessibility. Many commenters expressed disappointment that the NPRM did not specifically require title III-covered entities to make their Web sites, through which they offer goods and services, accessible to individuals with disabilities. Commenters urged the Department to require specifically that entities that provide goods or services on the Internet make their Websites accessible, regardless of whether or not these entities also have a ''bricks and mortar' location. The commenters explained that such clarification was needed because of the current ambiguity caused by court decisions as to whether web-only businesses are covered under title III. Commenters argued that the cost of making Web sites accessible through Web site design is minimal, yet critical, to enabling individuals with disabilities to benefit from the goods and services an entity offers through its Web site. The Internet has become an essential tool for many Americans and, when accessible, provides individuals with disabilities great independence. Commenters recommended that, at a minimum, the Department require covered entities to meet the Electronic and Information Technology Accessibility Standards issued pursuant to section 508. Under section 508 of the Rehabilitation Act of 1973, Federal agencies are required to make their Web sites accessible. 29 U.S.C. 794(d); 36 CFR Part 1194.

The Department agrees that the ability to access the goods and services offered on the Internet through the Web sites of public accommodations is of great importance to individuals with disabilities, particularly those who are blind or who have low vision. When the ADA was enacted in 1990, the Internet was unknown to most of the public. Today, the Internet plays a critical role in daily life for personal, civic, commercial, and business purposes. In light of the growing importance of eBcommerce, ensuring nondiscriminatory access to the goods and services offered through the Web sites of covered entities can play a significant role

in fulfilling the goals of the ADA.

Although the language of the ADA does not explicitly mention the Internet, the Department has taken the position that title III covers access to Web sites of public accommodations. The Department has issued guidance on the ADA as applied to the Web sites of public entities, which includes the availability of standards for Web site accessibility. *See Accessibility of State and Local Government Websites to People with Disabilities* (June 2003), available at *www.ada.gov/websites2.htm*. As the Department stated in that publication, an agency (and similarly a public accommodation) with an inaccessible Web site also may meet its legal obligations by providing an accessible alternative for individuals to enjoy its goods or services, such as a staffed telephone information line. However, such an alternative must provide an equal degree of access in terms of hours of operation and range of options and programs available. For example, if retail goods or bank services are posted on an inaccessible Web site that is available 24 hours a day, 7 days a week to individuals without disabilities, then the alternative accessible method must also be available 24 hours a day, 7 days a week. Additional guidance is available in the Web Content Accessibility Guidelines (WCAG), available at *http://www.w3.org/TR/WAIWEBCONTENT* (last visited June 24, 2010), which are developed and maintained by the Web Accessibility Initiative, a subgroup of the World Wide Web Consortium (W3C®).

The Department did not issue proposed regulations as part of its NPRM, and thus is unable to issue specific regulatory language on Web site accessibility at this time. However, the Department expects to engage in rulemaking relating to Web site accessibility under the ADA in the near future.

Multiple chemical sensitivities. The Department received comments from a number of individuals asking the Department to add specific language to the final rule addressing the needs of individuals with chemical sensitivities. These commenters expressed concern that the presence of chemicals interferes with their ability to participate in a wide range of activities. These commenters also urged the Department to add multiple chemical sensitivities to the definition of a disability.

The Department has determined not to include specific provisions addressing multiple chemical sensitivities in the final rule. In order to be viewed as a disability under the ADA, an impairment must substantially limit one or more major life activities. An individual's major life activities of respiratory or neurological functioning may be substantially limited by allergies or sensitivity to a degree that he or she is a person with a disability. When a person has this type of disability, a covered entity may have to make reasonable modifications in its policies and practices for that person. However, this determination is an individual assessment and must be made on a case-by-case basis.

Title III Regulations

1991 Preamble and Section-by-Section Analysis

Department of Justice

Appendix C to the title III rule incorporates the guidance, i.e., the 1991 Section-by-Section Analysis, to the title III rule published July 26, 1991. The 1991 analysis remains relevant to the extent it is not contradicted by the amendments to the rules or it provides guidance on provisions of the rules unchanged by the revised 2010 ADA regulations.

APPENDIX C TO PART 36 — GUIDANCE ON ADA REGULATION ON NONDISCRIMINATION ON THE BASIS OF DISABILITY BY PUBLIC ACCOMMODATIONS AND IN COMMERCIAL FACILITIES ORIGINALLY PUBLISHED ON JULY 26, 1991

SECTION-BY-SECTION ANALYSIS AND RESPONSE TO COMMENTS

Subpart A—General

Section 36.101 Purpose

Section 36.101 states the purpose of the rule, which is to effectuate title III of the Americans with Disabilities Act of 1990. This title prohibits discrimination on the basis of disability by public accommodations, requires places of public accommodation and commercial facilities to be designed, constructed, and altered in compliance with the accessibility standards established by this part, and requires that examinations or courses related to licensing or certification for professional or trade purposes be accessible to persons with disabilities.

Section 36.102 Application

Section 36.102 specifies the range of entities and facilities that have obligations under the final rule. The rule applies to any public accommodation or commercial facility as those terms are defined in §36.104. It also applies, in accordance with section 309 of the ADA, to private entities that offer examinations or courses related to applications, licensing, certification, or credentialing for secondary or postsecondary education, professional, or trade purposes. Except as provided in §36.206, ''Retaliation or coercion,'' this part does not apply to individuals other than public accommodations or to public entities. Coverage of private individuals and public entities is discussed in the preamble to §36.206.

As defined in §36.104, a public accommodation is a private entity that owns, leases or leases to, or operates a place of public accommodation. Section 36.102(b)(2) emphasizes that the general and specific public accommodations requirements of subparts B and C obligate a public accommodation only with respect to the operations of a place of public accommodation. This distinction is drawn in recognition of the fact that a private entity that meets the regulatory definition of public accommodation could also own, lease or lease to, or operate facilities that are not places of public accommodation. The rule would exceed the reach of the ADA if it were to apply the public accommodations requirements of subparts B and C to the operations of a private entity that do not involve a place of public accommodation. Similarly, §36.102(b)(3) provides that the new construction and alterations requirements of subpart D obligate a public accommodation only with respect to facilities used as, or designed or constructed for use as, places of public accommodation or commercial facilities.

On the other hand, as mandated by the ADA and reflected in §36.102(c), the new construction and alterations requirements of subpart D apply to a commercial facility whether or not the facility is a place of public accommodation, or is owned, leased, leased to, or operated by a public accommodation.

Section 36.102(e) states that the rule does not apply to any private club, religious entity, or public entity. Each of these terms is defined in §36.104. The exclusion of private clubs and religious entities is derived from section 307 of the ADA; and the exclusion of public entities is based on the statutory definition of public accommodation in section 301(7) of the ADA, which excludes entities other than private entities from coverage under title III of the ADA.

Section 36.103 Relationship to Other Laws

Section 36.103 is derived from sections 501 (a) and (b) of the ADA. Paragraph (a) provides that, except as otherwise specifically provided by this part, the ADA is not intended to apply lesser standards than are required under title V of the Rehabilitation Act of 1973, as amended (29 U.S.C. 790–794), or the regulations implementing that title. The standards of title V of the Rehabilitation Act apply for purposes of the ADA to the extent that the ADA has not explicitly adopted a different standard from title V. Where the ADA explicitly provides a different standard from section 504, the ADA standard applies to the ADA, but not to section 504. For example, section 504 requires that all federally assisted programs and activities be readily accessible to and usable by individuals with handicaps, even if major structural alterations are necessary to make a program accessible. Title III of the ADA, in contrast, only requires alterations to existing facilities if the modifications are ''readily achievable,'' that is, able to be accomplished easily and without much difficulty or expense. A public accommodation that is covered under both section 504 and the ADA is still required to meet the ''program accessibility'' standard in order to comply with section 504, but would not be in violation of the ADA unless

it failed to make ''readily achievable'' modifications. On the other hand, an entity covered by the ADA is required to make ''readily achievable'' modifications, even if the program can be made accessible without any architectural modifications. Thus, an entity covered by both section 504 and title III of the ADA must meet both the ''program accessibility'' requirement and the ''readily achievable'' requirement.

Paragraph (b) makes explicit that the rule does not affect the obligation of recipients of Federal financial assistance to comply with the requirements imposed under section 504 of the Rehabilitation Act of 1973.

Paragraph (c) makes clear that Congress did not intend to displace any of the rights or remedies provided by other Federal laws or other State or local laws (including State common law) that provide greater or equal protection to individuals with disabilities. A plaintiff may choose to pursue claims under a State law that does not confer greater substantive rights, or even confers fewer substantive rights, if the alleged violation is protected under the alternative law and the remedies are greater. For example, assume that a person with a physical disability seeks damages under a State law that allows compensatory and punitive damages for discrimination on the basis of physical disability, but does not allow them on the basis of mental disability. In that situation, the State law would provide narrower coverage, by excluding mental disabilities, but broader remedies, and an individual covered by both laws could choose to bring an action under both laws. Moreover, State tort claims confer greater remedies and are not preempted by the ADA. A plaintiff may join a State tort claim to a case brought under the ADA. In such a case, the plaintiff must, of course, prove all the elements of the State tort claim in order to prevail under that cause of action.

A commenter had concerns about privacy requirements for banking transactions using telephone relay services. Title IV of the Act provides adequate protections for ensuring the confidentiality of communications using the relay services. This issue is more appropriately addressed by the Federal Communications Commission in its regulation implementing title IV of the Act.

Section 36.104 Definitions

''Act.'' The word ''Act'' is used in the regulation to refer to the Americans with Disabilities Act of 1990, Pub. L. 101–336, which is also referred to as the ''ADA.''

''Commerce.'' The definition of ''commerce'' is identical to the statutory definition provided in section 301(1) of the ADA. It means travel, trade, traffic, commerce, transportation, or communication among the several States, between any foreign country or any territory or possession and any State, or between points in the same State but through another State or foreign country. Commerce is defined in the same manner as in title II of the Civil Rights Act of 1964, which prohibits racial discrimination in public accommodations.

The term ''commerce'' is used in the definition of ''place of public accommodation.'' According to that definition, one of the criteria that an entity must meet before it can be considered a place of public accommodation is that its operations affect commerce. The term ''commerce'' is similarly used in the definition of ''commercial facility.''

The use of the phrase ''operations affect commerce'' applies the full scope of coverage of the Commerce Clause of the Constitution in enforcing the ADA. The Constitution gives Congress broad authority to regulate interstate commerce, including the activities of local business enterprises (e.g., a physician's office, a neighborhood restaurant, a laundromat, or a bakery) that affect interstate commerce through the purchase or sale of products manufactured in other States, or by providing services to individuals from other States. Because of the integrated nature of the national economy, the ADA and this final rule will have extremely broad application.

''Commercial facilities'' are those facilities that are intended for nonresidential use by a private entity and whose operations affect commerce. As explained under §36.401, ''New construction,'' the new construction and alteration requirements of subpart D of the rule apply to all commercial facilities, whether or not they are places of public accommodation. Those commercial facilities that are not places of public accommodation are not subject to the requirements of subparts B and C (e.g., those requirements concerning auxiliary aids and general nondiscrimination provisions).

Congress recognized that the employees within commercial facilities would generally be protected under title I (employment) of the Act. However, as the House Committee on Education and Labor pointed out, ''[t]o the extent that new facilities are built in a manner that make[s] them accessible to all individuals, including potential employees, there will be less of a need for individual employers to engage in reasonable accommodations for particular employees.'' H.R. Rep. No. 485, 101st Cong., 2d Sess., pt. 2, at 117 (1990) [hereinafter ''Education and Labor report'']. While employers of fewer than 15 employees are not covered by title I's employment discrimination provisions, there is no such limitation with respect to new construction covered under title III. Congress chose not to so limit the new construction provisions because of its desire for a uniform requirement of accessibility in new construction, because accessibility can be accomplished easily in the design and construction

stage, and because future expansion of a business or sale or lease of the property to a larger employer or to a business that is a place of public accommodation is always a possibility.

The term ''commercial facilities'' is not intended to be defined by dictionary or common industry definitions. Included in this category are factories, warehouses, office buildings, and other buildings in which employment may occur. The phrase, ''whose operations affect commerce,'' is to be read broadly, to include all types of activities reached under the commerce clause of the Constitution.

Privately operated airports are also included in the category of commercial facilities. They are not, however, places of public accommodation because they are not terminals used for ''specified public transportation.'' (Transportation by aircraft is specifically excluded from the statutory definition of ''specified public transportation.'') Thus, privately operated airports are subject to the new construction and alteration requirements of this rule (subpart D) but not to subparts B and C. (Airports operated by public entities are covered by title II of the Act.) Places of public accommodation located within airports, such as restaurants, shops, lounges, or conference centers, however, are covered by subparts B and C of this part.

The statute's definition of ''commercial facilities'' specifically includes only facilities ''that are intended for nonresidential use'' and specifically exempts those facilities that are covered or expressly exempted from coverage under the Fair Housing Act of 1968, as amended (42 U.S.C. 3601–3631). The interplay between the Fair Housing Act and the ADA with respect to those facilities that are ''places of public accommodation'' was the subject of many comments and is addressed in the preamble discussion of the definition of ''place of public accommodation.''

''Current illegal use of drugs.'' The phrase ''current illegal use of drugs'' is used in §36.209. Its meaning is discussed in the preamble for that section.

''Disability.'' The definition of the term ''disability'' is comparable to the definition of the term ''individual with handicaps'' in section 7(8)(B) of the Rehabilitation Act and section 802(h) of the Fair Housing Act. The Education and Labor Committee report makes clear that the analysis of the term ''individual with handicaps'' by the Department of Health, Education, and Welfare in its regulations implementing section 504 (42 FR 22685 (May 4, 1977)) and the analysis by the Department of Housing and Urban Development in its regulation implementing the Fair Housing Amendments Act of 1988 (54 FR 3232 (Jan. 23, 1989)) should also apply fully to the term ''disability'' (Education and Labor report at 50).

The use of the term ''disability'' instead of ''handicap'' and the term ''individual with a disability'' instead of ''individual with handicaps'' represents an effort by the Congress to make use of up-to-date, currently accepted terminology. The terminology applied to individuals with disabilities is a very significant and sensitive issue. As with racial and ethnic terms, the choice of words to describe a person with a disability is overlaid with stereotypes, patronizing attitudes, and other emotional connotations. Many individuals with disabilities, and organizations representing such individuals, object to the use of such terms as ''handicapped person'' or ''the handicapped.'' In other recent legislation, Congress also recognized this shift in terminology, e.g., by changing the name of the National Council on the Handicapped to the National Council on Disability (Pub. L. 100–630).

In enacting the Americans with Disabilities Act, Congress concluded that it was important for the current legislation to use terminology most in line with the sensibilities of most Americans with disabilities. No change in definition or substance is intended nor should be attributed to this change in phraseology.

The term ''disability'' means, with respect to an individual—

(A) A physical or mental impairment that substantially limits one or more of the major life activities of such individual;

(B) A record of such an impairment; or

(C) Being regarded as having such an impairment.

If an individual meets any one of these three tests, he or she is considered to be an individual with a disability for purposes of coverage under the Americans with Disabilities Act.

Congress adopted this same basic definition of ''disability,'' first used in the Rehabilitation Act of 1973 and in the Fair Housing Amendments Act of 1988, for a number of reasons. It has worked well since it was adopted in 1974. There is a substantial body of administrative interpretation and judicial precedent on this definition. Finally, it would not be possible to guarantee comprehensiveness by providing a list of specific disabilities, especially because new disorders may be recognized in the future, as they have since the definition was first established in 1974.

Test A—A Physical or Mental Impairment That Substantially Limits One or More of the Major Life Activities of Such Individual

Physical or mental impairment. Under the first test, an individual must have a physical or mental impairment. As explained in paragraph (1) (i) of the definition, ''impairment'' means any physiological disorder or condition, cosmetic disfigurement, or anatomical

loss affecting one or more of the following body systems: Neurological; musculoskeletal; special sense organs (including speech organs that are not respiratory, such as vocal cords, soft palate, and tongue); respiratory, including speech organs; cardiovascular; reproductive; digestive; genitourinary; hemic and lymphatic; skin; and endocrine. It also means any mental or psychological disorder, such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities. This list closely tracks the one used in the regulations for section 504 of the Rehabilitation Act of 1973 (see, *e.g.*, 45 CFR 84.3(j)(2)(i)).

Many commenters asked that ''traumatic brain injury'' be added to the list in paragraph (1)(i). Traumatic brain injury is already included because it is a physiological condition affecting one of the listed body systems, i.e., ''neurological.'' Therefore, it was unnecessary for the Department to add the term to the regulation.

It is not possible to include a list of all the specific conditions, contagious and noncontagious diseases, or infections that would constitute physical or mental impairments because of the difficulty of ensuring the comprehensiveness of such a list, particularly in light of the fact that other conditions or disorders may be identified in the future. However, the list of examples in paragraph (1)(iii) of the definition includes: Orthopedic, visual, speech and hearing impairments; cerebral palsy; epilepsy, muscular dystrophy, multiple sclerosis, cancer, heart disease, diabetes, mental retardation, emotional illness, specific learning disabilities, HIV disease (symptomatic or asymptomatic), tuberculosis, drug addiction, and alcoholism.

The examples of ''physical or mental impairments'' in paragraph (1)(iii) are the same as those contained in many section 504 regulations, except for the addition of the phrase ''contagious and noncontagious'' to describe the types of diseases and conditions included, and the addition of ''HIV disease (symptomatic or asymptomatic)'' and ''tuberculosis'' to the list of examples. These additions are based on the ADA committee reports, caselaw, and official legal opinions interpreting section 504. In *School Board of Nassau County* v. *Arline*, 480 U.S. 273 (1987), a case involving an individual with tuberculosis, the Supreme Court held that people with contagious diseases are entitled to the protections afforded by section 504. Following the *Arline* decision, this Department's Office of Legal Counsel issued a legal opinion that concluded that symptomatic HIV disease is an impairment that substantially limits a major life activity; therefore it has been included in the definition of disability under this part. The opinion also concluded that asymptomatic HIV disease is an impairment that substantially limits a major life activity, either because of its actual effect on the individual with HIV disease or because the reactions of other people to individuals with HIV disease cause such individuals to be treated as though they are disabled. See Memorandum from Douglas W. Kmiec, Acting Assistant Attorney General, Office of Legal Counsel, Department of Justice, to Arthur B. Culvahouse, Jr., Counsel to the President (Sept. 27, 1988), *reprinted in* Hearings on S. 933, the Americans with Disabilities Act, Before the Subcomm. on the Handicapped of the Senate Comm. on Labor and Human Resources, 101st Cong., 1st Sess. 346 (1989). The phrase ''symptomatic or asymptomatic'' was inserted in the final rule after ''HIV disease'' in response to commenters who suggested that the clarification was necessary to give full meaning to the Department's opinion.

Paragraph (1)(iv) of the definition states that the phrase ''physical or mental impairment'' does not include homosexuality or bisexuality. These conditions were never considered impairments under other Federal disability laws. Section 511(a) of the statute makes clear that they are likewise not to be considered impairments under the Americans with Disabilities Act.

Physical or mental impairment does not include simple physical characteristics, such as blue eyes or black hair. Nor does it include environmental, cultural, economic, or other disadvantages, such as having a prison record, or being poor. Nor is age a disability. Similarly, the definition does not include common personality traits such as poor judgment or a quick temper where these are not symptoms of a mental or psychological disorder. However, a person who has these characteristics and also has a physical or mental impairment may be considered as having a disability for purposes of the Americans with Disabilities Act based on the impairment.

Substantial limitation of a major life activity. Under Test A, the impairment must be one that ''substantially limits a major life activity.'' Major life activities include such things as caring for one's self, performing manual tasks, walking, seeing, hearing, speaking, breathing, learning, and working. For example, a person who is paraplegic is substantially limited in the major life activity of walking, a person who is blind is substantially limited in the major life activity of seeing, and a person who is mentally retarded is substantially limited in the major life activity of learning. A person with traumatic brain injury is substantially limited in the major life activities of caring for one's self, learning, and working because of memory deficit, confusion, contextual difficulties, and inability to reason appropriately.

A person is considered an individual with a disability for purposes of Test A, the first prong of the definition, when the individual's

important life activities are restricted as to the conditions, manner, or duration under which they can be performed in comparison to most people. A person with a minor, trivial impairment, such as a simple infected finger, is not impaired in a major life activity. A person who can walk for 10 miles continuously is not substantially limited in walking merely because, on the eleventh mile, he or she begins to experience pain, because most people would not be able to walk eleven miles without experiencing some discomfort.

The Department received many comments on the proposed rule's inclusion of the word ''temporary'' in the definition of ''disability.'' The preamble indicated that impairments are not necessarily excluded from the definition of ''disability'' simply because they are temporary, but that the duration, or expected duration, of an impairment is one factor that may properly be considered in determining whether the impairment substantially limits a major life activity. The preamble recognized, however, that temporary impairments, such as a broken leg, are not commonly regarded as disabilities, and only in rare circumstances would the degree of the limitation and its expected duration be substantial: Nevertheless, many commenters objected to inclusion of the word ''temporary'' both because it is not in the statute and because it is not contained in the definition of ''disability'' set forth in the title I regulations of the Equal Employment Opportunity Commission (EEOC). The word ''temporary'' has been deleted from the final rule to conform with the statutory language. The question of whether a temporary impairment is a disability must be resolved on a case-by-case basis, taking into consideration both the duration (or expected duration) of the impairment and the extent to which it actually limits a major life activity of the affected individual.

The question of whether a person has a disability should be assessed without regard to the availability of mitigating measures, such as reasonable modifications or auxiliary aids and services. For example, a person with hearing loss is substantially limited in the major life activity of hearing, even though the loss may be improved through the use of a hearing aid. Likewise, persons with impairments, such as epilepsy or diabetes, that substantially limit a major life activity, are covered under the first prong of the definition of disability, even if the effects of the impairment are controlled by medication.

Many commenters asked that environmental illness (also known as multiple chemical sensitivity) as well as allergy to cigarette smoke be recognized as disabilities. The Department, however, declines to state categorically that these types of allergies or sensitivities are disabilities, because the determination as to whether an impairment is a disability depends on whether, given the particular circumstances at issue, the impairment substantially limits one or more major life activities (or has a history of, or is regarded as having such an effect).

Sometimes respiratory or neurological functioning is so severely affected that an individual will satisfy the requirements to be considered disabled under the regulation. Such an individual would be entitled to all of the protections afforded by the Act and this part. In other cases, individuals may be sensitive to environmental elements or to smoke but their sensitivity will not rise to the level needed to constitute a disability. For example, their major life activity of breathing may be somewhat, but not substantially, impaired. In such circumstances, the individuals are not disabled and are not entitled to the protections of the statute despite their sensitivity to environmental agents.

In sum, the determination as to whether allergies to cigarette smoke, or allergies or sensitivities characterized by the commenters as environmental illness are disabilities covered by the regulation must be made using the same case-by-case analysis that is applied to all other physical or mental impairments. Moreover, the addition of specific regulatory provisions relating to environmental illness in the final rule would be inappropriate at this time pending future consideration of the issue by the Architectural and Transportation Barriers Compliance Board, the Environmental Protection Agency, and the Occupational Safety and Health Administration of the Department of Labor.

Test B—A Record of Such an Impairment

This test is intended to cover those who have a record of an impairment. As explained in paragraph (3) of the rule's definition of disability, this includes a person who has a history of an impairment that substantially limited a major life activity, such as someone who has recovered from an impairment. It also includes persons who have been misclassified as having an impairment.

This provision is included in the definition in part to protect individuals who have recovered from a physical or mental impairment that previously substantially limited them in a major life activity. Discrimination on the basis of such a past impairment is prohibited. Frequently occurring examples of the first group (those who have a history of an impairment) are persons with histories of mental or emotional illness, heart disease, or cancer; examples of the second group (those who have been misclassified as having an impairment) are persons who have been misclassified as having mental retardation or mental illness.

Test C—Being Regarded as Having Such an Impairment

This test, as contained in paragraph (4) of the definition, is intended to cover persons who are treated by a private entity or public accommodation as having a physical or mental impairment that substantially limits a major life activity. It applies when a person is treated as if he or she has an impairment that substantially limits a major life activity, regardless of whether that person has an impairment.

The Americans with Disabilities Act uses the same ''regarded as'' test set forth in the regulations implementing section 504 of the Rehabilitation Act. *See, e.g.*, 28 CFR 42.540(k)(2)(iv), which provides:

(iv) ''Is regarded as having an impairment'' means (A) Has a physical or mental impairment that does not substantially limit major life activities but that is treated by a recipient as constituting such a limitation; (B) Has a physical or mental impairment that substantially limits major life activities only as a result of the attitudes of others toward such impairment; or (C) Has none of the impairments defined in paragraph (k)(2)(i) of this section but is treated by a recipient as having such an impairment.

The perception of the private entity or public accommodation is a key element of this test. A person who perceives himself or herself to have an impairment, but does not have an impairment, and is not treated as if he or she has an impairment, is not protected under this test. A person would be covered under this test if a restaurant refused to serve that person because of a fear of ''negative reactions'' of others to that person. A person would also be covered if a public accommodation refused to serve a patron because it perceived that the patron had an impairment that limited his or her enjoyment of the goods or services being offered.

For example, persons with severe burns often encounter discrimination in community activities, resulting in substantial limitation of major life activities. These persons would be covered under this test based on the attitudes of others towards the impairment, even if they did not view themselves as ''impaired.''

The rationale for this third test, as used in the Rehabilitation Act of 1973, was articulated by the Supreme Court in *Arline*, 480 U.S. 273 (1987). The Court noted that, although an individual may have an impairment that does not in fact substantially limit a major life activity, the reaction of others may prove just as disabling. ''Such an impairment might not diminish a person's physical or mental capabilities, but could nevertheless substantially limit that person's ability to work as a result of the negative reactions of others to the impairment.'' *Id*. at 283. The Court concluded that, by including this test in the Rehabilitation Act's definition, ''Congress acknowledged that society's accumulated myths and fears about disability and disease are as handicapping as are the physical limitations that flow from actual impairment.'' *Id*. at 284.

Thus, a person who is not allowed into a public accommodation because of the myths, fears, and stereotypes associated with disabilities would be covered under this third test whether or not the person's physical or mental condition would be considered a disability under the first or second test in the definition.

If a person is refused admittance on the basis of an actual or perceived physical or mental condition, and the public accommodation can articulate no legitimate reason for the refusal (such as failure to meet eligibility criteria), a perceived concern about admitting persons with disabilities could be inferred and the individual would qualify for coverage under the ''regarded as'' test. A person who is covered because of being regarded as having an impairment is not required to show that the public accommodation's perception is inaccurate (e.g., that he will be accepted by others, or that insurance rates will not increase) in order to be admitted to the public accommodation.

Paragraph (5) of the definition lists certain conditions that are not included within the definition of ''disability.'' The excluded conditions are: transvestism, transsexualism, pedophilia, exhibitionism, voyeurism, gender identity disorders not resulting from physical impairments, other sexual behavior disorders, compulsive gambling, kleptomania, pyromania, and psychoactive substance use disorders resulting from current illegal use of drugs. Unlike homosexuality and bisexuality, which are not considered impairments under either the Americans with Disabilities Act (see the definition of ''disability,'' paragraph (1)(iv)) or section 504, the conditions listed in paragraph (5), except for transvestism, are not necessarily excluded as impairments under section 504. (Transvestism was excluded from the definition of disability for section 504 by the Fair Housing Amendments Act of 1988, Pub. L. 100–430, §6(b).) The phrase ''current illegal use of drugs'' used in this definition is explained in the preamble to §36.209.

''Drug.'' The definition of the term ''drug'' is taken from section 510(d)(2) of the ADA.

''Facility.'' ''Facility'' means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where the building, property, structure, or equipment is located. Committee reports made clear that the definition of facility was drawn from the definition of facility in current Federal regulations (*see, e.g.*, Education and Labor report

at 114). It includes both indoor and outdoor areas where human-constructed improvements, structures, equipment, or property have been added to the natural environment.

The term ''rolling stock or other conveyances'' was not included in the definition of facility in the proposed rule. However, commenters raised questions about the applicability of this part to places of public accommodation operated in mobile facilities (such as cruise ships, floating restaurants, or mobile health units). Those places of public accommodation are covered under this part, and would be included in the definition of ''facility.'' Thus the requirements of subparts B and C would apply to those places of public accommodation. For example, a covered entity could not discriminate on the basis of disability in the full and equal enjoyment of the facilities (§36.201). Similarly, a cruise line could not apply eligibility criteria to potential passengers in a manner that would screen out individuals with disabilities, unless the criteria are ''necessary,'' as provided in §36.301.

However, standards for new construction and alterations of such facilities are not yet included in the Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG) adopted by §36.406 and incorporated in appendix A. The Department therefore will not interpret the new construction and alterations provisions of subpart D to apply to the types of facilities discussed here, pending further development of specific requirements.

Requirements pertaining to accessible transportation services provided by public accommodations are included in §36.310 of this part; standards pertaining to accessible vehicles will be issued by the Secretary of Transportation pursuant to section 306 of the Act, and will be codified at 49 CFR part 37.

A public accommodation has obligations under this rule with respect to a cruise ship to the extent that its operations are subject to the laws of the United States.

The definition of ''facility'' only includes the site over which the private entity may exercise control or on which a place of public accommodation or a commercial facility is located. It does not include, for example, adjacent roads or walks controlled by a public entity that is not subject to this part. Public entities are subject to the requirements of title II of the Act. The Department's regulation implementing title II, which will be codified at 28 CFR part 35, addresses the obligations of public entities to ensure accessibility by providing curb ramps at pedestrian walkways.

''Illegal use of drugs.'' The definition of ''illegal use of drugs'' is taken from section 510(d)(1) of the Act and clarifies that the term includes the illegal use of one or more drugs.

''Individual with a disability'' means a person who has a disability but does not include an individual who is currently illegally using drugs, when the public accommodation acts on the basis of such use. The phrase ''current illegal use of drugs'' is explained in the preamble to §36.209.

''Place of public accommodation.'' The term ''place of public accommodation'' is an adaptation of the statutory definition of ''public accommodation'' in section 301(7) of the ADA and appears as an element of the regulatory definition of public accommodation. The final rule defines ''place of public accommodation'' as a facility, operated by a private entity, whose operations affect commerce and fall within at least one of 12 specified categories. The term ''public accommodation,'' on the other hand, is reserved by the final rule for the private entity that owns, leases (or leases to), or operates a place of public accommodation. It is the public accommodation, and not the place of public accommodation, that is subject to the regulation's nondiscrimination requirements. Placing the obligation not to discriminate on the public accommodation, as defined in the rule, is consistent with section 302(a) of the ADA, which places the obligation not to discriminate on any person who owns, leases (or leases to), or operates a place of public accommodation.

Facilities operated by government agencies or other public entities as defined in this section do not qualify as places of public accommodation. The actions of public entities are governed by title II of the ADA and will be subject to regulations issued by the Department of Justice under that title. The receipt of government assistance by a private entity does not by itself preclude a facility from being considered as a place of public accommodation.

The definition of place of public accommodation incorporates the 12 categories of facilities represented in the statutory definition of public accommodation in section 301(7) of the ADA:

1. Places of lodging.
2. Establishments serving food or drink.
3. Places of exhibition or entertainment.
4. Places of public gathering.
5. Sales or rental establishments.
6. Service establishments.
7. Stations used for specified public transportation.
8. Places of public display or collection.
9. Places of recreation.
10. Places of education.
11. Social service center establishments.
12. Places of exercise or recreation.

In order to be a place of public accommodation, a facility must be operated by a private entity, its operations must affect commerce, and it must fall within one of these 12

categories. While the list of categories is exhaustive, the representative examples of facilities within each category are not. Within each category only a few examples are given. The category of social service center establishments would include not only the types of establishments listed, day care centers, senior citizen centers, homeless shelters, food banks, adoption agencies, but also establishments such as substance abuse treatment centers, rape crisis centers, and halfway houses. As another example, the category of sales or rental establishments would include an innumerable array of facilities that would sweep far beyond the few examples given in the regulation. For example, other retail or wholesale establishments selling or renting items, such as bookstores, videotape rental stores, car rental establishment, pet stores, and jewelry stores would also be covered under this category, even though they are not specifically listed.

Several commenters requested clarification as to the coverage of wholesale establishments under the category of ''sales or rental establishments.'' The Department intends for wholesale establishments to be covered under this category as places of public accommodation except in cases where they sell exclusively to other businesses and not to individuals. For example, a company that grows food produce and supplies its crops exclusively to food processing corporations on a wholesale basis does not become a public accommodation because of these transactions. If this company operates a road side stand where its crops are sold to the public, the road side stand would be a sales establishment covered by the ADA. Conversely, a sales establishment that markets its goods as ''wholesale to the public'' and sells to individuals would not be exempt from ADA coverage despite its use of the word ''wholesale'' as a marketing technique.

Of course, a company that operates a place of public accommodation is subject to this part only in the operation of that place of public accommodation. In the example given above, the wholesale produce company that operates a road side stand would be a public accommodation only for the purposes of the operation of that stand. The company would be prohibited from discriminating on the basis of disability in the operation of the road side stand, and it would be required to remove barriers to physical access to the extent that it is readily achievable to do so (see §36.304); however, in the event that it is not readily achievable to remove barriers, for example, by replacing a gravel surface or regrading the area around the stand to permit access by persons with mobility impairments, the company could meet its obligations through alternative methods of making its goods available, such as delivering produce to a customer in his or her car (see §36.305). The concepts of readily achievable barrier removal and alternatives to barrier removal are discussed further in the preamble discussion of §§36.304 and 36.305.

Even if a facility does not fall within one of the 12 categories, and therefore does not qualify as a place of public accommodation, it still may be a commercial facility as defined in §36.104 and be subject to the new construction and alterations requirements of subpart D.

A number of commenters questioned the treatment of residential hotels and other residential facilities in the Department's proposed rule. These commenters were essentially seeking resolution of the relationship between the Fair Housing Act and the ADA concerning facilities that are both residential in nature and engage in activities that would cause them to be classified as ''places of public accommodation'' under the ADA. The ADA's express exemption relating to the Fair Housing Act applies only to ''commercial facilities'' and not to ''places of public accommodation.''

A facility whose operations affect interstate commerce is a place of public accommodation for purposes of the ADA to the extent that its operations include those types of activities engaged in or services provided by the facilities contained on the list of 12 categories in section 301(7) of the ADA. Thus, a facility that provides social services would be considered a ''social service center establishment.'' Similarly, the category ''places of lodging'' would exclude solely residential facilities because the nature of a place of lodging contemplates the use of the facility for short-term stays.

Many facilities, however, are mixed use facilities. For example, in a large hotel that has a separate residential apartment wing, the residential wing would not be covered by the ADA because of the nature of the occupancy of that part of the facility. This residential wing would, however, be covered by the Fair Housing Act. The separate nonresidential accommodations in the rest of the hotel would be a place of lodging, and thus a public accommodation subject to the requirements of this final rule. If a hotel allows both residential and short-term stays, but does not allocate space for these different uses in separate, discrete units, both the ADA and the Fair Housing Act may apply to the facility. Such determinations will need to be made on a case-by-case basis. Any place of lodging of the type described in paragraph (1) of the definition of place of public accommodation and that is an establishment located within a building that contains not more than five rooms for rent or hire and is actually occupied by the proprietor of the establishment as his or her residence is not covered by the ADA. (This exclusion from coverage does not apply to other categories of public accommodations, for example, professional offices or homeless

shelters, that are located in a building that is also occupied as a private residence.)

A number of commenters noted that the term ''residential hotel'' may also apply to a type of hotel commonly known as a ''single room occupancy hotel.'' Although such hotels or portions of such hotels may fall under the Fair Housing Act when operated or used as long-term residences, they are also considered ''places of lodging'' under the ADA when guests of such hotels are free to use them on a short-term basis. In addition, ''single room occupancy hotels'' may provide social services to their guests, often through the operation of Federal or State grant programs. In such a situation, the facility would be considered a ''social service center establishment'' and thus covered by the ADA as a place of public accommodation, regardless of the length of stay of the occupants.

A similar analysis would also be applied to other residential facilities that provide social services, including homeless shelters, shelters for people seeking refuge from domestic violence, nursing homes, residential care facilities, and other facilities where persons may reside for varying lengths of time. Such facilities should be analyzed under the Fair Housing Act to determine the application of that statute. The ADA, however, requires a separate and independent analysis. For example, if the facility, or a portion of the facility, is intended for or permits short-term stays, or if it can appropriately be categorized as a service establishment or as a social service establishment, then the facility or that portion of the facility used for the covered purpose is a place of public accommodation under the ADA. For example, a homeless shelter that is intended and used only for long-term residential stays and that does not provide social services to its residents would not be covered as a place of public accommodation. However, if this facility permitted short-term stays or provided social services to its residents, it would be covered under the ADA either as a ''place of lodging'' or as a ''social service center establishment,'' or as both.

A private home, by itself, does not fall within any of the 12 categories. However, it can be covered as a place of public accommodation to the extent that it is used as a facility that would fall within one of the 12 categories. For example, if a professional office of a dentist, doctor, or psychologist is located in a private home, the portion of the home dedicated to office use (including areas used both for the residence and the office, e.g., the entrance to the home that is also used as the entrance to the professional office) would be considered a place of public accommodation. Places of public accommodation located in residential facilities are specifically addressed in §36.207.

If a tour of a commercial facility that is not otherwise a place of public accommodation, such as, for example, a factory or a movie studio production set, is open to the general public, the route followed by the tour is a place of public accommodation and the tour must be operated in accordance with the rule's requirements for public accommodations. The place of public accommodation defined by the tour does not include those portions of the commercial facility that are merely viewed from the tour route. Hence, the barrier removal requirements of §36.304 only apply to the physical route followed by the tour participants and not to work stations or other areas that are merely adjacent to, or within view of, the tour route. If the tour is not open to the general public, but rather is conducted, for example, for selected business colleagues, partners, customers, or consultants, the tour route is not a place of public accommodation and the tour is not subject to the requirements for public accommodations.

Public accommodations that receive Federal financial assistance are subject to the requirements of section 504 of the Rehabilitation Act as well as the requirements of the ADA.

Private schools, including elementary and secondary schools, are covered by the rule as places of public accommodation. The rule itself, however, does not require a private school to provide a free appropriate education or develop an individualized education program in accordance with regulations of the Department of Education implementing section 504 of the Rehabilitation Act of 1973, as amended (34 CFR part 104), and regulations implementing the Individuals with Disabilities Education Act (34 CFR part 300). The receipt of Federal assistance by a private school, however, would trigger application of the Department of Education's regulations to the extent mandated by the particular type of assistance received.

''Private club.'' The term ''private club'' is defined in accordance with section 307 of the ADA as a private club or establishment exempted from coverage under title II of the Civil Rights Act of 1964. Title II of the 1964 Act exempts any ''private club or other establishment not in fact open to the public, except to the extent that the facilities of such establishment are made available to the customers or patrons of [a place of public accommodation as defined in title II].'' The rule, therefore, as reflected in §36.102(e) of the application section, limits the coverage of private clubs accordingly. The obligations of a private club that rents space to any other private entity for the operation of a place of public accommodation are discussed further in connection with §36.201.

In determining whether a private entity qualifies as a private club under title II, courts have considered such factors as the degree of member control of club operations, the selectivity of the membership selection

process, whether substantial membership fees are charged, whether the entity is operated on a nonprofit basis, the extent to which the facilities are open to the public, the degree of public funding, and whether the club was created specifically to avoid compliance with the Civil Rights Act. See *e.g., Tillman* v. *Wheaton-Haven Recreation Ass'n,* 410 U.S. 431 (1973); *Daniel* v. *Paul,* 395 U.S. 298 (1969); *Olzman* v. *Lake Hills Swim Club, Inc.,* 495 F.2d 1333 (2d Cir. 1974); *Anderson* v. *Pass Christian Isles Golf Club, Inc.,* 488 F.2d 855 (5th Cir. 1974); *Smith* v. *YMCA,* 462 F.2d 634 (5th Cir. 1972); *Stout* v. *YMCA,* 404 F.2d 687 (5th Cir. 1968); *United States* v. *Richberg,* 398 F.2d 523 (5th Cir. 1968); *Nesmith* v. *YMCA,* 397 F.2d 96 (4th Cir. 1968); *United States* v. *Lansdowne Swim Club,* 713 F. Supp. 785 (E.D. Pa. 1989); *Durham* v. *Red Lake Fishing and Hunting Club, Inc.,* 666 F. Supp. 954 (W.D. Tex. 1987); *New York* v. *Ocean Club, Inc.,* 602 F. Supp. 489 (E.D.N.Y. 1984); *Brown* v. *Loudoun Golf and Country Club, Inc.,* 573 F. Supp. 399 (E.D. Va. 1983); *United States* v. *Trustees of Fraternal Order of Eagles,* 472 F. Supp. 1174 (E.D. Wis. 1979); *Cornelius* v. *Benevolent Protective Order of Elks,* 382 F. Supp. 1182 (D. Conn. 1974).

''Private entity.'' The term ''private entity'' is defined as any individual or entity other than a public entity. It is used as part of the definition of ''public accommodation'' in this section.

The definition adds ''individual'' to the statutory definition of private entity (see section 301(6) of the ADA). This addition clarifies that an individual may be a private entity and, therefore, may be considered a public accommodation if he or she owns, leases (or leases to), or operates a place of public accommodation. The explicit inclusion of individuals under the definition of private entity is consistent with section 302(a) of the ADA, which broadly prohibits discrimination on the basis of disability by any person who owns, leases (or leases to), or operates a place of public accommodation.

''Public accommodation.'' The term ''public accommodation'' means a private entity that owns, leases (or leases to), or operates a place of public accommodation. The regulatory term, ''public accommodation,'' corresponds to the statutory term, ''person,'' in section 302(a) of the ADA. The ADA prohibits discrimination ''by any person who owns, leases (or leases to), or operates a place of public accommodation.'' The text of the regulation consequently places the ADA's nondiscrimination obligations on ''public accommodations'' rather than on ''persons'' or on ''places of public accommodation.''

As stated in §36.102(b)(2), the requirements of subparts B and C obligate a public accommodation only with respect to the operations of a place of public accommodation. A public accommodation must also meet the requirements of subpart D with respect to facilities used as, or designed or constructed for use as, places of public accommodation or commercial facilities.

''Public entity.'' The term ''public entity'' is defined in accordance with section 201(1) of the ADA as any State or local government; any department, agency, special purpose district, or other instrumentality of a State or States or local government; and the National Railroad Passenger Corporation, and any commuter authority (as defined in section 103(8) of the Rail Passenger Service Act). It is used in the definition of ''private entity'' in §36.104. Public entities are excluded from the definition of private entity and therefore cannot qualify as public accommodations under this regulation. However, the actions of public entities are covered by title II of the ADA and by the Department's title II regulations codified at 28 CFR part 35.

''Qualified interpreter.'' The Department received substantial comment regarding the lack of a definition of ''qualified interpreter.'' The proposed rule defined auxiliary aids and services to include the statutory term, ''qualified interpreters'' (§36.303(b)), but did not define that term. Section 36.303 requires the use of a qualified interpreter where necessary to achieve effective communication, unless an undue burden or fundamental alteration would result. Commenters stated that a lack of guidance on what the term means would create confusion among those trying to secure interpreting services and often result in less than effective communication.

Many commenters were concerned that, without clear guidance on the issue of ''qualified'' interpreter, the rule would be interpreted to mean ''available, rather than qualified'' interpreters. Some claimed that few public accommodations would understand the difference between a qualified interpreter and a person who simply knows a few signs or how to fingerspell.

In order to clarify what is meant by ''qualified interpreter'' the Department has added a definition of the term to the final rule. A qualified interpreter means an interpreter who is able to interpret effectively, accurately, and impartially both receptively and expressively, using any necessary specialized vocabulary. This definition focuses on the actual ability of the interpreter in a particular interpreting context to facilitate effective communication between the public accommodation and the individual with disabilities.

Public comment also revealed that public accommodations have at times asked persons who are deaf to provide family members or friends to interpret. In certain circumstances, notwithstanding that the family member or friend is able to interpret or is a certified interpreter, the family member or friend may not be qualified to render the necessary interpretation because of factors such as emotional or personal involvement

or considerations of confidentiality that may adversely affect the ability to interpret ''effectively, accurately, and impartially.''

''Readily achievable.'' The definition of ''readily achievable'' follows the statutory definition of that term in section 301(9) of the ADA. Readily achievable means easily accomplishable and able to be carried out without much difficulty or expense. The term is used as a limitation on the obligation to remove barriers under §§36.304(a), 36.305(a), 36.308(a), and 36.310(b). Further discussion of the meaning and application of the term ''readily achievable'' may be found in the preamble section for §36.304.

The definition lists factors to be considered in determining whether barrier removal is readily achievable in any particular circumstance. A significant number of commenters objected to §36.306 of the proposed rule, which listed identical factors to be considered for determining ''readily achievable'' and ''undue burden'' together in one section. They asserted that providing a consolidated section blurred the distinction between the level of effort required by a public accommodation under the two standards. The readily achievable standard is a ''lower'' standard than the ''undue burden'' standard in terms of the level of effort required, but the factors used in determining whether an action is readily achievable or would result in an undue burden are identical (See Education and Labor report at 109). Although the preamble to the proposed rule clearly delineated the relationship between the two standards, to eliminate any confusion the Department has deleted §36.306 of the proposed rule. That section, in any event, as other commenters noted, had merely repeated the lists of factors contained in the definitions of readily achievable and undue burden.

The list of factors included in the definition is derived from section 301(9) of the ADA. It reflects the congressional intention that a wide range of factors be considered in determining whether an action is readily achievable. It also takes into account that many local facilities are owned or operated by parent corporations or entities that conduct operations at many different sites. This section makes clear that, in some instances, resources beyond those of the local facility where the barrier must be removed may be relevant in determining whether an action is readily achievable. One must also evaluate the degree to which any parent entity has resources that may be allocated to the local facility.

The statutory list of factors in section 301(9) of the Act uses the term ''covered entity'' to refer to the larger entity of which a particular facility may be a part. ''Covered entity'' is not a defined term in the ADA and is not used consistently throughout the Act. The definition, therefore, substitutes the term ''parent entity'' in place of ''covered entity'' in paragraphs (3), (4), and (5) when referring to the larger private entity whose overall resources may be taken into account. This usage is consistent with the House Judiciary Committee's use of the term ''parent company'' to describe the larger entity of which the local facility is a part (H.R. Rep. No. 485, 101st Cong., 2d Sess., pt. 3, at 40–41, 54–55 (1990) (hereinafter ''Judiciary report'')).

A number of commenters asked for more specific guidance as to when and how the resources of a parent corporation or entity are to be taken into account in determining what is readily achievable. The Department believes that this complex issue is most appropriately resolved on a case-by-case basis. As the comments reflect, there is a wide variety of possible relationships between the site in question and any parent corporation or other entity. It would be unwise to posit legal ramifications under the ADA of even generic relationships (e.g., banks involved in foreclosures or insurance companies operating as trustees or in other similar fiduciary relationships), because any analysis will depend so completely on the detailed fact situations and the exact nature of the legal relationships involved. The final rule does, however, reorder the factors to be considered. This shift and the addition of the phrase ''if applicable'' make clear that the line of inquiry concerning factors will start at the site involved in the action itself. This change emphasizes that the overall resources, size, and operations of the parent corporation or entity should be considered to the extent appropriate in light of ''the geographic separateness, and the administrative or fiscal relationship of the site or sites in question to any parent corporation or entity.''

Although some commenters sought more specific numerical guidance on the definition of readily achievable, the Department has declined to establish in the final rule any kind of numerical formula for determining whether an action is readily achievable. It would be difficult to devise a specific ceiling on compliance costs that would take into account the vast diversity of enterprises covered by the ADA's public accommodations requirements and the economic situation that any particular entity would find itself in at any moment. The final rule, therefore, implements the flexible case-by-case approach chosen by Congress.

A number of commenters requested that security considerations be explicitly recognized as a factor in determining whether a barrier removal action is readily achievable. The Department believes that legitimate safety requirements, including crime prevention measures, may be taken into account so long as they are based on actual risks and are necessary for safe operation of the public accommodation. This point has been included in the definition.

Some commenters urged the Department not to consider acts of barrier removal in complete isolation from each other in determining whether they are readily achievable. The Department believes that it is appropriate to consider the cost of other barrier removal actions as one factor in determining whether a measure is readily achievable.

''Religious entity.'' The term ''religious entity'' is defined in accordance with section 307 of the ADA as a religious organization or entity controlled by a religious organization, including a place of worship. Section 36.102(e) of the rule states that the rule does not apply to any religious entity.

The ADA's exemption of religious organizations and religious entities controlled by religious organizations is very broad, encompassing a wide variety of situations. Religious organizations and entities controlled by religious organizations have no obligations under the ADA. Even when a religious organization carries out activities that would otherwise make it a public accommodation, the religious organization is exempt from ADA coverage. Thus, if a church itself operates a day care center, a nursing home, a private school, or a diocesan school system, the operations of the center, home, school, or schools would not be subject to the requirements of the ADA or this part. The religious entity would not lose its exemption merely because the services provided were open to the general public. The test is whether the church or other religious organization operates the public accommodation, not which individuals receive the public accommodation's services.

Religious entities that are controlled by religious organizations are also exempt from the ADA's requirements. Many religious organizations in the United States use lay boards and other secular or corporate mechanisms to operate schools and an array of social services. The use of a lay board or other mechanism does not itself remove the ADA's religious exemption. Thus, a parochial school, having religious doctrine in its curriculum and sponsored by a religious order, could be exempt either as a religious organization or as an entity controlled by a religious organization, even if it has a lay board. The test remains a factual one—whether the church or other religious organization controls the operations of the school or of the service or whether the school or service is itself a religious organization.

Although a religious organization or a religious entity that is controlled by a religious organization has no obligations under the rule, a public accommodation that is not itself a religious organization, but that operates a place of public accommodation in leased space on the property of a religious entity, which is not a place of worship, is subject to the rule's requirements if it is not under control of a religious organization. When a church rents meeting space, which is not a place of worship, to a local community group or to a private, independent day care center, the ADA applies to the activities of the local community group and day care center if a lease exists and consideration is paid.

''Service animal.'' The term ''service animal'' encompasses any guide dog, signal dog, or other animal individually trained to provide assistance to an individual with a disability. The term is used in §36.302(c), which requires public accommodations generally to modify policies, practices, and procedures to accommodate the use of service animals in places of public accommodation.

''Specified public transportation.'' The definition of ''specified public transportation'' is identical to the statutory definition in section 301(10) of the ADA. The term means transportation by bus, rail, or any other conveyance (other than by aircraft) that provides the general public with general or special service (including charter service) on a regular and continuing basis. It is used in category (7) of the definition of ''place of public accommodation,'' which includes stations used for specified public transportation.

The effect of this definition, which excludes transportation by aircraft, is that it excludes privately operated airports from coverage as places of public accommodation. However, places of public accommodation located within airports would be covered by this part. Airports that are operated by public entities are covered by title II of the ADA and, if they are operated as part of a program receiving Federal financial assistance, by section 504 of the Rehabilitation Act. Privately operated airports are similarly covered by section 504 if they are operated as part of a program receiving Federal financial assistance. The operations of any portion of any airport that are under the control of an air carrier are covered by the Air Carrier Access Act. In addition, airports are covered as commercial facilities under this rule.

''State.'' The definition of ''State'' is identical to the statutory definition in section 3(3) of the ADA. The term is used in the definitions of ''commerce'' and ''public entity'' in §36.104.

''Undue burden.'' The definition of ''undue burden'' is analogous to the statutory definition of ''undue hardship'' in employment under section 101(10) of the ADA. The term undue burden means ''significant difficulty or expense'' and serves as a limitation on the obligation to provide auxiliary aids and services under §36.303 and §§36.309 (b)(3) and (c)(3). Further discussion of the meaning and application of the term undue burden may be found in the preamble discussion of §36.303.

The definition lists factors considered in determining whether provision of an auxiliary aid or service in any particular circumstance would result in an undue burden.

The factors to be considered in determining whether an action would result in an undue burden are identical to those to be considered in determining whether an action is readily achievable. However, ''readily achievable'' is a lower standard than ''undue burden'' in that it requires a lower level of effort on the part of the public accommodation (see Education and Labor report at 109).

Further analysis of the factors to be considered in determining undue burden may be found in the preamble discussion of the definition of the term ''readily achievable.''

Subpart B—General Requirements

Subpart B includes general prohibitions restricting a public accommodation from discriminating against people with disabilities by denying them the opportunity to benefit from goods or services, by giving them unequal goods or services, or by giving them different or separate goods or services. These general prohibitions are patterned after the basic, general prohibitions that exist in other civil rights laws that prohibit discrimination on the basis of race, sex, color, religion, or national origin.

Section 36.201 General

Section 36.201(a) contains the general rule that prohibits discrimination on the basis of disability in the full and equal enjoyment of goods, services, facilities, privileges, advantages, and accommodations of any place of public accommodation.

Full and equal enjoyment means the right to participate and to have an equal opportunity to obtain the same results as others to the extent possible with such accommodations as may be required by the Act and these regulations. It does not mean that an individual with a disability must achieve an identical result or level of achievement as persons without a disability. For example, an exercise class cannot exclude a person who uses a wheelchair because he or she cannot do all of the exercises and derive the same result from the class as persons without a disability.

Section 302(a) of the ADA states that the prohibition against discrimination applies to ''any person who owns, leases (or leases to), or operates a place of public accommodation,'' and this language is reflected in §36.201(a). The coverage is quite extensive and would include sublessees, management companies, and any other entity that owns, leases, leases to, or operates a place of public accommodation, even if the operation is only for a short time.

The first sentence of paragraph (b) of §36.201 reiterates the general principle that both the landlord that owns the building that houses the place of public accommodation, as well as the tenant that owns or operates the place of public accommodation, are public accommodations subject to the requirements of this part. Although the statutory language could be interpreted as placing equal responsibility on all private entities, whether lessor, lessee, or operator of a public accommodation, the committee reports suggest that liability may be allocated. Section 36.201(b) of that section of the proposed rule attempted to allocate liability in the regulation itself. Paragraph (b)(2) of that section made a specific allocation of liability for the obligation to take readily achievable measures to remove barriers, and paragraph (b)(3) made a specific allocation for the obligation to provide auxiliary aids.

Numerous commenters pointed out that these allocations would not apply in all situations. Some asserted that paragraph (b)(2) of the proposed rule only addressed the situation when a lease gave the tenant the right to make alterations with permission of the landlord, but failed to address other types of leases, e.g., those that are silent on the right to make alterations, or those in which the landlord is not permitted to enter a tenant's premises to make alterations. Several commenters noted that many leases contain other clauses more relevant to the ADA than the alterations clause. For example, many leases contain a ''compliance clause,'' a clause which allocates responsibility to a particular party for compliance with all relevant Federal, State, and local laws. Many commenters pointed out various types of relationships that were left unaddressed by the regulation, e.g., sale and leaseback arrangements where the landlord is a financial institution with no control or responsibility for the building; franchises; subleases; and management companies which, at least in the hotel industry, often have control over operations but are unable to make modifications to the premises.

Some commenters raised specific questions as to how the barrier removal allocation would work as a practical matter. Paragraph (b)(2) of the proposed rule provided that the burden of making readily achievable modifications within the tenant's place of public accommodation would shift to the landlord when the modifications were not readily achievable for the tenant or when the landlord denied a tenant's request for permission to make such modifications. Commenters noted that the rule did not specify exactly when the burden would actually shift from tenant to landlord and whether the landlord would have to accept a tenant's word that a particular action is not readily achievable. Others questioned if the tenant should be obligated to use alternative methods of barrier removal before the burden shifts. In light of the fact that readily achievable removal of barriers can include such actions as moving of racks and displays, some commenters doubted the appropriateness of requiring a

landlord to become involved in day-to-day operations of its tenants' businesses.

The Department received widely differing comments in response to the preamble question asking whether landlord and tenant obligations should vary depending on the length of time remaining on an existing lease. Many suggested that tenants should have no responsibilities in ''shorter leases,'' which commenters defined as ranging anywhere from 90 days to three years. Other commenters pointed out that the time remaining on the lease should not be a factor in the rule's allocation of responsibilities, but is relevant in determining what is readily achievable for the tenant. The Department agrees with this latter approach and will interpret the rule in that manner.

In recognition of the somewhat limited applicability of the allocation scheme contained in the proposed rule, paragraphs (b)(2) and (b)(3) have been deleted from the final rule. The Department has substituted instead a statement that allocation of responsibility as between the parties for taking readily achievable measures to remove barriers and to provide auxiliary aids and services both in common areas and within places of public accommodation may be determined by the lease or other contractual relationships between the parties. The ADA was not intended to change existing landlord/tenant responsibilities as set forth in the lease. By deleting specific provisions from the rule, the Department gives full recognition to this principle. As between the landlord and tenant, the extent of responsibility for particular obligations may be, and in many cases probably will be, determined by contract.

The suggested allocation of responsibilities contained in the proposed rule may be used if appropriate in a particular situation. Thus, the landlord would generally be held responsible for making readily achievable changes and providing auxiliary aids and services in common areas and for modifying policies, practices, or procedures applicable to all tenants, and the tenant would generally be responsible for readily achievable changes, provision of auxiliary aids, and modification of policies within its own place of public accommodation.

Many commenters objected to the proposed rule's allocation of responsibility for providing auxiliary aids and services solely to the tenant, pointing out that this exclusive allocation may not be appropriate in the case of larger public accommodations that operate their businesses by renting space out to smaller public accommodations. For example, large theaters often rent to smaller traveling companies and hospitals often rely on independent contractors to provide childbirth classes. Groups representing persons with disabilities objected to the proposed rule because, in their view, it permitted the large theater or hospital to evade ADA responsibilities by leasing to independent smaller entities. They suggested that these types of public accommodations are not really landlords because they are in the business of providing a service, rather than renting space, as in the case of a shopping center or office building landlord. These commenters believed that responsibility for providing auxiliary aids should shift to the landlord, if the landlord relies on a smaller public accommodation or independent contractor to provide services closely related to those of the larger public accommodation, and if the needed auxiliary aids prove to be an undue burden for the smaller public accommodation. The final rule no longer lists specific allocations to specific parties but, rather, leaves allocation of responsibilities to the lease negotiations. Parties are, therefore, free to allocate the responsibility for auxiliary aids.

Section 36.201(b)(4) of the proposed rule, which provided that alterations by a tenant on its own premises do not trigger a path of travel obligation on the landlord, has been moved to §36.403(d) of the final rule.

An entity that is not in and of itself a public accommodation, such as a trade association or performing artist, may become a public accommodation when it leases space for a conference or performance at a hotel, convention center, or stadium. For an entity to become a public accommodation when it is the lessee of space, however, the Department believes that consideration in some form must be given. Thus, a Boy Scout troop that accepts donated space does not become a public accommodation because the troop has not ''leased'' space, as required by the ADA.

As a public accommodation, the trade association or performing artist will be responsible for compliance with this part. Specific responsibilities should be allocated by contract, but, generally, the lessee should be responsible for providing auxiliary aids and services (which could include interpreters, Braille programs, etc.) for the participants in its conference or performance as well as for assuring that displays are accessible to individuals with disabilities.

Some commenters suggested that the rule should allocate responsibilities for areas other than removal of barriers and auxiliary aids. The final rule leaves allocation of all areas to the lease negotiations. However, in general landlords should not be given responsibility for policies a tenant applies in operating its business, if such policies are solely those of the tenant. Thus, if a restaurant tenant discriminates by refusing to seat a patron, it would be the tenant, and not the landlord, who would be responsible, because the discriminatory policy is imposed solely by the tenant and not by the landlord. If, however, a tenant refuses to modify a ''no

pets'' rule to allow service animals in its restaurant because the landlord mandates such a rule, then both the landlord and the tenant would be liable for violation of the ADA when a person with a service dog is refused entrance. The Department wishes to emphasize, however, that the parties are free to allocate responsibilities in any way they choose.

Private clubs are also exempt from the ADA. However, consistent with title II of the Civil Rights Act (42 U.S.C. 2000a(e), a private club is considered a public accommodation to the extent that ''the facilities of such establishment are made available to the customers or patrons'' of a place of public accommodation. Thus, if a private club runs a day care center that is open exclusively to its own members, the club, like the church in the example above, would have no responsibility for compliance with the ADA. Nor would the day care center have any responsibilities because it is part of the private club exempt from the ADA.

On the other hand, if the private club rents to a day care center that is open to the public, then the private club would have the same obligations as any other public accommodation that functions as a landlord with respect to compliance with title III within the day care center. In such a situation, both the private club that ''leases to'' a public accommodation and the public accommodation lessee (the day care center) would be subject to the ADA. This same principle would apply if the private club were to rent to, for example, a bar association, which is not generally a public accommodation but which, as explained above, becomes a public accommodation when it leases space for a conference.

Section 36.202 Activities

Section 36.202 sets out the general forms of discrimination prohibited by title III of the ADA. These general prohibitions are further refined by the specific prohibitions in subpart C. Section 36.213 makes clear that the limitations on the ADA's requirements contained in subpart C, such as ''necessity'' (§36.301(a)) and ''safety'' (§36.301(b)), are applicable to the prohibitions in §36.202. Thus, it is unnecessary to add these limitations to §36.202 as has been requested by some commenters. In addition, the language of §36.202 very closely tracks the language of section 302(b)(1)(A) of the Act, and that statutory provision does not expressly contain these limitations.

Deny participation—Section 36.202(a) provides that it is discriminatory to deny a person with a disability the right to participate in or benefit from the goods, services, facilities, privileges, advantages, or accommodations of a place of public accommodation.

A public accommodation may not exclude persons with disabilities on the basis of disability for reasons other than those specifically set forth in this part. For example, a public accommodation cannot refuse to serve a person with a disability because its insurance company conditions coverage or rates on the absence of persons with disabilities. This is a frequent basis of exclusion from a variety of community activities and is prohibited by this part.

Unequal benefit—Section 36.202(b) prohibits services or accommodations that are not equal to those provided others. For example, persons with disabilities must not be limited to certain performances at a theater.

Separate benefit—Section 36.202(c) permits different or separate benefits or services only when necessary to provide persons with disabilities opportunities as effective as those provided others. This paragraph permitting separate benefits ''when necessary'' should be read together with §36.203(a), which requires integration in ''the most integrated setting appropriate to the needs of the individual.'' The preamble to that section provides further guidance on separate programs. Thus, this section would not prohibit the designation of parking spaces for persons with disabilities.

Each of the three paragraphs (a)–(c) prohibits discrimination against an individual or class of individuals ''either directly or through contractual, licensing, or other arrangements.'' The intent of the contractual prohibitions of these paragraphs is to prohibit a public accommodation from doing indirectly, through a contractual relationship, what it may not do directly. Thus, the ''individual or class of individuals'' referenced in the three paragraphs is intended to refer to the clients and customers of the public accommodation that entered into a contractual arrangement. It is not intended to encompass the clients or customers of other entities. A public accommodation, therefore, is not liable under this provision for discrimination that may be practiced by those with whom it has a contractual relationship, when that discrimination is not directed against its own clients or customers. For example, if an amusement park contracts with a food service company to operate its restaurants at the park, the amusement park is not responsible for other operations of the food service company that do not involve clients or customers of the amusement park. Section 36.202(d) makes this clear by providing that the term ''individual or class of individuals'' refers to the clients or customers of the public accommodation that enters into the contractual, licensing, or other arrangement.

Section 36.203 Integrated Settings

Section 36.203 addresses the integration of persons with disabilities. The ADA recognizes that the provision of goods and services in an integrated manner is a fundamental tenet of nondiscrimination on the basis of

disability. Providing segregated accommodations and services relegates persons with disabilities to the status of second-class citizens. For example, it would be a violation of this provision to require persons with mental disabilities to eat in the back room of a restaurant or to refuse to allow a person with a disability the full use of a health spa because of stereotypes about the person's ability to participate. Section 36.203(a) states that a public accommodation shall afford goods, services, facilities, privileges, advantages, and accommodations to an individual with a disability in the most integrated setting appropriate to the needs of the individual. Section 36.203(b) specifies that, notwithstanding the existence of separate or different programs or activities provided in accordance with this section, an individual with a disability shall not be denied the opportunity to participate in such programs or activities that are not separate or different. Section 306.203(c), which is derived from section 501(d) of the Americans with Disabilities Act, states that nothing in this part shall be construed to require an individual with a disability to accept an accommodation, aid, service, opportunity, or benefit that he or she chooses not to accept.

Taken together, these provisions are intended to prohibit exclusion and segregation of individuals with disabilities and the denial of equal opportunities enjoyed by others, based on, among other things, presumptions, patronizing attitudes, fears, and stereotypes about individuals with disabilities. Consistent with these standards, public accommodations are required to make decisions based on facts applicable to individuals and not on the basis of presumptions as to what a class of individuals with disabilities can or cannot do.

Sections 36.203 (b) and (c) make clear that individuals with disabilities cannot be denied the opportunity to participate in programs that are not separate or different. This is an important and overarching principle of the Americans with Disabilities Act. Separate, special, or different programs that are designed to provide a benefit to persons with disabilities cannot be used to restrict the participation of persons with disabilities in general, integrated activities.

For example, a person who is blind may wish to decline participating in a special museum tour that allows persons to touch sculptures in an exhibit and instead tour the exhibit at his or her own pace with the museum's recorded tour. It is not the intent of this section to require the person who is blind to avail himself or herself of the special tour. Modified participation for persons with disabilities must be a choice, not a requirement.

Further, it would not be a violation of this section for an establishment to offer recreational programs specially designed for children with mobility impairments in those limited circumstances. However, it would be a violation of this section if the entity then excluded these children from other recreational services made available to nondisabled children, or required children with disabilities to attend only designated programs.

Many commenters asked that the Department clarify a public accommodation's obligations within the integrated program when it offers a separate program, but an individual with a disability chooses not to participate in the separate program. It is impossible to make a blanket statement as to what level of auxiliary aids or modifications are required in the integrated program. Rather, each situation must be assessed individually. Assuming the integrated program would be appropriate for a particular individual, the extent to which that individual must be provided with modifications will depend not only on what the individual needs but also on the limitations set forth in subpart C. For example, it may constitute an undue burden for a particular public accommodation, which provides a full-time interpreter in its special guided tour for individuals with hearing impairments, to hire an additional interpreter for those individuals who choose to attend the integrated program. The Department cannot identify categorically the level of assistance or aid required in the integrated program.

The preamble to the proposed rule contained a statement that some interpreted as encouraging the continuation of separate schools, sheltered workshops, special recreational programs, and other similar programs. It is important to emphasize that §36.202(c) only calls for separate programs when such programs are ''necessary'' to provide as effective an opportunity to individuals with disabilities as to other individuals. Likewise, §36.203(a) only permits separate programs when a more integrated setting would not be ''appropriate.'' Separate programs are permitted, then, in only limited circumstances. The sentence at issue has been deleted from the preamble because it was too broadly stated and had been erroneously interpreted as Departmental encouragement of separate programs without qualification.

The proposed rule's reference in §36.203(b) to separate programs or activities provided in accordance with ''this section'' has been changed to ''this subpart'' in recognition of the fact that separate programs or activities may, in some limited circumstances, be permitted not only by §36.203(a) but also by §36.202(c).

In addition, some commenters suggested that the individual with the disability is the only one who can decide whether a setting is ''appropriate'' and what the ''needs'' are.

Others suggested that only the public accommodation can make these determinations. The regulation does not give exclusive responsibility to either party. Rather, the determinations are to be made based on an objective view, presumably one which would take into account views of both parties.

Some commenters expressed concern that §36.203(c), which states that nothing in the rule requires an individual with a disability to accept special accommodations and services provided under the ADA, could be interpreted to allow guardians of infants or older people with disabilities to refuse medical treatment for their wards. Section 36.203(c) has been revised to make it clear that paragraph (c) is inapplicable to the concern of the commenters. A new paragraph (c)(2) has been added stating that nothing in the regulation authorizes the representative or guardian of an individual with a disability to decline food, water, medical treatment, or medical services for that individual. New paragraph (c) clarifies that neither the ADA nor the regulation alters current Federal law ensuring the rights of incompetent individuals with disabilities to receive food, water, and medical treatment. See, *e.g.*, Child Abuse Amendments of 1984 (42 U.S.C. 5106a(b)(10), 5106g(10)); Rehabilitation Act of 1973, as amended (29 U.S.C 794); Developmentally Disabled Assistance and Bill of Rights Act (42 U.S.C. 6042).

Sections 36.203(c) (1) and (2) are based on section 501(d) of the ADA. Section §501(d) was designed to clarify that nothing in the ADA requires individuals with disabilities to accept special accommodations and services for individuals with disabilities that may segregate them:

The Committee added this section (501(d)) to clarify that nothing in the ADA is intended to permit discriminatory treatment on the basis of disability, even when such treatment is rendered under the guise of providing an accommodation, service, aid or benefit to the individual with disability. For example, a blind individual may choose not to avail himself or herself of the right to go to the front of a line, even if a particular public accommodation has chosen to offer such a modification of a policy for blind individuals. Or, a blind individual may choose to decline to participate in a special museum tour that allows persons to touch sculptures in an exhibit and instead tour the exhibits at his or her own pace with the museum's recorded tour.

(Judiciary report at 71–72.) The Act is not to be construed to mean that an individual with disabilities must accept special accommodations and services for individuals with disabilities when that individual chooses to participate in the regular services already offered. Because medical treatment, including treatment for particular conditions, is not a special accommodation or service for individuals with disabilities under section 501(d), neither the Act nor this part provides affirmative authority to suspend such treatment. Section 501(d) is intended to clarify that the Act is not designed to foster discrimination through mandatory acceptance of special services when other alternatives are provided; this concern does not reach to the provision of medical treatment for the disabling condition itself.

Section 36.213 makes clear that the limitations contained in subpart C are to be read into subpart B. Thus, the integration requirement is subject to the various defenses contained in subpart C, such as safety, if eligibility criteria are at issue (§36.301(b)), or fundamental alteration and undue burden, if the concern is provision of auxiliary aids (§36.303(a)).

Section 36.204 Administrative Methods

Section 36.204 specifies that an individual or entity shall not, directly, or through contractual or other arrangements, utilize standards or criteria or methods of administration that have the effect of discriminating on the basis of disability or that perpetuate the discrimination of others who are subject to common administrative control. The preamble discussion of §36.301 addresses eligibility criteria in detail.

Section 36.204 is derived from section 302(b)(1)(D) of the Americans with Disabilities Act, and it uses the same language used in the employment section of the ADA (section 102(b)(3)). Both sections incorporate a disparate impact standard to ensure the effectiveness of the legislative mandate to end discrimination. This standard is consistent with the interpretation of section 504 by the U.S. Supreme Court in *Alexander* v. *Choate,* 469 U.S. 287 (1985). The Court in *Choate* explained that members of Congress made numerous statements during passage of section 504 regarding eliminating architectural barriers, providing access to transportation, and eliminating discriminatory effects of job qualification procedures. The Court then noted: ''These statements would ring hollow if the resulting legislation could not rectify the harms resulting from action that discriminated by effect as well as by design.'' *Id* at 297 (footnote omitted).

Of course, §36.204 is subject to the various limitations contained in subpart C including, for example, necessity (§36.301(a)), safety (§36.301(b)), fundamental alteration (§36.302(a)), readily achievable (§36.304(a)), and undue burden (§36.303(a)).

Section 36.205 Association

Section 36.205 implements section 302(b)(1)(E) of the Act, which provides that a public accommodation shall not exclude or

otherwise deny equal goods, services, facilities, privileges, advantages, accommodations, or other opportunities to an individual or entity because of the known disability of an individual with whom the individual or entity is known to have a relationship or association. This section is unchanged from the proposed rule.

The individuals covered under this section include any individuals who are discriminated against because of their known association with an individual with a disability. For example, it would be a violation of this part for a day care center to refuse admission to a child because his or her brother has HIV disease.

This protection is not limited to those who have a familial relationship with the individual who has a disability. If a place of public accommodation refuses admission to a person with cerebral palsy and his or her companions, the companions have an independent right of action under the ADA and this section.

During the legislative process, the term ''entity'' was added to section 302(b)(1)(E) to clarify that the scope of the provision is intended to encompass not only persons who have a known association with a person with a disability, but also entities that provide services to or are otherwise associated with such individuals. This provision was intended to ensure that entities such as health care providers, employees of social service agencies, and others who provide professional services to persons with disabilities are not subjected to discrimination because of their professional association with persons with disabilities. For example, it would be a violation of this section to terminate the lease of an entity operating an independent living center for persons with disabilities, or to seek to evict a health care provider because that individual or entity provides services to persons with mental impairments.

Section 36.206 Retaliation or Coercion

Section 36.206 implements section 503 of the ADA, which prohibits retaliation against any individual who exercises his or her rights under the Act. This section is unchanged from the proposed rule. Paragraph (a) of §36.206 provides that no private entity or public entity shall discriminate against any individual because that individual has exercised his or her right to oppose any act or practice made unlawful by this part, or because that individual made a charge, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under the Act or this part.

Paragraph (b) provides that no private entity or public entity shall coerce, intimidate, threaten, or interfere with any individual in the exercise of his or her rights under this part or because that individual aided or encouraged any other individual in the exercise or enjoyment of any right granted or protected by the Act or this part.

Illustrations of practices prohibited by this section are contained in paragraph (c), which is modeled on a similar provision in the regulations issued by the Department of Housing and Urban Development to implement the Fair Housing Act (see 24 CFR 100.400(c)(1)). Prohibited actions may include:

(1) Coercing an individual to deny or limit the benefits, services, or advantages to which he or she is entitled under the Act or this part;

(2) Threatening, intimidating, or interfering with an individual who is seeking to obtain or use the goods, services, facilities, privileges, advantages, or accommodations of a public accommodation;

(3) Intimidating or threatening any person because that person is assisting or encouraging an individual or group entitled to claim the rights granted or protected by the Act or this part to exercise those rights; or

(4) Retaliating against any person because that person has participated in any investigation or action to enforce the Act or this part.

This section protects not only individuals who allege a violation of the Act or this part, but also any individuals who support or assist them. This section applies to all investigations or proceedings initiated under the Act or this part without regard to the ultimate resolution of the underlying allegations. Because this section prohibits any act of retaliation or coercion in response to an individual's effort to exercise rights established by the Act and this part (or to support the efforts of another individual), the section applies not only to public accommodations that are otherwise subject to this part, but also to individuals other than public accommodations or to public entities. For example, it would be a violation of the Act and this part for a private individual, e.g., a restaurant customer, to harass or intimidate an individual with a disability in an effort to prevent that individual from patronizing the restaurant. It would, likewise, be a violation of the Act and this part for a public entity to take adverse action against an employee who appeared as a witness on behalf of an individual who sought to enforce the Act.

Section 36.207 Places of Public Accommodation Located in Private Residences

A private home used exclusively as a residence is not covered by title III because it is neither a ''commercial facility'' nor a ''place of public accommodation.'' In some situations, however, a private home is not used exclusively as a residence, but houses a place of public accommodation in all or part of a home (e.g., an accountant who meets with his or her clients at his or her residence). Section 36.207(a) provides that those portions of the private residence used in the operation

of the place of public accommodation are covered by this part.

For instance, a home or a portion of a home may be used as a day care center during the day and a residence at night. If all parts of the house are used for the day care center, then the entire residence is a place of public accommodation because no part of the house is used exclusively as a residence. If an accountant uses one room in the house solely as his or her professional office, then a portion of the house is used exclusively as a place of public accommodation and a portion is used exclusively as a residence. Section 36.207 provides that when a portion of a residence is used exclusively as a residence, that portion is not covered by this part. Thus, the portions of the accountant's house, other than the professional office and areas and spaces leading to it, are not covered by this part. All of the requirements of this rule apply to the covered portions, including requirements to make reasonable modifications in policies, eliminate discriminatory eligibility criteria, take readily achievable measures to remove barriers or provide readily achievable alternatives (e.g., making house calls), provide auxiliary aids and services and undertake only accessible new construction and alterations.

Paragraph (b) was added in response to comments that sought clarification on the extent of coverage of the private residence used as the place of public accommodation. The final rule makes clear that the place of accommodation extends to all areas of the home used by clients and customers of the place of public accommodation. Thus, the ADA would apply to any door or entry way, hallways, a restroom, if used by customers and clients; and any other portion of the residence, interior or exterior, used by customers or clients of the public accommodation. This interpretation is simply an application of the general rule for all public accommodations, which extends statutory requirements to all portions of the facility used by customers and clients, including, if applicable, restrooms, hallways, and approaches to the public accommodation. As with other public accommodations, barriers at the entrance and on the sidewalk leading up to the public accommodation, if the sidewalk is under the control of the public accommodation, must be removed if doing so is readily achievable.

The Department recognizes that many businesses that operate out of personal residences are quite small, often employing only the homeowner and having limited total revenues. In these circumstances the effect of ADA coverage would likely be quite minimal. For example, because the obligation to remove existing architectural barriers is limited to those that are easily accomplishable without much difficulty or expense (*see* §36.304), the range of required actions would be quite modest. It might not be readily achievable for such a place of public accommodation to remove any existing barriers. If it is not readily achievable to remove existing architectural barriers, a public accommodation located in a private residence may meet its obligations under the Act and this part by providing its goods or services to clients or customers with disabilities through the use of alternative measures, including delivery of goods or services in the home of the customer or client, to the extent that such alternative measures are readily achievable (*See* §36.305).

Some commenters asked for clarification as to how the new construction and alteration standards of subpart D will apply to residences. The new construction standards only apply to the extent that the residence or portion of the residence was designed or intended for use as a public accommodation. Thus, for example, if a portion of a home is designed or constructed for use exclusively as a lawyer's office or for use both as a lawyer's office and for residential purposes, then it must be designed in accordance with the new construction standards in the appendix. Likewise, if a homeowner is undertaking alterations to convert all or part of his residence to a place of public accommodation, that work must be done in compliance with the alterations standards in the appendix.

The preamble to the proposed rule addressed the applicable requirements when a commercial facility is located in a private residence. That situation is now addressed in §36.401(b) of subpart D.

Section 36.208 Direct Threat

Section 36.208(a) implements section 302(b)(3) of the Act by providing that this part does not require a public accommodation to permit an individual to participate in or benefit from the goods, services, facilities, privileges, advantages and accommodations of the public accommodation, if that individual poses a direct threat to the health or safety of others. This section is unchanged from the proposed rule.

The Department received a significant number of comments on this section. Commenters representing individuals with disabilities generally supported this provision, but suggested revisions to further limit its application. Commenters representing public accommodations generally endorsed modifications that would permit a public accommodation to exercise its own judgment in determining whether an individual poses a direct threat.

The inclusion of this provision is not intended to imply that persons with disabilities pose risks to others. It is intended to address concerns that may arise in this area. It establishes a strict standard that must be met before denying service to an individual

with a disability or excluding that individual from participation.

Paragraph (b) of this section explains that a ''direct threat'' is a significant risk to the health or safety of others that cannot be eliminated by a modification of policies, practices, or procedures, or by the provision of auxiliary aids and services. This paragraph codifies the standard first applied by the Supreme Court in *School Board of Nassau County* v. *Arline*, 480 U.S. 273 (1987), in which the Court held that an individual with a contagious disease may be an ''individual with handicaps'' under section 504 of the Rehabilitation Act. In *Arline*, the Supreme Court recognized that there is a need to balance the interests of people with disabilities against legitimate concerns for public safety. Although persons with disabilities are generally entitled to the protection of this part, a person who poses a significant risk to others may be excluded if reasonable modifications to the public accommodation's policies, practices, or procedures will not eliminate that risk. The determination that a person poses a direct threat to the health or safety of others may not be based on generalizations or stereotypes about the effects of a particular disability; it must be based on an individual assessment that conforms to the requirements of paragraph (c) of this section.

Paragraph (c) establishes the test to use in determining whether an individual poses a direct threat to the health or safety of others. A public accommodation is required to make an individualized assessment, based on reasonable judgment that relies on current medical evidence or on the best available objective evidence, to determine: The nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures will mitigate the risk. This is the test established by the Supreme Court in *Arline*. Such an inquiry is essential if the law is to achieve its goal of protecting disabled individuals from discrimination based on prejudice, stereotypes, or unfounded fear, while giving appropriate weight to legitimate concerns, such as the need to avoid exposing others to significant health and safety risks. Making this assessment will not usually require the services of a physician. Sources for medical knowledge include guidance from public health authorities, such as the U.S. Public Health Service, the Centers for Disease Control, and the National Institutes of Health, including the National Institute of Mental Health.

Many of the commenters sought clarification of the inquiry requirement. Some suggested that public accommodations should be prohibited from making any inquiries to determine if an individual with a disability would pose a direct threat to other persons. The Department believes that to preclude all such inquiries would be inappropriate. Under §36.301 of this part, a public accommodation is permitted to establish eligibility criteria necessary for the safe operation of the place of public accommodation. Implicit in that right is the right to ask if an individual meets the criteria. However, any eligibility or safety standard established by a public accommodation must be based on actual risk, not on speculation or stereotypes; it must be applied to all clients or customers of the place of public accommodation; and inquiries must be limited to matters necessary to the application of the standard.

Some commenters suggested that the test established in the *Arline* decision, which was developed in the context of an employment case, is too stringent to apply in a public accommodations context where interaction between the public accommodation and its client or customer is often very brief. One suggested alternative was to permit public accommodations to exercise ''good faith'' judgment in determining whether an individual poses a direct threat, particularly when a public accommodation is dealing with a client or customer engaged in disorderly or disruptive behavior.

The Department believes that the ADA clearly requires that any determination to exclude an individual from participation must be based on an objective standard. A public accommodation may establish neutral eligibility criteria as a condition of receiving its goods or services. As long as these criteria are necessary for the safe provision of the public accommodation's goods and services and applied neutrally to all clients or customers, regardless of whether they are individuals with disabilities, a person who is unable to meet the criteria may be excluded from participation without inquiry into the underlying reason for the inability to comply. In places of public accommodation such as restaurants, theaters, or hotels, where the contact between the public accommodation and its clients is transitory, the uniform application of an eligibility standard precluding violent or disruptive behavior by any client or customer should be sufficient to enable a public accommodation to conduct its business in an orderly manner.

Some other commenters asked for clarification of the application of this provision to persons, particularly children, who have short-term, contagious illnesses, such as fevers, influenza, or the common cold. It is common practice in schools and day care settings to exclude persons with such illnesses until the symptoms subside. The Department believes that these commenters misunderstand the scope of this rule. The ADA only prohibits discrimination against an individual with a disability. Under the ADA and

this part, a ''disability'' is defined as a physical or mental impairment that substantially limits one or more major life activities. Common, short-term illnesses that predictably resolve themselves within a matter of days do not ''substantially limit'' a major life activity; therefore, it is not a violation of this part to exclude an individual from receiving the services of a public accommodation because of such transitory illness. However, this part does apply to persons who have long-term illnesses. Any determination with respect to a person who has a chronic or long-term illness must be made in compliance with the requirements of this section.

Section 36.209 Illegal Use of Drugs

Section 36.209 effectuates section 510 of the ADA, which clarifies the Act's application to people who use drugs illegally. Paragraph (a) provides that this part does not prohibit discrimination based on an individual's current illegal use of drugs.

The Act and the regulation distinguish between illegal use of drugs and the legal use of substances, whether or not those substances are ''controlled substances,'' as defined in the Controlled Substances Act (21 U.S.C. 812). Some controlled substances are prescription drugs that have legitimate medical uses. Section 36.209 does not affect use of controlled substances pursuant to a valid prescription, under supervision by a licensed health care professional, or other use that is authorized by the Controlled Substances Act or any other provision of Federal law. It does apply to illegal use of those substances, as well as to illegal use of controlled substances that are not prescription drugs. The key question is whether the individual's use of the substance is illegal, not whether the substance has recognized legal uses. Alcohol is not a controlled substance, so use of alcohol is not addressed by §36.209. Alcoholics are individuals with disabilities, subject to the protections of the statute.

A distinction is also made between the use of a substance and the status of being addicted to that substance. Addiction is a disability, and addicts are individuals with disabilities protected by the Act. The protection, however, does not extend to actions based on the illegal use of the substance. In other words, an addict cannot use the fact of his or her addiction as a defense to an action based on illegal use of drugs. This distinction is not artificial. Congress intended to deny protection to people who engage in the illegal use of drugs, whether or not they are addicted, but to provide protection to addicts so long as they are not currently using drugs.

A third distinction is the difficult one between current use and former use. The definition of ''current illegal use of drugs'' in §36.104, which is based on the report of the Conference Committee, H.R. Conf. Rep. No. 596, 101st Cong., 2d Sess. 64 (1990), is ''illegal use of drugs that occurred recently enough to justify a reasonable belief that a person's drug use is current or that continuing use is a real and ongoing problem.''

Paragraph (a)(2)(i) specifies that an individual who has successfully completed a supervised drug rehabilitation program or has otherwise been rehabilitated successfully and who is not engaging in current illegal use of drugs is protected. Paragraph (a)(2)(ii) clarifies that an individual who is currently participating in a supervised rehabilitation program and is not engaging in current illegal use of drugs is protected. Paragraph (a)(2)(iii) provides that a person who is erroneously regarded as engaging in current illegal use of drugs, but who is not engaging in such use, is protected.

Paragraph (b) provides a limited exception to the exclusion of current illegal users of drugs from the protections of the Act. It prohibits denial of health services, or services provided in connection with drug rehabilitation, to an individual on the basis of current illegal use of drugs, if the individual is otherwise entitled to such services. As explained further in the discussion of §36.302, a health care facility that specializes in a particular type of treatment, such as care of burn victims, is not required to provide drug rehabilitation services, but it cannot refuse to treat an individual's burns on the grounds that the individual is illegally using drugs.

A commenter argued that health care providers should be permitted to use their medical judgment to postpone discretionary medical treatment of individuals under the influence of alcohol or drugs. The regulation permits a medical practitioner to take into account an individual's use of drugs in determining appropriate medical treatment. Section 36.209 provides that the prohibitions on discrimination in this part do not apply when the public accommodation acts on the basis of current illegal use of drugs. Although those prohibitions do apply under paragraph (b), the limitations established under this part also apply. Thus, under §36.208, a health care provider or other public accommodation covered under §36.209(b) may exclude an individual whose current illegal use of drugs poses a direct threat to the health or safety of others, and, under §36.301, a public accommodation may impose or apply eligibility criteria that are necessary for the provision of the services being offered, and may impose legitimate safety requirements that are necessary for safe operation. These same limitations also apply to individuals with disabilities who use alcohol or prescription drugs. The Department believes that these provisions address this commenter's concerns.

Other commenters pointed out that abstention from the use of drugs is an essential

condition for participation in some drug rehabilitation programs, and may be a necessary requirement in inpatient or residential settings. The Department believes that this comment is well-founded. Congress clearly did not intend to exclude from drug treatment programs the very individuals who need such programs because of their use of drugs. In such a situation, however, once an individual has been admitted to a program, abstention may be a necessary and appropriate condition to continued participation. The final rule therefore provides that a drug rehabilitation or treatment program may deny participation to individuals who use drugs while they are in the program.

Paragraph (c) expresses Congress' intention that the Act be neutral with respect to testing for illegal use of drugs. This paragraph implements the provision in section 510(b) of the Act that allows entities ''to adopt or administer reasonable policies or procedures, including but not limited to drug testing,'' that ensure an individual who is participating in a supervised rehabilitation program, or who has completed such a program or otherwise been rehabilitated successfully, is no longer engaging in the illegal use of drugs. Paragraph (c) is not to be construed to encourage, prohibit, restrict, or authorize the conducting of testing for the illegal use of drugs.

Paragraph (c) of §36.209 clarifies that it is not a violation of this part to adopt or administer reasonable policies or procedures to ensure that an individual who formerly engaged in the illegal use of drugs is not currently engaging in illegal use of drugs. Any such policies or procedures must, of course, be reasonable, and must be designed to identify accurately the illegal use of drugs. This paragraph does not authorize inquiries, tests, or other procedures that would disclose use of substances that are not controlled substances or are taken under supervision by a licensed health care professional, or other uses authorized by the Controlled Substances Act or other provisions of Federal law, because such uses are not included in the definition of ''illegal use of drugs.''

One commenter argued that the rule should permit testing for lawful use of prescription drugs, but most favored the explanation that tests must be limited to *unlawful* use in order to avoid revealing the use of prescription medicine used to treat disabilities. Tests revealing legal use of prescription drugs might violate the prohibition in §36.301 of attempts to unnecessarily identify the existence of a disability.

Section 36.210 Smoking

Section 36.210 restates the clarification in section 501(b) of the Act that the Act does not preclude the prohibition of, or imposition of restrictions on, smoking. Some commenters argued that §36.210 does not go far enough, and that the regulation should prohibit smoking in all places of public accommodation. The reference to smoking in section 501 merely clarifies that the Act does not require public accommodations to accommodate smokers by permitting them to smoke in places of public accommodations.

Section 36.211 Maintenance of Accessible Features

Section 36.211 provides that a public accommodation shall maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by persons with disabilities by the Act or this part. The Act requires that, to the maximum extent feasible, facilities must be accessible to, *and usable by*, individuals with disabilities. This section recognizes that it is not sufficient to provide features such as accessible routes, elevators, or ramps, if those features are not maintained in a manner that enables individuals with disabilities to use them. Inoperable elevators, locked accessible doors, or ''accessible'' routes that are obstructed by furniture, filing cabinets, or potted plants are neither ''accessible to'' nor ''usable by'' individuals with disabilities.

Some commenters objected that this section appeared to establish an absolute requirement and suggested that language from the preamble be included in the text of the regulation. It is, of course, impossible to guarantee that mechanical devices will never fail to operate. Paragraph (b) of the final regulation provides that this section does not prohibit isolated or temporary interruptions in service or access due to maintenance or repairs. This paragraph is intended to clarify that temporary obstructions or isolated instances of mechanical failure would not be considered violations of the Act or this part. However, allowing obstructions or ''out of service'' equipment to persist beyond a reasonable period of time would violate this part, as would repeated mechanical failures due to improper or inadequate maintenance. Failure of the public accommodation to ensure that accessible routes are properly maintained and free of obstructions, or failure to arrange prompt repair of inoperable elevators or other equipment intended to provide access, would also violate this part.

Other commenters requested that this section be expanded to include specific requirements for inspection and maintenance of equipment, for training staff in the proper operation of equipment, and for maintenance of specific items. The Department believes that this section properly establishes the general requirement for maintaining access and that further, more detailed requirements are not necessary.

Section 36.212 Insurance

The Department received numerous comments on proposed §36.212. Most supported the proposed regulation but felt that it did not go far enough in protecting individuals with disabilities and persons associated with them from discrimination. Many commenters argued that language from the preamble to the proposed regulation should be included in the text of the final regulation. Other commenters argued that even that language was not strong enough, and that more stringent standards should be established. Only a few commenters argued that the Act does not apply to insurance underwriting practices or the terms of insurance contracts. These commenters cited language from the Senate committee report (S. Rep. No. 116, 101st Cong., 1st Sess., at 84–86 (1989) (hereinafter ''Senate report'')), indicating that Congress did not intend to affect existing insurance practices.

The Department has decided to adopt the language of the proposed rule without change. Sections 36.212 (a) and (b) restate section 501(c) of the Act, which provides that the Act shall not be construed to restrict certain insurance practices on the part of insurance companies and employers, as long as such practices are not used to evade the purposes of the Act. Section 36.212(c) is a specific application of §36.202(a), which prohibits denial of participation on the basis of disability. It provides that a public accommodation may not refuse to serve an individual with a disability because of limitations on coverage or rates in its insurance policies (see Judiciary report at 56).

Many commenters supported the requirements of §36.212(c) in the proposed rule because it addressed an important reason for denial of services by public accommodations. One commenter argued that services could be denied if the insurance coverage required exclusion of people whose disabilities were reasonably related to the risks involved in that particular place of public accommodation. Sections 36.208 and 36.301 establish criteria for denial of participation on the basis of legitimate safety concerns. This paragraph does not prohibit consideration of such concerns in insurance policies, but provides that any exclusion on the basis of disability must be based on the permissible criteria, rather than on the terms of the insurance contract.

Language in the committee reports indicates that Congress intended to reach insurance practices by prohibiting differential treatment of individuals with disabilities in insurance offered by public accommodations unless the differences are justified. ''Under the ADA, a person with a disability cannot be denied insurance or be subject to different terms or conditions of insurance based on disability alone, if the disability does not pose increased risks'' (Senate report at 84; Education and Labor report at 136). Section 501(c) (1) of the Act was intended to emphasize that ''insurers may continue to sell to and underwrite individuals applying for life, health, or other insurance on an individually underwritten basis, or to service such insurance products, *so long as the standards used are based on sound actuarial data and not on speculation*'' (Judiciary report at 70 (emphasis added); see also Senate report at 85; Education and Labor report at 137).

The committee reports indicate that underwriting and classification of risks must be ''based on sound actuarial principles or be related to actual or reasonably anticipated experience'' (see, *e.g.*, Judiciary report at 71). Moreover, ''while a plan which limits certain kinds of coverage based on classification of risk would be allowed * * *, the plan may not refuse to insure, or refuse to continue to insure, or limit the amount, extent, or kind of coverage available to an individual, or charge a different rate for the same coverage solely because of a physical or mental impairment, except where the refusal, limitation, or rate differential is based on sound actuarial principles or is related to actual or reasonably anticipated experience'' (Senate report at 85; Education and Labor report at 136–37; Judiciary report at 71). The ADA, therefore, does not prohibit use of legitimate actuarial considerations to justify differential treatment of individuals with disabilities in insurance.

The committee reports provide some guidance on how nondiscrimination principles in the disability rights area relate to insurance practices. For example, a person who is blind may not be denied coverage based on blindness independent of actuarial risk classification. With respect to group health insurance coverage, an individual with a pre-existing condition may be denied coverage for that condition for the period specified in the policy, but cannot be denied coverage for illness or injuries unrelated to the pre-existing condition. Also, a public accommodation may offer insurance policies that limit coverage for certain procedures or treatments, but may not entirely deny coverage to a person with a disability.

The Department requested comment on the extent to which data that would establish statistically sound correlations are available. Numerous commenters cited pervasive problems in the availability and cost of insurance for individuals with disabilities and parents of children with disabilities. No commenters cited specific data, or sources of data, to support specific exclusionary practices. Several commenters reported that, even when statistics are available, they are often outdated and do not reflect current medical technology and treatment methods. Concern was expressed that adequate efforts are not made to distinguish those individuals

who are high users of health care from individuals in the same diagnostic groups who may be low users of health care. One insurer reported that ''hard data and actuarial statistics are not available to provide precise numerical justifications for every underwriting determination,'' but argued that decisions may be based on ''logical principles generally accepted by actuarial science and fully consistent with state insurance laws.'' The commenter urged that the Department recognize the validity of information other than statistical data as a basis for insurance determinations.

The most frequent comment was a recommendation that the final regulation should require the insurance company to provide a copy of the actuarial data on which its actions are based when requested by the applicant. Such a requirement would be beyond anything contemplated by the Act or by Congress and has therefore not been included in the Department's final rule. Because the legislative history of the ADA clarifies that different treatment of individuals with disabilities in insurance may be justified by sound actuarial data, such actuarial data will be critical to any potential litigation on this issue. This information would presumably be obtainable in a court proceeding where the insurer's actuarial data was the basis for different treatment of persons with disabilities. In addition, under some State regulatory schemes, insurers may have to file such actuarial information with the State regulatory agency and this information may be obtainable at the State level.

A few commenters representing the insurance industry conceded that underwriting practices in life and health insurance are clearly covered, but argued that property and casualty insurance are not covered. The Department sees no reason for this distinction. Although life and health insurance are the areas where the regulation will have its greatest application, the Act applies equally to unjustified discrimination in all types of insurance provided by public accommodations. A number of commenters, for example, reported difficulties in obtaining automobile insurance because of their disabilities, despite their having good driving records.

Section 36.213 Relationship of Subpart B to Subparts C and D

This section explains that subpart B sets forth the general principles of nondiscrimination applicable to all entities subject to this regulation, while subparts C and D provide guidance on the application of this part to specific situations. The specific provisions in subparts C and D, including the limitations on those provisions, control over the general provisions in circumstances where both specific and general provisions apply. Resort to the general provisions of subpart B is only appropriate where there are no applicable specific rules of guidance in subparts C or D. This interaction between the specific requirements and the general requirements operates with regard to contractual obligations as well.

One illustration of this principle is its application to the obligation of a public accommodation to provide access to services by removal of architectural barriers or by alternatives to barrier removal. The general requirement, established in subpart B by §36.203, is that a public accommodation must provide its services to individuals with disabilities in the most integrated setting appropriate. This general requirement would appear to categorically prohibit ''segregated'' seating for persons in wheelchairs. Section 36.304, however, only requires removal of architectural barriers to the extent that removal is ''readily achievable.'' If providing access to all areas of a restaurant, for example, would not be ''readily achievable,'' a public accommodation may provide access to selected areas only. Also, §36.305 provides that, where barrier removal is not readily achievable, a public accommodation may use alternative, readily achievable methods of making services available, such as curbside service or home delivery. Thus, in this manner, the specific requirements of §§36.304 and 36.305 control over the general requirement of §36.203.

Subpart C—Specific Requirements

In general, subpart C implements the ''specific prohibitions'' that comprise section 302(b)(2) of the ADA. It also addresses the requirements of section 309 of the ADA regarding examinations and courses.

Section 36.301 Eligibility Criteria

Section 36.301 of the rule prohibits the imposition or application of eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any goods, services, facilities, privileges, advantages, and accommodations, unless such criteria can be shown to be necessary for the provision of the goods, services, facilities, privileges, advantages, or accommodations being offered. This prohibition is based on section 302(b)(2)(A)(i) of the ADA.

It would violate this section to establish exclusive or segregative eligibility criteria that would bar, for example, all persons who are deaf from playing on a golf course or all individuals with cerebral palsy from attending a movie theater, or limit the seating of individuals with Down's syndrome to only particular areas of a restaurant. The wishes, tastes, or preferences of other customers may not be asserted to justify criteria that

would exclude or segregate individuals with disabilities.

Section 36.301 also prohibits attempts by a public accommodation to unnecessarily identify the existence of a disability; for example, it would be a violation of this section for a retail store to require an individual to state on a credit application whether the applicant has epilepsy, mental illness, or any other disability, or to inquire unnecessarily whether an individual has HIV disease.

Section 36.301 also prohibits policies that unnecessarily impose requirements or burdens on individuals with disabilities that are not placed on others. For example, public accommodations may not require that an individual with a disability be accompanied by an attendant. As provided by §36.306, however, a public accommodation is not required to provide services of a personal nature including assistance in toileting, eating, or dressing.

Paragraph (c) of §36.301 provides that public accommodations may not place a surcharge on a particular individual with a disability or any group of individuals with disabilities to cover the costs of measures, such as the provision of auxiliary aids and services, barrier removal, alternatives to barrier removal, and reasonable modifications in policies, practices, and procedures, that are required to provide that individual or group with the nondiscriminatory treatment required by the Act or this part.

A number of commenters inquired as to whether deposits required for the use of auxiliary aids, such as assistive listening devices, are prohibited surcharges. It is the Department's view that reasonable, completely refundable, deposits are not to be considered surcharges prohibited by this section. Requiring deposits is an important means of ensuring the availability of equipment necessary to ensure compliance with the ADA.

Other commenters sought clarification as to whether §36.301(c) prohibits professionals from charging for the additional time that it may take in certain cases to provide services to an individual with disabilities. The Department does not intend §36.301(c) to prohibit professionals who bill on the basis of time from charging individuals with disabilities on that basis. However, fees may not be charged for the provision of auxiliary aids and services, barrier removal, alternatives to barrier removal, reasonable modifications in policies, practices, and procedures, or any other measures necessary to ensure compliance with the ADA.

Other commenters inquired as to whether day care centers may charge for extra services provided to individuals with disabilities. As stated above, §36.302(c) is intended only to prohibit charges for measures necessary to achieve compliance with the ADA.

Another commenter asserted that charges may be assessed for home delivery provided as an alternative to barrier removal under §36.305, when home delivery is provided to all customers for a fee. Charges for home delivery are permissible if home delivery is not considered an alternative to barrier removal. If the public accommodation offers an alternative, such as curb, carry-out, or sidewalk service for which no surcharge is assessed, then it may charge for home delivery in accordance with its standard pricing for home delivery.

In addition, §36.301 prohibits the imposition of criteria that ''tend to'' screen out an individual with a disability. This concept, which is derived from current regulations under section 504 (see, *e.g.*, 45 CFR 84.13), makes it discriminatory to impose policies or criteria that, while not creating a direct bar to individuals with disabilities, indirectly prevent or limit their ability to participate. For example, requiring presentation of a driver's license as the sole means of identification for purposes of paying by check would violate this section in situations where, for example, individuals with severe vision impairments or developmental disabilities or epilepsy are ineligible to receive a driver's license and the use of an alternative means of identification, such as another photo I.D. or credit card, is feasible.

A public accommodation may, however, impose neutral rules and criteria that screen out, or tend to screen out, individuals with disabilities, if the criteria are necessary for the safe operation of the public accommodation. Examples of safety qualifications that would be justifiable in appropriate circumstances would include height requirements for certain amusement park rides or a requirement that all participants in a recreational rafting expedition be able to meet a necessary level of swimming proficiency. Safety requirements must be based on actual risks and not on speculation, stereotypes, or generalizations about individuals with disabilities.

Section 36.302 Modifications in Policies, Practices, or Procedures

Section 36.302 of the rule prohibits the failure to make reasonable modifications in policies, practices, and procedures when such modifications may be necessary to afford any goods, services, facilities, privileges, advantages, or accommodations, unless the entity can demonstrate that making such modifications would fundamentally alter the nature of such goods, services, facilities, privileges, advantages, or accommodations. This prohibition is based on section 302(b)(2)(A)(ii) of the ADA.

For example, a parking facility would be required to modify a rule barring all vans or all vans with raised roofs, if an individual who uses a wheelchair-accessible van wishes to park in that facility, and if overhead structures are high enough to accommodate

the height of the van. A department store may need to modify a policy of only permitting one person at a time in a dressing room, if an individual with mental retardation needs and requests assistance in dressing from a companion. Public accommodations may need to revise operational policies to ensure that services are available to individuals with disabilities. For instance, a hotel may need to adopt a policy of keeping an accessible room unoccupied until an individual with a disability arrives at the hotel, assuming the individual has properly reserved the room.

One example of application of this principle is specifically included in a new §36.302(d) on check-out aisles. That paragraph provides that a store with check-out aisles must ensure that an adequate number of accessible check-out aisles is kept open during store hours, or must otherwise modify its policies and practices, in order to ensure that an equivalent level of convenient service is provided to individuals with disabilities as is provided to others. For example, if only one check-out aisle is accessible, and it is generally used for express service, one way of providing equivalent service is to allow persons with mobility impairments to make all of their purchases at that aisle. This principle also applies with respect to other accessible elements and services. For example, a particular bank may be in compliance with the accessibility guidelines for new construction incorporated in appendix A with respect to automated teller machines (ATM) at a new branch office by providing one accessible walk-up machine at that location, even though an adjacent walk-up ATM is not accessible and the drive-up ATM is not accessible. However, the bank would be in violation of this section if the accessible ATM was located in a lobby that was locked during evening hours while the drive-up ATM was available to customers without disabilities during those same hours. The bank would need to ensure that the accessible ATM was available to customers during the hours that any of the other ATM's was available.

A number of commenters inquired as to the relationship between this section and §36.307, ''Accessible or special goods.'' Under §36.307, a public accommodation is not required to alter its inventory to include accessible or special goods that are designed for, or facilitate use by, individuals with disabilities. The rule enunciated in §36.307 is consistent with the ''fundamental alteration'' defense to the reasonable modifications requirement of §36.302. Therefore, §36.302 would not require the inventory of goods provided by a public accommodation to be altered to include goods with accessibility features. For example, §36.302 would not require a bookstore to stock Brailled books or order Brailled books, if it does not do so in the normal course of its business.

The rule does not require modifications to the legitimate areas of specialization of service providers. Section 36.302(b) provides that a public accommodation may refer an individual with a disability to another public accommodation, if that individual is seeking, or requires, treatment or services outside of the referring public accommodation's area of specialization, and if, in the normal course of its operations, the referring public accommodation would make a similar referral for an individual without a disability who seeks or requires the same treatment or services.

For example, it would not be discriminatory for a physician who specializes only in burn treatment to refer an individual who is deaf to another physician for treatment of an injury other than a burn injury. To require a physician to accept patients outside of his or her specialty would fundamentally alter the nature of the medical practice and, therefore, not be required by this section.

A clinic specializing exclusively in drug rehabilitation could similarly refuse to treat a person who is not a drug addict, but could not refuse to treat a person who is a drug addict simply because the patient tests positive for HIV. Conversely, a clinic that specializes in the treatment of individuals with HIV could refuse to treat an individual that does not have HIV, but could not refuse to treat a person for HIV infection simply because that person is also a drug addict.

Some commenters requested clarification as to how this provision would apply to situations where manifestations of the disability in question, itself, would raise complications requiring the expertise of a different practitioner. It is not the Department's intention in §36.302(b) to prohibit a physician from referring an individual with a disability to another physician, if the disability itself creates specialized complications for the patient's health that the physician lacks the experience or knowledge to address (see Education and Labor report at 106).

Section 36.302(c)(1) requires that a public accommodation modify its policies, practices, or procedures to permit the use of a service animal by an individual with a disability in any area open to the general public. The term ''service animal'' is defined in §36.104 to include guide dogs, signal dogs, or any other animal individually trained to provide assistance to an individual with a disability.

A number of commenters pointed to the difficulty of making the distinction required by the proposed rule between areas open to the general public and those that are not. The ambiguity and uncertainty surrounding these provisions has led the Department to adopt a single standard for all public accommodations.

Section 36.302(c)(1) of the final rule now provides that ''[g]enerally, a public accommodation shall modify policies, practices, and procedures to permit the use of a service animal by an individual with a disability.'' This formulation reflects the general intent of Congress that public accommodations take the necessary steps to accommodate service animals and to ensure that individuals with disabilities are not separated from their service animals. It is intended that the broadest feasible access be provided to service animals in all places of public accommodation, including movie theaters, restaurants, hotels, retail stores, hospitals, and nursing homes (see Education and Labor report at 106; Judiciary report at 59). The section also acknowledges, however, that, in rare circumstances, accommodation of service animals may not be required because a fundamental alteration would result in the nature of the goods, services, facilities, privileges, or accommodations offered or provided, or the safe operation of the public accommodation would be jeopardized.

As specified in §36.302(c)(2), the rule does not require a public accommodation to supervise or care for any service animal. If a service animal must be separated from an individual with a disability in order to avoid a fundamental alteration or a threat to safety, it is the responsibility of the individual with the disability to arrange for the care and supervision of the animal during the period of separation.

A museum would not be required by §36.302 to modify a policy barring the touching of delicate works of art in order to enhance the participation of individuals who are blind, if the touching threatened the integrity of the work. Damage to a museum piece would clearly be a fundamental alteration that is not required by this section.

Section 36.303 Auxiliary Aids and Services.

Section 36.303 of the final rule requires a public accommodation to take such steps as may be necessary to ensure that no individual with a disability is excluded, denied services, segregated or otherwise treated differently than other individuals because of the absence of auxiliary aids and services, unless the public accommodation can demonstrate that taking such steps would fundamentally alter the nature of the goods, services, facilities, advantages, or accommodations being offered or would result in an undue burden. This requirement is based on section 302(b)(2)(A)(iii) of the ADA.

Implicit in this duty to provide auxiliary aids and services is the underlying obligation of a public accommodation to communicate effectively with its customers, clients, patients, or participants who have disabilities affecting hearing, vision, or speech. To give emphasis to this underlying obligation, §36.303(c) of the rule incorporates language derived from section 504 regulations for federally conducted programs (see *e.g.*, 28 CFR 39.160(a)) that requires that appropriate auxiliary aids and services be furnished to ensure that communication with persons with disabilities is as effective as communication with others.

Auxiliary aids and services include a wide range of services and devices for ensuring effective communication. Use of the most advanced technology is not required so long as effective communication is ensured. The Department's proposed §36.303(b) provided a list of examples of auxiliary aids and services that was taken from the definition of auxiliary aids and services in section 3(1) of the ADA and was supplemented by examples from regulations implementing section 504 in federally conducted programs (see *e.g.*, 28 CFR 39.103). A substantial number of commenters suggested that additional examples be added to this list. The Department has added several items to this list but wishes to clarify that the list is not an all-inclusive or exhaustive catalogue of possible or available auxiliary aids or services. It is not possible to provide an exhaustive list, and such an attempt would omit new devices that will become available with emerging technology.

The Department has added videotext displays, computer-aided transcription services, and open and closed captioning to the list of examples. Videotext displays have become an important means of accessing auditory communications through a public address system. Transcription services are used to relay aurally delivered material almost simultaneously in written form to persons who are deaf or hard of hearing. This technology is often used at conferences, conventions, and hearings. While the proposed rule expressly included television decoder equipment as an auxiliary aid or service, it did not mention captioning itself. The final rule rectifies this omission by mentioning both closed and open captioning.

In this section, the Department has changed the proposed rule's phrase, ''orally delivered materials,'' to the phrase, ''aurally delivered materials.'' This new phrase tracks the language in the definition of ''auxiliary aids and services'' in section 3 of the ADA and is meant to include nonverbal sounds and alarms and computer-generated speech.

Several persons and organizations requested that the Department replace the term ''telecommunications devices for deaf persons'' or ''TDD's'' with the term ''text telephone.'' The Department has declined to do so. The Department is aware that the Architectural and Transportation Barriers Compliance Board has used the phrase ''text telephone'' in lieu of the statutory term ''TDD'' in its final accessibility guidelines. Title IV of the ADA, however, uses the term ''Telecommunications Device for the Deaf,''

and the Department believes it would be inappropriate to abandon this statutory term at this time.

Paragraph (b)(2) lists examples of aids and services for making visually delivered materials accessible to persons with visual impairments. Many commenters proposed additional examples such as signage or mapping, audio description services, secondary auditory programs (SAP), telebraillers, and reading machines. While the Department declines to add these items to the list in the regulation, they may be considered appropriate auxiliary aids and services.

Paragraph (b)(3) refers to the acquisition or modification of equipment or devices. For example, tape players used for an audio-guided tour of a museum exhibit may require the addition of Brailled adhesive labels to the buttons on a reasonable number of the tape players to facilitate their use by individuals who are blind. Similarly, permanent or portable assistive listening systems for persons with hearing impairments may be required at a hotel conference center.

Several commenters suggested the addition of current technological innovations in microelectronics and computerized control systems (e.g., voice recognition systems, automatic dialing telephones, and infrared elevator and light control systems) to the list of auxiliary aids and services. The Department interprets auxiliary aids and services as those aids and services designed to provide effective communications, i. e., making aurally and visually delivered information available to persons with hearing, speech, and vision impairments. Methods of making services, programs, or activities accessible to, or usable by, individuals with mobility or manual dexterity impairments are addressed by other sections of this part, including the requirements for modifications in policies, practices, or procedures (§36.302), the elimination of existing architectural barriers (§36.304), and the provision of alternatives to barriers removal (§36.305).

Paragraph (b)(4) refers to other similar services and actions. Several commenters asked for clarification that ''similar services and actions'' include retrieving items from shelves, assistance in reaching a marginally accessible seat, pushing a barrier aside in order to provide an accessible route, or assistance in removing a sweater or coat. While retrieving an item from a shelf might be an ''auxiliary aid or service'' for a blind person who could not locate the item without assistance, it might be a readily achievable alternative to barrier removal for a person using a wheelchair who could not reach the shelf, or a reasonable modification to a self-service policy for an individual who lacked the ability to grasp the item. (Of course, a store would not be required to provide a personal shopper.) As explained above, auxiliary aids and services are those aids and services required to provide effective communications. Other forms of assistance are more appropriately addressed by other provisions of the final rule.

The auxiliary aid requirement is a flexible one. A public accommodation can choose among various alternatives as long as the result is effective communication. For example, a restaurant would not be required to provide menus in Braille for patrons who are blind, if the waiters in the restaurant are made available to read the menu. Similarly, a clothing boutique would not be required to have Brailled price tags if sales personnel provide price information orally upon request; and a bookstore would not be required to make available a sign language interpreter, because effective communication can be conducted by notepad.

A critical determination is what constitutes an effective auxiliary aid or service. The Department's proposed rule recommended that, in determining what auxiliary aid to use, the public accommodation consult with an individual before providing him or her with a particular auxiliary aid or service. This suggestion sparked a significant volume of public comment. Many persons with disabilities, particularly persons who are deaf or hard of hearing, recommended that the rule should require that public accommodations give ''primary consideration'' to the ''expressed choice'' of an individual with a disability. These commenters asserted that the proposed rule was inconsistent with congressional intent of the ADA, with the Department's proposed rule implementing title II of the ADA, and with longstanding interpretations of section 504 of the Rehabilitation Act.

Based upon a careful review of the ADA legislative history, the Department believes that Congress did not intend under title III to impose upon a public accommodation the requirement that it give primary consideration to the request of the individual with a disability. To the contrary, the legislative history demonstrates congressional intent to strongly encourage consulting with persons with disabilities. In its analysis of the ADA's auxiliary aids requirement for public accommodations, the House Education and Labor Committee stated that it ''expects'' that ''public accommodation(s) will consult with the individual with a disability before providing a particular auxiliary aid or service'' (Education and Labor report at 107). Some commenters also cited a different committee statement that used mandatory language as evidence of legislative intent to require primary consideration. However, this statement was made in the context of reasonable accommodations required by title I with respect to employment (Education and Labor report at 67). Thus, the Department finds that strongly encouraging consultation with

persons with disabilities, in lieu of mandating primary consideration of their expressed choice, is consistent with congressional intent.

The Department wishes to emphasize that public accommodations must take steps necessary to ensure that an individual with a disability will not be excluded, denied services, segregated or otherwise treated differently from other individuals because of the use of inappropriate or ineffective auxiliary aids. In those situations requiring an interpreter, the public accommodations must secure the services of a qualified interpreter, unless an undue burden would result.

In the analysis of §36.303(c) in the proposed rule, the Department gave as an example the situation where a note pad and written materials were insufficient to permit effective communication in a doctor's office when the matter to be decided was whether major surgery was necessary. Many commenters objected to this statement, asserting that it gave the impression that only decisions about major surgery would merit the provision of a sign language interpreter. The statement would, as the commenters also claimed, convey the impression to other public accommodations that written communications would meet the regulatory requirements in all but the most extreme situations. The Department, when using the example of major surgery, did not intend to limit the provision of interpreter services to the most extreme situations.

Other situations may also require the use of interpreters to ensure effective communication depending on the facts of the particular case. It is not difficult to imagine a wide range of communications involving areas such as health, legal matters, and finances that would be sufficiently lengthy or complex to require an interpreter for effective communication. In some situations, an effective alternative to use of a notepad or an interpreter may be the use of a computer terminal upon which the representative of the public accommodation and the customer or client can exchange typewritten messages.

Section 36.303(d) specifically addresses requirements for TDD's. Partly because of the availability of telecommunications relay services to be established under title IV of the ADA, §36.303(d)(2) provides that a public accommodation is not required to use a telecommunication device for the deaf (TDD) in receiving or making telephone calls incident to its operations. Several commenters were concerned that relay services would not be sufficient to provide effective access in a number of situations. Commenters argued that relay systems (1) do not provide effective access to the automated systems that require the caller to respond by pushing a button on a touch tone phone, (2) cannot operate fast enough to convey messages on answering machines, or to permit a TDD user to leave a recorded message, and (3) are not appropriate for calling crisis lines relating to such matters as rape, domestic violence, child abuse, and drugs where confidentiality is a concern. The Department believes that it is more appropriate for the Federal Communications Commission to address these issues in its rulemaking under title IV.

A public accommodation is, however, required to make a TDD available to an individual with impaired hearing or speech, if it customarily offers telephone service to its customers, clients, patients, or participants on more than an incidental convenience basis. Where entry to a place of public accommodation requires use of a security entrance telephone, a TDD or other effective means of communication must be provided for use by an individual with impaired hearing or speech.

In other words, individual retail stores, doctors' offices, restaurants, or similar establishments are not required by this section to have TDD's, because TDD users will be able to make inquiries, appointments, or reservations with such establishments through the relay system established under title IV of the ADA. The public accommodation will likewise be able to contact TDD users through the relay system. On the other hand, hotels, hospitals, and other similar establishments that offer nondisabled individuals the opportunity to make outgoing telephone calls on more than an incidental convenience basis must provide a TDD on request.

Section 36.303(e) requires places of lodging that provide televisions in five or more guest rooms and hospitals to provide, upon request, a means for decoding closed captions for use by an individual with impaired hearing. Hotels should also provide a TDD or similar device at the front desk in order to take calls from guests who use TDD's in their rooms. In this way guests with hearing impairments can avail themselves of such hotel services as making inquiries of the front desk and ordering room service. The term ''hospital'' is used in its general sense and should be interpreted broadly.

Movie theaters are not required by §36.303 to present open-captioned films. However, other public accommodations that impart verbal information through soundtracks on films, video tapes, or slide shows are required to make such information accessible to persons with hearing impairments. Captioning is one means to make the information accessible to individuals with disabilities.

The rule specifies that auxiliary aids and services include the acquisition or modification of equipment or devices. For example, tape players used for an audio-guided tour of a museum exhibit may require the addition of Brailled adhesive labels to the buttons on a reasonable number of the tape players to

facilitate their use by individuals who are blind. Similarly, a hotel conference center may need to provide permanent or portable assistive listening systems for persons with hearing impairments.

As provided in §36.303(f), a public accommodation is not required to provide any particular aid or service that would result either in a fundamental alteration in the nature of the goods, services, facilities, privileges, advantages, or accommodations offered or in an undue burden. Both of these statutory limitations are derived from existing regulations and caselaw under section 504 and are to be applied on a case-by-case basis (see, e.g., 28 CFR 39.160(d) and *Southeastern Community College* v. *Davis,* 442 U.S. 397 (1979)). Congress intended that ''undue burden'' under §36.303 and ''undue hardship,'' which is used in the employment provisions of title I of the ADA, should be determined on a case-by-case basis under the same standards and in light of the same factors (Judiciary report at 59). The rule, therefore, in accordance with the definition of undue hardship in section 101(10) of the ADA, defines undue burden as ''significant difficulty or expense'' (see §§36.104 and 36.303(a)) and requires that undue burden be determined in light of the factors listed in the definition in 36.104.

Consistent with regulations implementing section 504 in federally conducted programs (see, e.g., 28 CFR 39.160(d)), §36.303(f) provides that the fact that the provision of a particular auxiliary aid or service would result in an undue burden does not relieve a public accommodation from the duty to furnish an alternative auxiliary aid or service, if available, that would not result in such a burden.

Section 36.303(g) of the proposed rule has been deleted from this section and included in a new §36.306. That new section continues to make clear that the auxiliary aids requirement does not mandate the provision of individually prescribed devices, such as prescription eyeglasses or hearing aids.

The costs of compliance with the requirements of this section may not be financed by surcharges limited to particular individuals with disabilities or any group of individuals with disabilities (§36.301(c)).

Section 36.304 Removal of Barriers

Section 36.304 requires the removal of architectural barriers and communication barriers that are structural in nature in existing facilities, where such removal is readily achievable, i.e., easily accomplishable and able to be carried out without much difficulty or expense. This requirement is based on section 302(b)(2)(A)(iv) of the ADA.

A number of commenters interpreted the phrase ''communication barriers that are structural in nature'' broadly to encompass the provision of communications devices such as TDD's, telephone handset amplifiers, assistive listening devices, and digital check-out displays. The statute, however, as read by the Department, limits the application of the phrase ''communications barriers that are structural in nature'' to those barriers that are an integral part of the physical structure of a facility. In addition to the communications barriers posed by permanent signage and alarm systems noted by Congress (see Education and Labor report at 110), the Department would also include among the communications barriers covered by §36.304 the failure to provide adequate sound buffers, and the presence of physical partitions that hamper the passage of sound waves between employees and customers. Given that §36.304's proper focus is on the removal of physical barriers, the Department believes that the obligation to provide communications equipment and devices such as TDD's, telephone handset amplifiers, assistive listening devices, and digital check-out displays is more appropriately determined by the requirements for auxiliary aids and services under §36.303 (see Education and Labor report at 107–108). The obligation to remove communications barriers that are structural in nature under §36.304, of course, is independent of any obligation to provide auxiliary aids and services under §36.303.

The statutory provision also requires the readily achievable removal of certain barriers in existing vehicles and rail passenger cars. This transportation requirement is not included in §36.304, but rather in §36.310(b) of the rule.

In striking a balance between guaranteeing access to individuals with disabilities and recognizing the legitimate cost concerns of businesses and other private entities, the ADA establishes different standards for existing facilities and new construction. In existing facilities, which are the subject of §36.304, where retrofitting may prove costly, a less rigorous degree of accessibility is required than in the case of new construction and alterations (see §§36.401–36.406) where accessibility can be more conveniently and economically incorporated in the initial stages of design and construction.

For example, a bank with existing automatic teller machines (ATM's) would have to remove barriers to the use of the ATM's, if it is readily achievable to do so. Whether or not it is necessary to take actions such as ramping a few steps or raising or lowering an ATM would be determined by whether the actions can be accomplished easily and without much difficulty or expense.

On the other hand, a newly constructed bank with ATM's would be required by §36.401 to have an ATM that is ''readily accessible to and usable by'' persons with disabilities in accordance with accessibility guidelines incorporated under §36.406.

The requirement to remove architectural barriers includes the removal of physical

barriers of any kind. For example, §36.304 requires the removal, when readily achievable, of barriers caused by the location of temporary or movable structures, such as furniture, equipment, and display racks. In order to provide access to individuals who use wheelchairs, for example, restaurants may need to rearrange tables and chairs, and department stores may need to reconfigure display racks and shelves. As stated in §36.304(f), such actions are not readily achievable to the extent that they would result in a significant loss of selling or serving space. If the widening of all aisles in selling or serving areas is not readily achievable, then selected widening should be undertaken to maximize the amount of merchandise or the number of tables accessible to individuals who use wheelchairs. Access to goods and services provided in any remaining inaccessible areas must be made available through alternative methods to barrier removal, as required by §36.305.

Because the purpose of title III of the ADA is to ensure that public accommodations are accessible to their customers, clients, or patrons (as opposed to their employees, who are the focus of title I), the obligation to remove barriers under §36.304 does not extend to areas of a facility that are used exclusively as employee work areas.

Section 36.304(b) provides a wide-ranging list of the types of modest measures that may be taken to remove barriers and that are likely to be readily achievable. The list includes examples of measures, such as adding raised letter markings on elevator control buttons and installing flashing alarm lights, that would be used to remove communications barriers that are structural in nature. It is not an exhaustive list, but merely an illustrative one. Moreover, the inclusion of a measure on this list does not mean that it is readily achievable in all cases. Whether or not any of these measures is readily achievable is to be determined on a case-by-case basis in light of the particular circumstances presented and the factors listed in the definition of readily achievable (§36.104).

A public accommodation generally would not be required to remove a barrier to physical access posed by a flight of steps, if removal would require extensive ramping or an elevator. Ramping a single step, however, will likely be readily achievable, and ramping several steps will in many circumstances also be readily achievable. The readily achievable standard does not require barrier removal that requires extensive restructuring or burdensome expense. Thus, where it is not readily achievable to do, the ADA would not require a restaurant to provide access to a restroom reachable only by a flight of stairs.

Like §36.405, this section permits deference to the national interest in preserving significant historic structures. Barrier removal would not be considered ''readily achievable'' if it would threaten or destroy the historic significance of a building or facility that is eligible for listing in the National Register of Historic Places under the National Historic Preservation Act (16 U.S.C. 470, *et seq.*), or is designated as historic under State or local law.

The readily achievable defense requires a less demanding level of exertion by a public accommodation than does the undue burden defense to the auxiliary aids requirements of §36.303. In that sense, it can be characterized as a ''lower'' standard than the undue burden standard. The readily achievable defense is also less demanding than the undue hardship defense in section 102(b)(5) of the ADA, which limits the obligation to make reasonable accommodation in employment. Barrier removal measures that are not easily accomplishable and are not able to be carried out without much difficulty or expense are not required under the readily achievable standard, even if they do not impose an undue burden or an undue hardship.

Section 36.304(f)(1) of the proposed rule, which stated that ''barrier removal is not readily achievable if it would result in significant loss of profit or significant loss of efficiency of operation,'' has been deleted from the final rule. Many commenters objected to this provision because it impermissibly introduced the notion of profit into a statutory standard that did not include it. Concern was expressed that, in order for an action not to be considered readily achievable, a public accommodation would inappropriately have to show, for example, not only that the action could not be done without ''much difficulty or expense'', but that a significant loss of profit would result as well. In addition, some commenters asserted use of the word ''significant,'' which is used in the definition of undue hardship under title I (the standard for interpreting the meaning of undue burden as a defense to title III's auxiliary aids requirements) (see §§36.104, 36.303(f)), blurs the fact that the readily achievable standard requires a lower level of effort on the part of a public accommodation than does the undue burden standard.

The obligation to engage in readily achievable barrier removal is a continuing one. Over time, barrier removal that initially was not readily achievable may later be required because of changed circumstances. Many commenters expressed support for the Department's position that the obligation to comply with §36.304 is continuing in nature. Some urged that the rule require public accommodations to assess their compliance on at least an annual basis in light of changes in resources and other factors that would be relevant to determining what barrier removal measures would be readily achievable.

Although the obligation to engage in readily achievable barrier removal is clearly a continuing duty, the Department has declined to establish any independent requirement for an annual assessment or self-evaluation. It is best left to the public accommodations subject to §36.304 to establish policies to assess compliance that are appropriate to the particular circumstances faced by the wide range of public accommodations covered by the ADA. However, even in the absence of an explicit regulatory requirement for periodic self-evaluations, the Department still urges public accommodations to establish procedures for an ongoing assessment of their compliance with the ADA's barrier removal requirements. The Department recommends that this process include appropriate consultation with individuals with disabilities or organizations representing them. A serious effort at self-assessment and consultation can diminish the threat of litigation and save resources by identifying the most efficient means of providing required access.

The Department has been asked for guidance on the best means for public accommodations to comply voluntarily with this section. Such information is more appropriately part of the Department's technical assistance effort and will be forthcoming over the next several months. The Department recommends, however, the development of an implementation plan designed to achieve compliance with the ADA's barrier removal requirements before they become effective on January 26, 1992. Such a plan, if appropriately designed and diligently executed, could serve as evidence of a good faith effort to comply with the requirements of §36.104. In developing an implementation plan for readily achievable barrier removal, a public accommodation should consult with local organizations representing persons with disabilities and solicit their suggestions for cost-effective means of making individual places of public accommodation accessible. Such organizations may also be helpful in allocating scarce resources and establishing priorities. Local associations of businesses may want to encourage this process and serve as the forum for discussions on the local level between disability rights organizations and local businesses.

Section 36.304(c) recommends priorities for public accommodations in removing barriers in existing facilities. Because the resources available for barrier removal may not be adequate to remove all existing barriers at any given time, §36.304(c) suggests priorities for determining which types of barriers should be mitigated or eliminated first. The purpose of these priorities is to facilitate long-term business planning and to maximize, in light of limited resources, the degree of effective access that will result from any given level of expenditure.

Although many commenters expressed support for the concept of establishing priorities, a significant number objected to their mandatory nature in the proposed rule. The Department shares the concern of these commenters that mandatory priorities would increase the likelihood of litigation and inappropriately reduce the discretion of public accommodations to determine the most effective mix of barrier removal measures to undertake in particular circumstances. Therefore, in the final rule the priorities are no longer mandatory.

In response to comments that the priorities failed to address communications issues, the Department wishes to emphasize that the priorities encompass the removal of communications barriers that are structural in nature. It would be counter to the ADA's carefully wrought statutory scheme to include in this provision the wide range of communication devices that are required by the ADA's provisions on auxiliary aids and services. The final rule explicitly includes Brailled and raised letter signage and visual alarms among the examples of steps to remove barriers provided in §36.304(c)(2).

Section 36.304(c)(1) places the highest priority on measures that will enable individuals with disabilities to physically enter a place of public accommodation. This priority on ''getting through the door'' recognizes that providing actual physical access to a facility from public sidewalks, public transportation, or parking is generally preferable to any alternative arrangements in terms of both business efficiency and the dignity of individuals with disabilities.

The next priority, which is established in §36.304(c)(2), is for measures that provide access to those areas of a place of public accommodation where goods and services are made available to the public. For example, in a hardware store, to the extent that it is readily achievable to do so, individuals with disabilities should be given access not only to assistance at the front desk, but also access, like that available to other customers, to the retail display areas of the store.

The Department agrees with those commenters who argued that access to the areas where goods and services are provided is generally more important than the provision of restrooms. Therefore, the final rule reverses priorities two and three of the proposed rule in order to give lower priority to accessible restrooms. Consequently, the third priority in the final rule (§36.304(c)(3)) is for measures to provide access to restroom facilities and the last priority is placed on any remaining measures required to remove barriers.

Section 36.304(d) requires that measures taken to remove barriers under §36.304 be subject to subpart D's requirements for alterations (except for the path of travel requirements in §36.403). It only permits deviations from the subpart D requirements

when compliance with those requirements is not readily achievable. In such cases, §36.304(d) permits measures to be taken that do not fully comply with the subpart D requirements, so long as the measures do not pose a significant risk to the health or safety of individuals with disabilities or others.

This approach represents a change from the proposed rule which stated that ''readily achievable'' measures taken solely to remove barriers under §36.304 are exempt from the alterations requirements of subpart D. The intent of the proposed rule was to maximize the flexibility of public accommodations in undertaking barrier removal by allowing deviations from the technical standards of subpart D. It was thought that allowing slight deviations would provide access and release additional resources for expanding the amount of barrier removal that could be obtained under the readily achievable standard.

Many commenters, however, representing both businesses and individuals with disabilities, questioned this approach because of the likelihood that unsafe or ineffective measures would be taken in the absence of the subpart D standards for alterations as a reference point. Some advocated a rule requiring strict compliance with the subpart D standard.

The Department in the final rule has adopted the view of many commenters that (1) public accommodations should in the first instance be required to comply with the subpart D standards for alterations where it is readily achievable to do so and (2) safe, readily achievable measures must be taken when compliance with the subpart D standards is not readily achievable. Reference to the subpart D standards in this manner will promote certainty and good design at the same time that permitting slight deviations will expand the amount of barrier removal that may be achieved under §36.304.

Because of the inconvenience to individuals with disabilities and the safety problems involved in the use of portable ramps, §36.304(e) permits the use of a portable ramp to comply with §36.304(a) only when installation of a permanent ramp is not readily achievable. In order to promote safety, §36.304(e) requires that due consideration be given to the incorporation of features such as nonslip surfaces, railings, anchoring, and strength of materials in any portable ramp that is used.

Temporary facilities brought in for use at the site of a natural disaster are subject to the barrier removal requirements of §36.304.

A number of commenters requested clarification regarding how to determine when a public accommodation has discharged its obligation to remove barriers in existing facilities. For example, is a hotel required by §36.304 to remove barriers in all of its guest rooms? Or is some lesser percentage adequate? A new paragraph (g) has been added to §36.304 to address this issue. The Department believes that the degree of barrier removal required under §36.304 may be less, but certainly would not be required to exceed, the standards for alterations under the ADA Accessibility Guidelines incorporated by subpart D of this part (ADAAG). The ADA's requirements for readily achievable barrier removal in existing facilities are intended to be substantially less rigorous than those for new construction and alterations. It, therefore, would be obviously inappropriate to require actions under §36.304 that would exceed the ADAAG requirements. Hotels, then, in order to satisfy the requirements of §36.304, would not be required to remove barriers in a higher percentage of rooms than required by ADAAG. If relevant standards for alterations are not provided in ADAAG, then reference should be made to the standards for new construction.

Section 36.305 Alternatives to Barrier Removal

Section 36.305 specifies that where a public accommodation can demonstrate that removal of a barrier is not readily achievable, the public accommodation must make its goods, services, facilities, privileges, advantages, or accommodations available through alternative methods, if such methods are readily achievable. This requirement is based on section 302(b)(2)(A)(v) of the ADA.

For example, if it is not readily achievable for a retail store to raise, lower, or remove shelves or to rearrange display racks to provide accessible aisles, the store must, if readily achievable, provide a clerk or take other alternative measures to retrieve inaccessible merchandise. Similarly, if it is not readily achievable to ramp a long flight of stairs leading to the front door of a restaurant or a pharmacy, the restaurant or the pharmacy must take alternative measures, if readily achievable, such as providing curb service or home delivery. If, within a restaurant, it is not readily achievable to remove physical barriers to a certain section of a restaurant, the restaurant must, where it is readily achievable to do so, offer the same menu in an accessible area of the restaurant.

Where alternative methods are used to provide access, a public accommodation may not charge an individual with a disability for the costs associated with the alternative method (see §36.301(c)). Further analysis of the issue of charging for alternative measures may be found in the preamble discussion of §36.301(c).

In some circumstances, because of security considerations, some alternative methods may not be readily achievable. The rule does not require a cashier to leave his or her post to retrieve items for individuals with disabilities, if there are no other employees on duty.

Section 36.305(c) of the proposed rule has been deleted and the requirements have been included in a new §36.306. That section makes clear that the alternative methods requirement does not mandate the provision of personal devices, such as wheelchairs, or services of a personal nature.

In the final rule, §36.305(c) provides specific requirements regarding alternatives to barrier removal in multiscreen cinemas. In some situations, it may not be readily achievable to remove enough barriers to provide access to all of the theaters of a multiscreen cinema. If that is the case, §36.305(c) requires the cinema to establish a film rotation schedule that provides reasonable access for individuals who use wheelchairs to films being presented by the cinema. It further requires that reasonable notice be provided to the public as to the location and time of accessible showings. Methods for providing notice include appropriate use of the international accessibility symbol in a cinema's print advertising and the addition of accessibility information to a cinema's recorded telephone information line.

Section 36.306 Personal Devices and Services

The final rule includes a new §36.306, entitled ''Personal devices and services.'' Section 36.306 of the proposed rule, ''Readily achievable and undue burden: Factors to be considered,'' was deleted for the reasons described in the preamble discussion of the definition of the term ''readily achievable'' in §36.104. In place of §§36.303(g) and 36.305(c) of the proposed rule, which addressed the issue of personal devices and services in the contexts of auxiliary aids and alternatives to barrier removal, §36.306 provides a general statement that the regulation does not require the provision of personal devices and services. This section states that a public accommodation is not required to provide its customers, clients, or participants with personal devices, such as wheelchairs; individually prescribed devices, such as prescription eyeglasses or hearing aids; or services of a personal nature including assistance in eating, toileting, or dressing.

This statement serves as a limitation on all the requirements of the regulation. The personal devices and services limitation was intended to have general application in the proposed rule in all contexts where it was relevant. The final rule, therefore, clarifies, this point by including a general provision that will explicitly apply not just to auxiliary aids and services and alternatives to barrier removal, but across-the-board to include such relevant areas as modifications in policies, practices, and procedures (§36.302) and examinations and courses (§36.309), as well.

The Department wishes to clarify that measures taken as alternatives to barrier removal, such as retrieving items from shelves or providing curb service or home delivery, are not to be considered personal services. Similarly, minimal actions that may be required as modifications in policies, practices, or procedures under §36.302, such as a waiter's removing the cover from a customer's straw, a kitchen's cutting up food into smaller pieces, or a bank's filling out a deposit slip, are not services of a personal nature within the meaning of §36.306. (Of course, such modifications may be required under §36.302 only if they are ''reasonable.'') Similarly, this section does not preclude the short-term loan of personal receivers that are part of an assistive listening system.

Of course, if personal services are customarily provided to the customers or clients of a public accommodation, e.g., in a hospital or senior citizen center, then these personal services should also be provided to persons with disabilities using the public accommodation.

Section 36.307 Accessible or Special Goods.

Section 36.307 establishes that the rule does not require a public accommodation to alter its inventory to include accessible or special goods with accessibility features that are designed for, or facilitate use by, individuals with disabilities. As specified in §36.307(c), accessible or special goods include such items as Brailled versions of books, books on audio-cassettes, closed captioned video tapes, special sizes or lines of clothing, and special foods to meet particular dietary needs.

The purpose of the ADA's public accommodations requirements is to ensure accessibility to the goods offered by a public accommodation, not to alter the nature or mix of goods that the public accommodation has typically provided. In other words, a bookstore, for example, must make its facilities and sales operations accessible to individuals with disabilities, but is not required to stock Brailled or large print books. Similarly, a video store must make its facilities and rental operations accessible, but is not required to stock closed-captioned video tapes. The Department has been made aware, however, that the most recent titles in videotape rental establishments are, in fact, closed captioned.

Although a public accommodation is not required by §36.307(a) to modify its inventory, it is required by §36.307(b), at the request of an individual with disabilities, to order accessible or special goods that it does not customarily maintain in stock if, in the normal course of its operation, it makes special orders for unstocked goods, and if the accessible or special goods can be obtained from a supplier with whom the public accommodation customarily does business. For example, a clothing store would be required to order specially-sized clothing at the request

of an individual with a disability, if it customarily makes special orders for clothing that it does not keep in stock, and if the clothing can be obtained from one of the store's customary suppliers.

One commenter asserted that the proposed rule could be interpreted to require a store to special order accessible or special goods of all types, even if only one type is specially ordered in the normal course of its business. The Department, however, intends for §36.307(b) to require special orders only of those particular types of goods for which a public accommodation normally makes special orders. For example, a book and recording store would not have to specially order Brailled books if, in the normal course of its business, it only specially orders recordings and not books.

Section 36.308 Seating in Assembly Areas.

Section 36.308 establishes specific requirements for removing barriers to physical access in assembly areas, which include such facilities as theaters, concert halls, auditoriums, lecture halls, and conference rooms. This section does not address the provision of auxiliary aids or the removal of communications barriers that are structural in nature. These communications requirements are the focus of other provisions of the regulation (see §§36.303–36.304).

Individuals who use wheelchairs historically have been relegated to inferior seating in the back of assembly areas separate from accompanying family members and friends. The provisions of §36.308 are intended to promote integration and equality in seating.

In some instances it may not be readily achievable for auditoriums or theaters to remove seats to allow individuals with wheelchairs to sit next to accompanying family members or friends. In these situations, the final rule retains the requirement that the public accommodation provide portable chairs or other means to allow the accompanying individuals to sit with the persons in wheelchairs. Persons in wheelchairs should have the same opportunity to enjoy movies, plays, and similar events with their families and friends, just as other patrons do. The final rule specifies that portable chairs or other means to permit family members or companions to sit with individuals who use wheelchairs must be provided only when it is readily achievable to do so.

In order to facilitate seating of wheelchair users who wish to transfer to existing seating, paragraph (a)(1) of the final rule adds a requirement that, to the extent readily achievable, a reasonable number of seats with removable aisle-side armrests must be provided. Many persons in wheelchairs are able to transfer to existing seating with this relatively minor modification. This solution avoids the potential safety hazard created by the use of portable chairs and fosters integration. The final ADA Accessibility Guidelines incorporated by subpart D (ADAAG) also add a requirement regarding aisle seating that was not in the proposed guidelines. In situations when a person in a wheelchair transfers to existing seating, the public accommodation shall provide assistance in handling the wheelchair of the patron with the disability.

Likewise, consistent vith ADAAG, the final rule adds in §36.308(a)(1)(ii)(B) a requirement that, to the extent readily achievable, wheelchair seating provide lines of sight and choice of admission prices comparable to those for members of the general public.

Finally, because Congress intended that the requirements for barrier removal in existing facilities be substantially less rigorous than those required for new construction and alterations, the final rule clarifies in §36.308(a)(3) that in no event can the requirements for existing facilities be interpreted to exceed the standards for alterations under ADAAG. For example, §4.33 of ADAAG only requires wheelchair spaces to be provided in more than one location when the seating capacity of the assembly area exceeds 300. Therefore, paragraph (a) of §36.308 may not be interpreted to require readily achievable dispersal of wheelchair seating in assembly areas with 300 or fewer seats. Similarly, §4.1.3(19) of ADAAG requires six accessible wheelchair locations in an assembly area with 301 to 500 seats. The reasonable number of wheelchair locations required by paragraph (a), therefore, may be less than six, but may not be interpreted to exceed six.

Proposed Section 36.309 Purchase of Furniture and Equipment

Section 36.309 of the proposed rule would have required that newly purchased furniture or equipment made available for use at a place of public accommodation be accessible, to the extent such furniture or equipment is available, unless this requirement would fundamentally alter the goods, services, facilities, privileges, advantages, or accommodations offered, or would not be readily achievable. Proposed §36.309 has been omitted from the final rule because the Department has determined that its requirements are more properly addressed under other sections, and because there are currently no appropriate accessibility standards addressing many types of furniture and equipment.

Some types of equipment will be required to meet the accessibility requirements of subpart D. For example, ADAAG establishes technical and scoping requirements in new construction and alterations for automated teller machines and telephones. Purchase or modification of equipment is required in certain instances by the provisions in §§36.201 and 36.202. For example, an arcade may need

to provide accessible video machines in order to ensure full and equal enjoyment of the facilities and to provide an opportunity to participate in the services and facilities it provides. The barrier removal requirements of §36.304 will apply as well to furniture and equipment (lowering shelves, rearranging furniture, adding Braille labels to a vending machine).

Section 36.309 Examinations and Courses

Section 36.309(a) sets forth the general rule that any private entity that offers examinations or courses related to applications, licensing, certification, or credentialing for secondary or postsecondary education, professional, or trade purposes shall offer such examinations or courses in a place and manner accessible to persons with disabilities or offer alternative accessible arrangements for such individuals.

Paragraph (a) restates section 309 of the Americans with Disabilities Act. Section 309 is intended to fill the gap that is created when licensing, certification, and other testing authorities are not covered by section 504 of the Rehabilitation Act or title II of the ADA. Any such authority that is covered by section 504, because of the receipt of Federal money, or by title II, because it is a function of a State or local government, must make all of its programs accessible to persons with disabilities, which includes physical access as well as modifications in the way the test is administered, e.g., extended time, written instructions, or assistance of a reader.

Many licensing, certification, and testing authorities are not covered by section 504, because no Federal money is received; nor are they covered by title II of the ADA because they are not State or local agencies. However, States often require the licenses provided by such authorities in order for an individual to practice a particular profession or trade. Thus, the provision was included in the ADA in order to assure that persons with disabilities are not foreclosed from educational, professional, or trade opportunities because an examination or course is conducted in an inaccessible site or without needed modifications.

As indicated in the ''Application'' section of this part (§36.102), §36.309 applies to any private entity that offers the specified types of examinations or courses. This is consistent with section 309 of the Americans with Disabilities Act, which states that the requirements apply to ''any person'' offering examinations or courses.

The Department received a large number of comments on this section, reflecting the importance of ensuring that the key gateways to education and employment are open to individuals with disabilities. The most frequent comments were objections to the fundamental alteration and undue burden provisions in §§36.309 (b)(3) and (c)(3) and to allowing courses and examinations to be provided through alternative accessible arrangements, rather than in an integrated setting.

Although section 309 of the Act does not refer to a fundamental alteration or undue burden limitation, those limitations do appear in section 302(b)(2)(A)(iii) of the Act, which establishes the obligation of public accommodations to provide auxiliary aids and services. The Department, therefore, included it in the paragraphs of §36.309 requiring the provision of auxiliary aids. One commenter argued that similar limitations should apply to all of the requirements of §36.309, but the Department did not consider this extension appropriate.

Commenters who objected to permitting ''alternative accessible arrangements'' argued that such arrangements allow segregation and should not be permitted, unless they are the least restrictive available alternative, for example, for someone who cannot leave home. Some commenters made a distinction between courses, where interaction is an important part of the educational experience, and examinations, where it may be less important. Because the statute specifically authorizes alternative accessible arrangements as a method of meeting the requirements of section 309, the Department has not adopted this suggestion. The Department notes, however, that, while examinations of the type covered by §36.309 may not be covered elsewhere in the regulation, courses will generally be offered in a ''place of education,'' which is included in the definition of ''place of public accommodation'' in §36.104, and, therefore, will be subject to the integrated setting requirement of §36.203.

Section 36.309(b) sets forth specific requirements for examinations. Examinations covered by this section would include a bar exam or the Scholastic Aptitude Test prepared by the Educational Testing Service. Paragraph (b)(1) is adopted from the Department of Education's section 504 regulation on admission tests to postsecondary educational programs (34 CFR 104.42(b)(3)). Paragraph (b)(1)(i) requires that a private entity offering an examination covered by the section must assure that the examination is selected and administered so as to best ensure that the examination accurately reflects an individual's aptitude or achievement level or other factor the examination purports to measure, rather than reflecting the individual's impaired sensory, manual, or speaking skills (except where those skills are the factors that the examination purports to measure).

Paragraph (b)(1)(ii) requires that any examination specially designed for individuals with disabilities be offered as often and in as timely a manner as other examinations. Some commenters noted that persons with disabilities may be required to travel long

distances when the locations for examinations for individuals with disabilities are limited, for example, to only one city in a State instead of a variety of cities. The Department has therefore revised this paragraph to add a requirement that such examinations be offered at locations that are as convenient as the location of other examinations.

Commenters representing organizations that administer tests wanted to be able to require individuals with disabilities to provide advance notice and appropriate documentation, at the applicants' expense, of their disabilities and of any modifications or aids that would be required. The Department agrees that such requirements are permissible, provided that they are not unreasonable and that the deadline for such notice is no earlier than the deadline for others applying to take the examination. Requiring individuals with disabilities to file earlier applications would violate the requirement that examinations designed for individuals with disabilities be offered in as timely a manner as other examinations.

Examiners may require evidence that an applicant is entitled to modifications or aids as required by this section, but requests for documentation must be reasonable and must be limited to the need for the modification or aid requested. Appropriate documentation might include a letter from a physician or other professional, or evidence of a prior diagnosis or accommodation, such as eligibility for a special education program. The applicant may be required to bear the cost of providing such documentation, but the entity administering the examination cannot charge the applicant for the cost of any modifications or auxiliary aids, such as interpreters, provided for the examination.

Paragraph (b)(1)(iii) requires that examinations be administered in facilities that are accessible to individuals with disabilities or alternative accessible arrangements are made.

Paragraph (b)(2) gives examples of modifications to examinations that may be necessary in order to comply with this section. These may include providing more time for completion of the examination or a change in the manner of giving the examination, e.g., reading the examination to the individual.

Paragraph (b)(3) requires the provision of auxiliary aids and services, unless the private entity offering the examination can demonstrate that offering a particular auxiliary aid would fundamentally alter the examination or result in an undue burden. Examples of auxiliary aids include taped examinations, interpreters or other effective methods of making aurally delivered materials available to individuals with hearing impairments, readers for individuals with visual impairments or learning disabilities, and other similar services and actions. The suggestion that individuals with learning disabilities may need readers is included, although it does not appear in the Department of Education regulation, because, in fact, some individuals with learning disabilities have visual perception problems and would benefit from a reader.

Many commenters pointed out the importance of ensuring that modifications provide the individual with a disability an equal opportunity to demonstrate his or her knowledge or ability. For example, a reader who is unskilled or lacks knowledge of specific terminology used in the examination may be unable to convey the information in the questions or to follow the applicant's instructions effectively. Commenters pointed out that, for persons with visual impairments who read Braille, Braille provides the closest functional equivalent to a printed test. The Department has, therefore, added Brailled examinations to the examples of auxiliary aids and services that may be required. For similar reasons, the Department also added to the list of examples of auxiliary aids and services large print examinations and answer sheets; ''qualified'' readers; and transcribers to write answers.

A commenter suggested that the phrase ''fundamentally alter the examination'' in this paragraph of the proposed rule be revised to more accurately reflect the function affected. In the final rule the Department has substituted the phrase ''fundamentally alter the measurement of the skills or knowledge the examination is intended to test.''

Paragraph (b)(4) gives examples of alternative accessible arrangements. For instance, the private entity might be required to provide the examination at an individual's home with a proctor. Alternative arrangements must provide conditions for individuals with disabilities that are comparable to the conditions under which other individuals take the examinations. In other words, an examination cannot be offered to an individual with a disability in a cold, poorly lit basement, if other individuals are given the examination in a warm, well lit classroom.

Some commenters who provide examinations for licensing or certification for particular occupations or professions urged that they be permitted to refuse to provide modifications or aids for persons seeking to take the examinations if those individuals, because of their disabilities, would be unable to perform the essential functions of the profession or occupation for which the examination is given, or unless the disability is reasonably determined in advance as not being an obstacle to certification. The Department has not changed its rule based on this comment. An examination is one stage of a licensing or certification process. An individual should not be barred from attempting

to pass that stage of the process merely because he or she might be unable to meet other requirements of the process. If the examination is not the first stage of the qualification process, an applicant may be required to complete the earlier stages prior to being admitted to the examination. On the other hand, the applicant may not be denied admission to the examination on the basis of doubts about his or her abilities to meet requirements that the examination is not designed to test.

Paragraph (c) sets forth specific requirements for courses. Paragraph (c)(1) contains the general rule that any course covered by this section must be modified to ensure that the place and manner in which the course is given is accessible. Paragraph (c)(2) gives examples of possible modifications that might be required, including extending the time permitted for completion of the course, permitting oral rather than written delivery of an assignment by a person with a visual impairment, or adapting the manner in which the course is conducted (i.e., providing cassettes of class handouts to an individual with a visual impairment). In response to comments, the Department has added to the examples in paragraph (c)(2) specific reference to distribution of course materials. If course materials are published and available from other sources, the entity offering the course may give advance notice of what materials will be used so as to allow an individual to obtain them in Braille or on tape but materials provided by the course offerer must be made available in alternative formats for individuals with disabilities.

In language similar to that of paragraph (b), paragraph (c)(3) requires auxiliary aids and services, unless a fundamental alteration or undue burden would result, and paragraph (c)(4) requires that courses be administered in accessible facilities. Paragraph (c)(5) gives examples of alternative accessible arrangements. These may include provision of the course through videotape, cassettes, or prepared notes. Alternative arrangements must provide comparable conditions to those provided to others, including similar lighting, room temperature, and the like. An entity offering a variety of courses, to fulfill continuing education requirements for a profession, for example, may not limit the selection or choice of courses available to individuals with disabilities.

Section 36.310 Transportation Provided by Public Accommodations

Section 36.310 contains specific provisions relating to public accommodations that provide transportation to their clients or customers. This section has been substantially revised in order to coordinate the requirements of this section with the requirements applicable to these transportation systems that will be contained in the regulations issued by the Secretary of Transportation pursuant to section 306 of the ADA, to be codified at 49 CFR part 37. The Department notes that, although the responsibility for issuing regulations applicable to transportation systems operated by public accommodations is divided between this Department and the Department of –Transportation, enforcement authority is assigned only to the Department of Justice.

The Department received relatively few comments on this section of the proposed rule. Most of the comments addressed issues that are not specifically addressed in this part, such as the standards for accessible vehicles and the procedure for determining whether equivalent service is provided. Those standards will be contained in the regulation issued by the Department of Transportation. Other commenters raised questions about the types of transportation that will be subject to this section. In response to these inquiries, the Department has revised the list of examples contained in the regulation.

Paragraph (a)(1) states the general rule that covered public accommodations are subject to all of the specific provisions of subparts B, C, and D, except as provided in §36.310. Examples of operations covered by the requirements are listed in paragraph (a)(2). The stated examples include hotel and motel airport shuttle services, customer shuttle bus services operated by private companies and shopping centers, student transportation, and shuttle operations of recreational facilities such as stadiums, zoos, amusement parks, and ski resorts. This brief list is not exhaustive. The section applies to any fixed route or demand responsive transportation system operated by a public accommodation for the benefit of its clients or customers. The section does not apply to transportation services provided only to employees. Employee transportation will be subject to the regulations issued by the Equal Employment Opportunity Commission to implement title I of the Act. However, if employees and customers or clients are served by the same transportation system, the provisions of this section will apply.

Paragraph (b) specifically provides that a public accommodation shall remove transportation barriers in existing vehicles to the extent that it is readily achievable to do so, but that the installation of hydraulic or other lifts is not required.

Paragraph (c) provides that public accommodations subject to this section shall comply with the requirements for transportation vehicles and systems contained in the regulations issued by the Secretary of Transportation.

Subpart D—New Construction and Alterations

Subpart D implements section 303 of the Act, which requires that newly constructed or altered places of public accommodation or commercial facilities be readily accessible to and usable by individuals with disabilities. This requirement contemplates a high degree of convenient access. It is intended to ensure that patrons and employees of places of public accommodation and employees of commercial facilities are able to get to, enter, and use the facility.

Potential patrons of places of public accommodation, such as retail establishments, should be able to get to a store, get into the store, and get to the areas where goods are being provided. Employees should have the same types of access, although those individuals require access to and around the employment area as well as to the area in which goods and services are provided.

The ADA is geared to the future—its goal being that, over time, access will be the rule, rather than the exception. Thus, the Act only requires modest expenditures, of the type addressed in §36.304 of this part, to provide access to existing facilities not otherwise being altered, but requires all new construction and alterations to be accessible.

The Act does not require new construction or alterations; it simply requires that, when a public accommodation or other private entity undertakes the construction or alteration of a facility subject to the Act, the newly constructed or altered facility must be made accessible. This subpart establishes the requirements for new construction and alterations.

As explained under the discussion of the definition of ''facility,'' §36.104, pending development of specific requirements, the Department will not apply this subpart to places of public accommodation located in mobile units, boats, or other conveyances.

Section 36.401 New Construction

General

Section 36.401 implements the new construction requirements of the ADA. Section 303 (a)(1) of the Act provides that discrimination for purposes of section 302(a) of the Act includes a failure to design and construct facilities for first occupancy later than 30 months after the date of enactment (i.e., after January 26, 1993) that are readily accessible to and usable by individuals with disabilities.

Paragraph 36.401(a)(1) restates the general requirement for accessible new construction. The proposed rule stated that ''any public accommodation or other private entity responsible for design and construction'' must ensure that facilities conform to this requirement. Various commenters suggested that the proposed language was not consistent with the statute because it substituted ''private entity responsible for design and construction'' for the statutory language; because it did not address liability on the part of architects, contractors, developers, tenants, owners, and other entities; and because it limited the liability of entities responsible for commercial facilities. In response, the Department has revised this paragraph to repeat the language of section 303(a) of the ADA. The Department will interpret this section in a manner consistent with the intent of the statute and with the nature of the responsibilities of the various entities for design, for construction, or for both.

Designed and Constructed for First Occupancy

According to paragraph (a)(2), a facility is subject to the new construction requirements only if a completed application for a building permit or permit extension is filed after January 26, 1992, and the facility is occupied after January 26, 1993.

The proposed rule set forth for comment two alternative ways by which to determine what facilities are subject to the Act and what standards apply. Paragraph (a)(2) of the final rule is a slight variation on Option One in the proposed rule. The reasons for the Department's choice of Option One are discussed later in this section.

Paragraph (a)(2) acknowledges that Congress did not contemplate having actual occupancy be the sole trigger for the accessibility requirements, because the statute prohibits a failure to ''design and construct for first occupancy,'' rather than requiring accessibility in facilities actually occupied after a particular date.

The commenters overwhelmingly agreed with the Department's proposal to use a date certain; many cited the reasons given in the preamble to the proposed rule. First, it is helpful for designers and builders to have a fixed date for accessible design, so that they can determine accessibility requirements early in the planning and design stage. It is difficult to determine accessibility requirements in anticipation of the actual date of first occupancy because of unpredictable and uncontrollable events (e.g., strikes affecting suppliers or labor, or natural disasters) that may delay occupancy. To redesign or reconstruct portions of a facility if it begins to appear that occupancy will be later than anticipated would be quite costly. A fixed date also assists those responsible for enforcing, or monitoring compliance with, the statute, and those protected by it.

The Department considered using as a trigger date for application of the accessibility standards the date on which a permit is granted. The Department chose instead the date on which a complete permit application is certified as received by the appropriate

government entity. Almost all commenters agreed with this choice of a trigger date. This decision is based partly on information that several months or even years can pass between application for a permit and receipt of a permit. Design is virtually complete at the time an application is complete (i.e., certified to contain all the information required by the State, county, or local government). After an application is filed, delays may occur before the permit is granted due to numerous factors (not necessarily relating to accessibility): for example, hazardous waste discovered on the property, flood plain requirements, zoning disputes, or opposition to the project from various groups. These factors should not require redesign for accessibility if the application was completed before January 26, 1992. However, if the facility must be redesigned for other reasons, such as a change in density or environmental preservation, and the final permit is based on a new application, the rule would require accessibility if that application was certified complete after January 26, 1992.

The certification of receipt of a complete application for a building permit is an appropriate point in the process because certifications are issued in writing by governmental authorities. In addition, this approach presents a clear and objective standard.

However, a few commenters pointed out that in some jurisdictions it is not possible to receive a ''certification'' that an application is complete, and suggested that in those cases the fixed date should be the date on which an application for a permit is received by the government agency. The Department has included such a provision in §36.401(a)(2)(i).

The date of January 26, 1992, is relevant only with respect to the last application for a permit or permit extension for a facility. Thus, if an entity has applied for only a ''foundation'' permit, the date of that permit application has no effect, because the entity must also apply for and receive a permit at a later date for the actual superstructure. In this case, it is the date of the later application that would control, unless construction is not completed within the time allowed by the permit, in which case a third permit would be issued and the date of the application for that permit would be determinative for purposes of the rule.

Choice of Option One for Defining ''Designed and Constructed for First Occupancy''

Under the option the Department has chosen for determining applicability of the new construction standards, a building would be considered to be ''for first occupancy'' after January 26, 1993, only (1) if the last application for a building permit or permit extension for the facility is certified to be complete (or, in some jurisdictions, received) by a State, county, or local government after January 26, 1992, and (2) if the first certificate of occupancy is issued after January 26, 1993. The Department also asked for comment on an Option Two, which would have imposed new construction requirements if a completed application for a building permit or permit extension was filed after the enactment of the ADA (July 26, 1990), and the facility was occupied after January 26, 1993.

The request for comment on this issue drew a large number of comments expressing a wide range of views. Most business groups and some disability rights groups favored Option One, and some business groups and most disability rights groups favored Option Two. Individuals and government entities were equally divided; several commenters proposed other options.

Those favoring Option One pointed out that it is more reasonable in that it allows time for those subject to the new construction requirements to anticipate those requirements and to receive technical assistance pursuant to the Act. Numerous commenters said that time frames for designing and constructing some types of facilities (for example, health care facilities) can range from two to four years or more. They expressed concerns that Option Two, which would apply to some facilities already under design or construction as of the date the Act was signed, and to some on which construction began shortly after enactment, could result in costly redesign or reconstruction of those facilities. In the same vein, some Option One supporters found Option Two objectionable on due process grounds. In their view, Option Two would mean that in July 1991 (upon issuance of the final DOJ rule) the responsible entities would learn that ADA standards had been in effect since July 26, 1990, and this would amount to retroactive application of standards. Numerous commenters characterized Option Two as having no support in the statute and Option One as being more consistent with congressional intent.

Those who favored Option Two pointed out that it would include more facilities within the coverage of the new construction standards. They argued that because similar accessibility requirements are in effect under State laws, no hardship would be imposed by this option. Numerous commenters said that hardship would also be eliminated in light of their view that the ADA requires compliance with the Uniform Federal Accessibility Standards (UFAS) until issuance of DOJ standards. Those supporting Option Two claimed that it was more consistent with the statute and its legislative history.

The Department has chosen Option One rather than Option Two, primarily on the

basis of the language of three relevant sections of the statute. First, section 303(a) requires compliance with accessibility standards set forth, or incorporated by reference in, regulations to be issued by the Department of Justice. Standing alone, this section cannot be read to require compliance with the Department's standards before those standards are issued (through this rulemaking). Second, according to section 310 of the statute, section 303 becomes effective on January 26, 1992. Thus, section 303 cannot impose requirements on the design of buildings before that date. Third, while section 306(d) of the Act requires compliance with UFAS if final regulations have not been issued, that provision cannot reasonably be read to take effect until July 26, 1991, the date by which the Department of Justice must issue final regulations under title III.

Option Two was based on the premise that the interim standards in section 306(d) take effect as of the ADA's enactment (July 26, 1990), rather than on the date by which the Department of Justice regulations are due to be issued (July 26, 1991). The initial clause of section 306(d)(1) itself is silent on this question:

If final regulations have not been issued pursuant to this section, for new construction for which a * * * building permit is obtained prior to the issuance of final regulations * * * (interim standards apply).

The approach in Option Two relies partly on the language of section 310 of the Act, which provides that section 306, the interim standards provision, takes effect on the date of enactment. Under this interpretation the interim standards provision would prevail over the operative provision, section 303, which requires that new construction be accessible and which becomes effective January 26, 1992. This approach would also require construing the language of section 306(d)(1) to take effect before the Department's standards are due to be issued. The preferred reading of section 306 is that it would require that, if the Department's final standards had not been issued by July 26, 1991, UFAS would apply to certain buildings until such time as the Department's standards were issued.

General Substantive Requirements of the New Construction Provisions

The rule requires, as does the statute, that covered newly constructed facilities be readily accessible to and usable by individuals with disabilities. The phrase ''readily accessible to and usable by individuals with disabilities'' is a term that, in slightly varied formulations, has been used in the Architectural Barriers Act of 1968, the Fair Housing Act, the regulations implementing section 504 of the Rehabilitation Act of 1973, and current accessibility standards. It means, with respect to a facility or a portion of a facility, that it can be approached, entered, and used by individuals with disabilities (including mobility, sensory, and cognitive impairments) easily and conveniently. A facility that is constructed to meet the requirements of the rule's accessibility standards will be considered readily accessible and usable with respect to construction. To the extent that a particular type or element of a facility is not specifically addressed by the standards, the language of this section is the safest guide.

A private entity that renders an ''accessible'' building inaccessible in its operation, through policies or practices, may be in violation of section 302 of the Act. For example, a private entity can render an entrance to a facility inaccessible by keeping an accessible entrance open only during certain hours (whereas the facility is available to others for a greater length of time). A facility could similarly be rendered inaccessible if a person with disabilities is significantly limited in her or his choice of a range of accommodations.

Ensuring access to a newly constructed facility will include providing access to the facility from the street or parking lot, to the extent the responsible entity has control over the route from those locations. In some cases, the private entity will have no control over access at the point where streets, curbs, or sidewalks already exist, and in those instances the entity is encouraged to request modifications to a sidewalk, including installation of curb cuts, from a public entity responsible for them. However, as some commenters pointed out, there is no obligation for a private entity subject to title III of the ADA to seek or ensure compliance by a public entity with title II. Thus, although a locality may have an obligation under title II of the Act to install curb cuts at a particular location, that responsibility is separate from the private entity's title III obligation, and any involvement by a private entity in seeking cooperation from a public entity is purely voluntary in this context.

Work Areas

Proposed paragraph 36.401(b) addressed access to employment areas, rather than to the areas where goods or services are being provided. The preamble noted that the proposed paragraph provided guidance for new construction and alterations until more specific guidance was issued by the ATBCB and reflected in this Department's regulation. The entire paragraph has been deleted from this section in the final rule. The concepts of paragraphs (b) (1), (2), and (5) of the proposed rule are included, with modifications and expansion, in ADAAG. Paragraphs (3) and (4) of the proposed rule, concerning fixtures and equipment, are not included in the rule or in ADAAG.

Some commenters asserted that questions relating to new construction and alterations of work areas should be addressed by the

EEOC under title I, as employment concerns. However, the legislative history of the statute clearly indicates that the new construction and alterations requirements of title III were intended to ensure accessibility of new facilities to all individuals, including employees. The language of section 303 sweeps broadly in its application to all public accommodations and commercial facilities. EEOC's title I regulations will address accessibility requirements that come into play when ''reasonable accommodation'' to individual employees or applicants with disabilities is mandated under title I.

The issues dealt with in proposed §36.401(b)(1) and (2) are now addressed in ADAAG section 4.1.1(3). The Department's proposed paragraphs would have required that areas that will be used only by employees as work stations be constructed so that individuals with disabilities could approach, enter, and exit the areas. They would not have required that all individual work stations be constructed or equipped (for example, with shelves that are accessible or adaptable) to be accessible. This approach was based on the theory that, as long as an employee with disabilities could enter the building and get to and around the employment area, modifications in a particular work station could be instituted as a ''reasonable accommodation'' to that employee if the modifications were necessary and they did not constitute an undue hardship.

Almost all of the commenters agreed with the proposal to require access to a work area but not to require accessibility of each individual work station. This principle is included in ADAAG 4.1.1(3). Several of the comments related to the requirements of the proposed ADAAG and have been addressed in the accessibility standards.

Proposed paragraphs (b) (3) and (4) would have required that consideration be given to placing fixtures and equipment at accessible heights in the first instance, and to purchasing new equipment and fixtures that are adjustable. These paragraphs have not been included in the final rule because the rule in most instances does not establish accessibility standards for purchased equipment. (See discussion elsewhere in the preamble of proposed §36.309.) While the Department encourages entities to consider providing accessible or adjustable fixtures and equipment for employees, this rule does not require them to do so.

Paragraph (b)(5) of proposed §36.401 clarified that proposed paragraph (b) did not limit the requirement that employee areas other than individual work stations must be accessible. For example, areas that are employee ''common use'' areas and are not solely used as work stations (e.g., employee lounges, cafeterias, health units, exercise facilities) are treated no differently under this regulation than other parts of a building; they must be constructed or altered in compliance with the accessibility standards. This principle is not stated in §36.401 but is implicit in the requirements of this section and ADAAG.

Commercial Facilities in Private Residences

Section 36.401(b) of the final rule is a new provision relating to commercial facilities located in private residences. The proposed rule addressed these requirements in the preamble to §36.207, ''Places of public accommodation located in private residences.'' The preamble stated that the approach for commercial facilities would be the same as that for places of public accommodation, i.e., those portions used exclusively as a commercial facility or used as both a commercial facility and for residential purposes would be covered. Because commercial facilities are only subject to new construction and alterations requirements, however, the covered portions would only be subject to subpart D. This approach is reflected in §36.401(b)(1).

The Department is aware that the statutory definition of ''commercial facility'' excludes private residences because they are ''expressly exempted from coverage under the Fair Housing Act of 1968, as amended.'' However, the Department interprets that exemption as applying only to facilities that are exclusively residential. When a facility is used as both a residence and a commercial facility, the exemption does not apply.

Paragraph (b)(2) is similar to the new paragraph (b) under §36.207, ''Places of public accommodation located in private residences.'' The paragraph clarifies that the covered portion includes not only the space used as a commercial facility, but also the elements used to enter the commercial facility, e.g., the homeowner's front sidewalk, if any; the doorway; the hallways; the restroom, if used by employees or visitors of the commercial facility; and any other portion of the residence, interior or exterior, used by employees or visitors of the commercial facility.

As in the case of public accommodations located in private residences, the new construction standards only apply to the extent that a portion of the residence is designed or intended for use as a commercial facility. Likewise, if a homeowner alters a portion of his home to convert it to a commercial facility, that work must be done in compliance with the alterations standards in appendix A.

Structural Impracticability

Proposed §36.401(c) is included in the final rule with minor changes. It details a statutory exception to the new construction requirement: the requirement that new construction be accessible does not apply where

an entity can demonstrate that it is structurally impracticable to meet the requirements of the regulation. This provision is also included in ADAAG, at section 4.1.1(5)(a).

Consistent with the legislative history of the ADA, this narrow exception will apply only in rare and unusual circumstances where unique characteristics of terrain make accessibility unusually difficult. Such limitations for topographical problems are analogous to an acknowledged limitation in the application of the accessibility requirements of the Fair Housing Amendments Act (FHAA) of 1988.

Almost all commenters supported this interpretation. Two commenters argued that the DOJ requirement is too limiting and would not exempt some buildings that should be exempted because of soil conditions, terrain, and other unusual site conditions. These commenters suggested consistency with HUD's Fair Housing Accessibility Guidelines (56 FR 9472 (1991)), which generally would allow exceptions from accessibility requirements, or allow compliance with less stringent requirements, on sites with slopes exceeding 10%.

The Department is aware of the provisions in HUD's guidelines, which were issued on March 6, 1991, after passage of the ADA and publication of the Department's proposed rule. The approach taken in these guidelines, which apply to different types of construction and implement different statutory requirements for new construction, does not bind this Department in regulating under the ADA. The Department has included in the final rule the substance of the proposed provision, which is faithful to the intent of the statute, as expressed in the legislative history. (See Senate report at 70–71; Education and Labor report at 120.)

The limited structural impracticability exception means that it is acceptable to deviate from accessibility requirements only where unique characteristics of terrain prevent the incorporation of accessibility features and where providing accessibility would destroy the physical integrity of a facility. A situation in which a building must be built on stilts because of its location in marshlands or over water is an example of one of the few situations in which the exception for structural impracticability would apply.

This exception to accessibility requirements should not be applied to situations in which a facility is located in ''hilly'' terrain or on a plot of land upon which there are steep grades. In such circumstances, accessibility can be achieved without destroying the physical integrity of a structure, and is required in the construction of new facilities.

Some commenters asked for clarification concerning when and how to apply the ADA rules or the Fair Housing Accessibility Guidelines, especially when a facility may be subject to both because of mixed use. Guidance on this question is provided in the discussion of the definitions of place of public accommodation and commercial facility. With respect to the structural impracticability exception, a mixed-use facility could not take advantage of the Fair Housing exemption, to the extent that it is less stringent than the ADA exemption, except for those portions of the facility that are subject only to the Fair Housing Act.

As explained in the preamble to the proposed rule, in those rare circumstances in which it is structurally impracticable to achieve full compliance with accessibility retirements under the ADA, places of public accommodation and commercial facilities should still be designed and constructed to incorporate accessibility features to the extent that the features are structurally practicable. The accessibility requirements should not be viewed as an all-or-nothing proposition in such circumstances.

If it is structurally impracticable for a facility in its entirety to be readily accessible to and usable by people with disabilities, then those portions that can be made accessible should be made accessible. If a building cannot be constructed in compliance with the full range of accessibility requirements because of structural impracticability, then it should still incorporate those features that are structurally practicable. If it is structurally impracticable to make a particular facility accessible to persons who have particular types of disabilities, it is still appropriate to require it to be made accessible to persons with other types of disabilities. For example, a facility that is of necessity built on stilts and cannot be made accessible to persons who use wheelchairs because it is structurally impracticable to do so, must be made accessible for individuals with vision or hearing impairments or other kinds of disabilities.

Elevator Exemption

Section 36.401(d) implements the ''elevator exemption'' for new construction in section 303(b) of the ADA. The elevator exemption is an exception to the general requirement that new facilities be readily accessible to and usable by individuals with disabilities. Generally, an elevator is the most common way to provide individuals who use wheelchairs ''ready access'' to floor levels above or below the ground floor of a multi-story building. Congress, however, chose not to require elevators in new small buildings, that is, those with less than three stories or less than 3,000 square feet per story. In buildings eligible for the exemption, therefore, ''ready access'' from the building entrance to a floor above

or below the ground floor is not required, because the statute does not require that an elevator be installed in such buildings. The elevator exemption does not apply, however, to a facility housing a shopping center, a shopping mall, or the professional office of a health care provider, or other categories of facilities as determined by the Attorney General. For example, a new office building that will have only two stories, with no elevator planned, will not be required to have an elevator, even if each story has 20,000 square feet. In other words, having either less than 3000 square feet per story or less than three stories qualifies a facility for the exemption; it need not qualify for the exemption on both counts. Similarly, a facility that has five stories of 2800 square feet each qualifies for the exemption. If a facility has three or more stories at any point, it is not eligible for the elevator exemption unless all the stories are less than 3000 square feet.

The terms ''shopping center or shopping mall'' and ''professional office of a health care provider'' are defined in this section. They are substantively identical to the definitions included in the proposed rule in §36.104, ''Definitions.'' They have been moved to this section because, as commenters pointed out, they are relevant only for the purposes of the elevator exemption, and inclusion in the general definitions section could give the incorrect impression that an office of a health care provider is not covered as a place of public accommodation under other sections of the rule, unless the office falls within the definition.

For purposes of §36.401, a ''shopping center or shopping mall'' is (1) a building housing five or more sales or rental establishments, or (2) a series of buildings on a common site, either under common ownership or common control or developed either as one project or as a series of related projects, housing five or more sales or rental establishments. The term ''shopping center or shopping mall'' only includes floor levels containing at least one sales or rental establishment, or any floor level that was designed or intended for use by at least one sales or rental establishment.

Any sales or rental establishment of the type that is included in paragraph (5) of the definition of ''place of public accommodation'' (for example, a bakery, grocery store, clothing store, or hardware store) is considered a sales or rental establishment for purposes of this definition; the other types of public accommodations (e.g., restaurants, laundromats, banks, travel services, health spas) are not.

In the preamble to the proposed rule, the Department sought comment on whether the definition of ''shopping center or mall'' should be expanded to include any of these other types of public accommodations. The Department also sought comment on whether a series of buildings should fall within the definition only if they are physically connected.

Most of those responding to the first question (overwhelmingly groups representing people with disabilities, or individual commenters) urged that the definition encompass more places of public accommodation, such as restaurants, motion picture houses, laundromats, dry cleaners, and banks. They pointed out that often it is not known what types of establishments will be tenants in a new facility. In addition, they noted that malls are advertised as entities, that their appeal is in the ''package'' of services offered to the public, and that this package often includes the additional types of establishments mentioned.

Commenters representing business groups sought to exempt banks, travel services, grocery stores, drug stores, and freestanding retail stores from the elevator requirement. They based this request on the desire to continue the practice in some locations of incorporating mezzanines housing administrative offices, raised pharmacist areas, and raised areas in the front of supermarkets that house safes and are used by managers to oversee operations of check-out aisles and other functions. Many of these concerns are adequately addressed by ADAAG. Apart from those addressed by ADAAG, the Department sees no reason to treat a particular type of sales or rental establishment differently from any other. Although banks and travel services are not included as ''sales or rental establishments,'' because they do not fall under paragraph (5) of the definition of place of public accommodation, grocery stores and drug stores are included.

The Department has declined to include places of public accommodation other than sales or rental establishments in the definition. The statutory definition of ''public accommodation'' (section 301(7)) lists 12 types of establishments that are considered public accommodations. Category (E) includes ''a bakery, grocery store, clothing store, hardware store, shopping center, or other sales or rental establishment.'' This arrangement suggests that it is only these types of establishments that would make up a shopping center for purposes of the statute. To include all types of places of public accommodation, or those from 6 or 7 of the categories, as commenters suggest, would overly limit the elevator exemption; the universe of facilities covered by the definition of ''shopping center'' could well exceed the number of multitenant facilities *not* covered, which would render the exemption almost meaningless.

For similar reasons, the Department is retaining the requirement that a building or series of buildings must house five or more sales or rental establishments before it falls within the definition of ''shopping center.''

Numerous commenters objected to the number and requested that the number be lowered from five to three or four. Lowering the number in this manner would include an inordinately large number of two-story multitenant buildings within the category of those required to have elevators.

The responses to the question concerning whether a series of buildings should be connected in order to be covered were varied. Generally, disability rights groups and some government agencies said a series of buildings should not have to be connected, and pointed to a trend in some areas to build shopping centers in a garden or village setting. The Department agrees that this design choice should not negate the elevator requirement for new construction. Some business groups answered the question in the affirmative, and some suggested a different definition of shopping center. For example, one commenter recommended the addition of a requirement that the five or more establishments be physically connected on the non-ground floors by a common pedestrian walkway or pathway, because otherwise a series of stand-alone facilities would have to comply with the elevator requirement, which would be unduly burdensome and perhaps infeasible. Another suggested use of what it characterized as the standard industry definition: ''A group of retail stores and related business facilities, the whole planned, developed, operated and managed as a unit.'' While the rule's definition would reach a series of related projects that are under common control but were not developed as a single project, the Department considers such a facility to be a shopping center within the meaning of the statute. However, in light of the hardship that could confront a series of existing small stand-alone buildings if elevators were required in alterations, the Department has included a common access route in the definition of shopping center or shopping mall for purposes of §36.404.

Some commenters suggested that access to restrooms and other shared facilities open to the public should be required even if those facilities were not on a shopping floor. Such a provision with respect to toilet or bathing facilities is included in the elevator exception in final ADAAG 4.1.3(5).

For purposes of this subpart, the rule does not distinguish between a ''shopping mall'' (usually a building with a roofed-over common pedestrian area serving more than one tenant in which a majority of the tenants have a main entrance from the common pedestrian area) and a ''shopping center'' (e.g., a ''shopping strip''). Any facility housing five or more of the types of sales or rental establishments described, regardless of the number of other types of places of public accommodation housed there (e.g., offices, movie theatres, restaurants), is a shopping center or shopping mall.

For example, a two-story facility built for mixed-use occupancy on both floors (e.g., by sales and rental establishments, a movie theater, restaurants, and general office space) is a shopping center or shopping mall if it houses five or more sales or rental establishments. If none of these establishments is located on the second floor, then only the ground floor, which contains the sales or rental establishments, would be a ''shopping center or shopping mall,'' unless the second floor was designed or intended for use by at least one sales or rental establishment. In determining whether a floor was intended for such use, factors to be considered include the types of establishments that first occupied the floor, the nature of the developer's marketing strategy, i.e., what types of establishments were sought, and inclusion of any design features particular to rental and sales establishments.

A ''professional office of a health care provider'' is defined as a location where a person or entity regulated by a State to provide professional services related to the physical or mental health of an individual makes such services available to the public. In a two-story development that houses health care providers only on the ground floor, the ''professional office of a health care provider'' is limited to the ground floor unless the second floor was designed or intended for use by a health care provider. In determining if a floor was intended for such use, factors to be considered include whether the facility was constructed with special plumbing, electrical, or other features needed by health care providers, whether the developer marketed the facility as a medical office center, and whether any of the establishments that first occupied the floor was, in fact, a health care provider.

In addition to requiring that a building that is a shopping center, shopping mall, or the professional office of a health care provider have an elevator regardless of square footage or number of floors, the ADA (section 303(b)) provides that the Attorney General may determine that a particular category of facilities requires the installation of elevators based on the usage of the facilities. The Department, as it proposed to do, has added to the nonexempt categories terminals, depots, or other stations used for specified public transportation, and airport passenger terminals. Numerous commenters in all categories endorsed this proposal; none opposed it. It is not uncommon for an airport passenger terminal or train station, for example, to have only two floors, with gates on both floors. Because of the significance of transportation, because a person with disabilities could be arriving or departing at any gate, and because inaccessible facilities could result in a total denial of transportation services, it is reasonable to require that newly constructed transit facilities be

accessible, regardless of square footage or number of floors. One comment suggested an amendment that would treat terminals and stations similarly to shopping centers, by requiring an accessible route only to those areas used for passenger loading and unloading and for other passenger services. Paragraph (d)(2)(ii) has been modified accordingly.

Some commenters suggested that other types of facilities (e.g., educational facilities, libraries, museums, commercial facilities, and social service facilities) should be included in the category of nonexempt facilities. The Department has not found adequate justification for including any other types of facilities in the nonexempt category at this time.

Section 36.401(d)(2) establishes the operative requirements concerning the elevator exemption and its application to shopping centers and malls, professional offices of health care providers, transit stations, and airport passenger terminals. Under the rule's framework, it is necessary first to determine if a new facility (including one or more buildings) houses places of public accommodation or commercial facilities that are in the categories for which elevators are required. If so, and the facility is a shopping center or shopping mall, or a professional office of a health care provider, then any area housing such an office or a sales or rental establishment or the professional office of a health care provider is not entitled to the elevator exemption.

The following examples illustrate the application of these principles:

1. A shopping mall has an upper and a lower level. There are two ''anchor stores'' (in this case, major department stores at either end of the mall, both with exterior entrances and an entrance on each level from the common area). In addition, there are 30 stores (sales or rental establishments) on the upper level, all of which have entrances from a common central area. There are 30 stores on the lower level, all of which have entrances from a common central area. According to the rule, elevator access must be provided to each store and to each level of the anchor stores. This requirement could be satisfied with respect to the 60 stores through elevators connecting the two pedestrian levels, provided that an individual could travel from the elevator to any other point on that level (i.e., into any store through a common pedestrian area) on an accessible path.

2. A commercial (nonresidential) ''townhouse'' development is composed of 20 two-story attached buildings. The facility is developed as one project, with common ownership, and the space will be leased to retailers. Each building has one accessible entrance from a pedestrian walk to the first floor. From that point, one can enter a store on the first floor, or walk up a flight of stairs to a store on the second floor. All 40 stores must be accessible at ground floor level or by accessible vertical access from that level. This does not mean, however, that 20 elevators must be installed. Access could be provided to the second floor by an elevator from the pedestrian area on the lower level to an upper walkway connecting all the areas on the second floor.

3. In the same type of development, it is planned that retail stores will be housed exclusively on the ground floor, with only office space (not professional offices of health care providers) on the second. Elevator access need not be provided to the second floor because all the sales or rental establishments (the entities that make the facility a shopping center) are located on an accessible ground floor.

4. In the same type of development, the space is designed and marketed as medical or office suites, or as a medical office facility. Accessible vertical access must be provided to all areas, as described in example 2.

Some commenters suggested that building owners who knowingly lease or rent space to nonexempt places of public accommodation would violate §36.401. However, the Department does not consider leasing or renting inaccessible space in itself to constitute a violation of this part. Nor does a change in use of a facility, with no accompanying alterations (e.g., if a psychiatrist replaces an attorney as a tenant in a second-floor office, but no alterations are made to the office) trigger accessibility requirements.

Entities cannot evade the requirements of this section by constructing facilities in such a way that no story is intended to constitute a ''ground floor.'' For example, if a private entity constructs a building whose main entrance leads only to stairways or escalators that connect with upper or lower floors, the Department would consider at least one level of the facility a ground story.

The rule requires in §36.401(d)(3), consistent with the proposed rule, that, even if a building falls within the elevator exemption, the floor or floors other than the ground floor must nonetheless be accessible, except for elevator access, to individuals with disabilities, including people who use wheelchairs. This requirement applies to buildings that do not house sales or rental establishments or the professional offices of a health care provider as well as to those in which such establishments or offices are all located on the ground floor. In such a situation, little added cost is entailed in making the second floor accessible, because it is similar in structure and floor plan to the ground floor.

There are several reasons for this provision. First, some individuals who are mobility impaired may work on a building's second floor, which they can reach by stairs and

the use of crutches; however, the same individuals, once they reach the second floor, may then use a wheelchair that is kept in the office. Secondly, because the first floor will be accessible, there will be little additional cost entailed in making the second floor, with the same structure and generally the same floor plan, accessible. In addition, the second floor must be accessible to those persons with disabilities who do not need elevators for level changes (for example, persons with sight or hearing impairments and those with certain mobility impairments). Finally, if an elevator is installed in the future for any reason, full access to the floor will be facilitated.

One commenter asserted that this provision goes beyond the Department's authority under the Act, and disagreed with the Department's claim that little additional cost would be entailed in compliance. However, the provision is taken directly from the legislative history (see Education and Labor report at 114).

One commenter said that where an elevator is not required, platform lifts should be required. Two commenters pointed out that the elevator exemption is really an exemption from the requirement for providing an accessible route to a second floor not served by an elevator. The Department agrees with the latter comment. Lifts to provide access between floors are not required in buildings that are not required to have elevators. This point is specifically addressed in the appendix to ADAAG (§4.1.3(5)). ADAAG also addresses in detail the situations in which lifts are permitted or required.

Section 36.402 Alterations

Sections 36.402–36.405 implement section 303(a)(2) of the Act, which requires that alterations to existing facilities be made in a way that ensures that the altered portion is readily accessible to and usable by individuals with disabilities. This part does not require alterations; it simply provides that when alterations are undertaken, they must be made in a manner that provides access.

Section 36.402(a)(1) provides that any alteration to a place of public accommodation or a commercial facility, after January 26, 1992, shall be made so as to ensure that, to the maximum extent feasible, the altered portions of the facility are readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs.

The proposed rule provided that an alteration would be deemed to be undertaken after January 26, 1992, if the physical alteration of the property is in progress after that date. Commenters pointed out that this provision would, in some cases, produce an unjust result by requiring the redesign or retrofitting of projects initiated before this part established the ADA accessibility standards. The Department agrees that the proposed rule would, in some instances, unfairly penalize projects that were substantially completed before the effective date. Therefore, paragraph (a)(2) has been revised to specify that an alteration will be deemed to be undertaken after January 26, 1992, if the physical alteration of the property begins after that date. As a matter of interpretation, the Department will construe this provision to apply to alterations that require a permit from a State, County or local government, if physical alterations pursuant to the terms of the permit begin after January 26, 1992. The Department recognizes that this application of the effective date may require redesign of some facilities that were planned prior to the publication of this part, but no retrofitting will be required of facilities on which the physical alterations were initiated prior to the effective date of the Act. Of course, nothing in this section in any way alters the obligation of any facility to remove architectural barriers in existing facilities to the extent that such barrier removal is readily achievable.

Paragraph (b) provides that, for the purposes of this part, an ''alteration'' is a change to a place of public accommodation or a commercial facility that affects or could affect the usability of the building or facility or any part thereof. One commenter suggested that the concept of usability should apply only to those changes that affect access by persons with disabilities. The Department remains convinced that the Act requires the concept of ''usability'' to be read broadly to include any change that affects the usability of the facility, not simply changes that relate directly to access by individuals with disabilities.

The Department received a significant number of comments on the examples provided in paragraphs (b)(1) and (b)(2) of the proposed rule. Some commenters urged the Department to limit the application of this provision to major structural modifications, while others asserted that it should be expanded to include cosmetic changes such as painting and wallpapering. The Department believes that neither approach is consistent with the legislative history, which requires this Department's regulation to be consistent with the accessibility guidelines (ADAAG) developed by the Architectural and Transportation Barriers Compliance Board (ATBCB). Although the legislative history contemplates that, in some instances, the ADA accessibility standards will exceed the current MGRAD requirements, it also clearly indicates the view of the drafters that ''minor changes such as painting or papering walls * * * do not affect usability'' (Education and Labor report at 111, Judiciary report at 64), and, therefore, are not alterations. The proposed rule was based on the existing MGRAD definition of ''alteration.''

The language of the final rule has been revised to be consistent with ADAAG, incorporated as appendix A to this part.

Some commenters sought clarification of the intended scope of this section. The proposed rule contained illustrations of changes that affect usability and those that do not. The intent of the illustrations was to explain the scope of the alterations requirement; the effect was to obscure it. As a result of the illustrations, some commenters concluded that any alteration to a facility, even a minor alteration such as relocating an electrical outlet, would trigger an extensive obligation to provide access throughout an entire facility. That result was never contemplated.

Therefore, in this final rule paragraph (b)(1) has been revised to include the major provisions of paragraphs (b)(1) and (b)(2) of the proposed rule. The examples in the proposed rule have been deleted. Paragraph (b)(1) now provides that alterations include, but are not limited to, remodeling, renovation, rehabilitation, reconstruction, historic restoration, changes or rearrangement in structural parts or elements, and changes or rearrangement in the plan configuration of walls and full-height partitions. Normal maintenance, reroofing, painting or wallpapering, asbestos removal, or changes to mechanical and electrical systems are not alterations unless they affect the usability of building or facility.

Paragraph (b)(2) of this final rule was added to clarify the scope of the alterations requirement. Paragraph (b)(2) provides that if existing elements, spaces, or common areas are altered, then each such altered element, space, or area shall comply with the applicable provisions of appendix A (ADAAG). As provided in §36.403, if an altered space or area is an area of the facility that contains a primary function, then the requirements of that section apply.

Therefore, when an entity undertakes a minor alteration to a place of public accommodation or commercial facility, such as moving an electrical outlet, the new outlet must be installed in compliance with ADAAG. (Alteration of the elements listed in §36.403(c)(2) cannot trigger a path of travel obligation.) If the alteration is to an area, such as an employee lounge or locker room, that is not an area of the facility that contains a primary function, that area must comply with ADAAG. It is only when an alteration affects access to or usability of an area containing a primary function, as opposed to other areas or the elements listed in §36.403(c)(2), that the path of travel to the altered area must be made accessible.

The Department received relatively few comments on paragraph (c), which explains the statutory phrase ''to the maximum extent feasible.'' Some commenters suggested that the regulation should specify that cost is a factor in determining whether it is feasible to make an altered area accessible. The legislative history of the ADA indicates that the concept of feasibility only reaches the question of whether it is possible to make the alteration accessible in compliance with this part. Costs are to be considered only when an alteration to an area containing a primary function triggers an additional requirement to make the path of travel to the altered area accessible.

Section 36.402(c) is, therefore, essentially unchanged from the proposed rule. At the recommendation of a commenter, the Department has inserted the word ''virtually'' to modify ''impossible'' to conform to the language of the legislative history. It explains that the phrase ''to the maximum extent feasible'' as used in this section applies to the occasional case where the nature of an existing facility makes it virtually impossible to comply fully with applicable accessibility standards through a planned alteration. In the occasional cases in which full compliance is impossible, alterations shall provide the maximum physical accessibility feasible. Any features of the facility that are being altered shall be made accessible unless it is technically infeasible to do so. If providing accessibility in conformance with this section to individuals with certain disabilities (e.g., those who use wheelchairs) would not be feasible, the facility shall be made accessible to persons with other types of disabilities (e.g., those who use crutches or who have impaired vision or hearing, or those who have other types of impairments).

Section 36.403 Alterations: Path of Travel

Section 36.403 implements the statutory requirement that any alteration that affects or could affect the usability of or access to an area of a facility that contains a primary function shall be made so as to ensure that, to the maximum extent feasible, the path of travel to the altered area, and the restrooms, telephones, and drinking fountains serving the altered area, are readily accessible to and usable by individuals with disabilities, including individuals who use wheelchairs, unless the cost and scope of such alterations is disproportionate to the cost of the overall alteration. Paragraph (a) restates this statutory requirement.

Paragraph (b) defines a ''primary function'' as a major activity for which the facility is intended. This paragraph is unchanged from the proposed rule. Areas that contain a primary function include, but are not limited to, the customer services lobby of a bank, the dining area of a cafeteria, the meeting rooms in a conference center, as well as offices and all other work areas in which the activities of the public accommodation or other private entities using the facility are

carried out. The concept of ''areas containing a primary function'' is analogous to the concept of ''functional spaces'' in §3.5 of the existing Uniform Federal Accessibility Standards, which defines ''functional spaces'' as ''[t]he rooms and spaces in a building or facility that house the major activities for which the building or facility is intended.''

Paragraph (b) provides that areas such as mechanical rooms, boiler rooms, supply storage rooms, employee lounges and locker rooms, janitorial closets, entrances, corridors, and restrooms are not areas containing a primary function. There may be exceptions to this general rule. For example, the availability of public restrooms at a place of public accommodation at a roadside rest stop may be a major factor affecting customers' decisions to patronize the public accommodation. In that case, a restroom would be considered to be an ''area containing a primary function'' of the facility.

Most of the commenters who addressed this issue supported the approach taken by the Department; but a few commenters suggested that areas not open to the general public or those used exclusively by employees should be excluded from the definition of primary function. The preamble to the proposed rule noted that the Department considered an alternative approach to the definition of ''primary function,'' under which a primary function of a commercial facility would be defined as a major activity for which the facility was intended, while a primary function of a place of public accommodation would be defined as an activity which involves providing significant goods, services, facilities, privileges, advantages, or accommodations. However, the Department concluded that, although portions of the legislative history of the ADA support this alternative, the better view is that the language now contained in §36.403(b) most accurately reflects congressional intent. No commenter made a persuasive argument that the Department's interpretation of the legislative history is incorrect.

When the ADA was introduced, the requirement to make alterations accessible was included in section 302 of the Act, which identifies the practices that constitute discrimination by a public accommodation. Because section 302 applies only to the operation of a place of public accommodation, the alterations requirement was intended only to provide access to clients and customers of a public accommodation. It was anticipated that access would be provided to employees with disabilities under the ''reasonable accommodation'' requirements of title I. However, during its consideration of the ADA, the House Judiciary Committee amended the bill to move the alterations provision from section 302 to section 303, which applies to commercial facilities as well as public accommodations. The Committee report accompanying the bill explains that:

New construction and alterations of both public accommodations and commercial facilities must be made readily accessible to and usable by individuals with disabilities * * *. Essentially, [this requirement] is designed to ensure that patrons *and employees* of public accommodations and commercial facilities are able to get to, enter and use the facility * * *. The rationale for making new construction accessible applies with equal force to alterations.

Judiciary report at 62–63 (emphasis added).

The ADA, as enacted, contains the language of section 303 as it was reported out of the Judiciary Committee. Therefore, the Department has concluded that the concept of ''primary function'' should be applied in the same manner to places of public accommodation and to commercial facilities, thereby including employee work areas in places of public accommodation within the scope of this section.

Paragraph (c) provides examples of alterations that affect the usability of or access to an area containing a primary function. The examples include: Remodeling a merchandise display area or employee work areas in a department store; installing a new floor surface to replace an inaccessible surface in the customer service area or employee work areas of a bank; redesigning the assembly line area of a factory; and installing a computer center in an accounting firm. This list is illustrative, not exhaustive. Any change that affects the usability of or access to an area containing a primary function triggers the statutory obligation to make the path of travel to the altered area accessible.

When the proposed rule was drafted, the Department believed that the rule made it clear that the ADA would require alterations to the path of travel only when such alterations are not disproportionate to the alteration to the primary function area. However, the comments that the Department received indicated that many commenters believe that even minor alterations to individual elements would require additional alterations to the path of travel. To address the concern of these commenters, a new paragraph (c)(2) has been added to the final rule to provide that alterations to such elements as windows, hardware, controls (e.g. light switches or thermostats), electrical outlets, or signage will not be deemed to be alterations that affect the usability of or access to an area containing a primary function. Of course, each element that is altered must comply with ADAAG (appendix A) . The cost of alterations to individual elements would be included in the overall cost of an alteration for purposes of determining disproportionality and would be counted

when determining the aggregate cost of a series of small alterations in accordance with §36.401(h) if the area is altered in a manner that affects access to or usability of an area containing a primary function.

Paragraph (d) concerns the respective obligations of landlords and tenants in the cases of alterations that trigger the path of travel requirement under §36.403. This paragraph was contained in the landlord/tenant section of the proposed rule, §36.201(b). If a tenant is making alterations upon its premises pursuant to terms of a lease that grant it the authority to do so (even if they constitute alterations that trigger the path of travel requirement), and the landlord is not making alterations to other parts of the facility, then the alterations by the tenant on its own premises do not trigger a path of travel obligation upon the landlord in areas of the facility under the landlord's authority that are not otherwise being altered. The legislative history makes clear that the path of travel requirement applies only to the entity that is already making the alteration, and thus the Department has not changed the final rule despite numerous comments suggesting that the tenant be required to provide a path of travel.

Paragraph (e) defines a ''path of travel'' as a continuous, unobstructed way of pedestrian passage by means of which an altered area may be approached, entered, and exited; and which connects the altered area with an exterior approach (including sidewalks, streets, and parking areas), an entrance to the facility, and other parts of the facility. This concept of an accessible path of travel is analogous to the concepts of ''accessible route'' and ''circulation path'' contained in section 3.5 of the current UFAS. Some commenters suggested that this paragraph should address emergency egress. The Department disagrees. ''Path of travel'' as it is used in this section is a term of art under the ADA that relates only to the obligation of the public accommodation or commercial facility to provide additional accessible elements when an area containing a primary function is altered. The Department recognizes that emergency egress is an important issue, but believes that it is appropriately addressed in ADAAG (appendix A), not in this paragraph. Furthermore, ADAAG does not require changes to emergency egress areas in alterations.

Paragraph (e)(2) is drawn from section 3.5 of UFAS. It provides that an accessible path of travel may consist of walks and sidewalks, curb ramps and other interior or exterior pedestrian ramps; clear floor paths through lobbies, corridors, rooms, and other improved areas; parking access aisles; elevators and lifts; or a combination of such elements. Paragraph (e)(3) provides that, for the purposes of this part, the term ''path of travel'' also includes the restrooms, telephones, and drinking fountains serving an altered area.

Although the Act establishes an expectation that an accessible path of travel should generally be included when alterations are made to an area containing a primary function, Congress recognized that, in some circumstances, providing an accessible path of travel to an altered area may be sufficiently burdensome in comparison to the alteration being undertaken to the area containing a primary function as to render this requirement unreasonable. Therefore, Congress provided, in section 303(a)(2) of the Act, that alterations to the path of travel that are disproportionate in cost and scope to the overall alteration are not required.

The Act requires the Attorney General to determine at what point the cost of providing an accessible path of travel becomes disproportionate. The proposed rule provided three options for making this determination.

Two committees of Congress specifically addressed this issue: the House Committee on Education and Labor and the House Committee on the Judiciary. The reports issued by each committee suggested that accessibility alterations to a path of travel might be ''disproportionate'' if they exceed 30% of the alteration costs (Education and Labor report at 113; Judiciary report at 64). Because the Department believed that smaller percentage rates might be appropriate, the proposed rule sought comments on three options: 10%, 20%, or 30%.

The Department received a significant number of comments on this section. Commenters representing individuals with disabilities generally supported the use of 30% (or more); commenters representing covered entities supported a figure of 10% (or less). The Department believes that alterations made to provide an accessible path of travel to the altered area should be deemed disproportionate to the overall alteration when the cost exceeds 20% of the cost of the alteration to the primary function area. This approach appropriately reflects the intent of Congress to provide access for individuals with disabilities without causing economic hardship for the covered public accommodations and commercial facilities.

The Department has determined that the basis for this cost calculation shall be the cost of the alterations to the area containing the primary function. This approach will enable the public accommodation or other private entity that is making the alteration to calculate its obligation as a percentage of a clearly ascertainable base cost, rather than as a percentage of the ''total'' cost, an amount that will change as accessibility alterations to the path of travel are made.

Paragraph (f)(2) (paragraph (e)(2) in the proposed rule) is unchanged. It provides examples of costs that may be counted as expenditures required to provide an accessible path of travel. They include:

• Costs associated with providing an accessible entrance and an accessible route to the altered area, for example, the cost of widening doorways or installing ramps;

• Costs associated with making restrooms accessible, such as installing grab bars, enlarging toilet stalls, insulating pipes, or installing accessible faucet controls;

• Costs associated with providing accessible telephones, such as relocating telephones to an accessible height, installing amplification devices, or installing telecommunications devices for deaf persons (TDD's);

• Costs associated with relocating an inaccessible drinking fountain.

Paragraph (f)(1) of the proposed rule provided that when the cost of alterations necessary to make the path of travel serving an altered area fully accessible is disproportionate to the cost of the overall alteration, the path of travel shall be made accessible to the maximum extent feasible. In response to the suggestion of a commenter, the Department has made an editorial change in the final rule (paragraph (g)(1)) to clarify that if the cost of providing a fully accessible path of travel is disproportionate, the path of travel shall be made accessible ''to the extent that it can be made accessible without incurring disproportionate costs.''

Paragraph (g)(2) (paragraph (f)(2) in the NPRM) establishes that priority should be given to those elements that will provide the greatest access, in the following order: An accessible entrance; an accessible route to the altered area; at least one accessible restroom for each sex or a single unisex restroom; accessible telephones; accessible drinking fountains; and, whenever possible, additional accessible elements such as parking, storage, and alarms. This paragraph is unchanged from the proposed rule.

Paragraph (h) (paragraph (g) in the proposed rule) provides that the obligation to provide an accessible path of travel may not be evaded by performing a series of small alterations to the area served by a single path of travel if those alterations could have been performed as a single undertaking. If an area containing a primary function has been altered without providing an accessible path of travel to serve that area, and subsequent alterations of that area, or a different area on the same path of travel, are undertaken within three years of the original alteration, the total cost of alterations to primary function areas on that path of travel during the preceding three year period shall be considered in determining whether the cost of making the path of travel serving that area accessible is disproportionate. Only alterations undertaken after January 26, 1992, shall be considered in determining if the cost of providing accessible features is disproportionate to the overall cost of the alterations.

Section 36.404 Alterations: Elevator Exemption

Section 36.404 implements the elevator exemption in section 303(b) of the Act as it applies to altered facilities. The provisions of section 303(b) are discussed in the preamble to §36.401(d) above. The statute applies the same exemption to both new construction and alterations. The principal difference between the requirements of §36.401(d) and §36.404 is that, in altering an existing facility that is not eligible for the statutory exemption, the public accommodation or other private entity responsible for the alteration is not required to install an elevator if the installation of an elevator would be disproportionate in cost and scope to the cost of the overall alteration as provided in §36.403(f)(1). In addition, the standards referenced in §36.406 (ADAAG) provide that installation of an elevator in an altered facility is not required if it is ''technically infeasible.''

This section has been revised to define the terms ''professional office of a health care provider'' and ''shopping center or shopping mall'' for the purposes of this section. The definition of ''professional office of a health care provider'' is identical to the definition included in §36.401(d).

It has been brought to the attention of the Department that there is some misunderstanding about the scope of the elevator exemption as it applies to the professional office of a health care provider. A public accommodation, such as the professional office of a health care provider, is required to remove architectural barriers to its facility to the extent that such barrier removal is readily achievable (see §36.304), but it is not otherwise required by this part to undertake new construction or alterations. This part does not require that an existing two story building that houses the professional office of a health care provider be altered for the purpose of providing elevator access. If, however, alterations to the area housing the office of the health care provider are undertaken for other purposes, the installation of an elevator might be required, but only if the cost of the elevator is not disproportionate to the cost of the overall alteration. Neither the Act nor this part prohibits a health care provider from locating his or her professional office in an existing facility that does not have an elevator.

Because of the unique challenges presented in altering existing facilities, the Department has adopted a definition of ''shopping center or shopping mall'' for the purposes of this section that is slightly different from the definition adopted under §36.401(d). For

the purposes of this section, a ''shopping center or shopping mall'' is (1) a building housing five or more sales or rental establishments, or (2) a series of buildings on a common site, connected by a common pedestrian access route above or below the ground floor, either under common ownership or common control or developed either as one project or as a series of related projects, housing five or more sales or rental establishments. As is the case with new construction, the term ''shopping center or shopping mall'' only includes floor levels housing at least one sales or rental establishment, or any floor level that was designed or intended for use by at least one sales or rental establishment.

The Department believes that it is appropriate to use a different definition of ''shopping center or shopping mall'' for this section than for §36.401, in order to make it clear that a series of existing buildings on a common site that is altered for the use of sales or rental establishments does not become a ''shopping center or shopping mall'' required to install an elevator, unless there is a common means of pedestrian access above or below the ground floor. Without this exemption, separate, but adjacent, buildings that were initially designed and constructed independently of each other could be required to be retrofitted with elevators, if they were later renovated for a purpose not contemplated at the time of construction.

Like §36.401(d), §36.404 provides that the exemptions in this paragraph do not obviate or limit in any way the obligation to comply with the other accessibility requirements established in this subpart. For example, alterations to floors above or below the ground floor must be accessible regardless of whether the altered facility has an elevator. If a facility that is not required to install an elevator nonetheless has an elevator, that elevator shall meet, to the maximum extent feasible, the accessibility requirements of this section.

Section 36.405 Alterations: Historic Preservation

Section 36.405 gives effect to the intent of Congress, expressed in section 504(c) of the Act, that this part recognize the national interest in preserving significant historic structures. Commenters criticized the Department's use of descriptive terms in the proposed rule that are different from those used in the ADA to describe eligible historic properties. In addition, some commenters criticized the Department's decision to use the concept of ''substantially impairing'' the historic features of a property, which is a concept employed in regulations implementing section 504 of the Rehabilitation Act of 1973. Those commenters recommended that the Department adopt the criteria of ''adverse effect'' published by the Advisory Council on Historic Preservation under the National Historic Preservation Act (36 CFR 800.9) as the standard for determining whether an historic property may be altered.

The Department agrees with these comments to the extent that they suggest that the language of the rule should conform to the language employed by Congress in the ADA. Therefore, the language of this section has been revised to make it clear that this provision applies to buildings or facilities that are eligible for listing in the National Register of Historic Places under the National Historic Preservation Act (16 U.S.C. 470 *et seq.*) and to buildings or facilities that are designated as historic under State or local law. The Department believes, however, that the criteria of adverse effect employed under the National Historic Preservation Act are inappropriate for this rule because section 504(c) of the ADA specifies that special alterations provisions shall apply only when an alteration would ''threaten or destroy the historic significance of qualified historic buildings and facilities.''

The Department intends that the exception created by this section be applied only in those very rare situations in which it is not possible to provide access to an historic property using the special access provisions in ADAAG. Therefore, paragraph (a) of §36.405 has been revised to provide that alterations to historic properties shall comply, to the maximum extent feasible, with section 4.1.7 of ADAAG. Paragraph (b) of this section has been revised to provide that if it has been determined, under the procedures established in ADAAG, that it is not feasible to provide physical access to an historic property that is a place of public accommodation in a manner that will not threaten or destroy the historic significance of the property, alternative methods of access shall be provided pursuant to the requirements of Subpart C.

Section 36.406 Standards for New Construction and Alterations

Section 36.406 implements the requirements of sections 306(b) and 306(c) of the Act, which require the Attorney General to promulgate standards for accessible design for buildings and facilities subject to the Act and this part that are consistent with the supplemental minimum guidelines and requirements for accessible design published by the Architectural and Transportation Barriers Compliance Board (ATBCB or Board) pursuant to section 504 of the Act. This section of the rule provides that new construction and alterations subject to this part shall comply with the standards for accessible design published as appendix A to this part.

Appendix A contains the Americans with Disabilities Act Accessibility Guidelines for

Buildings and Facilities (ADAAG) which is being published by the ATBCB as a final rule elsewhere in this issue of the FEDERAL REGISTER. As proposed in this Department's proposed rule, §36.406(a) adopts ADAAG as the accessibility standard applicable under this rule.

Paragraph (b) was not included in the proposed rule. It provides, in chart form, guidance for using ADAAG together with subparts A through D of this part when determining requirements for a particular facility. This chart is intended solely as guidance for the user; it has no effect for purposes of compliance or enforcement. It does not necessarily provide complete or mandatory information.

Proposed §36.406(b) is not included in the final rule. That provision, which would have taken effect only if the final rule had followed the proposed Option Two for §36.401(a), is unnecessary because the Department has chosen Option One, as explained in the preamble for that section.

Section 504(a) of the ADA requires the ATBCB to issue minimum guidelines to supplement the existing Minimum Guidelines and Requirements for Accessible Design (MGRAD) (36 CFR part 1190) for purposes of title III. According to section 504(b) of the Act, the guidelines are to establish additional requirements, consistent with the Act, ''to ensure that buildings and facilities are accessible, in terms of architecture and design, . . . and communication, to individuals with disabilities.'' Section 306(c) of the Act requires that the accessibility standards included in the Department's regulations be consistent with the minimum guidelines, in this case ADAAG.

As explained in the ATBCB's preamble to ADAAG, the substance and form of the guidelines are drawn from several sources. They use as their model the 1984 Uniform Federal Accessibility Standards (UFAS) (41 CFR part 101, subpart 101–19.6, appendix), which are the standards implementing the Architectural Barriers Act. UFAS is based on the Board's 1982 MGRAD. ADAAG follows the numbering system and format of the private sector American National Standard Institute's ANSI A117.1 standards. (American National Specifications for Making Buildings and Facilities Accessible to and Usable by Physically Handicapped People (ANSI A117–1980) and American National Standard for Buildings and Facilities—Providing Accessibility and Usability for Physically Handicapped People (ANSI A117.1–1986).) ADAAG supplements MGRAD. In developing ADAAG, the Board made every effort to be consistent with MGRAD and the current and proposed ANSI Standards, to the extent consistent with the ADA.

ADAAG consists of nine main sections and a separate appendix. Sections 1 through 3 contain general provisions and definitions. Section 4 contains scoping provisions and technical specifications applicable to all covered buildings and facilities. The scoping provisions are listed separately for new construction of sites and exterior facilities; new construction of buildings; additions; alterations; and alterations to historic properties. The technical specifications generally reprint the text and illustrations of the ANSI A117.1 standard, except where differences are noted by italics. Sections 5 through 9 of the guidelines are special application sections and contain additional requirements for restaurants and cafeterias, medical care facilities, business and mercantile facilities, libraries, and transient lodging. The appendix to the guidelines contains additional information to aid in understanding the technical specifications. The section numbers in the appendix correspond to the sections of the guidelines to which they relate. An asterisk after a section number indicates that additional information appears in the appendix.

ADAAG's provisions are further explained under Summary of ADAAG below.

GENERAL COMMENTS

One commenter urged the Department to move all or portions of subpart D, New Construction and Alterations, to the appendix (ADAAG) or to duplicate portions of subpart D in the appendix. The commenter correctly pointed out that subpart D is inherently linked to ADAAG, and that a self-contained set of rules would be helpful to users. The Department has attempted to simplify use of the two documents by deleting some paragraphs from subpart D (e.g., those relating to work areas), because they are included in ADAAG. However, the Department has retained in subpart D those sections that are taken directly from the statute or that give meaning to specific statutory concepts (e.g., structural impracticability, path of travel). While some of the subpart D provisions are duplicated in ADAAG, others are not. For example, issues relating to path of travel and disproportionality in alterations are not addressed in detail in ADAAG. (The structure and contents of the two documents are addressed below under Summary of ADAAG.) While the Department agrees that it would be useful to have one self-contained document, the different focuses of this rule and ADAAG do not permit this result at this time. However, the chart included in §36.406(b) should assist users in applying the provisions of subparts A through D, and ADAAG together.

Numerous business groups have urged the Department not to adopt the proposed ADAAG as the accessibility standards, because the requirements established are too high, reflect the ''state of the art,'' and are inflexible, rigid, and impractical. Many of these objections have been lodged on the

basis that ADAAG exceeds the statutory mandate to establish ''minimum'' guidelines. In the view of the Department, these commenters have misconstrued the meaning of the term ''minimum guidelines.'' The statute clearly contemplates that the guidelines establish a level of access—a minimum—that the standards must meet or exceed. The guidelines are not to be ''minimal'' in the sense that they would provide for a low level of access. To the contrary, Congress emphasized that the ADA requires a ''high degree of convenient access.'' Education and Labor report at 117–18. The legislative history explains that the guidelines may not ''reduce, weaken, narrow or set less accessibility standards than those included in existing MGRAD'' and should provide greater guidance in communication accessibility for individuals with hearing and vision impairments. Id. at 139. Nor did Congress contemplate a set of guidelines less detailed than ADAAG; the statute requires that the ADA guidelines supplement the existing MGRAD. When it established the statutory scheme, Congress was aware of the content and purpose of the 1982 MGRAD; as ADAAG does with respect to ADA, MGRAD establishes a minimum level of access that the Architectural Barriers Act standards (i.e., UFAS) must meet or exceed, and includes a high level of detail.

Many of the same commenters urged the Department to incorporate as its accessibility standards the ANSI standard's technical provisions and to adopt the proposed scoping provisions under development by the Council of American Building Officials' Board for the Coordination of Model Codes (BCMC). They contended that the ANSI standard is familiar to and accepted by professionals, and that both documents are developed through consensus. They suggested that ADAAG will not stay current, because it does not follow an established cyclical review process, and that it is not likely to be adopted by nonfederal jurisdictions in State and local codes. They urged the Department and the Board to coordinate the ADAAG provisions and any substantive changes to them with the ANSI A117 committee in order to maintain a consistent and uniform set of accessibility standards that can be efficiently and effectively implemented at the State and local level through the existing building regulatory processes.

The Department shares the commenters' goal of coordination between the private sector and Federal standards, to the extent that coordination can lead to substantive requirements consistent with the ADA. A single accessibility standard, or consistent accessibility standards, that can be used for ADA purposes and that can be incorporated or referenced by State and local governments, would help to ensure that the ADA requirements are routinely implemented at the design stage. The Department plans to work toward this goal.

The Department, however, must comply with the requirements of the ADA, the Federal Advisory Committee Act (5 U.S.C app. 1 *et seq.*) and the Administrative Procedure Act (5 U.S.C 551 *et seq.*). Neither the Department nor the Board can adopt private requirements wholesale. Furthermore, neither the 1991 ANSI A117 Standard revision nor the BCMC process is complete. Although the ANSI and BCMC provisions are not final, the Board has carefully considered both the draft BCMC scoping provisions and draft ANSI technical standards and included their language in ADAAG wherever consistent with the ADA.

Some commenters requested that, if the Department did not adopt ANSI by reference, the Department declare compliance with ANSI/BCMC to constitute equivalency with the ADA standards. The Department has not adopted this recommendation but has instead worked as a member of the ATBCB to ensure that its accessibility standards are practical and usable. In addition, as explained under subpart F, Certification of State Laws or Local Building Codes, the proper forum for further evaluation of this suggested approach would be in conjunction with the certification process.

Some commenters urged the Department to allow an additional comment period after the Board published its guidelines in final form, for purposes of affording the public a further opportunity to evaluate the appropriateness of including them as the Departments accessibility standards. Such an additional comment period is unnecessary and would unduly delay the issuance of final regulations. The Department put the public on notice, through the proposed rule, of its intention to adopt the proposed ADAAG, with any changes made by the Board, as the accessibility standards. As a member of the Board and of its ADA Task Force, the Department participated actively in the public hearings held on the proposed guidelines and in preparation of both the proposed and final versions of ADAAG. Many individuals and groups commented directly to the Department's docket, or at its public hearings, about ADAAG. The comments received on ADAAG, whether by the Board or by this Department, were thoroughly analyzed and considered by the Department in the context of whether the proposed ADAAG was consistent with the ADA and suitable for adoption as both guidelines and standards. The Department is convinced that ADAAG as adopted in its final form is appropriate for these purposes. The final guidelines, adopted here as standards, will ensure the high level of access contemplated by Congress, consistent with the ADA's balance between the interests of people with disabilities and the business community.

A few commenters, citing the Senate report (at 70) and the Education and Labor report (at 119), asked the Department to include in the regulations a provision stating that departures from particular technical and scoping requirements of the accessibility standards will be permitted so long as the alternative methods used will provide substantially equivalent or greater access to and utilization of the facility. Such a provision is found in ADAAG 2.2 and by virtue of that fact is included in these regulations.

Comments on specific provisions of proposed ADAAG

During the course of accepting comments on its proposed rule, the Department received numerous comments on ADAAG. Those areas that elicited the heaviest response included assistive listening systems, automated teller machines, work areas, parking, areas of refuge, telephones (scoping for TDD's and volume controls) and visual alarms. Strenuous objections were raised by some business commenters to the proposed provisions of the guidelines concerning check-out aisles, counters, and scoping for hotels and nursing facilities. All these comments were considered in the same manner as other comments on the Department's proposed rule and, in the Department's view, have been addressed adequately in the final ADAAG.

Largely in response to comments, the Board made numerous changes from its proposal, including the following:

• Generally, at least 50% of public entrances to new buildings must be accessible, rather than all entrances, as would often have resulted from the proposed approach.

• Not all check-out aisles are required to be accessible.

• The final guidelines provide greater flexibility in providing access to sales counters, and no longer require a portion of every counter to be accessible.

• Scoping for TDD's or text telephones was increased. One TDD or text telephone, for speech and hearing impaired persons, must be provided at locations with 4, rather than 6, pay phones, and in hospitals and shopping malls. Use of portable (less expensive) TDD's is allowed.

• Dispersal of wheelchair seating areas in theaters will be required only where there are more than 300 seats, rather than in all cases. Seats with removable armrests (i.e., seats into which persons with mobility impairments can transfer) will also be required.

• Areas of refuge (areas with direct access to a stairway, and where people who cannot use stairs may await assistance during an emergency evacuation) will be required, as proposed, but the final provisions are based on the Uniform Building Code. Such areas are not required in alterations.

• Rather than requiring 5% of new hotel rooms to be accessible to people with mobility impairments, between 2 and 4% accessibility (depending on total number of rooms) is required. In addition, 1% of the rooms must have roll-in showers.

• The proposed rule reserved the provisions on alterations to homeless shelters. The final guidelines apply alterations requirements to homeless shelters, but the requirements are less stringent than those applied to other types of facilities.

• Parking spaces that can be used by people in vans (with lifts) will be required.

• As mandated by the ADA, the Board has established a procedure to be followed with respect to alterations to historic facilities.

SUMMARY OF ADAAG

This section of the preamble summarizes the structure of ADAAG, and highlights the more important portions.

• *Sections 1 Through 3*

Sections 1 through 3 contain general requirements, including definitions.

• *Section 4.1.1, Application*

Section 4 contains scoping requirements. Section 4.1.1, Application, provides that all areas of newly designed or newly constructed buildings and facilities and altered portions of existing buildings and facilities required to be accessible by §4.1.6 must comply with the guidelines unless otherwise provided in §4.1.1 or a special application section. It addresses areas used only by employees as work areas, temporary structures, and general exceptions.

Section 4.1.1(3) preserves the basic principle of the proposed rule: Areas that may be used by employees with disabilities shall be designed and constructed so that an individual with a disability can approach, enter, and exit the area. The language has been clarified to provide that it applies to any area used only as a work area (not just to areas ''that may be used by employees with disabilities''), and that the guidelines do not require that any area used as an individual work station be designed with maneuvering space or equipped to be accessible. The appendix to ADAAG explains that work areas must meet the guidelines' requirements for doors and accessible routes, and recommends, but does not require, that 5% of individual work stations be designed to permit a person using a wheelchair to maneuver within the space.

Further discussion of work areas is found in the preamble concerning proposed §36.401(b).

Section 4.1.1(5)(a) includes an exception for structural impracticability that corresponds to the one found in §36.401(c) and discussed in that portion of the preamble.

• *Section 4.1.2, Accessible Sites and Exterior Facilities: New Construction*

This section addresses exterior features, elements, or spaces such as parking, portable toilets, and exterior signage, in new construction. Interior elements and spaces are covered by §4.1.3.

The final rule retains the UFAS scoping for parking but also requires that at least one of every eight accessible parking spaces be designed with adequate adjacent space to deploy a lift used with a van. These spaces must have a sign indicating that they are van-accessible, but they are not to be reserved exclusively for van users.

• *Section 4.1.3, Accessible Buildings: New Construction*

This section establishes scoping requirements for new construction of buildings and facilities.

Sections 4.1.3 (1) through (4) cover accessible routes, protruding objects, ground and floor surfaces, and stairs.

Section 4.1.3(5) generally requires elevators to serve each level in a newly constructed building, with four exceptions included in the subsection. Exception 1 is the ''elevator exception'' established in §36.401(d), which must be read with this section. Exception 4 allows the use of platform lifts under certain conditions.

Section 4.1.3(6), Windows, is reserved. Section 4.1.3(7) applies to doors.

Under §4.1.3(8), at least 50% of all public entrances must be accessible. In addition, if a building is designed to provide access to enclosed parking, pedestrian tunnels, or elevated walkways, at least one entrance that serves each such function must be accessible. Each tenancy in a building must be served by an accessible entrance. Where local regulations (e.g., fire codes) require that a minimum number of exits be provided, an equivalent number of accessible entrances must be provided. (The latter provision does not require a greater number of entrances than otherwise planned.)

ADAAG Section 4.1.3(9), with accompanying technical requirements in Section 4.3, requires an area of rescue assistance (*i.e.*, an area with direct access to an exit stairway and where people who are unable to use stairs may await assistance during an emergency evacuation) to be established on each floor of a multi-story building. This was one of the most controversial provisions in the guidelines. The final ADAAG is based on current Uniform Building Code requirements and retains the requirement that areas of refuge (renamed ''areas of rescue assistance'') be provided, but specifies that this requirement does not apply to buildings that have a supervised automatic sprinkler system. Areas of refuge are not required in alterations.

The next seven subsections deal with drinking fountains (§4.1.3(10)); toilet facilities (§4.1.3(11)); storage, shelving, and display units (§4.1.3(12)), controls and operating mechanisms (§4.1.3(13)), emergency warning systems (§4.1.3(14)), detectable warnings (§4.1.3(15)), and building signage (§4.1.3(16)). Paragraph 11 requires that toilet facilities comply with §4.22, which requires one accessible toilet stall (60<″×60<″) in each newly constructed restroom. In response to public comments, the final rule requires that a second accessible stall (36<″×60<″) be provided in restrooms that have six or more stalls.

ADAAG Section 4.1.3(17) establishes requirements for accessibility of pay phones to persons with mobility impairments, hearing impairments (requiring some phones with volume controls), and those who cannot use voice telephones. It requires one interior ''text telephone'' to be provided at any facility that has a total of four or more public pay phones. (The term ''text telephone'' has been adopted to reflect current terminology and changes in technology.) In addition, text telephones will be required in specific locations, such as covered shopping malls, hospitals (in emergency rooms, waiting rooms, and recovery areas), and convention centers.

Paragraph 18 of Section 4.1.3 generally requires that at least five percent of fixed or built-in seating or tables be accessible.

Paragraph 19, covering assembly areas, specifies the number of wheelchair seating spaces and types and numbers of assistive listening systems required. It requires dispersal of wheelchair seating locations in facilities where there are more than 300 seats. The guidelines also require that at least one percent of all fixed seats be aisle seats without armrests (or with moveable armrests) on the aisle side to increase accessibility for persons with mobility impairments who prefer to transfer from their wheelchairs to fixed seating. In addition, the final ADAAG requires that fixed seating for a companion be located adjacent to each wheelchair location.

Paragraph 20 requires that where automated teller machines are provided, at least one must comply with section 4.34, which, among other things, requires accessible controls, and instructions and other information that are accessible to persons with sight impairments.

Under paragraph 21, where dressing rooms are provided, five percent or at least one must comply with section 4.35.

• *Section 4.1.5, Additions*

Each addition to an existing building or facility is regarded as an alteration subject to §§36.402 through 36.406 of subpart D, including the date established in §36.402(a). But additions also have attributes of new construction, and to the extent that a space or element in the addition is newly constructed,

each new space or element must comply with the applicable scoping provisions of sections 4.1.1 to 4.1.3 for new construction, the applicable technical specifications of sections 4.2 through 4.34, and any applicable special provisions in sections 5 through 10. For instance, if a restroom is provided in the addition, it must comply with the requirements for new construction. Construction of an addition does not, however, create an obligation to retrofit the entire existing building or facility to meet requirements for new construction. Rather, the addition is to be regarded as an alteration and to the extent that it affects or could affect the usability of or access to an area containing a primary function, the requirements in section 4.1.6(2) are triggered with respect to providing an accessible path of travel to the altered area and making the restrooms, telephones, and drinking fountains serving the altered area accessible. For example, if a museum adds a new wing that does not have a separate entrance as part of the addition, an accessible path of travel would have to be provided through the existing building or facility unless it is disproportionate to the overall cost and scope of the addition as established in §36.403(f).

• *Section 4.1.6, Alterations*

An alteration is a change to a building or facility that affects or could affect the usability of or access to the building or facility or any part thereof. There are three general principles for alterations. First, if any existing element or space is altered, the altered element or space must meet new construction requirements (section 4.1.6(1)(b)). Second, if alterations to the elements in a space when considered together amount to an alteration of the space, the entire space must meet new construction requirements (section 4.1.6(1)(c)). Third, if the alteration affects or could affect the usability of or access to an area containing a primary function, the path of travel to the altered area and the restrooms, drinking fountains, and telephones serving the altered area must be made accessible unless it is disproportionate to the overall alterations in terms of cost and scope as determined under criteria established by the Attorney General (§4.1.6(2)).

Section 4.1.6 should be read with §§36.402 through 36.405. Requirements concerning alterations to an area serving a primary function are addressed with greater detail in the latter sections than in section 4.1.6(2). Section 4.1.6(1)(j) deals with technical infeasibility. Section 4.1.6(3) contains special technical provisions for alterations to existing buildings and facilities.

• *Section 4.1.7, Historic Preservation*

This section contains scoping provisions and alternative requirements for alterations to qualified historic buildings and facilities. It clarifies the procedures under the National Historic Preservation Act and their application to alterations covered by the ADA. An individual seeking to alter a facility that is subject to the ADA guidelines and to State or local historic preservation statutes shall consult with the State Historic Preservation Officer to determine if the planned alteration would threaten or destroy the historic significance of the facility.

• *Sections 4.2 Through 4.35*

Sections 4.2 through 4.35 contain the technical specifications for elements and spaces required to be accessible by the scoping provisions (sections 4.1 through 4.1.7) and special application sections (sections 5 through 10). The technical specifications are the same as the 1980 version of ANSI A117.1 standard, except as noted in the text by italics.

• *Sections 5 Through 9*

These are special application sections and contain additional requirements for restaurants and cafeterias, medical care facilities, business and mercantile facilities, libraries, and transient lodging. For example, at least 5 percent, but not less than one, of the fixed tables in a restaurant must be accessible.

In section 7, Business and Mercantile, paragraph 7.2 (Sales and Service Counters, Teller Windows, Information Counters) has been revised to provide greater flexibility in new construction than did the proposed rule. At least one of each type of sales or service counter where a cash register is located shall be made accessible. Accessible counters shall be dispersed throughout the facility. At counters such as bank teller windows or ticketing counters, alternative methods of compliance are permitted. A public accommodation may lower a portion of the counter, provide an auxiliary counter, or provide equivalent facilitation through such means as installing a folding shelf on the front of the counter at an accessible height to provide a work surface for a person using a wheelchair.

Section 7.3., Check-out Aisles, provides that, in new construction, a certain number of each design of check-out aisle, as listed in a chart based on the total number of check-out aisles of each design, shall be accessible. The percentage of check-outs required to be accessible generally ranges from 20% to 40%. In a newly constructed or altered facility with less than 5,000 square feet of selling space, at least one of each type of check-out aisle must be accessible. In altered facilities with 5,000 or more square feet of selling space, at least one of each design of check-out aisle must be made accessible when altered, until the number of accessible aisles

of each design equals the number that would be required for new construction.

• *Section 9, Accessible Transient Lodging*

Section 9 addresses two types of transient lodging: hotels, motels, inns, boarding houses, dormitories, resorts, and other similar places (sections 9.1 through 9.4); and homeless shelters, halfway houses, transient group homes, and other social service establishments (section 9.5). The interplay of the ADA and Fair Housing Act with respect to such facilities is addressed in the preamble discussion of the definition of ''place of public accommodation'' in §36.104.

The final rule establishes scoping requirements for accessibility of newly constructed hotels. Four percent of the first hundred rooms, and roughly two percent of rooms in excess of 100, must meet certain requirements for accessibility to persons with mobility or hearing impairments, and an additional identical percentage must be accessible to persons with hearing impairments. An additional 1% of the available rooms must be equipped with roll-in showers, raising the actual scoping for rooms accessible to persons with mobility impairments to 5% of the first hundred rooms and 3% thereafter. The final ADAAG also provides that when a hotel is being altered, one fully accessible room and one room equipped with visual alarms, notification devices, and amplified telephones shall be provided for each 25 rooms being altered until the number of accessible rooms equals that required under the new construction standard. Accessible rooms must be dispersed in a manner that will provide persons with disabilities with a choice of single or multiple-bed accommodations.

In new construction, homeless shelters and other social service entities must comply with ADAAG; at least one type of amenity in each common area must be accessible. In a facility that is not required to have an elevator, it is not necessary to provide accessible amenities on the inaccessible floors if at least one of each type of amenity is provided in accessible common areas. The percentage of accessible sleeping accommodations required is the same as that required for other places of transient lodging. Requirements for facilities altered for use as a homeless shelter parallel the current MGRAD accessibility requirements for leased buildings. A shelter located in an altered facility must have at least one accessible entrance, accessible sleeping accommodations in a number equivalent to that established for new construction, at least one accessible toilet and bath, at least one accessible common area, and an accessible route connecting all accessible areas. All accessible areas in a homeless shelter in an altered facility may be located on one level.

Section 10, Transportation Facilities

Section 10 of ADAAG is reserved. On March 20, 1991, the ATBCB published a supplemental notice of proposed rulemaking (56 FR 11874) to establish special access requirements for transportation facilities. The Department anticipates that when the ATBCB issues final guidelines for transportation facilities, this part will be amended to include those provisions.

Subpart E—Enforcement

Because the Department of Justice does not have authority to establish procedures for judicial review and enforcement, subpart E generally restates the statutory procedures for enforcement.

Section 36.501 describes the procedures for private suits by individuals and the judicial remedies available. In addition to the language in section 308(a)(1) of the Act, §36.501(a) of this part includes the language from section 204(a) of the Civil Rights Act of 1964 (42 U.S.C. 2000a–3(a)) which is incorporated by reference in the ADA. A commenter noted that the proposed rule did not include the provision in section 204(a) allowing the court to appoint an attorney for the complainant and authorize the commencement of the civil action without the payment of fees, costs, or security. That provision has been included in the final rule.

Section 308(a)(1) of the ADA permits a private suit by an individual who has reasonable grounds for believing that he or she is ''about to be'' subjected to discrimination in violation of section 303 of the Act (subpart D of this part), which requires that new construction and alterations be readily accessible to and usable by individuals with disabilities. Authorizing suits to prevent construction of facilities with architectural barriers will avoid the necessity of costly retrofitting that might be required if suits were not permitted until after the facilities were completed. To avoid unnecessary suits, this section requires that the individual bringing the suit have 'reasonable grounds' for believing that a violation is about to occur, but does not require the individual to engage in a futile gesture if he or she has notice that a person or organization covered by title III of the Act does not intend to comply with its provisions.

Section 36.501(b) restates the provisions of section 308(a)(2) of the Act, which states that injunctive relief for the failure to remove architectural barriers in existing facilities or the failure to make new construction and alterations accessible ''shall include'' an order to alter these facilities to make them readily accessible to and usable by persons with disabilities to the extent required by title III. The Report of the Energy and Commerce Committee notes that ''an order to make a facility readily accessible to and usable by

individuals with disabilities is mandatory'' under this standard. H.R. Rep. No. 485, 101st Cong., 2d Sess, pt 4, at 64 (1990). Also, injunctive relief shall include, where appropriate, requiring the provision of an auxiliary aid or service, modification of a policy, or provision of alternative methods, to the extent required by title III of the Act and this part.

Section 36.502 is based on section 308(b)(1)(A)(i) of the Act, which provides that the Attorney General shall investigate alleged violations of title III and undertake periodic reviews of compliance of covered entities. Although the Act does not establish a comprehensive administrative enforcement mechanism for investigation and resolution of all complaints received, the legislative history notes that investigation of alleged violations and periodic compliance reviews are essential to effective enforcement of title III, and that the Attorney General is expected to engage in active enforcement and to allocate sufficient resources to carry out this responsibility. Judiciary Report at 67.

Many commenters argued for inclusion of more specific provisions for administrative resolution of disputes arising under the Act and this part in order to promote voluntary compliance and avoid the need for litigation. Administrative resolution is far more efficient and economical than litigation, particularly in the early stages of implementation of complex legislation when the specific requirements of the statute are not widely understood. The Department has added a new paragraph (c) to this section authorizing the Attorney General to initiate a compliance review where he or she has reason to believe there may be a violation of this rule.

Section 36.503 describes the procedures for suits by the Attorney General set out in section 308(b)(1)(B) of the Act. If the Department has reasonable cause to believe that any person or group of persons is engaged in a pattern or practice of resistance to the full enjoyment of any of the rights granted by title III or that any person or group of persons has been denied any of the rights granted by title III and such denial raises an issue of general public importance, the Attorney General may commence a civil action in any appropriate United States district court. The proposed rule provided for suit by the Attorney General ''or his or her designee.'' The reference to a ''designee'' has been omitted in the final rule because it is unnecessary. The Attorney General has delegated enforcement authority under the ADA to the Assistant Attorney General for Civil Rights. 55 FR 40653 (October 4, 1990) (to be codified at 28 CFR 0.50(1).)

Section 36.504 describes the relief that may be granted in a suit by the Attorney General under section 308(b)(2) of the Act. In such an action, the court may grant any equitable relief it considers to be appropriate, including granting temporary, preliminary, or permanent relief, providing an auxiliary aid or service, modification of policy or alternative method, or making facilities readily accessible to and usable by individuals with disabilities, to the extent required by title III. In addition, a court may award such other relief as the court considers to be appropriate, including monetary damages to persons aggrieved, when requested by the Attorney General.

Furthermore, the court may vindicate the public interest by assessing a civil penalty against the covered entity in an amount not exceeding $50,000 for a first violation and not exceeding $100,000 for any subsequent violation. Section 36.504(b) of the rule adopts the standard of section 308(b)(3) of the Act. This section makes it clear that, in counting the number of previous determinations of violations for determining whether a ''first'' or ''subsequent'' violation has occurred, determinations in the same action that the entity has engaged in more than one discriminatory act are to be counted as a single violation. A ''second violation'' would not accrue to that entity until the Attorney General brought another suit against the entity and the entity was again held in violation. Again, all of the violations found in the second suit would be cumulatively considered as a ''subsequent violation.''

Section 36.504(c) clarifies that the terms ''monetary damages'' and ''other relief'' do not include punitive damages. They do include, however, all forms of compensatory damages, including out-of-pocket expenses and damages for pain and suffering.

Section 36.504(a)(3) is based on section 308(b)(2)(C) of the Act, which provides that, ''to vindicate the public interest,'' a court may assess a civil penalty against the entity that has been found to be in violation of the Act in suits brought by the Attorney General. In addition, §36.504(d), which is taken from section 308(b)(5) of the Act, further provides that, in considering what amount of civil penalty, if any, is appropriate, the court shall give consideration to ''any good faith effort or attempt to comply with this part.'' In evaluating such good faith, the court shall consider ''among other factors it deems relevant, whether the entity could have reasonably anticipated the need for an appropriate type of auxiliary aid needed to accommodate the unique needs of a particular individual with a disability.''

The ''good faith'' standard referred to in this section is not intended to imply a willful or intentional standard—that is, an entity cannot demonstrate good faith simply by showing that it did not willfully, intentionally, or recklessly disregard the law. At the same time, the absence of such a course of conduct would be a factor a court should weigh in determining the existence of good faith.

Section 36.505 states that courts are authorized to award attorneys fees, including litigation expenses and costs, as provided in section 505 of the Act. Litigation expenses include items such as expert witness fees, travel expenses, etc. The Judiciary Committee Report specifies that such items are included under the rubric of ''attorneys fees'' and not ''costs'' so that such expenses will be assessed against a plaintiff only under the standard set forth in *Christiansburg Garment Co.* v. *Equal Employment Opportunity Commission*, 434 U.S. 412 (1978). (Judiciary report at 73.)

Section 36.506 restates section 513 of the Act, which encourages use of alternative means of dispute resolution. Section 36.507 explains that, as provided in section 506(e) of the Act, a public accommodation or other private entity is not excused from compliance with the requirements of this part because of any failure to receive technical assistance.

Section 36.305 Effective Date

In general, title III is effective 18 months after enactment of the Americans with Disabilities Act, i.e., January 26, 1992. However, there are several exceptions to this general rule contained throughout title III. Section 36.508 sets forth all of these exceptions in one place.

Paragraph (b) contains the rule on civil actions. It states that, except with respect to new construction and alterations, no civil action shall be brought for a violation of this part that occurs before July 26, 1992, against businesses with 25 or fewer employees and gross receipts of $1,000,000 or less; and before January 26, 1993, against businesses with 10 or fewer employees and gross receipts of $500,000 or less. In determining what constitutes gross receipts, it is appropriate to exclude amounts collected for sales taxes.

Paragraph (c) concerns transportation services provided by public accommodations not primarily engaged in the business of transporting people. The 18-month effective date applies to all of the transportation provisions except those requiring newly purchased or leased vehicles to be accessible. Vehicles subject to that requirement must be accessible to and usable by individuals with disabilities if the solicitation for the vehicle is made on or after August 26, 1990.

Subpart F—Certification of State Labs or Local Building Codes

Subpart F establishes procedures to implement section 308(b)(1)(A)(ii) of the Act, which provides that, on the application of a State or local government, the Attorney General may certify that a State law or local building code or similar ordinance meets or exceeds the minimum accessibility requirements of the Act. In enforcement proceedings, this certification will constitute rebuttable evidence that the law or code meets or exceeds the ADA's requirements.

Three significant changes, further explained below, were made from the proposed subpart, in response to comments. First, the State or local jurisdiction is required to hold a public hearing on its proposed request for certification and to submit to the Department, as part of the information and materials in support of a request for certification, a transcript of the hearing. Second, the time allowed for interested persons and organizations to comment on the request filed with the Department (§36.605(a)(1)) has been changed from 30 to 60 days. Finally, a new §36.608, Guidance concerning model codes, has been added.

Section 36.601 establishes the definitions to be used for purposes of this subpart. Two of the definitions have been modified, and a definition of ''model code'' has been added. First, in response to a comment, a reference to a code ''or part thereof'' has been added to the definition of ''code.'' The purpose of this addition is to clarify that an entire code need not be submitted if only part of it is relevant to accessibility, or if the jurisdiction seeks certification of only some of the portions that concern accessibility. The Department does not intend to encourage ''piecemeal'' requests for certification by a single jurisdiction. In fact, the Department expects that in some cases, rather than certifying portions of a particular code and refusing to certify others, it may notify a submitting jurisdiction of deficiencies and encourage a reapplication that cures those deficiencies, so that the entire code can be certified eventually. Second, the definition of ''submitting official'' has been modified. The proposed rule defined the submitting official to be the State or local official who has principal responsibility for administration of a code. Commenters pointed out that in some cases more than one code within the same jurisdiction is relevant for purposes of certification. It was also suggested that the Department allow a State to submit a single application on behalf of the State, as well as on behalf of any local jurisdictions required to follow the State accessibility requirements. Consistent with these comments, the Department has added to the definition language clarifying that the official can be one authorized to submit a code on behalf of a jurisdiction.

A definition of ''model code'' has been added in light of new §36.608.

Most commenters generally approved of the proposed certification process. Some approved of what they saw as the Department's attempt to bring State and local codes into alignment with the ADA. A State agency said that this section will be the backbone of the intergovernmental cooperation essential

if the accessibility provisions of the ADA are to be effective.

Some comments disapproved of the proposed process as timeconsuming and laborious for the Department, although some of these comments pointed out that, if the Attorney General certified model codes on which State and local codes are based, many perceived problems would be alleviated. (This point is further addressed by new §36.608.)

Many of the comments received from business organizations, as well as those from some individuals and disability rights groups, addressed the relationship of the ADA requirements and their enforcement, to existing State and local codes and code enforcement systems. These commenters urged the Department to use existing code-making bodies for interpretations of the ADA, and to actively participate in the integration of the ADA into the text of the national model codes that are adopted by State and local enforcement agencies. These issues are discussed in preamble section 36.406 under General comments.

Many commenters urged the Department to evaluate or certify the entire code enforcement system (including any process for hearing appeals from builders of denials by the building code official of requests for variances, waivers, or modifications). Some urged that certification not be allowed in jurisdictions where waivers can be granted, unless there is a clearly identified decision-making process, with written rulings and notice to affected parties of any waiver or modification request. One commenter urged establishment of a dispute resolution mechanism, providing for interpretation (usually through a building official) and an administrative appeals mechanism (generally called Boards of Appeal, Boards of Construction Appeals, or Boards of Review), before certification could be granted.

The Department thoroughly considered these proposals but has declined to provide for certification of processes of enforcement or administration of State and local codes. The statute clearly authorizes the Department to certify the codes themselves for equivalency with the statute; it would be ill-advised for the Department at this point to inquire beyond the face of the code and written interpretations of it. It would be inappropriate to require those jurisdictions that grant waivers or modifications to establish certain procedures before they can apply for certification, or to insist that no deviations can be permitted. In fact, the Department expects that many jurisdictions will allow slight variations from a particular code, consistent with ADAAG itself. ADAAG includes in §2.2 a statement allowing departures from particular requirements where substantially equivalent or greater access and usability is provided. Several sections specifically allow for alternative methods providing equivalent facilitation and, in some cases, provide examples. (See, e.g., section 4.31.9, Text Telephones; section 7.2(2) (iii), Sales and Service Counters.) Section 4.1.6 includes less stringent requirements that are permitted in alterations, in certain circumstances.

However, in an attempt to ensure that it does not certify a code that in practice has been or will be applied in a manner that defeats its equivalency with the ADA, the Department will require that the submitting official include, with the application for certification, any relevant manuals, guides, or any other interpretive information issued that pertain to the code. (§36.603(c)(1).) The requirement that this information be provided is in addition to the NPRM's requirement that the official provide any pertinent formal opinions of the State Attorney General or the chief legal officer of the jurisdiction.

The first step in the certification process is a request for certification, filed by a ''submitting official'' (§36.603). The Department will not accept requests for certification until after January 26, 1992, the effective date of this part. The Department received numerous comments from individuals and organizations representing a variety of interests, urging that the hearing required to be held by the Assistant Attorney General in Washington, DC, after a preliminary determination of equivalency (§36.605(a)(2)), be held within the State or locality requesting certification, in order to facilitate greater participation by all interested parties. While the Department has not modified the requirement that it hold a hearing in Washington, it has added a new subparagraph 36.603(b)(3) requiring a hearing within the State or locality before a request for certification is filed. The hearing must be held after adequate notice to the public and must be on the record; a transcript must be provided with the request for certification. This procedure will insure input from the public at the State or local level and will also insure a Washington, DC, hearing as mentioned in the legislative history.

The request for certification, along with supporting documents (§36.603(c)), must be filed in duplicate with the office of the Assistant Attorney General for Civil Rights. The Assistant Attorney General may request further information. The request and supporting materials will be available for public examination at the office of the Assistant Attorney General and at the office of the State or local agency charged with administration and enforcement of the code. The submitting official must publish public notice of the request for certification.

Next, under §36.604, the Assistant Attorney General's office will consult with the ATBCB and make a preliminary determination to either (1) find that the code is equivalent

(make a ''preliminary determination of equivalency'') or (2) deny certification. The next step depends on which of these preliminary determinations is made.

If the preliminary determination is to find equivalency, the Assistant Attorney General, under §36.605, will inform the submitting official in writing of the preliminary determination and publish a notice in the FEDERAL REGISTER informing the public of the preliminary determination and inviting comment for 60 days. (This time period has been increased from 30 days in light of public comment pointing out the need for more time within which to evaluate the code.) After considering the information received in response to the comments, the Department will hold a hearing in Washington. This hearing will not be subject to the formal requirements of the Administrative Procedure Act. In fact, this requirement could be satisfied by a meeting with interested parties. After the hearing, the Assistant Attorney General's office will consult again with the ATBCB and make a final determination of equivalency or a final determination to deny the request for certification, with a notice of the determination published in the FEDERAL REGISTER.

1If the preliminary determination is to deny certification, there will be no hearing (§36.606). The Department will notify the submitting official of the preliminary determination, and may specify how the code could be modified in order to receive a preliminary determination of equivalency. The Department will allow at least 15 days for the submitting official to submit relevant material in opposition to the preliminary denial. If none is received, no further action will be taken. If more information is received, the Department will consider it and make either a final decision to deny certification or a preliminary determination of equivalency. If at that stage the Assistant Attorney General makes a preliminary determination of equivalency, the hearing procedures set out in §36.605 will be followed.

Section 36.607 addresses the effect of certification. First, certification will only be effective concerning those features or elements that are both (1) covered by the certified code and (2) addressed by the regulations against which they are being certified. For example, if children's facilities are not addressed by the Department's standards, and the building in question is a private elementary school, certification will not be effective for those features of the building to be used by children. And if the Department's regulations addressed equipment but the local code did not, a building's equipment would not be covered by the certification.

In addition, certification will be effective only for the particular edition of the code that is certified. Amendments will not automatically be considered certified, and a submitting official will need to reapply for certification of the changed or additional provisions.

Certification will not be effective in those situations where a State or local building code official allows a facility to be constructed or altered in a manner that does not follow the technical or scoping provisions of the certified code. Thus, if an official either waives an accessible element or feature or allows a change that does not provide equivalent facilitation, the fact that the Department has certified the code itself will not stand as evidence that the facility has been constructed or altered in accordance with the minimum accessibility requirements of the ADA. The Department's certification of a code is effective only with respect to the standards in the code; it is not to be interpreted to apply to a State or local government's application of the code. The fact that the Department has certified a code with provisions concerning waivers, variances, or equivalent facilitation shall not be interpreted as an endorsement of actions taken pursuant to those provisions.

The final rule includes a new §36.608 concerning model codes. It was drafted in response to concerns raised by numerous commenters, many of which have been discussed under General comments (§36.406). It is intended to assist in alleviating the difficulties posed by attempting to certify possibly tens of thousands of codes. It is included in recognition of the fact that many codes are based on, or incorporate, model or consensus standards developed by nationally recognized organizations (e.g., the American National Standards Institute (ANSI); Building Officials and Code Administrators (BOCA) International; Council of American Building Officials (CABO) and its Board for the Coordination of Model Codes (BCMC); Southern Building Code Congress International (SBCCI)). While the Department will not certify or ''precertify'' model codes, as urged by some commenters, it does wish to encourage the continued viability of the consensus and model code process consistent with the purposes of the ADA.

The new section therefore allows an authorized representative of a private entity responsible for developing a model code to apply to the Assistant Attorney General for review of the code. The review process will be informal and will not be subject to the procedures of §§36.602 through 36.607. The result of the review will take the form of guidance from the Assistant Attorney General as to whether and in what respects the model code is consistent with the ADA's requirements. The guidance will not be binding on any entity or on the Department; it will assist in evaluations of individual State or local codes and may serve as a basis for establishing priorities for consideration of individual codes. The Department anticipates

that this approach will foster further cooperation among various government levels, the private entities developing standards, and individuals with disabilities.

Re: Burnt Ridge Development Traffic Study

Job #: 91800.34

The Chazen Companies has completed the data collection for the Burnt Ridge Development Traffic Calming Study. Presented below are the summaries of the data collected.

A. License Plate Survey

A license plate survey was conducted on Tuesday, September 11, 2018 to identify how many vehicles were driving through the development (i.e., vehicles that did not start or end their trip from within the development.) License plates were recorded entering and exiting the development at the three access points during the typical morning and afternoon commuter periods of 7-9 a.m. and 4-6 p.m.

Table 1 shows the amount of traffic in the development in the peak one-hour periods of 7:30-8:30 a.m. and 4:30-5:30 p.m. In the morning peak, a total of 162 vehicles traveled in the development with 86 driving through (43 enter, then exit) and 76 starting/ending from within the development. In the afternoon peak, a total of 260 vehicles traveled in the development with 160 driving through (80 enter, then exit) and 100 starting/ending from within the development. The drive-thru traffic is 53% - 62% of the total development traffic volumes.

Table 1 – Traffic Volumes (vehicles per hour – vph)

	AM Peak Hour			PM Peak Hour		
	Total	**Drive-Thru**	**Within Dev.**	**Total**	**Drive-Thru**	**Within Dev.**
Entering	74	43	31	138	80	58
Exiting	88	43	45	122	80	42
Total	162	86	76	260	160	100

B. Trip Generation Comparison

A comparison was made between the actual volume of traffic occurring from within the development to the volume that would be calculated using industry standards. Traffic expected to be generated by a development is calculated using information contained in the Institute of Transportation Engineers' (ITE) publication, *Trip Generation, 10th Edition*. At the time of the data collection, the development consisted

of 60 homes, 3 of which were under construction. Table 2 shows the expected volumes, based on 57 occupied homes, and the actual volumes. The table shows that the development is generating traffic at higher volumes (69% higher) than would be projected using industry standards.

Table 2 – Trip Generation Comparison

	AM Peak Hour Volumes		PM Peak Hour Volumes	
	ITE Data	Actual Data	ITE Data	Actual Data
Entering	11	31	37	58
Exiting	34	45	22	42
Total	45	76	59	100

C. Speed Data

Vehicle speeds on Burnt Hills Drive and Wooden Lane were recorded on Monday, September 24 through Wednesday, September 26, 2018 covering a period of 48-hours. The average speed and 85th-percentile speeds are shown in Table 3. The 85th-percentile speed is the speed at which 85% of motorists are traveling at or below. The 85th-percentile speed is typically used in roadway design and in speed limit studies. As the table shows, the speeds approximate the Area Speed Limit of 30 mph.

Table 3 – Speed Data (mph)

	Burnt Hills Drive		Wooden Lane	
	Average	85th %-tile	Average	85th %-tile
Eastbound	28	32	25	29
Westbound	28	32	28	33

D. Crash History

The latest 3-year crash history was requested and received from NYSDOT's Accident Location Information System (ALIS). The data period was from June 1, 2015 through May 31, 2018. During this period one crash was reported and it occurred at the intersection of Upper Sherman Road and Burnt Hills Drive. The crash type was right-angle with no injuries reported.

The next step in the study would be to present traffic calming options that could be implemented to potentially reduce the volume of traffic driving through the development.

Safety

Traffic Calming ePrimer

The Traffic Calming ePrimer is a free, online resource openly available for public use. The ePrimer presents a thorough review of current traffic calming practice and contains the information needed to understand this complex field. The ePrimer is presented in eight distinct modules developed to allow the reader to move between each to find the desired information, without a cover-to-cover reading. The ePrimer presents:

- a definition of traffic calming, its purpose, and its relationship to other transportation initiatives (like complete streets and context sensitive solutions);
- illustrations and photographs of 22 different types of traffic calming measures;
- considerations for their appropriate application, including effects and design and installation specifics;
- research on the effects of traffic calming measures on mobility and safety for passenger vehicles; emergency response, public transit, and waste collection vehicles; and pedestrians and bicyclists;
- examples and case studies of both comprehensive traffic calming programs and neighborhood-specific traffic calming plans;
- case studies that cover effective processes used to plan and define a local traffic calming program or project and assessments of the effects of individual and series of traffic calming measures.

John Mate	Transportation Engineer

CITY OF REDONDO BEACH

TRAFFIC CALMING TOOLS & DEVICES REPORT - DRAFT

1. WHAT IS TRAFFIC CALMING?

"Traffic calming is the combination of mainly physical measures that reduce the negative effects of motor vehicles use, alter driver behavior and improve conditions for non-motorized street users." from "*Traffic Calming, State of the Practice*", Institute of Transportation Engineers (ITE), 1999.
The University of California at Berkeley defined traffic calming as "physical retrofitting or changes in operations of management strategies on existing streets, designed to reduce adverse impacts such as speeding and excessive volumes and to improve safety and amenity."
Cities, though, have structured their traffic calming programs about the 3 E's: Education, Enforcement, and Engineering. These measures include enhanced police enforcement, speed displays, community speed watch programs, as well as physical measures such as chokers, traffic circles and speed humps.

2. RESIDENTIAL STREETS – PURPOSE?

"Streets are public spaces for many activities and functions. The first function of residential streets is to serve the land that abuts them. They provide access to homes by all who enter and leave, and all who deliver and collect. But they are also routes for those who wish only to pass through the area. It is here that conflict arises, for there is a basic discrepancy between the impact of vehicular traffic and the tranquility of a residential street." from *Residential Street Design and Traffic Control,* ITE, 1989.

The basic goals of traffic control relevant to residential streets are to enhance:

1. Safety
2. Efficient movement of vehicles consonant with local conditions and the safety objective
3. Environmental goals, such as accessibility for local traffic, minimization of unnecessary traffic, and encouragement of changes in modal choice where this promotes the quality of life and/or specific objectives of a neighborhood. (from *Residential Street Design and Traffic Control*, ITE, 1989)

The main purpose of residential streets is to provide vehicular access to the homes abutting the street, by those who live, visit or deliver there. The alternate use of residential streets as playgrounds is usually left to cul-de-sac streets and very low volume residential streets. This idea is slowly changing as more and more residents are requesting more safety, more access and mobility and a better quality of life on their particular street.
The purpose of this report is to review as many of the traffic calming measures presently available, review the legal challenges, and effect on emergency operations.

3. TRAFFIC COLLISION FACTS ON RESIDENTIAL STREETS IN REDONDO BEACH

A common complaint by many residents is the need for a speed hump or flashing lights as a result of the many collisions seen or heard over the years living at one location. Also, the residents request these additional issues as a result of the perception that safety needs to be increased on the residential streets as a result of perceived speeding.

Residential streets rarely have collisions. There is a perception of traffic hazard and exposure to possible accidents above and beyond which can be quantified. It is the feeling of being unsafe, the experience of a certain threat emanating from traffic. The Redondo Beach Police Department reviewed the past five years, 2000-2005, of accident history relating to residential streets. Police found that there were two injury accidents per year for the entire five year period where the primary factor involved was speeding and the accident occurred midblock. Also found were two collisions per year for the entire five year period relating to speed occurring within residential intersections.

4. VARIOUS TYPES OF TRAFFIC CALMING MEASURES

The following pages review the various types of traffic calming measures with a description when necessary, the advantages, disadvantages, effect on emergency vehicles and cost. They are grouped as follows: Signs, Visible Traffic Enforcement, Automatic Speed Enforcement, Signals, Traffic Reminders, Electronic Speed Reminders, Street Redesign, and Street Restrictors.

A. SIGNS

1) Stop Sign

Advantages:
- Requires traffic to stop.
- Speeds reduced at intersections where pedestrian activity is expected.
- Effect on speed is limited to within approximately 200 feet of the stop sign. Little effect on mid-block speeds.
- May discourage cut through traffic.

Disadvantages:
- Drivers may "roll" through intersections at locations that may not need a stop sign. May create disrespect for stop signs at all locations. These aspects are difficult to measure.
- Effect on traffic volume is little if the bypassed route is congested or delayed.
- Increased noise and air pollution.

Emergency response times:
- May increase emergency response times.

Cost: $300 per sign & pavement markings

2) Speed Limit Sign

- Effect on speed - Signing generally has a negligible impact on actual operating speeds. The majority of people drive at a speed that they consider reasonable and safe.
- Effect on volume – none.
- Issue – The California Vehicle Code sets a 25 mph "prima facie" speed limit automatically for all residential streets. Signing is not required for enforcement of the prima facie speed limit to occur and hold up in court. In some situations, signing is advisable to notify motorists of a change of speed limit across and intersection, and such may occur on the local residential street system. Negligible impact on speeds suggests that overuse may be counterproductive. A few well placed signs are more likely to be noticed and heeded than a proliferation of randomly placed ones.

Advantages:

- Usually popular with the neighborhood.
- Can reduce speeds if enforced.

Disadvantages:

- Requires on-going police enforcement.
- Adds additional signs in neighborhood.
- Speed limit enforcement based on radar or laser is limited by surveys and the size of the streets.

Emergency response times:

- Little or no effect on emergency vehicles.

Cost: $250 per sign

3) No Left Turn, No Right Turn, Do Not Enter Signs

Advantages:

- Safety may increase on the original street with less conflicting turn movements allowed.
- May have a significant positive effect on reducing traffic volumes on the cross street.
- Can address "time of day" problems.

Disadvantages:

- Speed on the cross street may increase slightly as a result of reduced intersection conflicts.
- May result in deliberate violations, particularly where police presence is infrequent.
- Safety may decrease at other locations if drivers are forced to make hazardous movements to compensate for restricted movements.
- Must consider impact on adjacent intersections where turns continue to be allowed.
- Residents must understand restrictions also apply to them.
- Requires enforcement.
- Adds more signs to the neighborhood.

Emergency response times:

- Does not impede emergency vehicles if the restriction is by sign only allowing emergency responder to violate the restriction with emergency lights, siren and due care.

Cost: $250 per sign

4) One-Way Sign

Advantages:

- May reduce total traffic on affected street.
- Safety is inherently greater on one-way segments, end treatments, signage and symbols, must be handled properly.

Disadvantages:

- May encourage increased speeds, although intentional one-way street discontinuities may limit this somewhat.
- May divert traffic to adjacent streets.
- Local residents may have longer travel distances.
- Restriction is subject to intentional violation.
- Too many one-way street discontinuities can confuse service vehicles and residents.
- Must consider before implementation; impacts on area-wide traffic patterns and affect on adjacent streets.

Emergency response times:

- Allows wrong way entry by emergency vehicles.
- Can reduce access by some emergency vehicles if parking on two sides reduces the usable roadway width.

Cost: $750 to $5000 depends on length/width of street, centerline striping requires removal, parking signs and entry/exit signs may need removal, replacement, pavement arrows recommended.

5) Children at Play Sign & similar signs such as Slow or Slow Entering Residential Area Signs

Advantages:

- Believed to slow drivers and enhance children's safety.
- Answers concerns of residents and shows city responsiveness.

Disadvantages:

- Not recognized by State of California or by the Federal Highway Administration as an official traffic control device.
- Not installed by the City as signs are not official traffic control devices.
- Sends wrong message of encouraging children to play within the street.
- City discourages children playing within a street as a pedestrian interaction with automobile could result in severe consequences.
- Children are falsely led to believe these signs create a safer environment.
- Unnecessary signs can confuse and annoy drivers.
- Unnecessary signs can foster disrespect for all signs.
- City provides many neighborhood parks where children may play safely.

Emergency response times:

- No effect.

Cost: $250 per sign.

6) Traffic Safety Public Awareness Campaign

This is a program such as the "Do Stop, Don't Speed" Campaign by the City of Manhattan Beach. In this campaign the City distributes free signs reading "Do Stop, Don't Speed" for placement in residents yards. Also trinkets such as Frisbees, yo-yo's and so on are given out at school functions and other public events. The City has a mascot for this program by the name of "Stopper". The campaign is aired on the local cable station.

Advantages:

- Drivers are continually educated to slow down at stop signs via signs in neighborhood and on cable television.
- May result in drivers being more aware of stop signs.
- Answers concerns of residents and shows city responsiveness.

Disadvantages:

- Not recognized by State of California or by the Federal Highway Administration as an official traffic control device.
- Unnecessary signs can confuse and annoy drivers.
- Unnecessary signs can foster disrespect for all signs.
- May result in sign blight at many locations.
- .Ongoing costs to City to maintain program.

Emergency response times:

- No effect.

Cost: Production cost for cable commercials at $6,000 to $8,000 each. Airing of commercials is approximately $10,000 per 100 airings. Ongoing replacement of signs and gifts for distribution $6,000 or more per year.

B. VISIBLE TRAFFIC ENFORCEMENT

The Redondo Beach Police Department has a traffic hotline number, (310) 937-6605, to call for assistance in obtaining speeding or stop sign enforcement, parking problems or other traffic related concerns.

1) Speeding Enforcement – typically used on collectors and arterial streets where traffic volumes and speeds are usually much higher than the posted (enforced) speed limit. Residential streets usually have lower volumes of traffic. The police unit is usually more visible, therefore, drivers 'tend' to obey the speed limit when enforcement is present.

2) Stop Sign Enforcement – turning restriction enforcement – police presence usually results in most drivers obeying the rules of the road.

Advantages:
- Visible enforcement is very effective.
- Can be used on short notice.
- Can reduce speeds temporarily.
- Can result in turn restrictions compliance temporarily.

Disadvantages:
- Temporary measure.
- Requires long term use to be effective.
- Fines are lower than enforcement costs.
- Majority of complaints will be from cited neighborhood residents.

Emergency response times
- No effect on emergency vehicles.

Costs: $75 or more per hour.

3) Parking Enforcement – police or parking enforcement officers' continuous or occasional presence results in most drivers obeying the rules of street parking, whether it is unpaid parking meters, red curb violations, non-display of disabled placards or .non display of preferential parking permits. The presence of these officers maintains better respect for the law and therefore a more livable neighborhood.

Advantages:

- Visible enforcement is very effective.
- Can be used on short notice.
- Can remove nonresident vehicles from a neighborhood.
- Can result in cleaner, friendlier neighborhoods.

Disadvantages:

- Temporary measure.
- Requires long term use to be effective.
- Fines are lower than enforcement costs.
- Majority of complaints will be from cited neighborhood residents.

Emergency response times

- No effect on emergency vehicles.

Costs: $75 or more per hour.

C. AUTOMATIC SPEED ENFORCEMENT

1) Speed camera is a portable radar unit taking picture of motorist, vehicle and speed for a citation by mail. This method is controversial and subject to various legal challenges.

Advantages:
- Can be directed to problem locations.
- May result in increased enforcement.

Disadvantages:
- Cost.
- Requires personnel to monitor equipment and violations.
- Currently disputed by court action.

2) Emergency response times:
- No effect on emergency vehicles.

So far only City of San Jose has this unit.

Cost: Santa Clara County court system receives majority of fees derived from the fines. Only 13 to 18 cents per dollar of fine is refunded back to City, if the fine is assessed.
City receives approximately $70,000 per year from citations.
Staff of 4.5 personnel, 3 vans including camera equipment costs is $350,000 per year.
Resulting in an overall cost of $280,000 per year.

3) Automated Red Light Camera is a safety device to decrease the number of broadside collisions at signalized intersections. This camera takes before and after pictures of drivers and their automobiles proceeding through a 'red light'. The owner of the vehicle will receive the processed citation. This automated enforcement system has been and is subject to various legal challenges.

Advantages:

- Does reduce the number of the more severe broadside collision.
- Can be directed to the problem intersections.
- Maintains enforcement day and night.
- Allows a police officer to improve other areas of public safety.

Disadvantages:

- Cost for installation, leasing of equipment, and assigned police personnel.
- Requires personnel to monitor equipment.
- May increase rear end collisions – although these are usually less severe than broad side collisions.
- Requires personnel to monitor equipment.
- Requires assigned police officer when two or more intersections become automated.
- Currently disputed by court action.

4) Emergency response times:

- No effect on emergency vehicles.

Cost: fines. Initially unit costs $25,000 per direction to install. A typical signalized intersection would cost $100,000 to install cameras in a four directions. City pays lessee of equipment $50- $75 per citation. City may break even with citation costs if enough fines are collected.

D. SIGNALS

Used at high volume intersections where cross traffic does not allow safe entry or turns for opposing traffic. Not used at low volume intersections unless there is a safety concern or a history of broadside collisions.

Advantages:

- Decrease of broadside collisions.
- Major street may have improved traffic flow.
- Allows pedestrians to cross intersection easily.

Disadvantages:

- Minor street traffic may wait longer before proceeding through intersection.
- Installation cost is high.
- Ongoing operation and maintenance costs.
- Red light running is always an issue.
- Effect on speed – may maintain higher speeds as drivers 'speed' through the intersection to 'make the light'.

Emergency response times:

- Effect on emergency vehicles is 3 to 5 seconds as emergency drivers must wait for traffic to clear.

Costs: installation is $150,000 or higher dependent upon size of intersection and number of lanes. Energy costs for 2005 average $1200 per year per intersection. Note: all City maintained signals have 100% LED lighting. Ongoing maintenance and operations costs.

E. TRAFFIC REMINDERS

1) Flashing Lights - used to emphasize a hazardous or unusual condition.

Advantages:

- Placed at many school crossings to alert drivers of the high number of students crossing at an intersection, specifically non stop sign or signaled controlled crossings. Also installed at many stop sign locations for additional emphasis to alert the driver to stop.
- May reduce speed, especially when children are present.

Disadvantages:

- Little or no effect on volume.

Emergency response times:

- No impact to emergency vehicle access.

Costs: $1,000 to $20,000 or more dependent upon if poles exist, size of pole, width of street, source of power, etc.

2) Larger Stop Signs Or Turn Restriction Signs
Some cities emphasize a problem intersection with the use of larger stop or regulatory signs.

Advantages:
- Alerts drivers where violations are frequent with/without police presence.
- Better visibility for drivers due to size or color.

Disadvantages:
- Adds to sign pollution within the neighborhood.
- Still may require ongoing police enforcement.

Emergency response times:
No affect.

Cost: $300 per sign

3) Light Actuated Crosswalk
Flashing pavement warning lights to advise motorists of pedestrians using the cross walk.

Advantages:
- More visible than traditional crosswalks.
- Can slow travel speeds.

Disadvantages:
- Pedestrians may ignore traffic relying more on the lights to control driver behavior.
- Only used at non-stop sign or non-signal controlled crosswalks.
- Requires more maintenance than traditional crosswalks sue to light replacement and power source issues.
- Cost increases based upon power source, number of lanes, activation type.

Emergency response times:
- No effect on emergency vehicles.

Cost: typical 2 lane road is $22,000 for solar powered system up to $60,000 for a wired system.

4) Sign Post Reflector
Reflective panels placed on the posts of stop signs and warning signs to emphasize the sign to the driver. These reflective panels are usually used at locations of critical concern, such as blatant disregard for the stop sign, the speed limit sign or the crosswalk.

Advantages:
- May alert driver to the sign posted alongside the street.
- May slow travel speeds if used with speed signs.
- Especially effective at night with the higher visibility.

Disadvantages:
- Drivers may ignore the sign locations without these reflective panels.
-
- Requires additional maintenance to clean and replace the reflective panel.

Emergency response times:
- No effect on emergency vehicles.

Cost: $50 per post.

F. SCHOOL RELATED TRAFFIC CALMING METHODS

1) Yellow Crosswalks, Adult School Crossing Guards, School Pedestrian Warning Signs, Flashing Lights and In-Roadway Crossing Guard Signs.

Advantages:

- The yellow school related colors are more visible than traditional white such as the paint for crosswalks and the signs with yellow background.
- The purpose is to slow travel speeds for the safety of the school age pedestrian.
- Adult crossing guards are able to visually see if the oncoming driver is aware of their presence before crossing the school children.

Disadvantages:

- School-age pedestrians may ignore traffic relying more on the signs and yellow crosswalks to control driver behavior.
- Drivers may become accustom to yellow related markings when not in use such as during the summer or weekends.
- Adult School Crossing Guards receive an hourly pay.

Emergency response times:

- No effect on emergency vehicles.

Cost: Varies.

2) Walk to School Routes & the Walking School Bus program

Maps have been published by the City for the various elementary schools to distribute at the beginning of the school year showing safe routes to walk to/from school.

The Walking School Bus program requires responsible parents/adults to 'collect' students as they walk their own student to school. Usually starts with one of the more distant students from the school and as the 'bus' walks more students are added. The walking school bus becomes safer as the number of pedestrians increase. Drivers show more respect for larger groups of pedestrians. Responsible parents/adults must continue to do this on a daily basis to/from school.

Advantages:

- The walking routes take advantage of the stop signs, traffic signals and crossing guards.
- The walking routes also account for other school age pedestrians on the same route.
- The walking route attempts to stay clear of any unusual traffic condition.
- Students have 'fun' walking to school together.
- The student/adult receives physical exercise.
- Removes vehicle(s) off the street.

Disadvantages:

- The school age pedestrian may be directed on a longer route in an effort to maintain the pedestrian's safety.
- Requires a commitment of time and responsibility be parent(s)/adult(s).

Emergency response times:

- No effect on emergency vehicles.

Cost: School District's cost to distribute flyer.

3) Safe School Zone Signs

During the mid 90's the state legislature passed laws in an effort to decrease the violence on and about school campuses. Some of these laws were the 'Gun-Free School Zone Act of 1993 & 1995', 'Drug –Free School Zone Act of 1993', and the reduction of criminal street gang activity about schools passed in 1993. These laws and other similar laws allowed the local enforcement agencies to increase the penalties for offenses committed within a school zone. A school zone was established as a 1000 feet zone around the school.

In an effort to promote awareness of these new laws, the Redondo Beach Unified School District requested the City to post orange and purple circular signs approximately at the 1000 feet distance from the boundaries of the school campuses. The signs state "Safe School Zone". Many of these signs still remain throughout the City.

Advantages:

- Emphasis the safe school boundaries according to state laws.
- Promotes awareness that the City of Redondo Beach and the Redondo Beach Unified School district is serious regarding maintaining safe school campuses and environs.

Disadvantages:

- A sign which has lost its significance over the years.

Emergency response times:

- No effect on emergency vehicles.

Cost: $50 per sign replacement.

G. ELECTRONIC SPEED REMINDERS

1) Radar Trailer

A portable trailer with a radar unit that detects the speed of passing vehicles and displays it on a reader board often with the speed limit sign next to the display.

Advantages:
- Encourages speed compliance.
- Can reduce speeds temporarily.
- Good public relations tool.
- Effective education tool.

Disadvantages:
- Not an enforcement tool.
- Ineffective on multilane highways.
- Less effective on high volume streets.
- Subject to vandalism.
- Effect is negligible on higher volume streets.
- Some motorists may speed up to register a higher speed.
- Requires frequent maintenance.
- Requires increase personnel for deployment.
- Personnel subject to injury on duty due to weight and manipulation concerns.
- Complaints by neighbors due to occupation of parking spaces.

Emergency response times:
- No effect on emergency vehicles.

Cost: Initial cost is $10,000 to $12,000 for a basic unit. Ongoing maintenance cost is above average. Cost of police officer to deploy unit weekly or daily.

2) Fixed Electronic Radar Signs

Electronic signs with a built-in radar unit which detects the speed of the oncoming vehicle and displays the speed. The existing speed limit sign may be posted adjacent or some electronic signs can flash 'slow down' when the speed is much higher than the speed limit or at times the sign may flash the posted speed limit.

- Same advantages and disadvantages as radar trailer.
- Some manufacturers have their signs vary the display showing the speed limit, vehicle speed or messages such as 'slow down'.

Emergency response times:
- None.

Cost: under $10,000 per unit. Ongoing cost is minimal.

H. STREET REDESIGN

1) One-Way Streets

Advantages:

- May reduce total traffic on affected street.
- Safety is inherently greater on one-way segments; end treatments must be handled properly.

Disadvantages:

- May encourage increased speeds. Although intentional one-way street discontinuities may limit this somewhat.
- May divert traffic to adjacent streets.
- Local residents may have longer travel distances.
- Restriction is subject to intentional violation.
- Too many one-way street discontinuities can confuse service vehicles and residents.
- Must consider before implementation, impacts on area-wide traffic patterns and affect on adjacent streets.
- Can reduce access by some emergency vehicles if parking on two sides reduces the usable roadway width.

Emergency response times:

- Allows wrong way entry by emergency vehicles, little or no delay unless parking on both sides reduces the usable roadway width.

Cost: $1000 to $5000 depends on length/width of street, if centerline striping requires removal, parking signs and entry/exit signs may need removal, replacement, pavement arrows recommended.

2) Narrow Lanes

Striping is usually used to create narrow lanes, often about 10 feet wide. The unused pavement can be used to stripe bicycle and/or parking lanes.

Advantages:
- Can be quickly implemented.
- Can be easily modified.
- May slow travel speeds.

Disadvantages:
- Not always perceived as an effective tool.
- Adds striping to neighborhood streets.
- Increases regular maintenance.
- Increases resurfacing costs.

Emergency response times:
- Little or no effect on emergency vehicles.

Costs: installation dependent on length of street – 1000 foot long block about $4000. On going maintenance and operations costs.

3) Raised Intersection

A raised intersection is a flat, raised area covering the entire intersection. There are ramps on all approaches. The plateau is usually about 4 inches high. Usually part of an area wide traffic calming scheme involving both streets.

Advantages:

- Reduces through-the-intersection movement speeds.
- Provides safer street crossing for pedestrians.
- Can be aesthetically pleasing, if bricks or a finished texture is used.
- Does not affect access.

Disadvantages:

- Installation cost is high.
- Requires drainage modifications.
- May increase pedestrian trip and fall incidents.
- Noise may increase due to slowing/braking.
- May result in street sweeping issues.

Emergency response times:

- Effect on emergency vehicles is 2 to 8 seconds as emergency drivers must slow for ramp portion.

Costs: installation is $40,000 or higher dependent upon size of intersection and necessary drainage improvements.

4) Raised Crosswalks

Raised crosswalks are crosswalks constructed 3 to 4 inches above the elevation of the street and across the width of the street. Usually have a flat section in the middle. Raised crosswalks are speed humps with a crosswalk. Used to reduce vehicle speeds where a high amount of pedestrians cross the street.

Advantages:
- Effectively reduces vehicle speeds
- Does not affect access.
- Good pedestrian safety treatment
- Increases pedestrian visibility and likelihood that drivers yield to pedestrians.

Disadvantages:
- May generate increased noise.
- Can require drainage modifications
- Result in a loss of parking.
- May shift some traffic to neighboring streets.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is 6 to 11 seconds depending on the size of the emergency vehicle.

Costs: installation is $8000 to $15,000 per crosswalk.

5) Traffic Circles (mini-roundabouts)

Traffic circles are raised circular islands located within the smaller local street intersections.
Requires drivers to travel around the circle in a counterclockwise pattern.
Typically controlled by “yield on entry” signs on all approaches.

Advantages:
- Effectively reduces vehicle speeds.
- Reduces broadside collision potential.
- Provides better side-street access.
- Opportunity for landscaping.

Disadvantages:
- Parking removal required.
- Can increase bike/auto conflicts.
- Can restrict large vehicle access.
- Can impede emergency vehicle access.
- Can increase sideswipe collisions.
- May result in trash collection issues.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is 3 to 6 seconds.

Costs: installation is $8,000 to $25,000, dependent upon size of intersection. Increased maintenance costs with landscaping.

6) Roundabout

Roundabouts are traffic circles used at major intersections with a high volume of traffic. Roundabouts are used to replace traffic signals in an effort to reduce delays. Typically used on streets with 20,000 vehicles per day or less.

Advantages:
- Decrease of broadside collisions.
- Major street may have improved traffic flow.
- Allows large vehicles to make U-turns.
- Removes large queues of vehicles waiting at stop controlled intersections.
- Opportunity for landscaping.

Disadvantages:
- Sometimes requires obtaining property behind the corners of the intersection.
- Installation cost is high.
- Inappropriate at locations where traffic backs up from other intersections.
- May increase sideswipe and lane change collisions.

Emergency response times:
- Effect on emergency vehicles is 2 to 10 seconds for emergency vehicle to turn left. Otherwise no more delay that at traffic signal and stop controlled intersections.

Costs: installation is $75,000 or higher dependent upon size of intersection, and number of travel lanes. This cost does not include any additional property if necessary. Increased maintenance costs with landscaping.

7) Choker

Chokers are midblock curb extensions that narrow a street by extending the sidewalk or widening the planting strip.

Advantages:
- Reduces vehicle speeds.
- Shorter pedestrian crossing.
- May reduce traffic volumes.
- Opportunity for landscaping.
- Opportunity to install fire hydrants at these locations to be away from parked cars.

Disadvantages:
- May require removal of parking.
- May create hazard for bicyclists.
- May impede the movement of larger emergency vehicles.
- May create drainage issues.
- May direct some traffic to other streets.
- May impede truck movements, such as trash haulers.
- May create street sweeping issues.

Emergency response times:
- Effect on most emergency vehicles is minimal as this location is clear of parked vehicles. Increased maintenance costs with landscaping.

Costs: installation is $15,000 each.

8) Curb Extension

Curb extensions are chokers placed at an intersection. Curb extensions are sometimes called bulbouts or neckdowns. Curb extensions result in a narrowing of the intersection.

Advantages:
- Reduces vehicle speed at street entrance.
- Shorter pedestrian crossing.
- Opportunity for landscaping or street furniture.

Disadvantages:
- May require removal of parking.
- May create drainage issues.
- Difficult for trucks or larger vehicles to turn right, including emergency vehicles.
- May impede trash haulers.

Emergency response times:
- Effect on emergency vehicles is 3 to 10 seconds. Emergency vehicles should be included in the initial design layout in order to reduce turning movement concerns.

Costs: installation is typically $15,000 to $50,000. Increased maintenance costs with landscaping.

9) Entrance Barrier

Entrance barriers are curb extensions or barriers that restrict movements into a street. They are constructed to approximately the center of the street, effectively obstructing one direction of traffic. Entrance barriers create a one-way segment at the intersection while maintaining two-way traffic for the rest of the block.

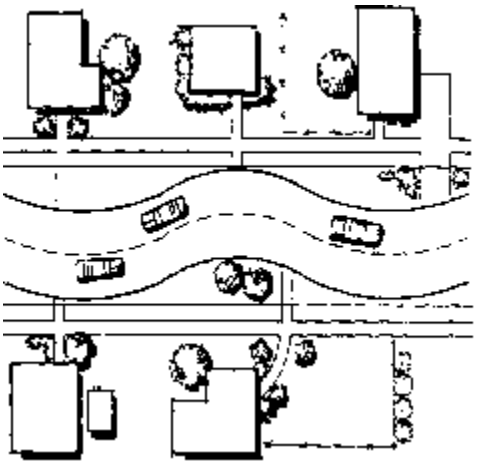
Advantages:
- Reduces cut-through traffic.
- Self enforcing.
- Shorter pedestrian crossings.
- Opportunity for landscaping.

Disadvantages:
- May divert traffic to other streets.
- Can increase trip lengths, must consider how residents will gain access to street.
- May result in a loss of parking.
- In effect at all times.
- May result in intentional violations by locals.
- May impact trash haulers.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is 3 to 5 seconds as long as emergency drivers are able to turn the wrong way on the street. Otherwise, to go around the block may increase the time by 1 minute or more.

Costs: installation is $15,000 or more depending on landscaping, irrigation, storm drains, etc. Increased maintenance costs with landscaping.

10) Chicane



A chicane is a series of two or more staggered curb extensions on alternating sides of a roadway. Horizontal deflection influences motorists to reduce speed through the serpentine roadway.

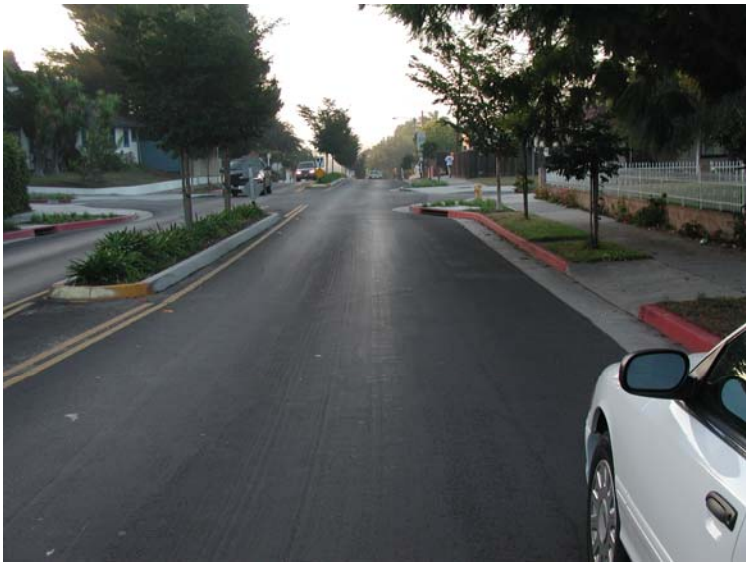
Advantages:
- Reduces vehicular speeds.
- Opportunity for landscaping.

Disadvantages:
- Significant parking loss.
- Increases maintenance.
- Cannot be used where right-of-way is limited (width of street).
- May increase conflicts with pedestrians and bicyclists.
- Many driveways along street will negate use of chicanes.
- May result in trash hauler issues.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is 3 seconds or less on residential streets as emergency personnel are slowing to look for house numbers.

Costs: installation is $30,000 to $50,000 each. Increased maintenance costs with landscaping.

11) Median Island (restricts turn movements or narrow lanes)



Median islands are raised islands in the center of a street that can be used to narrow lanes for speed control and/or create a barrier to prohibit left turns into or from a side street.

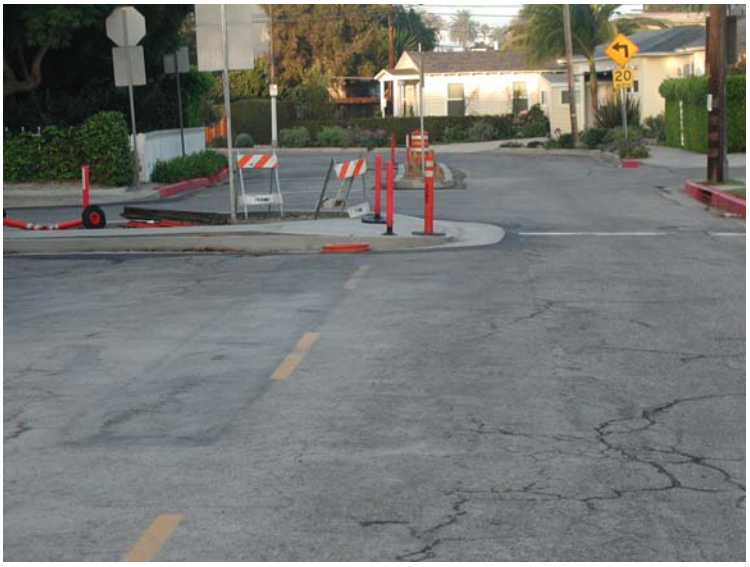
Advantages:
- Reduction in vehicular speeds.
- Major street may have improved traffic flow.
- Reduces collision potential.
- Opportunity for landscaping.
- May divert unwanted traffic volumes.

Disadvantages:
- Could require parking removal.
- May reduce driveway access.
- May divert traffic to other streets.
- May result in conflict with bicyclists and vehicles.
- Possibly ongoing maintenance and operations costs.

Emergency response times:
- Effect on emergency vehicles is negligible unless the median results in the emergency unit going around the block.

Costs: installation is $15,000 to $75,000 depending upon size. Increased maintenance costs with landscaping.

12) Restricted Movement Barrier



Restricted movement barriers are raised islands that prevent certain movements at an intersection. These islands are often landscaped.

Advantages:
- Reduces cut-through traffic volumes.
- Provides pedestrian refuge area.
- May reduce speeding.

Disadvantages:
- Redirects traffic to other streets.
- Will increase trip lengths.
- May be aesthetically unattractive.
- May result in street sweeping issues.
- May result in trash hauler issues.

Emergency response times:
- Effect on emergency vehicles is 3 to 5 seconds as long as emergency drivers may enter street the wrong way; otherwise must travel around the block.

Costs: installation is $15,000 or higher.

13) Diagonal Diverters

Diagonal diverters are raised areas placed diagonally across a four-legged intersection. They prohibit through movements by creating two "L" shaped intersections.

Advantages:
- Reduces cut-through traffic.
- Reduces travel speed near the intersection.
- Reduces collision potential.
- Can be landscaped.
- Circulation less impacted versus full street closure.

Disadvantages:
- Directs traffic to other streets.
- May increase trip lengths.
- Always in effect.
- May create drainage issues.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is minimal unless emergency drivers must go around the block. Diagonal diverters should be designed to allow emergency vehicles to drive over them to reduce the response time.

Costs: installation is $25,000 to $50,000 each. Increase maintenance costs with landscaping.

14) Street Closure

Used when citizens want the benefit if a cul-de-sac style street. The street closure shifts traffic onto other streets and denies critical emergency access.

Advantages:
- Reduces cut-through traffic.
- Reduces traffic volumes.
- Always in effect.
- Opportunity for landscaping.
- Design with small openings to allow for bicyclists and pedestrians.

Disadvantages:
- Directs traffic to other streets.
- Increases trip lengths.
- May lose some street parking.
- May result in drainage issues.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is major if emergency vehicles must go around the block. If street closure is designed to allow emergency vehicle access, delay may be only 5 to 10 seconds as emergency drivers must wait for traffic to clear.

Costs: installation is $10,000 to $30, 0000. Ongoing maintenance and operations costs. Increased maintenance costs with landscaping.

I. SPEED RESTRICTORS (vertical deflectors)

1) Bumps

The short raised asphalt obstructions, mainly used in private parking lots, are the speed bumps. As a result of the extreme discomfort to the vehicle and the occupants, this style of speed restriction is not recommended for cities to use on streets with their higher speeds.

Not Recommended.

2) Humps

Speed humps are areas of pavement raised from 2 inches to 4 inches in height over a length of 12 feet. They work by forcing motorists to slow down to comfortably pass over them. They are marked with signs and pavement markings.

Advantages:
- Reduces vehicle speeds.
- Can reduce traffic volumes if a 'faster' parallel route exists.
- Does not require parking removal.
- Always in effect.

Disadvantages:
- May direct traffic to other streets.
- Not aesthetically pleasing, requires additional signage and pavement markings.
- Increases noise near speed hump from braking, accelerating and vehicle suspension.
- May result in noise complaints from resident.
- Difficult to construct without proper tools (template).
- May result in trash hauler issues.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is an average delay of 6 to 11 seconds. There is also some evidence that humps stress equipment and create unnecessary wear and tear. Emergency operations prefer using speed tables or speed cushions instead.

Costs: installation is $15,000.
Ongoing maintenance and operations costs.

3) Speed Tables

A speed table has a more gradual rise than the speed hump and also has a flat length of at least 10 feet and up to 20 to 23 feet to accommodate buses.

Advantages:
- Reduces vehicle speeds.
- Can reduce traffic volumes if a 'faster' parallel route exists.
- Always in effect.
- Preferred by drivers of larger vehicles over speed humps.

Disadvantages:
- May direct traffic to other streets.
- Not aesthetically pleasing, requires additional signs and pavement markings.
- Increase in noise near speed table from braking and accelerating.
- May lose some street parking.
- May result in trash hauler issues.
- May result in street sweeping issues.
- May result in drainage issues.

Emergency response times:
- Effect on emergency vehicles is 2 to 9 seconds.

Costs: installation is $15,000 to $30,000.
Ongoing maintenance and operations costs.

4) Speed Cushions

A speed cushion is typically a rectangular section of pavement that is raised no more than 3 inches high. Speed cushions are placed across the travel way with a 2-foot space between each cushion. The 2-foot space allows for commercial vehicles to traverse the raised cushions without actually running over the cushion. This reduces the noise created by large vehicles. The vertical deflection encourages passenger vehicles to reduce speed.

Advantages:
- Reduces vehicle speeds.
- Can reduce traffic volumes if a 'faster' parallel route exists.
- Always in effect.
- Preferred by drivers of larger vehicles which can straddle the cushions.
- Preformed units are easy to install.
- May be removed and re-installed at other locations.

Disadvantages:
- May divert traffic.
- Not aesthetically pleasing, requires additional signing and pavement markings.
- Increase in noise near speed cushion from braking and accelerating.
- May result in street sweeping issues.

Emergency response times:
- Effect on emergency vehicles is 1 to 4 seconds with the smaller equipment. Larger emergency vehicles are not affected by speed cushions.

Costs: installation is $2,500 per rectangular section; for a typical narrow one lane in each direction street, 2 sections are required for a cost of $5,000. Cost includes signs and pavement marking also.
Ongoing maintenance and operations costs.

5. LIABILITY

Previous to the 1980's, the State of California adopted rules and regulations in regards to cities placing official traffic control devices within a city. These traffic control devices include, but are not limited to, stop signs, yield right of way signs, speed restriction signs, railroad warning approach signs, street name signs, lines and markings on the roadway, and stock crossing signs.(Section 21400 CVC).

During the late 1970's, the City of Berkeley installed concrete bollards and intersection diverters to reduce cut-through traffic in various neighborhoods. The City of Berkeley was challenged in court to remove all of the large concrete bollards it had installed to control the flow of traffic and to reduce collisions (*Rumford v. City of Berkeley*, 1982). The California Supreme Court ruled the diverters and half closures installed by the City of Berkeley were traffic control devices not authorized by State law. The Court stated that in California, a locality has no right to interfere with the free flow of traffic unless expressly authorized by State statute.

During 1983, the California legislature passed a bill legalizing all existing diverters as roadway design features. California Vehicle Code, (CVC) Section 440 states "An "official traffic control device" is any sign, signal, marking, or device, consistent with Section 21400, placed or erected by authority of a public body or official having jurisdiction, for the purpose of regulating, warning, or guiding traffic, *but does not include islands, curbs, traffic barriers, speed humps, speed bumps, or other roadway design feature.*

A. Regarding street closures and partial closures

Local authorities may adopt rules and regulations by ordinance on the following matters per CVC 21101 (f); "Prohibiting entry to, or exit from, or both, from any street by means of islands, curbs, traffic barriers, or other roadway design features to implement the circulation element of a general plan adopted pursuant to Article 6 (commencing with Section 65350) of Chapter 3 of Division 1 of Title 7 of the Government code. The rules and regulations authorized by this subdivision shall be consistent with the responsibility of local government to provide for the health and safety of its citizens."

A traffic barrier proposed to be installed pursuant to Vehicle Code Section 21101(f) should be:

a) based on a design approved by a traffic engineer in order to provide "design immunity" to the city;

b) generally authorized by language in the circulation element of the city's general plan;

c) constructed, sited and managed in accordance with rules and standards contained in a program approved by ordinance or resolution of the city council;

d) approved in compliance with CEQA; and

e) not involve a regionally significant roadway.

The above are conditions required for a city to implement a partial or full street closure on a city street. (taken from a paper, "Legal Issues Regarding the Implementation

of Traffic Calming" and Neighborhood Parking Control Measures", Kevin G. Ennis, Esq., March 14, 2003.

B. Regarding installation of speed humps (vertical deflections)

The issue of the installation of speed humps always initiates the response of "What about the liability?" As per CVC Section 440, speed humps are categorized as "other roadway design features". Most cities have taken the position that they can be installed without specific Vehicle Code authority or conformance to state standards.

The state standards referred to are the *Manual on Traffic Control Devices*, the Federal Highway Administration edition and the California supplement and the Caltrans *Highway Design Manual*. Previous to 2004, the State of California used the 1996 Caltrans *Traffic Manual* for the installation and requirements for signs, marking, signals, and lighting. Since 2004, California has adopted the federal standards for the installation of signs, marking, signals, etc. of the *Manual on Uniform Traffic Control Devices* (MUTCD) with a CA supplement. In regards to roadway design features such as corner radius, slopes, pavement design etc. the policies followed are published in the Caltrans *Highway Design Manual*. There is also the standard published by the American Association of State Highway and Transportation Officials, *A Policy of Geometric Design of Highways and Streets*. The MUTCD specifies pavement markings and warning signs to be used at speed humps but there are **no geometric, designs, nor placement** standards for speed humps in the previously referenced standards used by traffic engineers. The federal government and state governments at this time have relinquished this rule to the individual jurisdictions.

Per the paper, "Legal Issues Regarding …… Control Measures", Ennis, 2003, "The courts and the California Attorney General have yet to rule on this issue. Recommended by Ennis for a city considering speed bumps (humps), it is advisable for a city to:

a) base the design and proposed locations on recognized engineering standards as approved by a traffic engineer in order to provide :"design immunity" to the city;
b) make sure the circulation element of the city's general plan does not conflict with a speed hump program;
c) provide that the speed humps are constructed, sited and managed in accordance with rules and standards contained in a program approved by ordinance or resolution of the city council; and
d) ensure that the process of approving the speed humps is done in compliance with CEQA.

Therefore, if the City Council decides to implement speed humps, speed tables or speed cushions, a set of standards relating to design, placement, and speed/traffic volume criteria is necessary for approval by the City Council, all in compliance with CEQA and the general plan.

The Risk Manager of the City sent an email request to various cities to inquire if they have speed humps, and if there have been any liability issues arising as a result of the

speed humps. The Cities of Monterey Park, Downey, and Long Beach do not have speed humps. Their main concern is litigation.
Downey also stated that slowing of emergency vehicles and jarring of the occupants and equipment are concerns.
The City of Long Beach has preferred to place the radar trailer at many locations. Also, Long Beach cites drivers for traveling 9 mph or more over the speed limit. The results have been a dramatic lowering of the speeds, long after the police have left. A third item the City of Long Beach uses is a Neighborhood Watch for Speeders. Block Captains record the licenses of speeders reported by residents. Once three reports are given by three different residents on the same vehicle, the police are notified and a letter is sent to the owner. The owner is placed on notice that they were seen speeding and the police will be working the neighborhood to find such offenders.

Cities replying that they had speed humps:
The City of Monrovia has 7 speed humps with all installed just 4 months ago in regard to speeding complaints. No complaints have been received from the residents regarding speeding. No legal complaints have been filed and no other method has been found to control speeding such as speed humps.
The City of Upland had a few speed humps installed years ago. The city has denied recent requests for speed humps as there are no established standards for the implementation of speed humps. No claims have been received by Upland.

The Risk Manager also received from our contract legal counsel that there is no information regarding immunizing a public entity for the installation of speed humps. The contract legal counsel recommends that a speed hump is designed and built by the City traffic engineers like any other roadway improvement project in an effort to immunize the city from liability.

Attached is a table of responses the Public Works Department of the City of Redondo Beach received in Nov. 2003 regarding various California cities and their response to the inquiry about speed humps.

Other liability issues regarding speed humps:

C. Noise nuisance

The creation of additional noise is a nuisance and a potential for another legal liability. Residents often complain of increased noise from vehicles downshifting, decelerating, accelerating, or actually making physical contact while navigating the calming devices. This is noted in the case of *Friends of H Street v. City of Sacramento*, Oct. 21, 1993. This case also makes reference to "cut –through traffic", which is a common occurrence in neighborhoods with traffic calming devices, as the traffic tends to move to a parallel street. Residents were trying to get the City to take some action regarding heavy traffic volumes, speeds, and noise on their neighborhood street. Their preference was to place restrictions on the street so that these nuisances would be removed. "The court ruled against the residents, holding that the routing of traffic is at the discretion of the city

council, that the rerouting of traffic in this case would hurt other streets, and that the city council could not please everyone. As the court saw it, the loss of peace and quiet is a fact of life which must be endured by all who live in the vicinity of freeway, highways, and city streets."

D. Vehicle Damage Claims

"Damage claims are much more common that lawsuits filed with the courts. But damage claims are still relatively rare, and the number of claims miniscule. Given the hundreds of traffic calming measures in place for many years in featured communities, these numbers are surprisingly small. Seattle, Washington has one of the longest running programs with the most measures in place. About two claims are filed per year over the past 15 years, with only three claims having been paid. This is very low compared with the number of claims filed and paid in connection with, for example, potholes." From *Traffic Calming, State of the Practice*, ITE, 1999.

6. EMERGENCY RESPONSE

Traffic calming measures that are effective in slowing or diverting automobiles will have the same effect, or sometimes greater effect on fire-rescue vehicles. The biggest challenge is to keep the effect on emergency response time within acceptable bounds or to find new ways of slowing and diverting other traffic without substantially impeding emergency response.

A 1997 survey by the City of Berkeley revealed that four out of five cities report "some concern" on the part of emergency services over the use of speed humps versus many of the other traffic calming measures. The other most criticized traffic calming measures were diverters, street closures and traffic circles.

Several cities have performed controlled tests of speed humps, speed tables and traffic circles to see how much delay is produced by them. Regardless of the traffic calming measure or fire-rescue vehicle, the delay per slow point is always under 10 seconds. That will add up if there is more that one traffic calming measure along a route. The "Traffic Calming, State of the Practice" ITE, 1999 published a response time study results from various cities for different traffic calming measures and vehicles.

Community **Response Time Goal (seconds)**	**Measure**	**Delay at Slow Point (seconds)**
Austin, TX 3.5 (fire)	12-foot speed humps	2.8 (fire engine) 3.0 (ladder truck) **2.3 (ambulance without patient)** **9.7 (ambulance with patient)**
Berkeley, CA 4 (fire) 5 (medical)	12-foot speed humps 22-foot speed tables	10.7 (fire engine) 9.2 (ladder truck) 3.0 (fire engine) 13.5 (ladder truck)
Boulder, CO 6 (fire)	8-foot speed hump 12-foot speed hump	4.7 (fire engine) 2.8 (fire engine)

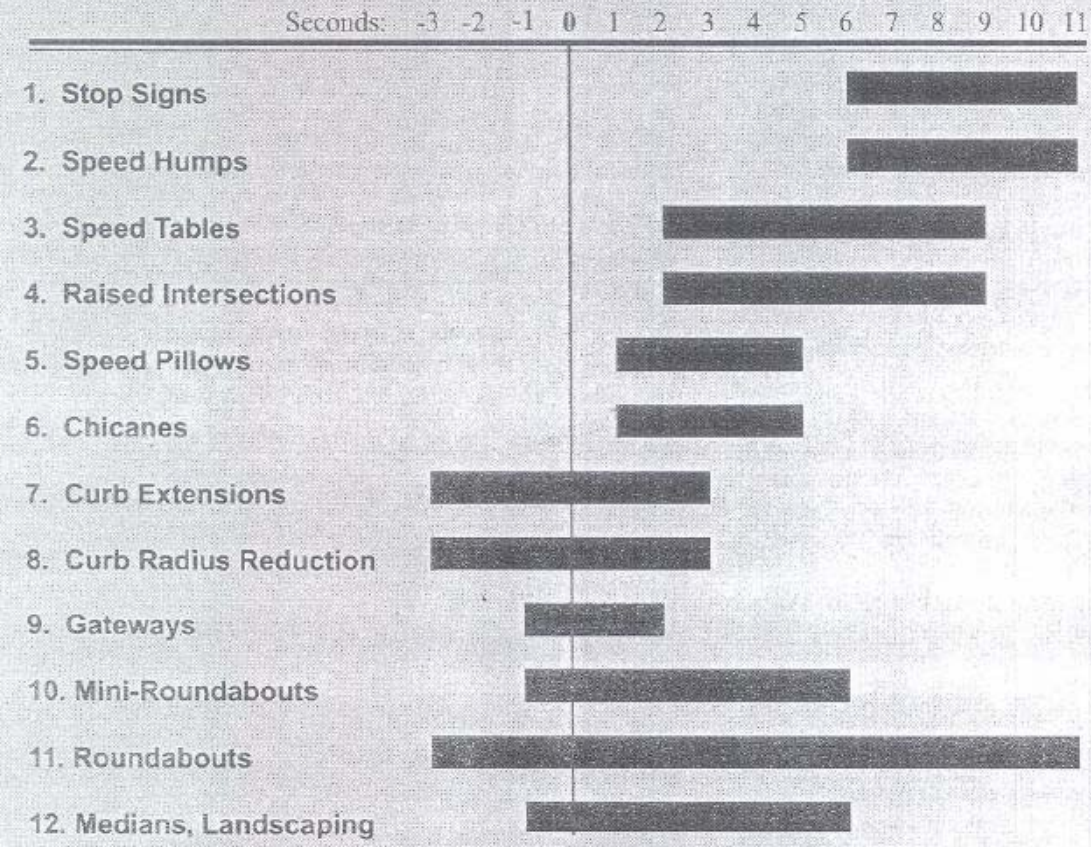
4 (medical)	37-foot speed table (6 inch rise) 40-foot speed table (6-inch rise) 25-foot diameter traffic circle	3.8 (fire engine) 3.8 (fire engine) 7.5 (fire engine)
Montgomery County, MD 5 (fire)	12-foot speed humps 18-foot diameter traffic circle	2.8 (ladder truck) 3.8 (ambulance) 4.2 (fire engine) 7.3 (pumper truck) 5.4 (ladder truck) 3.2 (ambulance) 5.0 (fire engine) 7.0 (pumper truck)
Portland, OR (assumes a 35 mph response cruising speed) 4 (fire)	14-foot speed humps 22-foot speed tables 16-24 foot oblong traffic circles	5.2 (fire engine) 2.9 (custom rescue vehicle) 6.6 (ladder truck) 3.0 (fire truck 0.3 (custom rescue vehicle) 3.0 (ladder truck) 6.1 (fire engine) 3.1 (custom rescue vehicle) 8.4 (ladder truck)
Sarasota, FL not given	12-foot humps	9.5 (ambulance)

Notice in the above table, the City of Austin, Texas timed an emergency response **with** and **also without** a patient in an ambulance, see bolded results. An additional 7.4 seconds is added to an emergency response with a patient in the ambulance. This slowing down is necessary in an effort not to give discomfort to the patient. This test was on a typical 12-foot speed hump installed by many cities. An ambulance delivering a patient to a hospital may have to travel over speed humps during this trip.

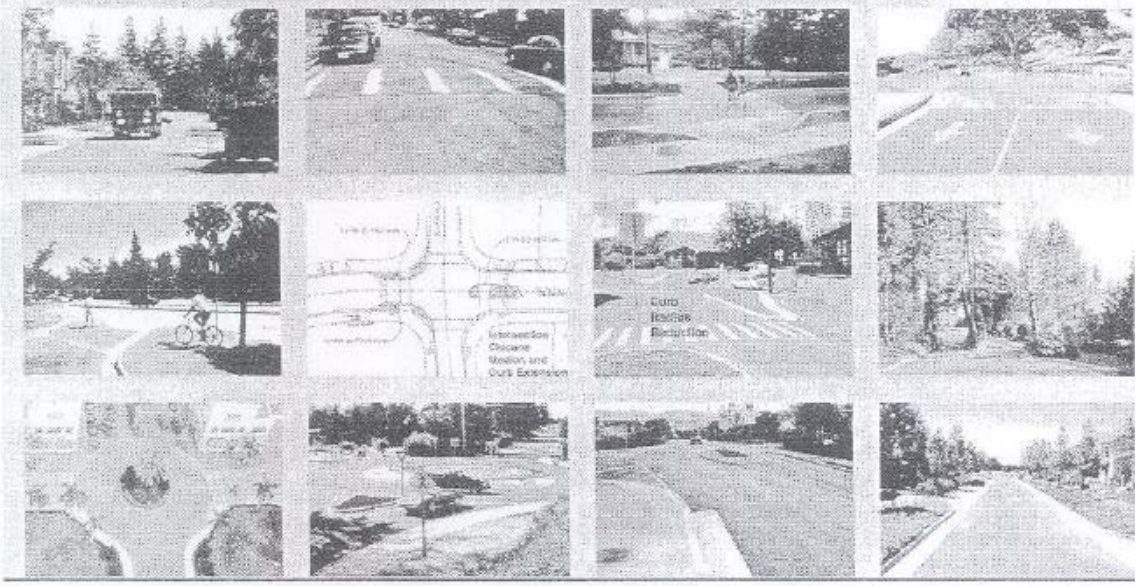
The booklet, "*Emergency Response, Traffic Calming and Traditional Neighborhood Streets*", Local Government Commission, 2001, contains a chart, (see next page) of delay caused by different traffic calming measures on emergency vehicles. This chart is not broken down into the various types of emergency vehicles or the dimensions for the calming measures. Therefore, this chart gives a range of delay in seconds with many variables which could be associated with the minimal or long delays.

For certain, the majority of traffic calming measures do slow the response times of emergency vehicles, from 2 to 6 seconds. Some traffic calming measures have a greater impact on emergency response time such as speed humps and large traffic circles than other measures such as mini-roundabouts or speed pillows.

Fire-rescue units nearly always oppose volume controls that lengthen response routes. Street closures, diagonal diverters, and median barriers may have this effect. More receptive are engineered measures that allow the emergency to travel the wrong –way in these situations.



Fire-rescue units usually oppose speed humps and other vertical measures that rattle and rock speeding vehicles. Traffic circles and chicanes are preferred even though they may create a slightly longer delay but they do so without vertical displacement.



Redesign of many of the traffic calming measures may result in fire-rescue response acceptance. Items such as lowering the 'lip' of the inside circle of a traffic circle from 4 to 2 inches will make it easier for larger vehicles to turn in the circle. Lock gates or removable bollards at street closures or diverters may also be acceptable to local fire-rescue units.

The police generally support traffic calming measures for their potential to control speeding and reduce collision severity. The engineered measures are self enforcing, which takes some of the pressure off police officers to enforce traffic laws.

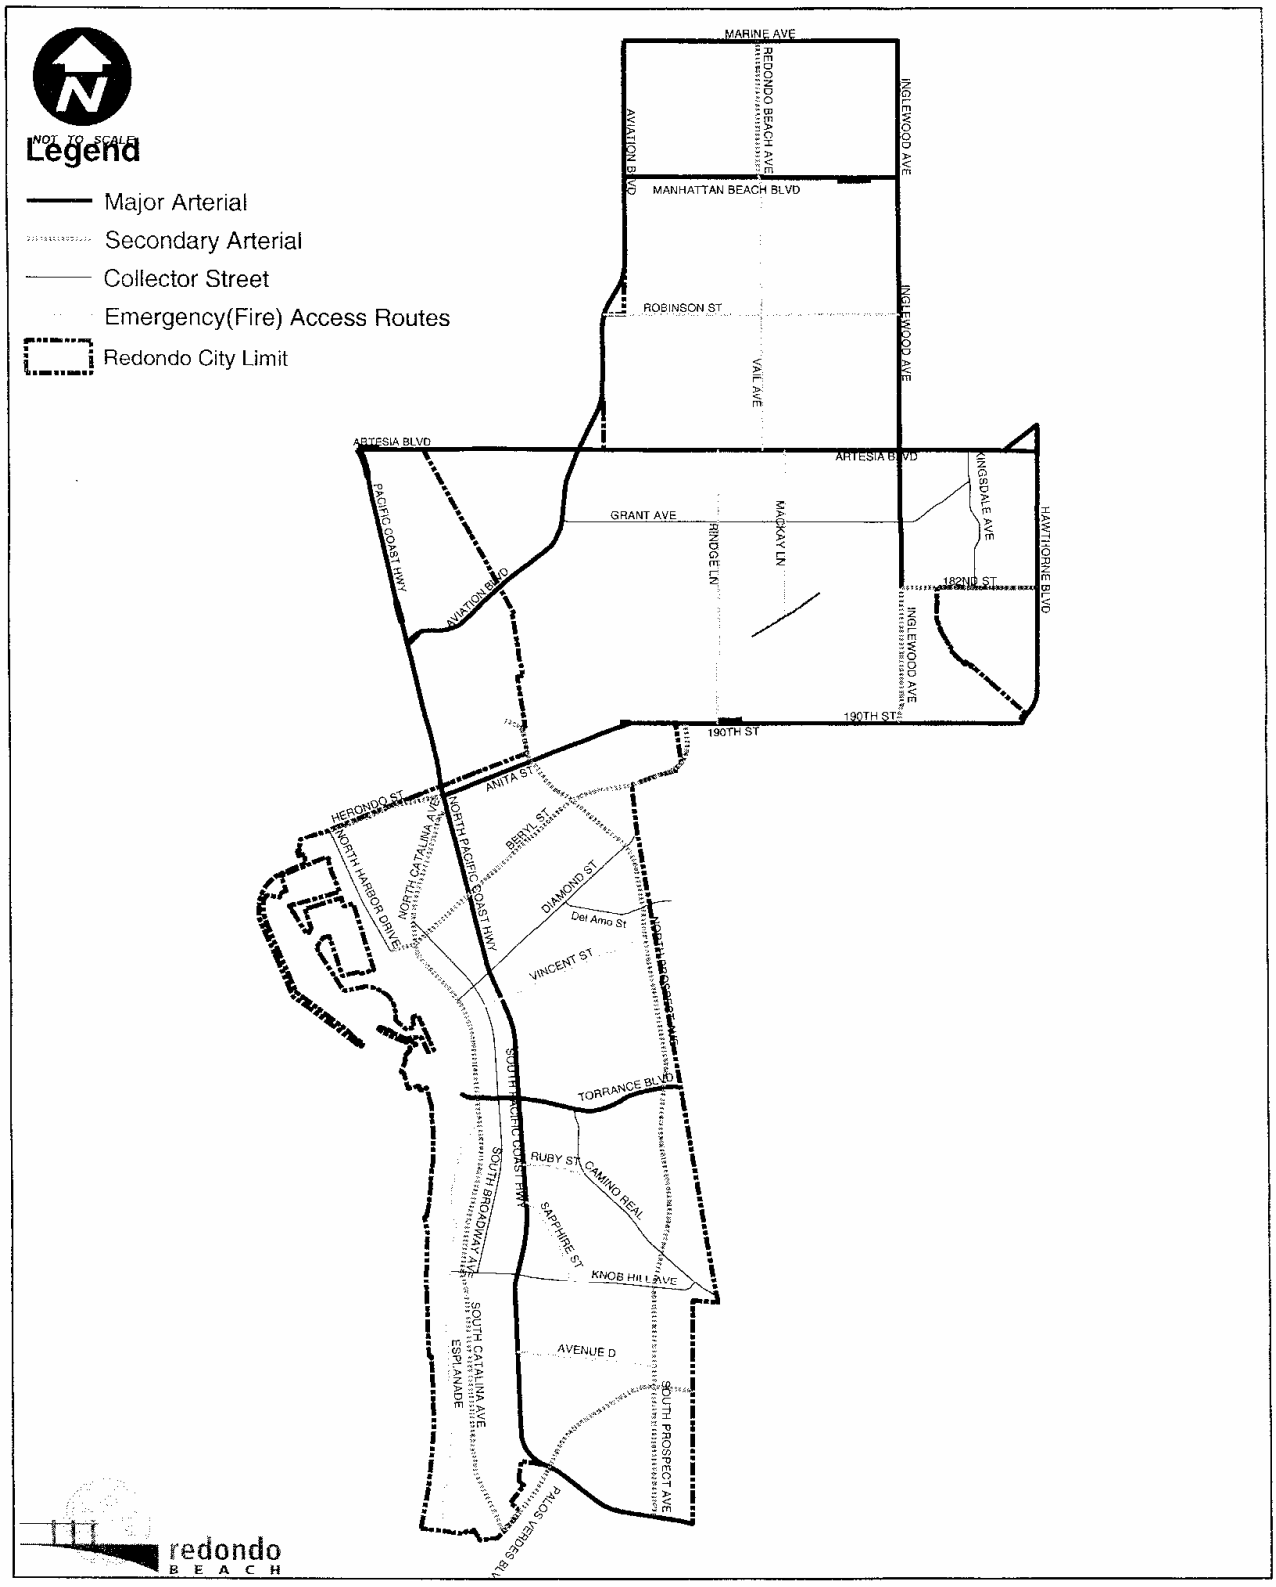
PART TWO: TRAFFIC CALMING

Approximate Delay Caused by Different Treatments

7. SPEED HUMP CRITERIA

A. Speed Hump Criteria from other Southern California Cities.

The issue of speed humps, even amongst other southern California Cities, is an ongoing controversial issue. The City obtained the following table of criteria used by other cities; some are noted as not using speed humps. Some of the criteria vary, such as the traffic volumes, the minimum street length, petition requirements and some cities have cost sharing with the residents for speed hump installation. These differences are a result of the traffic engineer responding to the local needs and desires of the community. Remember, for improved liability protection, since speed humps are not official traffic control devices, each city must develop their own criteria for the implementation of speed humps. The design of the speed hump will also vary between each city.



Attachment A contains a speed hump survey of various cites throughout California obtained from the Public Works Department.

B. City of Redondo Beach - possible criteria for speed humps.

The City of Redondo Beach must develop its own set of speed hump criteria and design if the City Council desires to implement a speed hump program. A possible set of criteria is given at the bottom of the speed hump table for the City of Redondo Beach. Also attached is a map showing the streets which are emergency response routes for police, fire and ambulance and should be exempt from speed hump installation.

Speed Hump Requirements
from various
Southern California Cities

CITY	CRITERIA								
	Traffic Volume Requirements VPD	Minimum	TRAVELING SPEED NO GREATER THAN M.P.H. w/in a 24 hour period)	COST City / Resident	Street Grade max.	Arterial Residential	PETITION REQUIREMENTS From Residents	Police/Fire Approval	COMMENTS
Carson	300 - 3000	40w	50% - 5m.p.h.		6%	residential	2/3	Yes	
El Segundo	**N/A**								
Gardena									
Hawthorne	500 - 2000	40w	85% - 7m.p.h.	City pays for cost by	2.50%		2/3		
Hermosa Beach	>than 2500	800' L	25	If approved,	8%	residential	67%	Yes	
Huntington Beach	not used								
Inglewood	1000 - 3000	750' L	85% - 5m.p.h.	cost sharing avaliable		residential	75%	Yes	
Lawndale	**N/A**								
Lomita	See LA County								
Manhattan Beach	not recommended								Previously installed;
Palos Verdes Estates				2K - 2.5K					
Rancho Palos Verdes	1500	1/4 mile	67% exceed 25 m.p.h.	2K - 2.5K	>than 6%	residential		Yes	
Rolling Hills									
Rolling Hills Estate	yes				>than 5%		67%		
Torrance	not allowed								
City of Los Angeles	500-10,000		85ile - 5 mph or more		<7%	25 or 30mph residential	75%	Yes	removal at city cost (no alleys)
Thousand Oaks	2500	40'W	87% exceed 5 mph			25 mph	60%	Yes	Good petition
Los Angeles County	5000						66% for 90% overall pro/con		
Culver City	3000		85% - 7 m.p.h.				60%		60% also for removal
Santa Monica			85%ile exceeds 32 mph					Yes	went from asphalt to rubberized humps?
Yorba Linda	1000 - 2000			80% petition with money		residential	80%		
Palm Springs	500 - 3000	600' L	85% - 7 m.p.h.						
Redondo Beach (tbd)	less than 2500		85%ile - 7 mph or more		< 8%		66%		

City of Redondo Beach- Streets Exempt from Speed Hump Installation

8. CALIFORNIA ENVIRONMENTAL QUALITY ACT CONCERNS

The placement of traffic control devices and roadway design features such as intersection chokers or speed humps may require traffic studies to comply with the California Environmental Quality Act (CEQA). These traffic studies will most probably be required for traffic calming measures such as cul-de-sacs or partial street closures. In these instances all or the majority of traffic will be required to travel upon another street or streets. The impact to these streets must be considered and traffic mitigation, if necessary, must be provided in order to minimize the impact on these streets. Compliance with the CEQA requirements will lessen the concerns and the need for litigation against the City.

City staff will determine on a case by case basis the extent of the traffic study or other studies necessary to comply with CEQA. There are no legal cases on file which have quantified when a city must mitigate additional vehicles on a street as a result of a nearby traffic calming modification.

The cost of the study should be borne by the petitioning neighborhood. Some cities have a 50/50 split whereas other cities pay for the first $10,000 and the neighborhood the remainder. This is an item to be discussed.

9. STUDY RESULTS ON THE EFFECTS OF VARIOUS TRAFFIC CALMING METHODS

City staff, Police personnel, City Manager's Office, and the Mayor and City Council have all been inundated with requests for speed humps, street closures, chokers, or any other traffic calming method to slow drivers or reduce the amount of traffic on a street. The following tables have been included in an effort to educate the public regarding the results determined by other cities in implementing various traffic calming methods. In particular most of the emphasis is on speed humps. speed tables, and stop signs. These traffic calming methods are the most requested by residents. Staff of the various cities completed before and after studies in an effort to understand the effects of the various traffic calming methods. The following tables are taken from *Traffic Calming, State of the Practice*, ITE, August 1999.

A. Speed and Volume Data Before and After Traffic Calming

The effects of various traffic calming methods are very site specific in relation to the effects on speeds and volume of traffic. The after effect of a traffic calming installation is very dependent upon the geometrics and spacing of the measures, availability of alternate routes, the treatment of nearby streets in regards to calming improvements, and many other factors. Speed distributions are represented by 85^{th} percentile speeds in traffic engineering studies. It represents the most probable highest safe speed driven by most motorists. The ITE *Traffic Calming* book tabled the speed results of hundreds of studies in their Appendix A. The first two pages of this information are shown on pages 44 & 45.

A summary of this information is provided on page 46. This summary table reveals the results of ten traffic calming measures and their after effects on speed. A warning must be given regarding the before and after numbers: the exact locations of the measurements may be at different locations as a result of the placement of the traffic calming device; also, the dates and times of the before and after studies maybe 1 month to 3 years before or after the installation of the measure, which could affect the results; and the number of surveyed samples may be to small to obtain a reasonable result. This table shows that the speed humps have the greatest impact on speed reduction by an average of 7 mph.

Also, at the bottom of this chart are two graphs which show the speed results as compared to the distance from the speed hump as studied by the City of Portland. The most impact is within the first one hundred feet on either side of the speed hump. Beyond one hundred feet, the affect on lowering the speed of a driver minimizes.

APPENDIX A

Speed and Volume Data Before and After Traffic Calming

Community/Location	Measure	85th Percentile Speed (mph)			Volumes (vehicles/day)			Comments
		Before	After	% Change	Before	After	% Change	
Austin, TX								
Richcreek Rd	12' humps	37	30	-19	503	543	8	Average or sum of two directions - speed data collected between humps - in most cases, before data 3 to 9 weeks before installation - after data collected from 2 weeks to 24 months after installation
Pasadena Dr	12' humps	36	31	-14	523	535	20	
Aspen Creek Pkwy	12' humps	38	26	-32	561	388	-31	
Woodland Ave	12' humps	40	28	-30	7,611	7,018	-8	
Roundup Tr	12' humps	39	31	-22	734	469	-36	
Cedar St	22' tables	35	28	-20	468	383	-18	
Broad Oaks Dr	22' tables	40	31	-23	357	290	-19	
Sunstrip Dr	22' tables	37	28	-24	932	952	2	
Rockpoint Dr	22' tables	36	30	-17	421	460	9	
Pack Saddle Pass	Diagonal diverter	N/A			3,600	1,400	-61	Data collected two blocks away - temporary diverter removed - traffic diverted to neighboring streets
Frontier Trail	Diagonal diverter	N/A			800	500	-38	Data collected one block away
Morrow St	Forced turn island and turn restriction	N/A			8,420	3,763	-55	Data collected four blocks away - Blocks westbound movement on Morrow St at Lamar Blvd
Davis St	Half closure	25	23	-8	2,233	568	-75	Data collected same block as half closure
Rainey St (70 blk)	Circle	33	35	6	389	269	-31	Part of neighborhood traffic calming treatment involving half closures, speed cushions, traffic circle, and neckdowns (temporary installations)
Rainey St (80 blk)	Speed cushions	35	28	-20	3,323	2,321	-30	
Rainey St (90 blk)	Speed cushions and neckdown	28	22	-21	835	1,869	124	
River St (600 blk)	Circle	N/A			610	590	-3	
River St (700 blk)	Circle	26	27	4	3,152	2,033	-36	

Note. In Appendix A, the 20 communities featured in this report are listed first, alphabetically. Data for several other communities follow.

Community/Location	Measure	85th Percentile Speed (mph)			Volumes (vehicles/day)			Comments
		Before	After	% Change	Before	After	% Change	
Bellevue, WA								
Somerset Dr	12' humps	39	27	-31	795	746	-6	Between humps - only alternate route consists of circuitous local streets - speeds at humps = 12–15 mph at 4" humps; 23–26 mph at 3" humps that replaced 4" humps
Highland Dr	12' humps	36	25	-31	1,702	1,934	14	No parallel route available - after measurement soon after installation
128th Ave NE (S of NE 2nd)	12' humps	33	27	-18	1,305	1,022	-22	
162nd Ave SE	12' humps	37	27	-27	1,472	1,071	-27	Good alternate route on parallel collector (161st Ave SE) - after measurement soon after installation - also report 2 years after
SE 63rd St	12' humps with chokers	36	25	-31	2,456	2,593	6	No parallel route available (Forest Dr would seem to provide good alternate) - also report speeds at humps
NE 39th St	12' humps with chokers	39	25	-35	3,685	2,931	-20	Good alternate route available on collector road (NE Northrup Way) - also report speeds at humps
108th St SE (location A)	22' tables	35	29	-17	2,540	1,942	-24	Speeds measured between tables - good alternate routes available on collector roads (Bellevue Way and 112th Ave, SE)
108th St SE (location B)	22' tables	34	31	-9	2,223	1,809	-19	
108th St SE (location C)	22' tables	35	31	-11	2,346	1,885	-20	
128th Ave NE (N of NE 5th St)	Half closure	N/A			770	442	-43	Data collected same block 20% violation rate
128th Ave NE (N of NE 5th St)	One-lane angled choker	31	28	-10	770	331	-57	Replaced half closure that was frequently violated
SE 46th Way	Circle with neckdowns	34	28	-18	N/A			
Berkeley, CA								
Acton St	12' humps	29	22	-24	N/A			Also report speeds at humps and range of speeds between and at humps - smaller range of speeds after than before installation
Berkeley Way	12' humps	31	22	-29	N/A			
Bonar St	12' humps	32	21	-34	N/A			
Capistrano Ave	12' humps	32	24	-25	N/A			
Catalina Ave	12' humps	25	22	-12	N/A			
Cornell Ave	12' humps	30	25	-17	N/A			
Curtis St	12' humps	34	28	-18	N/A			
El Camino Real St	12' humps	28	23	-18	N/A			

Table 5.1. Speed Impacts Downstream of Traffic Calming Measures.

Sample Measure	Sample Size	85th Percentile Speed (mph)*		
		Average After Calming	Average Change After Calming	Percentage Change*
12-foot humps	179	27.4 (4.0)	-7.6 (3.5)	-22 (9)
14-foot humps	15	25.6 (2.1)	-7.7 (2.1)	-23 (6)
22-foot tables	58	30.1 (2.7)	-6.6 (3.2)	-18 (8)
Longer tables	10	31.6 (2.8)	-3.2 (2.4)	-9 (7)
Raised intersections	3	34.3 (6.0)	-.3 (3.8)	-1 (10)
Circles	45	30.3 (4.4)	-3.9 (3.2)	-11 (10)
Narrowings	7	32.3 (2.8)	-2.6 (5.5)	-4 (22)
One-lane slow points	5	28.6 (3.1)	-4.8 (1.3)	-14 (4)
Half closures	16	26.3 (5.2)	-6.0 (5.2)	-19 (11)
Diagonal diverters	7	27.9 (5.2)	-1.4 (4.7)	-4 (17)

*Measures within parentheses represent the standard deviation from the average. This table is summarized from data presented in appendix A.

Source: Bureau of Traffic Management, City of Portland, June 1997.

B. Accidents Before and After Traffic Calming

A question which is sometimes asked is "what are the affects of the various traffic calming methods on collisions?" Assumed is as a result of the lower speeds, eliminating conflicting movements and having drivers become more aware, that the traffic calming methods result in a lower number of collisions. Most traffic calming methods result in lowering of the volume of traffic. As a result the collisions may move elsewhere as motorists divert to other streets. In this country, traffic calming is restricted to low volume residential streets where collisions occur infrequently to begin with and collision rates get lost in the random variations from year to year. The next table reveals the collision frequencies before and after traffic calming from unpublished documents. Taken From Table 5.7, *Traffic Calming: State of the Practice*, ITE. The overall reduction is collisions after adjusting for the reduction in volumes is only 4%.

				Average Annual Collisions
Traffic Calming Measures	# of Sites	Before Calming	After Calming	Percentage Change
12-foot humps	50	2.62	2.29	-13
14-foot humps	5	4.36	2.62	-40
22-foot tables	8	6.71	3.66	-45
Circles	17	5.89	4.24	-28
Overall	193	2.54	1.24	-51
Sites with volume data	55	4.43	3.22	-27
Rate adjusted for decrease in volume data	55	3.36	3.22	-4

10. RESULTS OF 10 SPEED SURVEYS ON RESIDENTIAL STREETS

The Police Traffic Division and the Engineering Services Department of the City of Redondo Beach are aware of streets where concerns regarding speeding and high traffic volumes have been mentioned in the past. Additional enforcement and signage improvements have occurred at most of these locations. The City obtained machine speed counts for a week at these locations, as if the City were to study these locations for speed hump installations. The following table reveals the results of these machine counts. Speeds on the ten streets vary from 28 to 45 mph and average volumes varied from 243 to 884 per direction per day. From this is the type of data and variation in results, the City must develop a policy regarding the installation of speed humps or speed cushions based on traffic volumes and 85%ile speeds.

SAMPLE OF RESIDENTIAL STREET SPEEDS

Location	Direction	85th Percentile	Average # Vehicles/Day	Start Date	End Date
611 Ave. D	Westbound	46 MPH	408	8/24/05	8/30/05
	Eastbound	28 MPH	372	9/2/05	9/8/05
218 Ave. F	Westbound	38 MPH	884	8/24/05	8/30/05
	Eastbound	33 MPH	1099	9/12/05	9/18/05
3022 Dow	Northbound	28 MPH	283	8/24/05	8/30/05
	Southbound	27 MPH	279	9/2/04	9/8/05
220 S. Guadalupe	Northbound	31 MPH	251	8/24/05	8/30/05
	Southbound	31 MPH	201	9/1/05	9/7/05
1709 Huntington	Eastbound	32 MPH	579	8/24/05	8/30/05
	Westbound	31 MPH	449	8/24/05	8/30/05
222 N. Juanita St	Northbound	29 MPH	335	8/24/05	8/30/05
	Southbound	28 MPH	359	8/24/05	8/30/05
809 N. Paulina Ave	Northbound	33 MPH	243	8/24/05	8/30/05
	Southbound	33 MPH	350	8/24/05	9/19/05
2011 Rockefeller	Westbound	32 MPH	487	8/24/05	8/30/05
(one-way street)					
1916 Ruhland Ave	Eastbound	38 MPH	540	8/24/05	8/30/05
	Westbound	33 MPH	534	8/24/05	8/30/05
1808 Spreckles Ln	Eastbound	29 MPH	515	8/24/05	8/30/05
	Westbound	28 MPH	364	8/24/05	8/30/05

11. SUMMARY ASSESSMENT OF TRAFFIC CALMING MEASURES

The following table shows a summary of the various traffic calming measures and their various impacts on speed, traffic volume reduction, noise, loss of parking, access restriction to a street, the effects on emergency vehicles particularly fire rescue units, maintenance costs, if any, and the cost of implementation.

12. PRIORITY PLACEMENT OF TRAFFIC CALMING MEASURES

Once a request is received from a resident regarding traffic related problem specifically related to speeding or cut-through traffic, the complaint will be handled with the devices listed in this traffic calming report. New ideas and devices will also be considered as these are developed.

Phase 1 Measures - A majority of the complaints may be resolved through the use of the first of the two E's: Education and Enforcement. A review of the signs in the neighborhood and/or striping may result in a need to refurbish these items. Further review may result in an analysis of engineering needs and referral as a Phase 2 measure. The need to have the police respond by enforcement will also be considered and authorized if necessary. The police may use the Volunteer's In Policing (VIP's) to 'shoot' radar for 2 hours to confirm a speeding concern. The traffic engineer may also use machines to verify the traffic volume and the speeding. The resident or residents may be given pamphlets educating them on the possible upcoming procedures and the effect the requested measure may have on the street and neighborhood. The traffic calming measures used in these measures will be designated as Phase 1 measures. Phase 1 measures will be administered by staff and do not require commission or council action.

Phase 2 Measures – these measures require the determination by the City that the Phase 1 measures are not working. Phase 2 measures will require a petition from the neighborhood and public meetings at the Public Works Commission and the City Council level. Phase 2 measures will implement the Engineering portion of the 3 E's. The traffic calming measures in Phase 2 will require physical modifications to the driver's travel pattern by the use of signs or physical roadway design features. These modifications should not require an extensive Environmental Impact Report. A minor traffic study may be required to satisfy the concerns of the residents on an adjacent street which may be impacted.

Phase 3 Measures – these measures require the determination by the City that the Phase 1 and Phase 2 Measures are not working if implemented. A petition from the neighborhood will be required, if not previously provided. The Phase 3 measures most probably will require an enhanced traffic study to fulfill the requirements of the CEQA process. The Phase 3 Measures have the most probability of affecting other neighborhood or city streets. Public meetings will be required before the Public Works Commission and the City Council.

Generalized Assessment of Traffic Calming Measures

Measure ^	Phase ^	Reduces Speed	Reduces Traffic	Noise	Loss of Parking	Restricts Access	Emergency Impacts	Maint-enance	Cost
Radar Trailer	1	Maybe	No	No Change	None	None	None	No	$10-12K
Speed Limit Signing	1	Maybe	No	No Change	None	None	None	Occasional	$250 /sign
Sign Post Reflector	1	Maybe	No	No Change	None	None	None	Some	$50 per post
Police Enforcement	1	Yes	Maybe	No Change	None	None	None	No	$75/hr
Slow Children at Play Sign #	1	No	No	No Change	None	None	None	Occasional	$250 /sign
Speed Camera +	1	Yes	Maybe	No Change	None	None	None	Yes	$150K+
Narrowing Lanes	2	Maybe	Maybe	No Change	None	None	None	Yes	$1-4K
Signed Restrictions	2	No	Yes	Decrease	None	Yes	None	Occasional	$250 /sign
Fixed Electronic Signs	2	Maybe	No	No Change	None	None	None	Occasional	$10K
Lighted Crosswalks	2	Yes – when in use	Minimal	No Change	None	None	None	Occasional	$22-60K
Chicane	2	Yes	Maybe	No Change	Yes	Maybe	Some	Occasional	$30-50K
Intersection Channelizing	2	Yes	Maybe	No Change	Yes	None	None	Maybe	$15-20K
Median Islands	2	Yes	Maybe	Decrease	Yes	Yes	Yes	Yes	$15-75K
Curb Extensions	2	Yes	No	No Change	Yes	None	Yes	Yes	$15-50K
Chokers	2	Yes	Maybe	No Change	Yes	None	Some	Yes	$15K
Speed Humps	3	Yes	Maybe	Increase	None	None	Yes	Yes*	$15K
Speed Cushions	3	Yes	Maybe	Increase	None	None	Some	Yes*	$5K+
Speed Table	3	Yes	Maybe	Increase	Yes	None	Yes	Yes*	$15-30K
Raised Crosswalk	3	Yes	Maybe	Increase	Yes	None	Yes	Yes*	$8-15K
Raised Intersection	3	Yes	Maybe	Increase	Maybe	None	Yes	Yes*	$40K+
One-Way Street	3	Maybe	Yes	Decrease	None	Yes	None	None	$1-5K
Traffic Circles	3	Yes	Maybe	No Change	Yes	Maybe	Yes	Yes	$8-25K
Roundabout	3	Yes	No	No Change	Yes	None	Some	Yes	$75K+

Stop Signs	3	Maybe	Maybe	Increase	None	None	Yes	Occasional	$300 /sign
Signal	3	Maybe	No	Increase	Yes	None	Some	Ongoing	$150K+
Movement Barrier	3	Maybe	Yes	Decrease	None	Yes	Yes	Yes	$15K
Entrance Barrier	3	Maybe	Yes	No Change	Maybe	Yes	Yes	Occasional	$15-20K

Street Closure	3	Maybe	Yes	Decrease	Maybe	Yes	Yes	Yes	$10-30K
Red Light Camera	3	Maybe	No	No Change	None	None	None	Yes	$50K+

^ In no particular order

* Must be reinstalled each time a street is resurfaced.

+ Not approved by State law – only San Jose has this system

- not an official traffic control device

13. CURRENT POLICIES USED BY THE CITY OF REDONDO BEACH REGARDING VARIOUS TRAFFIC AND PARKING ISSUES

Currently the City Engineer and Transportation Engineer respond to many requests for stop signs, red curbs about driveways, residential disabled parking spaces, residential permit parking, and time limit parking affecting residential areas. The policy for each of these issues is shown on the latter pages of the attachments.

Survey Concerning Speed Humps

November 24, 2003

Respondent agencies who allow or do not have speed humps, are as follows:

City & Respondent	Comments
City of Wasco; C. Alan Whitten; alwhitten@CI.WASCO.CA.US	We have just reciently enacted a traffic impact fee, that for the first time is giving us the option of installing traffic calming measures. We are also in the process of formulating policy for the installation of traffic calming devices. I can tell you that we have generaly had a negitive reaction to speed bumps, and a more positive reaction to the 'speed table' option. A good resource for different traffic calming measures can be found at www.trafficcalming.org I can tell you that the City of Bakersfield has quite a good speed bump policy. Contact Steve Walker at (661) 326-3724.
City of Torrance; Ted Semaan; tsemaan@tormet.com	The City of Torrance does not have any speed humps installed on our streets.....yet. Speed Humps are a component of our Neighborhood Traffic Management (Calming) Program adopted by the Council in 1998. The SH's were approved in concept but not by design. Approximately one year ago, our division prepared a design for Speed Humps and took it to the Traffic Commission for discussion and concurrence to the design with the goal of taking the design to Council for approval. The design was very similar to that used by the City of Los Angeles and many surrounding cities in which the SH's are 12' wide and 2 5/8" high. We have not taken the design to the Council yet. Our approach in addressing their consideration along with other Traffic Calming tools has been to take specific location requests into a neighborhood forum. We determine the extent of the neighborhood to be considered, which will include any surrounding streets that may be potentially impacted and homeowners we anticipate to utilize this street as part of their commute. The second parameter we use is to identify the neighborhood by the surrounding arterial streets. Lastly, we use the school attendance boundary for the notification. By utilizing the Neighborhood approach, we have had residents from surrounding streets or those utilizing the streets, yet from the "neighborhood", object to the installation of speed humps. The objections are similar to what you have heard before (noise, inconvenience, squealing wheels, etc...). In addition, some of those opposing SH's have referenced driving over ones installed in neighboring jurisdictions and their displeasure with their impact. We have taken several of these neighborhood meetings to the Traffic Commission and the City Council. In all cases, the Commission and Council have agreed not to install the speed humps. I have a feeling that will change at sometime in the future, we'll wait and see. I hope this helps, please let me know if you require any additional information.
City of Daly City; Peter Gleichenhaus; pgleichenhaus@dalycity.org	We do not permit speed bumps on city streets. Our Fire Department has convinced us that any benefits from such traffic control devices are overcome by the disadvantage to the ability to respond in emergencies in timely fashion.
City of Dublin; Ginger Russell; ginger.russell@ci.dublin.ca.us	To date, the City of Dublin has not allowed speed bumps, undulations, or anything of that type. The major reasons are liability and the fact that they slow the response time for emergency vehicles. Just an "aside" comment - there are humps (fairly severe ones) on my dad's street in Sacramento, and there is the constant sound of vehicles slowing down & revving up as they negotiate the humps, cargo banging in the back of trucks, etc., which would be really obnoxious to me if I lived there.
City of Lodi; Richard Prima; rprima@lodi.gov	Here in Lodi, we have not installed any and have had a few requests. We have considered them recently, but Police and Fire are very skeptical. There's lots of information available on designs for various conditions and I think they are worth considering. One of the biggest problems is coming up with a policy that the City Council can adhere to and the money for installations. I understand some cities require private participation in the cost. I look forward to seeing the results of your survey.
City of Covina; Vince Mastrosimone; vmastrosimone@ci.covina.ca.us	No we do not use speed bumps in Covina.
City of Fairfield; Gene S. Cortright; gcortright@ci.fairfield.ca.us	We do not allow speed bumps on public streets.

Survey Concerning Speed Humps

November 24, 2003

Respondent agencies who allow or do not have speed humps, are as follows:

City & Respondent	Comments
City of Foster; John Lisenko; llisenko@fostercity.org	We do not allow speed humps.
City of Hanford; Karen McAlister; kmcalister@ci.hanford.ca.us	No, we do not allow speed bumps in our city due to liability issues.
The City of Irvine; Barry Greenstein; bgreenstein@ci.irvine.ca.us	The City of Irvine does not permit speed bumps / humps within public streets.
City of Stockton; Barry O'Regan; Barry.O'Regan@ci.stockton.ca.us	City of Stockton does not allow. But the City of Sacrament has a good program. Check out their web page for more information.
City of San Bruno; Scott T. Munns; smunns@ci.sanbruno.ca.us	San Bruno has not allowed speed bumps in the past. We have numerous narrower than standard streets with a large volume of on street parking. This acts as a sort of natural "choker" and tends to keep travel speed down. Pls send me a copy of the results of your survey
Suisun City; Steve Baker; sbaker@suisun.com	We do not allow speed bumps, but we are asked to implement either them or stop signs all the time.

CITY OF REDONDO BEACH POLICY

REQUEST FOR STOP SIGNS AT INTERSECTIONS OF RESIDENTIAL STREETS:

1. The resident must collect signatures from residents of the impacted block in each direction of the location proposed for a stop sign. The petition must state the reasons for the request of additional stop signs at the intersections.

2. Submit the petition to the City Engineer, or Transportation Engineer, of Engineering and Building Services.

3. Engineering Services shall conduct a traffic study including traffic counts, collision history and field observations of the intersection. Engineering Services may also recommend other improvements in an effort not to add additional stop signs. The recommendation to approve additional stop signs shall follow the standards establish within the Manual on Uniform Traffic Control Devices and adopted by the State of California. This portion of the procedure may take from 12 to 18 weeks.

4. The Transportation Engineer will summit his findings and recommendations to the Public Works Commission at a public meeting. Residents will be invited from one block in all directions from the requested location. This portion of the procedure may take an additional 4 to 6 weeks.

5. The Public Works Commission shall recommend or deny the request. The recommendation to install additional stop signs will be presented before the City Council for approval. If the Public Works Commission recommends against the request, the recommendation may be appealed within 30 days to the City Council. This portion of the process may take an additional 4 to 6 weeks depending on the City Council schedule.

6. If the stop sign request is approved by the City Council, the Transportation Engineer will issue a work order to the Public Works Department for installation. This portion of the process may take an additional 4 to 6 weeks.

CITY OF REDONDO BEACH POLICY

REQUEST FOR RED CURBS AT PRIVATE DRIVEWAYS:

1. The resident must contact, via mail, phone or email, the Transportation Engineer requesting the painting of red curb about either side of the driveway. Any resident in a multi-unit residence must also obtain written authorization from the other residents in the complex. The authorization letter may be produced by the requester for the red curb.

2. The minimum red curb allowed shall be no less than 3 feet in length unless physically unable to meet the 3 feet requirement. Red curb shall be painted from 'bottom' of driveway approach.

3. Engineering Services shall conduct a field review and obtain necessary dimensions of the driveway and adjacent curb related features. This portion of the process may take 2 to 4 weeks.

4. Engineering Services will issue a work order to the Department of Public Works if the red curb is approved. This portion of the process may take 6 to 8 weeks.

5. Any additional length of red curb, not to exceed 3 additional feet, beyond the initial 3 feet will require the written authorization of the adjacent neighbor; that is the neighbor on same side as additional extended red curb. Corner residences will be requested to obtain authorization of the adjacent neighbor, regardless of which side driveway red is extended. Additional length of red curb allowed will not exceed 6 feet on either side of driveway. If the neighbor lives in a multi-unit complex, a representative of each unit must sign the authorization.

6. Any red curb requested beyond the 6 feet, per side of driveway, will require the written request from a representative of all residential units on the site. The Engineering Services Department will present the request to the Public Works Commission with 120 days of receipt of request. All residents on the block(s) affected will be invited to this meeting to provide input on the request. The action of the Public Works Commission may be appealed within 30 days to the City Council.

7. Engineering Services will issue a work order to the Department of Public Works upon the approval of the red curb and after the appeal period as ended. This portion of the process may take 6 to 8 weeks.

The above red curb policy is for clearance of parked vehicles from residential driveways. Red curbs for sight distance clearance at intersections, fire hydrants or other hazards please contact the City's Transportation Engineer.

CITY OF REDONDO BEACH POLICY

REQUEST FOR RESIDENTIAL DISABLED PARKING SPACES:

The following documents are required to be delivered to the Transportation Engineer for the City of Redondo Beach:

1. A copy of the disabled placard, license plate, or the DMV registration for the disabled plate;
2. A letter from your doctor stating the present status of your condition. This letter is kept in the file to verify your condition warrants a disabled-parking space;
3. A letter requesting a disabled parking space and the location: this letter must state why the garage cannot be used or the driveway for entry by the disabled person; and
4. A letter signed by your immediate neighbors, stating that they approve of the disabled parking space being placed in front of your residence. This includes **all** the neighbors on each side of you. Also if you live in a multi unit complex, **all** of the residents within your complex must sign the letter.

The request may be denied if the driveway is not located on an excessive slope and the topography does not make entry into the residence unreasonable.

Other parking regulations such as no parking for street sweeping are still enforced for the parking location.

There is no charge for the installation of the disabled parking space.

A work order will be written to the Public Works Department if all of the above are justified per the Transportation Engineer.

CITY OF REDONDO BEACH POLICY

REQUEST FOR PERMIT PREFERENTIAL PARKING:

1. The resident must obtain a petition of the neighborhood signed by occupants of no-less than 66% of the dwelling units comprising no-less that 50 percent of the developed frontage of the areas proposed for the preferential parking zone. The petition must state the fee charged for the preferential parking permit, the schedule of fines, and the hours and days the neighborhood is impacted by nonresident vehicles.

2. Submit the petition to the City Engineer, or Transportation Engineer, of Engineering and Building Services.

3. Engineering Services shall conduct a parking survey to determine if the street parking is excessively impacted by the parking of commuter vehicles. Street parking is excessively impacted when more than 75% of the legal on-street parking spaces are occupied by vehicles; and more than 25% of the legal on-street parking are occupied by nonresident vehicles. The City Engineer may consider other factors such as enforcement of parking regulations or impact to adjacent areas with the establishment of a preferential parking zone in regards to approving or denying the request.

4. If the City Engineer determines the street shall be so designated, the recommendation shall be presented before the Public Works Commission. A public hearing shall be given with the owners and occupants of each parcel given notice of such meeting.

5. The Public Works Commission shall recommend or deny the request. If the Public Works Commission recommends against the request, the recommendation may be appealed within 30 days to the City Council.

The above process is explained in detail in Sections 3-7.1701 through 3-7.1706 of the Redondo Beach Municipal Code.

CITY OF REDONDO BEACH POLICY

REQUEST FOR TIME LIMIT PARKING AFFECTING RESIDENTIAL PARKING:

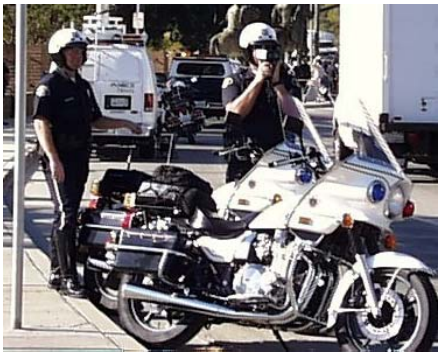
In an effort to control on-street parking, a resident may follow the following procedures to request the installation or modifications of signs to regulate on-street parking.

1. The resident must obtain a petition of the neighborhood signed by occupants of no-less than 66% of the dwelling units comprising the street frontage affected by the non residential parking. The petition must state the times and days of the impact resulting from the non residential parking of vehicles. Time limit parking is allowed only between the hours of 8:00 a.m. and 6:00 p.m. of any day, except Sunday.

2. Submit the petition to the City Engineer, or Transportation Engineer, of Engineering and Building Services.

3. Engineering Services shall conduct a parking survey to determine if the street parking is excessively impacted as a result of proximity to nearby businesses or employment centers, or other reasons where the unrestricted parking of vehicles would cause traffic congestion or deprive the public use of available curb space.

4. If the City Engineer determines the street is impacted by the unrestricted parking of vehicles then a recommendation will be referred to the Public Works Commission to install 1 hour, 2 hour, 3 hour or 4 hour time limit parking. A public meeting shall be given with notification of the meeting sent to the owners and occupants of each parcel.



5. The Public Works Commission shall recommend or deny the request. If the Public Works Commission recommends against the request, the recommendation may be appealed within 30 days to the City Council.

The installation of time limit parking for a residential area is permitted through Redondo Beach Municipal Code Section 3-7.1302.

TRAFFIC CALMING TOOLKIT

EDUCATION

ENFORCEMENT

ENGINEERING

CITY OF SAN JOSE
CAPITAL OF SILICON VALLEY

DEPARTMENT OF TRANSPORTATION

PURPOSE

The purpose of the Traffic Calming Toolkit is to provide residents and community leaders with information about the City of San José's Traffic Calming Policy (included in the Appendix). Effective traffic calming employs the **3 E's: Education, Enforcement and Engineering**. This Toolkit is designed to provide community leaders with a model to guide residents toward a better understanding of the available tools and the necessary steps to seek basic and comprehensive traffic calming services. Primary contacts for traffic calming services are:

For **traffic safety education**, contact San José's *Street Smarts* program at:

Website:	**www.getstreetsmarts.org**
Email:	**info@getstreetsmarts.org**
Phone:	**(408) 975-3238**

For **traffic enforcement**, contact the Police Department's Traffic Enforcement Unit (TEU) at:

Website:	**www.sjpd.org/TEU**
Enforcement requests:	**www.sjpd.org/_forms/TEU_Request_Form.asp**
Phone:	**(408) 277-4341**

For **parking enforcement**, contact the Parking Compliance Unit at:

Website:	**www.sanjoseca.gov/transportation/parking_enforcement.htm**
E-mail:	**parking.compliance@sanjoseca.gov**
Phone:	**(408) 534-2900**

For **traffic calming** issues regarding traffic engineering, contact the Department of Transportation (DOT) at:

Website:	**www.sanjoseca.gov/transportation/traffic_calming.htm**
E-mail:	**traffic.calming@sanjoseca.gov**
Phone:	(**408) 535-3850** [ask for Neighborhood Traffic Management and provide your City Council District or nearest cross street]

More helpful contacts available at: **www.sanjoseca.gov/transportation/c_departmentcontact.htm**.

SECTION

1 What Is Traffic Calming?

Traffic Calming is the management of vehicular and pedestrian traffic so that its negative impacts on neighborhoods and schools are minimized.

TRAFFIC CALMING OVERVIEW

High traffic speeds and volumes, as well as inappropriate driver behavior, can adversely impact neighborhoods. These conditions can also have a negative effect on pedestrians and bicyclists, particularly near schools, community centers, libraries or parks. The City responds to these conditions by conducting traffic engineering studies which may result in the installation of traffic control devices, pedestrian and bicycle improvements or physical roadway features. San José's Police and Transportation Departments may also deploy officers to enforce traffic and parking regulations and to provide education to school children and communities. These efforts are referred to as ***traffic calming***.

San José has two levels of traffic calming: Basic and Comprehensive

San José's Traffic Calming Policy describes the general processes and responsibilities related to traffic calming so that interested parties can effectively access this City service. San José's traffic calming services are categorized into two levels: **Basic and Comprehensive**. A summary of traffic calming measures, objectives and guidelines are located in the Appendix. More general information on available traffic resources is located at the San José Department of Transportation (DOT) website at: http://www.sanjoseca.gov/transportation.

SECTION

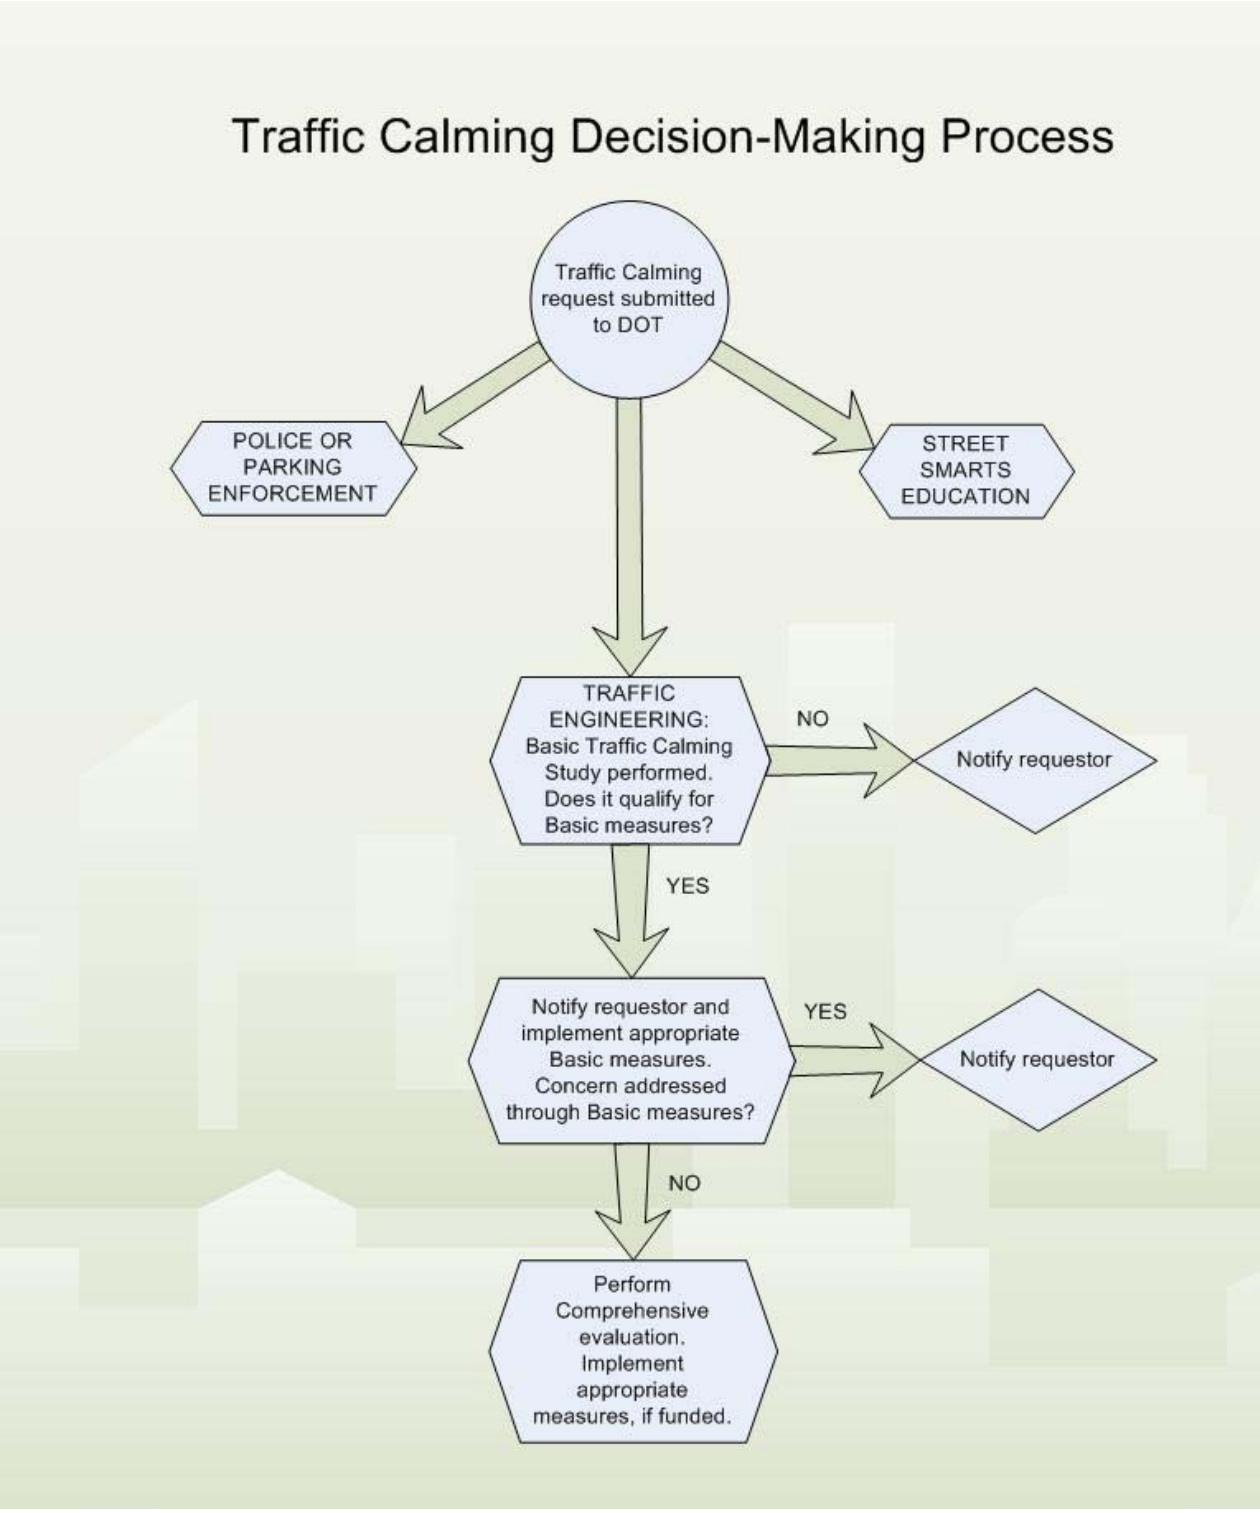
2

Evaluation and Implementation

Comprehensive traffic calming can be considered when

Basic traffic calming has not addressed adverse conditions.

OVERVIEW



Individuals and organizations having traffic concerns may begin by contacting San José's Department of Transportation (DOT) at **traffic.calming@sanjoseca.gov or (408) 535-3850**.

San José's Traffic Calming Policy establishes the criteria and procedures for traffic calming in the City. DOT will perform the appropriate study to address the requester's specific concern and situation. The nature and severity of the concern, verified through field observation and/or data collection, will determine which traffic calming measure(s) should be implemented. The goal is to complete Basic traffic calming engineering studies within 35 days of the receipt of the request (may vary based on staffing levels). Traffic enforcement is provided by the San José Police Department's Traffic Enforcement Unit, and enforcement requests will be completed based on their current staffing and workload levels. If traffic safety education is requested or recommended to address driver, pedestrian and/or bicyclist behavior, the goal is to perform a traffic safety education presentation within eight (8) weeks. However, the presentation schedule is often dependent upon coordination of a desired timeframe with neighborhood or school representatives. Traffic concerns that require Comprehensive measures will first have trial installations to assess the effectiveness and neighborhood support for the devices, as well as to allow for minor adjustments to size and shape before final permanent installation. Installation of major roadway features requires City Council approval, which will extend the time period before installation. The goal is to take the time to conduct an appropriate level of outreach to ensure sufficient community involvement and awareness of intended actions. The traffic calming decision-making process is shown in the following diagram:

The Street Smarts program provides traffic safety education.

SJPD's Traffic Enforcement Unit provides traffic enforcement.

Parking and Traffic Compliance provides parking enforcement.

YES
Notify requestor and implement appropriate Basic measures. Concern addressed through Basic measures?
YES
Notify requestor
NO
Perform Comprehensive evaluation. Implement appropriate measures, if funded.

BASIC TRAFFIC CALMING

Basic traffic calming services include the installation of traffic control devices (such as crosswalks, stop signs, residential permit parking, truck restrictions and bike lanes), traffic enforcement by SJPD's Traffic Enforcement Unit, and traffic safety education from DOT's Street Smarts program. The application of Basic and Comprehensive – Level 1 and 2 devices are subject to federal, state and local policies and guidelines.

COMPREHENSIVE TRAFFIC CALMING

Neighborhoods that are experiencing adverse traffic conditions that cannot be addressed using Basic traffic calming services may be eligible for a Comprehensive traffic calming project. If an adverse traffic condition cannot be addressed through Basic traffic calming services, a Comprehensive traffic calming analysis can be initiated.

Comprehensive traffic calming projects are limited to residential, 2-lane local or neighborhood collector streets.

The implementation of Comprehensive traffic calming projects is limited to residential, 2-lane local or neighborhood collector streets, with a maximum posted speed limit of 30 mph. Streets designated as General Plan streets, transit routes or used as emergency response routes are generally not considered for Comprehensive traffic calming measures, except for dynamic speed signs and messaging systems. These roadways, by their classification or function, are intended to carry higher volumes of traffic to accommodate a large vehicle mix.

THRESHOLD CRITERIA FOR COMPREHENSIVE PROJECTS

The following threshold criteria must be met to be considered for the implementation of Comprehensive traffic calming projects:

<u>Local Streets (25 mph posted speed limit, 1,000 – 3,000 vehicles/day):</u>

- ✓ 85th percentile speed of 33 mph or more

or

- ✓ 40% or more of the daily traffic is cut-through traffic, where cut-through traffic is defined as traffic entering a neighborhood with a destination outside of that neighborhood

Neighborhood Collector Streets – connects local streets to major streets (25 or 30 mph posted speed limit, 1,000 – 6,000 veh/day):

- ✓ 85th percentile speed of 33 mph or more on 25 mph posted streets

or

- ✓ 85th percentile speed of 37 mph or more on 30 mph posted streets

PRIORITIZATION OF ELIGIBLE COMPREHENSIVE PROJECTS

Eligible Comprehensive traffic calming projects will be prioritized for implementation based upon the severity of the traffic conditions by taking into account the following cumulative traffic impacts: speeding, volume, cut-through traffic, crash history, proximity to pedestrian generators (like schools, parks, community centers) and unique roadway conditions. Priority points will be assigned per the following table:

Eligible Comprehensive projects are prioritized to be implemented based on traffic impacts.

Speed	2 points for each mph difference between the 85th percentile speed and the posted or *prima facie* speed limit
Volume	1 point for each 500 vehicles over 1,000 vehicles per day; 5 points if 40 – 65% or more ADT on local street is cut-through traffic between arterials or major roadways; 10 points if higher than 65%
Crash History	5 points for each speed-related crash in the past 3 years
Pedestrian Generators (15 points max.)	5 points for each school, park or trail access, library or community center along roadway; 3 points if within 1 block; 2 points if within 2 blocks
Unique Conditions (15 points max.)	5 points for designation as a Bike Route or as a General Plan pedestrian corridor, or for proximity to neighborhood business district or existing/planned transit hub; 5 points for evidence of crashes or speeding, such as long skid marks or broken glass; 5 points for missing sidewalk section; 5 points for unique roadway geometry that substantially restricts visibility; 5 points for high crash rate

At the close of each funding cycle (fiscal year), the highest ranked projects will be considered for construction in the following fiscal year, dependent upon funding, resource availability and community support. However, adjustments in schedules of traffic calming projects may be made based on coordination with scheduled capital improvement or private development projects or on availability of funding specific to the project.

REASSESSMENT OF WARRANTED COMPREHENSIVE PROJECTS

Projects not selected in a given funding cycle will remain on the priority list for consideration in the next funding cycle and prioritized along with any newly eligible projects. As resources permit, projects may be reassessed to ensure that the priority ranking reflects any significant changes in land use, speed, volume, crash history, pedestrian activity or other conditions that may have occurred on any given roadway(s).

COMMUNITY SUPPORT FOR COMPREHENSIVE PROJECTS

Substantial community support is required for the installation of physical roadway devices on either a trial or permanent basis, including the active involvement of a neighborhood traffic committee. Generally, committee members must own property or reside within the affected project area. If the project area falls within a recognized Neighborhood Association, then the traffic committee should also include a member from that Neighborhood Association. Utilizing relevant data and community input, DOT and the traffic committee will develop a proposed traffic calming plan. Based on potential impacts of the proposed plan, DOT will determine the affected project area. The traffic committee will distribute a petition developed by DOT to all households, businesses, schools and absentee property owners within the project area. The petition must have majority support (50% + 1) of all affected households, businesses and schools within the project area for implementation of trial and permanent installations. In addition, some physical devices impact adjacent property owners more than others and have specific installation guidelines and criteria to meet.

Substantial community support is required for the installation of physical roadway devices.

COMPREHENSIVE PROJECT SCHEDULE

Most Comprehensive projects will require a trial installation, which will generally occur within four (4) months from the date the plan was finalized

and supported by the community or approved by the City Council. The duration of the trial will normally be six (6) months, during which time City staff will evaluate the effectiveness of the installation. Minor adjustments may be made to the installation based upon review by City staff and input from the community. Based on all relevant data and community input, DOT (in coordination with the traffic committee) will develop a proposed plan and schedule for permanent installation of the Comprehensive project that will be presented to the community for approval.

Level 1 projects supported by the community will be programmed for installation. Community-supported Level 2 projects will be presented to the City Council for consideration and, if approved, programmed for installation. Installation of final Comprehensive projects will be dependent on the complexity of the project and the available resources for construction and ongoing maintenance of installed devices.

The City may accept donations for implementation and ongoing maintenance of eligible Comprehensive projects.

REAPPLICATION FOR COMPREHENSIVE TRAFFIC CALMING

Neighborhoods that do not qualify for a Comprehensive traffic calming project may reapply in two (2) years from the date of DOT's final consideration. The 2-year time period may be waived by the City Traffic Engineer if significant land use changes or other significant change has occurred.

COMMUNITY FUNDING OF COMPREHENSIVE PROJECTS

The City may accept donations from residents, neighborhoods, community groups, schools and/or businesses for the implementation and ongoing maintenance of Comprehensive traffic calming projects that are eligible for installation under the Traffic Calming Policy. Donations need to comply with all provisions of City Council Policy 1-17.

OUTREACH REQUIREMENTS FOR COMPREHENSIVE PROJECTS

Residents, businesses and schools that may be affected by the outcome of a Comprehensive traffic calming project must be notified in writing of any planned actions or schedule. Comprehensive projects that involve the

installation of physical roadway features will normally require at least one community meeting with the households, businesses and schools in the project area. Notices for any community meeting must be distributed at least ten (10) calendar days in advance. Notices are to be provided to all properties within the project area (see "Community Support for Comprehensive Projects" Section), consistent with notification methods in City Council Policy 6-30. Projects will also be coordinated with providers of emergency response services, transit services, utilities and related services.

POLICY EXEMPTIONS FOR COMPREHENSIVE PROJECTS

Local residential street and neighborhood collectors that do not meet the threshold criteria may be eligible for Comprehensive traffic calming measures if the City Traffic Engineer determines that a unique or unusual condition exists which results in negative traffic impacts caused by a high crash rate, vehicles traveling at excessive speeds, significant pedestrian activity or proximity to major traffic corridors or traffic generators that contribute to extraordinary changes to normal traffic conditions. These roadways will be prioritized along with roadways that meet the threshold criteria based on the methodology outlined in the Traffic Calming Policy.

General Plan streets, transit routes and emergency response routes may be eligible for dynamic warning signs or messaging systems if substantial levels of speeding are present as determined by DOT through an engineering traffic study, and as funding is available for their installation and ongoing maintenance.

Streets that do not meet threshold criteria for Comprehensive measures may be considered if there are unique or unusual conditions.

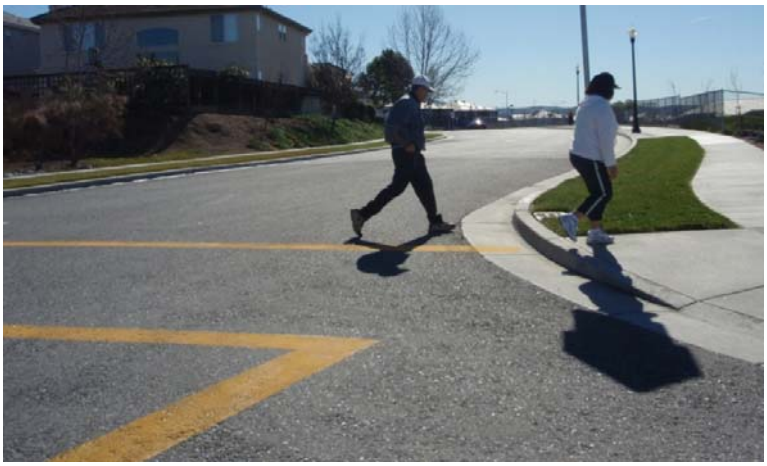
SECTION

3

Basic Traffic Calming Measures

Basic traffic calming measures are those traffic control devices and programs implemented on a day-to-day basis.

OVERVIEW



Basic traffic calming consists of those traffic control devices and programs that can be implemented on a day-to-day basis to regulate, warn, guide, enforce and educate motorists, pedestrians and bicyclists. They include standard striping and signing elements as found in the California Manual on Uniform Traffic Control Devices, minor roadway design elements to improve visibility and safety, enforcement by police and parking compliance officers, and safety education programs.

Basic traffic calming is used where most traffic concerns can be addressed using education, enforcement and/or engineering. Basic traffic calming measures include:

- Traffic Safety Education Programs
- Police Enforcement
- Parking Enforcement
- Curb Markings
- Crosswalks
- Radar Trailer
- Edgeline Striping
- High-Visibility Crosswalks
- High-Visibility Signs
- Stop Signs
- Traffic Signage
- Signed Turn Restrictions
- Truck Restrictions
- Residential Permit Parking

Basic traffic calming utilizes the 3 E's:

- ✓ Education
- ✓ Enforcement
- ✓ Engineering

EDUCATION

TRAFFIC SAFETY EDUCATION PROGRAMS

Ever run a red light, jaywalk or speed through a neighborhood or school zone? Many have, and that's why the City of San José created **Street Smarts**, a traffic safety education program to change driver, pedestrian and bicyclist behavior and enhance safety in school zones and neighborhoods. These behaviors are often the root cause of many traffic accidents, and that is why education has become the latest tool that communities are using, in conjunction with engineering and enforcement, to calm traffic. The Street Smarts program brings education about driver, pedestrian and bicyclist behaviors to schools, neighborhoods and senior centers to improve safety on San José streets.

Contact DOT for the Street Smarts traffic safety education program.

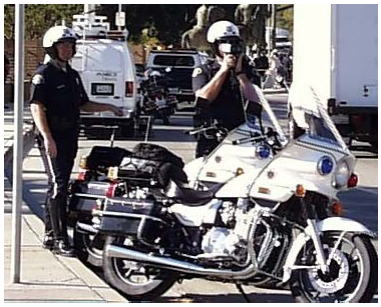
Classroom safety posters, school safety flyers, school fence banners, traffic safety education classroom kits (available on CD-ROM) and parent education seminars are available to San José schools. The Street Smarts School Safety Education Program reaches an estimated 28,000 elementary and middle school students annually, through assemblies, bike "roadeos" and helmet fittings and giveaways. This program is provided at no cost to schools.

Each neighborhood that adopts the Street Smarts program receives approximately three hours of driver, pedestrian and bicyclist behavior education, which begins with an interactive and somewhat humorous presentation by DOT staff. This introductory presentation takes approximately one hour, including a question and answer session.

Street Smarts

www.getstreetsmarts.org

In addition, the volunteer receives a Street Smarts Neighborhood Kit and coordinates the distribution of materials from the kit to their neighborhood. Each kit contains items to reinforce the Street Smarts messages through family participation and discussions.



For more information about the nationally recognized Street Smarts traffic safety education program or to schedule a presentation for your school, neighborhood or senior center, please contact DOT's **Traffic Safety Education at (408) 975-3296**.

ENFORCEMENT

POLICE ENFORCEMENT

Police enforcement entails the presence of police to monitor speeds and other inappropriate driving behavior and issue citations when necessary. This method is used as an initial attempt to increase driver compliance on streets. It is most applicable on streets with documented speeding problems or notable stop sign/red light violations that need quick mitigation. It can also be used during the learning period when new devices or restrictions are first implemented. For police enforcement, contact the **Traffic Enforcement Unit (TEU)** of the Police Department via their **on-line enforcement request form or at (408) 277-4341.**

Positive Aspects

- ✓ Effective while officer is actually present at the location
- ✓ Can target specific times deemed to be most problematic
- ✓ Can be implemented on short notice
- ✓ Targets violators without affecting normal traffic

Negative Aspects

- ✓ It is a temporary measure
- ✓ Enforcement may be delayed and/or limited, due to police availability and other policing duties

PARKING ENFORCEMENT

Enforcement of parking regulations is done by DOT's **Parking Compliance**. They also have a team of officers dedicated to enforcing parking regulations in school zones and for vehicle abatement, to address vehicles parked for more than 72 hours. To request parking enforcement, contact the Parking Compliance Unit at **parking.compliance@sanjoseca.gov or (408) 534-2900**.

Positive Aspects

- ✓ Effective while officers are actually present at the location
- ✓ Can be targeted to specific time periods that are deemed to be most problematic

Negative Aspects

- ✓ It is a temporary measure
- ✓ Enforcement may be delayed and/or limited, due to officer availability and other parking duties

ENGINEERING

TRAFFIC ENGINEERING OVERVIEW

Traffic engineering includes the installation of traffic control devices – as governed by federal, state and local policies and guidelines – to address speeding, volume and/or pedestrian safety concerns. DOT will conduct an evaluation to determine the appropriate measures that can be implemented to address the concern. Examples of traffic engineering tools within Basic traffic calming are detailed below.

CURB MARKINGS

Curb markings are special curb paintings that restrict or limit parking along the curb to enhance safety and/or increase visibility of pedestrians and bicyclists or provide specific parking based on an area's parking needs. Curb marking applications include:

- ✓ Red curb at pedestrian ramps
- ✓ Red curb at crosswalk or intersection to increase visibility
- ✓ Red curb at and/or between driveways to increase visibility
- ✓ Blue curb for disabled-accessible parking
- ✓ White and yellow curbs for passenger and freight loading zones
- ✓ Green curb for timed parking

Positive Aspects

- ✓ Provides safer conditions for motorists, pedestrians & bicyclists
- ✓ Easy to install

Negative Aspect

- ✓ Could result in loss of parking, increasing parking demand in the neighborhood

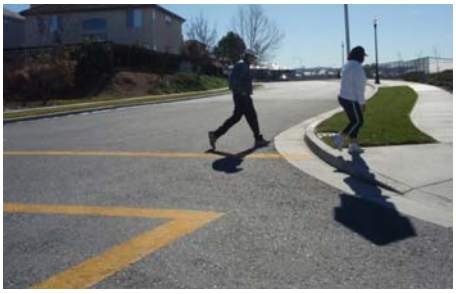
TRAFFIC SIGNAGE

Traffic signs may be installed to make roadway users aware of a roadway condition, to fully utilize parking capacity or to restrict vehicular traffic. Examples include speed limit, curve warning, turn restrictions and parking signage.

Positive Aspects

- ✓ Increases driver awareness of roadway conditions
- ✓ Parking signage maximizes utilization of available parking
- ✓ Turn restrictions can reduce cut-through traffic

Negative Aspects



- ✓ Turn restrictions may redirect traffic to other neighborhood streets
- ✓ Too much signage may cause drivers to "tune out" most or all signs
- ✓ Signage is not self-enforcing

CROSSWALKS

Pedestrians may legally cross any City street, except midblock between signalized intersections or where expressly prohibited by signage. A marked crosswalk (at intersection or mid-block) may be installed to help pedestrians to cross a street. The primary function of marked crosswalks is to guide and channelize pedestrians to a preferred crossing location. Marked crosswalks are most appropriate near schools, recreational facilities and other pedestrian generators.

Positive Aspects

- ✓ Provides centralized location for pedestrians to cross street
- ✓ Increases driver awareness of pedestrians
- ✓ Easy to install

Negative Aspects

- ✓ Can provide false sense of security to pedestrians entering traffic
- ✓ May require removal of parking near crosswalk

HIGH-VISIBILITY CROSSWALKS

A high visibility crosswalk is a marked, uncontrolled crosswalk (uncontrolled means it has no Stop signs or traffic signals) that incorporates striping patterns and/or fluorescent green signage to improve the visibility of the crosswalk. High visibility striping is generally used at uncontrolled crosswalks, while high visibility signage is only used at uncontrolled crosswalks.

High visibility crosswalks are mainly used on high volume, multi-lane roadways.

Positive Aspects

- ✓ Further increases driver awareness of pedestrians
- ✓ May slow traffic
- ✓ Requires minimal maintenance for striped crosswalks and signage

Negative Aspect

- ✓ Can provide false sense of security to pedestrians entering traffic

RADAR TRAILER

A mobile radar display trailer informs drivers of their speeds. The radar trailer is applicable on any street where speeding is a problem and there is adequate roadside capacity to accommodate the trailer without creating a hazard.

Positive Aspects

- ✓ Educational tool
- ✓ Good public relations for neighborhoods
- ✓ Effective for temporary speed reduction

Negative Aspects

- ✓ Not self-enforcing
- ✓ Duration of effectiveness is limited
- ✓ May require temporary loss of parking

STOP SIGNS

The California Manual on Uniform Traffic Control Devices states that "Stop signs should not be used for speed control." Stop signs are intended to assign the right-of-way among motorists, pedestrians and cyclists at an intersection. Although many citizens believe that stop signs help reduce speeds on their street, numerous studies have shown that speeds are as high or higher at mid-block than those locations without stop signs. To address speeding concerns, other measures may be available. Stop signs are installed based on San José City Council Policy 8-1 (also located in the Appendix). Criteria for Stop signs include crash history, conflicting vehicular traffic at the intersection, proximity to schools or parks and any unusual conditions, such as the layout of the intersection.

Stop signs are typically used on non-arterial streets and intersections.

Positive Aspects

- ✓ Reduces right-of-way conflicts at an intersection
- ✓ Increases opportunities for pedestrians to cross the roadway
- ✓ May discourage cut-through traffic

Negative Aspects

- ✓ Unwarranted stop signs increase unnecessary delay for the main approaches
- ✓ Pedestrian safety compromised if motorists do not comply
- ✓ Penalizes all motorists on the main street, even those obeying the speed limit
- ✓ Potential traffic diversion onto other streets
- ✓ May increase speeds mid-block, as drivers attempt to make up perceived "lost time" from stopping
- ✓ Potential increase in noise and air pollution in the vicinity of the stop from added stops/starts

More Stop sign information is available on the San José DOT webpage at: **http://www.sanjoseca.gov/transportation/traffic_signsmarkings.htm**.

EDGELINE STRIPING

Edgeline striping is used to create narrow travel lanes which give the impression of a narrow street. This visual narrowing may help reduce overall speeds. Striping can be at curb end or midblock to create a median. Edgeline striping is most applicable on long, wide residential streets with speeding traffic.

Positive Aspects

- ✓ May slow traffic
- ✓ Easy to install and modify as necessary
- ✓ Low cost of implementation

Negative Aspects

- ✓ May not be self-enforcing
- ✓ Painted medians may require loss of parking

TRUCK RESTRICTIONS

Restricting the entry of trucks over 5 tons into residential neighborhoods may be achieved through the posting of truck restriction signs. This method is most applicable on residential streets to help reduce cut-through traffic of commercial vehicles not doing business within that neighborhood. Consideration is given to those streets where truck volumes are 2 – 5% or more of the total daily volume, or there are more than 50 heavy trucks consistently using the street. This element requires City Council approval.

Positive Aspects

- ✓ Redirects commercial traffic onto main streets
- ✓ Reduces noise, air pollution and street degradation due to trucks on residential streets

Negative Aspects

- ✓ Not self-enforcing
- ✓ Does not apply to local trucks doing business in the area

RESIDENTIAL PERMIT PARKING

This program is administered primarily to address continuous parking shortage in residential neighborhoods due to non-residential parking intrusion from outside the neighborhood that cannot be resolved through standard parking prohibitions. Under this program, the neighborhood is designated as a permit parking area via City Council approval. Upon approval, residents must purchase permits for themselves and their visitors to park on streets within that permit parking zone.

Permit parking is not an appropriate solution when the area is experiencing a shortage of parking due to neighborhood parking demand.

Residential permit parking zones have been established in the City of San José to address severe parking shortages adjacent to the HP Pavilion Arena, San José State University, the Convention Center, Civic Center, the Berryessa Flea Market and other areas.

More information on the Residential Permit Parking program is available on San José DOT's webpage at: **http://www.sanjoseca.gov/transportation/permits_parking.htm**.

Positive Aspects

- ✓ Protects the neighborhood from invasive commercial and business parking demand
- ✓ Preserves parking spaces for residents and guests

Negative Aspects

- ✓ Costly to implement, administer and maintain
- ✓ Regular enforcement is necessary for effectiveness
- ✓ Could result in unexpected citations issued to guests
- ✓ Inconvenient for residents due to the renewal process, guest permits, etc.

SECTION

4

Comprehensive Traffic Calming Measures

Comprehensive traffic calming uses physical design features or dynamic signage and warning systems to enhance pedestrian safety or slow traffic within, or divert traffic from, residential neighborhoods.

OVERVIEW

Neighborhoods that are experiencing adverse traffic conditions that cannot be addressed using Basic traffic calming may be eligible for a Comprehensive traffic calming project. Procedures and threshold criteria to determine adverse traffic conditions are detailed in Section 2 – "Evaluation and Implementation." Comprehensive traffic calming projects are classified into two categories – Level 1 and Level 2. All physical features placed in the roadway must not impede emergency response.

SECTION

4a Comprehensive – Level 1

Level 1 measures are intended to address speeding, volume and/or safety concerns using devices that go beyond Basic traffic calming.

OVERVIEW

Level 1 traffic calming generally consists of physical roadway design features or dynamic signage and warning systems designed to slow vehicular traffic within, or divert traffic from, residential neighborhoods, or to enhance pedestrian safety. They are employed when the use of Basic traffic calming measures do not effectively address these concerns. Level 1 traffic calming measures include:

Flashing Beacons
(School zones or crosswalks)
Radar Speed Display Signs
Median Islands
Road Humps
Chokers
Bulbouts
Traffic Circles

FLASHING BEACONS (CROSSWALKS/SCHOOL ZONES)

Flashing beacons are flashing amber lights that can be placed at entrances to school zones (on streets with posted speed limit above 25 mph) or at uncontrolled crosswalks to enhance the visibility of the school zone or crosswalk. Flashing beacons for school zones are activated during the school's pick-up and drop-off times. Flashing beacons at uncontrolled locations with high vehicle and pedestrian volumes are generally activated by pedestrian push-buttons.

Positive Aspects

- ✓ Increases driver awareness of reduced speed limit or crosswalk
- ✓ For schools, can be activated only during school pick-up and drop-off times
- ✓ For uncontrolled crosswalks, can be activated by pedestrian push-button to be visible to drivers only when pedestrians want to cross

Negative Aspects

- ✓ May create false sense of security for pedestrians
- ✓ Added cost to install and maintain
- ✓ At crosswalks, pedestrians may not use push-button
- ✓ Long-term effectiveness may be limited for everyday drivers

RADAR SPEED DISPLAY SIGNS

Radar speed display signs are a permanent version of the radar trailer, where drivers are informed of their speeds. These signs are intended for multi-lane streets with higher speed limits and moderate volumes.

Positive Aspects

- ✓ Increases driver awareness of reduced speed limit
- ✓ Can be activated only during school pick-up and drop-off times
- ✓ Educational tool

Negative Aspects

- ✓ Added cost to install and maintain
- ✓ Long-term effectiveness may be limited for everyday drivers

MID-BLOCK CHOKERS

Chokers are raised islands in the parking zone that can be detached from the curb-line to allow for drainage. Mid-block chokers narrow the roadway and are most applicable on wide streets with long blocks having speeding and cut-through problems. Chokers can have the same narrowing effect as parked vehicles on streets where there is little or no on-street parking. Chokers may be installed with either landscaping or hardscape treatment.

Positive Aspects

- ✓ Narrowed travel lanes can slow vehicle speeds
- ✓ Breaks up driver's sight-line
- ✓ Increases pedestrian and motorist visibility

Negative Aspects

- ✓ Likely loss of parking
- ✓ Narrow lanes redirects bicyclists into vehicular travel lane
- ✓ Debris can collect in between choker and gutter
- ✓ High cost to construct and maintain

MEDIANS

Medians are raised islands in the center of the roadway that separate traffic directions. Medians are used on wide streets to narrow the travel lanes and ease pedestrian crossings. The San José Fire Department must approve this feature, as it may impact their response times.

Positive Aspects

- ✓ Narrowed travel lanes can slow vehicle speeds
- ✓ Provides shorter distance for pedestrians to cross travel lanes
- ✓ Breaks up driver's sight-line
- ✓ Opportunity for landscaping and visual enhancements to the neighborhood

Negative Aspects

- ✓ May interrupt driveway access and result in U-turns at the end of medians
- ✓ Likely loss of parking
- ✓ High cost to construct and maintain

BULBOUTS (DETACHED OR ATTACHED)

Bulbouts narrow the street width at intersections, creating a shorter and safer pedestrian crossing while encouraging drivers to slow down. These may contain special paving or landscaping and are generally used at intersections where parking is already restricted.

Detached bulbouts may be striped or raised islands containing special paving or landscaping while maintaining existing drainage patterns. Attached bulbouts require altering the curb, gutter and sidewalk. These installations also affect the existing drainage patterns, possibly requiring installation of additional storm drains.

Positive Aspects

- ✓ Pedestrian crossing distance is reduced
- ✓ Narrowed roadway section may contribute to reduction of speeds
- ✓ Breaks up driver's sight-line
- ✓ Opportunity for landscaping and visual enhancements to the neighborhood

Negative Aspects

- ✓ May reduce visibility for cyclists who are less visible to turning and cross traffic
- ✓ May require partial or total loss of parking
- ✓ High cost to construct and maintain
- ✓ May increase emergency response times
- ✓ Debris can collect in gutter and crosswalk in detached bulbout installations
- ✓ Care should be taken to keep motorists from hitting bulbouts

Detached Bulbout

Attached Bulbouts

ROAD HUMPS

Road humps are areas of pavement raised three (3) inches in height over a minimum of 12 feet in length. Road humps have pavement markings, advisory signs and advanced warning signs.

Road humps can be used on residential 2-lane local or minor neighborhood collector roadways, with a maximum posted speed limit of 30 mph to address speed problems. It may also be used to deter cut-through traffic. The San José Fire Department must approve this feature, as it may impact their response times. Road humps are not used on streets designated as primary response routes for emergency vehicles and should not be used along transit routes.

Positive Aspects

- ✓ Slows speeding traffic, with minimal impact to non-speeding traffic
- ✓ May decrease volume
- ✓ Requires minimal maintenance

Negative Aspects

- ✓ Likely increase in traffic noise in the vicinity of the hump
- ✓ May increase emergency response times
- ✓ Difficult to replace when street is being resurfaced

TRAFFIC CIRCLES

Traffic circles are raised circular medians that direct traffic counterclockwise within an intersection. Vehicles must change their direction of travel to maneuver around the circle. Per the State guidelines, traffic circles are controlled by "Yield" signage on all approaches. Traffic circles can help manage speeds, reduce volume and improve side street access. The San José Fire Department must approve this feature, as it may impact response times. Traffic circles may contain low growth landscaping and/or a tree.

Positive Aspects

- ✓ Slows traffic as drivers maneuver around traffic circle
- ✓ Provides increased access to main street from side street
- ✓ Breaks up sight-lines on straight streets
- ✓ Changes the look of the street, making it more aesthetically pleasing

Negative Aspects

- ✓ Possible driver confusion entering traffic circle after yielding to traffic already in circle
- ✓ Likely impact on left turns by large vehicles
- ✓ May impact emergency response
- ✓ Bicyclists must merge with traffic around circle

CHICANES

Chicanes create a curved street alignment that can be designed into new developments or retrofitted in existing right-of-ways. The curvilinear alignment requires additional maneuvering and shortens drivers' sight-lines, resulting in lower overall speeds.

This device can be applied to any street where speed control is desired, provided the street is wide enough to accommodate the curvilinear design. Chicanes may require additional right-of-way for construction.

Positive Aspects

- ✓ May slow down traffic and reduce cut-through traffic
- ✓ Changes the look of the street, making it more aesthetically pleasing
- ✓ Has minimal impact on emergency response

Negative Aspects

- ✓ Requires extensive design and expensive implementation
- ✓ Requires major modification of drainage features and likely other utilities
- ✓ May require partial or total removal of street parking
- ✓ May have little or no impact on cut-through traffic

SECTION

4b Comprehensive – Level 2

Level 2 measures are traffic control devices and roadway design features primarily designed to discourage cut-through traffic on residential streets.

OVERVIEW

Level 2 traffic calming services are physical roadway features primarily designed to redirect cut-through traffic away from residential streets. Level 2 projects require extensive neighborhood involvement and outreach and City Council approval. Level 2 measures include:

Diverters
Partial Street Closure
Extended Medians
Full Street Closure

DIVERTERS

Diverters are raised areas placed across a four-way intersection that prohibit through movements and force turns for approaches. Diverters can be considered on local streets where cut-through traffic is a major problem.

Positive Aspects

- ✓ Reduces cut-through traffic
- ✓ Channels traffic flow, thus eliminating vehicular conflicts at an intersection
- ✓ Can be designed to accommodate emergency vehicles
- ✓ Opportunity for landscaping and visual enhancements to the neighborhood

Negative Aspects

- ✓ Will redirect traffic to other local streets
- ✓ Causes increased travel time for local residents
- ✓ High cost to construct and maintain
- ✓ Is a permanent measure, even though problem may be limited to certain times of day
- ✓ May require removal of parking near intersection
- ✓ Needs significant warning and guiding signs

EXTENDED MEDIAN

Medians are raised islands in the center of the roadway that separate traffic directions. Extended medians continue through an intersection, thus eliminating through traffic along the cross-street and all left turns. Medians can be considered on wide streets to narrow the perceived street width, break up sight-lines on straight streets and ease pedestrian crossings. Extended medians can also be considered to discourage cut-through traffic through a neighborhood.

Positive Aspects

- ✓ Narrowed travel lanes can slow vehicle speeds
- ✓ Opportunity for landscaping and visual enhancements to the neighborhood
- ✓ Reduces cut-through traffic on cross-street

Negative Aspects

- ✓ Has a significant impact on emergency access and operations
- ✓ May interrupt driveway access and result in added U-turns
- ✓ High cost to construct and maintain
- ✓ May require removal of parking near intersection

PARTIAL CLOSURE

A partial closure is a physical barrier that restricts vehicles from turning into a street, while still allowing for bicycle access. The adjacent lane is left open to allow vehicles to exit, while two-way traffic is maintained for the remainder of the block. Partial closures can be considered on local streets with cut-through traffic.

Positive Aspects

- ✓ Restricts movements into a street while maintaining full access and movement within the street block for residents
- ✓ Reduces cut-through traffic into street
- ✓ Provides shorter distance for pedestrians to cross travel lanes

Negative Aspects

- ✓ May redirect traffic to other local streets
- ✓ May increase trip length for local drivers
- ✓ Is a permanent measure, even though problem may be limited to certain times of day
- ✓ High cost to construct and maintain

FULL CLOSURE

A complete closure of the street blocks both lanes of travel, so that the street becomes a cul-de-sac. This measure eliminates all through traffic and limits street access to local residents. This measure is applicable to local streets with major cut-through concerns where an emergency vehicle response route does not exist. The closure location may be designed as a pocket park with through bicycle and pedestrian access, depending on roadway geometrics.

Positive Aspects

- ✓ Restricts all through traffic
- ✓ Effective volume and speed control measure
- ✓ Improves the aesthetic quality of the street

Negative Aspects

- ✓ May re-direct traffic to other local streets
- ✓ High cost to construct and maintain, including possible right-of-way acquisition
- ✓ May increase trip length for local drivers
- ✓ May require partial removal of on-street parking
- ✓ Not applicable for designated emergency vehicle response routes

5 Appendix

APPENDIX A: TRAFFIC CALMING POLICY

City of San José, California

COUNCIL POLICY

TITLE TRAFFIC CALMING POLICY FOR RESIDENTIAL NEIGHBORHOODS	PAGE 1 of 6	POLICY NUMBER 5-6
EFFECTIVE DATE April 25, 2000	**REVISED DATE** June 17, 2008	

APPROVED BY COUNCIL ACTION 4/25/2000, Item 9j, Res. Nos. 69541 and 69542; 6/26/2001, Item 6.11, Res. No. 70524, 6/17/2008, Item 6.2(a), Res. No. 74443

BACKGROUND

High traffic speeds and volumes, as well as inappropriate behavior of motorists can adversely impact San José neighborhoods. Traffic can also have a negative effect on pedestrians and bicyclists, particularly near schools, community centers and parks. The City responds to these conditions by conducting traffic engineering studies which may result in the installation of traffic control devices, pedestrian and bicycle improvements, or physical roadway features. The Police and Transportation Departments may also deploy officers to enforce traffic and parking regulations, and provide traffic safety education to school children and adults. For the purpose of this policy, these efforts are referred to as ***traffic calming.***

PURPOSE

The purpose of this Council policy is to provide a framework for the general processes, responsibilities and outreach related to traffic calming so that interested parties can effectively access this City service. The performance measure goals contained in this policy are desirable, but subject to available City resources and the level of active community involvement.

POLICY

It is the policy of San José to minimize the negative impacts associated with traffic on all streets, particularly within residential neighborhoods and near schools, by applying education, enforcement, and sound engineering solutions developed with strong community involvement. Traffic calming solutions are categorized into two levels: basic and comprehensive.

Basic traffic calming services are those traffic control devices and programs that are implemented on a day-to-day basis to regulate, warn, guide, enforce and educate motorists, pedestrians and bicyclists; and generally apply to all streets. Residential neighborhoods with traffic impacts that cannot be addressed through basic traffic calming services may be eligible for additional traffic calming measures referred to as comprehensive traffic calming projects.

Comprehensive traffic calming projects are physical roadway design features or dynamic signage and warning systems which are intended to slow traffic within, or divert traffic from residential neighborhoods, or to enhance pedestrian safety.

All traffic calming services and projects are to be coordinated with other transportation policies and be consistent with the General Plan; and where possible, coordinated with other capital and private development projects. Traffic calming projects should be designed and implemented with the goal of not transferring negative traffic conditions from one neighborhood roadway to another. For the purpose of this policy, 'cut-through' traffic is defined as traffic that is using a local residential street to avoid arterial or major collector roadways, and is not traffic that has an origin or destination within the immediate neighborhood.

BASIC TRAFFIC CALMING SERVICES

A. Request for Traffic Calming Services

Individuals or organizations with concerns about negative impacts of traffic should contact the City's Department of Transportation (DOT) to request a traffic engineering analysis. If the concern regards the enforcement of traffic or parking regulations, the Traffic Enforcement Unit (TEU) of the Police Department, or the Parking Compliance Unit of DOT will be notified. If the concern regards the need for education, a traffic safety presentation will be scheduled.

B. Services and Schedules

DOT performs a wide variety of traffic engineering studies. The appropriate study will be performed to address the requester's particular concern and situation. If traffic control devices, such as signs or pavement markings are needed, DOT will coordinate the installation. The performance measure goal for evaluating a concern and installing an appropriate device is 35 calendar days from the date the request is received.

Some studies require extensive data collection and field observations, or are subject to independent policies and guidelines, such as those for stop signs, crosswalks, and bike lanes, and will require additional time. In addition, devices that require City Council approval, such as heavy truck restrictions may require several months for analysis, public review and implementation. The goal is to take the time and conduct an appropriate level of outreach to ensure sufficient community involvement and awareness of intended actions.

If traffic safety education is requested or recommended to address driver, pedestrian or bicyclist behavior, the goal is to perform a traffic safety education presentation within eight weeks. However, the presentation schedule is often dependent upon coordination of a desired timeframe with neighborhood or school representatives.

COMPREHENSIVE TRAFFIC CALMING PROJECTS

A. Initiation of Comprehensive Traffic Calming Projects

Neighborhoods that are experiencing adverse traffic conditions that cannot be addressed using Basic Traffic Calming Services may be eligible for a comprehensive traffic calming project. If an adverse traffic condition cannot be addressed through basic traffic calming services, DOT will automatically initiate a comprehensive traffic calming analysis.

B. Comprehensive Traffic Calming Projects

A comprehensive traffic calming project generally involves the construction of a physical roadway feature(s) or installation of a dynamic warning sign or message system, and includes the following types of projects:

- ***Level 1 traffic calming projects*** are intended to reduce vehicular speed or enhance pedestrian safety. Level 1 projects require neighborhood involvement and outreach as described in Section F and Outreach Requirements. Examples of roadway features or signage include, but are not limited to, median islands, chokers, traffic circles, road humps, enhanced crosswalks, and school zone beacons or radar speed display signs.

- ***Level 2 traffic calming projects*** involve the redirecting of traffic to address excessive volumes resulting from cut-through traffic. Level 2 projects require extensive neighborhood involvement and outreach as described in Section F and Outreach Requirements, and ultimately, City Council approval. Examples of projects and features in this category include traffic diversion islands, full or partial street closures, and changing the direction of travel on a street.

Examples of roadway features, dynamic warning signs and message systems are contained in DOT's Traffic Calming Toolkit, which is available for community use. The Toolkit can be viewed at www.sanjoseca.gov/transportation/forms/toolkit.pdf and is intended to provide information regarding the various traffic calming services that are available.

C. Eligible Roadways

The implementation of comprehensive traffic calming projects is limited to residential, 2-lane local or minor neighborhood collector roadways, with a maximum posted speed limit of 30 mph. Streets designated as General Plan streets, transit routes, or used as emergency response routes are generally not eligible for comprehensive traffic calming measures, except for dynamic speed signs and messaging systems. These roadways by their classification, or function, are intended to carry higher volumes of traffic and accommodate a large vehicle mix.

Threshold Criteria:

The following threshold criteria must be met for the implementation of comprehensive traffic calming projects:

Local Streets: (posted speed limit of 25 mph and 1,000—3,000 vehicles per day)

- 85th percentile speed of 33 mph or more, or
- 40% or more of the daily traffic is 'cut-through' traffic

Neighborhood Collector Streets: (posted speed limit of 25 mph or 30 mph and 1,000—6,000 vehicles per day)

- 85^{th} percentile speed of 33 mph or more on 25 mph posted streets, or
- 85^{th} percentile speed of 37 mph or more on 30 mph posted streets

D. Prioritization of Comprehensive Projects

Eligible comprehensive traffic calming projects will be prioritized for implementation based upon the severity of the traffic conditions by taking into account the following cumulative traffic impacts: speeding, volume, cut-through traffic, crash history, proximity to pedestrian generators such as schools, parks and community centers and unique roadway conditions. Priority points will be assigned as shown below.

Priority Ranking

Speed	2 points for each mph difference between the 85th percentile speed and the posted or prima facie speed limit
Volume	1 point for each 500 vehicles over 1,000 vehicles per day 5 points if 40—65% or more ADT on local street is cut-through traffic between arterials or major roadways, 10 points if higher than 65%
Crash History	5 points for each speed related crash in the last 3 years
Pedestrian Generators (15 points max.)	5 points for each school, park or trail access, library, or community center along roadway 3 points if within 1 block, 2 points within 2 blocks
Unique Conditions (15 points max.)	5 points for designation as a bike route or as a General Plan pedestrian corridor, or for proximity to neighborhood business district, or existing/ planned transit hub; 5 points for evidence of crashes or speeding, such as long skid marks or broken glass; 5 points for missing sidewalk section; 5 points for unique roadway geometry that substantially restricts visibility; 5 points for high crash rate

*ADT - average daily traffic

At the close of each funding cycle (fiscal year), the highest ranked projects will be considered for construction in the following fiscal year, depending upon funding, resource availability and community support. However, adjustments in schedules of traffic calming projects may be made based upon coordination with scheduled capital improvement or private development projects, or availability of funding specific to the project.

E. Reassessment of Warranted Comprehensive Projects

Projects not selected in a given funding cycle will remain on the priority list for consideration in the next funding cycle and prioritized along with newly eligible projects. As resources permit, projects may be reassessed to ensure that the priority ranking reflects significant changes in land use, speed, volume, crash history, pedestrian activity, or other conditions that may have occurred on any given roadway(s).

F. Community Support for Selected Comprehensive Projects

Substantial community support is required for the installation of physical roadway devices on either a trial or permanent basis, including the active involvement of a neighborhood traffic committee. Generally, committee members must own property or reside within the affected project area. If the project area falls within a recognized Neighborhood Association, then the traffic committee should also include a member from that Neighborhood Association. Utilizing relevant data and community input, DOT and the traffic committee will develop a proposed traffic calming plan. Based upon potential impacts of the proposed plan, DOT will determine the affected project area. The traffic committee will distribute a petition developed by DOT to all households, businesses, schools, and absentee property owners within the project area. Some physical devices impact adjacent property owners more than others, and have specific installation guidelines and criteria that must also be met.

Trial Installations: The petition must have 50% + 1 support of all affected households, businesses and schools within the project area before a trial installation is implemented (Level 1 projects) or presented to City Council (Level 2 projects) for authorization to proceed.

Permanent Installations: The petition must have 50% + 1 support of all affected households, businesses and schools within the project area for implementation of the final plan (Level 1 projects) or to be scheduled for presentation to City Council (Level 2 projects) for approval.

G. Comprehensive Project Schedule

Most comprehensive projects will require a trial installation, which will generally occur within four months from the date the plan is finalized and supported by the community or approved by City Council. The duration of the trial will normally be six months, during which time City staff will evaluate the effectiveness of the installation. During the trial, minor adjustments may be made to the plan based upon review by City staff and input from the community. Based on all relevant data and community input, DOT, in coordination with the traffic committee, will develop a proposed plan and schedule for permanent installation of the comprehensive project that will be presented to the community for approval.

Level 1 projects supported by the community will be programmed for implementation. Community supported Level 2 projects will be presented to City Council for consideration, and, if approved, programmed for implementation. Installation of final comprehensive projects will be dependent upon the complexity of the project and available resources for construction and ongoing maintenance of installed devices.

H. Reapplication for Comprehensive Traffic Calming Project

Neighborhoods that do not qualify for a comprehensive traffic calming project may reapply in two years from the date of DOT's final consideration. The two-year time period may be waived by the City Traffic Engineer if significant land use changes or other significant change has occurred.

COMMUNITY FUNDING FOR COMPREHENSIVE TRAFFIC CALMING PROJECTS

The City may accept donations from residents, neighborhoods, community groups, schools and/or businesses for the implementation and ongoing maintenance of comprehensive traffic calming projects that are eligible for installation under the provisions of this policy. Donations will need to comply with all provisions of City Council Policy 1-17.

OUTREACH REQUIREMENTS

Residents, businesses and schools that may be affected by the outcome of a comprehensive traffic calming project, will be notified in writing of any planned actions and schedule. Comprehensive projects that involve the installation of physical roadway features will normally require at least one (1) community meeting with households, businesses and schools in the project area. Notices for any community meeting will be distributed at least ten (10) calendar days in advance. Notices will be provided to all properties within the project area as defined in Section F. The methods of notification will be consistent with those contained in Council Policy 6-30. Projects will also be coordinated with providers of emergency response services, transit services, utilities and related services as needed.

POLICY EXEMPTIONS

Local residential streets and neighborhood collectors that do not meet the threshold criteria in Section C may be eligible for comprehensive traffic calming measures if the City Traffic Engineer determines that a unique or unusual condition exists which results in negative traffic impacts caused by a high number or rate of crashes, vehicles traveling at excessive speeds, significant pedestrian activity, or proximity to major traffic corridors or traffic generators that contribute to extraordinary changes to normal traffic conditions. These roadways will be prioritized along with the roadways that meet the threshold criteria based upon the ranking methodology in Section D.

General Plan streets, transit routes, emergency response routes, may be eligible for dynamic warning signs or messaging systems if substantial levels of speeding are present as determined by DOT through an engineering traffic study, and funding is available for their installation and ongoing maintenance.

DEVELOPMENT IMPACTS IN EXISTING NEIGHBORHOODS

All proposed private and public development projects will be reviewed for potential traffic calming or pedestrian safety issues and a study will be required when necessary as determined through the City's development review process. DOT, Public Works and other City staff or consultants will be actively involved in the review of any proposed development that is determined to potentially create or significantly increase an adverse traffic condition in an existing neighborhood. It is the intent of this involvement that the development will be designed or that traffic calming or pedestrian or bicycle conditions will be placed on the developer to eliminate or minimize the portion of the adverse impacts that are a result of the development.

APPENDIX B: STOP SIGN POLICY

City of San José, California

COUNCIL POLICY

TITLE	PAGE	POLICY NUMBER
CRITERIA FOR THE INSTALLATION OF STOP SIGNS	1 of 4	8-1
EFFECTIVE DATE April 3, 1972	**REVISED DATE** April 3, 2001	
APPROVED BY COUNCIL ACTION 4/3/72; 7/5/79—Item 9a; Ordinance Nos. 204 & 20500 adopted 2/10/81; 5/7/85—Item 12a; 3/22/94—Item 9l; 4/3/01, Item 6.3, Resolution No. 70257.		

BACKGROUND

Stop signs are installed to establish right-of-way at intersections between motorists, cyclists, and pedestrians, reduce delay, and enhance safety for all roadway users.

PURPOSE

To state Council Policy relative to the designation of stop intersections.

POLICY

It is the policy of the City Council that the City install stop signs in locations where the City Traffic Engineer, in the exercise of his/her engineering judgment, determines that such installation is appropriate. The City Traffic engineer should consider installation of a stop sign at an intersection that meets or exceeds the minimum guidelines set forth in this Policy. Potential conflicting City policies such as the Intersection Level of Service shall be considered, and may form the basis for the denial of stop signs despite other justifying factors. It is also the policy of the City Council that stop signs be installed at intersections as authorized by the City Traffic Engineer under the direction of the City Council or the Traffic Appeals Commission. In addition, stop signs are placed at entrances to through highways designated by the City Traffic Engineer or at intersections designated by the City Traffic Engineer as stop intersections in accordance with Title 11, Chapter 11.36, Section 11.36.030, 11.36.035 of the Municipal Code.

CRITERIA FOR INSTALLATION OF STOP SIGNS

A. **Two-Way (or One-Way) Stop Sign Analysis.**

The City Traffic Engineer should consider installation of two-way (or one-way) stop signs if an intersection obtains a minimum of 18 points as determined below:

1. **Volume conflicts (maximum 9 points)**
   a. **Higher Volume Street:** One point for every 100 vehicles per day entering the intersection in excess of 600 vehicles per day. (Maximum 5 points).
   b. **Lower Volume Street:** One point for every 100 vehicles per day entering the intersection in excess of 300 vehicles per day. (Maximum 4 points).
2. **Visibility Conditions** - One point for each one MPH that the safe approach speed to the intersection is less than 20 MPH.
3. **Crash experience** - Six points for each crash during any 12-month period within two years prior to investigation that might have been prevented by the vehicles complying with properly placed stop signs.
4. **School Warrant (maximum 6 points)** - The City Traffic Engineer shall assign points for the intersection being adjacent to or within two blocks from the school (kindergarten to twelfth grade).

If an intersection is adjacent to or within two blocks of several schools, then additional points will be assigned using the same point distribution:

INTERSECTION	SCHOOL 1	SCHOOL 2	SCHOOL 3
Adjacent	3 points	3 points	3 points
One Block	2 points	2 points	2 points
Two Block	1 point	1 point	1 point

5. **Unusual conditions (maximum 9 points)**

   Points may be assigned considering the severity of:

   a. High pedestrian and bicycle activity because of proximity to recreational facilities including school facilities, parks, senior centers, high-density housing, neighborhood library, transit stops, and other facilities that generate high pedestrian and bicycle activity;

   b. Average speeds in excess of the speed limit;

   c. Visual signs of emergency maneuvers such as skid marks and crash debris;

   d. Unique geometric conditions exist.

B. **All Way Stop Sign Analysis For Non-General Plan Streets.**

The criteria for the all-way stop analysis recognizes that delays are superseded by the desire to reduce potential crashes. An intersection qualifies for this analysis if it has residential frontage, a street not on the City's adopted General Plan, and does not exceed an average daily traffic volume of 6,000. If both streets at an intersection are residential, then the installation of all-way stop signs should be considered if the intersection obtains a minimum of 20 points as determined below.

1. **Volume conflicts (maximum 12 points)** - One point for every 100 conflicting movements per day in excess of the first 400 conflicting movements for a four-way intersection. One point for every 100 conflicting movements per day in excess of the first 300 conflicting movements for a three-way intersection.

2. **Crash experience** - Six points for each crash during any 12-month period within two years prior to investigation that might have been prevented by the vehicles complying with properly placed stop signs.

3. **School Warrant (maximum 6 points)** - Points shall be assigned for the intersection being adjacent to or within two blocks from the school. Multiple schools will generate additional points using the same point distribution:

INTERSECTION	SCHOOL 1	SCHOOL 2	SCHOOL 3
Adjacent	3 points	3 points	3 points
One Block	2 points	2 points	2 points
Two Block	1 point	1 point	1 point

5. **Unusual conditions (maximum 12 points)**

   Points may be assigned considering the severity of:

   a. High pedestrian and bicycle activity because of proximity to recreational facilities including school facilities, parks, senior centers, high-density housing, neighborhood library, transit stops, and other facilities that generate high pedestrian and bicycle activity;

   b. Intersections within a pedestrian corridor or zone as identified in the General Plan;

   c. Average speeds in excess of the speed limit;

   d. Visual signs of emergency maneuvers such as skid marks and crash debris;

   e. Unique geometric conditions exist;

   f. Visibility concerns exist.

C. **All-Way Stop Sign Analysis for General Plan Streets.**

The criteria for non-residential General Plan streets recognizes the desire to enhance safety reduce potential crashes and the desire to minimize unnecessary delays. The City Traffic Engineer should consider installing all-way stop signs if the intersection obtains a minimum of 28 points as determined below:

1. **Volume conflicts and overall delays (maximum 15 points)**

Higher Volume Approach Four-Hour Volume	Points	Lower Volume Approach Four-Hour Volume	Points
0—1400	0	600—800	1
1401—1700	1	801—1000	2
1701—2000	2	1001—1200	3
2001—2300	3	1201—1400	4
2301—2600	4	1401—1600	5
2601—2900	5	1601—1800	6
2901—3200	4	1801—2000	7
3201—3500	3	2001—2200	8
3501—3800	2	2201—2400	9
3801—4100	1	2401—Over	10
4101—Over	0		

2. **Delay on higher volume street (maximum 5 points)**

Points assigned in accordance with the following table:

Higher Volume Street to Lower Volume Street 24-Hour Volume Ratio

Volume Ratio	Points
1.0:1 to 1.4:1	5
1.5:1 to 1.9:1	4
2.0:1 to 2.9:1	3
3.0:1 to 3.9:1	2
4.0:1 to 4.9:1	1
Greater than 5.0:1	0

3. **Crash Experience** - Six points for each crash during any 12-month period within two years prior to investigation that might have been prevented by the vehicles complying with properly placed stop signs.

4. **School Warrant (maximum 6 points)** - Points shall be assigned for the intersection being adjacent to or within two blocks from the school. Multiple schools will generate additional points using the same point distribution:

INTERSECTION	SCHOOL 1	SCHOOL 2	SCHOOL 3
Adjacent	3 points	3 points	3 points
One Block	2 points	2 points	2 points
Two Block	1 point	1 point	1 point

5. **Unusual conditions (maximum 12 points)**

Points may be assigned considering the severity of:

a. High pedestrian and bicycle activity because of proximity to recreational facilities including school facilities, parks, senior centers, high-density housing, neighborhood library, transit stops, and other facilities that generate high pedestrian and bicycle activity;

b. Intersections within a pedestrian corridor or zone as identified in the General Plan;

c. Average speeds in excess of the speed limit;

d. Visual signs of emergency maneuvers such as skid marks and crash debris;
e. Low volume street;
f. Unique geometric conditions exist;
g. Visibility concerns exist.

6. The City Traffic Engineer shall do an analysis of the following items prior to installing an all-way stop on a General Plan street:
   a. Determine the crash rate for the intersection for the previous one year and three year period and compare with the City-wide average of that particular type of intersection (e.g., major collector/local controlled by two-way stop);
   b. Determine the proximity of the subject intersection with existing traffic signals and planned traffic signals;
   c. Determine if the subject intersection is warranted for a traffic signal;
   d. Determine the possible diversion of through traffic due to delays caused by an additional stop, including an assessment of the impact on other streets;
   e. Level of service shall be calculated for the intersection to assess peak hour congestion.

APPEAL OF DENIAL OF REQUEST FOR STOP SIGNS

If, after a citizen request to install stop signs at a particular intersection, the City Traffic Engineer decides for any reason not to install such stop signs, then the Traffic Appeals Commission is authorized, pursuant to the San José Municipal code, to hear an appeal. If, after hearing all the facts presented to it on appeal, the Traffic Appeals commission determines that installation of a stop sign is appropriate and safe, then it shall order the City Traffic Engineer to install such stop sign. The Traffic Appeals Commission shall order the installation of a stop sign that does not meet the warrants set forth in this Council Policy only upon making a specific written determination that installation of such stop sign is consistent with the public safety. The City Traffic Engineer shall be authorized to install stop signs as directed by the Traffic Appeals Commission.

APPENDIX C: GUIDELINE TO TRAFFIC CALMING OPTIONS

Ref	Measure	Traffic Investigation and/or Analysis Req'd?	Estimated Cost to Implement	Funding and Resource Options Available to the Community (SNI, consultants, volunteers, private funding)	Council Policy or City Guidelines
BASIC MEASURES					
1	Police Enforcement	Possible	Subject to resources	May require neighborhood involvement	Enforcement is driven by number of complaints, crash history, proximity to schools
2	Parking Enforcement	Possible	Subject to resources	May require neighborhood involvement	Presence of parking restrictions, proximity to schools, requests
3	Radar Trailer	Possible	Subject to resources		Level of speeding, requests
4	Safety Education	None	Subject to resources	Requires neighborhood involvement	
5	Curb Markings	Minor	Minor		City guidelines
6	Striping	Minor	Minor	May require neighborhood involvement and support	State and City guidelines
7	Signs (speed limit, curve warning, parking restrictions, etc)	Minor-Major, depends on signs	Minor	May require neighborhood involvement and support	State law and guidelines, City guidelines
8	High-Visibility Signs	Minor	Minor		City guidelines
9	Crosswalks	Minor	Minor		State and City guidelines
10	High-Visibility Crosswalks	Minor	Minor		City guidelines
11	Truck Restriction	Major	Minor		City guidelines, and by ordinance
12	Stop Signs	Minor	Minor		City Policy
13	Residential Permit Parking	Major	Depends on area size New zones have fee per permit (cost to residents)	Requires neighborhood involvement	City guidelines, and by ordinance
COMPREHENSIVE – LEVEL 1 MEASURES					
14	Radar Speed Display Signage	Minor	$15K-20K/sign ongoing O&M	SNI or private funding	Traffic Calming Policy
15	School Zone Beacons	Minor	$12K-$15K/pair ongoing O&M	SNI or private funding	Traffic Calming Policy
16	Enhanced Crosswalks (flashing beacons or textured - asphalt)	Minor	$15K-$20K/location ongoing O&M	SNI or private funding	Traffic Calming Policy
17	Road Bumps	Major	$7K each	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
18	Bulb-outs	Major	$200K-$600K/pair	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
19	Traffic Circle	Major	$60K-$100K ongoing O&M if landscaped	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
20	Chokers	Major	$20K/pair (detached) ongoing O&M if landscaped	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
21	Medians	Major	$10K-$20K each ongoing O&M if landscaped	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
22	Chicanes	Major	$10K each (detached) ongoing O&M if landscaped	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
COMPREHENSIVE – LEVEL 2 MEASURES					
23	Diverters	Major	Depends on design	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
24	Partial Closure	Major	Depends on design	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
25	Extended Median	Major	Depends on design	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy
26	Full Closure	Major	Depends on design	SNI or private funding. Requires neighborhood support.	Traffic Calming Policy

APPENDIX D: SUMMARY OF TRAFFIC CALMING MEASURES AND OBJECTIVES

		Impact of Traffic Calming Objectives – Desirable Effects						Impact of Traffic Calming Objectives – Undesirable Effects					
	Measure	**Reduce Speed**	**Reduce Volume**	**Increase Driver Safety**	**Increase Pedestrian Safety**	**Increase Biking Safety**	**Increase Aesthetics**	**Noise Increase**	**Pollution Increase**	**Loss of Parking**	**Restricts Access**	**Emergency Impacts**	**Increase Maintenance**

Traffic Calming Programs and Emergency Response:

A Competition of Two Public Goods

APPROVED BY

SUPERVISING COMMITTEE:

_____

_____

DEDICATION

Every minute of every day, a group of dedicated people constantly remains vigilant throughout the communities of the United States to respond and provide emergency services to the victims of those who encounter the perils of fires and medical emergencies. The Fire Chief and other subordinate Chief Officers, whether professional or volunteer, provide the leadership to direct these local emergency service responses.

The Fire Chief, who is considered the "community expert" on fire protection and emergency medical service matters, is often confronted with tough policy development choices and emergency scene decisions to ensure the protection of both his/her staff and the public they serve. I wish to dedicate this professional report to the men and women of America's fire service, particularly those Chiefs who wear the white helmets, in hopes that this research can assist them in making sound, quality decisions for their respective communities.

ACKNOWLEDGEMENTS

True professional reports, regardless of the discipline, require both the internal and external contributions of many people and organizations. This report is not different. Without their willingness to share their resources, be it time, information, or experiences, this report would have been impossible to author.

Before a report such as this can be submitted, one must have the desire to enter graduate school. My desire for such an achievement would not have been possible without the inspiration and encouragement of a former graduate of the LBJ School. My sincerest thanks goes to Elizabeth Gray (Class of 1990), who instilled the confidence within me to pursue this endeavor. At a time when I thought my formal education had ended, she saw otherwise.

I would like to thank my supervising committee, Bill Spelman and Bill Black, for their guidance and review of this report. Also, I want to thank the entire faculty at the LBJ School of Public Affairs, who has provided me, and other students, with the knowledge and ability to perform analytical public policy reviews.

Sharing professional information is not possible without networking. I wish to respectfully thank all of my colleagues throughout the U.S. fire service who were so willing to share their perspectives and experiences during

the development of this paper. Particular thanks goes to the Chief Officers and officials of the Austin, Berkeley, Boulder, Fresno, Montgomery County (MD), Portland, and Sacramento Fire Departments.

A great appreciation is also extended to Joan Hudson and the staff of the City of Austin Neighborhood Traffic Calming Program. Their generosity of information and professional interactions created a positive environment, from a proponent's perspective, to explore and expound upon the subject of this paper.

Without a doubt, the greatest contributor to my research goes to Kathleen Calongne. Her collection of documents, information and sources, from an opponent's point of view, were invaluable to this report. For all of her previous work, perseverance, and accumulation of information from networking with others, I truly consider her one of the "pioneers" of the traffic calming debate. Her cohorts, such as Amy Muhs, Emily Wilcox and Ray Bowman, are three of the many others who assisted in providing research materials or methods.

Finally, my greatest appreciation goes to my wife Linda, and my two daughters, Brande and Brittani, who have graciously endured the family pressures generated during the development of this report. However, their compassion and understanding goes far beyond that. Over the last twenty years, they have given me the utmost support and encouragement to pursue

my professional development dreams at the expense of many family sacrifices. To them, I will forever be indebted.

Traffic Calming Programs & Emergency Response:

A Competition of Two Public Goods

by

Leslie W. Bunte, Jr., M.P.Aff.

The University of Texas at Austin, 2000

SUPERVISOR: William Spelman

A natural dilemma for public policy makers occurred when two public policies conflicted with each other causing immense political and emotional stress upon both the policy maker and the public. This research paper examined the disagreement that had occurred in communities throughout the United States where traffic-calming programs were found to be in direct conflict with providing prompt emergency services. Thus, a conflict of two public goods was created.

This professional report examined the history and the positive and negative aspects of traffic calming programs. Negative impacts upon emergency services were substantiated by various emergency response time tests conducted by leading U.S. Fire Departments. Information was also

obtained on injuries that have occurred to firefighters from traffic calming devices as well as documented mechanical damages to emergency vehicles.

Traffic calming programs were found to contribute to air pollution as verified by several previous environmental studies conducted specifically for traffic calming devices. This report also revealed the enormous potential for civil liabilities for local governments, particularly with the violation of the American with Disabilities Act. In general, most U.S. local governments placed their traffic calming programs in moratorium due to all of the conflicts that were generated.

A policy analysis was conducted specifically for the conflict that had arisen in Austin, Texas. Based on quantitative processes, this analysis showed that Austin would lose an additional 37 lives per year with patients of sudden cardiac arrest if the Fire and EMS Departments experienced a 30 second delay in response times due to traffic calming. The analyses also concluded that at best, only one pedestrian life could be saved each year from traffic calming as pedestrian fatalities rarely occurred within residential neighborhoods. A *risk/benefit* analyses also demonstrated that traffic-calming devices have more of a negative impact than a positive impact to the community.

To reduce the conflict, and ensure at least a balance of these two public goods, a set of recommendations was formulated for the City of Austin

policy makers and for those of other communities who had similar circumstances.

Chapter 1. Introduction

Vibrant societies of today utilize democratic style governments to promote and maintain quality lifestyles for their people. These governments accomplish the amenable lifestyles by adhering to various core principles and values. Being responsive to the people is one of many mainstay principles. Thus, governments should be sensitive to both the general, as well as the specific needs of those expressed by the society. One value of this *responsiveness* tenet is that the government should provide services and programs that will ensure the health, safety, and welfare of the people. Such provisions do indeed provide for a quality lifestyle enjoyed by the citizens and enhances the overall well being of the society.

At all levels of government, many questions arise on how to provide the means to accomplish or uphold these desired principles and values. Determining the policies and methods to execute public policies is not always an easy task for the decision-makers of the government. As illustrated later, this process is extremely compounded when two separate public policies or programs, each of which has positive benefits to specific portions of the society, conflict with each other.

Anyone who has ever witnessed a federal public hearing regarding where to place a nuclear power plant, or who has attended a state agency public

forum on the selection of public school textbooks, can certainly attest that such gatherings contain a large amount of debate and highly accentuated emotions from the citizenry. For the policy maker, particularly the elected official, this can be a difficult arena whereby they are faced with the dilemma of choosing between the specific interest groups of the society.

For example, those who want cheaper electricity production, that is less dependent upon fossil fuels, are often pitted against those who want policies of strict regulation that will protect the environment and mankind from technological disaster. Similar conflict occurs when determining if public school textbooks should contain explicit sex education, or strong emphasis on the Darwinism theory, versus those who desire for these subjects to be relegated to within the family unit of the home. In many instances such as these, government officials prefer to find some middle ground for compromise that is acquiescent to all parties.

Local governments too, are not immune from such volatile policy conflicts. These conflicts often have a very wide spectrum. Their intensities will vary from locale to locale, again depending upon the general and specific values of the community. The policy of prohibiting the smoking of tobacco products in most public places in Austin, Texas is quite different from those cities in the tobacco producing states such as the Carolinas. This decision for Austin may have been very easy, in contrast to the Carolina cities, where such

a policy would strongly conflict with their economic retention policies. Although this is a specific policy concern that may not apply to other cities, there are many other government policies and programs that are applicable to all local governments. Public transportation is one such example.

The central transportation concern presented to local governments by angry neighborhood residents, is that there are too many cars going too fast within the neighborhood. As a result, they fear for their safety. These governments are faced with finding solutions to this problem, whether they be building more roadway infrastructures to handle the increased volumes, or using alternative approaches to slowing the speeds of traffic.

Often, constructing larger transportation systems requires assistance from the state and federal governments. Unfortunately, this can take an immense amount of time before a remedy is implemented. Because of these difficulties, many local governments have resorted to locally funded *traffic calming* programs to "calm" the local streets. These programs can have positive and negative results, and like nuclear power plants or textbook selections, they will also generate a lot of public debate and expression of emotion.

The term *traffic calming* is complex, meaning different things to different people and locales. "Traffic calming is a process whereby people are encouraged to find alternative means of transportation, to drive more slowly,

to drive alternate routes, to drive with respect for the neighborhood through which one is traveling."[1]

Another view is that "[t]raffic calming is an attempt to strike a balance between vehicular traffic and everyone else who uses the street: pedestrians, bikers, business people and residents. That balance tilts away from cars. Some see traffic calming as a way of 'reclaiming' local streets from a traditional domination by automobiles. Others see it more modestly as a way of trying to restore the safety and peace in neighborhoods that are becoming overwhelmed with speeding traffic."[2]

Although the definitions may fluctuate, even within transportation professional circles, the best definition for the purpose of this paper is one rendered by the Institute of Transportation Engineers (ITE). "Traffic calming is the combination of mainly physical measures that reduce the negative effects of motor vehicle use, alter driver behavior and improve conditions for non-motorized street users".[3] This definition incorporates the use of physical street devices such speed humps, traffic circles, and street closures.

Traffic calming programs have purportedly, by some accounts, reduced traffic speed, volume, and accidents within neighborhoods, thus improving the safety and livability of the residents. Although the accuracy of results is often debated, these outcomes when they do occur can certainly be expressed as a public "good."

Another public "good" generally provided by the local government is that of efficient and prompt emergency services. Most local governments spend very large segments of their monetary resources for ensuring quality police, fire and emergency medical services (EMS). Unfortunately, providing this public good conflicts with the very core objectives of traffic calming programs.

The chief complaint is that traffic-calming devices delay the response times of emergency services to the community. Quick response times are directly correlated to the effectiveness of these emergency services. Virtually every service delivery performance measurement for fire and EMS departments is directly related to their response times. Some, but not all police services are directly impacted by quicker response times. Increasing the number of fire and EMS stations and the number of police units are actions that local governments frequently take to ensure that response times are not depredated.

Often, the response delays due to traffic calming devices are viewed as satisfying a few residents at the expense and increased risk of lesser effective emergency services, resultantly provided to the remainder of the entire community. Herein lies the debate, *Traffic calming and emergency response: A competition of two public goods.*

Like the conflicting public policy examples already presented, traffic-calming policies are full of public debate and emotion from all factions of the communities. Generally, this includes a specific group of neighborhood residents who desire traffic calming devices vying against those who routinely pass through the neighborhood, including representatives from the emergency services departments, who oppose their use.

One can easily envision the spectacle at such a public hearing debate. With fake blood cosmetology and trauma depicted bandages, young four to six year old children are marched before a city council dais, while pleading protective mothers are theatrically urging the council members to prevent child pedestrian tragedies by installing traffic calming devices within their neighborhood. Their claim is that few seconds, or even a minute, of delay encountered by emergency responders is insignificant to a child being killed by a speeding car.

On the other hand, the mayor and council is often faced with the Fire Chief, emblazoned in a full dress service uniform, advising the council members that such action will be detrimental to the emergency service delivery provided to victims and patients. Supplemented with position reinforcing remarks such as those of Fire Chief Larry Donner of the Boulder (CO) Fire Department, makes the final decision a truly high stake issue. "One minute is a long time to wait when you are the one not breathing!"[4] As he

further points out, this is even more critical when you have already waited more than three or four minutes for the emergency responders to arrive.

Now, after such "battle lines have been drawn", does the elected official go to one side or the other, or does he/she look for alternatives? What kind of analysis needs to be done for such a decision by the policy maker, or by those who assist with the policy formulation and implementation? This paper attempts to address this particular issue for the policy makers within the City of Austin, Texas. Further, this document can also serve as a model analysis for others who are responsible for policy development within their own communities.

With today's sophisticated news media access and vast explosion of electronic information dissemination within our society, public policy is being reviewed and scrutinized more than ever before. With more and more of these public accountability tools, the public is demanding that policies be well thought out, analyzed, evaluated, sensitive to all interests, and adequately planned for, rather than decisions being made on the pure intuition of the policy makers. Good sound analytical processes are needed for superior public policy formulation. This paper has been developed with that approach in mind.

In this chapter, the reader has been given an overview of the policy conflict that can erupt from traffic calming programs and response times.

There are many other conflicts with this issue that are explored in the remaining chapters. From this, a comprehensive policy analysis may be performed.

In order to fully understand the potential impacts to traffic calming, the reader should have a thorough knowledge of traffic calming devices. Chapter Two does this by providing a brief history of traffic calming in Europe and in the United States. The objectives and benefits from traffic calming programs, as well as device descriptions, are also reviewed.

Chapter Three provides an in-depth examination that traffic calming has upon the emergency service departments. This includes an understanding of the emergency response time concept and how the physical features of emergency vehicles are not compatible for traffic calming devices. A history of firefighter and paramedic injuries along with fleet damage is also presented. The most important aspect of this chapter is a summary of the field test studies performed by five different fire department agencies. The results of these studies quantify the response time delays for various traffic calming devices.

A negative impact to traffic calming that is often overlooked is that of increased vehicle emissions. Chapter Four is a literature review of how automobile exhaust emissions are another policy conflict for traffic calming. Summarized vehicle case studies are presented which quantify the impact of automobile emissions pertaining to specific traffic calming devices.

Every public policy has civil liability implications. The issue of traffic calming is no different. Chapter Five addresses the potential legal ramifications that traffic-calming devices pose to the Americans with Disabilities Act. Several other general liabilities to the local government are also covered.

As traffic calming has gained popularity in the last five to seven years, many local governments have instituted such programs or policies. The current postures of several of the U.S. cities are examined in Chapter Six. For parallel comparison, the Austin, Texas posture for traffic calming is explained. The overview of the Austin Neighborhood Traffic Calming Program serves as background information for the next chapter.

Chapter Seven is the heart of this professional report. This chapter encompasses analyses which measure the impacts of the traffic calming initiatives for Austin. Using local data and various analytical methods, a policy analysis is conducted that studies the impacts to traffic speed and volume, pedestrian accidents, sudden cardiac arrest, Austin Fire Department response times, and the projected impact of lives saved and lost due to traffic calming devices.

Although many arguments can be made for and against traffic calming, Chapter Eight serves somewhat as a forum for that debate. In this chapter, the

implications of the findings contained in Chapter Seven are discussed in detail.

And finally, Chapter Nine provides the real fruits of this policy review. A formal set of recommendations has been developed from this analysis. These recommendations are directed to the various policy makers within the City of Austin as they are based upon the Austin analysis. However, many of these recommendations would apply to most other local governments who have very similar circumstances.

Chapter 2. Traffic Calming Programs and Devices

History of Traffic Calming

Some 30 to 40 years ago the beginnings of traffic calming programs came into popularity in Europe. The earliest roots of traffic calming have been traced backed to the Netherlands, where in the late 1960's, the desires were "to turn the street into an obstacle course for motor vehicles, and an extension of home for residents."[1]

The Dutch utilized diversion schemes, such as street closings, one-way streets, and other traffic calming devices using physical measures such as speed humps. These concepts quickly spread to other countries such as Germany, Sweden, Denmark, England France, Japan, Israel, Austria, and Switzerland. With success on neighborhood streets, "[t]he Germans quickly learned that calming individual streets resulted in traffic diversion".[2] They then embarked upon a plan to extend the devices to the main roads.

Although traffic calming has been around for a number of years, Great Britain has elected, within the last decade, to aggressively implement traffic calming programs. This was developed in the shadow of a 1963 government document, *Traffic In Towns*, which is credited with initiating the shift towards

traffic calming as a viable transportation program. Colin Buchanan, the author of the document, is considered to be the father of traffic calming.[3]

Although Omaha, Nebraska experienced with the use of speed humps in the 1960's on some selected streets, their approach was not fully considered as a traffic-calming program. Two cities in America are recognized as being the pioneers for full-scale traffic calming programs. Seattle, Washington passed a $12 million dollar bond issue in 1968 for improving neighborhood streets, and thus had both the resources and public support to forge ahead with traffic calming initiatives. Following in 1975, Berkeley, California adopted a citywide traffic management plan, which specifically included traffic calming.[4]

Although residential streets have been addressed, the outlook for traffic calming devices upon larger volume streets is of question. To begin with, traffic-calming programs in the U.S. are continuing without any official sanctioning, which is extremely vulnerable to legal review. On a lesser scale than the Europeans, "U.S. programs have generated before-and-after speed, volume, and collision data, but nothing equivalent in scope or rigor to the European studies. Some European communities have long since concluded that traffic calming must encompass higher order roads if traffic safety, livability, and walkability are to be achieved outside isolated pockets."[5]

Given the unpopularity and rising opposition to traffic calming, the move to higher-class roadways in the United States may never be reached. This may be evidenced by the growing sentiment that "[e]veryone seems to want traffic calming in their neighborhood, but not on their route into the city which might be someone else's neighborhood."[6]

Traffic Calming Objectives & Strategies

Traffic calming programs, as the name implies, are an attempt to slow down automobile speeds and reduce the volume of traffic. Thus, there are several objectives that are usually established for the programs. They are: slow traffic speeds; reduce cut-through traffic; increase the safety of pedestrians, bicyclists, and vehicles; reduce traffic noise; and improve the aesthetics of the neighborhoods.

The approaches chosen by local governments to meet these objectives are centered on two distinct strategies that may be used separately or together. "These initiatives involve passive or 'soft' strategies and active or 'hard' strategies. Passive strategies are less restrictive in nature and use subtle or psychological means to influence drivers to behave in a desired fashion."[7] Examples of this strategy include traffic signals, signs, markings at pedestrian crossings, educational programs and traditional policing, through citations and fines, for enforcement.

"Active strategies are more restrictive in that they prevent or reduce movement of traffic by changing the street configuration or by the use of physical barriers or devices."[8] These type of devices are the one's that generally create the most controversy in communities. Some examples of the street re-configurations or physical barriers are street closures, partial closures, diverters, roadway gates, cul-de-sacs, chokers and curb extensions to create narrower streets. Without a doubt, the most used example of this strategy is the speed hump. "These 'hard' control devices are largely self-enforcing and create a visual impression, real or imagined, that a street isn't intended for through traffic."[9]

Unfortunately, many cities have reacted too quickly to citizen complaints about traffic, without fully identifying if a problem truly exists. This generally results in traffic calming devices being installed without being fully warranted. When this occurs, one can be sure that opposition will rapidly arise and conflict ensues. In many instances, neighborhood residents perceive there is a problem, when in fact there may not be one.

Analysis & Results

The first step for any traffic-calming program then is to identify and verify the problem. To accomplish this, local governments must utilize an array of analysis methods to help clarify the nature and extent of the problems.

This analysis should include studies and data collection of daily traffic volumes, accident rates, speed levels, cut-through traffic, and post results. Once the problem is correctly identified, then the proper traffic calming devices designed for the problem can be selected and implemented.

Traffic volume studies should always be used to determine the amount of traffic that is passing through a neighborhood. These should be conducted over a 24 hour period during the middle portion of the week or for the specific times and days of the week of concern. The best conclusive data is achieved by conducting a seven-day period survey. If possible, the analysis should include the actual empirical change in daily traffic, along with the percentage change, after devices are installed.

In general, most studies indicate that traffic calming is effective in reducing traffic volume in neighborhoods. However, the accuracy of the reductions reported may not be statistically sound. This is evidenced by the perspectives of Reid Ewing, of the Institute of Transportation Engineers (ITE), who is one of the leading experts on traffic calming issues. Regarding traffic volume surveys in his writings, Ewing is quick to "[n]ote that while sample sizes for several measures are large enough to provide meaningful results, the small sample sizes for others [cities] provide only general indicators of effectiveness. Care should be taken when considering their effectiveness."[10]

Of greater debate to the accuracy of the volume reduction reports are the inconsistencies of how and where the data is collected. As asserted further by Ewing, “results depend on where measurements are taken, with volume impacts being attenuated by intervening intersections. Data from studies …indicate that volumes in the same block as diagonal diverters decline by an average of 45 percent after installation. A block away, but with an intervening intersection, volumes decline by less than half that percentage.”[11]

Accident studies should be used to identify the nature and frequency of accidents within a neighborhood. By classifying traffic incidents, the parties and factors involved, locations can be identified where traffic calming devices can be placed to reduce the hazards. Who is involved, such as pedestrians or bicyclists, rights of way, time of day, weather and speed relationships can be of great value.

Ewing also cautions the accuracy of accident studies.

> It is often difficult to draw conclusive results from traffic calming accident analysis. Most safety studies of traffic calming compare "before and after" accident experience. Few studies take into account the influence of potential changes in accident reporting, weather conditions, and traffic diversion. Most traffic calming measures result in some reduction in traffic. Thus collisions may migrate to other streets as motorists divert to avoid traffic-calmed streets. For a comprehensive review of the safety impact, it is important to examine a wide-area, including streets with and without traffic calming.[12]

A recent Canadian report, summarizing 43 international studies, indicated that collision frequency declined anywhere from 8 to 100 percent after some sort of traffic calming was implemented.[13] This illustrates a severe variability, which suggests that all parameter measurements were not the same. An example, as noted earlier, is that many foreign countries use traffic calming devices on major arterial and collector streets, whereas that is not the case in the U.S. One could easily use these statistics to argue, either for or against, the effectiveness of traffic calming.

According to Ewing's research, the reductions of collisions in the U.S. are not as favorable as in other countries. "In most cases the number of collisions went down or stayed the same, but exceptions appear frequently. One reason for these mixed results may be due to statistics. Traffic calming in the United States is largely restricted to low-volume residential streets. Collisions occur infrequently on such streets to begin with, and systematic changes in collision rates may get lost in the random variation from year to year. This limits the confidence in drawing inferences about safety impacts of traffic calming."[14]

Most traffic calming programs include some type of speed analysis. These generally measure the frequency and range of speeds incurred upon a residential street. The nationally accepted method used by traffic engineers to determine safe speeds is the *85th percentile speed* methodology. This

percentile represents the speed below, which 85 percent of the drivers travel upon any surveyed roadway. This standard is used to establish speed limits by government officials and is used by the court systems in determining if speed limits are reasonable and thus enforceable. Due to this standard being used in the court systems, extreme care must be taken for determining speed levels within a neighborhood. For example, if current speed data reveals that the 85^{th} percentile speed is significantly above the current posted speed limit, then this may give evidence and credence to the need for raising the posted speed limit within the neighborhood rather than slowing the speed.

The Ewing research documents the results of speed studies conducted by various cities on hundreds of streets in the U.S. Most of these studies reveal that traffic calming does indeed reduce the speed of drivers. However, Ewing notes the effectiveness of the commonly used speed humps and the suspicious statistical confidence levels associated with their dubious success.

> Speed humps have the greatest impact on 85th percentile speeds, reducing them by an average of more than 7 mph, or 20 percent. Raised intersections, long speed tables, and circles have the least impact. One critical caveat: Rarely in the researched before-and-after studies is it made clear where speed measurements were taken in relation to the traffic calming measures. Occasionally a study will report 'midpoint' or 'midblock' speeds, but because the spacing of traffic calming measures or the length of blocks is unknown, the exact location of speed measurements is also unknown. The after speeds may be 100 feet from slow points, 200 feet, or some other distance. Obviously, where the measurement is taken has a profound effect on the result, because motorists decelerate as they approach slow points

> and accelerate as they leave them. Summary statistics of this sort provide, at best, ballpark estimates of impacts.[15]

Because of the different parameters measured by each locale, Ewing points to further concern for inaccuracy in establishing a national speed reduction average:

> [t]he exact date of measurement is seldom known. The "before" measurement may be 1 month or 3 years before installation; the "after" measurement, 1 week or 2 years afterward. The exact time of measurement may affect results because of the natural growth of traffic and the tendency of travelers to adjust to the new measures…A final caveat: While sample sizes for some measures are large, and sample averages are thus likely to be close to true average by virtue of the law of large numbers, sample sizes for other measures are miniscule. The sample includes 179 studies of standard 12-foot humps, but only 3 studies of raised intersections. The potential sampling error is accordingly many times greater for raised intersections than for 12-foot humps.[16]

Cut through traffic studies should also be conducted prior to installation of traffic calming devices. Knowing when, where, and the time of day cut-through traffic is occurring is important to device selection. Another factor that has to be determined is if cut-through traffic is actually legitimate or is of those driving specifically to and from some destination within the neighborhood.

Finally, as alluded to already, post-result studies need to be performed to document the impact of the action taken. Obviously, this data is critical to the effectiveness of a specific project, but collectively the data can be helpful in evaluating the entire program within that jurisdiction.

Description of Traffic Calming Devices

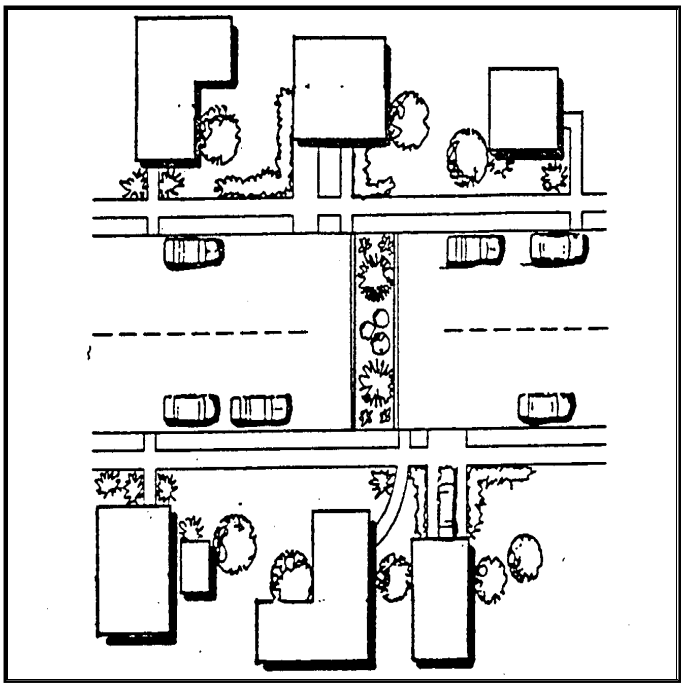
Traffic calming devices can be divided into of one of two general categories which predominately addresses either traffic volume or speed. *Volume control* devices are those, which divert traffic to another route, severely limit, or eliminate through traffic within an area. Examples of these types of devices are: full street closures, half street closures, diagonal diverters and semi-diverters.

The other category is that of *speed control* devices. Within this category are three sub-categories of *vertical, horizontal* and *narrowing* type devices. Vertical devices are elevated devices upon the roadway that uses the forces of accelerated ascents and decent to discourage speed. Speed bumps are the most radical type of these devices. Horizontal devices capitalize on shifting lateral forces of the vehicle due to rapid course diversions to accomplish reduced speeds. Traffic circles and chicanes are common examples of these types of devices. Rather than using the forces of physics, narrowing devices use a "psycho-perspective sense" of enclosure to discourage speeding. Curb extensions creating "neck downs" or a diminished path of travel are the objective of these type devices.[17]

There is quite a variety of traffic calming devices. Each device has positive and negative distinctiveness. As well, some are better suited for

different types of street conditions and applications. A complete listing of all types of devices and tools with their respective descriptions is contained in Appendix A. This Appendix provides in-depth information regarding the advantages, disadvantages and applications of each traffic calming measure. Brief reviews of the more common devices are examined in the remainder of this chapter. Most of the information contained in this chapter review, and in Appendix A, is adapted from the City of Boulder (CO) Neighborhood Traffic Mitigation Program Toolkit.

Volume Control Devices



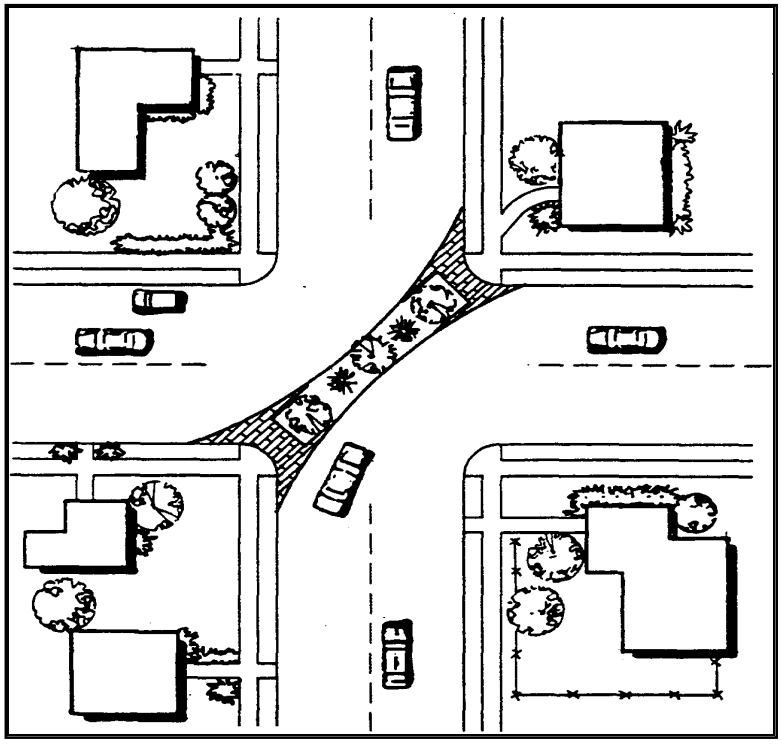
As stated earlier, the objective of volume control devices is to discourage and reduce the number of vehicles traveling through a neighborhood. Generally, this requires diverting the traffic to another route that is more suitable to handle such volume. The following are some of the more common examples of volume control devices:

Street Closure

This is probably the most drastic of all traffic calming devices as it severely limits the use of the street to the residents. Although it does eliminate cut through traffic, this device can often be perceived as an inconvenience by the residents and as an unwarranted restriction by the general public. Using planters, raised barriers, bollards or landscaping to completely block the street for traffic, accomplishes the desired effect as illustrated in Figure 2.1.

Figure 2.1

Street Closure



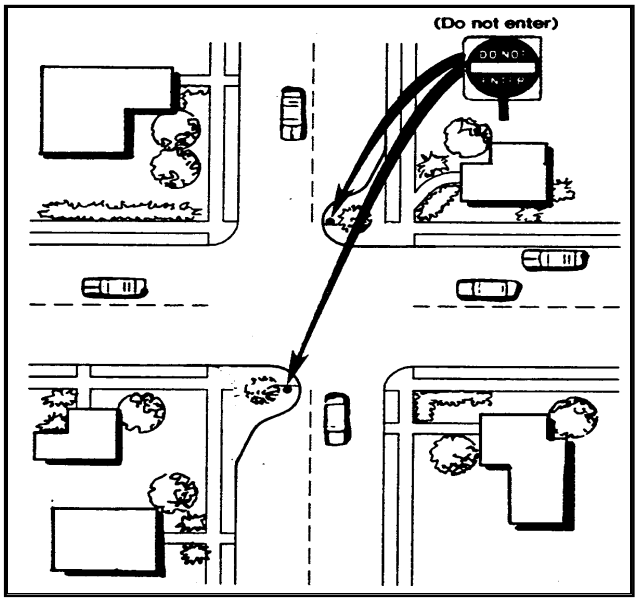
Source: City of Boulder NTMP Toolkit

Diagonal Diverter

This particular device is placed diagonally across an intersection with the design intent to interrupt traffic flow across the intersection. As a result, this installation is very effective for cut-through traffic and maintains a continuous routing of vehicles. However, because there is no opposing traffic, actual increased turning speeds by motorists can occur. As shown in Figure 2.2, this diverter could also increase trip lengths for some inconvenienced residents.

Figure 2.2

Diagonal Diverter

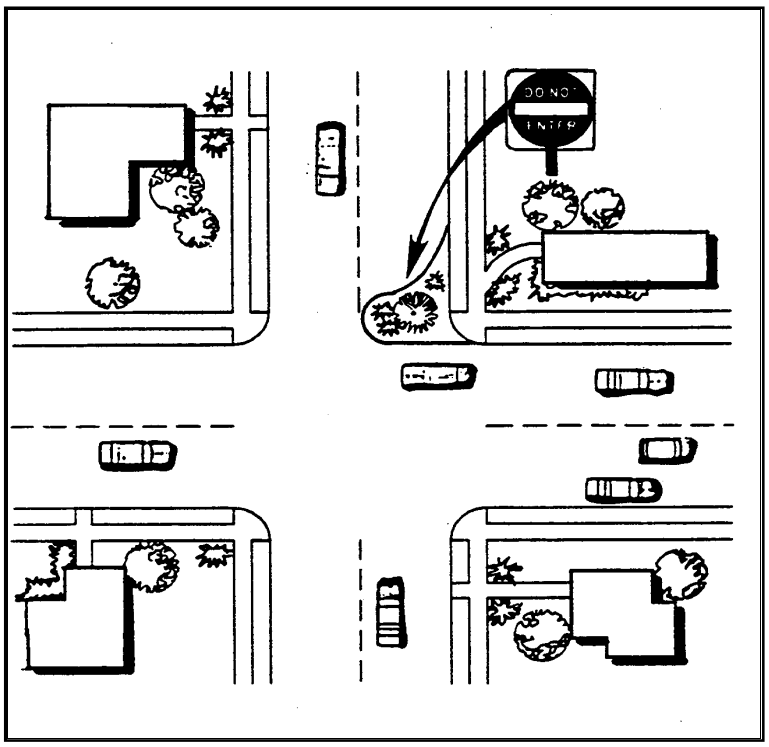


Source: City of Boulder NTMP Toolkit

Semi-Diverter

Whenever there is a desire to physically block one direction of traffic at a certain point on a two-way street, a *semi-diverter* traffic-calming device is selected similar to the one in Figure 2.3. In effect, this prevents vehicles from turning, or forcing a turn, depending upon the desire. Cut through traffic is reduced, but there is not a 100% compliance with all drivers, particularly when no on-coming traffic is encountered. Again, trip lengths could increase for some residents depending on the location of the semi-diverters.

Figure 2.3
Semi-Diverter



Source: City of Boulder NTMP Toolkit

Turn Prohibitions

Based on the same principle as the semi-diverter, the *turn prohibition* device is used when only a specific turning movement is desired on one particular street. This design, as shown in Figure 2.4, is very useful when only one street of the intersection experiences more traffic than the others, or when there is a need to eliminate two-way traffic conflicts. This device too, can have a detrimental effect on the access of the neighborhood to some residents.

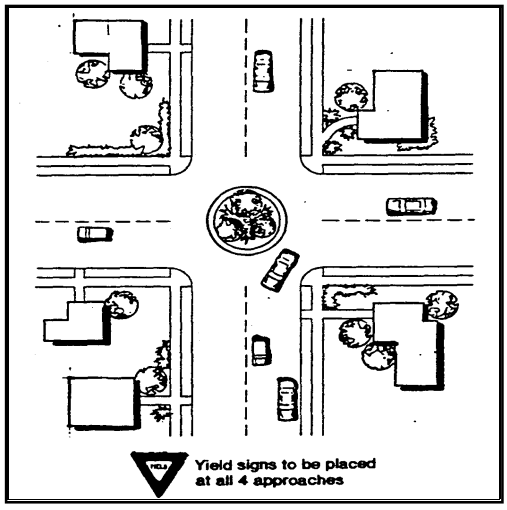
Figure 2.4
Turn Prohibitions

Source: City of Boulder NTMP Toolkit

Speed Control Devices

Using the erratic forces of acceleration and braking to slow vehicles are the objectives of most *speed control* devices. These forces occur as a result of vertical, horizontal or narrowing deflections to the paths of travel. As with volume control devices, these installations have benefits as well as drawbacks to their intended objectives.

Horizontal Speed Controls



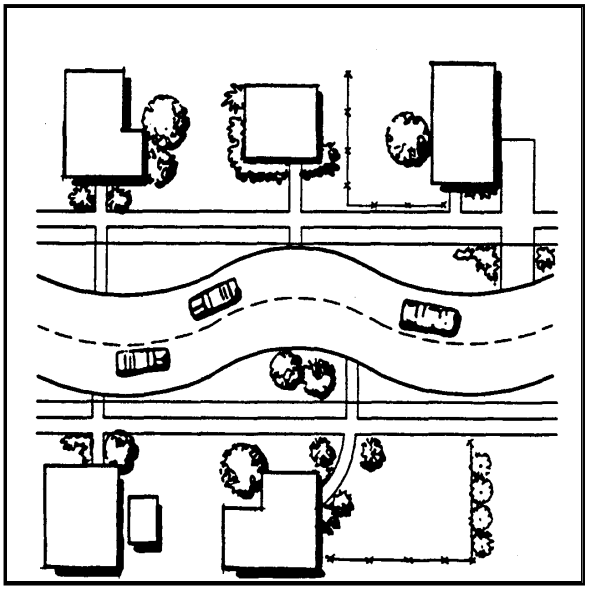
The horizontal speed controls devices have no vertical elevations within their design. They are designed to cause the driver to decelerate in order to generally maneuver from side to side, or in different directions, to successfully pass through the device. Here, the objective is to incorporate abnormal lateral forces that require the driver to reduce the speed of travel without losing control of the vehicle. Traffic circles and chicanes are the two most common types of the horizontal speed control devices.

Traffic Circles

Of all the horizontal devices, the *traffic circle* is probably the most controversial. These are raised circular medians located in the middle of a four-way intersection that requires drivers to travel in a counter-clockwise direction to reach the desired continuation street of the intersection. When properly constructed, no vehicle can travel through the intersection in a straight line as is depicted in Figure 2.5. Generally, the cars are required to "yield upon entry", thus granting the right of way to the cars already within the circle pattern. Traffic circles increase the confusion and danger for street crossing by pedestrians and bicyclists.

Figure 2.5

Traffic Circles

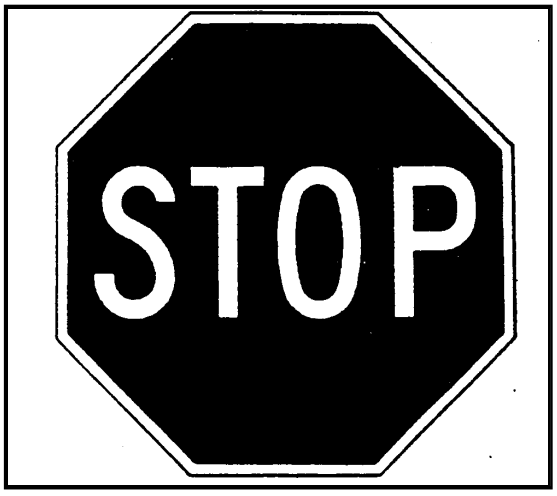


Source: City of Boulder NTMP Toolkit

Chicane Deviations

The *chicane* design redraws the path of travel so that the street is no longer straight. This is accomplished by the installation of curb extensions in between intersections. As shown in Figure 2.6, this horizontal deflection requires drivers to slow in order to maneuver to the left and right. Some residents gain additional right of way frontage to their property whereas others lose right of way frontage. Thus, this device is difficult to implement unless the street already offers a wide adequate right of way. Most residents within the entire chicane scheme lose street parking opportunities.

Figure 2.6
Chicane Deviations



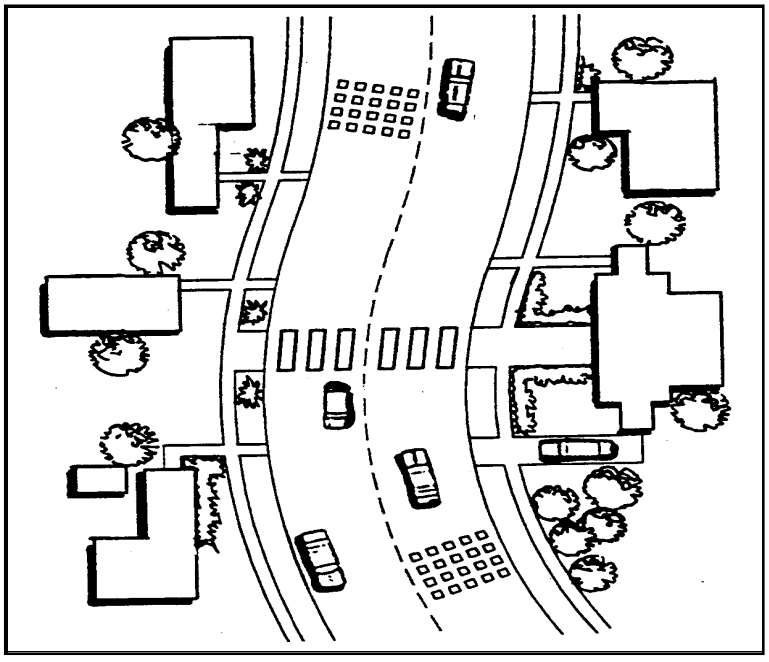
Source: City of Boulder NTMP Toolkit

Stop Signs

As most know, the red hexagonal sign containing the message to "stop", as depicted in Figure 2.7, is a traffic command established by the entity having jurisdiction. The purpose of *stop signs* is to designate the right of way of traffic at intersections. They are very useful when a low volume street intersects with a high volume street or for intersections with equal volume. If there is not enough traffic at the intersections then compliance will usually not be compelled. Many transportation officials argue that the signs do not decrease the average speed and therefore they do not support their use as a speed control tool.

Figure 2.7

Stop Signs



Source: City of Boulder NTMP Toolkit

Rumble Strips

These devices are patterned sections of rough pavement textures, which abruptly alert the drivers to a dangerous approaching condition. This sudden noise encountered by drivers is useful in areas of concealed stop signs or pedestrian crossings in mid-blocks. They are generally ineffective in reducing overall speeds and adversely impact bicyclists. The *rumble strips* are very noisy by design and thus are generally not recommended for neighborhood settings. Rumble strip examples are contained in Figure 2.8.

Figure 2.8

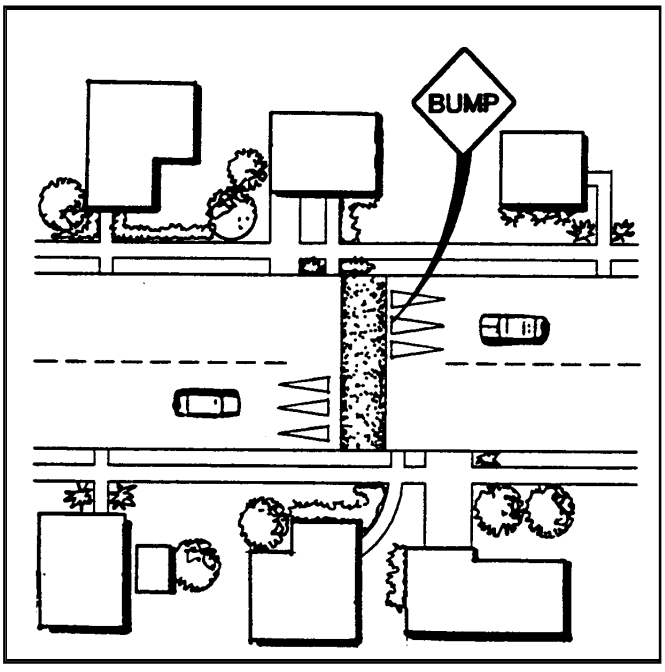
Rumble Strips

Source: City of Boulder NTMP Toolkit

Vertical Speed Controls

This device sub-category generates the most displeasure with the citizens who frequently use the roadways. The increased acceleration and braking that is necessary to traverse these vertical impediments causes speed interruptions while traveling upon the roadway. The ascent and decent of these elevated devices can cause discomfort for the passengers as well as maintaining the control of the vehicle unless they are crossed at lower speeds.

Speed humps, speed cushions, and raised intersections are the more commonly type vertical speed control devices found in communities with traffic mitigation calming plans. In general terms, the speed hump is the most economical type of vertical speed control device. As a result, this is often the most utilized device in traffic calming schemes.



Emergency services particularly object to these devices as they contribute to delayed response times and cause repeated mechanical stresses to the suspensions of emergency vehicles. They can also increase noise and air pollution.

Speed Humps

Speed humps are wave-shaped paved humps in the street as illustrated in Figure 2.9. The height of the hump determines how fast a vehicle can traverse the device without causing discomfort to the driver or damaging the vehicle. Discomfort and the feeling of being "out of control" increases as the speed attempt increases. Without a doubt, speed humps are the most controversial traffic-calming device. Generally, the height of most humps is about four inches. They are usually 12 to 22 feet wide.

Figure 2.9

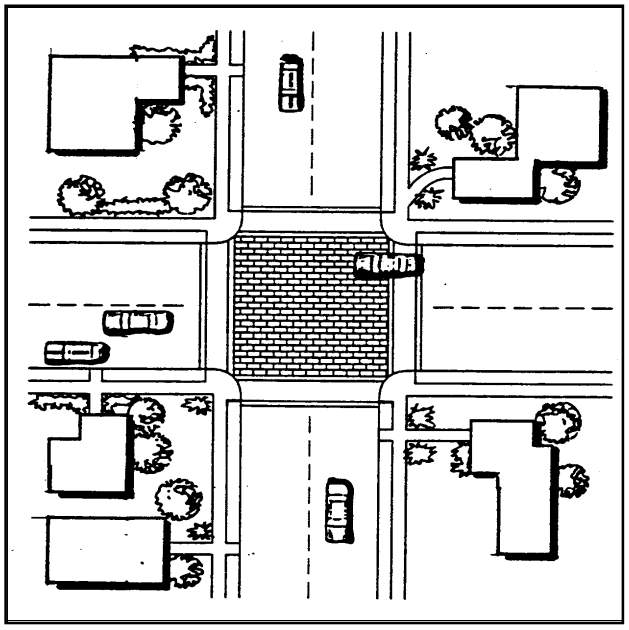
Speed Humps

Source: City of Boulder NTMP Toolkit

Speed Cushions

On a similar concept as the speed hump, *speed cushions* are designed to have a minimal impact to emergency response vehicles. Rather than extending the full width of the roadway, speed cushions partially cover the roadway. These devices, as shown in Figure 2.10, consist of either recycled rubber or asphalt, raised about 3 inches in height. The length of the cushion is about 10 feet. The spaces between the cushions allow emergency vehicles to partially straddle the device. Thus, these vehicles can traverse this device easier and faster than the speed hump.

Figure 2.10
Speed Cushion



Source: City of Austin Public Works & Transportation Department

Raised Intersections

A *raised intersection* is of similar design as the speed hump except that it encompasses the entire portion of the intersection area. This raised plateau is about 4 inches higher than the surrounding streets. Thus, one must slow to enter as well as maintain a slow speed to exit the intersection. This device, like the one shown in Figure 2.11, provides excellent amenity for pedestrians and is effective for speed control at intersections. Like the speed humps, these devices have a negative impact on emergency response times.

Figure 2.11

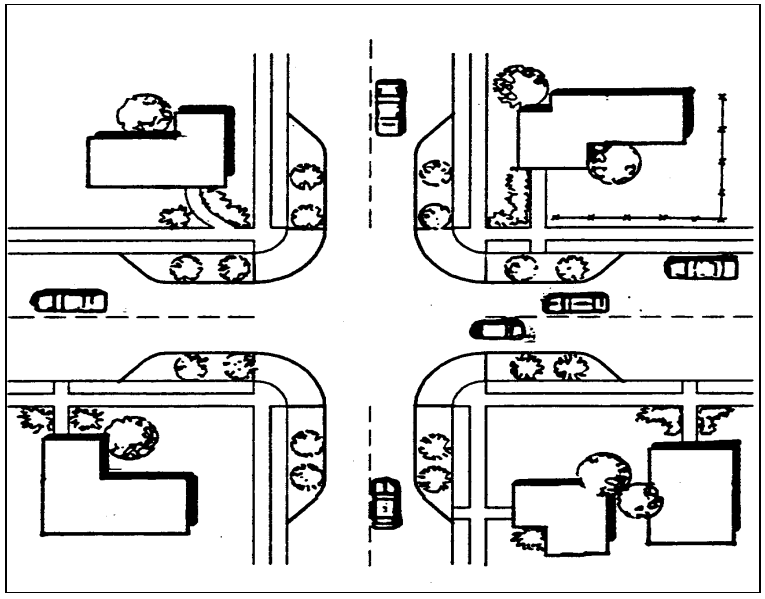
Raised Intersections

Source: City of Boulder NTMP Toolkit

Narrowing Control Devices

In general, wider roads encourage higher motor vehicle speeds. To combat these, alterations to roadways can be made to create a "psycho-perspective sense" of enclosing or narrowing the roadway. Many of the effective traffic calming devices capitalize on this element. Decreased road widths translate to decreased traffic speeds.

There can be many variations to the type of narrowing devices used by the communities with traffic calming programs. These types of devices are more expensive than most of the speed control devices. Due to the increased expense, narrowing devices are less likely to be utilized in traffic calming programs.



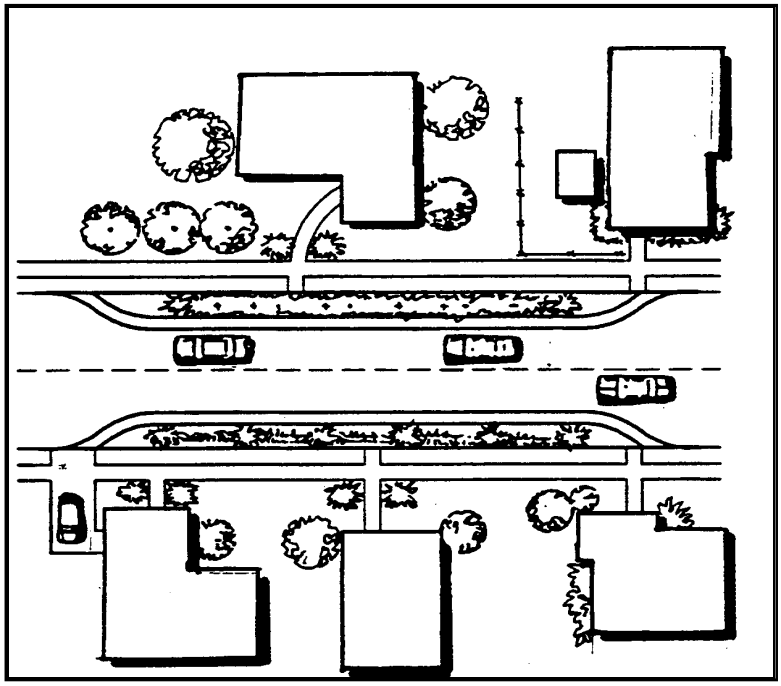
The type of devices can be used at intersections, mid-block for lane width reductions or simply to divide the center of traffic paths of a street. The following are the more commonly used narrowing control devices:

Neckdowns

The objective of these devices is to physically reduce the road width at intersections. This is accomplished by extending the curb radius of each corner point of the intersection. As the road begins to narrow, vehicles have to reduce speeds to ensure adequate fender clearances of on-coming vehicles at the entrance to an intersection. Figure 2.12 reveals how their design does not accommodate bicyclists very well.

Figure 2.12

Neckdowns



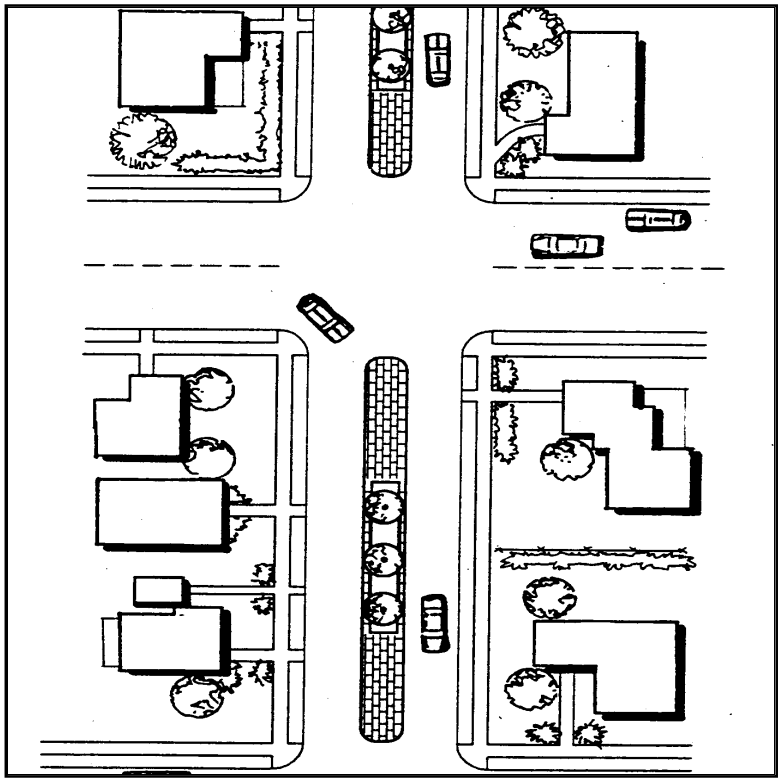
Source: City of Boulder NTMP Toolkit

Lane Narrowing

Similar to a neckdown, *lane narrowing* occurs in the mid-block portion of roadways rather than at the intersection. They are especially effective where there are long stretches of roadways between intersections. Many residents object to their placement in front of their homes as their parking is eliminated totally. These devices can also be dangerous for bike riders. Figure 2.13 illustrates a mid-block lane narrowing.

Figure 2.13

Lane Narrowing



Source: City of Boulder NTMP Toolkit

Center Median

The width of the street is reduced when a median is placed longitudinally along the center of the street. This in turn narrows the path of travel for on-coming lanes as shown in Figure 2.13. The addition of landscaping can also add to the effect of a narrow passageway. This often restricts all parking where the medians may be placed.

Figure 2.14

Center Median

Chapter 3. Emergency Service Issues

Emergency Response Times & Routes

Operators of emergency service vehicles are charged with the responsibility of navigating their vehicles to emergency scenes by taking routes that will yield the shortest amount of travel time possible. This elapsed travel time, which begins when a unit is dispatched to an emergency, and ends when they arrive on the scene, is commonly referred to as *response time*. Undoubtedly, the most debatable issue regarding traffic calming devices rests with the negative impacts on response times for emergency service vehicles.

In conflicting roles, the neighborhood streets that are good candidates for traffic calming devices are also the very same streets that are often utilized by emergency services. Not unlike the general public, drivers of emergency service vehicles commonly select streets that provide for faster speeds, cut-through access to adjacent areas, and lesser physical impediments in order to achieve the shortest response time to their destinations. These type of preferred, frequently used streets by the emergency services are often referred to as *primary response routes*.

At least one, more often several, primary response routes are used on every emergency response to reach any location in the service area. Close

proximity to emergency response routes is the very premise for optimal site selections for fire and EMS stations. In addition, most emergency service departments require their vehicle operators to devote an immense amount of time to studying and maintaining a superior knowledge of the streets within their geographical service area. This is to further ensure the emergency responders select the shortest, quickest routes that will yield minimal response times.

Recognizing the crucial importance of primary response, the Institute of Transportation Engineers (ITE) recommends that these routes should remain free of impediments. "Speed humps should not be installed on streets that are defined or used as primary or routine emergency vehicle access routes."[1]

Fire and EMS Vehicles

As traffic-calming devices are designed to slow the vehicular traffic of the public, they also slow the speeds of emergency vehicles. Most passenger cars are lighter in weight, have a shorter wheelbase, and utilize much softer suspension systems than the other vehicles used upon roadways. In addition, they generally contain a higher horsepower to weight ratio and contain very effective, sophisticated braking systems. Although these vehicles are slowed somewhat by traffic calming devices, these features allow the passenger vehicles to traverse the devices much easier than any other type of vehicle.

As a result, the passenger type automobiles used by police departments do not generally experience significant delays in emergency responses when confronted by speed humps. Police cars have the ability to heavily accelerate between speed humps to compensate for lost time crossing over the humps.

Of the three major emergency services, fire and EMS departments experience much greater response delays due to traffic calming devices as compared to their counterparts in the police departments. The actual response delays for fire apparatus will vary due to their size and type when responding to an emergency.

One must also remember that the delay in responses for EMS units can have a double jeopardy. Unlike the police and fire departments, emergency responses for EMS units are not just a one-way trip to the emergency scene. In most instances, their services require a return trip of traversing traffic calming devices while transporting patients to the nearest hospital. So, the overall impact for EMS is significantly higher than for any of the other emergency services.

Fire departments use many different types of apparatus within their fleets to carry out their missions. Most utilize heavy truck type designs. Compared to automobiles, fire trucks have a longer wheelbase, stiffer suspensions, and heavy gross vehicle weights. Pumper and tanker type fire trucks carry various large volumes of water (between 500 to 2000 gallons),

which weigh many tons. Ladder trucks, which have the largest wheelbase, carry large steel, aerial extension ladder devices (75' to 135' in length) which obviously are also very heavy.

With these physical features, fire apparatus operators must greatly reduce their speeds to safely traverse vertical speed humps and to negotiate very tight turning radiuses of traffic circles, chicanes, or deflector type devices. In addition, most fire apparatus are not adept for quick acceleration or de-acceleration extremes. Thus, they struggle severely to regain normal cruising speeds between devices.

EMS vehicles too are generally of a heavy truck type of design. Although they are not as heavy as fire trucks, they contain a large box type compartment for transporting patients and medical crews. This box configuration is unusually tall, quite bulky, and thus has a high center of gravity. Due to this design, when maneuvering over or through traffic calming devices, the EMS unit has a great tendency to severely shift from front to rear or side-to-side. Obviously, this type of transport condition can have very detrimental effects upon cardiac patients or severe trauma patients, i.e. bone fractures. There have also been reports that EMS personnel have been unable to successfully begin cardio-pulmonary resuscitation (CPR), intravenous medications, or intubate patients while traversing traffic calming devices.[2]

Although the delay in response time has been the focus of most opponents of traffic calming devices, there are some other severe, negative peripheral issues to fire and EMS emergency responses. Two of these issues warrant notation as they relate to both safety and additional direct costs for traffic calming programs.

Firefighter/Paramedic Injuries

There have been documented cases where firefighters have incurred injuries while traversing speed humps. A Montgomery County firefighter, responding to a 1997 fire incident, received substantial injuries to his neck and back while wearing a seat belt and full firefighter protective clothing. This employee was out of work for two months, served limited duty for another ten months before subsequently being released on full disability retirement in July of 1998.[3]

The Sacramento (CA) Fire Department has documented several firefighter injuries due to speed humps. One fire fighter was granted an early retirement after she struck her head on the roof of an apparatus while traversing a speed hump enroute to an incident. She suffered a cervical spine compression injury. Another firefighter experienced vertebrae compression injuries in another separate incident. That firefighter was awarded permanent disability status and could no longer work as a firefighter. In both of these

cases, each firefighter was wearing a seat belt and yet the force of the jolt caused them to strike their heads on the cab roofs. The third known injury was believed to be an aggravation/recurrence injury. It is believed that this firefighter had a previous neck injury and that the speed humps aggravated or caused further injury. A fourth injury resulted during the performance of actual speed hump testing. This too was a spinal injury to the back.[4]

The Fresno (CA) Fire Department too has had at least four documented cases of "injury on the job" incidents during emergency responses from crossing speed humps in fire apparatus. The injuries have been incurred from firefighters striking their heads on the roofs of fire trucks. These injuries have mainly occurred to the Officers of the units who ride in the forward passenger side of the fire apparatus. Preliminary departmental investigations reveal that the drivers are not as severely impacted as they have "air-ride" seats whereas the Officers seating position generally have fixed "bench type" seating. In addition, the rear facing firefighter riding positions appear to be less vulnerable to this injury particularly for the fire unit models that contain a raised roof area.[5]

Fleet Damage

There is a growing concern that traffic calming devices cause increased maintenance to fire vehicles. The erratic weight shifts to the fire apparatus

creates increased flexing and stress to suspension components such as steering devices, axles and frames. The Fresno (CA) Fire Department has experienced increased incidence of apparatus frame cracks. They attribute this to additional frame stressing and twisting from speed humps.[6]

A similar situation is documented in Berkeley, California. "Driving over speed humps cause[s] the frame to flex at awkward angles and serve to stress the apparatus needlessly. Because of this, the average life span of emergency vehicles would be shortened. One of our aerial ladder trucks had to have gussets welded to the frame to strengthen the frame member in order to stop a stress fracture. This was a direct result from the speed humps on Derby Street between Shattuck and Telegraph".[7]

Probably the department that has endured the most damage is the Sacramento (CA) Fire Department. They have documented several engines as having flattened springs, and/or body welds breaking loose from the vehicles' frame. Each apparatus experiencing these problems was assigned to response districts containing a higher number of speed humps than other areas of the city.[8] Due to this higher saturation of humps, fewer alternative routes were available to these units. Thus, these units experienced more repeated trips of passing over these devices.

One very dramatic Sacramento incident involved a 1975 Calavar Firebird apparatus, which is a 150' articulating ladder platform, weighing

approximately 72,000 pounds. While responding to an incident, the apparatus had a front axle assembly shear off after crossing a speed hump. Fortunately, no one was hurt, but there obviously was significant damage to the apparatus.[9]

Although not as severe, another fleet damaging incident also occurred in Sacramento. As the ladder/tiller unit crossed over speed humps at a speed of 20 mph, tremendous flexes and twists were placed upon the unit to the extent that all of the compartment doors, on both sides, abruptly came open. This resulted in most of the loose equipment stored inside being dumped onto the street.[10] This is finding is consistent with an Austin, TX speed hump test where a "power steering dipstick was dislodged from [the] motor over hump #5; equipment bouncing noise could be easily heard within compartments at all humps; radar noted speeds at all humps was at least 20 mph."[11]

Water tanks carried on the apparatus have also been subjected to damage. "One [San Diego] Fire Department truck tank was broken as the vehicle rolled over a hump."[12] In another report, "This city's first speed hump…has cost the Louisville Fire District more than $1,000 in damage to a truck."[13]

Vehicle damage from speed humps have also been reported in other public service fleet operations. Primarily bus routes and public transportation systems seem to be the most impacted. In England, "Midland Fox has estimated that damage resulting from traffic calming costs an estimated

£40,000 a year, with double-decker buses being the worst affected. Minor incidents have occurred…resulting in broken springs, skirting and exhausts, and…collapsed suspension."[14] The Sacramento (CA) Regional Transit System experienced major bus damages also. As a result, the transit system will no longer provide bus routes on streets that contain speed humps. Whenever new humps are placed down, the transit system simply moves to another route where humps are not located.[15] This may also be true for school buses. With speed hump problems on Twain Avenue in San Diego, "[s]chool buses are opting for Estrella [Avenue] to avoid Twain's undulations."[16]

Some special transit vehicles for the disabled have also documented increased maintenance from constantly going over or around traffic calming devices. These include increase in front-end alignments, brake pads wearing more quickly, shocks and springs need more frequent replacement, and damage to water valves, fuel tanks and mufflers that are located underneath the vehicle.[17]

Response Time Tests & Studies

Although most opponents and proponents agree that traffic-calming devices cause delays to emergency services, the real heart of the issue is how much of a delay occurs and does this have a significant impact on the outcome of the emergency event? Pressed to provide quantitative and qualitative data,

several fire departments and local governments have conducted various tests and studies in an attempt to measure the effect that traffic calming devices have upon emergency vehicles. Because traffic conditions and calming devices differ from one locale to another, the results of these tests and studies can vary with each jurisdiction. Each of the known major tests or studies is reviewed here along with the summary findings of each.

Portland, OR (January 1996)

The first major metropolitan city to extensively research and measure the effects on fire vehicle travel times of traffic calming devices occurred in Portland, Oregon. Beginning in the fall of 1995, the Portland Bureaus of Fire and Traffic Management initiated quantitative testing of the relationship between traffic calming devices and emergency response times. Four variables, which were thought to influence the response time impacts, were considered. The variables identified were: the driver, the type of fire vehicle, the desired speed, and the type of traffic calming devices.

Six vehicles consisting of fire engines, rescue units, squad units, and ladder trucks were used. With four test runs per vehicle, at speeds of 25, 30, 35, and 40 mph, a total of 24 tests were administered for each street. Of the six streets tested, two had 22-feet wide speed humps, two had speed hump widths of 14-feet, and the remaining two contained one traffic circle each.

The actual elapsed time from start to finish was timed and compared to the calculated response time for the same distance without traffic devices. The time difference represented the amount of response delay.[18]

The summarized findings and conclusions of the report indicated that the performance of the individual drivers did not significantly influence the results. The delays per device were interrelated to the three remaining variables of the type of vehicle, the type of device and the desired travel speed. The range of delays for all vehicles, with the four tested speeds, and the specific device tested is as follows:

22-foot Speed Humps:	0.0 to 9.2 seconds per hump
14-foot Speed Humps:	1.0 to 9.4 seconds per hump
Traffic Circles:	1.3 to 10.7 seconds per circle[19]

A closer examination of the data results for the specific speed of 30 mph reveals that the speed hump delays experienced for a fire engine is 3.7 seconds, compared to 4.9 seconds for longer ladder trucks. The rescue unit at this speed, which is comparable to an EMS unit, encountered a 1.7 second delay per hump.[20]

Most importantly of this study, interpretations of the data for the desired speeds of 25 mph vs. 40 mph would suggest that the faster a fire or EMS unit tries to travel, the greater the impact is for the delay. Most fire and EMS operators prefer a cruising speed of 35-40 mph. In essence, the more a driver

intensifies his/her efforts to transverse the humps, the greater the impact delay. For some cases, the impact per hump could be upwards of three-fold as depicted in Table 3.1.

Table 3.1

Speed Hump Response Delays for 25 MPH vs. 40 MPH

Vehicle	Response Speed	Delay Per Hump	% Delay For Faster Speed (40 mph)
EMS Unit	At 25 mph	1.3 seconds	
	At 40 mph	5.1 seconds	292%
Fire Engine	At 25 mph	2.8 seconds	
	At 40 mph	8.5 seconds	203%
Ladder Truck	At 25 mph	4.3 seconds	
	At 40 mph	10.3 seconds	139%

Austin, TX (March 1996)

In response to an explosion growth of popularity and request by citizens for speed humps on over 600+ streets, the Austin Fire Department conducted an analysis outlining the impacts to fire and EMS vehicles. This particular test measured the average time delays per each speed hump, with a total of six humps (14 feet wide) being crossed. The time increases to traverse the humps were approximately 2 to 10 seconds. This variation was due primarily to the type of emergency vehicle tested. For example, EMS units responding without a patient had an increase average of 2.2 seconds per hump compared

to a 9.6 second increase when transporting a critically injured patient. Fire engine pumper trucks and ladder trucks experienced an average delay variation of 2.8 to 3.6 seconds per hump. These results were from test parameters requiring the drivers to maneuver over the humps at speeds of their own discretion or at 15 mph. They were to then regain a 30 mph cruising speed between the humps.[21]

Another series of tests, requiring the drivers to maintain a 20 mph speed while crossing the humps and regaining to 30 mph in between humps, was found to be close to or beyond the reasonable limits of traversing speed humps. Specifically, all drivers in this test series expressed concern that they were out of control or that this speed was very potentially damaging to their apparatus.

In fact, some drivers refused to conduct seconds runs of this test at that speed. Thus, the data from this particular test was not used to determine the impact inferences. However, this confirms that apparatus cannot traverse speed humps safely at speeds of 20 mph or greater.[22]

Applying the data from this test, and using the 1999 Austin Fire Department average response time of 4.25 minutes, a simple extrapolation would reveal the impact of the increased response time expressed in a percentage.[23] A citizen living at the end of this particular test location, which

requires emergency vehicles to cross the six speed humps, would experience the increased response times noted in Figure 3.2.

Table 3.2
Response Time Increases for Six Speed Humps

Vehicle Type	Average Response Time	Average Time Increase (for 6 Speed Humps)	Total Increased Response Time	Percent Differential Increase for Delay
Pumper Truck	4.25 min.	.28 min.	4.53 min.	7%
Ladder Truck	4.25 min.	.37 min.	4.62 min.	9%
EMS (no patient)	4.25 min.	.27 min.	4.52 min.	6%
EMS (with patient)	4.25 min.	.97 min.	5.22 min.	23%

Montgomery County, MD (August 1997)

Facing increased pressures from the public and from politicians, the Montgomery County Fire Department was directed to study the issue in August 1997. The scope of this study was to measure the effects of circular type speed humps and traffic circles. Two test courses were implemented, one having three speed humps, and the second course containing one traffic circle. The evaluation team, composed of Montgomery County staff personnel from the Fire and the Public Works Departments, established test methodology employing most of the same measurement techniques used previously in both

the Austin and Portland tests. Three types of fire trucks and one ambulance were used in test runs.

Similar to the Austin test, the Montgomery County Fire and Rescue units experienced an average delay of 2.8 to 7.3 seconds per hump.[24] Likewise to the Portland test, a delay range of 3.2 to 7.0 seconds was experienced for the Montgomery County units maneuvering around the traffic circle test.[25] Although these delays are similar to the other studies, the research staff discovered that the four vehicles averaged slightly less than 20 mph across the test route. This is far below the widely accepted response time study by the Rand Institute in New York City, which established that fire department apparatus travel at an average cruising speed on 39.2 mph. Thus, their findings would, in all likelihood, represent the minimum delays that one could expect from fire and EMS units.[26]

Rather than just examining response time implications, this study utilized a linear form of measurement for determining service impact. Using the data, a chart was established showing how much closer, or an equivalent distance, a unit would have to be stationed to an incident scene due to the response delays it would encounter from crossing speed humps. Assuming one wanted to maintain a 5-minute response time goal, the chart shows that every speed hump the unit has to cross, while maintaining a 25 mph cruising speed, is equivalent to being .05 (1/20) mile further from the incident scene. If the

scenario contained 5 humps to cross, this would have the effect of adding approximately ¼ mile to the equivalent response distance. Thus, a station would need to be ¼ mile closer to the incident in order to maintain a 5-minute response goal.[27]

Linear measurement of course is in direct proportion to station coverage area measurements. As noted by the Montgomery County report, the areas served by fire stations could be greatly impacted:

> Should speed hump-impeded routes taken by responding units limit average speed to 20 mph, the amount of area they can serve within 5 minutes may drop to the area within 1.3 linear miles from the station versus the area within 2.0 linear miles served within 5 minutes along unimpeded routes upon which a cruising speed of 35-40 mph is attainable. Coverage of 1.3 miles in each direction from a station would be about 6.8 square miles per station for a total of 210 square miles covered by the County's 31 fire-rescue stations. In comparison, coverage of 2.0 miles in each direction would equal 16 square miles per station for a total of 496 square miles covered by the same 31 stations. Assuming the 1.3 mile scenario, station coverage would be 42% of that available from stations unimpeded by speed humps, implying that 58% of the residents/service recipients would wait more than 5 minutes for service after dialing 911.[28]

These findings could be illustrated in a different manner. If the Montgomery County residents desired to maintain the 5.0 minute response time goal and wanted traffic calming to the level indicated above, they would have to add 42 more fire stations, for a total of 73, in order to keep their current level of service. Due to the decreased speeds and increased response

times, these stations would have to be placed closer to each other than where they presently are. In addition, the financial impact would be overwhelming.

Berkeley, CA (October 1997)

In July 1995, after the Berkeley Fire Department (BFD) and disabled residents expressed strong concern over the proliferation of speed humps, the City Council ordered for an evaluation to be conducted. Further, the analysis was directed to consider not only the effectiveness of speed humps but also the full impacts of the devices. This study was completed in October 1997.

Two types of traffic calming devices were evaluated by the Fire Department. One test was performed on a street with six 12-foot circular speed humps, while the other was conducted on a street with two 22-foot flat top designed humps. For each test, a fire engine and a ladder truck were driven over the street segment containing the humps and then over a very similar adjacent street of the same distance but containing no humps. All test runs were timed and the response delay was identified by the time differences.[29]

Test results for the 12-foot humps suggested an increase of 10 seconds per hump. This time delay was similar for both the engine and ladder units. Based on this street, which is approximately 3 blocks or 1/3 mile long, the

Fire Department would experience an increase response delay of an additional one-minute.[30]

The results for the 22-foot humps revealed a significantly less delay particularly for the engine apparatus. The delay experienced by the engine was approximately 3 seconds per hump. However, the ladder truck had a much longer delay of approximately 13 seconds for this type of hump. This report does clarify that the delays measured by the BFD was greater than the four to six second delay per hump that other cities had identified. The BFD staff attributed these variances to driver behavior and limited physical testing.[31]

Boulder, CO (April 1998)

With growing concern and heated public debate over recent traffic calming installations, the Boulder Fire Department conducted tests to determine the response delays associated with traffic circles. Two tests, approximately one year apart, were performed.

In June of 1995, after affixing temporary orange traffic cones to depict the outline of a future traffic circles, a consulting engineer firm and the Boulder Fire Department conducted tests with fire apparatus. This test required the drivers of the units to maneuver around a traffic circle within a

three-block roadway. The findings revealed that the delay was 7.5 seconds. The average speed of the units was 23 mph. [32]

One year later, the same test was performed. However, the traffic circle had the same dimensions but was constructed of temporary concrete blocks rather than the orange cones of the previous year. Under this condition, the fire units experienced an increase in the delay going from 7.5 to 10.0 seconds. Relative to the increased delay, the average speed also dropped from 23 mph to 20 mph. These increases are believed to be attributed to the more intimidating concrete barriers rather than the less harmful orange cones.[33]

Combined findings of the Portland, Austin, Montgomery County, and Berkeley tests confirm that speed humps cause considerable delays for emergency response vehicles. The Portland, Montgomery County, and Boulder tests verify that significant delays occur also from traffic circles. Thus, all of these tests substantiate that traffic-calming devices pose a negative impact to the outcome of life threatening incidents and other emergency service level deliveries. The level of this impact will be explored in Chapter Seven.

Chapter 4. Environmental/Air Quality Emission Issues

Vehicle Emissions

The very core principle of local government is to adopt and enforce policies and standards that will ensure a high quality of life for the local citizens. Obviously, policies and programs that provide for safe, sustainable neighborhoods along with efficient emergency services are one of many pieces to achieve that end. Equally important to those services and programs, local government officials are mandated to protect the environment and natural resources of their region.

The relationship between traffic management calming devices and the subsequent environmental impacts is a relatively new issue that will demand further exploration and analysis.[1] Resultantly, the extent to which traffic management schemes bring about environmental improvements or degradations is difficult to quantify at present. However, like the negative impacts for emergency response times, there is some preliminary evidence that would strongly suggest that traffic calming contributes to increased air pollution.

We do know that the emissions from an individual car are generally low, in relation to the smokestack images of factories and refineries that many

people associate with air pollution. But in numerous major metropolitan areas across the U.S., the personal automobile is the single greatest polluter, as emissions from millions of vehicles add to a growing problem. Driving a car is probably the most *polluting* daily activity of a typical citizen.[2]

According to the U.S. Environmental Protection Agency (EPA), motor vehicles in this country are presently responsible for up to half of the smog-forming volatile organic compounds (VOC's). They release more that 50 percent of the hazardous air pollutants and up to 90 percent of the carbon monoxide (CO) found in urban air.[3] The EPA has identified and established acceptable concentration levels for six specific pollutants in outdoor air. They are: ground level ozone (O_3) commonly referred to as smog; nitrogen oxides (NO_x) of which nitrogen dioxide (NO_2) is the most abundant; sulfur dioxide (SO_2); carbon monoxide (CO), lead (Pb); and particulate matter (PM).[4] These serve as the target gases for measuring automobile emissions. Obviously, local governments must maintain a constant vigilance to these pollutants that contribute to air pollution.

Factors contributing to automobile emissions can be classified into two broad categories, one being *technical*, and the other *operational*. Vehicle weight, engine size and design, fuel type, exhaust configuration, and aerodynamic features are all technical factors effecting emission qualities and quantities. Operational factors relate to how the driver uses the vehicle, such

as speed, acceleration and deceleration techniques, and idling.[5] The operational factors are likely to be the most influenced by traffic calming devices since their primary objective is to change the driving patterns of vehicle operators.

Vehicle Emission Case Studies

Within the last several years, various studies have been conducted in Australia, Austria, Denmark, Germany, Holland, Sweden and the United Kingdom (UK), which show that vehicle emission pollutants, along with fuel consumption, are increased with traffic calming devices, particularly speed humps. Two of these studies related to area-wide traffic calming features, whereas the remaining six measured the emissions on single sections of roadways containing the devices. To date, only one U.S. study was identified that measured vehicle emissions resulting from traffic calming devices. All of these case studies, with the exception of the German study, revealed increases in air pollution emissions primarily due to acceleration and deceleration while traversing speed humps. Summaries of these studies can be found in Appendix B that convincingly demonstrates that traffic-calming devices contribute considerably to air pollution and fuel consumption.

Buxtehude, Germany

The lone positive test from Germany, which appears to be one of the first studies for this issue, studied the impacts of traffic calming for five major to medium size cities in Germany from 1983 to 1986. This report concludes that traffic-calming devices reduce air pollutants. Strangely, only the positive results of one of these cities (Buxtehude) were reported extensively in the report. Therefore, the Buxtehude study is regularly referenced as an example in which traffic calming has been shown to reduce vehicle emissions[6]. There is concern to the overall validity of this report since the details of the other German cities were not amply pronounced or revealed.

United Kingdom

In 1993, the Transport Research Laboratory in Crowthorne, England studied the effects of vehicle emissions in regards to acceleration and deceleration while traversing speed humps. This research group constructed hypothetical speed hump profiles at different intervals (50, 75, and 100 meters) over a 300-meter length of roadway. Both flat top and circular design humps were incorporated into the scheme. Established test assumptions were that vehicles accelerated 67 percent, and decelerated 33 percent of the time respectively, for the distances between the humps. The emission outputs of the

different hump schemes were compared to the same linear configuration without any devices, i.e. traveling unobstructed and at the same speed.

For the 75 meter scheme, with average speeds of 15-17 mph due to hump traversing, "cars showed increases in CO and HC [hydrocarbons] of around 70-80% and 70-100% respectively, and an increase in CO_2 [carbon dioxide] of around 50-60%. NO_x emissions were predicted to be around 0-20% lower after calming."[7] With emissions showing a large increase while accelerating and decelerating, the scientists also analyzed the emissions generated by cars traveling at constant speeds of 20 and 30 mph without going over speed humps. The lower speed of 20 MPH was shown to generate more harmful emissions than a vehicle traveling at 30 mph. This was evidenced by increases of both CO and HC to approximately 40-80 percent, and an increase of CO_2 by 30-40 percent. Emissions of NO_x were also seen to increase by around 20-30 percent.[8]

This study clearly demonstrates that automobile emissions increase with accelerating and decelerating. In addition, the results reveal that more emissions are emitted at slower travel speeds than higher speeds normally encountered on residential neighborhood type streets.

Sweden

A Swedish study in 1995 examined the impacts of automobile emissions in relation to the number of humps crossed and the regaining of desired vehicle speeds in between humps. The parameters of this test included the emissions for a constant speed with no humps, compared to emissions for traversing one hump, and then another test for ten humps. On tests with humps, all vehicles were to reduce their speed from 50 to 30 km/h [32 to 19 mph] before the hump, and then reestablish a speed of 50 km/h after the hump.

The analysis showed emissions increase of 20 percent and a fuel consumption increase of 5 percent while crossing over one hump. As anticipated, each of these test measurements was significantly increased when traveling over 10 humps. Rather than being solely proportional to the number of humps crossed, increases in emissions were found to be between 200-300 percent, while fuel consumption saw an increase of 40-50 percent.[9]

Austria (AIT/FIA)

One of the most disturbing findings involves a case study performed in Austria by the Alliance Internationale de Tourisme/Federation Internationale de I'Automobile (AIT/FIA) Traffic Commission. This study analyzed the emissions of vehicles limited to a travel speed of 30 km/h [19 mph] upon a

test site composed of a 1.5 km [.93 mile] containing six speed humps. The test results and findings were as follows:

> A vehicle, which slows down to 15 km/h [9 mph] before the bump and accelerates to 30 km/h immediately after the bump emits 10 times as much nitrogen oxide (NO_X) as a vehicle which maintains a constant speed of 30 km/h. NO_X emission per kilometer thus increases from 0.03 to 0.3 gm. The vehicle which drew to a halt at each bump showed a NO_X emission of 0.24 gm/km, i.e. 8 times more than that of a vehicle maintaining a constant speed of 30 km/h. On the stretch of road containing speed bumps carbon monoxide (CO) emissions were three times a great as those of a vehicle maintaining a constant speed. Fuel consumption increased from 7.9 litres to an additional two litres per 100 km on the stretch of road where the vehicle braked six times. Carbon dioxide emission (CO_2) increased in the same way. Hydrocarbon (HC) emissions were so low in all cases that they were below the probative level.[10]

Table 4.1 contains the measurements and percentage impacts of this study.

Table 4.1

Environmental Impacts of AIT/FIA Case Study

Environmental Impact	Test 1: Without speed bumps	Test 2: With 6 speed bumps	Test 3: With 6 speed bumps
Driver Behavior	Constant speed of 30 km/h (19 mph)	Slowing down from 30 to 15 km/h (9 mph)	Slowing down from 30 to 0 km/h (19-0 mph)
Fuel Consumption (litres/100 km)	7.9	9.9 (+24%)	10.8 (+36%)
Nitrogen Oxide (No_x) (gm/km)	0.03	0.3 (+900%)	0.24 (+700%)
Carbon Monoxide (CO) (gm/km)	0.23	0.6 (+160%)	0.62 (+170%)
Carbon Dioxide (CO_2)	199.9	247.3 (+24%)	271.4 (+36 %)

Notes:
Length of Test Route: 1.5 km (.93 mile) with 6 speed bumps (Tests 2 and 3)
Comparative Test: 1.5 km without speed bumps (Test 1)
Vehicle used or the test: medium-range car with tuned catalytic converter

Source: Jean-Martin Kuntschen (TCS), AIT/FIA Traffic Commission

Although the AIT/FIA report focuses on measuring vehicle emissions, the physical methodology and course layout is very similar to the previously reviewed Austin, Texas test. That analysis was conducted only to measure the time delays associated with speed humps. Due to the similarities, these two tests serve to complement each other in their findings regarding the two different elements of the research issues.

Portland, ME (Stevens Avenue)

The referencing of the Buxtehude, Germany study actually caused some extreme embarrassment and severance of federal funding for a traffic-calming project awarded to the City of Portland, Maine. The City of Portland applied for a grant under the Congestion Mitigation/Air Quality (CMAQ) program of the Federal Highway Administration (FHWA) within the U.S. Department of Transportation (DOT). This federal funding mandated that approved projects must reduce air pollution and improve air quality. In particular, the City of Portland sought the funding to install traffic calming devices on Stevens Avenue within their city.

In their justification documents for the federal funding, the City of Portland noted "There is no experience in Maine and little in the United States that documents the effect of traffic calming on air quality. Based on published data, the City of Portland believes the proposed traffic calming measures will improve the air quality."[11] The document then refers to the how the lone study of Buxtehude, Germany (population 33,000) demonstrated a decrease in emissions contrary to other studies.

The project was approved for federal funding and began in 1997. The devices were installed and DeLuca-Hoffman Associates, Inc. served as the contractor for the City to collect and analyze the results of this entire

initiative. In May 1998, De-Luca-Hoffman Associates, Inc. submitted the findings to the City of Portland, which showed increases, rather than decreases, in air pollution for the project.[12]

Based on these findings, the FHWA/DOT had no choice but to suspend the funding for the project.

> The study evaluated the impacts of the traffic-calming project, including air quality impacts. The report documents a 46% increase in VOC [volatile organic compounds] emissions and a 17% decrease in NO_X [nitrous oxide] emissions. In sum, the study indicates that the Stevens Avenue Traffic Calming project has resulted in an increase in pollutants. Indeed, the actual pollution impacts could be worse than what was presented in the report, as the report did not take into account the emission impacts of increased braking and acceleration associated with the raised crosswalks…As a result of the study, we are not willing to approve any further expenditure of CMAQ funds on this project.[13]

A total of $233,600 was originally approved for the project. However, with the increased emissions verified, and to the embarrassment of City officials, $140,000 was withheld by the FHWA/DOT from the City of Portland to complete the project.[14]

Cold Start Emissions

A new area of concern is that of vehicle *cold start* emissions. The greatest amount of tailpipe pollutants is emitted during a vehicle's cold start phase. A cold start phase is the first few minutes, or miles traveled, of an engine's operation before the catalytic converter becomes effective.[15] A 1994

Swedish Environmental Protection Agency report verifies there is "a substantial increase of CO and HC emissions during the cold start sequence."[16] In another similar study conducted in the U.S., the Society of Automotive Engineers (SAE) found that "cold engines use more fuel and generate more pollution than engines that are fully warmed up. The effect on catalyst equipped cars is marked because catalysts do no work until their temperature reaches a suitable level."[17]

In relation to traffic calming, the concern is that a large percentage of the vehicles traversing over a neighborhood's calming devices are vehicle trip departures that originate from within the neighborhood. As a result, these vehicles generate higher cold start emissions due to early acceleration and deceleration, and thus add further to the increased air emissions than those produced by the non-resident general traffic. However, the exact impact of this condition is not known.

Air Quality Impact to Austin, Texas

The significance of increased air pollution from excessive automobile emissions is currently of paramount importance to the City of Austin, Texas. Under the Federal Clean Air Act of 1970, Congress authorized the U.S. Environmental Protection Agency (EPA) to set thresholds on the quantities of which certain types of pollutants can be in the ambient air at any time. States

are required to carry out most of the enforcement responsibilities for these federal standards. The Texas Natural Resource Conservation Commission (TNRCC) is the designated state agency to fulfill this responsibility.[18]

Metropolitan areas that are considered to have air quality as good as, or better than, the National Ambient Air Quality Standards (NAAQS) as established by the EPA are classified as "attainment areas". Those areas that are close to violating the standard are "maintenance" areas. These areas are encouraged to enact voluntary policies and programs aimed at reducing pollution. Any metropolitan area that is in violation of any one of the six identified pollutant standards is classified as a "non-attainment" area. An area may be an attainment area for one pollutant and a "non-attainment" area for another pollutant.[19] These "non-attainment" areas are mandated to implement actions and programs that will reduce the pollution levels back to acceptable standards. The NAAQS establishes the limits for the six specific pollutants that were identified at the beginning of this chapter.

In 1997, the EPA implemented a tougher measurement standard for determining "attainment." Austin was on pace to fail that standard for ozone until a federal court ruled, in an unrelated case, that the new EPA methodology was unconstitutional. Although this gave Austin a reprieve for a while, the EPA is expected to be authorized to soon reestablish the new

measurement methodology. Austin will again be expected to not meet the new ozone requirements.[20]

The ramifications to the citizens of Austin for being in a "non-attainment" area can be severe and costly. For certain, the metropolitan area would be mandated to implement a basic vehicle inspection and maintenance program for vehicles. This would require all vehicle owners to have their vehicles regularly inspected for excessive emissions. A fee accompanies the inspection. Owners would also be required to repair any deficient vehicles.[21]

The other main concern deals with federal highway funding for major transportation projects. The city's failure to take mandatory and proactive actions to reduce the pollution levels could result in federal funding being withheld for the major projects within the Austin area.[22] Failure to receive such funding would place a greater burden on the citizens.

Thus, the City of Austin needs to evaluate the negative impact that increased vehicle emissions from traffic calming measures can have upon other programs and initiatives to prevent air pollution. Again, traffic calming is in competition with another public good.

Chapter 5. Civil Liability Issues

In any high profile, controversial issue that occurs within local government, one usually can be assured that legal implications will be introduced into the debate. The issue of traffic calming is certainly not immune from the realms of civil jurisprudence. In most instances, the legal aspects are usually centered on three elements of law. The first one generally questions the statutory authority of local governments to provide for traffic calming devices. Second, for local actions and decisions, it is reasonable to expect legal challenges to the constitutionality of infringing upon the rights of residents. And the third area for review will usually involve the level of exposure the local government might incur from those seeking personal and/or property damage relief as a result of the public policy. Obviously, for these reasons, legal review is recommended for good public policy formation.

The formally adopted decisions and actions of all elected officials of government are always subject to legal scrutiny and risk. That level of risk is usually based on established precedents of case law coupled with sound practices that are reinforced with established national standards. Traffic calming actions and programs are vulnerable to suit.

Although there are national and professional standards for components of public transportation roadway systems, there are none from an adoptive

government body or agency for traffic calming devices. Two nationally accepted transportation standards, the *Manual on Uniform Traffic Control Devices for Streets and Highways* (MUTCD) established by the U.S. Federal Highway Administration, and *A Policy of Geometric Design of Highways and Streets,* produced by the American Association of State Highway and Transportation Officials, are silent as to required design features or placement of traffic calming devices. Again, with no authorizing laws, standards or accepted professional practices, a local government has potential exposure to unwanted legal challenges and claims.[1]

ADA Implications

Recently, more and more concern and debate is emerging regarding the impacts that traffic-calming devices have upon persons with disabilities. Disabled citizens charge that these devices cause undue pain, suffering, and injury whenever they routinely encounter these roadway modifications. Generally, these citizens are opposed to the vertical devices such as speed humps, raised crossings and traffic circles on public right of ways.

One legal exposure to local governments is related to the federally mandated American with Disabilities Act (ADA) of 1990 and the law's application to public roadways. A review of some of the provisions of this law reveals the potential legal exposures:

ADA, Title II, State and Local Government, Department of Justice Regulations, 28 CFR Part 35.

§35.104 Definitions.

Facility means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock, or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where building, property, structure, or equipment is located.[2]

The ADA law also addresses the new construction and alterations of roadways.

§35.151 New Construction and Alterations.

(a) Design and construction. Each facility or part of a facility constructed by, on behalf of, or for the use of a public entity shall be designed and constructed in such manner that the facility or part of the facility is readily accessible to and usable by individuals with disabilities, if the construction was commenced after January 26, 1992.

(b) Alteration. Each facility or part of a facility altered by, on behalf of, or for the use of a public entity in a manner that affects or could affect the usability of the facility or part of the facility shall, to the maximum extent feasible, be altered in such manner that the altered portion of the facility is readily accessible to and usable by individuals with disabilities, if the alteration was commenced after January 26, 1992.[3]

Some ADA compliance problems, and even court issues, have arisen from differing interpretations of the term “alteration”. In most instances, the removal of a roadway surface and replacement with a new layer of paving is not considered by most highway agencies as an “alteration”. However, the above ADA definition of an “alteration” appears to be much broader with the

language of "affects or could affect the usability of a facility or part of a facility". This was reflected in a recent court case interpreting the definition. "In *Kinney v. Yerusalim* (812 F. Supp. 547[F.D. PA, 1993]), a Federal district appeals court decision held, 'if a street is to be altered to make it more usable by the general public, it must also be made more usable for those with ambulatory disabilities.'"[4] This ruling makes traffic calming, particularly vertical devices, more vulnerable to potential litigation.

Disabled citizens certainly view that placing speed humps upon roads is an "altered portion of the facility" that becomes less accessible and usable, and thus is in direct violation of Title II of the ADA. This is supported by the concern expressed in a City of Berkeley (CA) internal memorandum. "The Commission [on Disability] is concerned that installation of speed humps appears to be contrary to the intent of the Americans with Disabilities Act (ADA), which stipulates that new facilities must be 'readily accessible to and usable by individuals with disabilities.' The ADA Title II regulations define 'facility' to include 'roads'. The regulations go on to say that alterations to facilities must be accessible and usable 'to the maximum extent feasible.'"[5]

Most recently, the Berkeley Commission on Disability further asserted their concerns prior to City Council action slated for November 23, 1999:

> The Commission opposes installation of any traffic management tool preventing equal access. If vertical deflection devices were scientifically evaluated and show to be safe for

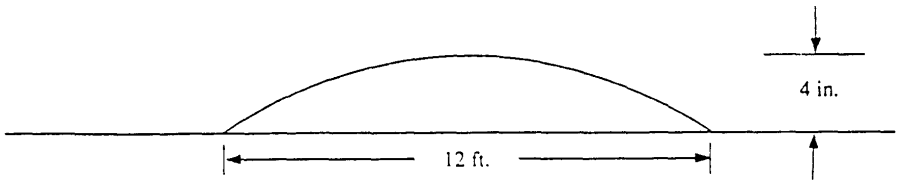
> vulnerable populations, there would be no such opposition; but it is not acceptable to install any vertical deflection devices for traffic management if they are designed to cause discomfort by generating up-and-down motion. Devices differing from current designs, but causing similar discomfort, also would restrict access for persons with disabilities. Examples of such variations included speed tables or raised pedestrian crosswalks, raised sections of roadway designed for vertical deflection of vehicles…Until adequate biomedical and engineering research is conducted, the moratorium should be retained on vertical deflection devices.[6]

Obviously, concerned about the legal implications regarding the ADA statute, the Berkeley City Council voted to indefinitely extend the moratorium on speed humps that had been in effect since July 1995.

Like other issues with traffic calming, the impacts upon disabled residents are difficult to quantify or qualify. There is little doubt that traveling over speed humps can be painful for those with orthopedic medical conditions and disabilities. "Contacts with disabled residents in Berkeley indicate that a number have problems with speed humps…they feel pain riding over humps in a vehicle, and they know of others who also do…Some slow down to nearly a full stop before crossing the humps, or cross them at an angle to lessen the impact."[7] The Berkeley report also revealed that crossing humps in para-transit vehicles was frequently cited as a problem. Like EMS units, these para-transit vehicles have a high center of gravity and heavy suspension systems.

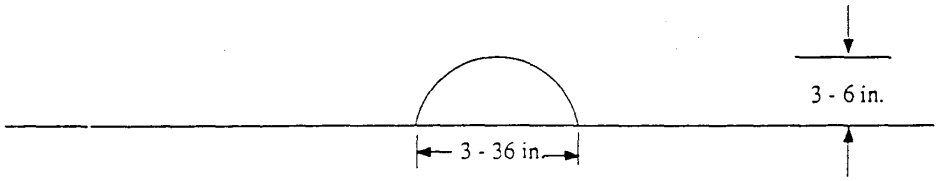
Similar concerns have been expressed from other special transit providers. "Many of our passengers have called us to complain about the rough ride they experience with speed humps and traffic circles."[8] This local transit provider urged the Boulder City Council members to consider traffic device alternatives that do not use physical barriers such as humps and traffic circles.

General Local Government Liability



With exception of federal law, the general liabilities to local governments fall under the auspices of state law. As state laws vary within states, so do the decisions and verdicts of the state courts. This generally depends upon how much authority has been extended to local governments by the states to regulate and implement traffic control measures. Some states have retained full control of all public roadways and streets, whereas others have granted limited authorities to the local government for local control. Civil action resulting in imposed personal or property damage could be expected in a number of areas.

Speed Bumps Banned



After automobiles were invented at the turn of the century, and their use became abundant and common, local governments were immediately

confronted with how to control their speeds. As such, the traffic calming issue of today is by far nothing new for policy makers. The actual idea of using physical barriers began early on with the installation of *speed bumps* on public streets. Speed bumps differ greatly than speed humps as they are much narrower and have a greater degree of rise, as do the more modern speed humps of today. Speed humps generally are 12 feet to 22 feet wide, and are generally 3 or 4 inches in height. Whereas, the older speed bump were only 3 to 36 inches wide and 3 to 6 inches high.[9] However, their public use was short lived. Figure 5.1 displays the differences of the two:

Figure 5.1
Speed Hump vs. Speed Bump Design

Typical Speed Hump

Typical Speed Bump

Source: *Transportation Quarterly*, Vol. 47, No.3, July 1993, p.459.

Clear, case law has been established which bans the use of speed bumps on public streets. One such case was *Vicksburg v. Harralson,* 101 So. 713 (Miss.1924); whereby the court issued a directed verdict against the City of Vicksburg. In upholding this verdict, the Mississippi Supreme Court asserted:

> We do not think the city had the right to place a dangerous device or obstruction in its street, making it unsafe, and which would likely injure persons traveling in automobiles over it.
>
> This scheme or method of warning drivers appears to us to be unreasonable, too drastic, and perilous for the purpose intended. The method of injuring one person in order to prevent danger to another is wrong in principle, as we see it, and is not such a reasonable regulation for the public safety as is warranted under the law, but is negligence. Creating one danger to prevent another is not in accord with the public safety – the very thing involved and desired.[10]

Traffic Control Device Legalities

One case in California had established that some devices used in traffic calming programs were illegal. "A locality has no right to interfere with the free flow of traffic unless expressly authorized by State statue. This fact led to the best-known legal challenge to traffic calming. *Rumford v. City of Berkeley*, 31 Cal.3d 545, 645 P.2d 124 [1982]…The California Supreme Court ruled that the diverters and half closures were traffic control devices not authorized by State law…Hence, the diverters and half closures were declared illegal."[11] However, after this case law was established, the California

Legislature responded by revising the statute to allow the local governments to use certain traffic calming devices not previously defined under the old law.

A 1998 Florida case brought the speed hump program in Sarasota to a complete halt. Challenging the City of Sarasota's authority to install speed humps, two citizens filed suit in state court. In a June 29, 1998 ruling from the Twelfth Judicial Circuit Court of Florida, Judge Robert B. Bennett ruled in favor of the plaintiffs. "In his order, the judge explained that Sarasota can put up only the traffic-control devices that are noted in the Federal Highway Administration's Manual on Uniform Traffic Control Devices (1988 Edition). Speed humps and speed tables are not included."[12]

This Court also adjudged: "Defendant [City of Sarasota] is permanently enjoined from erecting speed humps or speed tables on the streets or highways of the City of Sarasota. [Further, the] Defendant is permanently and mandatorily enjoined to forthwith remove from the streets and highways of the City of Sarasota all speed humps and speed tables previously erected and to restore the effected streets and highways to the condition they were in prior to the construction of the speed humps and speed tables."[13]

However, on appeal by the City of Sarasota, the Florida Second District Court of Appeal overturned the ruling from the lower court. "In overruling Bennett, the appellate court did not address the key question of whether speed humps are legal, however. Instead, the three-judge panel ruled that the

plaintiffs, Robert Windom and John Hartenstine, did not have legal standing to file the suit. The court's failure to address the legality of the humps themselves leaves open the possibility of another successful action against them...the appellate court stopped well short of declaring humps legal. The narrow scope of the court's ruling means that adding more humps could still pose some risk."[14]

Another case, *Marlboro Township v. Freehold Regional High School District*, involves speed bumps and the local fire code. The Freehold High School installed speed bumps at the entrance of the school and at a side entrance in an effort to keep students from speeding through the parking lot. The local fire department of Marlboro Township, New Jersey considered the speed humps a clear violation of the fire code. Adopted by ordinance, the BOCA (Building Officials and Code Administrators, Inc.) Fire Prevention Code/1978, prohibits the erection and maintenance of speed humps. Formal requests to remove the humps were denied by the school district.

After failing to obtain voluntary compliance, the fire inspector swore out a summons charging the school administrator with violation of the ordinance. The municipal court judge found the school district in violation, ordered the humps removed, and fined the school administrator $250. On appeal, the Superior Court of New Jersey reversed the decision, citing the school district was not bound by the code.

However, the State Appeals Court reversed and upheld the municipal court decision stating that the school building was exempt from the fire code, but that the surrounding parking lot was not. The court in upholding the conviction, enjoined the hump removals, and suspended the imposed fine for the administrator.

Recognizing conflicting policy and intentions the Appeals Court had this to say: "This appeal demonstrates graphically that which occurs when genuinely caring persons face each other armed with substantial and genuine conflicting policy concerns".[15]

Currently, Texas law is silent regarding the authorization or use of traffic control devices. In addition, no Texas legal cases were identified pertaining to the usage of such devices upon public streets.

Personal Injury

There is great potential for vehicle occupants to be injured from traffic calming devices. Severe injuries can occur to the head, neck and spinal vertebrae, along with various strains and/or bruising whenever a vehicle becomes out of control after crossing a device and striking another vehicle, fixed object and/or pedestrian.

Local governments lie dangerously close to the liability for such injuries. A state court appeals case from Ohio, *Sanchez v. Austintown Township*

Trustees, 1986 Ohio App., LEXIS 5410 (Ohio App. 1986) serves as notice to local governments for personal liability claims. After a passenger was unexpectedly thrown to the floor of a motor home when it crossed over a speed bump in a public park, the court ruled that a municipality could be liable for the personal injury and damage resulting from such a device.[16]

Such a liability was also found in the private sector in *Harrington v. LaBelle's of Colorado, Inc.*, 765 P.2d 732 (Mont. 1988). In this case, a bicyclist was awarded a $125,000 settlement against the parking lot owner when he was injured after striking a speed bump.[17]

Noise Nuisance

The creation of additional noise as a nuisance is potential for another legal liability. Residents often complain of increased noise from vehicles downshifting, decelerating, accelerating, or actually making physical vehicular/street contact while navigating calming devices. This is noted in the case of *Friends of H Street v. City of Sacramento*, 24 Cal.2d 607, (Cal. Ct. App. Oct. 21, 1993). This case also makes reference to "cut-through traffic", which is a common occurrence in neighborhoods with traffic calming devices, as the traffic tends to move to a parallel street. Residents were trying to get the City to take some action regarding heavy traffic volumes, speed, and noise on their neighborhood street. Their preference was to place restrictions on the

street so that these nuisances would be removed. "The court ruled against the residents, holding that the routing of traffic is at the discretion of the city council, that the rerouting of traffic in this case would hurt other streets, and that the city council could not please everyone. As the court saw it: '[l]oss of peace and quiet is a fact of life which must be endured by all who live in the vicinity of freeways, highways, and city streets."[18]

Vibration/Structure Damage

In the United Kingdom, there is growing concern that increased vibrations from vehicle weight shifting while traversing over speed humps has caused cracks in the foundations of nearby homes. Recent studies by the Transport Research Laboratory (TRL), England's leading authority on transportation issues, have shown that certain soils can transmit harmful tremors straight into the foundations of buildings. As a result of these findings, the TRL will recommend local governments to test soil stability before installing any speed humps.

"Amanda Dickson is one of many homeowners whose worst fears have been confirmed by the latest studies. Large cracks appeared in the basement of her north London house soon after humps were laid outside."[19] She went on to report that trucks and vans caused the worst vibrations. Further, a chartered building surveyor of the area noted that vibrations from speed

humps can be a serious contributing factor to damage of older buildings. "The new findings will worry local authorities, many of which first installed humps on the TRL's advice and now face lawsuits from disgruntled householders which could run into millions of pounds".[20]

Accidental Air Bag Deployment

With more and more U.S. vehicles being required to install airbags, there is a growing concern that accidental deployments of these safety devices will increase. This has been evidenced by Nissan's four confirmed incidents of air bag deployments involving Maxima sedans after striking speed bumps.[21] "The vertical jolt of going over a speed bump can trigger some crash sensors to go off and inflate the airbag…Air bags have been triggered when going over speed bumps and potholes on the road, hitting curbs at low speeds, and by other minor disturbances…Air bag-caused injuries to the face, chest, hands, and arms could occur to the driver and passenger, as have occurred in crashes as low as 8 to 15 miles per hour. Of the approximately 42 children who have been tragically killed by airbags, the vast majority has been in low-speed accidents below 15 miles per hour."[22]

Failure to Warn Drivers

Associated with unexpected impacts, significant liability could be imposed particularly when the local government fails to properly sign and adequately warn the motorist of traffic calming devices. This duty to warn was established in *Polk County v. Donna M. Sofka.*

"If, however, the governmental entity knows when it creates a curve that a vehicle cannot safely negotiate the curve at speeds of more than twenty-five miles per hour, such entity must take steps to warn the public of the danger."[23]

Street Damage

There is debate, within transportation professionals, over whether or not speed humps cause damage to the actual streets they are placed upon. The City of Griffin, Georgia failed to meet the legalities of a policy interpretation by the State Department of Transportation (DOT). In Georgia, the State DOT provides financial assistance for street paving within cities. In order to receive state funding of $285,000 to repave 18 streets, this City had to meet all of the terms of the DOT. One of those terms was DOT's refusal to repave any street that contained speed humps. The City agreed to remove speed humps so as to receive the funding.[24]

"DOT Commissioner Wayne Shackelford confirmed in an interview that speed humps are against department policy and have been for years. 'We

don't fund resurfacing on any street that has speed humps,' he said. Shackelford believes speed humps cause pavement to wear out quicker."[25] Additionally, severe gouging and abrasion can occur to the pavement from the undercarriages of vehicles when crossing speed humps too fast.

Vehicle Damage Claims

In some cases, one could certainly argue that calming devices cause damages likewise to the undercarriages of vehicles while traversing over humps at posted speed limits. In turn, one could expect a higher frequency of damage claims rather than actual law suits. "Montgomery County has paid two claims involving speed humps. In one case, the driver of a community college van went over a hump at a speed alleged to be too high, and a student was injured. The county agreed to pay $2,500 in medical expenses to avoid the expense of litigation. In the other case, hump markings came off on the undercarriage of a car that had bottomed out traveling too fast. Because the hump markings had been improperly applied, the county assumed liability…"[26]

Summary

On the surface, one would not expect significant liability potential with the use of traffic calming devices. However, there are numerous legal

vulnerabilities that exist for local governments with traffic calming programs. The largest exposure appears to rest with the modifications to roadways while complying with the Americans with Disabilities Act. Another area that is not very clear is the authority of the local government to use traffic calming devices since they are not recognized within national transportation standards.

As has been reviewed, there are also numerous potential liabilities relating to personal liability and property damage from traffic calming devices. In short, there are no precedent setting cases that have outright declared speed humps illegal. However, there is strong evidence that some citizens are turning more towards the court systems in an attempt to suspend traffic calming programs. As such, local governments must fully examine their legal liability potential prior to adopting traffic calming initiatives.

Chapter 6. Traffic Calming Postures of Local Governments

With limited planning and awareness in the early beginning, many major, "progressive oriented" cities within the U.S. entered the uncharted waters of traffic calming devices and programs. Their use was viewed as a fresh new approach for managing transportation problems within these cities. The concept for this strategy emphasizes the intellectual placement and force of physics rather than the traditional oppressive force of policing. As this approach came into vogue by the mid-1990's, there was an immense proliferation of placing these devices in the communities without ensuring that all stakeholders had ample input for widely accepted support. As a result, objections, complaints, and concerns began to engulf politicians who soon began looking for neutral ground.

Realizing the difficulty in reaching neutral ground, actions were taken by many local governments to slow down the issue. These de-escalations took on many forms such as moratoriums, reduced funding, or pending legal litigation. A summary review of several U.S. cities is provided to illustrate the status of many traffic-calming programs across this country. A more in-depth policy review is given for the City of Austin, Texas, as this information will

provide a good background for the analysis contained in upcoming Chapter Seven.

Postures of Various U.S. Cities

In the publication *Traffic Calming: State of the Practice*, author Reid Ewing examined the top 20 most innovative cities with traffic calming programs. From this literature, it is evident that many traffic-calming programs have been "calmed" in and of themselves. The following reports from this source reveal the postures or current states of practice by ten of those cities:[1]

Montgomery County, Maryland

Citizens challenging the legality of its speed hump program filed a lawsuit against the county. This was then followed by an anti-hump petition drive calling for a vote to prohibit speed humps. Both the lawsuit and the petition were dismissed, thus there was no legal or voter decision. In response to the controversy, the county council imposed a moratorium on new speed hump applications, which was later lifted after eligibility requirements were established. However, due to the stringent approval guidelines, a virtual moratorium still exists.

Portland, Oregon

Similar to Montgomery County, Portland has been sued and had a moratorium on the continuance of traffic calming devices. The City won the lawsuit, however it is under appeal, so the legality is yet to be determined. Because of emergency services concerns, a moratorium was put into effect restricting speed humps and circles on the primary response routes. Once the moratorium was lifted, city leaders discontinued the funding for the program.

San Diego, California

A moratorium was imposed in this city over the dispute of warrants for the placement of traffic calming devices. Under pressure from citizens, city council members violated previously established warrants and had speed humps installed on some collector roads. As a result, some citizens and fire officials were outraged by the action. To immediately alleviate the situation, a moratorium has been put into effect for all new speed humps until new warrants can be established.

Boulder, Colorado

The issue of traffic calming in the City of Boulder was attacked from two sides. Many first questioned the $900,000 annual budget for this "general reentrenchment of traffic calming" program. Again, with growing public

opposition, along with the never-ending debate of emergency response times, the City Council eventually reduced the budget to $250,000 each year. Since then, it has been cut again to $100,000 annually. In addition, the funding can only be used for demonstration, education and enforcement projects until the response time issue can be satisfactorily addressed.

Gwinnett County, Georgia

In an attempt to ensure that all stake holders were considered, this County expanded the notification area of the neighborhoods so that all of those involved would be informed. This resulted in opposition groups being formed from the adjacent streets that became active in opposing new applications for neighborhoods wanting traffic calming. Reacting to the revolts of the program, the Commissioners placed all applications on hold until it could be determined what level of public support there is for the program.

Five Other Local Governments

"Sarasota, FL, has been sued, and lost; the decision is being [was] appealed. Berkeley, CA, has a total moratorium in effect. Eugene, OR, has a moratorium on speed humps, while Howard County, MD, has a moratorium on speed humps and most other vertical measures. San Jose, CA, has stopped funding comprehensive neighborhood traffic calming plans."[2] Director

Wayne Tanda, Department of Streets and Traffic with the City of San Jose was quite blunt with their posture. According to Tanda, "San Jose decided to stop penalizing 95 percent of the its drivers for problems caused by the other five percent."[3]

Posture of Austin, Texas

"Traffic management programs often focus entirely on the installation of one or two types of traffic control devices with little or no area-wide planning…A neighborhood group complains and a speed hump, stop sign or other device is installed where requested and that is the end of the process. This strategy has occasionally been successful."[4] Austin's initial traffic calming strategy in 1994 certainly would have fit that description during its early era.

Actually, Austin's experience and current posture toward traffic calming is very similar to those cities already noted. What began as a full-blown proliferation of speed hump installations, has now been reduced to a very limited use of speed humps, while other devices are being tested in pilot neighborhoods.

In response to citizens expressing concerns to intensified traffic volumes, speed and safety for pedestrians, the City of Austin Transportation staff developed the Neighborhood Traffic Management Program during the mid-

1980's. This program was designed to conduct neighborhood surveys to analyze the growing traffic problems. However, this concept was short-lived, as the program was not funded due to budget constraints from a souring economy.

The requests for action by citizens kept coming in at City Hall. During 1994, the Department of Public Works and Transportation (PW&T), along with several neighborhood associations, was successful in getting the City Council to include funding in the Fiscal Year 1994-95 budget for a Speed Hump Program.[5] After the initiation of the program, the PW&T Department received requests for speed humps on over 600 streets. Currently, that list has grown to 1400 streets.[6] Many of the streets requested multiple humps. For this type of demand, the level of funding was not adequate for all requests, much less conducting comprehensive traffic studies to determine their need.

Realizing that the funding would not meet the demand, the Department of PW&T began allowing the installation of humps that were privately paid for by the neighborhoods. Resultantly, a flooding of speed hump installations began to proliferate the city, particularly in the wealthier northwest quadrants.

In 1995, as the Austin Fire Department was denying many installation requests, the Department quickly found itself on the opposing side of many neighborhood associations. The separate Austin Emergency Medical Services Department joined the Fire Department in expressing reservations about speed

hump installations. Both of the departments' concerns focused upon the increased response times for fires and medical emergencies, damage to apparatus, along with the safety and effectiveness of medical care during patient transport.[7] Compounding the issue, the PW&T Department quickly pointed blame to the Fire Department, whenever irate citizens called in reaction to their speed hump applications being rejected.

In March 1996, the Austin City Manager requested that the Fire and EMS Departments conduct tests to measure the delays in response times due to the humps. As previously discussed in Chapter Three, the average delay for emergency response vehicles was found to be between 2 and 10 seconds per hump. This test helped substantiate the similar findings of the Portland test conducted earlier that year.

Neighborhood Traffic Calming Program

Due to the concerns expressed by the emergency service departments, and the potential for shifting traffic from one neighborhood street to another neighborhood street, the Speed Hump Program was temporarily suspended in the spring of 1997. Later that year as directed by the City Council, a focus group of stakeholders from the neighborhood associations, city council appointees, transportation officials, and other city staff, addressed the issues

and made recommendations. These recommendations were incorporated into the Neighborhood Traffic Calming Program (NTCP).[8]

"The purpose of the Neighborhood Traffic Calming activity is to provide transportation improvements for neighborhood residents in order to enhance the safety and quality of neighborhoods in Austin."[9] This program allows for neighborhoods to submit an application for program consideration. Annually, five project areas are chosen in different geographical sections of the city. These selections are based on a needs assessment.

The heart of the program requires that city staff and the selected neighborhoods work together in developing a traffic-calming plan for the awarded area. An equal amount of funding is designated for the devices in each neighborhood. Once selected, a neighborhood group is formed to create the neighborhood traffic plan. After the plan is finalized, the plan is submitted to the residents of the neighborhood for voter approval. If more than 60 percent of the returned ballots approve the plan, then the plan is implemented.

Initially, the NTCP requires city staff to conduct a comprehensive traffic study to identify and prioritize the traffic problems of the selected neighborhood. Measurements and levels of traffic volume, vehicular speed, pedestrian activity, and other observations are recorded. This data is later used in developing the neighborhood plan.

Representatives from the neighborhood, working as committee, meet with the city staff to develop effective area-wide solutions to the problem. This working group, no larger than 15 people, is comprised of residents living within the area and at least one board member from the neighborhood association. No more than two members can reside on the same street. In addition, representatives of local businesses within the project area may participate. This generally includes the actual selection and placement of the devices to match the traffic study findings.

There are many traffic calming devices that a neighborhood may select. The devices selected will depend upon the traffic problem, i.e. vehicular speeding or cut-through traffic. Also, the device cost is a factor, as each plan must stay within a prescribed budget. The devices may include traffic circles, speed humps/cushions, diverters, curb extensions, textured crosswalks, chicanes, slow points, and/or others.

Once some consensus is achieved for the types and locations of devices, the PW & T Department staff then analyzes the proposal. "The evaluation may result in changing the proposed device. The technical expertise of the Transportation Division staff governs the selection and location of the proposed devices. For example, steep grades may preclude the installation of a device. Staff identifies these barriers and informs the working group."[10] Interestingly, the Austin guidelines allow for the Transportation

Division to prohibit devices but the same authority is not given to public safety departments. Further, public safety departments are not given the opportunity for staff comment prior to the plan being revealed to the working group.

Once the plan is developed it is presented for review to the other neighborhood residents. The plan is mailed to each resident within the project area along with a ballot. Prior to the vote submission, an "open house" is conducted within the neighborhood where residents may "come and go" at their pleasure to ask questions about the plan. Members of the neighborhood working group and city officials, including emergency services representatives, are on hand to answer any questions.

Originally, the plan review required a public meeting within the neighborhood that was conducted by the residents' working group and city staff members. This was a more formalized meeting where the staff and working group would present the plan and answer questions from the audience. This forum generated much debate, however the residents in attendance were able to hear and witness collectively the pros and cons of the plan and the respective views of their neighbors.

In 1998, after a very heated public meeting, the residents of a northwest Austin neighborhood voted down the proposed plan. This was the first neighborhood to reject a traffic-calming plan. Shortly thereafter, the PW&T

Department staff revised the requirement for a formal public meeting and substituted the "open house" forum which has generated a lot less public discussion, participation, and input.

Residents may mail in their vote or turn in their ballot at the "open house" meeting. Each household, and property owner (if different) along with each business is allowed to vote. If 60 percent of those voting are in favor of the plan, then the project is approved for construction and implementation.

Currently, the Traffic Calming Section administers the program with 7 FTE's (full-time equivalent) employees. For the 1999-2000 fiscal year, the operating budget for this section is $413,371.[11] However, "[f]unding for the construction of traffic calming devices in 1999-2000 is anticipated from a $1,053,000 transfer from the General Fund to the traffic calming Capital Improvement Fund (CIP)."[12] With this expenditure for 1999-2000, the Department projects the program will reduce the current neighborhood speeds by 20 percent, in the project areas only.[13] In summary, the City of Austin expends approximately $1.5 million each year in an attempt to lower current speeds by approximately five to seven mph or less only within five distinct neighborhoods.

Traffic Calming Viewpoints of PW&T Staff

The City of Austin Public Works and Transportation Department (PW&T) has been actively involved in traffic calming for over the last six years. Currently, Ms. Joan Hudson administers the Neighborhood Traffic Calming Program for the PW&T. A personal interview was conducted with Ms. Hudson to obtain the positive and negative aspects of traffic calming from a local proponent point of view.

Ms. Hudson was asked to outline the general benefits of traffic calming initiatives. She stated, "at the forefront, there should be three major objectives. Reduction of speed, and cut-through traffic, should be accomplished along with meeting other desires of the neighborhood to increase the quality of life for the residents."[14] As examples of the "other desires", she pointed to residents being able to walk their streets or ride bicycles without being in fear of their safety. Quality of life is an important aspect of neighborhood livability. However, Ms. Hudson did point out that the City of Austin has yet to conduct any follow-up surveys to determine if citizens have indeed felt that their quality of life has improved from the traffic calming initiatives.

When asked to expound upon any negatives to traffic calming, Ms. Hudson gave the following response. "As a whole, to the neighborhood and

city, no significant negative aspects have been identified. Now, for the individual, there are some negatives that develop, such as how to go around traffic circles, parking in front of their house is disturbed, or the impacts of increased response times".[15] In general she felt that the negatives presented to her thus far were more so from individual concerns rather than resident groups or clusters.

When specifically asked about the impact to emergency response times, Ms. Hudson confirmed that traffic calming would have some delay. According to Ms. Hudson, "with traffic calming, if you delay anybody, then your delaying everybody, as there will be some impact. The level of that impact is the main question that needs to be considered."[16]

Ms. Hudson revealed that there have definitely been improvements and benefits to the City of Austin with the newer Neighborhood Traffic Calming Program compared to the older Speed Hump Program. "We are now looking at the whole neighborhood and allowing everyone to be involved and vote on a plan. Whereas before, the Speed Hump Program was too isolated. Neighborhood association members who were pushing for speed humps did not necessarily seek or gain the approval of the majority of residents."[17]

The current program is more responsive to the neighborhood. In general, there is greater neighborhood acceptance as the process now allows for the residents to be better informed and to be involved. The group is now

offered a greater array of traffic calming devices to choose from rather than just speed humps. Landscaping options allow for the neighborhood to be beautified or aesthetically pleasing. Also, the program is receiving more financial support allowing for more resources to be applied to the projects. Equally important, representatives from the emergency services are directly involved with the neighborhood working groups in developing traffic calming plans.

When asked how the program has directly benefited the City of Austin, Ms. Hudson was quick to point out that Austin's approach has employed several features and alternatives that other cities have not. As an example, Austin conducts a comprehensive study of the applicant neighborhood to determine if it qualifies for traffic calming and to identify what devices would be most effective. When concerns by the emergency services departments arose, the PW&T explored and implemented the speed cushion. This modified vertical device, was designed to be less detrimental to emergency vehicles yet maintain similar effects for ordinary traffic vehicles.

Ms. Hudson was asked to identify the greatest successful traffic calming projects undertaken in Austin. She felt that the Rainey Street project was a success as that neighborhood experienced a one-third traffic volume reduction. She also pointed to the accomplishments of the Bouldin Creek

neighborhood as speed reductions reached 17 percent. In addition, the devices selected blended in well with the neighborhood creating more acceptance.

As she noted Rainey Street as a success story, a follow-up question was asked if that neighborhood would have been better served with a street closure rather than all of the calming devices used. She expressed that such an action certainly would have yielded better results but we "should respect the desire of the neighborhood and that it is up to the neighborhood residents to decide what to accept."[18]

In regards to measuring the effectiveness of the program, Ms. Hudson indicated that performance measurements relating to speed and volume reductions within project neighborhoods are reported to the City Council. She was not aware of any other alternative performance methodology that was being used by other entities.

When asked to project the future of traffic calming programs, Ms. Hudson felt that there would be a continuance as the demand for the devices continues to increase as more and more citizens hear about and witness the programs in other areas of the city. She readily admits that the program will continue to be very controversial. With a follow-up question to that response, she was asked to identify, in her opinion, the biggest threat to traffic calming issues. Without any hesitancy she cited the "conflict of emergency response impacts upon the community" as the greatest obstacle for the program. She

also identified the difficult balancing of "resident inconvenience" as a horizon issue for neighborhood acceptance. Further, Ms. Hudson was not aware of any threats to the program from discrimination or violation claims of the ADA.

In closing, Ms. Hudson revealed the value of this program to the citizens of Austin. "Building community teams to bring forth their ideas in improving their neighborhoods, in their minds—and fulfilling the goal of improving the quality of life in their neighborhood has been a very rewarding thing."[19]

Program Results

The first year, 1998-99, included funding projects in the neighborhoods of Rainey Street, Bouldin Creek, Windsor Hills, Hyde Park/Hancock, and Northwest. Four of these approved traffic calming plans, while the Northwest neighborhood rejected their plan. For 1999-2000, the included neighborhoods are Highland, Wooten, Zilker, Old West Austin, and East Town Lake. Currently, one plan has passed, one has failed, and the other three are still being developed with resident approval/rejection to be determined later this year.

Chapter 7. Impact Analysis for Traffic Calming Devices

Overview of Analysis Methodology

Although there have been several studies conducted by various fire departments for determining the response delays of specific traffic calming devices, little has been done to evaluate the effect of these delays. This section will be devoted to analyzing and quantifying the impacts to the public safety responders and to the citizens whom they serve. Specifically, this analysis will be conducted utilizing the data trends and inputs from the City of Austin, Texas.

Conducting a valid analysis of reduced speeds and cut-through traffic is difficult to accomplish due to many variable factors. Good "before and after" data, that is collected at the same time periods, days, seasons, etc., is often very hard to procure consistently. Also, the timing of how soon or how long after the device installation the study is conducted is a major factor regarding data validity. More importantly, with cut-through traffic, area wide surveys need to be conducted as the traffic generally moves somewhere else. These area wide surveys are obviously very labor and cost intensive. However, with these known variables, an attempt will be made to evaluate the effectiveness

of the traffic devices for reducing speed and traffic volume within one Austin neighborhood.

Accident reduction rates require an intense study of historical data to determine any effectiveness. To fully study the aspects of accident reduction goes far beyond the resources and capability of this research paper. Also, due to the many contributing external factors of accidents, interpretation of accident rates in relation to traffic calming should be viewed with extreme caution. Therefore, no attempt will be made to analyze the actual impact of the use of traffic calming devices to reduce the number of accidents occurring in Austin. This approach is consistent with a recent publication from the Institute of Traffic Engineers (ITE), who certainly has the resources to conduct such studies:

> It is often difficult to draw conclusive results from traffic calming accident analyses. Most safety studies of traffic calming compare "before and after" accident experiences. Few studies take into account the influence of potential changes in accident reporting, weather, conditions, and traffic diversion…In addition, the before-and-after studies presented here do not control for time trends or regression to the mean or other factors that could possibly affect the validity and reliability of the results. These limitations should be kept in mind when interpreting the results…[1]

In addition to speeding and traffic volume, residents of neighborhoods always voice their concerns for pedestrian safety. An examination of the pedestrian fatality rate in Austin over the last few years will be conducted. Although there is significant numbers of pedestrian accidents each year, this

analysis will focus upon those occurring only upon neighborhood streets excluding major thoroughfares.

As the population increases, so does the demand for public safety services. With the Austin Fire Department being an integral component of the emergency medical system, a review of their response time data in conjunction with Austin's growth patterns will be reviewed. Since they respond to both fire and medical emergencies, their response data would appear to reflect a more inclusive impact to public safety services.

Incidents in which someone's life is in immediate jeopardy are the highest priority of all emergency calls. These most frequently are the incidents involving sudden cardiac arrest (SCA) victims. The sooner, or conversely later, that a victim of SCA receives field medical intervention will have a direct impact on the survivability rate of that patient.

With the response time history established, and identifying the frequency and survival of SCA, one can then examine the impact that traffic calming devices has on providing emergency services. A statistical analysis will be conducted utilizing this data to predict the number of lives of SCA victims that can be saved or lost due to changes in response times within Austin.

Finally, from the data perils of pedestrian accidents and sudden cardiac arrest victims, a parallel can be drawn discerning their comparative impacts. Utilizing a risk/benefit ratio, one could determine the value, in terms of lives

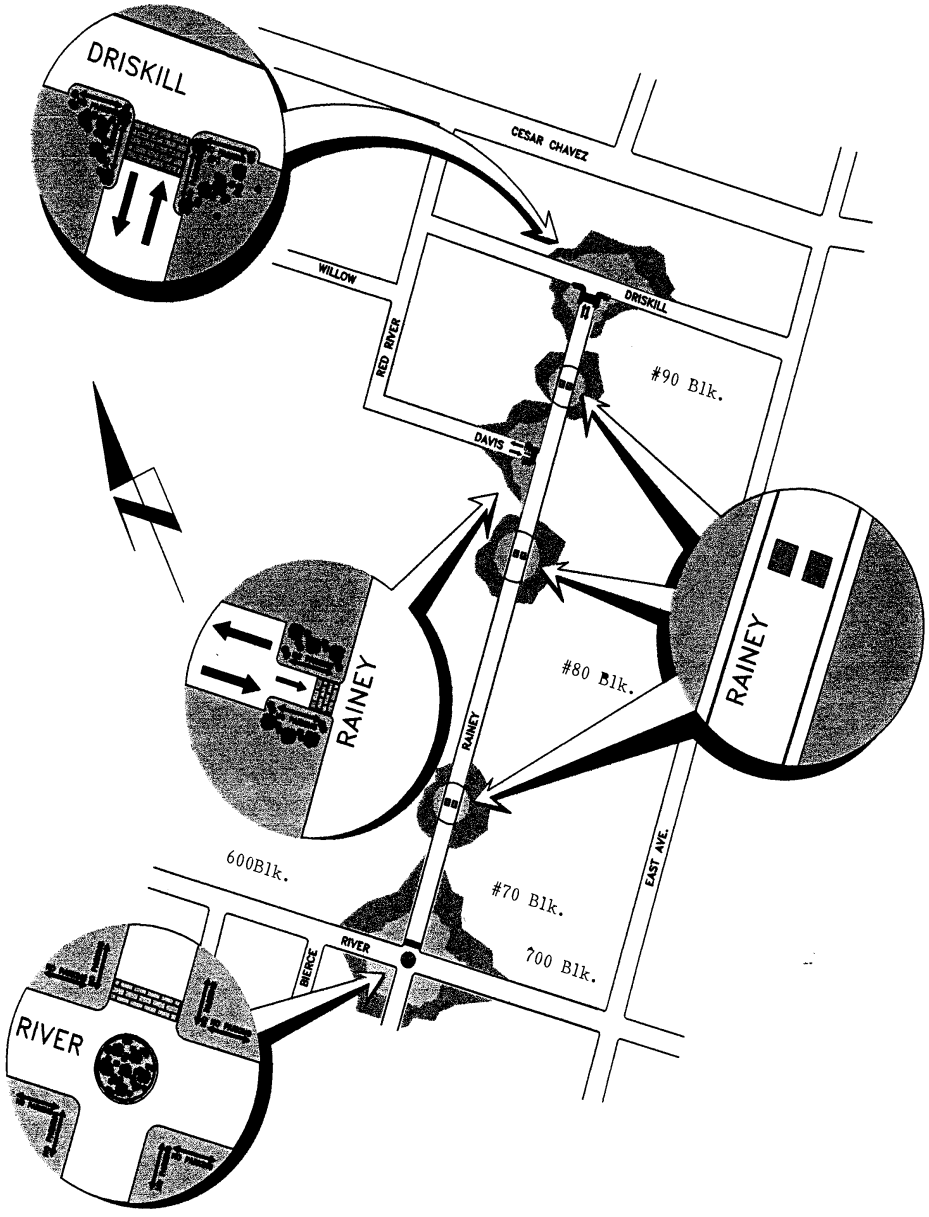
saved or lost, for measuring the effectiveness of traffic calming programs. By determining the greater value or "good", official decision-makers would then be formulating policy more so on fact rather than perception or mere intuition.

Reduced Speeds & Volume/Cut-Through Traffic

Caution must always be used in interpreting the effectiveness of traffic calming with speed and volume reduction statistics. What may appear as positives on the surface, can translate into a negative situation when comparing the whole. Because of the low established speed of 30 mph for most neighborhood streets, speed reductions reported in percentages may sound appealing, but are they really significant reductions to make a neighborhood calmer? As depicted in Table 7.1, the Davis Street observations of the Rainey Street Neighborhood Traffic Calming Project serve as a good example. The accompanying map of the Rainey Street Neighborhood is contained in Figure 7.1.

Table 7.1

Rainey Street Neighborhood Traffic Calming Project



Location	TC Device	85th Percentile Speed (mph)			Volumes (vehicles/day)		
		Before	After	% Change	Before	After	% Change
Davis St.	Half Closure	25	23	-8	2233	568	-75
Rainey St. (60 Blk.)	Circle	33	35	6	389	269	-31
Rainey St. (70 & 80 Blk.)	Speed Cushions	35	28	-20	3323	2321	-30
Rainey St. (90 Blk.)	Speed Cushions & Neckdown	28	22	-21	835	1869	124
River St. (600 Blk.)	Circle	N/A	N/A	N/A	610	590	-3
River St. (700 Blk.)	Circle	26	27	4	3152	2033	-36

Source: Adapted from Reid Ewing, *Traffic Calming: State of the Practice*, (Washington, D.C.: Institute of Transportation Engineers, August 1999), Appendix A: Speed and Volume Data, p. 207.

After traffic calming, speed reduced by eight percent, a mild reduction but certainly not one with glowing results. However, in contrast to the eight percent reduction, speed was reduced by only two mph! Albeit a reduction, reducing the speed from 25 mph to 23 mph on a street with a designated speed limit of 30 mph can hardly be considered as a very productive yield in relation to the cost.

Figure 7.1

Map of the Rainey Street Calming Project

Source: City of Austin, Department of Public Works & Transportation

Did the neighborhood actually gain that much with this installation? Perhaps the greater question is did this street warrant traffic calming in the first place, since the 85th percentile speed was 25 mph or below? A closer look shows this street had a volume problem rather than a speeding problem.

In fairness, however, one of the other streets showed a favorable increase. The #70 & #80 block of Rainey Street showed a 20 percent reduction in speed. This was a seven mph decrease from 35 mph down to 28 mph. Given that the existing condition prior to traffic calming was in excess of the established 30 mph norm, bringing the speed down below the posted speed should be viewed as a success. However, one must also consider the 85th percentile again. This percentile standard is used universally in transportation studies to establish speed limits, as 85 percent of the drivers travel at a reasonable safe speed. In this case, one could argue that the speed limit on this section of road should be 35 mph instead of 30 mph, thus again, no need for traffic calming devices. Nonetheless, a 30 mph speed for a non-collector street would appear to be reasonable to maintain a safe neighborhood.

These two speed comparisons, both positive and negative, illustrate that the evaluation of a program needs to encompass the entire project rather than just providing a blanket success statement heard by many transportation officials that “we have accomplished speed and volume reductions”. Again, Table 7.1 reveals that only two locations of the five (with data) had speeding

in excess of 30 mph. Although small, two of the locations actually saw speed increase rather than decrease after traffic calming. Three locations actually had speed decreases, including the one that was only by two mph.

Of the other two locations, the cautionary advice previously expressed by Ewing regarding the unreliability of "after" speed data may be in order here. One of these sets of data could have easily been skewed, as persons traveling on this portion of the street were accustomed to making a turn onto another street in this area.

However, with the data taken right after the implementation of the half closure, many travelers probably found themselves slowing at this intersection realizing they could not turn and would have to change their traffic patterns and proceed on through the portion of the route they were not fully acquainted with. Thus, a lower speed would immediately be expected thereafter until driver/region familiarity increases. Also, the 85^{th} percentile speed for this particular street was also below 30 mph to begin with.

The fifth street does indeed show a reasonable decrease. Thus, one could say that traffic-calming devices realistically reduced the speeds for this neighborhood on one out of five streets. Again, knowing when the "after" data collection was taken for this location, along with ensuring consistent methodology with the "before" collections, is critical in trying to make any reasonable inferences.

A similar interpretation can be made for the traffic volume impacts within this neighborhood. At first glance, an immediate impression would show a large decrease in traffic volume as five out of the six locations show volume decreases. The overall mathematical decrease for the neighborhood is approximately 27.5 percent, which is an admirable decrease. But a closer examination using the data, along with a field visit to the site, can lead to different interpretations than just what the raw data portrays.

Introspectively, a look at who has actually benefited might not be as nearly uplifting. Two of the locations, #60 Block of Rainey Street and the 600 block of River Street have only one dwelling and very minimal traffic volumes. Thus, their effect on the registered decrease has very little impact on neighborhood satisfaction. The device for the 700 block of River Street apparently had a good effect in reducing volume, with a 36 percent decrease. Unfortunately, this portion of the street has only two dwellings facing the street.

The neighbors living at the #70 & #80 block of Rainey Street received a clear benefit from the program as they saw a 30 percent decrease in volume. This portion of the street contains 25 residential structures. The greatest benefactor was the lone resident on Davis Street where the half-closure device drastically reduced traffic by 75 percent. Of noteworthy mention, this one

Davis Street resident is a former Austin City Council Member who advocated traffic calming for the neighborhood.

The real losers of the neighborhood are the residents of the #90 block of Rainey Street. Due to the partial closure at Davis Street, these residents suffered an astounding 124 percent increase in traffic volume. As noted in an earlier chapter, traffic-calming devices have a tendency to divert traffic to other areas. In essence, the bulk of the traffic volume burden shifted from the lone Davis Street resident to all of the #90 block Rainey Street residents. With this heavy volume increase, coupled with a questionable decrease in speeding, one would have to wonder how supportive this section of the neighborhood is now towards the traffic-calming project. This particular section of Rainey Street has eight households.

From these findings, one could argue that 25 households clearly benefited whereas eight residential structures saw a major decline in the livability of their neighborhood. The net gain was that 17 households benefited from this $150,000 to $200,000 project to improve the safety and livability of the neighborhood. In other words, for every three households that improved, one household saw a deterioration of the previous livability status. There is no doubt that a majority benefited. However, this was at the expense of others within the neighborhood.

So, one must thoroughly look at the overall impact of speeding and traffic volume to evaluate the project's effectiveness. This consists of reviewing the empirical data, as in Table 7.1, along with on-site observations, so as to better interpret the data. In this case an improvement analysis chart, contained in Table 7.2, helps illustrates the effectiveness of this particular project.

Table 7.2

Improvement Analysis of the Rainey Street Neighborhood Traffic Calming Project

POSTIVE FINDINGS (Significant Improvement)	**MARGINAL FINDINGS** (Marginal Improvement)	**NEGATIVE FINDINGS** (Negative Improvement)
Speeding/#70 & 80 Rainey St.: 7 mph decrease in speed (-20%)	*Speeding/Davis St.*: 2 mph decrease (8%); already well below 30 mph	*Speeding/#60 Rainey St.*: 6% increase in speed
Volume/#70 & 80 Rainey St.: 30% reduced volume	*Speeding/#90 Rainey St.:* Already below 30 mph; dropped 6 mph; data skew questionable	*Speeding/River St. (600 Blk.):* 4% increase in speed
Net Households Benefited: 17 (25 Benefit - 8 non-benefit=17)	*Volume/Davis St:* 75% reduction (but only 1 resident improved)	*Volume:* River St. Major 124% increase
	Volume/#60 Rainey St: small volume count of the whole "before & after"	
	Volume/River St. (600 Blk.): decrease of 20 cars per day (-3%); insignificant volume	
	Volume/River St. (700 Blk.): 36% decrease (but only effects 2 houses)	

Note: Speeding and Volume Data obtained from Table 7.1; Households benefited from on-site visit

As the improvement chart illustrates in Table 7.2, the marginal and negative findings outweigh the positives. Specifically, for this neighborhood, the analysis suggests that the overall impact of this project was of very limited success to the entire neighborhood. Although a 30-36 percent traffic volume decrease occurred on the most used street, the fact still remains that more than 2000 vehicles per day (vpd) continued to use this thoroughfare. Although better than 3000+ vpd, 2000+ vpd would still seem excessive for a truly neighborhood street like Rainey Street.

These findings also seem to be substantiated by the recent comments of residents and landowners. With almost a full year of traffic calming devices, they say "their quiet neighborhood has become nearly uninhabitable. Cut-through traffic going to Interstate 35 races past driveways. Out-of-towners use the street and driveways as satellite parking for the Austin Convention Center."[2]

Apparently, in retrospect, a full or partial street closure device at one end of the neighborhood would have resolved the volume and subsequently the speed problem. With Rainey Street not being classified as an emergency response route strengthens this choice even more. In all likelihood, this option would have been more economical than the cost of all of the other devices combined. The downside to this option is that the residents themselves are more inconvenienced by closure devices than the cut-through drivers. By

having only “one-way-in/out” routes they lose a greater freedom of movement.

For the analysis of this neighborhood, one could easily view the overall success as at best marginal, rather than optimal.

Pedestrian Fatality Data

One of the goals of traffic calming is to make the neighborhoods safer for pedestrians and bicyclists. In theory, slower speeds and less traffic volume will reduce accidents. As already indicated, accident rate studies generally are not good measurement tools due to the number of uncontrollable factors not related to traffic calming devices. However, a review of the pedestrian fatality data can at the very least establish a baseline of frequency and severity of traffic problems.

Data was obtained from the Austin Police Department for all pedestrian fatalities for the last three years. This data included deaths of both pedestrians and bicyclists. As depicted in Table 7.3 for the years of 1997 through 1999, Austin averaged 15.3 pedestrian fatalities per year. The surprising finding was that no more than one fatality occurred each year, and zero in 1999, on Austin neighborhood streets. Again, speaking in average terms, Austin experiences only .66 pedestrian deaths per year on neighborhood streets.

Table 7.3
City of Austin Pedestrian Fatality Data

Year	Pedestrian Fatalities	Pedestrian Fatalities on Neighborhood Streets	Percent of Pedestrian Fatalities on Neighborhood Streets
1997	15	1	6.6%
1998	17	1	5.8%
1999	14	0	0%
Avg. Per Year	**15.3**	**.66**	**4.3%**

Source: Austin Police Department, Planning & Research Section

Another shocking find, was that out of the 46 pedestrian fatalities for that three-year period, only five involved *failure to control speed* as a factor. None of these five speeding incidents occurred on neighborhood streets. The primary contributing factor for virtually all of the fatalities, including the two residential fatalities, involved the *pedestrian failure to yield the right of way to vehicle* or *pedestrian in roadway*.

All of the data collections revealed that both speeding and pedestrian fatalities within neighborhoods occur with low frequency. Detailed information regarding this data for each year can be found in Appendix C.

For the purpose of the impact analysis performed in this chapter, precise pedestrian fatality data was collected for the period of December 1, 1997 to November 30, 1998. During this particular analysis period, Austin recorded 17 pedestrian fatalities, of which one occurred upon residential

streets. That data, also in Appendix C, will be used comparatively as a baseline to other analyses.

Sudden Cardiac Arrest Data

As previously established, traffic calming devices have a detrimental effect upon the response times of emergency service providers. The delay in response times can have a profound impact on bringing a raging fire under control as well as providing life saving medical care. The most crucial, time sensitive emergency situations are those in which a person has undergone respiratory or cardiac arrest. Without immediately restoring these vital life functions, a person can die or suffer permanent brain damage in 6 to 8 minutes.[3]

This crucial 6 to 8 minutes begins when someone goes into an arrest, not when the fire or EMS units begin their response. Elapsed time for detecting someone in arrest, calling 911, dispatchers processing the call, notifying the fire/EMS stations, and response travel time all have to be completed within that six to eight minute window. Additional time on the scene is also needed to diagnose the problem, and set up to administer the emergency medical care.

Sudden Cardiac Arrest and Defibrillation

Cardiac arrest is not the same thing as a heart attack. A heart attack occurs when the blood arteries of the heart muscle become blocked, depriving blood to a portion of that muscle, which in turn impairs or reduces the heart's ability to adequately supply blood to the remainder of the body. The severity of a heart attack is classified by how much of the heart muscle is damaged from lack of blood flow and the changed production capacity of the heart. This condition also mandates prompt medical intervention.

Sudden cardiac arrest (SCA) is different in that the electrical nerve impulses of the heart muscle, rather than the muscle blood supply, do not operate normally. SCA is a major cause of death in the United States that claims an estimated 250,000 lives each year. "Abnormal heart rhythms called arrhythmias cause most sudden cardiac arrests. Ventricular fibrillation (VF) is the most common arrhythmia that causes cardiac arrest. It is a condition in which the heart's electrical impulses suddenly become chaotic, often without warning. This causes the heart to stop abruptly. Victims collapse and quickly lose consciousness. Death usually follows unless responders restore a normal heart rhythm within 5-7 minutes."[4]

The basic cause of SCA is not well understood. Many victims have no history of heart disease, nor have their lives been affected by this underlying

heart condition. So, much of the public is susceptible to SCA. However, unlike other life threatening diseases such as cancer or AIDS, there is a definitive therapy for SCA that can even be administered outside a hospital environment. This therapy is known as *defibrillation*.[5]

Defibrillation occurs when an electrical shock is delivered to the heart of an unconscious patient through a series of wires and telemetry from an electronic device called a *defibrillator*. This shock stops the abnormal rhythm and restores a coordinated rhythm that results in the normal pumping action of the heart to resume. Originally, defibrillators could only be used by emergency room physicians or field paramedics assigned to EMS units. However, with the advances in miniature solid-state circuitry and microcomputers, field devices have been developed to automatically recognize when a patient is in a ventricular fibrillation state. This particular device no longer requires an operator of extensive medical training background. Further, the devices advise the emergency responder that a shock is needed, and then deliver the shock automatically. These new devices are known as *automatic external defibrillators*, or AEDs.[6] Widespread deployment of AEDs throughout many emergency service departments has resulted from this new technology.

The Chain of Survival

There are four critical links to providing effective emergency treatment of SCA. Starting and implementing these links will very well determine whether one lives or dies from SCA. The American Heart Association describes and advocates the use of the "chain of survival" as follows:

1. *Early Access to Care* - In most communities, dialing 911 activates the emergency medical system, which dispatches the appropriate emergency personnel to the scene.

2. *Early Cardiopulmonary Resuscitation [CPR]*- If performed properly, CPR can add a few minutes to the time available for successful defibrillation. Millions of people have learned the breathing and chest compression techniques of CPR, but it does not replace defibrillation in saving lives.

3. *Early Defibrillation* - The critical link in treating victims in VF is delivery of an electrical shock. Each minute of delay in returning the heart to its normal pattern of beating decreases the chance of survival by 10 percent. After as little as 10 minutes, very few resuscitation attempts are successful.

4. *Early Advance Care* - After successful defibrillation, some patients require more advanced treatments, such as airway control or intravenous drugs, on the way to the hospital.[7]

The City of Austin has invested considerable resources over the last few years to ensure that this chain of survival is improved to provide better emergency medical care to its citizens. The 20 year-old 911 Center will have improvements made this year to the computer aided dispatch (CAD) system for quicker dispatching services. The EMS Department, along with other

health agencies and colleges, has aggressive public training programs for teaching citizens CPR.

AEDs have been placed on over 55 fire department front-line response units for the city. They provide the first responder role for over 22 front-line EMS units who also carry defibrillators. These EMS units also provide advance drug intervention treatments to patients while enroute to local area trauma centers.

But as in any chain, it is only as strong as its weakest link. Traffic-calming devices severely hamper and jeopardize the delivery of two of the four links of the chain of survival. Response delays will impact the most critical link of early defibrillation, and will affect the early advanced care during transport to hospitals.

Cardiac Arrest in Austin

The Austin Emergency Medical Services (AEMS) department provides basic and advanced life support services to all of the residents of Travis County. AEMS is one of the few EMS systems in the country that maintains a very thorough database on cardiac arrest cases that they respond to. This tracking includes information about the incident, patient history, and includes tracking the surviving patient's progress through their discharge from a hospital. Annually, AEMS produces a report on this data. Not to be confused

with heart attack incidents, this data collection applies only to those victims who were in cardiac arrest at some point.

For the 1998 reporting year, which began on December 1, 1997 and extended through November 30, 1998, AEMS, AFD and other county fire departments responded to 486 confirmed sudden cardiac arrest cases in Travis County. The population for Travis County for that period was 1,205,895. A total of 251 victims (52 percent) were pronounced dead at the scene after resuscitation attempts. Conversely, 235 (48 percent) patients, with positive vital life signs, were transported to a medical facility. Of those transported, 108 (22 percent) were discharged from the emergency room to a unit or floor of the hospital. Out of this, 49 patients (10 percent) were discharged alive from the hospital.[8]

The frequencies of the SCAs are maintained for each zip code within the County. Since this analysis is limited to the effects of traffic calming within the City of Austin, only the data from the zip codes within the city limits of Austin are used. Because Austin encompasses a substantial area and comprises the bulk concentration population of Travis County, AEMS, along with the Austin Fire Department responded to 442 SCAs within the city limits of Austin. This figure will be used hereafter for other quantitative analysis documented within this report. A complete listing of the Austin included zip codes and frequency for SCAs is contained in Appendix D.

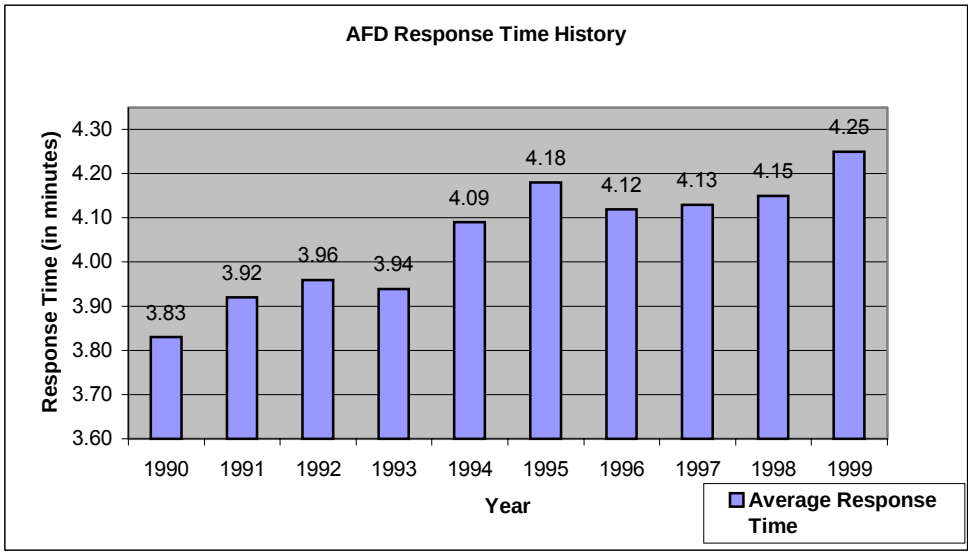
AFD Response Time Data

The best trained emergency responders and the highest quality life saving equipment is of no value to the public when those resources cannot respond in an expedited efficient manner. *Response time*, without a doubt, is the most frequently used performance measure of the fire and EMS services. Virtually every other performance measure, whether positive or negative, is directly dependent upon how fast either of the departments can put their skills and resources into action. *Response time*, for the purposes of this report and the respective data collections, is the amount of time that elapses from when a dispatch signal is given to a fire or EMS station until the unit arrives on the scene of an emergency. This includes all travel time and excludes the time for dispatchers to triage and process the call for help.

Fire Responses

Although the consequences of poor response times to medical emergencies have been documented, they are also similar for fire suppression. The speed and quickness that a fire department commences actions to combat a fire has a direct relationship to fire spread, the difficulty in controlling the fire, as well as minimizing property damage from other perils such as smoke and water.

Of course, the first priority in any fire department response is that of rescuing people who may be trapped within a fire building. A fire will increase at various exponential rates for each uncontrolled minute depending upon many condition factors. At this rate, a fire can easily intensify and achieve excessive elevated temperatures to cause other nearby combustibles to reach their ignition temperatures in less than five minutes. This condition is known as *flashover*.



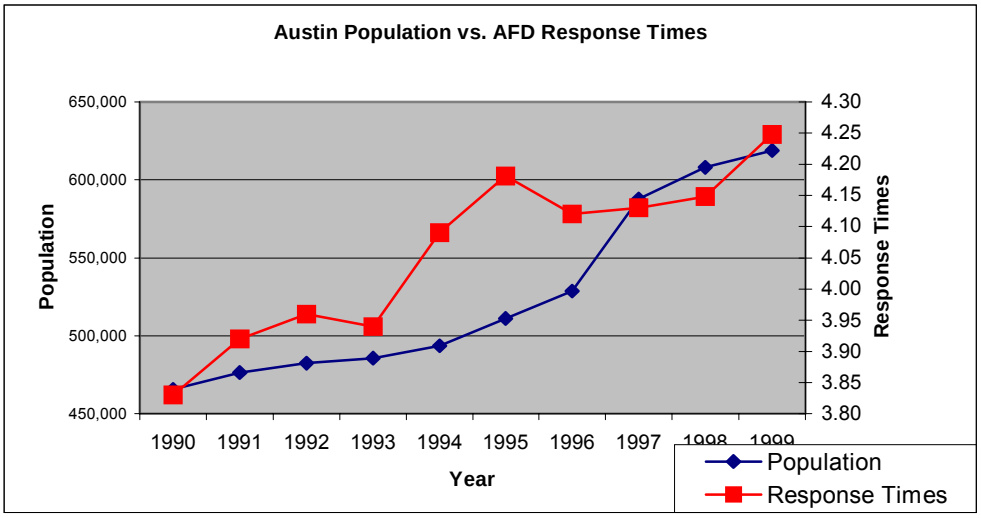
In order to prevent this stage and regain control of such an emergency, the fire department should be on the scene within five minutes. This requires the fire unit to have a travel time of not more than three minutes from the station. Like the medical emergencies, the fire must first be detected, help called for, and time to process and dispatch the fire units. So, two minutes or less generally elapses during this portion of the chain.

To compound matters, new federal standards have recently been established that require at least four firefighters to be assembled on the fireground before an interior attack can be made. Because a lot of communities cannot afford to have a minimum of four firefighters assigned to each unit, this usually requires the arrival of a second fire unit before such an attack can commence. Thus, traffic calming does not delay merely the first due unit to fire scenes. There is an old and very valid adage within the fire

service. "What gets done in the first five minutes at a fire scene determines what will occur in the next five hours".

Although a three, or even 3.5, minute goal is highly desirable, the Austin Fire Department has not enjoyed such a response time for over ten years. In 1990, AFD recorded a respectable 3.83-minute response time. Unfortunately, the department has witnessed response time increases virtually every year since. Of greater concern, is that the recorded response times have been over the four-minute mark for the last six years. As depicted in Figure 7.2, these response times are for all fire and medical emergency related incidents.

Figure 7.2
AFD Response Time History



Source: Austin Fire Department, Administration Division, MIS Section

There can be numerous reasons for increased response times. Growth, both in population and landmass, is the primary contributor to the changes. More people equate to more fires, more cardiac arrests, more traumas, and other demands for increased service. Undoubtedly, more traffic and congestion accompanies this growth due to the lack of adequate arterial or collector streets. Unless the local government develops aggressive policies and capital improvement projects to stay in front of the demand, the quality of emergency services will degrade for the community.

Figure 7.3 shows that Austin has experienced a phenomenal growth rate over the last ten years. During most of that period, response times rose more than the growth rate. Only in 1997 & 1998 was the annual response time increase below the population growth rate. Regardless of the growth rate correlation, the response time is still far in excess of four minutes.

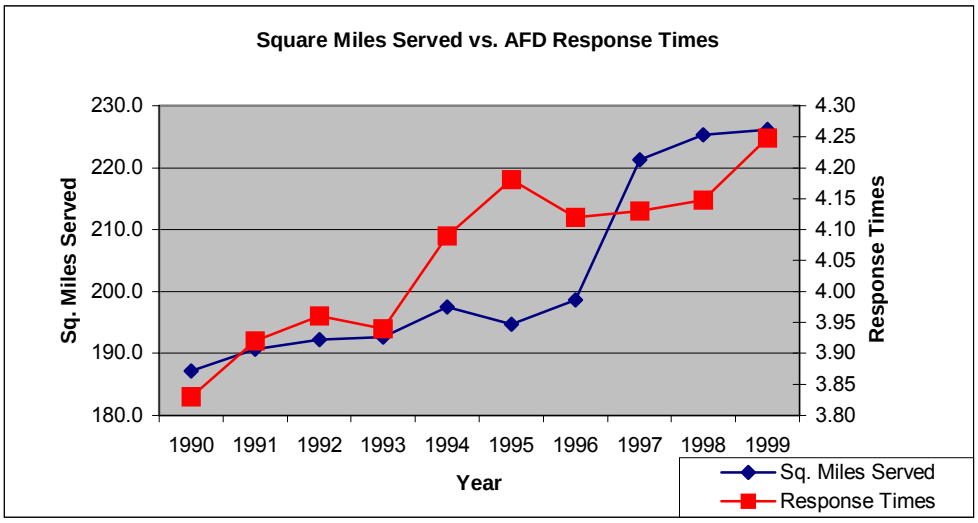


Figure 7.3
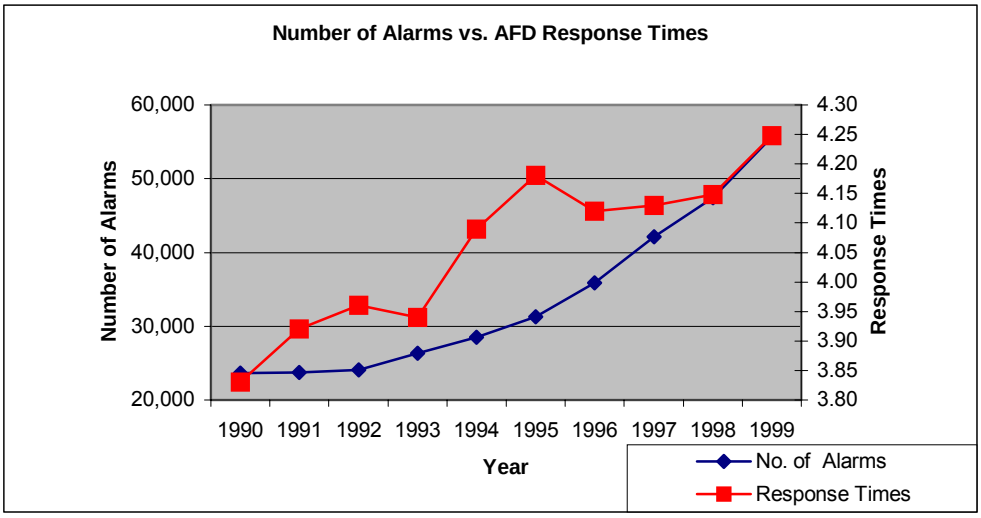
Population vs. AFD Response Times

Source: Austin Fire Department, Administration Division, MIS Section

As the land mass increases, the travel distances to emergencies also increase. Unless additional fire stations or first responder contracts with existing volunteer fire department are implemented, response times will continue to escalate for newly annexed areas. The relationship of increased landmass to increased response times is contained in Figure 7.4. Again, as for population, AFD response times escalated more with land mass increases until 1997. Yet, this is still an undesirable level. Obviously, resources were increased during that period to get under the growth curve.

Figure 7.4
Square Miles Served vs. AFD Response Times

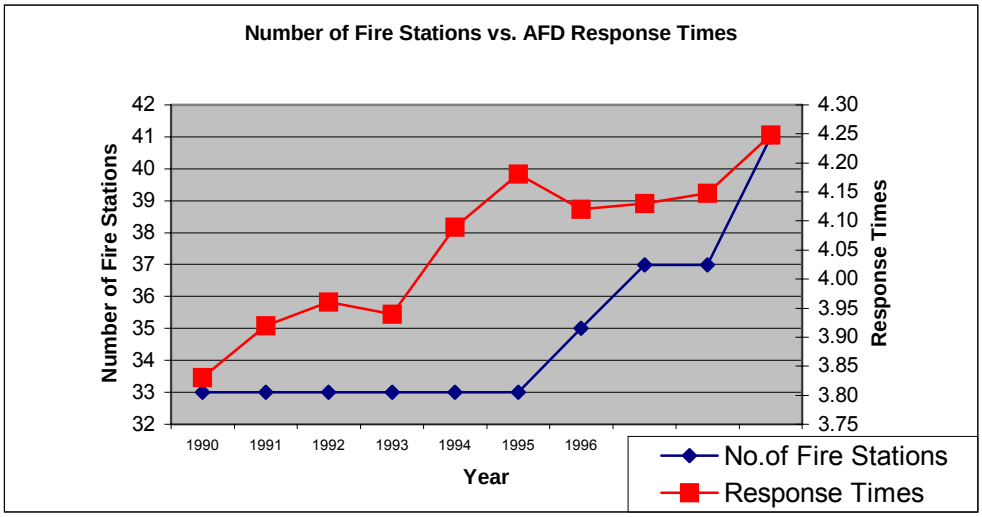


Source: Austin Fire Department, Administration Division, MIS Section

As mentioned earlier, increased populations and area will lead to more service demand. As expected, there was a sharp rise in the number of emergency incidents AFD responded to over the past ten years. Figure 7.5 reveals that response times were rising with the increased alarm volume until it dipped slightly in 1993. Then significant response time increases occurred in 1994 and 1995. A minimal decline occurred in 1996 but immediately began rising again in 1997. This data is interesting as during 1995 and 1996, the installation of speed humps in Austin was at an all-time high. Ironically, response times dropped slightly in 1996 when two fire stations were added. Responses are now at an all time high of 4.25 minutes in 1999.

Although certainly not the sole reason for these increases in response time, one could argue that traffic calming was a contributor to this escalating data finding. However, the data definitively demonstrates that response times are steadily increasing at an alarming rate. Any additional burdens or further proliferation of external increase factors such as traffic-calming devices, severely compounds the issue.

Figure 7.5
Number of Alarms vs. AFD Response Times



Source: Austin Fire Department, Administration Division, MIS Section

As shown in Figure 7.6, the addition of fire stations can lead to improvement to response times if done in a timely and consistent manner. However, with a "plan and build" time taking almost two years, a city can easily find itself playing "catch up". Seeing an increase to a then "all-time

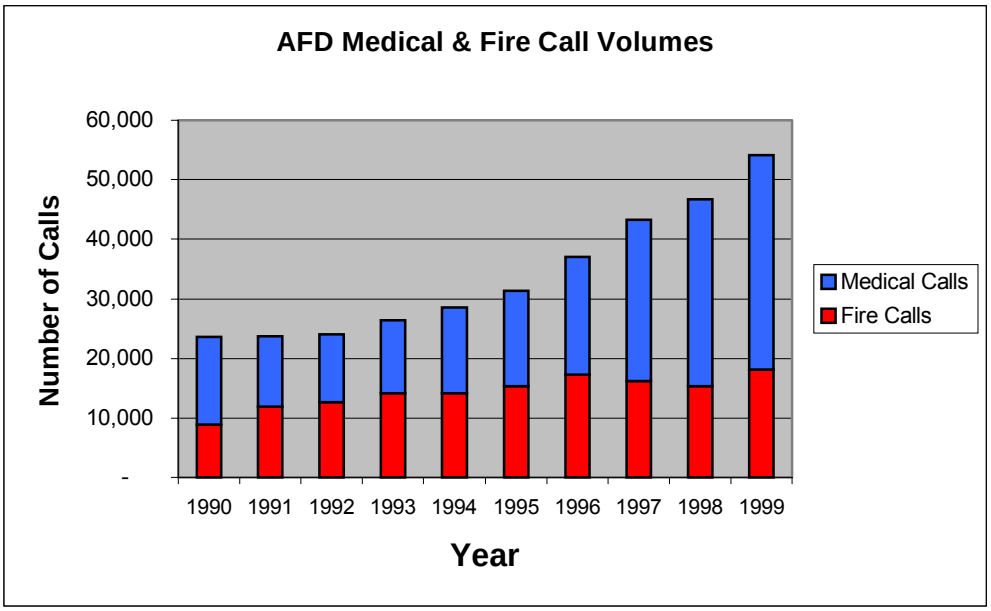
high" in response times in 1995, procurement plans for two more fire stations began immediately. After increasing from 33 to 35 stations in 1996, response times showed a decrease from the year before. However, even with the addition of four other stations by 1999, the average response still rose to the highest mark yet of 4.25 minutes. Thus, increased resources are still not keeping up with other factors contributing to response time increases.

Figure 7.6
Number of Fire Stations vs. AFD Response Times

Source: Austin Fire Department, Administration Division, MIS Section

As demonstrated by the growth trends in population, land mass, call volume and increased fire station locations, the annual average response time of the Austin Fire Department has seen a significant degradation over the last ten years. With an alarming increase again in 1999, the response time is still not below the four-minute mark the department recorded in 1993.

The economic vitality forecast for Austin is still very bright, meaning that notable growth levels will continue for some time. As growth is also probably responsible for neighborhood traffic calming initiatives, the emergency service data suggest that the local government is barely able to keep services at an acceptable level. This government will be hard pressed to return to the response times achieved seven years ago. All of this suggests strongly that emergency service providers and citizens cannot afford additional delays from traffic calming with continued increases of future sustained growth.



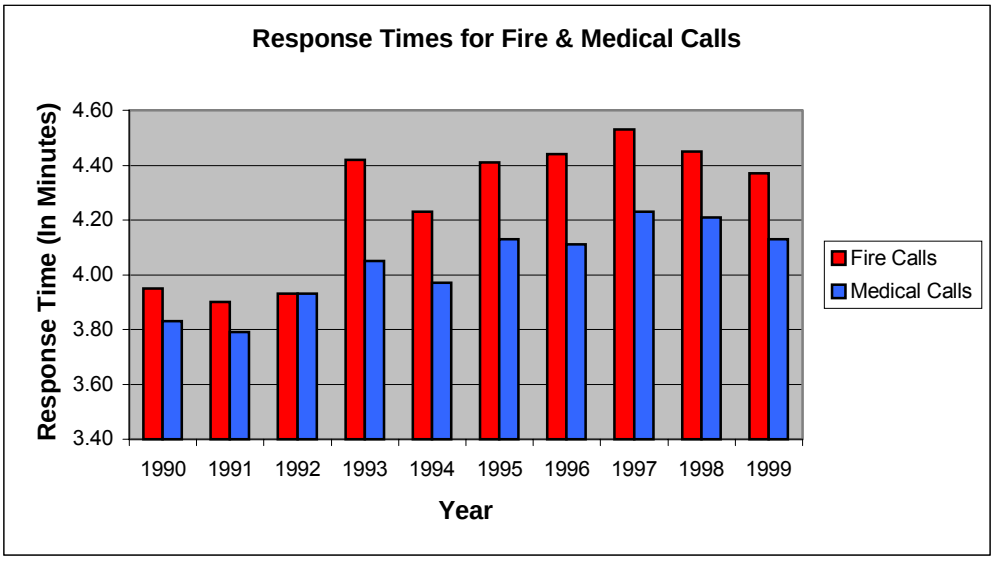
AFD Medical Responses

The Austin Fire Department, as a first responder to medical emergencies, is the first tier of a two-tier emergency medical services system within Austin. Working under the same standards and protocols with the second tier Austin Emergency Medical Services Department, AFD is an integral component of the system delivery to the citizens.

Although total call volumes have increased over the last ten years for AFD, the ratio of fire calls to medical calls has decreased significantly. This trend parallels with the rest of the U.S. With better fire detection equipment, improved hazard environments, and better safety education, the number of fires is decreasing per capita in this country. Resultantly, many fire departments now experience more than 50 percent of their call volume for

medical calls than for fire calls. Austin is no exception to this trend as revealed in Figure 7.7. For the last five years medical calls have exceeded the number of fire calls. In 1999, 67 percent of the AFD call volume was for medical calls, an all-time high. .

Figure 7.7
AFD Medical and Fire Call Volumes



Source: Austin Fire Department, Administration Division, MIS Section

In Austin, there are 41 fire stations that house 59 fire apparatus, whereas AEMS has 22 paramedic/transport units. With this disparity and a high call volume, the AEMS units are most often likely to be migratory, rather than stationary, in moving from call to call throughout the city. Since the more abundant fire stations are strategically located throughout the city, a fire apparatus will generally arrive on the scene of a medical emergency faster

than an EMS unit. Thus, the reasoning for having fire units serve as the primary first responders and carry AEDs, for emergency medical care.

Although the routes are the same, AFD response times for medical emergencies is somewhat quicker than the response times for fire calls. In most instances, fire fighters don fire protective garments and self-contained breathing apparatus prior to leaving the station for fire calls. This equipment is not required for medical calls. Although the "scramble time" can vary, medical response times are usually one-half of a minute quicker than for fire responses. Figure 7.8 illustrates the AFD response times for medical and fire incidents for the last ten-year period.

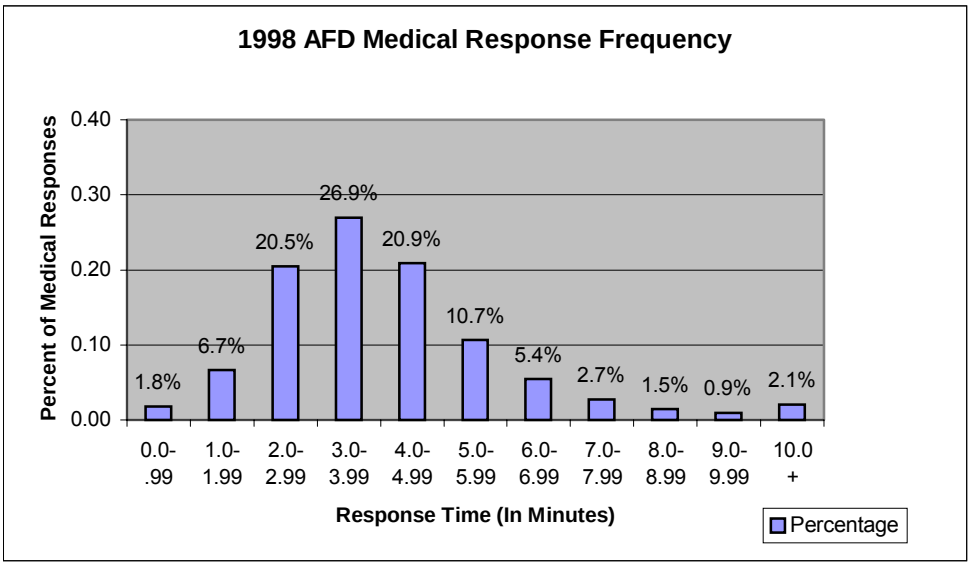


Figure 7.8
Response Times for Medical and Fire Emergencies

Source: Austin Fire Department, Administration Division, MIS Section

As already noted, the effectiveness of quality emergency medical care is directly dependent upon when that care can arrive at a scene. Call frequency distribution then has a profound effect upon the efficiency of the service. In preparation for an analysis later in this chapter, the percentage frequency distributions for medical calls responded to by AFD are contained in Figure 7.9. This 1998 data was purposely selected to coincide with the 1998 Austin SCA data reviewed earlier in this chapter.

Figure 7.9
1998 Medical Response Frequency

Source: Austin Fire Department, Administration Division

In summary, AFD has experienced increased response times over the last ten years. Emergency medical calls are now the bulk of the fire department's services to the city. Response delays due to traffic calming devices can

severely jeopardize the delivery of emergency medical care and fire protection services. The implementation of additional resources has not adequately kept up with the growth demands for the emergency service delivery of seven to ten years ago.

Impact to SCA Victims in Austin

With the availability of good data from both the Austin Fire Department and Austin Emergency Medical Services, sound statistical analyses can be performed to quantify the impacts that traffic calming devices have upon victims of sudden cardiac arrest in Austin. Utilizing probability calculations, one can project the negative impact of lives lost due to traffic calming devices. Conversely, one could also predict the positive gains of lives saved when response times are improved. This specific analysis incorporated a risk probability model spreadsheet developed by Ray Bowman of Boulder, Colorado.[9] The visual layout of the model has been modified for this analysis, however the statistical calculations for the projections have not been altered.

The time period analyzed is from December 1, 1997 to November 30, 1998. All of the source data reviewed heretofore for that period will be used for this analysis. In general, this model contains four major elements. The first element requires the current response time frequency distribution of the local fire department for medical emergencies. The second data set involves

the survival probabilities of sudden cardiac arrest as established by reputable medical authorities. The third element requires an input variable for the estimated response time delay/improvement to be tested. From this, an adjusted local survival probability can be calculated.[10] The fourth and final element requires an input variable to denote the number of sudden cardiac arrest cases experienced within the response area for the analyzed time period. From these data sets, an extrapolation can be made as to the number of SCA lives saved or lost due to the traffic calming conditions from what is currently predicted.

The versatile Bowman model can be viewed in three methods. One method makes projections based on the overall increase in response time due to any reasons, such as increased traffic volume, a fixed delay such as a blocked railroad crossing, or response delays from traffic calming. Projections can also be made for the aggregate impacts generated for each number of calming devices along a response route, i.e. three speed humps. The third option allows for one to also examine the positives from improving response times, such as the installation of electronic devices at traffic signal locations whereby the light changes in favor of the responding emergency unit. This analysis will look at all three methods. A complete listing for the response time models pertaining to the City of Austin and the statistical verification for the Bowman model can be found in Appendix D.

Analysis for a General Response Delay

For 1998, AFD maintained an average response time to medical emergencies of 3.62 minutes. For this analysis test, the current response time is increased by 14 percent (about 30 seconds). Recalling that an emergency vehicle would encounter 2 to 10 second delays per device while responding through a neighborhood containing several devices, the 14 percent (30 second) variable is not an unreasonable delay approximation. The data sources and prediction for this scenario is contained in Table 7.4.

As depicted, a 14 percent, or 30 second, increase in response time from traffic calming initiatives would now save only 177 lives compared to the predicted 215 lives saved if there were no increases in overall response times. In this case for 1998, 37 additional lives would be lost due to the delays caused by traffic calming devices. It should also be noted that this is a per year loss, that would continue year after year provided there was no decrease in the response times.

Some clarification is needed here for the "predicted lives saved" category of the model. This term relates to those victims who, in the field, maintained positive vital life signs and are transported to the hospital. The objective of the first responder is keeping the patient alive until they can be handed over to a more qualified medical authority such as an ER physician.

Source: Adapted from the Ray Bowman spreadsheet "Consequences of Emergency Response on Cardiac Arrest Survival"

The “predicted lives saved” of 215 by the model is a very close approximation of the 235 actual SCA patients transported to a medical facility in Austin during 1998. This gives reasonable statistical validity to the Bowman Model as the prediction closely resembles the actual history data.

Analysis of Delay Per Device

The negative impact results are further illustrated when utilizing the delay per device feature of the Bowman model. In this instance, delays are incorporated for each device encountered by the emergency medical responders. The model has been inputted with three devices for the emergency responders to travel over. Table 7.5 projects the number of lives lost from this hypothetical, but real, delay.

Fire and EMS units having to cross three traffic-calming devices significantly reduces someone's probability for survival. With Austin's current history of 442 sudden cardiac arrest cases, only 196 could expect to survive rather than the predicted 215 without any traffic calming device delays. This translates into a nine percent reduction of potential lives that could be saved. According to the model, there would have been 18 less Austinites surviving SCA in 1998 had emergency responders encountered three traffic calming devices along their routes.

Analysis for a General Response Improvement

Additional lives can be saved whenever response times are improved. Reduced response times can be achieved in a number of ways such as increasing the number of arterials on the transportation grid system, adding fire stations or improving traffic control signals at intersections.

Numerous cities around the country have capitalized on the technology improvements by implementing Emergency Response Management Systems (ERMS) using the Opticom™ Priority Control System developed by the 3M Company. In general, this system allows on-coming emergency vehicles to control an approaching traffic signal in their favor, thus minimizing the delay for stopping for red lights. The technology allows an emergency vehicle to activate or hold a green light at traffic signals along its route when making an

emergency response. Each emergency vehicle is equipped with electronic emitters that sends a signal to the traffic light and modifies the normal operation sequence of the light. The emitters can activate a traffic signal from as much as a ¼ mile distance from the intersection. With a green signal captured for the emergency vehicle, a red is displayed with sufficient yellow to red intervals for the cross street traffic to safely clear the intersection or stop and allow the emergency vehicle to pass through with minimal delay.[11] In addition, the potential for accidents involving emergency vehicles is also reduced.

A 1978 study using the Opticom™ system with the Denver Fire Department revealed that their response times decreased proportionally with the number of Opticom™ controlled intersections. With three controlled intersections, the response time improved by 14.3 percent, whereas six intersections with Opticom™ equipped traffic lights saw a 22.5 percent improvement.[12] This report was further affirmed by a similar study conducted in Houston, in 1991. With tests performed from two different fire stations, response times were reduced with one station experiencing a 16 percent reduction while the other improved by 23 percent.[13]

Currently, the City of Austin has approximately 750 traffic controlled intersections within the city limits. Almost 50 of these are actually maintained by the Texas Department of Transportation (TxDOT) for the state

highways within Austin. Approximately 125 of the 750 (16 percent) controlled intersections, are equipped with the Opticom™ devices. Ninety-five of these are concentrated in the immediate downtown area rather than residential areas. Most of these were installed with grant funding from TxDOT as no permanent funding for a sustained program has ever been authorized.[14]

Again, using the Bowman model, a projection can be made of how many sudden cardiac arrest lives can be saved from the present history if Opticom™ devices allowed for a quicker response. Table 7.6 reveals the positive impact that can be attained if response time were improved by approximately 30 seconds, or 14 percent. This seems to be a reasonable target increase based on the study results of Denver and Houston.

Annual SCA Cases obtained from Austin Emergency Medical Services

Source: Adapted from the Ray Bowman spreadsheet "Consequences of Emergency Response on Cardiac Arrest Survival"

With an improved response time of this extent, a projected 255 people would have been saved from SCA rather than the estimated 215 lives. This translates to 41 more Austin citizens would have been saved than what was currently projected for 1998.

This entire analysis signifies that there is a direct correlation of survival from sudden cardiac arrest to the response time arrival of emergency medical personnel. The Austin experience illustrates that their traffic-calming program does have a significant detrimental effect to SCA survivability and the quality of emergency services provided to the community.

Risk/Benefit Ratio

A number of analytical processes can be used to evaluate public policy. One such process is establishing a *risk benefit ratio* whereby the risk of one public service can be divided by the benefits of another service. In general, policy decisions are reached or reinforced with the policy option that has the lesser risk and greater benefit ratio. Such a comparison can be made for the Austin traffic-calming program. One ratio will be established for traffic calming device installations; the other will be conducted for traffic flow improvements utilizing the Opticom™ systems.

Table 7.7 shows the results of this analysis, again using the previously established data for Austin, Texas.

Table 7.7

Risk Benefit Ratio for Austin, TX

Policy/Program	Projected Risk	Projected Benefit	Risk/Benefit Ratio
Installation of Traffic Calming Devices	37 lives lost to SCA	1 pedestrian life saved	37 lives lost for 1 life saved
Installation of Opticoms to Reduce Response Time	1 pedestrian life lost	41 lives saved from SCA	1 life lost for 41 lives saved

Again, based on this analytical comparison, one can easily determine that there is a much greater risk for installing traffic calming devices compared to the benefit for a policy or program that provides a reduction in emergency vehicle response times. In essence, Austin has adopted a public policy program that loses 37 lives (SCA) for every one life saved (pedestrian).

Chapter 8. Discussion of Policy Implications

Many arguments can be made for or against public policies relating to traffic calming initiatives. Often, public policies are quickly adopted in the wake of highly emotional issues, reaction to perceived fears or threats, or in response to a small interest group that may not represent the interests of the remainder of the community. In many instances, traffic-calming initiatives have been instituted in a large number of communities under these circumstances.

Traffic calming programs are established generally to improve neighborhoods by reducing traffic speeds and volumes, lower accident rates, and improve pedestrian safety. Often the traffic danger within a neighborhood is generally a *perceived danger* by the residents, rather than an established one. Because they personally witness the extremes of the data, residents often convey an exaggerated depiction of the problem than what is borne out and validated by the field data analysis.

Unless policies and programs are well thought out, analyzed, planned, and appropriately implemented that meet the overall needs of the entire community, most citizens will not be thoroughly satisfied with the local government's actions for a particular issue. The intent of this research was to review all of the aspects surrounding the traffic calming issue and attempt to

qualify and quantify the issues so that public and appointed policy makers could reach prudent decisions for their communities. These decisions would then be based on analytical processes rather than mere intuition or perceptions. Thus, this chapter should serve as the findings and interpretations of the content information reviewed herein. Chapter Nine, the final one, will contain policy recommendations from these findings, interpretations, and discussion.

Devices Useful When Warranted

Often, traffic-calming devices are used as a first, "knee jerk" reaction to a problem rather than a last resort. In many instances, there is quick response by the local government to the out crying of a few people who perceive there is a major problem. The local entity then records a quick set of speed and volume data, and devices are then put in place. As cautioned by Reid Ewing, a leading expert in traffic calming, speed, volume, and accident studies can be easily skewed. Therefore, full, in-depth, comprehensive analyses needs to be performed of the entire area to determine the problem. In addition there is often a lack of periodic efforts to increase enforcement by the police.

Most traffic control devices are effective for their intended use, i.e. slowing traffic or decreasing volume. However, their misuse is generally what comes under more scrutiny. There are certainly some situations where

some type of traffic calming is warranted. The Rainey Street project in Austin serves as one good example.

This very small neighborhood did not have a collector street, nor were there other parallel streets within the neighborhood, or adjacent neighborhoods, for cut-through traffic to divert to. Cut through traffic and speeding were the main complaints of the Rainey Street neighborhood. A quick analysis was done showing there was high traffic volume and very little speeding over the established 30 mph speed limit. Little was done from an enforcement standpoint, because there was not truly a speeding problem, only one perceived by the residents.

The traffic volume however, was a legitimate issue as over 3,000 vehicles per day (vpd) passed through the neighborhood. The neighborhood location, in very close proximity to two major arterials, was truly a result of cut-through traffic.

By not fully analyzing the problem with an intensive, thorough traffic study to establish the best remedy, the City Public Works & Transportation Department and the neighborhood-working group responded with a plan that was less than desirable for all parties. Instead, the neighborhood adopted a much more expensive plan to ensure it received its “full entitlement” of the funds allocated for the project rather selecting the best option. This is a potential problem with the City of Austin Traffic Calming Program. Too

many neighborhood-working groups focus on obtaining as many devices as the project budget will allow. Instead, the groups should be selecting the best options to solve the identified problem rather than solving the "spending problem."

Several speed cushions were placed when speeding was not a major problem. Speeding actually increased in some areas afterwards, as drivers were attempting to "make up for lost time." A traffic circle and two neck downs were placed to discourage traffic, which ended up having a limited effect on the volume. The volume was cut from 3,000 to 2,000 vpd, still a very high number of vehicles in a residential neighborhood. In fact, a portion of Rainey Street had a very dramatic increase in volume. Holding true to most traffic calming devices, the placement of a device on one street will generally move the problem to another street. In this case, it was further up the street rather than another parallel street.

Not being a major response route, this neighborhood would have been better served with a complete street closure. The cut-through traffic would have been totally eliminated and the perceived speeding problem would have disappeared with no traffic. All of the neighbors, instead of a few, would have benefited and none would have had a degradation of their current situation. More importantly, the overall goal would have been accomplished,

as all of the cut-through drivers would have had to stay on the arterial streets, which is precisely the route they needed to stay upon.

In this case, the City of Austin was treating symptoms, rather than completing a formal examination to make an accurate diagnosis and prescribe the correct actions for a cure. As a result, the neighborhood did not get completely well and still has troubling side effects. Thus, one can understand how a neighborhood would be of the opinion that the City did not fully do what they said they would do.

Although traffic-calming devices slow some traffic they do not slow all traffic. When the 85th percentile methodology is used to establish speed limits, this means that 15 percent are going faster. Is it reasonable to assume that this 15 percent is going to slow down when they encounter devices? This is probably unlikely, because if they are likely to drive at a unsafe speed to begin with, they are just as likely to accelerate and brake harder "to make up for lost ground" in between the devices. As pointed out earlier, police cars responding to emergencies are not greatly impacted by the delay, because of their smaller size, higher horsepower to weight ratio, they can navigate quicker between the devices. With this being true, then the other 15 percent of the civilian traffic can easily do the same.

Another quandary is the perceived speeding problem and the 85th percentile rule. Traffic calming devices have been put on streets with 85th

percentile speeds less than 30 mph. This is contrary to state law, as the 30 mph speed limit is the minimum established by state law for all public streets except for special designated areas such as school and park zones. Recognizing this, law enforcement will generally not write citations for speeding unless the violation is 7 to 10 mph over the speed limit. This is due to most judges not considering a guilty verdict unless the overage establishes a clear violation of the fact beyond a reasonable doubt.

Transportation officials are generally hesitant to perform actual speed studies, as the 85th percentile speed often exceeds the 30 mph limit, meaning that the speed limit should be increased to the newly field noted 85th percentile. Thus, any citations for speeding in excess of the established 30 mph, but less than the newly established 85th percentile speed, would have excellent grounds for dismissal.

Further, knowing this information, the local government is somewhat obligated to change the speed limit once it becomes aware the 85th percentile speed has increased. For this reason, these transportation officials are always willing to apply devices in places where the 85th percentile is below 30 mph, as this does not jeopardize the posted 30 mph speed limit. Again, under this scenario, devices are placed on streets when there is a perceived need, not a legitimate one, when speeds are below 30 mph.

Thus, devices are useful when their need is thoroughly analyzed and is warranted to solve the root cause of the problem. These devices should not be used to treat the symptoms of other community problems such as a lack of sufficient arterial and collector streets. Partial success leads only to partial fulfilled benefits, which increases public apathy. None of these outcomes lend themselves to good public policy.

Emergency Response Delays and Impacts

Many local governments fail to look at all of the impacts to traffic calming before making an affirmative decision to pursue such an initiative. Often these impacts outweigh the benefits. Numerous findings of the literature review and of the analytical processes contained in the previous chapters have demonstrated how traffic calming is detrimental to emergency services.

As proven with the five case studies presented, response times for fire and EMS emergency vehicles are definitely impacted. Delays in response time range from 2 to 10 seconds depending upon the type of vehicle and the type of device encountered. All of the studies showed that EMS units are in double jeopardy of their response times as they encounter delays to the emergency scene and on the return trip to the hospital when transporting patients.

There can be great financial impacts to cities with increased response times. As the response time is increased, the area of effective station coverage decreases. This situation would require local governments to build more stations to maintain the same coverage. At the very least, if traffic-calming initiatives continue, efforts should be made to modify the Austin fire station location criteria so that future stations will be closer to each other than what is presently done. Not only is this a great capital cost, a very expensive annual operational cost follows to put more firefighters and paramedics on the payroll to decrease the response times. Thus, the total cost of traffic calming goes far into the future than just the implementation costs for devices.

This is very true for the Austin Fire Department as their average annual response times for the last ten years has steadily increased. Even more critical, that average response time has been over four minutes for the last six years. Without a doubt, response times have increased with the tremendous growth rates. As a result, the Department has been unable to actively keep up with the growth curves. With projected growth rates to occur even more, it is doubtful that the Department can return to a sub-four minute response anytime soon.

Fire engine apparatus can cost up to $350,000 with ladder apparatus costing $600,000. Each has a front-line service life of about ten years if all goes well. That life is drastically reduced if the unit is very active. With

repeated damage to these vehicles from the constant flexing of traversing speed humps, the expected life will diminish. This in turn increases the average capital cost per year as replacement apparatus are needed sooner than the expected ten year service life. Again, another increased direct cost for minimal gain.

The greatest impact on response times involves those of sudden cardiac arrest (SCA). As previously shown, a 14 percent increase in response times due to traffic calming devices can lead to an additional 37 lives being lost each year. Even on a lesser time delay scale for three speed humps, 18 people of Austin could have been expected to die from SCA compared to the history established. These all are very alarming numbers.

The bottom line to this negative impact is that the citizens of Austin are already seeing a tremendous increase in response times due to growth. Additional delays due to traffic calming only intensifies that situation and causes the efficiency of emergency services to decline. One has to severely question the reasonableness and accountability of maintaining public policies that expend over $100 million per year in operational costs (capital costs excluded) for fire and EMS service, yet at the same time spend $1.5 million to diminish the quality of those services. Not to mention, the supreme measure, the number of lives at stake.

Finally, this policy analysis reveals there is a severe imbalance of trying to maintain or improve response times while allowing those response times to erode in the traffic calmed neighborhoods. One analysis strongly supports efforts to improve response time through technological improvements of traffic signals. From a risk/benefit, and a predicted lives saved standpoint, a good public policy would include provisions for improving response times. At the very minimum, policy makers should ensure that any projects that degrade response times should be offset by projects, such as Opticoms™, to at least maintain current response time levels.

Environmental/Air Quality Impacts

As local elected officials might satisfy some residents of neighborhoods, they are likely to encroach upon the sentiments of environmentalists. Several studies were presented that demonstrated that traffic calming does increase air pollution. The findings show that air pollution increases with lower speeds of around 20 mph compared to 30 or 40 mph. Greater auto emissions occur with more activities of acceleration and braking for speed bumps compared to an evenly sustained speed without any obstacles. In addition, there was validated evidence that showed that fuel consumption also increased dramatically with traffic calming devices.

Failure to recognize this pollution contributor could cause the local government unexpected financial impacts and/or political embarrassment. Since the increased pollution is established, other non-related grants, such as other transportation or air quality grants and funding could be in jeopardy. This is particularly true if they contain clauses that the City of Austin should not implement programs that would lead to further air pollution. The episodes in Portland, Maine and Griffin, Georgia serve as examples that can easily happen to any local government if they fail to evaluate how their policy on traffic calming could affect other air quality or financial policies already in place.

Austin officials in particular, face a very similar related vulnerability. Currently, Austin is precariously perched on the threshold of being classified as a "non-attainment area" by the U. S. Environmental Protection Agency (EPA). Due to this, they are mandated to take certain steps to improve air quality within the region. As traffic-calming programs contribute to air pollution, the EPA may construe such action as not being proactive measures to meet air quality standards. Again, this could pose as great political embarrassment and possible funding implications.

Civil Liabilities

There is no doubt that local governments are at great risk for potential civil litigation with their traffic calming programs. Virtually, all local governmental laws, ordinances and regulations are based upon some type of authorizations or national standards. In the case of traffic calming, neither of these conditions exists. None of the nationally accepted traffic codes, used by transportation professionals, recognize traffic calming devices as traffic controls. The inability to rely on a national standard eliminates a commonly used defense platform used for many other government litigation cases involving policies and programs.

Because speed bumps have been previously banned, one has to reason that traffic calming devices of similar design, such as speed humps, would have to be teetering on the edge of legality. Other devices such as diverters and half closures were declared illegal in California. In a related speed hump case, a Florida court remained silent of declaring speed humps illegal, thus leaving the legality of speed humps unanswered. Because of the tone of these rulings, one can easily surmise that traffic-calming devices are on the cusp of being illegal. For Texas, the law pertaining to this issue is silent, as no cases have been established yet as a precedent.

Discrimination vulnerability indeed lies within the provisions of the American with Disabilities Act (ADA). This federal law is a clear mandate to eliminate discrimination against persons with disabilities. Eliminating transportation barriers is one such objective to ensure that those with disabilities do not suffer more than those without disabilities. As speed humps have been designed to principally cause discomfort, a strong case can be made for ADA discrimination.

All local governments have an affirmative duty to make reasonable modifications to their policies, programs, practices, and procedures to avoid disability discrimination unless the modifications would fundamentally alter the nature of the service or program. Since roads are a facility covered by the ADA, any alterations must conform to ensuring they do not discriminate those with disabilities. Obviously, traffic-calming devices fall into this situation. However, no precedent cases have been established at this time.

Austin, like other cities is at great risk here, because they have not performed any biomedical or engineering studies validating that the devices are safe for those with disabilities. Such an analysis should be done prior to the installation of the devices. In addition, such validations would need to occur not only for disabled drivers, but also for the disabled passengers riding in para-transit vehicles.

There are other issues that are ripe for litigation. Property and personal damages due to noise, failure to warn, vibration damages, and accidental air bag deployments are claims that can be made. Certainly, damage claims for personal injury and vehicle damage would be a common type of litigation.

Of great concern to local governments is the potential danger to their own employees and equipment. There have been ample documented cases presented where firefighters have been seriously injured while riding in fire trucks as they traversed speed humps. Workmen compensation settlements for an injury due to one traffic-calming device can far outweigh the benefits of that device. Again, the intent of traffic calming is to reduce injuries and make a safer environment, not increase the danger to individuals. This includes public safety workers.

Undoubtedly, the largest vulnerability lies with the negligence of service delivery. Local governments who intentionally place traffic calming devices, knowing that such devices increase the risk or cause life threatening delays, will be opening themselves to negligent death lawsuits. Such lawsuits are extremely likely to originate by those who lose family members when the emergency services encounters traffic calming devices while enroute to that emergency. As most elected officials know, the court assessed damages for such a negligent death suit can be astounding.

When traffic calming began, there was little quantifiable information defining the delay potentials. However, as more and more studies are conducted by fire departments, and more risk analyses are presented similar to the ones included in this research, a much clearer validation can then be presented by those who are damaged. Policy makers should also be keenly aware that no quantitative analyses has been performed thus far demonstrating the number of lives that can be saved from traffic calming devices. Thus, there have been limited quantitative or qualitative data, if any, to justify the needs for traffic calming.

Local Government Postures

Once what was in vogue within many communities is now in the closet. Due to most of the issues revealed in this document, many elected local officials throughout the U.S. have found themselves in the midst of a conflict that has little middle ground. As a result, the only option to keep from having to take a solid position is to put the traffic calming issue on hold in the form of moratorium. That condition best describes the postures of most cities today in regards to their traffic calming programs. Many are hoping it will go away, while others resort to the political policy death of no continued funding.

Austin has a full moratorium on the installation of speed humps except for those in an approved traffic calming project area. In effect, traffic-calming

devices are still being implemented but only by a select few. Yet, when the neighborhood residents become fully notified, this issue has a tendency to falter or fail as occurred in Gwinett County, Georgia.

A Growing Public Sentiment

In an attempt to save the program, the City of Austin Public Works & Transportation Department changed its processes. Revised public type hearing formats were eliminated whereby full neighborhood debate could no longer be engaged and entered into for full public review and justification. As a end result, a neighborhood usually gets a traffic calming plan that does not fully meet its needs or is not wanted after it is implemented. Again, wasted resources for a partial benefit.

Two situations in Austin serve as examples of resident displeasure. Almost three years after the installation of speed humps on a major neighborhood street in Austin, some residents are expressing a desire to have the humps removed. This particular street, Floral Park Drive, is a primary response route for the local fire station.

As noted in an earlier chapter, fire and EMS personnel are responsible for taking the quickest routes to emergencies. Due to the numerous humps on this street, most fire apparatus operators avoid this thoroughfare for emergency responses and take a parallel side street to save time. This has been very

upsetting to the residents of the parallel street as they are awakened at night by the associated noise with a responding emergency vehicle.

Residents have requested fire department administrators to direct the fire apparatus operators to take different routes. However, due to the selection of routes being a "judgment call" by the operator, the administrators cannot give such direction without tremendous liability potential. Resultantly, the only options for the neighbors of the parallel street are to work to get the humps removed or simply "live with the decision".

The second example comes from the Hyde Park neighborhood in central Austin. In this neighborhood numerous traffic circles were installed. These circles were placed on both the north/south and east/west streets that the fire station is located on. This means that virtually every emergency incident that this station responds to, the firefighters will encounter traffic calming devices.

Not only are the firefighters unhappy, there are indications that the residents did not fully receive what they expected. The comments from Hyde Park residents contained in a neighborhood newsletter confirms the displeasure of the neighborhood:

> The City of Austin recently completed the installation of traffic calming devices in the Hyde Park neighborhood. I asked both former HPNA [Hyde Park Neighborhood Association] traffic calming committee members and non-committee Hyde Park residents about their experiences with traffic calming. A summary of these interviews follows:

The traffic circles are charming, but may be dangerous to bicyclists and pedestrians, because drivers are NOT yielding the right of way. Apparently, the worst circle (as far as failure to yield right of way goes) is the one on 42nd and Speedway. If you would like to experience this circle firsthand, approach from 42nd street rather than from Speedway. The through traffic from Speedway is not slowing and yielding, which was what the circle was supposed to achieve. It was felt that 4-way stops would have been better and cheaper than circles, although the circles themselves were thought to be "charming". It was also pointed out that emergency vehicles such as fire trucks could not negotiate the circles safely. They ended up running over parts of the circles...

One HPNA member was still mad at the City because they did NOT follow the HPNA recommendations. She said the committee was "powerless" once the City took over...

…There is another circle at 43rd and Avenue B that has been very dangerous because 43rd street is too wide to make a circle an effective device.

There were also problems with the speed "cushions" on Duval and Speedway. They are supposed to be lined up so that the fire truck can straddle them swiftly and safely as needed for emergencies. An HPNA member said they were positioned incorrectly on the road and now force the fire trucks into either the bike lanes or into the center of the street towards oncoming traffic. The Hyde Park fire station is still complaining about them. The HPNA talked to a fire department administrator who thought the traffic calming devices wouldn't be a problem. HPNA recommended that WPNA[Windsor Park Neighborhood Association] check with the ACTUAL DRIVERS of emergency vehicles (those who are actually going through and responding to calls in our neighborhood) before putting in permanent devices like circles and speed cushions to slow traffic.

Finally, I informally polled several Hyde Park neighbors about their reactions to the traffic calming devices and most of them did not like the circles.

> One problem mentioned was that pedestrians have no safe way to cross from corner to corner where there is a circle. Residents who live on corners where there are circles can no longer park on the street near their homes, because these areas are now designated "no parking" zones. Bicyclists are finding the circles to be dangerous because they have to compete for the narrowed street areas at the corners. Failure to yield right of way is a recurrent problem. One resident told me she once drove through one of the circles without even looking for other cars because she was distracted and in a hurry. She was glad that no other cars had been coming and was shook up to think what might have happened had there been another car.
>
> As to speed "cushions", several people thought they were probably a good idea, but they didn't like to travel on them on a daily basis.[1]

Although some may claim that traffic calming is supported by the neighborhood, there are strong indications that negative public sentiment is vastly growing and shifting against traffic calming programs. The trend in Austin, as illustrated by the above two situations, is that once the neighborhood residents become fully informed of the issue they generally disapprove of the initiatives. This is further supported by the earlier review of two other neighborhoods in Austin who have recently voted down proposed traffic calming plans for their neighborhoods.

All of these actions demonstrate for Austin, as is probable for other cities, that good, sound processes for validating that an overwhelming majority of the residents in a neighborhood truly desire traffic calming programs is lacking. This could also affirm that some residents truly perceive and exaggerate there is a problem when in actually one does not exist.

Been There, Done That!

During the 1990's, there was a terrific explosion of new innovative strategies for organizational development and business management. With so many new approaches, a lot of companies and businesses found themselves looking at different strategies only to find they had implemented a similar strategy before only it were now under another name. Somewhere during that time, a new catchphrase was coined "been there, done that"! That phrase describes very accurately the San Jose experience with traffic calming.

San Jose has a population of 783,000 and had a growth rate of nearly 25 percent in the early 1990's.[2] With the similarities that Austin currently is experiencing, as did San Jose about 20 years ago, the city officials of Austin may want to take heed from the "been there, done that" posture of San Jose. Their situation was best described as follows:

> In the 1970's, San Jose was the fastest-growing large city in the nation, as Silicon Valley blossomed in the former farm fields south of San Francisco. Major arteries and freeways did not keep up with growth, and traffic spilled into the old square-grid road system of San Jose's neighborhoods.
>
> City officials threw up signs announcing a host of new regulations, speed limits, turn prohibitions, truck bans, parking restrictions, [and] stop signs. Often, the new rules simply shunted traffic onto other residential streets.
>
> The city tried neighborhood watches and radar speed-display boards, but complaints kept mounting. The city adopted a

> comprehensive traffic-calming program, but in 1993 it was cancelled because of budget problems.
>
> In 1993, two major highways were finished, greatly helping to relieve congestion…The city saw a 70 percent drop in traffic complaints in the past six years, due in large to the new arterial connections and freeways.
>
> "Traffic calming, the city is discovering, is not just about installing speed humps or diverters in a roadway," says Wayne K. Tanda, director of the city's department of streets and traffic.
>
> "It's about strategy: Enhancing arterial and freeway networks; rethinking land use and urban design; and using intelligent transportation systems to better manage traffic signals, inform people of traffic conditions and travel alternatives, and monitor speeding vehicles". [Tanda]
>
> San Jose's strategy frowns on devices like road bumps and street closures, which Tanda says are aimed at the minority of lawbreakers. San Jose decided to stop penalizing 95 percent of its drivers for problems caused by the other five percent.[3]

While many policy-makers grapple over what to do with increases in traffic volume and speeding on residential streets because of congested arterials, San Jose abandoned their traffic calming initiatives in favor of addressing the root problem of insufficient arterial roadways.

In addition to the highway and arterial improvements, traffic-calming programs were limited to only proven techniques that would keep cars on the major highways and out of the adjoining neighborhoods. Again, the Rainey Street Neighborhood Project in Austin would have been better off under this San Jose strategy.

With San Jose's inability to keep up with rapid growth, increased traffic speed and volume (*been there*); and their ineffective traffic calming programs (*done that!*); Austin should give strong consideration to observe and apply similar actions of the San Jose experience.

The Final Analysis

As noted in the beginning, there is truly a competition between the two public goods of traffic calming and emergency service response times. From the onset, various literature reviews, analyses, and research functions have been performed in an attempt to establish qualitative and quantifiable data to assist policy makers and elected officials in formulating and establishing good, sound public policy for this issue.

Although, many of the issues and impacts discovered with this process may very well apply to other communities, clear findings and trends were established for Austin. The overall risks for traffic calming programs far outweigh the gains. All together, traffic calming is counter-productive to many other public policies.

Response times continue to increase while fire stations are being built at a record rate to keep those times in check. As shown by the sudden cardiac and pedestrian analyses, more lives are being lost than those that could be saved from traffic calming. Traffic calming adds to air pollution which conflicts

with the proactive steps taken by the City to prevent from becoming a “non-attainment” area for pollutants.

Like most other cities, Austin experiences a large amount of litigation, some frivolous and some legitimate. Although frivolous lawsuits can be easily filed, the current situation appears to be ripe for a legitimate Americans with Disability Act claim. Not having a national traffic-calming standard for Austin to rely upon compounds the risk. A detrimental court ruling could mean a tremendous loss to millions of tax dollars already or projected to be spent for roadways, by a magistrates' order to remove all traffic calming devices.

Growing general public apathy is a serious political atmosphere that elected officials certainly want to avoid. With the continuance of traffic calming programs being implemented without overwhelming support by the neighborhoods, an elected official can easily find himself/herself embroiled in a controversy where there appears to be minimal “middle ground”.

What makes the traffic calming programs harder to justify, is that there have been no legitimate studies that can truly quantify or project that the programs save lives. Further, with the admission of a leading transportation expert, we have been cautioned as to the validity of local speed and accident surveys that denote improvements.

And finally, there is clear substantiation and reasoning that improvements to the emergency response times would clearly benefit the citizens of Austin, both in lives and costs. Rather than spending considerable public funds for a few to improve the perception of a neighborhood problem, a better value could be gained for the whole by improving response times.

As a final policy analysis and assessment, traffic calming programs should be reviewed at the local level with the greatest amount of introspect to identify all of the impacts to the community, rather than focusing on a perceived problem often exaggerated by a few. Austin's posture should be immediately reviewed using many of the methods, data and information contained in this report. Without a doubt, more extensive research needs to be conducted on the local level as well within the professional circles of public service officials.

From the perspective of this research, Austin should give serious consideration to abandoning the current "pilot program" and adopt the San Jose strategy of redirecting its traffic calming efforts towards addressing the real problem of improving the arterials and major thoroughfares.

For the immediate, legitimate and warranted problems identified within neighborhoods, Austin policy makers should install only those devices that have a profound effect upon the situation, rather than applying "band-aid" remedies to make residents feel good about a perceived problem. Full and

partial street closures are two examples of responsive and effective devices. Most traffic control devices have very limited or marginal results. Installing such devices is only patronizing the residents, and jeopardizes the emergency services to the remainder of the community. Neither of which seems to be of good policy principles.

At the very least, the City of Austin policy should prescribe and include measures to ensure that emergency response times do not increase. By doing so, rather than there being a *competition* between two public goods, there would be a *balance* of two public goods. This would seem to be a prudent attribute for good, sound, public policy.

Chapter 9. Recommendations

With quantitative and qualitative analytical processes, good public policy can be formulated to ensure that the overall needs of the public are met. This approach allows for all elements of the local government to rectify their policy differences prior to public introduction and implementation. In addition, citizens, residents, and policy makers can be provided with the results of the analyses so that they too are in a better position to make informed, prudent and reasonable decisions. Comprehensive analyses ensures that sound public policy, rather than conflicting policy, is rendered for the citizens and eliminates embarrassment to the policy makers.

A set of recommendations has been formulated from the findings and discussion of this professional report for the City of Austin policy makers as well as the policy makers of other communities who have been or likely will be embroiled in this debate. These recommendations are not listed in any particular order of priority or preference.

Recommendation #1:

Avoid other policy conflicts prior to adopting a traffic calming policy/program by requiring each local government department to conduct a comprehensive policy analysis containing their respective impact statements.

An in-depth review by all the affected service departments of the proposed policy at the incipient stage is extremely critical. Too often, many cities have hastily approved and implemented traffic calming programs that resulted in a policy controversy they did not expect. Unfortunately, many of these conflicts originated within another service department of the same local government after implementation.

Such an analysis should weigh all of the positive and negative impacts of the policy as included in pre-established departmental impact statements. From these identified impacts, analytical methodologies should be developed to measure the impacts. Policy approvals should be obtained, at a minimum, from the departments of public works, law, risk management, environmental protection, and the emergency services

Recommendation #2:

Verify that a legitimate problem exists, not a perceived problem.

Often there is a *perceived* danger by residents within neighborhoods when in fact the traffic characteristics fall within in the norm. Due to this,

care should be taken to not prematurely respond to a small vocal group based solely upon their observations. Extensive field analyses should be performed to properly validate the problem. Aggressively responding to small groups without verification can cause a much greater opposition group to arise in the end.

A full-scale validation should include, but not be limited to the following:

- Traffic volume analysis: This should be measured for a wide area in order to determine what volume levels exist and to evaluate if the traffic will shift to another area.
- Traffic Speed Analysis: This should verify that there is a substantial amount of traffic exceeding the posted speed limits. New 85th percentile surveys should also be conducted during this process. Local governments should not rely on data surveys older than two years old to properly assess the current situation.
- Accident Studies: These should be conducted, but verified with caution as there are many factors that contribute to accidents that are not related to traffic calming. This is particularly true as accidents occur infrequently on neighborhood streets.

- Significant Sample Sizes: All data collections should have large sample sizes to ensure statistical soundness. Caution for data inferences should be exercised with small samples.
- Limited Confidence Inferences: Contributing factors to accidents, along with speed and volume data, varies from locale to locale; approach with limited confidence in drawing safety impact improvements; do not rely heavily on other jurisdictional studies.
- Before & After Studies: Be sure that the parameters of the "before" data is exactly the same for measuring the "after" data, i.e. traffic count locations, radar locations, time and day of week, etc. Failure to follow precise measurement parameters lead to skewed and questionable results.
- Establish Pedestrian Accident Frequencies: The infrequency of these accidents within neighborhoods is often not factored into the scope of the problem. Specifically, pedestrian accident rates occurring only upon residential streets should be evaluated. Pedestrian accident data involving major thoroughfares should be discarded and not included in an analysis. Failure to remove this data will lead to exaggerated reporting of the actual situation within neighborhoods.

Recommendation #3:

Require neighborhoods to submit a petition with at least 60 to 75 percent of the residents confirming their desire for traffic calming devices.

Many times the effort to obtain traffic calming relief is spearheaded by the leadership figures of local neighborhood associations. Soon after they start the process, opposition begins to develop to a level greater than anticipated. Some people quickly find themselves opposing the plan when they find out a device will be placed in front of their house rather than someone else's house. To ensure there are no "neighborhood backfires", local governments would be well advised to require these neighborhood associations to strongly commit "up front" to this effort. Signatures on a petition of an overwhelming number, such as 60 to 75 percent of the neighborhood, would help bind residents of their stance. Such an endorsement also serves to protect the policy maker from undue scrutiny.

Recommendation #4:

Evaluate the full impact to emergency response times to all citizens.

It is imperative that local governments fully know and predict what will happen to their emergency services response times. Several fire department studies have documented the delays due to specific traffic calming devices. Most cities have the data available to conduct a medical service

analysis for cardiac arrest identical or similar to the Bowman model. With these tools, policy researchers can now establish good baseline measurements for the delays and predict potential impacts that could be expected for the community.

In addition, more information is now becoming available regarding the extent of injuries to firefighters and paramedics. Strong consideration must be given to ensuring that their work environment, like the neighborhoods, is as safe as possible. The aspect of predicted fleet damage should also be included in the emergency response assessment.

Recommendation #5:

Evaluate the full environmental impact to the air quality of the area.

Traffic calming devices contribute to air pollution. Prior to implementing a traffic-calming program, each local government should obtain verification from their respective state agency that this program will not violate any of the air standards established by that agency or other state or federal agencies. In addition, the local government should evaluate all of their air quality grant funded programs to ensure they are not in violation of any previous agreements. By accepting the funding, most local governments also agree to adopt policies and programs that do not contribute to air pollution within their area. Failure to receive any of these confirmations could

jeopardize existing funding and cause undue fiscal hardship upon the citizens as well as political embarrassment.

Recommendation # 6:

If a traffic-calming program is established, ensure that a "working group" of residents from the neighborhood is assembled to work with City staff to develop a traffic plan.

Working by the side of City staff members, neighborhood residents can help identify problem areas as well as establish alternatives to rectifying the problem. The City staff should include public works officials as well as representatives from the emergency services. The neighborhood group should consist of more than just the leadership group of the neighborhood association. This group should be a cross section of the neighborhood with representatives from different streets, and with a limitation of those from the same street, as well as those who would not necessarily be proponents of traffic calming devices. These have to be *consensus* people, meaning not those in the majority who agree, but rather, those who *accept* the plan even though they may not fully agree with the plan.

Recommendation #7:

Conduct thorough legal risk assessments, not just authorizations.

Too often questions of legality are limited to verifying that the local government has the authority to implement traffic calming devices. The local governments rarely properly evaluate other potential jurisprudence issues. As more and more risk studies are developed, as the one contained in this report for Austin, Texas, there is a clearer confirmation that response delays do occur. Knowingly and voluntarily continuing to contribute to a deteriorating situation can only lead to increased liability risks for the emergency services.

Local governments who elect to install traffic calming devices should take extra measures to ensure safe legal ground regarding the Americans with Disabilities Act. These governments should conduct bio-medical and engineering studies to validate that traffic calming devices are safe and pose no hazard to those with disabilities.

Recommendation #8:

Traffic calming devices should not be used for treating symptoms of traffic problems. Take actions to eliminate the root cause of the traffic problem.

A good analysis will reveal the primary cause of the traffic concern. Once identified, permanent remedies should be incorporated to fully remove

the problem. If a problem truly exists, then drastic measures such as a street closing may be the cure in order. Speed humps and diverters will not be the best answer to a continuing nagging problem. Failure to effectively eliminate the problem will result in disappointment from most residents.

If drastic measures are not taken, then traffic calming measures should be limited to severely warranted locations, such as neighborhoods close to freeways. Neighborhoods of high crime are other good candidates for traffic calming, as the benefit of reducing the crime and restoring the neighborhood has a greater justified benefit than those of low crime areas.

Policy makers should make sure that a traffic solution on one street doesn't move the problem to an adjacent street. Perhaps a better-cost benefit would be utilizing traffic-calming funding to expedite the construction of larger arterials. This directly addresses the root problem, as commuters would stay off the neighborhood streets in preference for adequate arterials.

Recommendation #9:

Emergency service departments should have the authority to disallow traffic calming plans that will adversely impact their response service delivery.

Emergency service officials should not be allowed to reject traffic calming plans just because "they don't like traffic calming." Reasonable

justifications should be given. However, local governments should refrain from restricting emergency service officials from having the ability to disallow plans when warranted.

Presently, the City of Austin emergency service departments are not allowed to "veto" any traffic-calming plan. If a proposed traffic calming plan causes a severe negative impact to service delivery, these departments currently must abide by the desires of a few citizens, which subsequently impacts the whole community. This situation erases all accountability to the remainder of the public. Good policy development should have checks and balances to ensure the overall benefit to the society.

In addition, this condition sets up a natural conflict within the local government, whereby the public works department can dictate their engineering designs for the placement of devices for traffic effectiveness, yet the fire or EMS department is not allowed to modify a plan that jeopardizes their service delivery.

Recommendation #10:

When a traffic calming policy is adopted, make sure that it is balanced.

As resources are allocated for traffic calming projects that increase response times, equal resources should also be implemented for improving

response times. Local governments should ensure that visible actions are taken to offset the downsides of traffic calming. Funding the remote electronic traffic control systems, such as the Opticom™ systems, is a good alternative to counter slower response times. Revising station location policies, by making them closer to each other, also compensates for the delays caused by the devices.

Recommendation #11:

Prohibit the installation of traffic calming devices on streets of fire station locations or primary response routes.

The greatest controversy erupts when devices are placed upon streets of fire station locations and the respective primary emergency response routes. The concern here is that one neighborhood's desire is negatively impacting someone who lives in an adjacent neighborhood now with a longer response time for emergency service. Restricting traffic calming devices on primary response routes does not impact the service to other neighborhoods and thus, greatly diminishes this debate, which in turn reduces opposition. Therefore, traffic calming devices should be allowed on streets whereby one does not have to travel upon to get to another neighborhood.

Although there are no national standards for traffic calming devices, there is a published guideline by the Institute of Traffic Engineers that

addresses the installation of these devices. That guideline specifically recommends that traffic calming devices not be but upon the roadways or streets of fire station locations or primary response routes. City of Austin officials should move to adopt that position.

Recommendation # 12:

Require that traffic-calming programs for neighborhoods be voted upon and approved by a super majority of the residents.

To ensure a high level of public support, and a diminished level of dissatisfaction with the local government, all proposed traffic calming programs of neighborhoods should be approved with an overwhelming majority of residents. If the problem is legitimate and validated, then a large majority of residents will be willing to endorse the plan. If the problem is not as severe as perceived, then the chance of passage is much less. Based on this, local governments should require that approval for all neighborhood plans should be based on a two-thirds or three-fourths approval.

In many instances, less than 25 percent of the ballots are returned casting a vote. One can easily see that only a few people casting an affirmative or negative vote can well control the balloting. Establishing super majority approval levels helps reduce any controversy that could develop later whenever a simple majority threshold is tabulated. Such a large approval

margin helps reveal the true sentiments of the residents, again allowing for better policy acceptance.

Recommendation #13:

Require objective evidence of material traffic problems before using traffic calming devices.

Most communities use the 85th speed percentile mark to measure acceptable speed limits. Local governments should tie their installation requirements to pre-established thresholds for speed and volume. For example, a city might not install any devices unless the 85th percentile was at least 5 mph over the posted speed limit. Another example may be 2,000 vehicles per day would make a street eligible for some type of diversion device. The establishment of these types of standards would allow traffic calming devices only where they would be fully warranted.

Recommendation #14:

Do not allow neighborhood project areas to have an established entitlement budget for a project.

Local governments that choose to have traffic calming programs should not allow citizens to pick and choose devices with accompanied budget limitations. Rather, they should obtain the device(s) that will yield the best

result. When finance entitlements are introduced or revealed, citizen groups of neighborhoods have a tendency to try and solve the money problem "of making sure we get all that we are entitled to" by attempting to get the most devices rather than properly selecting and solving the traffic problem.

Recommendation #15:

Ensure that true public hearings are held for proposed traffic calming plans within neighborhoods to ensure openness for public debate and decision-making.

A formal public hearing format should be conducted within the neighborhood prior to residents voting upon a traffic-calming plan. This type of an established forum should be presented so that residents can hear first hand the advantages and disadvantages of traffic calming. Local government staff and policy makers should be on hand to help answer questions. Although one can expect tremendous debate at such a hearing, the resident will be exposed to more information to make an informed decision with, whether that information be pro or con.

Local governments should not adopt the "open house" forum used by the City of Austin. This forum allows only those with specific questions to come and visit with City staff or the members of the neighborhood committee who formulated the plan. They are not offered the opportunity to hear from

those who may support/oppose the plan, nor is there an opportunity for those directly supporting/opposing the plan to address the remainder of undecided residents. A true public hearing forum, allowing all sides to be heard, is a basic principle of a free, open, participative, and democratic government.

Recommendation #16:

Evaluate and manage traffic calming programs with meaningful performance measurements.

Quality public policy programs of today must be constantly measured to determine their effectiveness and benefit. Traffic calming programs should be no exception. Traffic calming may be effective for the first six months or year after installation, but how does it compare two or three years later? This monitoring should be on going.

Of greater importance, is the establishment of success thresholds. What makes a successful traffic-calming program? Local governments should establish definitive methodologies that establish meaningful results. For example, the City of Austin desperately needs to modify their current measurement tool of reducing speed in project neighborhoods by 20 percent. At a posted speed of 30 mph, that is 6 mph. One would be hard pressed to consider that a meaningful result since the legal speed is set at 30 mph. However, this performance measurement could be meaningful when speeds

are 40 mph on a neighborhood street instead of the posted 30 mph. Care should be taken to only report the reductions where they are above the speed limit.

Recommendation #17:

Conduct follow-up surveys one year after the installation of devices to determine the satisfaction level of the residents.

One of the central goals of traffic calming is to improve the quality of life and livability of the neighborhoods. However, very few cities if any attempt to measure this value. Failure to collect such data, could lead to continuance of a program that is viewed as another local government program that does not meet the needs of the people. Conversely, if the results of these surveys are positive, then strong reinforcement is established for the program to continue. Sustained public approval is a cornerstone for good public policy. Therefore, it is extremely important to measure resident satisfaction long after "newness" of the project wears off.

Recommendation #18:

Policy makers, whether appointed or elected, should base their public policy/program decisions upon fact not emotions.

Too many times, policy makers allow emotions from stakeholders to greatly influence their actions rather than relying on analytical facts and findings. Many local government staff members, as well as concerned citizens, whether pro or con, often commit an immense amount of time and effort to establish facts of a situation so that reasonable decisions can be deduced from these work products. The analyses conducted should be heavily incorporated into governance decisions.

If the data reveals that traffic calming is a better benefit than longer emergency service response times, then traffic calming should be adopted. Conversely, if more lives can be saved with unchanged or reduced emergency response times, then traffic calming initiatives should not be implemented.

In the case of Austin, Texas, there is clear evidence much more overall harm to the citizens would result from traffic calming than from the very limited benefits, if any, that it might produce. With emotion to the side, one can reasonably and prudently justify a policy decision to suspend the current traffic-calming program.

This recommendation can also be applied for other cities only after they have conducted a comprehensive policy analysis similar to the one contained in this report.

Appendix A

City of Boulder, Colorado

Neighborhood Traffic Mitigation Program

Tool Kit

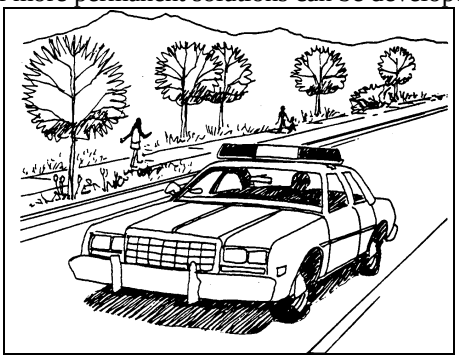
(Adapted)

TRADITIONAL ENFORCEMENT

Definition
Sporadic monitoring of speeding and other violations by police.
Police officers can come out to a neighborhood for short periods of time to issue tickets.
Additionally, police officers can "take a neighborhood under their wing", and monitor traffic on a regular basis.

Temporary
Enforcement is always temporary.

Street Types
Enforcement can be performed on any street.
Logistics make some locations problematic or ineffective.
Mitigation can be initiated.



Best Used If
Excessive speed on a street and there is an urgent need for quick action.
Neighborhood is undertaking a Speed Watch program, is using the radar trailer or has newly installed mitigation measures.
Neighborhood is in design phase and needs interim assistance.

Benefits
Temporary good public relations tool.
Serves to inform public that speeding is an undesirable behavior for which there are consequences.

Don't Use If
Locations where it's physically impossible to pull vehicles over without creating a hazard.

Negatives
Effect is not permanent. Enforcement is an expensive tool (currently total cost recovery for enforcement does not exist).

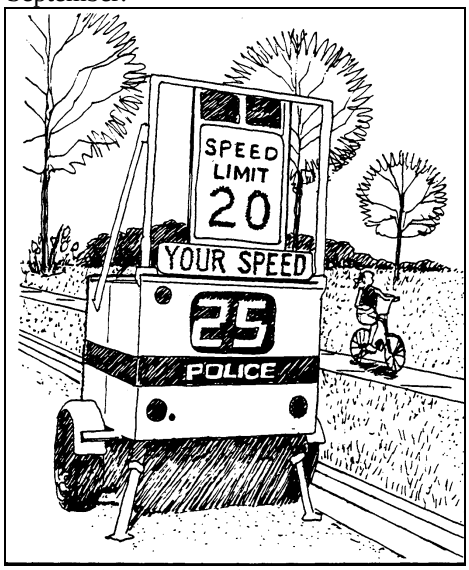
Considerations
Enforcement should be regarded as supplemental to other measures, not the sole solution.
Enforcement should not be considered a permanent form of mitigation.
Used as a "quick fix" until more permanent solutions can be developed and implemented.

RADAR SPEED MONITORING TRAILER

Definition
Mobile radar display advises motorists of their speed.

Temporary
In place for several hours or days in given location.

Street Types
Acceptable for use of high or low volume two lane streets.



Best Used If
Excessive speed occurring.

Benefits
An educational tool.
Useful especially in school and construction zones where spot speed reduction is important.
Very good public relations tool.

Don't Use If
Very remote location. Extremely heavy traffic volume.

Negatives
Requires periodic enforcement.
Effective for limited duration.
Units moved frequently which requires manpower.

Considerations
Boulder has purchased a radar speed monitoring trailer.
Delivery is scheduled for mid-September.

EDUCATION

Definition:
Activities that change people's minds. Reading informative text, meetings & workshops with city staff, interaction with neighbors, signing campaign, enforcement activities, neighborhood speed watch, school programs, parent outreach, etc.

Brochures
Letters to the Editor
Newspaper ads & notices
Public Service Announcements
Bus Cards
Neighborhood Workshops/Discussions

Temporary
Education efforts can be flexible in duration.

Streets Types
Education can be applied in almost any situation.

Don't Use If
Education has already been seriously attempted with no significant results.

Negatives
May be difficult to measure effectiveness.
Can be expensive.
May take time to be effective.
May wear off over time.

Best Used For
A traffic problem that involves human behavior.

Benefits
Can be very effective, is relatively inexpensive, involves and empowers citizens, works well with other mitigation tools.

Considerations
Neighborhoods should share experiences with education methods.

NEIGHBORHOOD SPEED CONTROL PROGRAM

Definition
A neighborhood education process in which neighbors become more aware of the specifics of their speeding problems. Neighborhood representatives are loaned radar guns by the Police Department, to monitor speed and identify chronic speeders. The City will then send letters to offending drivers calling their attention to their behavior and requesting them to change it.

Temporary
Should be in place for two months or longer in order to gain maximum educational benefit.

Streets
More likely to be effective on local streets.

Best Used If
Neighborhood willingness to participate.
Most traffic is local traffic.
Neighborhood Speed Watch has not yet been attempted.

Benefits
Can effectively address traffic problems that are caused by neighbors.
Can heighten general awareness of neighborhood traffic concerns.
Can serve to unify neighborhoods.
Can be a good first step toward building consensus on physical mitigation measures.

Don't Use If
No willingness on the part of the neighborhood to participate.

Negatives
Not likely to be as effective on non-local traffic.
May make neighbors feel "spied on" by one another.

Considerations
Participation in Neighborhood Speed Watch will be limited to two neighborhoods at a time.
Training in use of the radar gun will be provided by the Police Department.
Neighborhoods representatives will be asked to sign an agreement to take proper care of the equipment and to use it only as specified by program guidelines.

SPEED LIMIT SIGNS

Definition
Signs that inform drivers of the maximum safe driving speed under normal conditions.

Temporary
Can be tried for six months to test effectiveness.

Street Type
Any streets, but may be unnecessary on many low volume residential streets.

Best Used If
Clear need to inform drivers of the speed limit.

Benefits
Inexpensive.

Don't Use If
Neighborhood doesn't want the "visual pollution".

Negatives
Unattractive in neighborhoods. Does not effect vehicle speed.

Consideration
Posting of artificially low speed limits will require constant enforcement and breed disrespect for traffic control devices.

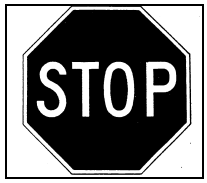
STOP SIGNS

Definition
Red hexagonal signs displaying the word "STOP". Stop signs are used to designate the right of way at intersections.

Temporary
Stop signs can be tried on a temporary basis. Before the signs are installed, the objectives for installation should be clearly defined. After 6 months, if the goals have been met and the neighborhood still wants the sign(s), the installation can be made permanent. If the objectives have not been adequately met, the signs will be removed.

Street Types
Stop signs are primarily used at low volume street intersections with high volume streets, or on all four approaches of an intersection with relatively equal volumes and/or a significant, correctable accident history.

Maintenance
Low maintenance.



Best Used If
An unusually high number of accidents involving right of way.
Significant cross traffic at the intersection.

Benefits
Very inexpensive.
If there is a lot of cut though traffic, stop signs might work as a diversion.
Insignificant traffic volumes.

Don't Use If
Steep grades. Insignificant traffic volumes or insignificant history of correctable accidents.
Need and intention is for speed control.

Negatives
If there is not a significant amount of cross traffic at the intersection, compliance will not be compelled.
Cyclists and pedestrians relying on stop signs can be hurt, and accidents may increase.
Excessive use of stop signs renders them meaningless.
Stop signs don't decrease average speed. Increase noise and pollution.

Considerations
Most stop signs that are warranted for right-of-way control are already installed.
Neighborhoods can consider an appropriate use *of* stop signs as a possible mitigation tool in limited circumstances, but widespread installation *of* stop signs for speed control is ineffective and will not be supported.

PSYCHO-PERCEPTION

Definition
Any material or message placed around or in a street that heightens driver response or induces the desired behavior. Example is transverse markings (striping) with inconsistent spacing that gives the illusion of increased speed. Novelty signs and use of landscaping are other examples.

Street Type:
Can be tried on any type of street, although not all methods are appropriate to all streets.

Maintenance
Depends on technique.
Low for signs, higher for pavement markings and landscaping.

Best Used If
Neighborhood desire to try them.

Benefits
Gives the neighborhood an opportunity to be creative with their response to traffic concerns. Can be aesthetically pleasing to the neighborhood.

Don't Use If
Specific technique has been proven dangerous or ineffective.

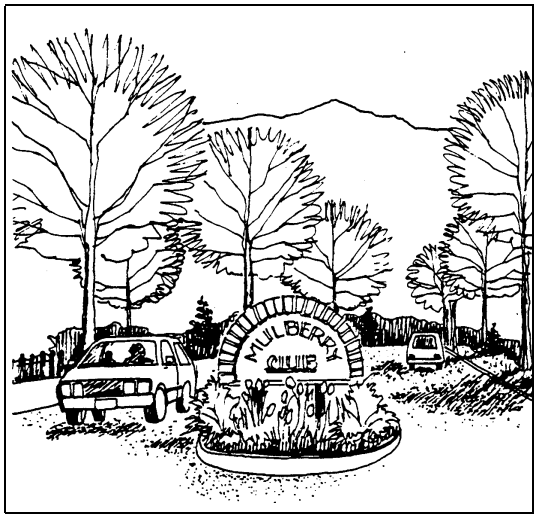
Negatives
Most psycho-perception tools are not likely to be effective in the long run, due to their dependence on novelty.

Considerations
It is important that psycho-perception tools make driving fast on the street seem less safe, but that they don't actually increase danger.

NEIGHBORHOOD IDENTIFICATION ISLAND, SIGN OR OBELISK

Definition
An island in the center of a street that includes a monument identifying a neighborhood and marks the entrance to the neighborhood or a sign, banner or other structure that helps to communicate a sense of neighborhood identity.

Temporary
Can be temporary but removal unlikely.



Street Type
Collector street or local street neighborhood entrance off of collectors or arterials.

Works Best If
Neighborhood boundary definition is desired.

Maintenance
Depends on type of installation.

Benefits
Alerts drivers that a change in their driving behavior is being requested.
Helps give neighborhood more of a sense of identity.
Allows neighborhoods creativity and participation in design.

Considerations:
A Neighborhood identification island is an entryway treatment that can be used most effectively in conjunction with other tools, if speed reduction is desired.

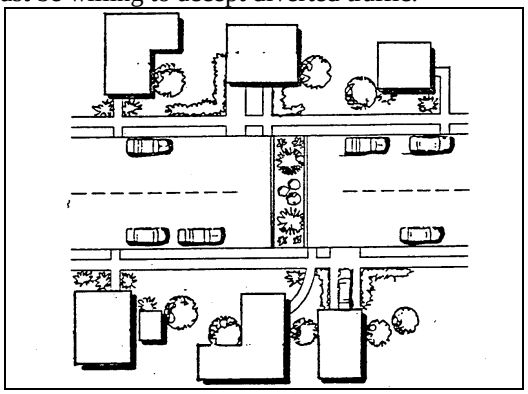
STREET CLOSURE

Definition
Street closed to motor vehicles using planters, bollards, or barriers, etc. Pedestrian and bike access maintained.

Best Used If
Other mitigation devices, i.e., speed humps, diverters would be inadequate.

Benefits
Eliminates cut-through traffic.

Don't Use If
Residents of immediate and adjacent neighborhood will not support restricted access.
Cannot substantially, adversely impact emergency vehicle response time.
Boulder's 1989 Transportation Master Plan opposes street closure unless extraordinary circumstances exist.
Conversion of street from public to private requires legal action; may need to grant easements for utilities, municipal services, etc.



Negatives
May be perceived as inconvenience by some neighbors and an unwarranted restriction by general public.

Temporary
Can be installed temporarily.

Street Types
Low volume streets where alternative access to homes can be provided (i.e., by alleys) and a clearly more desirable and feasible route exists.

Maintenance
Landscaping.

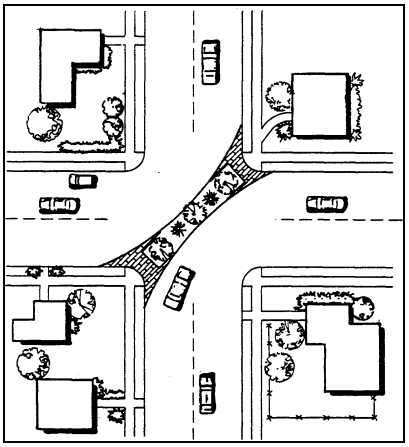
Considerations
A large percentage of immediate neighborhood must want it.
Adjacent neighborhoods must be willing to accept diverted traffic.

DIAGONAL DIVERTERS

Definition
A barrier placed diagonally across a four legged intersection, interrupting traffic flow across the intersection. These barriers can be used to create a maze-like effect in a neighborhood.

Temporary
Can be tried on a temporary basis for 6-12 months.

Street Types
Neighborhood (local) streets.



Best Used When
Cut-through traffic is the primary problem for the neighborhood.

Benefits
Practically eliminates cut-through traffic.
Maintains continuous routing opportunities (unless a cul-de-sac or street closure).

Don't Use If
No reasonable alternate routes available for both emergency response vehicles and through traffic.
Cut-through traffic is not a significant issue.

Negatives
People can turn at higher speeds because there is no opposing traffic.
May reduce emergency routing opportunities.
May increase trip length for some residents.

Considerations
These barriers should be traversable for bikes and pedestrians.
Likely to increase traffic on adjacent streets, so should be considered only where appropriate alternatives are available.

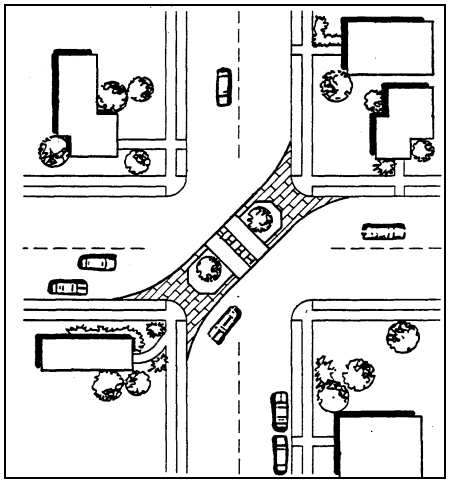
TRAVERSABLE BARRIERS

Definition
A barrier placed across any portion of a street that is traversable for bikes, pedestrians, roller bladers, and emergency vehicles, but not for other motor vehicles.

Temporary
Can be tried on a temporary basis for 6-12 months.

Street types
Low volume streets with cut-through traffic.

Maintenance
Landscaping.



Best Used If
Cut-through traffic on a street that should be low volume.

Benefits
Reduces cut-through traffic..

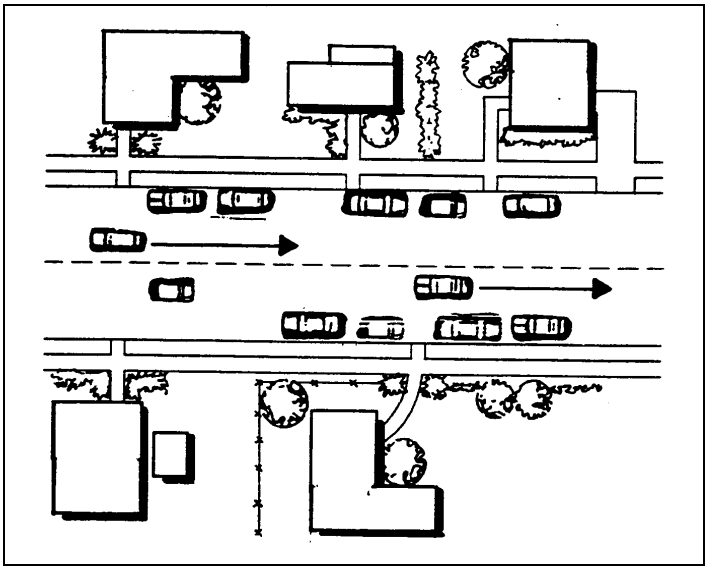
Don't Use lf
No appropriate facility for diverted traffic.

Negatives
If not enforced regularly, parked cars may block access.
Depending on design, may be subject to violation by unauthorized vehicles.
Altered traffic patterns may increase trip length.

Considerations
Diversion onto neighboring streets needs to be analyzed.
Cut-through traffic needs to be evaluated.

ONE-WAY STREETS

Definition
Self-explanatory.



Temporary
Can implement on temporary basis (6 mo.) to ascertain if benefits outweigh disadvantages.

Best Used If
There's a need for parking on both sides of a narrow street. Pedestrian safety is a significant concern.

Benefits
Tend to be safer due to lack of friction from opposing traffic flow.
Can facilitate traffic flow through an area.
Can open up narrow street for more resident parking.
Increases pedestrian safety. Maintain reasonable access for emergency vehicles.
Maze effect of one-way streets can discourage through traffic.

Don't Use If
Generally need to provide one way streets in pairs, which is frequently not possible in a neighborhood setting.

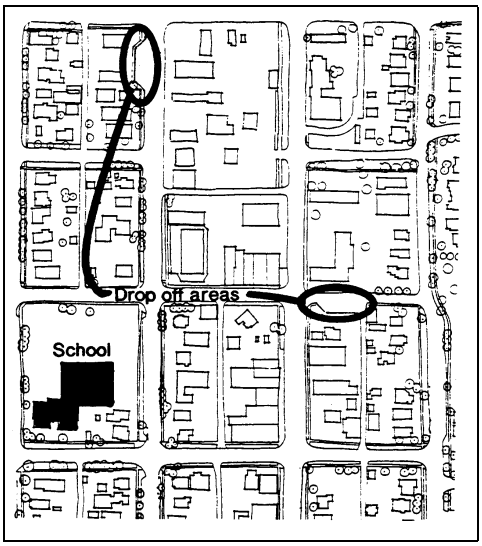
Negatives
Can lead to increased vehicle speeds.
May result in longer trip length.
May increase emergency response time.

DROP-OFF ZONE FOR SCHOOLS

Definition
A zone placed at least two blocks from a school for parents to drop their kids off, in order to reduce traffic congestion around the school. Each school should have several zones to disperse traffic.

Temporary
May be tried on a temporary basis.

Street Types
Streets surrounding schools.



Best Used If
Problems with traffic congestion around schools.
Feasible, safe drop off locations.

Benefits
Would decrease congestion immediately adjacent to the school, increasing safety.
Would encourage walking.

Don't Use If
No drop off areas available that don't pose significant hazards for children or drivers.

Negatives
If not well considered, could simply displace congestion/hazards to another location.

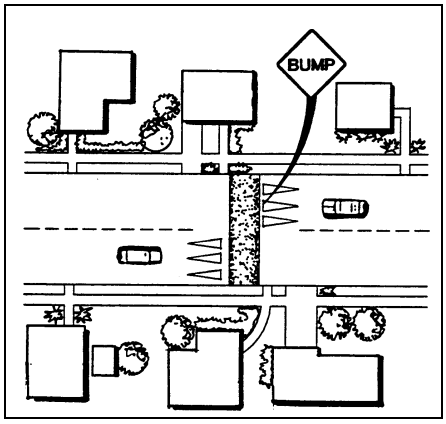
Considerations
Adequate communication and support for parents and kids to make the change would be essential to the success of this concept.

SPEED HUMPS

Definition
Speed humps are wave-shaped paved humps in the street. The height of the speed hump . determines how fast it can be navigated without causing discomfort to the driver or damage to the vehicle. Discomfort increases as speed over the limit increases.

Temporary
Speed humps are impractical to install on a temporary basis.

Street Types
Speed humps are generally considered local street tools.
Applications on collector streets need to be very carefully evaluated.



Maintenance
Well constructed humps should maintain their shape for several years, however the striping associated with them must be maintained biennially.

Best Used If
The street has a documented speeding problem.
"Soft" approaches have proven ineffective.

Benefits
Slows traffic.
Few drivers travel over speed humps with excessive speed more than once.
"Self enforcing."
Relatively inexpensive.

Don't Use If
The street is on a major emergency vehicle route and no reasonable alternative is available.
Steep grades.

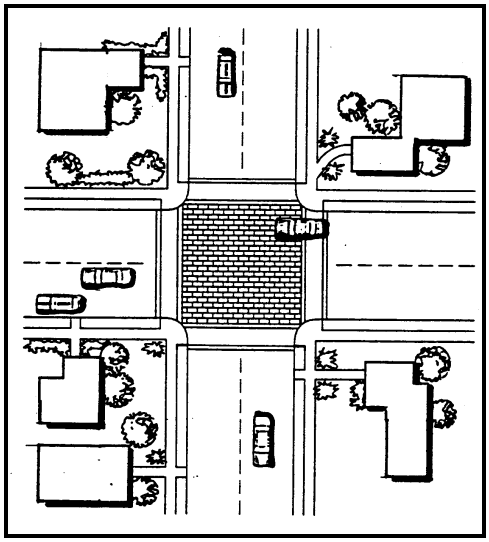
Negatives
Can increase voice and air pollution by the hump (however, less negative impact than a stop sign).

RAISED INTERSECTIONS

Definition
A raised plateau of roadway where roads intersect. The plateau is generally about 4' higher than the surrounding streets.

Temporary
No temporary installations of raised intersections.

Street Types
Can be used on high or low volume streets.



Best For
High pedestrian volumes with significant safety concerns.
Significant, excessive vehicle speed.

Benefits
Effective speed reduction, better for emergency vehicles than speed humps..
Aesthetically pleasing if well designed.
Excellent pedestrian safety treatment.

Don't Use If
Critical emergency vehicle route.

Negatives
Expensive.
Not as good as a flat street for emergency vehicles.

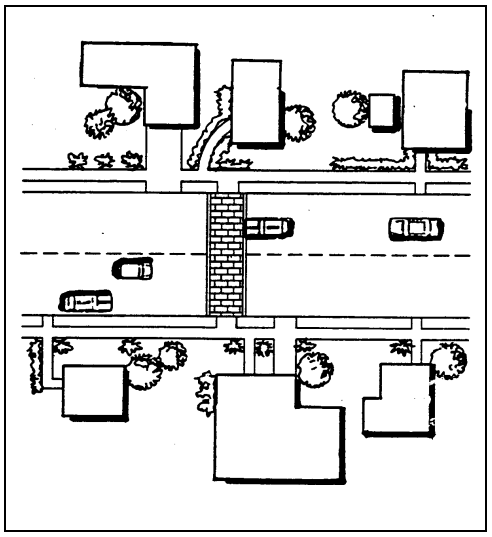
Considerations
Transit concerns will need to be identified and worked through.

RAISED CROSSWALKS

Definition
A speed hump designed as a pedestrian crossing.

Temporary
No.

Street Type
Can be used on medium and low volume streets.



Don't Use If
Important emergency vehicle route.

Negatives
Negative impact on emergency vehicles if on primary emergency vehicle routes.

Best Used If
High volume of pedestrians.
Vehicle speed is a concern.

Benefits
Effective speed control at the installation.
Excellent pedestrian amenity.

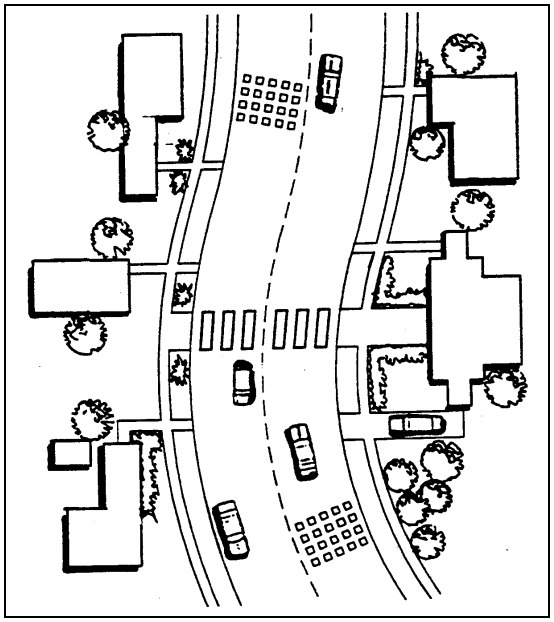
Considerations
City will need to negotiate with RTD for acceptance of speed humps, raised crossings and intersections on bus routes. Not immediately implementable on these streets, but expect to be used in the future.

RUMBLE STRIPS

Definition
Patterned sections of rough pavement, which alert drivers to a dangerous condition of traffic control measure.

Temporary
No feasible temporary installation.

Street Types
Use of high or low volume streets.



Maintenance
Snow removal equipment tends to damage them.

Best Used At
Concealed stop sign or pedestrian crossing.

Benefits
Relatively inexpensive to install.

Don't Use If
Rarely will rumble strips be the most appropriate tools.

Negatives
High maintenance. Adversely impact bicyclists. Generally ineffective in reducing vehicle speeds. Rumble strips are noisy by design, and not recommended for neighborhood settings.

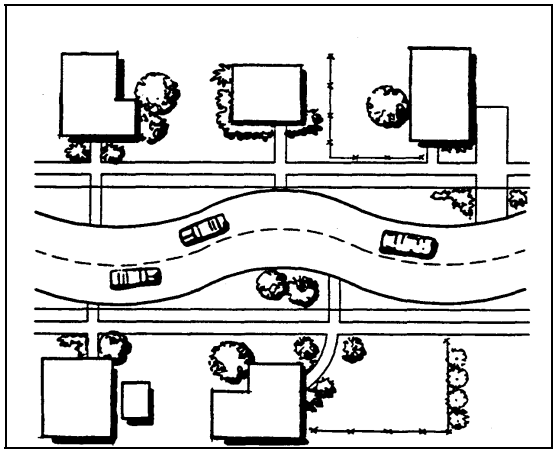
DEVIATIONS

Definition:
Deviations redraw the path of travel so that the street is not straight (by the installation of offset curb extensions).

Temporary
May be tried on a temporary basis for 6-12 months.

Street Types
Any street with adequate right-of-way.

Maintenance
Landscape maintenance will constitute an ongoing expense.



Best Used For
Excessive speed on straight street.
Adequate right-of-way exists to alter curbline.

Benefits
Accepted by public as speed control devices.
Aesthetically pleasing.
Reduce speed without significantly impacting emergency response.

Don't Use If
Roadway is already narrow.

Negatives
Expensive.

Considerations
Deviations are not very effective unless significant offsets are created.
Neighbors may be responsible for landscape maintenance.

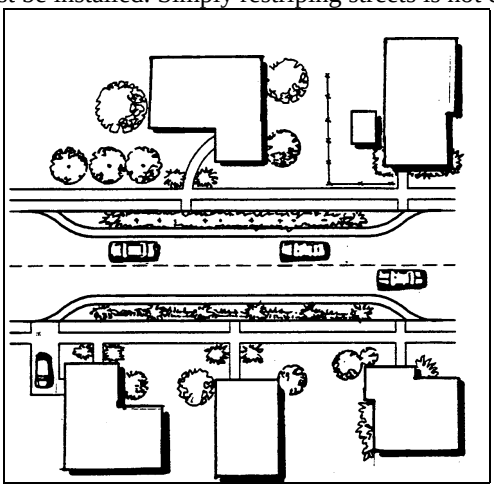
LANE NARROWING

Definition
A lane physically narrowed to nine to eleven feet, expanding sidewalks and landscaped areas, adding medians, 'sideians', on street parking, etc.

Temporary
Can be tried on a temporary basis for 6-12 months.

Street Types
Appropriate for most street type

Maintenance
Landscape maintenance. (May need to involve neighborhood participation.)



Best Used If
Excessive speed due primarily to street width.

Benefits
Good for pedestrians due to shorter crossing distance.
Slows traffic without seriously affecting emergency vehicle response time.

Don't Use If.
No possibility of eliminating on street parking.
Inadequate right-of-way to do a safe, effective treatment.

Negatives
Can be dangerous for bikes.

Considerations
For lane narrowing to slow cars, it helps to include visual distractions, such as bushes, trees, transverse markings, and other psycho perception techniques.
May increase accident potential because opposing vehicle streams are brought closer together.
Physical restrictions must be installed. Simply restriping streets is not effective.

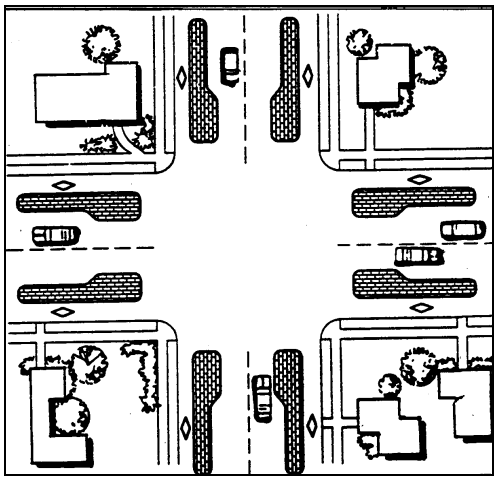
CHOKERS: (TRAVEL BOTH WAYS)

Definition
Large lamb chop-shaped islands installed at the intersection to reduce speed. Two lanes of travel are maintained, but lanes are narrow. Bike lanes are maintained outside of the choker, on both sides.

Temporary
Chokers can be tried on a temporary basis for 6-12 months.

Street Types
Chokers will work best on low to medium volume neighborhood streets.

Maintenance
Care needs to be taken by maintenance to keep snow out of the bike and ped lanes.



Best For
Neighborhood that desire significant slowing at an intersection.
Pedestrian safety concern at the intersection.
Bike safety concern at the intersection.

Don't Use If
The street is a snow route.

Benefits
Straight access for bikes.
Crossing distance is reduced for pedestrians.
Traffic is slowed at the intersection, possibly reducing accidents.

Negatives
Snow removal is complicated, especially in the bike lanes.

Considerations:
The bike lanes and choker should be well marked. The bike lanes should be wide enough for bike trailers.

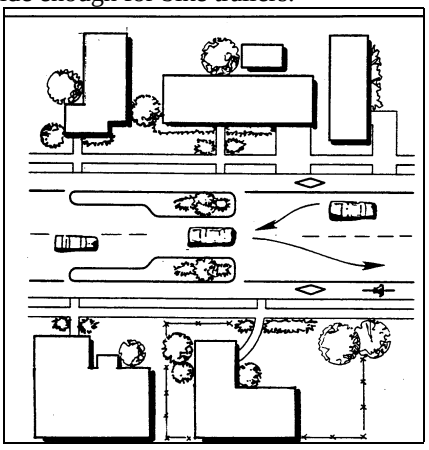
LANE ELIMINATING CHOKER
(mid-block)

Definition
Large lamb chop shaped islands placed mid-block on either side of a street to reduce street width to one lane. Cars may travel in either direction, but must queue and takes turns. Bike lanes are maintained on the outer sides of the choker.

Temporary
Chokers can be tried on a temporary basis for 6-12 months.

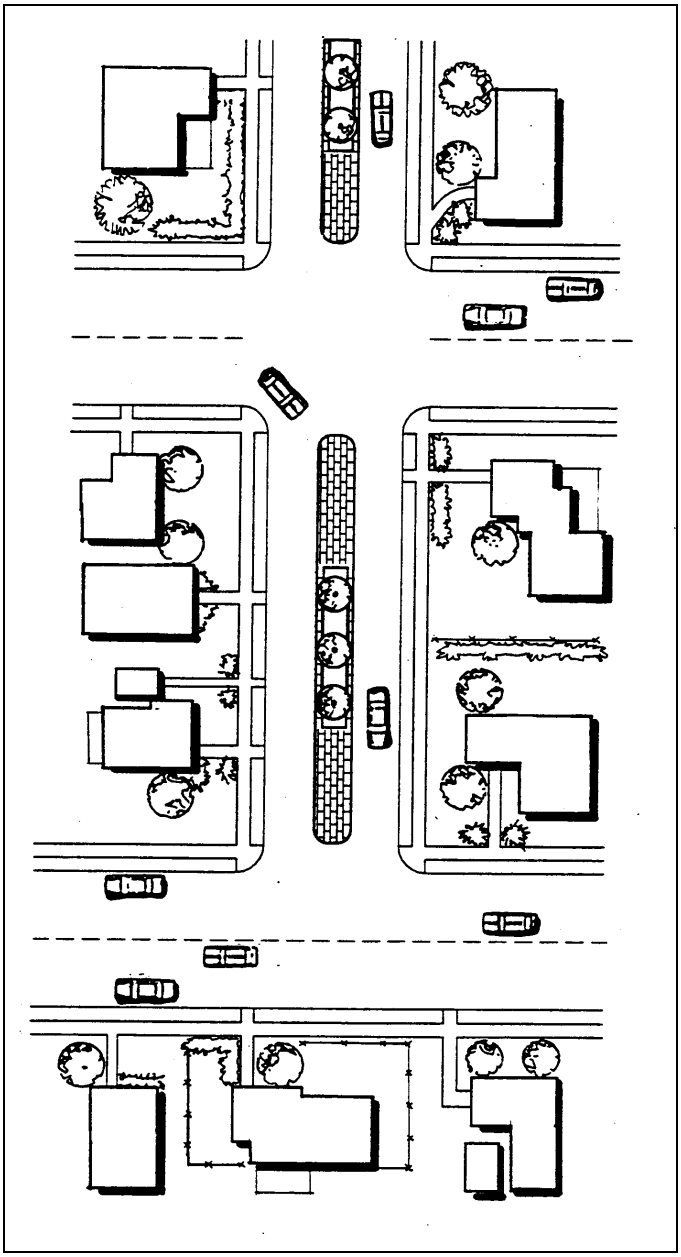
Street Types
Chokers will work best on low volume neighborhood streets.

Maintenance
Care needs to be taken by maintenance workers to keep snow out of the bike/ped areas.



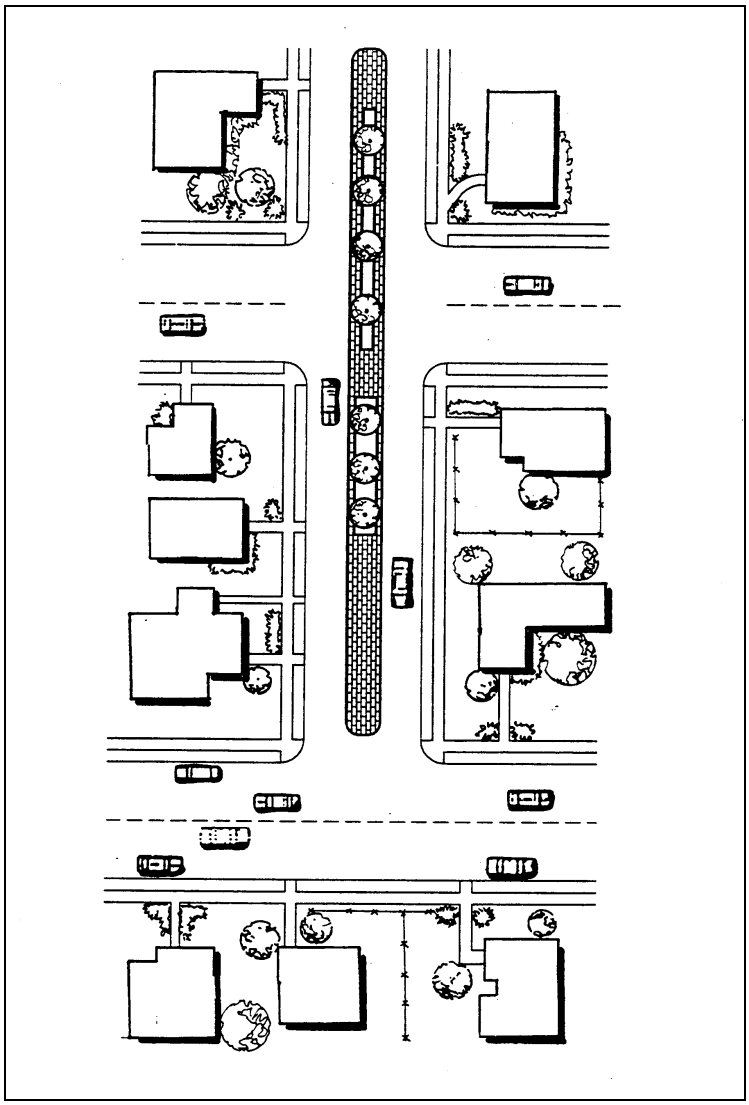
Best Used On
Low volume neighborhood streets with speed and/or cut-through traffic problems.

Benefits
Straight access for bikes.
Crossing distance is reduced for pedestrians.
Likely to reduce cut-through traffic and speed.

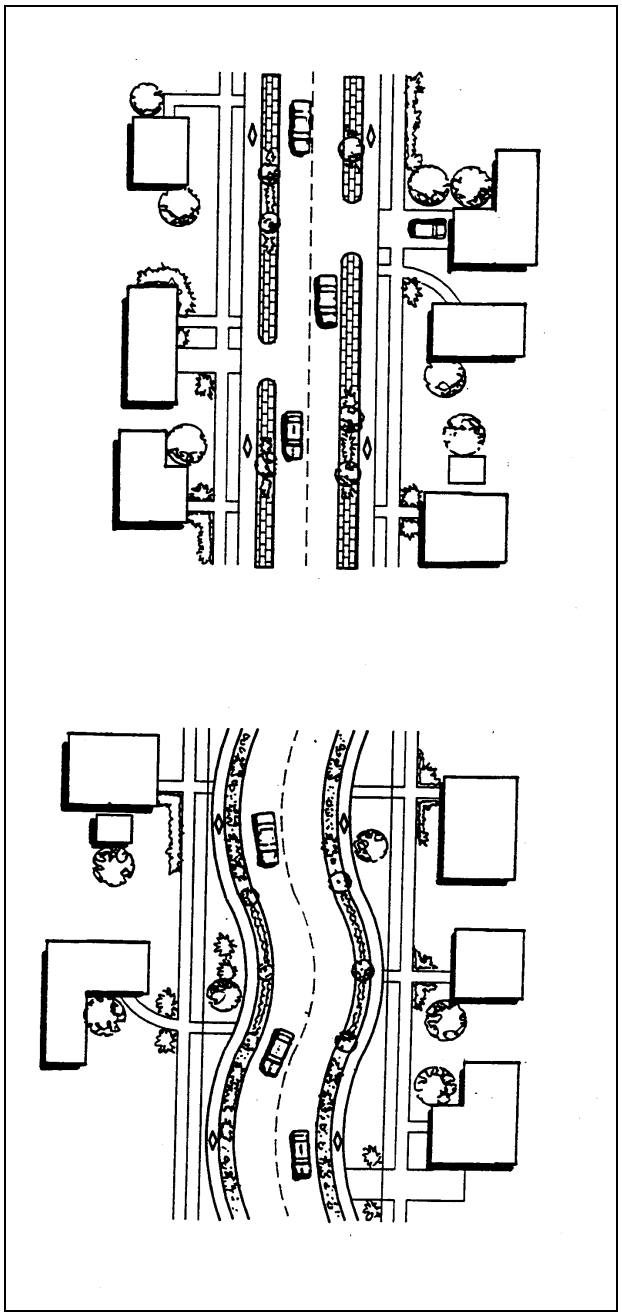


Don't Use If
High volume location.
The street is a snow route.

Negatives
Expensive if drainage issues involved.



Considerations:
Adequate public information should be provided, since this is a new treatment for Boulder.
The bike lanes and choker should be well marked.
The bike lanes should be wide enough for bike trailers.



Median at center of roadway

Median barrier

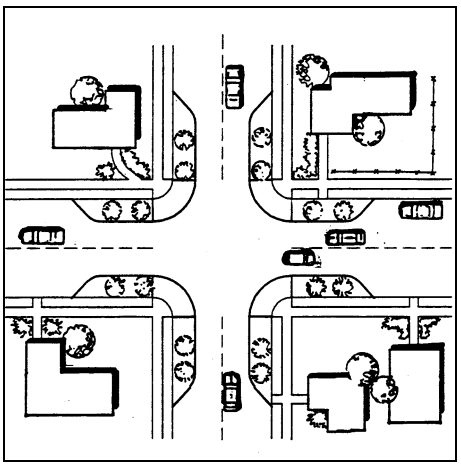
SIDEIANS

NECKDOWNS

Definition
Physical reduction of road width at intersections or mid block. Neckdowns differ from chokers in that they are attached to the curb and do not maintain an 'at grade" bike lane lateral to the neckdown.

Temporary
Can be tried on a temporary basis.

Street Types
Appropriate for most street types.



Best Used
Where speed and/or volume make pedestrian safety a concern.
In conjunction with other physical mitigation tools.

Benefits
Reduce road surface/ crossing distance.
Can add aesthetically if landscaped.

Don't Use If
The street is an established bike route.

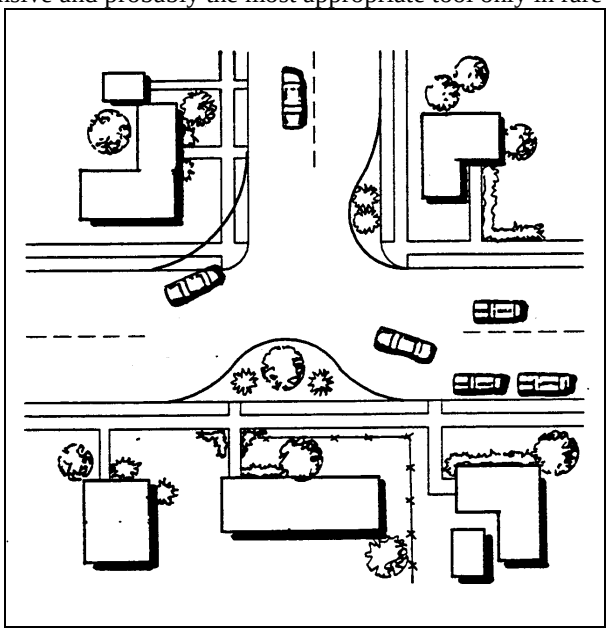
Negatives
Can be bad for cyclists, if not designed to accommodate them. Unless the neckdown significantly reduces road width (i.e. not just eliminates parking spaces or bike lanes) neckdowns do not affect speed.

Considerations
Neckdowns alone are a pedestrian amenity, however they must be used in conjunction with other mitigation tools to be effective for speed reduction.

REALIGNED INTERSECTIONS

Definition
Starting with a T intersection of a side street into a larger through street, the realigned intersection interrupts the traffic flow on the larger street by curving it into the side street.

Temporary
Not feasible as a temporary installation.



Best Used If
Enough traffic to reprioritize traffic flow.

Benefits
Slows traffic when realignment is significant.

Don't Use If
No level of additional traffic on the side street is acceptable.
Low volume street.

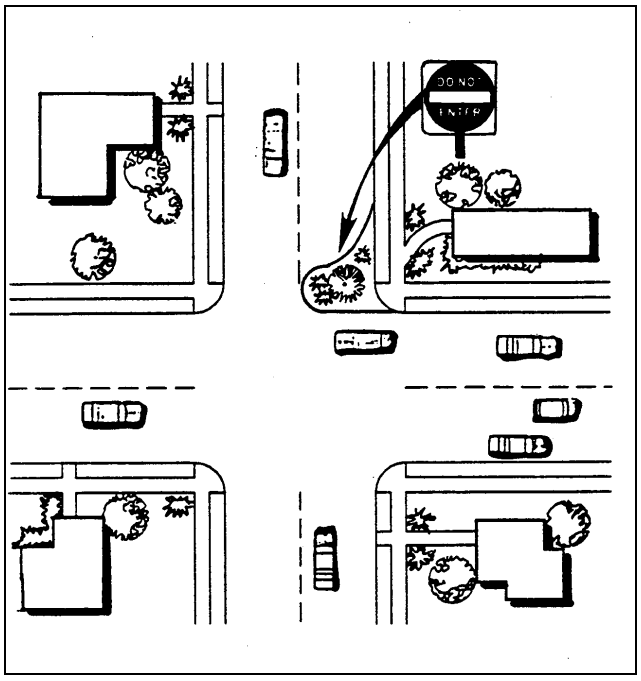
Negatives
Much more expensive than a stop sign.
May encourage increased traffic volume on the affected side street.
If not drastic enough, cyclists and cars may ignore the stop signs at the realigned intersection.

Considerations
Treatment is very expensive and probably the most appropriate tool only in rare conditions.

TURN PROHIBITIONS

Definition:
Physical barriers or signs ("No Right Turn," "No Left Turn," "Do Not Enter") that prohibit a particular turning movement.

Temporary
Can be installed experimentally or used during limited hours, such as rush hours or school hours.



Street Tunes
Local streets or major, paired arterials.

Best Used If
Significant cut-through traffic.
Need to eliminate two way conflicts.

Benefits
Reduces cut-through traffic in neighborhoods.

Don't Use If
Neighborhood unwilling to limit its own access. No appropriate alternative facility.

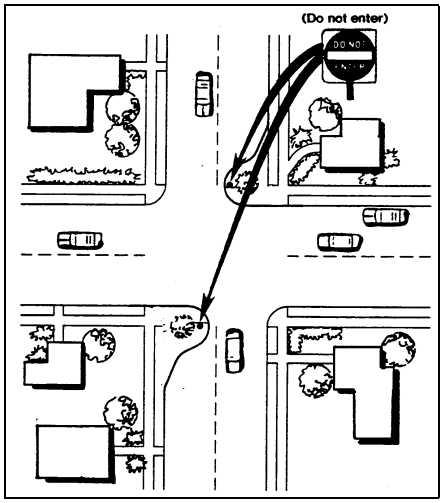
Negatives
May increase trip length due to revised trip patterns.

SEMI-DIVERTERS

Definition
Physical blockage of one direction of traffic at one point on an otherwise two way street. The open lane of traffic is signed "One way", that is, traffic from the blocked lane is not allowed to go around the barrier through the open lane.

Temporary
Semi-diverters can be tried on temporary basis.

Street Types
Better on low volume streets.



Best Used If
Neighborhood has cut through traffic, and there is an appropriate alternative route for blocked cut through traffic.

Benefits
Do not present a significant obstacle to emergency vehicles.
Good for limiting one-way cut-through traffic.
Can be designed to provide two-way access for bicycles.

Don't Use If
No cut-through traffic.
No good alternate route for diverted traffic.

Negatives
Compliance with semi-diverters is not 100%.
May increase trip length for some residents.

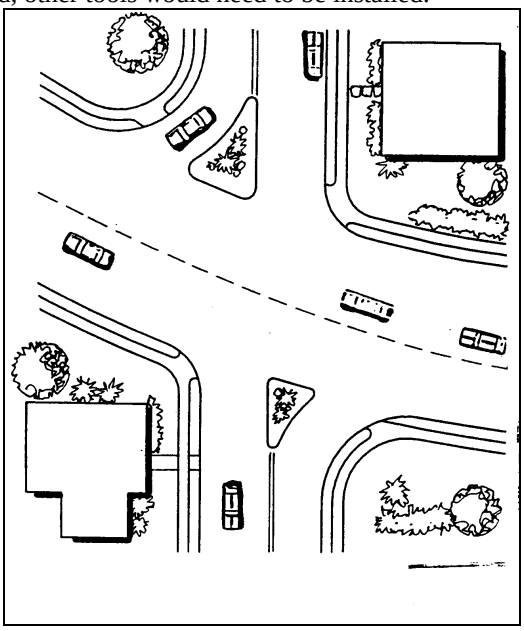
Considerations:
If speed reduction is desired, additional tools should be utilized.

FORCED TURN BARRIERS

Definition
Traffic islands installed to prevent or ensure certain turning movements at an intersection.

Temporary
May be tried on a temporary basis for 6-12 months.

Street Types
Primarily used to direct traffic off of local streets.



Best For
Cut-through traffic.

Benefits
Changes driving patterns. May significantly reduce cut-through traffic.

Don't Use If
Emergency response access is unacceptably hampered.

Negatives
May increase trip length for some drivers.

Considerations
If speed reduction is desired, other tools would need to be installed.

TRAFFIC CIRCLES

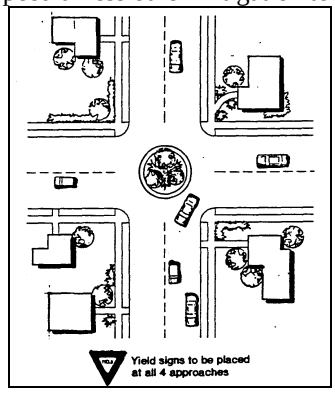
Definition
Traffic circles are raised circular areas (like medians) placed in an existing intersection. Drivers travel in a counter-clockwise direction around the circle. Traditional circles are “yield upon entry,” meaning that cars in the circle have the right of way and cars entering the circle must wait to do so until the path is clear. When a traffic circle is placed in an intersection, no automobile can travel in a straight line.

Temporary
Can be tried on a temporary basis, using essentially "portable" materials. The traffic circle should be made permanent or removed within 12 months.

Street Types
Traffic circles can be use on high and low volume streets.

Best Used If
Insufficient gaps for cross street traffic to traverse or access the higher volume street.
A speeding problem exists.

Benefits



Reprioritizes traffic to increase accessibility for local residents.
Cross traffic may become a mitigation tool in itself.

Don't Use If
Creation of gaps is the primary motivation for pursuing mitigation.

Negatives
May make pedestrian crossing more confusing at the intersection

Considerations
Special consideration to bike and pedestrian safety must be given if traffic circles are installed in high volume intersections .

Traffic circles may not reduce speed unless other mitigation tools are present on the street.

1635 Mariposa Ave.
Boulder, Colorado 80202
March 19, 1997

Mr. Ray Bowman
Pacemark Inc.
5455 Spine Rd.
Boulder, Colorado 80301

Dear Ray:

I have checked your method for estimating the probability of surviving a heart attack when treated by the emergency services of the Boulder Fire Department and have found it to be correct. Your use of numerical integration is formalized below.

Let S = the event that a person survives a heart attack due to emergency action of the BFD.

T_i = time interval in which the BFD arrives.

Now $S = (S \cap T_1) \cup (S \cap T_2) \cup \cdots\cdots \cup (S \cap T_n)$

I am using a discrete model rather than a continuous one to avoid curve fitting and to simplify calculations.

Let P(S) = Probability that a given individual survives due to BFD action.

Then $P(S) = P(S/T_1)P(T_1) + \cdots + P(S/T_n)P(T_n)$

This equation corresponds to the righthand four columns in your table: "Consequences of Emergency Response on Cardiac Arrest Survival".

To obtain the average or expected number of survivors, E(S), multiply the number of cases, n, by P(S). $E(S) = nP(S)$. Let Q(S) be the probability that one does not survive emergency treatment; is is a fatality. Then the expected number of fatalities, E(F) is

$$E(F) = nQ(S) = n - E(S).$$

Sincerely yours,

Irving Weiss, PhD

VITA

Leslie W. Bunte Jr. was born in Austin, Texas on April 5, 1954, the son of Leslie W. Bunte Sr. and Doris Reimers Bunte. After completing his work at Georgetown High School, Georgetown, Texas, in 1972, he entered Southwest Texas State University in San Marcos, Texas.

In 1973, he joined the Austin Fire Department (AFD) as a probationary firefighter. He quickly rose through the ranks at AFD, serving in many capacities such as Fire Inspector, Lieutenant Training Officer, Lieutenant Arson/Fire Investigator, and Fire Captain of Operations. In February 1994, he was appointed Assistant Fire Chief, a position he still holds today.

Concurrently, with his service at AFD, he also served in a part-time capacity as Fire Chief for the Georgetown Fire Department for 17 years. During his tenure with the City of Georgetown, he was also called upon to serve six months as Interim Police Chief in Georgetown while a search was conducted for a permanent chief. After being appointed Assistant Fire Chief in Austin, he subsequently relinquished his duties with the City of Georgetown.

During his fire service career, he reentered college as a part-time student. In 1978, he was awarded an Associate of Science Degree in Fire Protection Technology from Austin Community College. Later in 1980, he received a Bachelor of Science Degree from Southwest Texas State University. A 1995 graduate of the four-year

National Fire Academy's (NFA) Executive Fire Office Program, he was awarded the 1994 NFA Outstanding Research Award, which was selected from over 200 other student research programs conducted that year.

In 1995, he entered the graduate program of the LBJ School of Public Affairs at The University of Texas at Austin.

Both traffic noise and air pollution linked to stroke

Road traffic noise and air pollution both increase the risk of having a stroke, recent research from Denmark suggests. The results suggest that traffic noise is more strongly associated with ischaemic stroke, whereas only air pollution appears to be linked with more serious, fatal strokes.

Environmental noise and air pollution are believed to have similar biological effects on our blood vessels that increase the risk of stroke. For instance, they may lead to hardened arteries and high blood pressure. Air pollution is thought to cause damage when it is inhaled and enters the bloodstream. Noise may have more indirect effects: it disturbs sleep and increases stress, which can raise blood pressure.

The study, conducted under the EU QUIET project[1], is one of few to investigate the combined effects of traffic noise and air pollution. It analysed data, from a population study of health and lifestyle of 51 569 residents in Copenhagen and Aarhus over 11 years. The participants were aged 50-64 years at the point of enrolling onto the study.

The researchers modelled air pollution and traffic noise levels for every participant's home. National medical records showed that 1999 of the participants had been diagnosed with stroke. For air pollution, the study focused on nitrogen oxides (NO_x) and nitrogen dioxide (NO_2), which are good markers of traffic air pollution and correlate closely with both ultrafine particles and PM_{10} (10 micrometres or less in diameter). Noise was calculated as L_{den}: measured over a 24 hour period, with a 10 dB penalty at night (22:00–07:00) and a 5 dB penalty in the evening (19:00–22:00) to reflect people's extra sensitivity to noise during these times.

Statistical models analysed the independent effects of noise and air pollution, as well as their combined effects. They also accounted for the influence of other factors that affect stroke risk, such as diet, physical activity and smoking, as identified from earlier research.

Participants were more likely to have had a stroke if they lived in noisy and polluted areas. Traffic noise and NO_2 levels had significant associations with ischaemic strokes in particular, a form of stroke that occurs when clots block blood flow to the brain. Similar patterns were seen between NO_x exposure and stroke risk, but they were not as statistically significant, so the study did not make a confident association between the two.

Every increase of 10 dB L_{den} of noise above 42 dB L_{den}, averaged over a year, increased the risk of ischaemic stroke for an individual by 16%, the data suggest. Every 10 micrograms of NO_2 per cubic metre of air (10 µg/m^3), also averaged over a year, increased the risk by 11%.

In combination, the greatest stroke risk of +28% was found for a NO_2-noise combination of over 15.7 µg/m^3 and above 62.1 dB L_{den}. This is compared to less than 11.3 µg/m^3 and under 55.3 dB L_{den}.

The data suggest that the body is only sensitive to air pollution, in relation to ischaemic stroke, when noise levels are high. Stroke risk increased significantly when noise levels were over 62.1 dB L_{den} even if NO_2 levels were relatively low (i.e. below 15.7 µg/m^3), but it did not increase when noise was low and pollution was high. However, the researchers say that more work is needed to investigate this pattern.

Of the 1999 stroke diagnoses, 171 were fatal. NO_2, but not noise, was associated with these serious strokes. The study's results also suggest that noise, but not air pollution, is more strongly associated with ischaemic stroke.

Livable Streets, Dangerous Roads

Traffic Calming Endangers the Lives of Those in Need of Emergency Services

Executive Summary

As the Triangle grows, motorists face significant increases in traffic congestion. City and county planners are hired, in part, to suggest plans that will alleviate this congestion. Unfortunately, they are doing the opposite. Based on city staff recommendations, city councils in Raleigh and neighboring cities have fallen victim to the latest planning fad: traffic calming. This seemingly worthwhile goal has significant detrimental consequences, including increased traffic congestion, more deaths due to slower emergency vehicle response times, and unnecessary costs to taxpayers.

What Is Traffic Calming?

The Institute of Transportation Engineers defines traffic calming as "changes in street alignment, installation of barriers, and other physical measures to reduce traffic speeds and/or cut-through volumes, in the interest of street safety, livability, and other public purposes."[1] The City of Raleigh defines traffic calming as "the combination of mainly physical measures that reduce negative effects of motor vehicle use, alter driver behavior and improve conditions for non-motorized street users."[2] Taken at face value, implementation of these definitions will increase traffic congestion, not alleviate it.

In Raleigh, the city's traffic-calming "toolbox" includes education and enforcement and familiar measures such as roadway striping, pavement markings, speed humps and bumps and raised crosswalks. The plan also includes bulb-outs (intersection curb extensions that reduce roadway width), raised median islands, mini-traffic circles, larger roundabouts, and mid-block street narrowings.[3]

A Short History of Traffic Calming

Traffic calming began as a grassroots movement in 1960s Europe, when *woonerven*, or "living yards" replaced streets in Delft. European "slow streets," designed for 20 mph traffic, emerged in the late 1970s. In Germany and Denmark, suburban slow streets were followed by traffic-calming measures on intercity highways in the 1980s.[4] In the United States, versions of traffic calming emerged along the West Coast in the late 1960s, and have remained common in cities in Washington, Oregon and California. In 1980, the first national study of traffic calming explored residential preferences related to traffic, collected performance data on speed humps, and reviewed legal issues.[5]

In North Carolina, traffic-calming measures have already been implemented in Asheville, Charlotte, Hickory and Winston Salem. The Town of Cary has conducted a pilot study and will likely implement traffic-calming measures in the near future.

Raleigh Is Implementing Traffic Calming

Raleigh's official Traffic Calming Program is limited to residential/local access and collector streets; 73 streets have been studied and are included on its traffic-calming priority list (see Appendix). Streets on the list are ranked based on speed, pedestrian activity, crash history and traffic volume. Construction has begun on the first three projects on the list: Ashe Avenue between Hillsborough Street and Western Boulevard, Plaza Place between Millbrook Avenue and Creedmoor Road, and Eagle Trace Drive in the Hedingham subdivision.

Traffic Calming Is Dangerous

Raleigh's traffic-calming devices are built in order to slow traffic. Curb bulb-outs, raised medians, and roundabouts are designed to slow passenger vehicles. For example, passenger vehicles on Plaza Way are forced into the center of the roadway by curb bulb-outs and then immediately forced to

the curb by a raised median. Negotiating this zigzag slalom course forces motorists to slow down. But these devices create even greater delays to emergency vehicles. Emergency vehicles' longer wheel-bases, stiff suspension, and high vehicle weights require their drivers to slow almost to a stop to negotiate the devices safely.

Scientific analysis predicts that deaths in a community rise due to delays of emergency vehicles caused by traffic-calming measures. Even minor delays to emergency vehicles caused by delay-inducing traffic-calming devices create far more risk to a community than speeding vehicles.

Researcher Ronald Bowman's analysis[6] shows that if Boulder, Colorado implemented its plans for traffic-calming devices, they would increase emergency vehicle response times. Bowman predicts that patients needing emergency treatment would incur an increased risk to their survivability of 85 to 1 for every one minute of additional delay to response times due to planned traffic calming. In other words, if emergency medical technicians were delayed one additional minute by traffic-calming devices, a heart attack patient would be 85 times more likely to die.

Assistant Fire Chief of Austin, Texas, Les Bunte applied the Bowman analytical techniques to the City of Austin.[7] His results predicted a risk factor of 35 to 1 for an additional increased delay of 30 seconds to Austin response times caused by deflection devices such as speed bumps and roundabouts. The Austin figures take into account only victims of Sudden Cardiac Arrest (heart attacks). Thus Bunte's analysis predicts that for every 30 seconds additional delay for emergency medical technicians caused by traffic-calming devices, a heart attack victim is 35 times more likely to die.

Because of delays and the risk to human life, firefighters and emergency service personnel across the country oppose traffic calming.[8] Bunte's study also showed that

Three Common Forms of Traffic Calming

1. Traffic Circle or Roundabout

2. Bulb-Out

3. Mid-Block Street Narrowing

Table 1: Effects of Traffic Calming Measures on Emergency Response Times

Community	*Traffic Calming Measure*	*Delay at Slow Point (in Seconds)*
Austin, TX	12-foot speed humps	2.8 (fire engine) 3.0 (ladder truck) 2.3 (ambulance w/o patient) 9.7 (ambulance w/ patient)
Berkeley, CA	12-foot speed humps	10.7 (fire engine) 9.2 (ladder truck)
	22-foot speed tables	3.0 (fire engine) 13.5 (ladder truck)
Boulder, CO	8-foot speed hump	4.7 (fire engine)
	12-foot speed humps	2.8 (fire engine)
	37-foot speed table	3.8 (fire engine)
	40-foot speed table	3.8 (fire engine)
	25-foot diameter traffic circle	7.5 (fire engine)
Montgomery County, MD	12-foot speed humps	2.8 (ladder truck) 3.8 (ambulance) 4.2 (fire engine) 7.3 (pumper truck)
	18-foot diameter traffic circle	5.4 (ladder truck) 3.2 (ambulance) 5.0 (fire engine) 7.0 (pumper truck)
Portland, OR	14-foot speed humps	5.2 (fire engine) 2.9 (custom rescue vehicle) 6.6 (ladder truck)
	22-foot speed tables	3.0 (fire truck) 0.3 (custom rescue vehicle) 3.0 (ladder truck)
	16-24 foot oblong traffic circles	6.1 (fire engine) 3.1 (custom rescue vehicle) 8.4 (ladder truck)
Sarasota, FL	12-foot speed humps	9.5 (ambulance)

Source: *Traffic Calming: The State of the Practice.*

in some cases, travel time of ambulances transporting heart attack victims doubled due to traffic calming.[9] Because of these risks, the Institute of Transportation Engineers' (ITE) "Guidelines for the Design and Application of Speed Humps"[10] (1997) states humps should never be placed on emergency response routes.

Studies performed by seven American cities and assembled by the Institute of Transportation Engineers show that speed humps, speed tables, and traffic circles (roundabouts) have negative effects on emergency response times[11] (see Table 1).

TABLE 2: COSTS AND EFFECTS OF VARIOUS TRAFFIC CALMING MEASURES

Measure	*Speed*	*Accidents*	*Capacity*	*Cost*
One-Way Streets	+37%	-38%	+19%	Variable
12' Speed Hump	-22%	-11%	-18%	$2000
14' Speed Hump	-23%	-41%	-18%	$2000
22' Speed Table	-18%	-45%	-12%	$2000
Longer Speed Table	-9%	-	-	$2500
Raised Intersection	-1%	-	-	$12,500
Traffic Circle	-11%	-29%	-	$3500-$15000
Narrowing	-7%	-	-	$8000
Choker	-14%	-	-20%	$7,000-$10,000
Half Choker	-19%	-	-42%	$3500-$5000
Diagonal Diverter	0%	-	-35%	$85,000

Source: Trafficcalming.org and the Institute of Traffic Engineers.

Moreover, it isn't clear that traffic-calming devices effectively combat safety hazards or protect pedestrians. While calming devices are built on the premise they will reduce accidents, a comprehensive study commissioned by the ITE and the Federal Highway Administration (FHWA) on traffic-calming projects in the United States concludes:

> Traffic calming in the U.S. is largely restricted to low volume residential streets. Collisions occur infrequently on such streets to begin with, and any systematic change in collision rates tends to get lost in the random variation from year to year. This limits our confidence in drawing inferences about safety impacts of traffic calming.[12]

When traffic-calming devices do reduce accidents, it is at considerable cost in time, money and emergency response. Table 2 shows costs and benefits of various traffic-calming measures, some of which create problems and costs for municipalities with little effect on pedestrian and motorist safety.

Two of the measures the City of Raleigh will use — narrowings and chokers — have no measurable effect on accidents but reduce capacity considerably and cost $7,000 to $10,000 apiece.

RALEIGH'S ROUNDABOUTS AND TWO-WAY STREET CONVERSIONS

Two other city programs are designed to slow traffic and increase traffic congestion, but they do not meet the city's narrow definition of traffic calming. The construction of roundabouts on Hillsborough Street near the campus of North Carolina State University and the conversion of downtown streets from one-way to two-way near the state capitol will aggravate the city's traffic-congestion problem and slow emergency vehicles, posing a threat to human life.

The city plans a return to two-way operation for several sets of one-way streets in downtown as part of Raleigh's "Livable Streets" plan. Martin and Hargett Streets, main corridors that cross through the city's new Fayetteville Street, have already been converted. As Raleigh converts one-way pairs to two-way travel, each will be re-designed "emphasizing the com-

fort and convenience of the pedestrian."[13]

With this conversion from one-way to two-way streets, Raleigh residents can expect more congestion, higher drive times through downtown and a higher frequency of accidents. Studies show that two-way streets with the same number of lanes as one-way streets move 20 to 50 percent fewer cars because of increased turn delays. According to the Center for the American Dream, seven lanes of a two-way street are needed to move as many vehicles as four lanes on a one-way grid because people turning left or right impose fewer delays on people behind them.[14]

Secondly, returning Raleigh streets to two-way operation will increase commuting time. Traffic signals on a one-way grid can easily be coordinated so drivers can proceed at a continuous speed without stopping frequently for red lights. One study found that converting two-way streets to one-way led to a 19-percent increase in traffic at speeds that averaged 37-percent faster. This wasn't because the maximum speed limit on the one-way streets was any greater than on two-way streets, but because drivers experienced 60 percent fewer stops.[15]

Most importantly, one-way streets are safer for both drivers and pedestrians. One study in the *Transportation and Traffic Engineering Handbook* found that converting two-way streets to one-way caused a 38-percent decrease in accidents.[16] Pedestrians benefit particularly from one-way streets. Two-way streets produced 163 percent more pedestrian accidents in Sacramento, and 100 percent more pedestrian accidents in Portland, Ore., Hollywood, Fla., and Raleigh, N.C. A study by the Research Triangle Institute called one-way streets "the most effective urban counter-measure" to pedestrian accidents.[17]

Raleigh's Roundabout Craze

Raleigh's plan to construct up to seven roundabouts on Hillsborough Street between Oberlin Road and Gorman Street and four in the surrounding neighborhood will cost citizens at least $17 million and do little to relieve congestion. As part of the Hillsborough Street redesign, the first roundabout was built in 2002 on Pullen Road next to N.C. State's campus. Bonds approved in 2005 will pay for most of the second stage of the project; city planners are deciding between two roundabouts near North Hall or roundabouts and a roadway extension connecting Pullen Road to Oberlin Road. The first option would cost $3.7 million if the work includes burying utility lines. Alternate plans have the city spending up to $7 million to complete two to four roundabouts. The cost for the whole project is currently estimated at $17 million.

The Hillsborough project calls for seven roundabouts in only 1.2 miles, or a roundabout every 900 feet. Because of these changes, planners predict that 30 percent of the 19,000 cars a day currently traveling on Hillsborough (mostly through traffic) will redirect to Western Boulevard and Wade Avenue – streets that are already congested. Traffic on Hillsborough is already far less than the 26,000 vehicles per day at its peak.

Other cities in the triangle are calming their streets as well. Chapel Hill is calming streets in its Oaks neighborhood. As part of the effort, the town is conducting a study of effectiveness of its program; results should be released in mid-November. In Wake Forest, the town opened its first roundabout in May at the intersection of Highway 1A and Highway 98 at Southeastern Seminary, resulting in confusion and increased congestion.[18] Despite public reaction, the town plans to install three more roundabouts in the near future.

The Cost of Calming

According to Kimley-Horn and Associates, Inc., the group that provided a background report on the city's traffic-calming plans,

the costs of calming could be considerable. Based on "starter ideas" sketched by study consultants for one neighborhood in Raleigh, it is estimated that the cost of a "typical" neighborhood traffic-calming project may total $2 million.[19] This figure is likely to change (higher or lower) based on the type of measures selected and the number of locations identified. Additionally, there is no reasonable method for estimating the latent demand citywide for traffic calming; that is, how many additional neighborhoods will want to be added to the list once they hear about the program? The city has already identified 73 streets based on its 2004 survey.

Raleigh's traffic-calming plan would also include yearly maintenance costs. The cost to maintain landscaping is estimated at $4,000 per year per mile of traffic-calmed roadway, assuming ten measures per mile.[20] This includes watering (needed for the first two years until plants are established), pruning, mulching, fertilizing, weeding, and plant replacement.

Given the anticipated mixed results of Raleigh's traffic-calming plan, the city would be better off spending its money on proven solutions.

Smart Alternatives

The City of Raleigh should consider some less costly and more effective alternatives to protect pedestrians and drivers. The Canada Safety Council suggests "preventive traffic enforcement must become the number one priority .... Police must be visible and active in problem areas."[21] Effective speed enforcement is also possible via red-light cameras. The city could also consider using roadway striping and pavement marking, stop signs, signal coordination, yield signs, turning and parking restrictions, or better illumination to increase pedestrian and motorist safety.

In Raleigh's growing downtown, the City should create as many one-way paired streets as possible. One-way pairs are safer for drivers and pedestrians and minimize congestion for commuters.

Conclusion

Planning fads come and go, but planners are seldom held responsible for the harm they cause. Once again, city government falls victim to myth vs. reality. Planners and their supporters deluge the city council with information about what traffic calming is supposed to accomplish. Rarely do city council members receive information regarding the reality of traffic calming, even though studies of the unintended consequences and disastrous results from other cities are readily available.

Perhaps the city council should hire a person whose full-time job is to throw cold water on every fantastic fad that the city staff supports. Then and only then will the council be able to make truly informed judgments.

Jenna Ashley Robinson is program assistant at the John Locke Foundation.

Appendix: The City of Raleigh's 2004 Traffic Calming Priority List[22]

Tsunami Inundation Map for Emergency Planning
Venice Quadrangle

State of California
County of Los Angeles

METHOD OF PREPARATION

Initial tsunami modeling was performed by the University of Southern California (USC) Tsunami Research Center funded through the California Emergency Management Agency (CalEMA) by the National Tsunami Hazard Mitigation Program. The tsunami modeling process utilized the MOST (Method of Splitting Tsunamis) computational program (Version 0), which allows for wave evolution over a variable bathymetry and topography used for the inundation mapping (Titov and Gonzalez, 1997; Titov and Synolakis, 1998).

The bathymetric/topographic data that were used in the tsunami models consist of a series of nested grids. Near-shore grids with a 3 arc-second (75- to 90-meters) resolution or higher, were adjusted to “Mean High Water” sea-level conditions, representing a conservative sea level for the intended use of the tsunami modeling and mapping.

A suite of tsunami source events was selected for modeling, representing realistic local and distant earthquakes and hypothetical extreme undersea, near-shore landslides (Table 1). Local tsunami sources that were considered include offshore reverse-thrust faults, restraining bends on strike-slip fault zones and large submarine landslides capable of significant seafloor displacement and tsunami generation. Distant tsunami sources that were considered include great subduction zone events that are known to have occurred historically (1960 Chile and 1964 Alaska earthquakes) and others which can occur around the Pacific Ocean “Ring of Fire.”

In order to enhance the result from the 75- to 90-meter inundation grid data, a method was developed utilizing higher-resolution digital topographic data (3- to 10-meters resolution) that better defines the location of the maximum inundation line (U.S. Geological Survey, 1993; Intermap, 2003; NOAA, 2004). The location of the enhanced inundation line was determined by using digital imagery and terrain data on a GIS platform with consideration given to historic inundation information (Lander, et al., 1993). This information was verified, where possible, by field work coordinated with local county personnel.

The accuracy of the inundation line shown on these maps is subject to limitations in the accuracy and completeness of available terrain and tsunami source information, and the current understanding of tsunami generation and propagation phenomena as expressed in the models. Thus, although an attempt has been made to identify a credible upper bound to inundation at any location along the coastline, it remains possible that actual inundation could be greater in a major tsunami event.

This map does not represent inundation from a single scenario event. It was created by combining inundation results for an ensemble of source events affecting a given region (Table 1). For this reason, all of the inundation region in a particular area will not likely be inundated during a single tsunami event.

MAP EXPLANATION

Tsunami Inundation Line

Tsunami Inundation Area

PURPOSE OF THIS MAP

This tsunami inundation map was prepared to assist cities and counties in identifying their tsunami hazard. It is intended for local jurisdictional, coastal evacuation planning uses only. This map, and the information presented herein, is not a legal document and does not meet disclosure requirements for real estate transactions nor for any other regulatory purpose.

The inundation map has been compiled with best currently available scientific information. The inundation line represents the maximum considered tsunami runup from a number of extreme, yet realistic, tsunami sources. Tsunamis are rare events; due to a lack of known occurrences in the historical record, this map includes no information about the probability of any tsunami affecting any area within a specific period of time.

Please refer to the following websites for additional information on the construction and/or intended use of the tsunami inundation map:

MAP BASE

Topographic base maps prepared by U.S. Geological Survey as part of the 7.5-minute Quadrangle Map Series (originally 1:24,000 scale). Tsunami inundation line boundaries may reflect updated digital orthophotographic and topographic data that can differ significantly from contours shown on the base map.

DISCLAIMER

The California Emergency Management Agency (CalEMA), the University of Southern California (USC), and the California Geological Survey (CGS) make no representation or warranties regarding the accuracy of this inundation map nor the data from which the map was derived. Neither the State of California nor USC shall be liable under any circumstances for any direct, indirect, special, incidental or consequential damages with respect to any claim by any user or any third party on account of or arising from the use of this map.

APPENDIX 60

INDEX 70

1. PURPOSE.

This document sets standards for facility accessibility by physically handicapped persons for Federal and federally-funded facilities. These standards are to be applied during the design, construction, and alteration of buildings and facilities to the extent required by the Architectural Barriers Act of 1968, as amended.

The technical provisions of these standards are the same as those of the American National Standard Institute's document A117.1-1980, except as noted in this text and on figures by italics.

2. GENERAL.

2.1 Authority. *These standards were jointly developed by the General Services Administration, the Department of Housing and Urban Development, the Department of Defense, and the United States Postal Service, under the authority of sections 2, 3, 4, and 4a, respectively, of the Architectural Barriers Act of 1968, as amended, Pub. L. No. 90-480, 42 U.S.C. 4151-4157.*

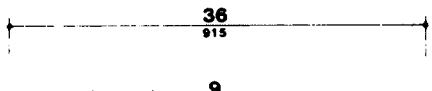
2.2 Provisions For Adults. The specifications in *these standards* are based upon adult dimensions and anthropometrics.

3. MISCELLANEOUS INSTRUCTIONS AND DEFINITIONS.

3.1 Graphic Conventions. Graphic conventions are shown in Table 1. Dimensions that are not marked "minimum" or "maximum" are absolute, unless otherwise indicated in the text or captions.

3.2 Dimensional Tolerances. All dimensions are subject to conventional building industry tolerances for field conditions.

3.3 Notes. The text of *these standards* does not contain notes or footnotes. Additional information, explanations, and advisory materials are located in the Appendix. Paragraphs marked with an asterisk have related, nonmandatory material in the Appendix. In the Appendix, the corresponding paragraph numbers are preceded by an A.



3.4 General Terminology.

comply with. Meet one or more specifications of this standard.

if, if...then. Denotes a specification that applies only when the conditions described are present.

may. Denotes an option or alternative.

Table 1
Graphic Conventions

Convention	Description
	Typical dimension line showing U.S. customary units (in inches) above the line and SI units (in millimeters) below
	Dimensions for short distances indicated on extended line
	Dimension line showing alternate dimensions required
	Direction of approach
max	Maximum
min	Minimum
	Boundary of clear floor area
℄	Centerline

shall. Denotes a mandatory specification or requirement.

should. Denotes an advisory specification or recommendation.

3.5 Definitions. The following terms shall, for the purpose of *these standards*, have the meaning indicated in this section.

Access Aisle. An accessible pedestrian space between elements, such as parking spaces, seating, and desks, that provides clearances appropriate for use of the elements.

Accessible. Describes a site, building, facility, or portion thereof that complies with *these standards* and that can be approached, entered, and used by physically disabled people.

Accessible Element. An *element* specified by *these standards* (for example, telephone, controls, and the like).

Accessible Route. A continuous unobstructed path connecting all accessible elements and spaces in a building or facility. Interior accessible routes may include corridors, floors, ramps, elevators, lifts, and clear floor space at fixtures. Exterior accessible routes may include parking access aisles, curb ramps, walks, ramps, and lifts.

Accessible Space. Space that complies with these standards.

Adaptability. The ability of certain building *spaces and* elements, such as kitchen counters, sinks, and grab bars, to be *added or* altered so as to accommodate the needs of either disabled or nondisabled *persons*, or to accommodate the needs of persons with different types or degrees of disability.

Addition. An expansion, extension, or increase in the gross floor area of a building or facility.

Administrative Authority. A governmental agency that adopts or enforces regulations and standards for the design, construction, or alteration of buildings and facilities.

Alteration. As applied to a building or structure, means a change or rearrangement in the structural parts or elements, or in the means of egress or in moving from one location or position to another. It does not include normal maintenance, repair, reroofing, interior decoration, or changes to mechanical and electrical systems.

Assembly Area. A room or space accommodating fifty or more individuals for religious, recreational, educational, political, social, or amusement purposes, or for the consumption of food and drink, including all connected rooms or spaces with a common means of egress and ingress. Such areas as conference rooms would have to be accessible in accordance with other parts of this standard but would not have to meet all of the criteria associated with assembly areas.

Automatic Door. A door equipped with a power-operated mechanism and controls that open and close the door automatically upon receipt of a momentary actuating signal. The switch that begins the automatic cycle may be a photoelectric device, floor mat, or manual switch mounted on or near the door itself (see power-assisted door).

Circulation Path. An exterior or interior way of passage from one place to another for pedestrians, including, but not limited to, walks, hallways, courtyards, stairways, and stair landings.

Clear. Unobstructed.

Common Use. Refers to those interior and exterior rooms, spaces, or elements that are made available for the use of a restricted group of people (for example, residents of an apartment building, the occupants of an office building, or the guests of such residents or occupants).

Cross Slope. The slope that is perpendicular to the direction of travel (see running slope).

Curb Ramp. A short ramp cutting through a curb or built up to it.

Dwelling Unit. A single unit of residence which provides a kitchen or food preparation area, in addition to rooms and spaces for living, bathing, sleeping, and the like. A single family home is a dwelling unit, and dwelling units are to be found in such housing types as townhouses and apartment buildings.

Egress, Means of. *An accessible route* of exit that meets all applicable code specifications of the regulatory building agency having jurisdiction over the building or facility.

Element. An architectural or mechanical component of a building, facility, space, or site, e.g., telephone, curb ramp, door, drinking fountain, seating, water closet.

Entrance. Any access point to a building or portion of building or facility used for the purpose of entering. An entrance includes the approach walk, the vertical access leading to the entrance platform, the entrance platform itself, vestibules if provided, the entry door(s) or gate(s), and the hardware of the entry door(s) or gate(s). The principal entrance of a building or facility is the main door through which most people enter.

Essential Features. Those elements and spaces that make a building or facility usable by, or serve the needs of, its occupants or users. Essential features include but are not limited to entrances, toilet rooms, and accessible routes. Essential features do not include those spaces that house the major activities for which the building or facility is intended, such as classrooms and offices.

Extraordinary Repair. The replacement or renewal of any element of an existing building or facility for purposes other than normal maintenance.

3.5 Definitions

Facility. All or any portion of a building, structure, or area, including the site on which such building, structure or area is located, wherein specific services are provided or activities performed.

Full and Fair Cash Value. Full and fair cash value is calculated for the estimated date on which work will commence on a project and means:

(1) The assessed valuation of a building or facility as recorded in the assessor's office of the municipality and as equalized at one hundred percent (100%) valuation, or
(2) The replacement cost, or
(3) The fair market value.

Functional Spaces. The rooms and spaces in a building or facility that house the major activities for which the building or facility is intended.

Housing. A building, facility, or portion thereof, excluding inpatient health care facilities, that contains one or more dwelling units or sleeping accommodations. Housing may include, but is not limited to, one and two-family dwellings, apartments, group homes, hotels, motels, dormitories, and mobile homes.

Marked Crossing. A crosswalk or other identified path intended for pedestrian use in crossing a vehicular way.

Multifamily Dwelling. Any building containing more than two dwelling units.

Operable Part. A part of a piece of equipment or appliance used to insert or withdraw objects, or to activate, deactivate, or adjust the equipment or appliance (for example, coin slot, pushbutton, handle).

Physically Handicapped. An individual who has a physical impairment, including impaired sensory, manual, or speaking abilities, which results in a functional limitation in access to and use of a building or facility.

Power-assisted Door. A door *used for human passage* with a mechanism that helps to open the door, or relieve the opening resistance of a door, upon the activation of a switch or a continued force applied to the door itself. If the switch or door is released, such doors immediately begin to close or close completely within 3 to 30 seconds (see automatic door).

Public Use. Describes interior or exterior rooms or spaces that are made available to the general public. Public use may be provided at a building or facility that is privately or publicly owned.

Ramp. A walking surface in an accessible space that has a running slope greater than 1:20.

Running Slope. The slope that is parallel to the direction of travel (see cross slope).

Service Entrance. An entrance intended primarily for delivery of services.

Signage. Verbal, symbolic, *tactile,* and pictorial information.

Site. A parcel of land bounded by a property line or a designated portion of a public right-of-way.

Site Improvement. Landscaping, paving for pedestrian and vehicular ways, outdoor lighting, recreational facilities, and the like, added to a site.

Sleeping Accommodations. Rooms in which people sleep, for example, dormitory and hotel or motel guest rooms.

Space. A definable area, e.g., toilet room, hall, assembly area, entrance, storage room, alcove, courtyard, or lobby.

Structural Impracticability. Changes having little likelihood of being accomplished without removing or altering a load-bearing structural member and/or incurring an increased cost of 50 percent or more of the value of the element of the building or facility involved.

Tactile. Describes an object that can be perceived using the sense of touch.

Tactile Warning. A standardized surface texture applied to or built into walking surfaces or other elements to warn visually impaired people of hazards in the path of travel.

Temporary. Applies to facilities that are not of permanent construction but are extensively used or essential for public use for a given (short) period of time, for example, temporary classrooms or classroom buildings at schools and colleges, or facilities around a major construction site to make passage accessible, usable, and safe for everybody. Structures directly associated with the actual processes of major construction, such as porto potties, scaffolding, bridging, trailers, and the like, are not included. *Temporary as applied to elements means installed for less than 6 months and not required for safety reasons.*

Vehicular Way. A route intended for vehicular traffic, such as a street, driveway, or parking lot.

Walk. An exterior pathway with a prepared surface intended for pedestrian use, including general pedestrian areas such as plazas and courts.

4. ACCESSIBLE ELEMENTS AND SPACES: SCOPE AND TECHNICAL REQUIREMENTS.

4.1 Minimum Requirements.

4.1.1 Accessible Sites and Exterior Facilities: *New Construction.* An accessible site shall meet the following minimum requirements:

(1) At least one accessible route complying with 4.3 shall be provided *within the boundary of the site* from public transportation stops, accessible parking

spaces, passenger loading zones if provided, and public streets or sidewalks to an accessible building entrance.

(2) At least one accessible route complying with 4.3 shall connect accessible buildings, facilities, elements, and spaces that are on the same site.

(3) All objects that protrude from surfaces or posts into circulation paths shall comply with 4.4.

(4) Ground surfaces along accessible routes and in accessible spaces shall comply with 4.5.

(5) (a) *If parking spaces are provided for employees or visitors, or both, then accessible spaces, complying with 4.6, shall be provided in each such parking area in conformance with the following table:*

Total Parking in Lot	*Required Minimum Number of Accessible Spaces*
1 to 25	*1*
26 to 50	*2*
51 to 75	*3*
76 to 100	*4*
101 to 150	*5*
151 to 200	*6*
201 to 300	*7*
301 to 400	*8*
401 to 500	*9*
501 to 1000	*
1001 and over	**

* *2 percent of total.*
** *20 plus 1 for each 100 over 1000.*

EXCEPTION: The total number of accessible parking spaces may be distributed among parking lots, if greater accessibility is achieved.

EXCEPTION: This does not apply to parking provided for official government vehicles owned or leased by the government and used exclusively for government purposes.

(b) *If passenger loading zones are provided, then at least one passenger loading zone shall comply with 4.6.5.*

(c) *Parking spaces for side lift vans are accessible parking spaces and may be used to meet the requirements of this paragraph.*

(d) *Parking spaces at accessible housing complying with 4.6 shall be provided in accordance with the following:*

(i) Where parking is provided for all residents, one accessible parking space shall be provided for each accessible dwelling unit; and

(ii) Where parking is provided for only a portion of the residents, an accessible parking space shall be provided on request of the occupant of an accessible dwelling unit;

(iii) Where parking is provided for visitors, 2 percent of the spaces, or at least one, shall be accessible.

(e) *Parking spaces at health care facilities complying with 4.6 shall be provided in accordance with the following:*

(i) General health care facilities, employee and visitor parking: Comply with Table 4.1.1(5)(a);

(ii) Outpatient facilities: 10 percent of the total number of parking spaces provided;

(iii) Spinal cord injury facilities, employee and visitor parking: 20 percent of total parking spaces provided.

(6) *If toilet facilities are provided on a site, then each such public or common use toilet facility shall comply with 4.22. If bathing facilities are provided on a site, then each such public or common use bathing facility shall comply with 4.23.*

EXCEPTION: These provisions are not mandatory for single user portable toilet or bathing units clustered at a single location; however, at least one toilet unit complying with 4.22 or one bathing unit complying with 4.23 should be installed at each location whenever standard units are provided.

(7) All signs shall comply with 4.30.1, 4.30.2 and 4.30.3. ***Elements and spaces of accessible facilities which shall comply with 4.30.5 and shall be identified by the International Symbol of Accessibility are:***

(a) Parking spaces designated as reserved for physically handicapped people;
(b) passenger loading zones;
(c) accessible entrances;
(d) accessible toilet and bathing facilities.

4.1.2 Accessible Buildings: ***New Construction.*** Accessible buildings and facilities shall meet the following minimum requirements:

(1) At least one accessible route complying with 4.3 shall connect accessible building or facility entrances with all accessible spaces and elements within the building or facility.

(2) All objects that overhang circulation paths shall comply with 4.4.

(3) Ground and floor surfaces along accessible routes and in accessible rooms and spaces shall comply with 4.5.

(4) Stairs connecting levels that are not connected by an elevator shall comply with 4.9.

(5) *One passenger elevator complying with 4.10 shall serve each level in all multi-story buildings and facilities. If more than one elevator is provided, each elevator shall comply with 4.10.*

4.1.2 Accessible Buildings: New Construction

EXCEPTION: Elevator pits, elevator penthouses, mechanical rooms, piping or equipment catwalks are excepted from this requirement.

EXCEPTION: Accessible ramps complying with 4.8 or, if no other alternative is feasible, accessible platform lifts complying with 4.11 may be used in lieu of an elevator.

(6) Windows. *(Reserved).*

(7) Doors:

(a) *At each accessible entrance to a building or facility, at least one door shall comply with 4.13.*

(b) *Within a building or facility, at least one door at each accessible space shall comply with 4.13.*

(c) *Each door that is an element of an accessible route shall comply with 4.13.*

(d) *Each door required by 4.3.10, Egress, shall comply with 4.13.*

EXCEPTION: In multiple-story buildings and facilities where at-grade egress from each floor is impossible, either of the following is permitted: the provision within each story of approved fire and smoke partitions that create horizontal exits, or, the provision within each floor of areas of refuge approved by agencies having authority for safety.

(8) *At least one principal entrance at each grade floor level to a building or facility shall comply with 4.14, Entrances. When a building or facility has entrances which normally serve any of the following functions: transportation facilities, passenger loading zones, accessible parking facilities, taxi stands, public streets and sidewalks, or accessible interior vertical access, then at least one of the entrances serving each such function shall comply with 4.14, Entrances. Because entrances also serve as emergency exits, whose proximity to all parts of buildings and facilities is essential, it is preferable that all or most exits be accessible.*

(9) *If drinking fountains or water coolers are provided, approximately 50 percent of those provided on each floor shall comply with 4.15 and shall be on an accessible route. If only one drinking fountain or water cooler is provided on any floor, it shall comply with 4.15.*

(10) If toilet facilities are provided, *then each public and common use* toilet room shall comply with 4.22. *Other toilet rooms shall be adaptable.* If bathing facilities are provided, *then each public and common use* bathroom shall comply with 4.23. *Accessible toilet rooms and bathing facilities shall be on an accessible route.*

(11) If storage facilities such as cabinets, shelves, closets, and drawers are provided in accessible spaces, *at least one of each type provided shall contain storage space complying with 4.25. Additional storage may be provided outside of the dimensions shown in Fig. 38.*

(12) Controls and operating mechanisms in accessible spaces, along accessible routes, or as parts of accessible elements (for example, light switches and dispenser controls) shall comply with 4.27.

(13) *If emergency warning systems are provided, then they shall include both audible alarms complying with 4.28.2 and visual alarms complying with 4.28.3. In facilities with sleeping accommodations, the sleeping accommodations shall have an alarm system complying with 4.28.4. Emergency warning systems in health care facilities may be modified to suit standard health care alarm design practice.*

(14) Tactile warnings shall be provided at hazardous conditions as specified in *4.29.3.*

(15) If signs are provided, they shall comply with 4.30.1, 4.30.2 and 4.30.3. ***In addition, permanent signage that identifies rooms and spaces shall also comply with 4.30.4 and 4.30.6.***

EXCEPTION: The provisions of 4.30.4 are not mandatory for temporary information on room and space signage, such as current occupant's name, provided the permanent room or space identification complies with 4.30.4.

(16) Public telephones:

(a) If public telephones are provided, *then accessible public telephones shall comply with 4.31, Telephones, and the following table:*

Number of public telephones provided on each floor:	*Number of telephones required to be accessible:**
1 or more single unit installations	*1 per floor*
*1 bank***	*1 per floor*
*2 or more banks***	*1 per bank. Accessible unit may be installed as a single unit in proximity (either visible or with signage) to the bank. At least one public telephone per floor shall meet the requirements for a forward reach telephone.****

**Additional public telephones may be installed at any height. Unless otherwise specified, accessible telephones may be either forward or side reach telephones.*

***A bank consists of two or more adjacent public telephones, often installed as a unit.*

6

***EXCEPTION: For exterior installations only, if dial tone first service is not available, then a side reach telephone may be installed instead of the required forward reach telephone (i.e., one telephone in proximity to each bank shall comply with 4.31).

(b) At least one of the public telephones complying with 4.31, Telephones, shall be equipped with a volume control. The installation of additional volume controls is encouraged, and these may be installed on any public telephone provided.

(17) If fixed or built-in seating, tables, or work surfaces are provided in accessible spaces, at least 5 percent, but always at least one, of seating spaces, tables, or work surfaces shall comply with 4.32.

(18) Assembly areas:

(a) If places of assembly are provided, they shall comply with the following table:

Capacity of Seating & Assembly Areas	Number of Required Wheelchair Locations
50 to 75	3
76 to 100	4
101 to 150	5
151 to 200	6
201 to 300	7
301 to 400	8
401 to 500	9
501 to 1,000	*
over 1,000	**

* 2 percent of total.
** 20 plus 1 for each 100 over 1,000.

(b) Assembly areas with audio-amplification systems shall have a listening system complying with 4.33 to assist a reasonable number of people, but no fewer than two, with severe hearing loss. For assembly areas without amplification systems and for spaces used primarily as meeting and conference rooms, a permanently installed or portable listening system shall be provided. If portable systems are used for conference or meeting rooms, the system may serve more than one room.

4.1.3 Accessible Housing. Accessible housing shall comply with the requirements of 4.1 and 4.34 except as noted below:

(1) ***Elevators:*** Where provided, elevators shall comply with 4.10. Elevators or other accessible means of vertical movement are not required in residential facilities when:

(a) No accessible dwelling units are located above or below the accessible grade level; and

(b) At least one of each type of common area and amenity provided for use of residents and visitors is available at the accessible grade level.

(2) ***Entrances:*** Entrances complying with 4.14 shall be provided as necessary to achieve access to and egress from buildings and facilities.

EXCEPTION: In projects consisting of one-to-four family dwellings where accessible entrances would be extraordinarily costly due to site conditions or local code restrictions, accessible entrances are required only to those buildings containing accessible dwelling units.

(3) ***Common Areas:*** At least one of each type of common area and amenity in each project shall be accessible and shall be located on an accessible route to any accessible dwelling unit.

4.1.4 Occupancy Classifications. Buildings and facilities shall comply with these standards to the extent noted in this section for various occupancy classifications, unless otherwise modified by a special application section. Occupancy classifications, and the facilities covered under each category include, but are not necessarily limited to, the listing which follows:

(1) ***General Exceptions.*** Accessibility is not required to elevator pits, elevator penthouses, mechanical rooms, piping or equipment catwalks, lookout galleries, electrical and telephone closets, and general utility rooms.

(2) ***Military Exclusions.*** The following facilities need not be designed to be accessible, but accessibility is recommended since the intended use of the facility may change with time.

(a) Unaccompanied personnel housing, closed messes, vehicle and aircraft maintenance facilities, where all work is performed by able-bodied military personnel, and, in general, all facilities which are intended for use or occupancy by able-bodied military personnel only.

(b) Those portions of Reserve and National Guard facilities which are designed and constructed primarily for use by able-bodied military personnel. This exclusion does not apply to those portions of a building or facility which may be open to the public or which may be used by the public during the conduct of normal business or which may be used by physically handicapped persons employed or seeking employment at such building or facility. These portions of the building or facility shall be accessible.

(c) Where the number of accessible spaces required is determined by the design capacity of a facility (such as parking or assembly areas), the number of able-bodied military persons used in determining the design capacity need not be counted when computing the number of accessible spaces required.

(3) ***Military Housing.*** In the case of military housing, which is primarily available for able-bodied military personnel and their dependents, at least 5

4.1.4 Occupancy Classifications

percent of the total but at least one unit (on an installation-by-installation basis) of all housing constructed will be designed and built to be either accessible or readily and easily modifiable to be accessible, but in any event, modification of individual units (including the making of adaptations), will be accomplished on a high priority basis when a requirement is identified. Common areas such as walks, streets, parking and play areas, and common entrances to multi-unit facilities shall be designed and built to be accessible.

*(4) **Assembly.** Assembly occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering together of persons for purposes such as civic, social or religious functions, recreation, food or drink consumption, or awaiting transportation. A room or space used for assembly purposes by less than fifty (50) persons and accessory to another occupancy shall be included as a part of that major occupancy. For purposes of these standards, assembly occupancies shall include the following:*

Facilities	Application
Amusement arcades Amusement park structures Arenas Armories Art galleries Auditoriums Banquet halls Bleachers Bowling alleys Carnivals Churches Clubs Community halls Courtrooms (public areas) Dance halls Drive-in theaters Exhibition halls Fairs Funeral parlors Grandstands Gymnasiums Motion picture theaters Indoor & outdoor swimming pools Indoor & outdoor tennis courts Lecture halls Libraries* Museums Night clubs Passenger stations Pool & billiard halls Restaurants** Skating rinks	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.
Stadiums Taverns & bars Television studios admitting audiences Theaters	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.

**See Part 8 for special applications.*
***See Part 5 for special applications.*

*(5) **Business.** Business occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service type transactions, including storage of records and accounts.*

Facilities	Application
Animal hospitals, kennels, pounds Automobile and other motor vehicle showrooms Banks Barber shops Beauty shops Car wash Civic administration Clinic, outpatient Dry cleaning Educational above 12th grade Electronic data processing Fire stations Florists & nurseries Laboratories: testing & research Laundries Motor vehicle service stations Police stations Post offices* Print shops Professional services: attorney, dentist, physician, engineer, etc. Radio & T.V. stations Telephone exchanges	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.

**See Part 9 for special applications.*

*(6) **Educational.** Educational occupancy includes, among others, the use of a building or structure, or portion thereof, by six or more persons at any time for educational purposes through the 12th grade.*

Schools for business or vocational training shall conform to the requirements of the trade, vocation or business taught.

6

4.1.4 Occupancy Classifications

Facilities	Application
Academies Kindergarten Nursery schools Schools	All areas shall comply.

(7) Factory Industrial. Factory industrial occupancy includes, among others, the use of a building or structure, or portion thereof, for assembling, disassembling, fabricating, finishing, manufacturing, packaging, processing or other operations that are not classified as a Hazardous Occupancy.

Facilities	Application
Aircraft Appliances Athletic equipment Automobile and other motor vehicle Bakeries Beverages Bicycles Boats, building Brick and masonry Broom or brush Business machines Canvas or similar Cameras and photo equipment Carpets & rugs, including cleaning Ceramic products Clothing Construction & agricultural machinery Disinfectants Dry cleaning & dyeing Electronics Engines, including rebuilding Film, photographic Food processing Foundries Furniture Glass products Gypsum Hemp products Ice Jute products Laundries Leather products Machinery Metal Motion pictures & television film Musical instruments Optical goods Paper products Plastic products	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.
Printing or publishing Recreational vehicles Refuse incineration Shoes Soaps & detergents Steel products: fabrication, assembly Textiles Tobacco Trailers Upholstering Wood, distribution Millwork Woodworking, cabinet Postal mail: processing facilities*	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.

*See Part 9 for special applications.

(8) Hazardous. Hazardous occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of corrosive, highly toxic, highly combustible, flammable or explosive materials that constitute a high fire or explosive hazard, including loose combustible fibers, dust and unstable materials.

Facilities	Application
Combustible dust Combustible fibers Combustible liquid Corrosive liquids Explosive material Flammable gas Flammable liquid Liquified petroleum gas Nitromethane Oxidizing materials Organic peroxide	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.

(9) Institutional. Institutional occupancy includes, among others, the use of a building or structure, or any portion thereof, in which people have physical or medical treatment or care, or in which the liberty of the occupants is restricted. Institutional occupancies shall include the following subgroups:

(a) Institutional occupancies for the care of children, including:

Facilities	Application
Child care facilities	All public use, common use, or areas which may result in employment of physically handicapped persons.

9

4.1.4 Occupancy Classifications

(b) Institutional occupancies used for medical or other treatment or care of persons, some of whom are suffering from physical or mental illness, disease or infirmity, including:

Facilities	Application
Long Term Care Facilities: (including Skilled Nursing Facilities, Intermediate Care Facilities, Bed & Care, and Nursing Homes).	At least 50 percent of patient toilets and bedrooms; all public use, common use or areas which may result in employment of physically handicapped persons.
Outpatient Facilities:	All patient toilets and bedrooms, all public use, common use, or areas which may result in employment of physically handicapped persons.
Hospital*:	
General Purpose Hospital:	At least 10 percent of patient toilets and bedrooms, all public use, common use, or areas which may result in employment of physically handicapped persons.
Special Purpose Hospital: (Hospitals that treat conditions that affect mobility).	All patient toilets and bedrooms, all public use, common use, or areas which may result in employment of physically handicapped persons.

* See Part 6 for special applications.

(c) Institutional occupancies where the occupants are under some degree of restraint or restriction for security reasons including:

Facilities	Application
Jails Prisons Reformatories Other detention or correctional facilities	5 percent of residential units available, or at least one unit, whichever is greater; all common use, visitor use, or areas which may result in employment of physically handicapped persons.

(10) Mercantile. Mercantile occupancy includes, among others, all buildings and structures or parts thereof, for the display and sale of merchandise, and involving stocks of goods, wares or merchandise incidental to such purposes and accessible to the public.*

Facilities	Application
Department stores Drug stores Markets Retail stores Shopping centers Sales rooms	All areas for which the intended use will require public access or which may result in employment of physically handicapped persons.

* See Part 7 for special applications.

***(11) Residential.** Residential occupancy includes, among others, the use of a building or structure, or portion thereof, for sleeping accommodations when not classed as an institutional occupancy. Residential occupancies shall comply with the requirements of 4.1 and 4.34 except as follows:*

(a) Residential occupancies where the occupants are primarily transient in nature (less than 30 days) including:

Facilities	Application
Hotels Motels Boarding houses	5 percent of the total units, or at least one, whichever is greater, and all public use, common use, and areas which may result in employment of physically handicapped persons.

(b) Residential occupancies in multiple dwellings where the occupants are primarily permanent in nature, including:

Facilities	Application
Multifamily housing (Apartment houses):	
Federally assisted	5 percent of the total, or at least one unit, whichever is greater, in projects of 15 or more dwelling units, or as determined by the appropriate Federal agency following a local needs assessment conducted by local government bodies or states under applicable regulations.
Federally owned	5 percent of the total, or at least one unit, whichever is greater.
Dormitories	5 percent of the total, or at least one unit, whichever is greater.

10

(c) Residential occupancies in one (1) and two (2) family dwellings where the occupancies are primarily permanent in nature and not classified as preceding residential categories or as institutional.

Facilities	Application
One and two family dwelling:	
Federally assisted, rental	*5 percent of the total, or at least one unit, whichever is greater, in projects of 15 or more dwelling units, or as determined by the appropriate Federal agency following a local needs assessment conducted by local government bodies or states under applicable regulations.*
Federally assisted, homeownership	*To be determined by home buyer.*
Federally owned	*5 percent of the total, or at least one unit, whichever is greater.*

(12) Storage. *Storage occupancy includes, among others, the use of a building or structure, or portion thereof, for storage that is not classified as a Hazardous Occupancy.*

Facilities	Application
Metal desks *Electrical coils* *Electrical motors* *Dry cell batteries* *Metal parts* *Empty cans* *Stoves* *Washers & Dryers* *Metal cabinets* *Glass bottles with noncombustible liquid* *Mirrors* *Foods in noncombustible containers* *Frozen foods* *Meats* *Fresh fruits and vegetables* *Dairy products* *Beer or wine up to 12 percent alcohol* *Distribution transformers*	*All areas for which the intended use will require public access or which may result in employment of physically handicapped persons shall comply.*
Cement in bags *Electrical insulators* *Gypsum board* *Inert pigments* *Dry insecticides*	*All areas for which the intended use will require public access or which may result in employment of physically handicapped persons shall comply.*

(13) Utility and Miscellaneous. *Utility and miscellaneous occupancies include, among others, accessory buildings and structures, such as:*

Facilities	Application
Fences over 6 ft. high *Tanks* *Cooling towers* *Retaining walls* *Buildings of less than 1,000 sq. ft. such as:* *Private garages* *Carports* *Sheds* *Agricultural buildings*	*All areas for which the intended use will require public access or which may result in employment of physically handicapped persons shall comply.*

4.1.5 Accessible Buildings: Additions. *Each addition to an existing building shall comply with 4.1.1 to 4.1.4 of 4.1, Minimum Requirements, except as follows:*

(1) Entrances. *If a new addition to a building or facility does not have an entrance, then at least one entrance in the existing building or facility shall comply with 4.1.4, Entrances.*

(2) Accessible route. *If the only accessible entrance to the addition is located in the existing building or facility, then at least one accessible route shall comply with 4.3, Accessible Route, and shall provide access through the existing building or facility to all rooms, elements, and spaces in the new addition.*

(3) Toilet and bathing facilities. *If there are no toilet rooms and bathing facilities in the addition and these facilities are provided in the existing building, then at least one toilet and bathing facility in the existing building shall comply with 4.22, Toilet Rooms, or 4.23, Bathrooms, Bathing Facilities, and Shower Rooms.*

(4) Elements, spaces, and common areas. *If elements, spaces, or common areas are located in the existing building and they are not provided in the addition, then consideration should be given to making those elements, spaces, and common areas accessible in the existing building.*

11

4.1.5 Accessible Buildings: Additions

EXCEPTIONS: Mechanical rooms, storage areas, and other such minor additions which normally are not frequented by the public or employees of the facility are excepted from 4.1.5.

*(5) **Housing:** (Reserved).*

4.1.6 Accessible Buildings: Alterations.

*(1) **General.** Alterations to existing buildings or facilities shall comply with the following:*

(a) If existing elements, spaces, essential features, or common areas are altered, then each such altered element, space, feature, or area shall comply with the applicable provisions of 4.1.1 to 4.1.4 of 4.1, Minimum Requirements.

(b) If power-driven vertical access equipment (e.g., escalator) is planned or installed where none existed previously, or if new stairs (other than stairs installed to meet emergency exit requirements) requiring major structural changes are planned or installed where none existed previously, then a means of accessible vertical access shall be provided that complies with 4.7, Curb Ramps; 4.8, Ramps; 4.10, Elevators; or 4.11, Platform Lifts; except to the extent where it is structurally impracticable in transit facilities.

(c) If alterations of single elements, when considered together, amount to an alteration of a space of a building or facility, the entire space shall be made accessible.

(d) No alteration of an existing element, space, or area of a building shall impose a requirement for greater accessibility than that which would be required for new construction. For example, if the elevators and stairs in a building are being altered and the elevators are, in turn, being made accessible, then no accessibility modifications are required to the stairs connecting levels connected by the elevator.

(e) If the alteration work is limited solely to the electrical, mechanical, or plumbing system and does not involve the alteration of any elements and spaces required to be accessible under these standards, then 4.1.6(3) does not apply.

(f) No new accessibility alterations will be required of existing elements or spaces previously constructed or altered in compliance with earlier standards issued pursuant to the Architectural Barriers Act of 1968, as amended.

(g) Mechanical rooms and other spaces which normally are not frequented by the public or employees of the building or facility or which by nature of their use are not required by the Architectural Barriers Act to be accessible are excepted from the requirements of 4.1.6.

(2) Where a building or facility is vacated and it is totally altered, then it shall be altered to comply with 4.1.1 to 4.1.5 of 4.1, Minimum Requirements, except to the extent where it is structurally impracticable.

(3) Where substantial alteration occurs to a building or facility, then each element or space that is altered or added shall comply with the applicable provisions of 4.1.1 to 4.1.4 of 4.1, Minimum Requirements, except to the extent where it is structurally impracticable. The altered building or facility shall contain:

(a) At least one accessible route complying with 4.3, Accessible Route, and 4.1.6(a);

(b) At least one accessible entrance complying with 4.14, Entrances. If additional entrances are altered then they shall comply with 4.1.6(a); and

(c) The following toilet facilities, whichever is greater:

(i) At least one toilet facility for each sex in the altered building complying with 4.22, Toilet Rooms, and 4.23, Bathrooms, Bathing Facilities, and Shower Rooms.

(ii) At least one toilet facility for each sex on each substantially altered floor, where such facilities are provided, complying with 4.22, Toilet Rooms; and 4.23, Bathrooms, Bathing Facilities, and Shower Rooms.

(d) In making the determination as to what constitutes "substantial alteration," the agency issuing standards for the facility shall consider the total cost of all alterations (including but not limited to electrical, mechanical, plumbing, and structural changes) for a building or facility within any twelve (12) month period. For guidance in implementing this provision, an alteration to any building or facility is to be considered substantial if the total cost for this twelve month period amounts to 50 percent or more of the full and fair cash value of the building as defined in 3.5.

EXCEPTION: If the cost of the elements and spaces required by 4.1.6(3)(a), (b), or (c) exceeds 15 percent of the total cost of all other alterations, then a schedule may be established by the standard-setting and/or funding agency to provide the required improvements within a 5-year period.

EXCEPTION: Consideration shall be given to providing accessible elements and spaces in each altered building or facility complying with:

(i) 4.6, Parking and Passenger Loading Zones,
(ii) 4.15, Drinking Fountains and Water Coolers,
(iii) 4.25, Storage,
(iv) 4.28, Alarms,
(v) 4.31, Telephones,
(vi) 4.32, Seating, Tables, and Work Surfaces,
(vii) 4.33, Assembly Areas.

(4) Special technical provisions for alterations to existing buildings or facilities:

12

(a) *Ramps. Curb ramps and ramps to be constructed on existing sites or in existing buildings or facilities may have slopes and rises as shown in Table 2 if space limitations prohibit the use of a 1:12 slope or less.*

Table 2
Allowable Ramp Dimensions for Construction in Existing Sites, Buildings, and Facilities

	Maximum Rise		Maximum Run	
Slope*	in	mm	ft	m
Steeper than 1:10 but no steeper than 1:8	3	75	2	0.6
Steeper than 1:12 but no steeper than 1:10	6	150	5	1.5

*A slope steeper than 1:8 not allowed.

(b) *Stairs. Full extension of stair handrails shall not be required in alterations where such extensions would be hazardous or impossible due to plan configuration.*

(c) *Elevators.*

(i) *If a safety door edge is provided in existing automatic elevators, then the automatic door reopening devices may be omitted (see 4.10.6).*

(ii) *Where existing shaft or structural elements prohibit strict compliance with 4.10.9, then the minimum floor area dimensions may be reduced by the minimum amount necessary, but in no case shall they be less than 48 in by 48 in (1220 mm by 1220 mm).*

(d) *Doors.*

(i) *Where existing elements prohibit strict compliance with the clearance requirements of 4.13.5, a projection of 5/8 in (16 mm) maximum will be permitted for the latch side door stop.*

(ii) *If existing thresholds measure 3/4 in (19 mm) high or less, and are beveled or modified to provide a beveled edge on each side, then they may be retained.*

(e) *Toilet rooms. Where alterations to existing facilities make strict compliance with 4.22 and 4.23 structurally impracticable, the addition of one "unisex" toilet per floor containing one water closet complying with 4.16 and one lavatory complying with 4.19, located adjacent to existing toilet facilities, will be acceptable in lieu of making existing toilet facilities for each sex accessible.*

EXCEPTION: In instances of alteration work where provision of a standard stall (Fig. 30(a)) is structurally impracticable or where plumbing code requirements prevent combining existing stalls to provide space, an alternate stall (Fig. 30(b)) may be provided in lieu of the standard stall.

(f) Assembly areas.

(i) *In alterations where it is structurally impracticable to disperse seating throughout the assembly area, seating may be located in collected areas as structurally feasible. Seating shall adjoin an accessible route that also serves as a means of emergency egress.*

(ii) *In alterations where it is structurally impracticable to alter all performing areas to be on an accessible route, then at least one of each type shall be made accessible.*

(5) Housing. *(Reserved).*

4.1.7 *Accessible Buildings: Historic Preservation.*

(1) ***Applicability.***

(a) *As a general rule, the accessibility provisions of part 4 shall be applied to "qualified" historic buildings and facilities. "Qualified" buildings or facilities are those buildings and facilities that are eligible for listing in the National Register of Historic Places, or such properties designated as historic under a statute of the appropriate state or local government body. Comments of the Advisory Council on Historic Preservation shall be obtained when required by Section 106 of the National Historic Preservation Act of 1966, as amended, 16 U.S.C. 470 and 36 CFR Part 800, before any alteration to a qualified historic building.*

(b) *The Advisory Council shall determine, on a case-by-case basis, whether provisions required by part 4 for accessible routes (exterior and interior), ramps, entrances, toilets, parking, and displays and signage, would threaten or destroy the historic significance of the building or facility.*

(c) *If the Advisory Council determines that any of the accessibility requirements for features listed in 4.1.7(1) would threaten or destroy the historic significance of a building or facility, then the special application provisions of 4.1.7(2) for that feature may be utilized. The special application provisions listed under 4.1.7(2) may only be utilized following a written determination by the Advisory Council that application of a requirement contained in part 4 would threaten or destroy the historic integrity of a qualified building or facility.*

4.1.7 Accessible Buildings: Historic Preservation

(2) ***Historic Preservation: Minimum Requirements.***

(a) *At least one accessible route complying with 4.3 from a site access point to an accessible entrance shall be provided.*

EXCEPTION: A ramp with a slope no greater than 1:6 for a run not to exceed 2 ft (610 mm) may be used as part of an accessible route at an entrance.

(b) *At least one accessible entrance which is used by the public complying with 4.14 shall be provided.*

EXCEPTION: If it is determined that no entrance used by the public can comply with 4.14, then access at any entrance not used by the general public but open (unlocked) with directional signs at the primary entrance may be used.

(c) *If toilets are provided, then at least one toilet facility complying with 4.22 and 4.1.6 shall be provided along an accessible route that complies with 4.3. Such toilet facility may be "unisex" in design.*

(d) *Accessible routes from an accessible entrance to all publicly used spaces on at least the level of the accessible entrance shall be provided. Access should be provided to all levels of a building or facility in compliance with 4.1 whenever practical.*

(e) *Displays and written information, documents, etc., should be located where they can be seen by a seated person. Exhibits and signage displayed horizontally, e.g., books, should be no higher than 44 in (1120 mm) above the floor surface.*

4.2 Space Allowance and Reach Ranges

4.2.1* Wheelchair Passage Width. The minimum clear width for single wheelchair passage shall be 32 in (815 mm) at a point and 36 in (915 mm) continuously (see Fig. 1 *and 24(e)).*

4.2.2 Width for Wheelchair Passing. The minimum width for two wheelchairs to pass is 60 in (1525 mm) (see Fig. 2).

4.2.3* Wheelchair Turning Space. The space required for a wheelchair to make a 180-degree turn is a clear space of 60 in (1525 mm) diameter (see Fig. 3(a)) or a T-shaped space (see Fig. 3(b)).

4.2.4* Clear Floor or Ground Space for Wheelchairs.

4.2.4.1 Size and Approach. The minimum clear floor or ground space required to accommodate a single, stationary wheelchair occupant is 30 in by 48 in (760 mm by 1220 mm) (see Fig. 4(a)). The minimum clear floor or ground space for wheelchairs may be positioned for forward or parallel approach to an object

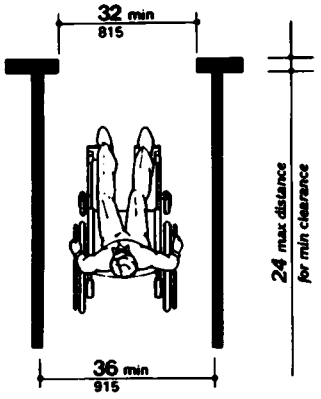


Fig. 1
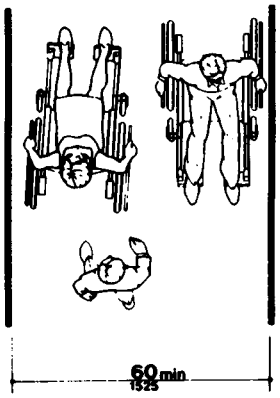
Minimum Clear Width for Single Wheelchair



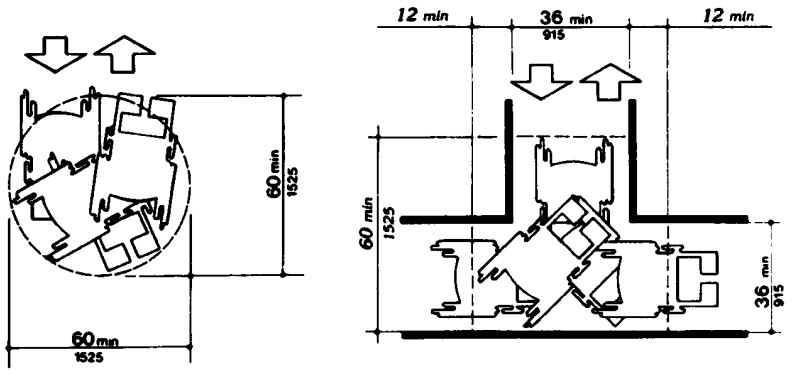


Fig. 2
Minimum Clear Width for Two Wheelchairs

(a)
60-in (1525-mm)-Diameter Space

(b)
T-Shaped Space for 180° Turns

Fig. 3
Wheelchair Turning Space

(see Fig. 4(b) and (c)). Clear floor or ground space for wheelchairs may be part of the knee space required under some objects.

4.2.4.2 Relationship of Maneuvering Clearance to Wheelchair Spaces. One full unobstructed side of the clear floor or ground space for a wheelchair shall adjoin or overlap an accessible route or adjoin another wheelchair clear floor space. If a clear floor space is located in an alcove or otherwise confined on all or part of three sides, additional maneuvering clearances shall be provided as shown in Fig. 4(d) and (e).

4.2.4.3 Surfaces for Wheelchair Spaces. Clear floor or ground spaces for wheelchairs shall comply with 4.5.

4.2.5 Forward Reach. If the clear floor space only allows forward approach to an object, the maximum high forward reach allowed shall be 48 in (1220 mm) (see Fig. 5(a)). *The minimum low forward reach is 15 in (380 mm).* If the high forward reach is over an obstruction, reach and clearances shall be as shown in Fig. 5(b).

4.2.6* Side Reach. If the clear floor space allows parallel approach by a person in a wheelchair, the maximum high side reach allowed shall be 54 in (1370 mm) and the low side reach shall be no less than 9 in (230 mm) above the floor (Fig. 6(a) and (b)). If the side reach is over an obstruction, the reach and clearances shall be as shown in Fig. 6(c).

4.3 Accessible Route.

4.3.1* General. All walks, halls, corridors, aisles, and other spaces that are part of an accessible route shall comply with 4.3.

4.3.2 Location.

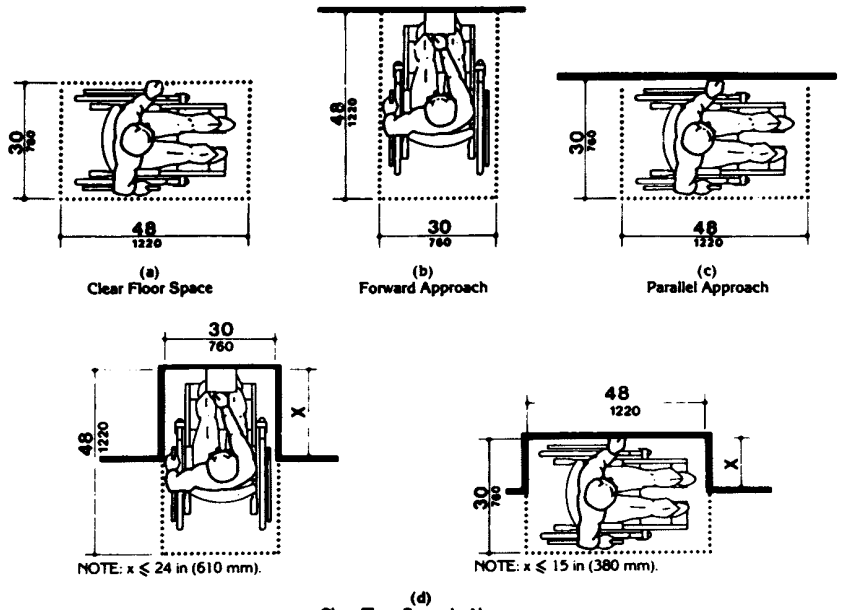
(1) At least one accessible route *within the boundary of the site* shall be provided from public transportation stops, accessible parking, and accessible passenger loading zones, and public streets or sidewalks to the accessible building entrance they serve.

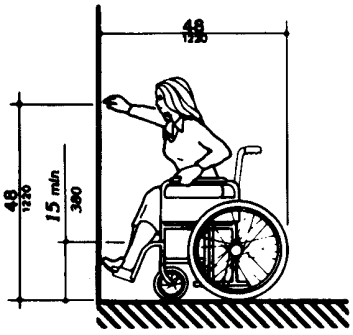
(2) At least one accessible route shall connect accessible buildings, facilities, elements, and spaces that are on the same site.

(3) At least one accessible route shall connect accessible building or facility entrances with all accessible spaces and elements and with all accessible dwelling units within the building or facility.

(4) An accessible route shall connect at least one accessible entrance of each accessible dwelling unit with those exterior and interior spaces and facilities that serve the accessible dwelling unit.

4.3 Accessible Route





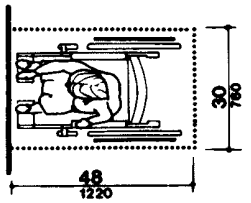


Fig. 4
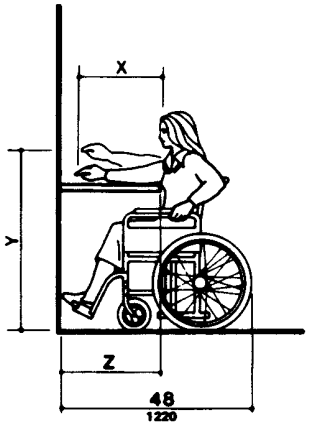
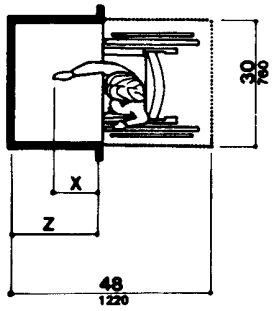
Minimum Clear Floor Space for Wheelchairs



16



4.3 Accessible Route

(a)
High Forward Reach Limit

NOTE: x shall be ≤ 25 in (635 mm); z shall be ≥ x. When x < 20 in (510 mm), then y shall be 48 in (1220 mm) maximum. When x is 20 to 25 in (510 to 635 mm), then y shall be 44 in (1120 mm) maximum.

(b)
Maximum Forward Reach over an Obstruction

Fig. 5
Forward Reach

17

4.3 Accessible Route

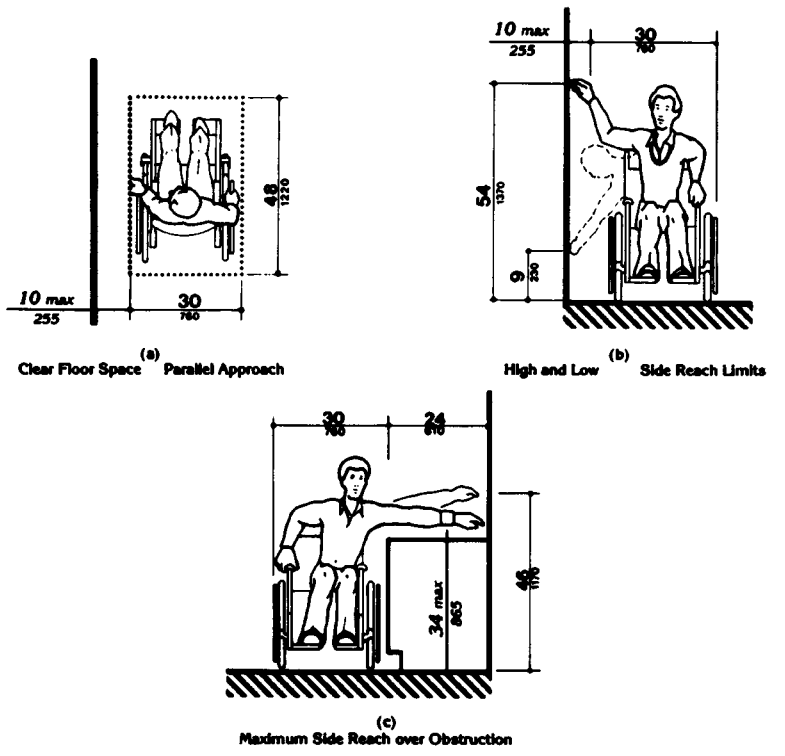


Fig. 6
Side Reach

4.3.3 Width. The minimum clear width of an accessible route shall be 36 in (915 mm) except at doors (see 4.13.5). If a person in a wheelchair must make a turn around an obstruction, the minimum clear width of the accessible route shall be as shown in Fig. 7.

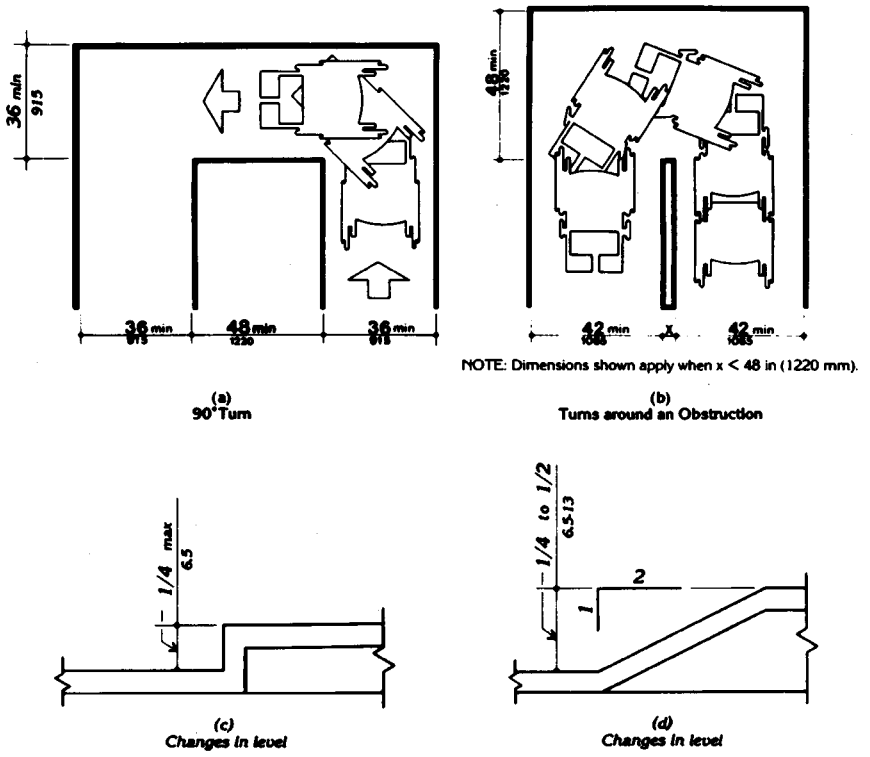
4.3.4 Passing Space. If an accessible route has less than 60 in (1525 mm) clear width, then passing spaces at least 60 in by 60 in (1525 mm by 1525 mm) shall be located at reasonable intervals not to exceed 200 ft (61 m). A T-intersection of two corridors or walks is an acceptable passing place.

4.3.5 Head Room. Accessible routes shall comply with 4.4.2.

4.3.6 Surface Textures. The surface of an accessible route shall comply with 4.5.

4.3.7 Slope. An accessible route with a running slope greater than 1:20 is a ramp and shall comply with 4.8. Nowhere shall the cross slope of an accessible route exceed 1:50.

18



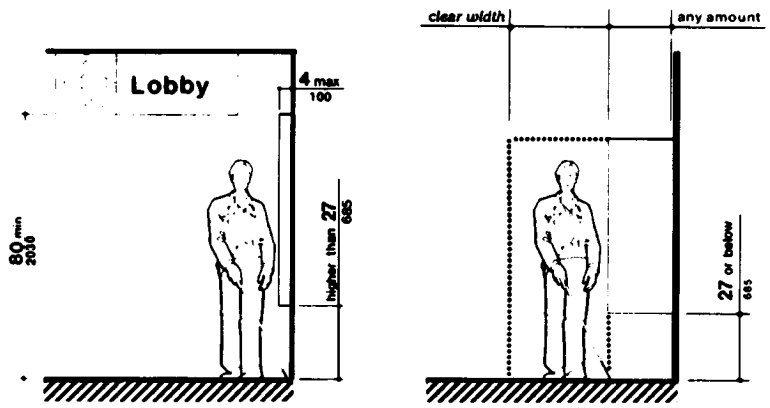


Fig. 7
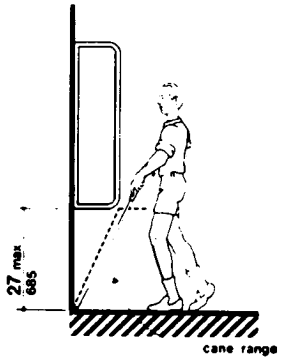
Width of Accessible Route

4.3.8 Changes in Levels. Changes in levels along an accessible route shall comply with 4.5.2. If an accessible route has changes in level greater than 1/2 in (13 mm), then a curb ramp, ramp, elevator, or platform lift shall be provided that complies with 4.7, 4.8, 4.10, or 4.11, respectively. Stairs shall not be part of an accessible route.



4.3.9 Doors. Doors along an accessible route shall comply with 4.13.

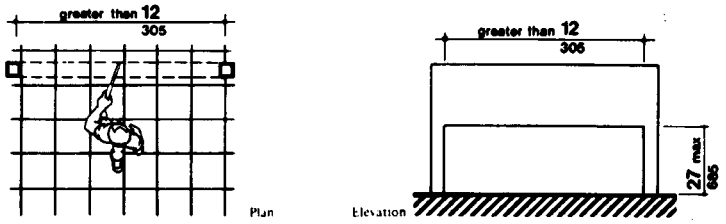
4.3.10* Egress. Accessible routes serving any accessible space or element shall also serve as a means of egress for emergencies or connect to an accessible place of refuge. Such accessible routes and places of refuge shall comply with the requirements of the administrative authority having jurisdiction. *Where fire code provisions require more than one means of egress from any space or room, then more than one accessible means of egress shall also be provided for handicapped people. Arrange egress so as to be readily accessible from all accessible rooms and spaces.*

4.4 Protruding Objects

(a)
Walking Parallel to a Wall

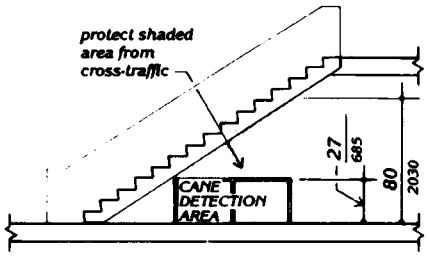
(b)
Walking Perpendicular to a Wall

Fig. 8
Protruding Objects



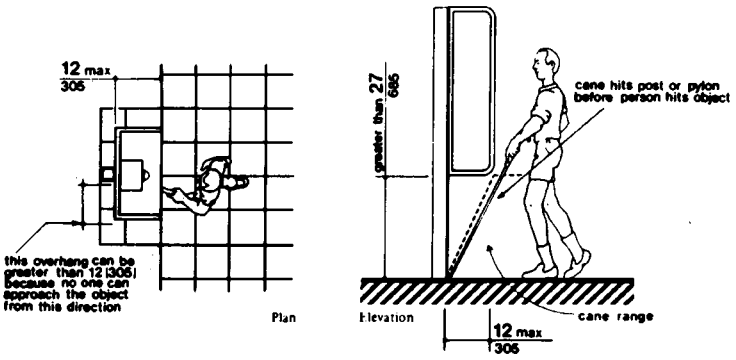
4.4 Protruding Objects.

4.4.1* General. Objects projecting from walls (for example, telephones) with their leading edges between 27 in and 80 in (685 mm and 2030 mm) above the finished floor shall protrude no more than 4 in (100 mm) into walks, halls, corridors, passageways, or aisles (see Fig. 8(a)). Objects mounted with their leading edges at or below 27 in (685 mm) above the finished floor may protrude any amount (see Fig. 8(a) and (b)). Free-standing objects mounted on posts or pylons may overhang 12 in (305 mm) maximum from 27 in to 80 in (685 mm to 2030 mm) above the ground or finished floor (see Fig. 8(c) and (d)). Protruding objects shall not reduce the clear width of an accessible route or maneuvering space (see Fig. 8(e)).



4.4.2 Head Room. Walks, halls, corridors, passageways, aisles, or other circulation spaces shall have 80 in (2030 mm) minimum clear head room (see Fig. 8(a)). *If vertical clearance of an area adjoining an accessible route is reduced to less than 80 in (nominal dimension), a barrier to warn blind or visually-impaired persons shall be provided (see Fig. 8(c)).*

20



4.4 Protruding Objects

Fig. 8
Protruding Objects *(Continued)*

4.5 Ground and Floor Surfaces.

4.5.1* General. Ground and floor surfaces along accessible routes and in accessible rooms and spaces, including floors, walks, ramps, stairs, and curb ramps, shall be stable, firm, *slip-resistant*, and shall comply with 4.5.

4.5.2 Changes in Level. Changes in level up to 1/4 in (6 mm) may be vertical and without edge treatment *(see Fig. 7(c))*. Changes in level between 1/4 in and 1/2 in (6 mm and 13 mm) shall be beveled with a slope no greater than 1:2 *(see Fig. 7(d))*. Changes in level greater than 1/2 in (13 mm) shall be accomplished by means of a ramp that complies with 4.7 or 4.8.

4.5.3* Carpet. If carpet or carpet tile is used on a ground or floor surface, then it shall be securely attached; have a firm cushion, pad, or backing or no cushion or pad; and have a level loop, textured loop, level cut pile, or level cut/uncut pile texture. The maximum pile height shall be 1/2 in (13 mm). Exposed edges of carpet shall be fastened to floor surfaces and have trim along the entire length of the exposed edge. Carpet edge trim shall comply with 4.5.2. *If carpet tile is used on an accessible ground or floor surface, it shall have a maximum combined thickness of pile, cushion, and backing height of 1/2 in (13 mm) (see Fig. 8(f)).*

4.5.4 Gratings. If gratings are located in walking surfaces, then they shall have spaces no greater than 1/2 in (13 mm) wide in one direction *(see Fig. 8(g))*. If gratings have elongated openings, then they shall be placed so that the long dimension is perpendicular to the dominant direction of travel *(see Fig. 8(h))*.

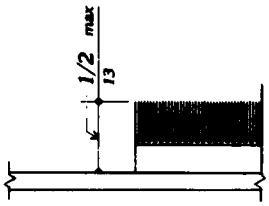

Fig. 8(f)
Carpet Tile Thickness

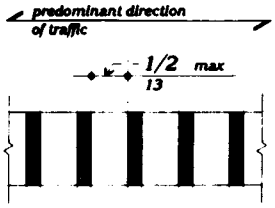

Fig. 8(g)
Gratings

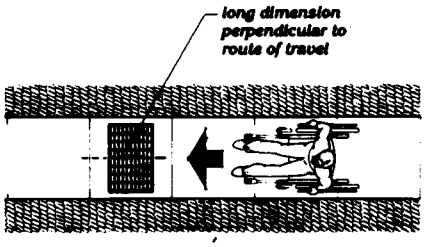

Fig. 8(h)
Grating Orientation

4.6 Parking and Passenger Loading Zones.

4.6.1 Minimum Number. *Parking spaces required to be accessible by 4.1 shall comply with 4.6.2 through 4.6.4. Passenger loading zones required to be accessible by 4.1 shall comply with 4.6.5 and 4.6.6.*

4.6.2 Location. Parking spaces for disabled people and accessible passenger loading zones that serve a particular building shall be *the spaces or zones located closest to the nearest accessible entrance on an accessible route.* In separate parking structures or lots that do not serve a particular building, parking spaces for disabled people shall be located on the shortest possible circulation route to an accessible pedestrian entrance of the parking facility.

4.6.3* Parking Spaces. Parking spaces for disabled people shall be at least 96 in (2440 mm) wide and shall have an adjacent access aisle 60 in (1525 mm) wide minimum (see Fig. 9). Parking access aisles shall be part of an accessible route to the building or facility entrance and shall comply with 4.3. Two accessible parking spaces may share a common access aisle. Parked vehicle overhangs shall not reduce the clear width of an accessible circulation route. *Parking spaces and access aisles shall be level with surface slopes not exceeding 1:50 in all directions.*

EXCEPTION: If accessible parking spaces for vans designed for handicapped persons are provided, each should have an adjacent access aisle at least 96 in (2440 mm) wide complying with 4.5, Ground and Floor Surfaces.

4.6.4* Signage. Accessible parking spaces shall be designated as reserved for the disabled by a sign showing the symbol of accessibility (see 4.30.5). Such signs shall not be obscured by a vehicle parked in the space.

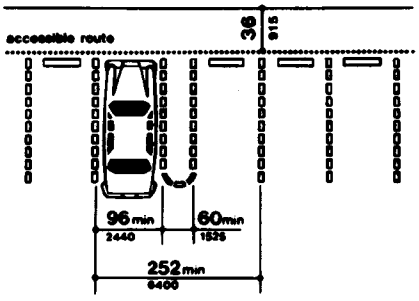

Fig. 9
Dimensions of Parking Spaces

4.6 Parking and Passenger Loading Zones

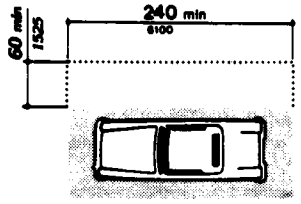

Fig. 10
Access Aisle at Passenger Loading Zones

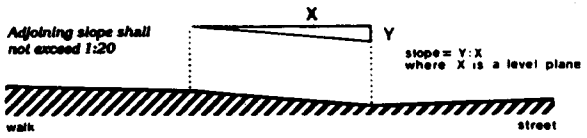
4.6.5 Passenger Loading Zones. Passenger loading zones shall provide an access aisle at least 60 in (1525 mm) wide and 20 ft (6 m) long adjacent and parallel to the vehicle pull-up space (see Fig. 10). If there are curbs between the access aisle and the vehicle pull-up space, then a curb ramp complying with 4.7 shall be provided. *Vehicle standing spaces and access aisles shall be level with surface slopes not exceeding 1:50 in all directions.*

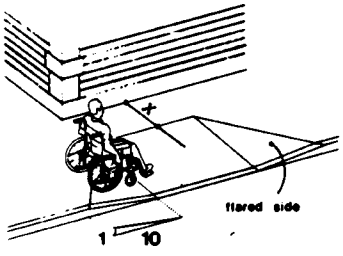
4.6.6 *Vertical Clearance.* *Provide minimum vertical clearances of 114 in at accessible passenger loading zones and along vehicle access routes to such areas from site entrances. If accessible van parking spaces are provided, then the minimum vertical clearance should be 114 in.*

4.7 Curb Ramps.

4.7.1 Location. Curb ramps complying with 4.7 shall be provided wherever an accessible route crosses a curb.

4.7.2 Slope. Slopes of curb ramps shall comply with 4.8.2. The slope shall be measured as shown in Fig. 11. *Transitions from ramps to walks, gutters, or streets shall be flush and free of abrupt changes. Maximum slopes of adjoining gutters, road surface immediately adjacent to the curb ramp, or accessible route shall not exceed 1:20.*





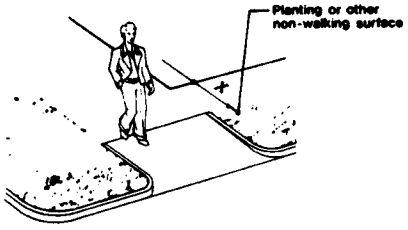


Fig. 11
Measurement of Curb Ramp Slopes

(a)
Flared Sides

(b)
Returned Curb

If X is less than 48 in, then the slope of the flared side shall not exceed 1:12.

Fig. 12
Sides of Curb Ramps

4.7.3 Width. The minimum width of a curb ramp shall be 36 in (915 mm), exclusive of flared sides.

4.7.4 Surface. Surfaces of curb ramps shall comply with 4.5.

4.7.5 Sides of Curb Ramps. If a curb ramp is located where pedestrians must walk across the ramp, *or where it is not protected by handrails or guardrails,* then it shall have flared sides; the maximum slope of the flare shall be 1:10 (see Fig. 12(a)). Curb ramps with returned curbs may be used where pedestrians would not normally walk across the ramp (see Fig. 12(b)).

4.7.6 Built-up Curb Ramps. Built-up curb ramps shall be located so that they do not project into vehicular traffic lanes (see Fig. 13).

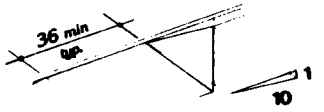

Fig. 13
Built-Up Curb Ramp

4.7.7 Warning Textures. *(Removed and reserved).*

4.7.8 Obstructions. Curb ramps shall be located or protected to prevent their obstruction by parked vehicles.

4.7.9 Location at Marked Crossings. Curb ramps at marked crossings shall be wholly contained within the markings, excluding any flared sides (see Fig. 15).

4.7.10 Diagonal Curb Ramps. If diagonal (or corner type) curb ramps have returned curbs or other well-defined edges, such edges shall be parallel to the direction of pedestrian flow. The bottom of diagonal curb ramps shall have 48 in (1220 mm) minimum clear space as shown in Fig. 15(c) and (d). If diagonal curb ramps are provided at marked crossings, the 48 in (1220 mm) clear space shall be within the markings (see Fig. 15(c) and (d)). If diagonal curb ramps have flared sides, they shall also have at least a 24 in (610 mm) long segment of straight curb located on each side of the curb ramp and within the marked crossing (see Fig. 15(c)).

4.7.11 Islands. Any raised islands in crossings shall be cut through level with the street or have curb ramps at both sides and a level area at least 48 in (1220 mm) long in the part of the island intersected by the crossings (see Fig. 15(a) and (b)).

4.7.12 Uncurbed Intersections. *(Removed and reserved).*

4.8 Ramps.

4.8.1* General. Any part of an accessible route with a slope greater than 1:20 shall be considered a ramp and shall comply with 4.8.

4.8.2* Slope and Rise. The least possible slope shall be used for any ramp. The maximum slope of a ramp in new construction shall be 1:12. The maximum rise for any run shall be 30 in (760 mm) (see Fig. 16). Curb ramps and ramps to be constructed on existing sites or in existing buildings or facilities may have slopes and rises as shown in Table 2 if space limitations prohibit the use of a 1:12 slope or less *(see 4.1.6).*

4.8.3 Clear Width. The minimum clear width of a ramp shall be 36 in (915 mm).

4.8.4 Landings. Ramps shall have level landings at the bottom and top of each run. Landings shall have the following features:

(1) The landing shall be at least as wide as the ramp run leading to it.

(2) The landing length shall be a minimum of 60 in (1525 mm) clear.

(3) If ramps change direction at landings, the minimum landing size shall be 60 in by 60 in (1525 mm by 1525 mm).

(4) If a doorway is located at a landing, then the area in front of the doorway shall comply with 4.13.6.

4.8.5* Handrails. If a ramp run has a rise greater than 6 in (250 mm) or a horizontal projection greater than 72 in (1830 mm), then it shall have handrails on both sides. Handrails are not required on curb ramps. Handrails shall comply with 4.26 and shall have the following features:

(1) Handrails shall be provided along both sides of ramp segments. The inside handrail on switchback or dogleg ramps shall always be continuous.

(2) If handrails are not continuous, they shall extend at least 12 in (305 mm) beyond the top and bottom of the ramp segment and shall be parallel with the floor or ground surface.

(3) The clear space between the handrail and the wall shall be 1-1/2 in (38 mm).

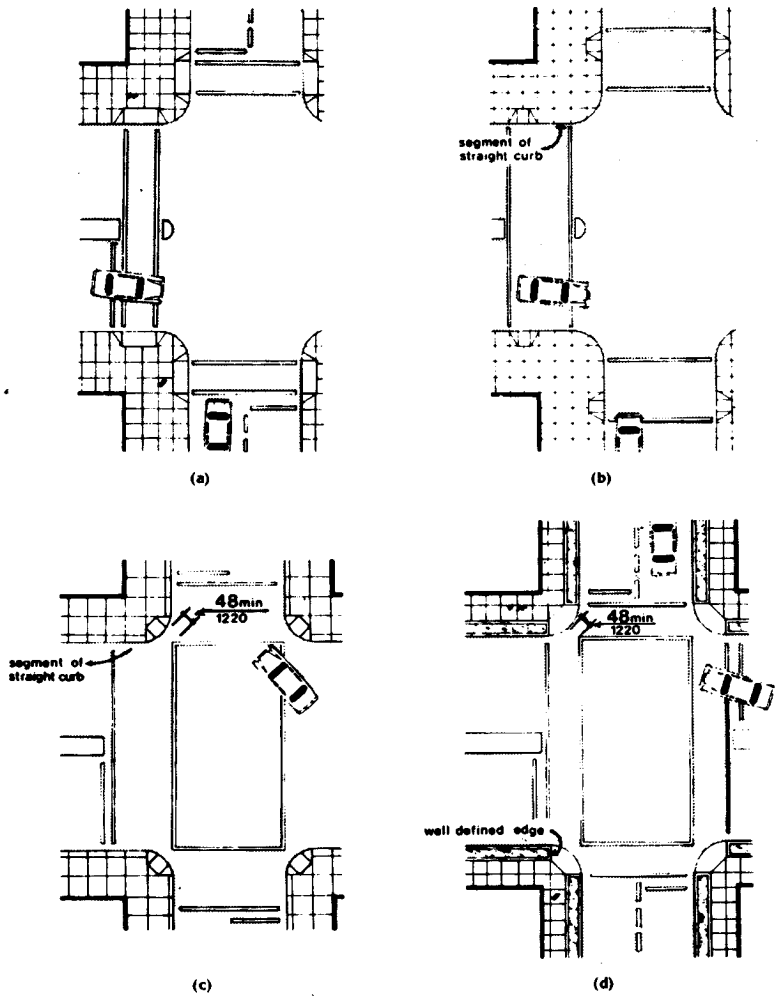
(4) Gripping surfaces shall be continuous.

(5) *Top of handrail gripping surfaces shall be mounted between 30 in and 34 in (760 mm and 865 mm) above ramp surfaces.*

(6) *Ends of handrails shall be either rounded or returned smoothly to floor, wall, or post.*

(7) *Handrails shall not rotate within their fittings.*

4.8 Ramps



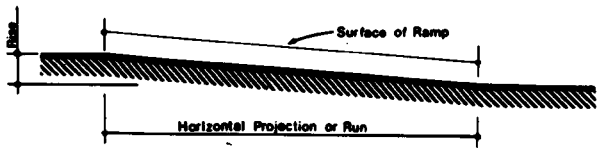


Fig. 15
Curb Ramps at Marked Crossings

26

Slope	Maximum Rise in	Maximum Rise mm	Maximum Horizontal Projection ft	Maximum Horizontal Projection m
1:12 to < 1:16	30	760	30	9
1:16 to < 1:20	30	760	40	12

Fig. 16
Components of a Single Ramp Run and Sample Ramp Dimensions

4.8.6 Cross Slope and Surfaces. The cross slope of ramp surfaces shall be no greater than 1:50. Ramp surfaces shall comply with 4.5.

4.8.7 Edge Protection. Ramps and landings with drop-offs shall have curbs, walls, railings, or projecting surfaces that prevent people from slipping off the ramp. Curbs shall be a minimum of 2 in (50 mm) high (see Fig. 17).

4.8.8 Outdoor Conditions. Outdoor ramps and their approaches shall be designed so that water will not accumulate on walking surfaces.

4.9 Stairs.

4.9.1 Minimum Number. Stairs *required to be accessible by 4.1 shall comply with 4.9.*

4.9.2 Treads and Risers. On any given flight of stairs, all steps shall have uniform riser heights and uniform tread widths. Stair treads shall be no less than 11 in (280 mm) wide, measured from riser to riser (see Fig. 18(a)). *Open risers are not permitted on accessible routes.*

4.9.3 Nosings. The undersides of nosings shall not be abrupt. The radius of curvature at the leading edge of the tread shall be no greater than 1/2 in (13 mm). Risers shall be sloped or the underside of the nosing shall have an angle not less than 60 degrees from the horizontal. Nosings shall project no more than 1-1/2 in (38 mm) (see Fig. 18).

4.9.4 Handrails. Stairways shall have handrails at both sides of all stairs. Handrails shall comply with 4.26 and shall have the following features:

(1) Handrails shall be continuous along both sides of stairs. The inside handrail on switchback or dogleg stairs shall always be continuous (see Fig. 19(a) and (b)).

(2) If handrails are not continuous, they shall extend at least 12 in (305 mm) beyond the top riser and at least 12 in (305 mm) plus the width of one tread beyond the bottom riser. At the top, the extension shall be parallel with the floor or ground surface. At the bottom, the handrail shall continue to slope for a distance of the width of one tread from the bottom riser; the remainder of the extension shall be horizontal (see Fig. 19(c) and (d)). Handrail extensions shall comply with 4.4.

(3) The clear space between handrails and wall shall be 1-1/2 in (38 mm).

(4) Gripping surfaces shall be uninterrupted by newel posts, other construction elements, or obstructions.

(5) *Top of handrail gripping surface shall be mounted between 30 in and 34 in (760 mm and 865 mm) above stair nosings.*

(6) *Ends of handrails shall be either rounded or returned smoothly to floor, wall, or post.*

(7) *Handrails shall not rotate within their fittings.*

4.9.5 Tactile Warnings at Stairs. *(Removed and reserved).*

4.9.6 Outdoor Conditions. Outdoor stairs and their approaches shall be designed so that water will not accumulate on walking surfaces.

4.9 Stairs

NOTE:
X is the 12 in minimum handrail extension required at each top riser.

Y is the minimum handrail extension of 12 in plus the width of one tread that is required at each bottom riser.

Fig. 19
Stair Handrails

29

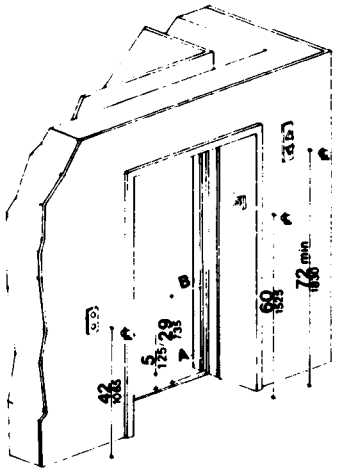
4.10 Elevators

4.10 Elevators.

4.10.1 General. *Accessible* elevators shall be on an accessible route and shall comply with 4.10 and with the American National Standard Safety Code for Elevators, Dumbwaiters, Escalators, and Moving Walks, ANSI A17.1-1978 and A17.1a-1979. This standard does not preclude the use of residential or fully enclosed wheelchair lifts when appropriate and approved by administrative authorities. *Freight elevators shall not be considered as meeting the requirements of this section, unless the only elevators provided are used as combination passenger and freight elevators for the public and employees.*

4.10.2 Automatic Operation. Elevator operation shall be automatic. Each car shall be equipped with a self-leveling feature that will automatically bring the car to floor landings within a tolerance of 1/2 in (13 mm) under rated loading to zero loading conditions. This self-leveling feature shall be automatic and independent of the operating device and shall correct the overtravel or undertravel.

4.10.3 Hall Call Buttons. Call buttons in elevator lobbies and halls shall be centered at 42 in (1065 mm) above the floor. Such call buttons shall have visual signals to indicate when each call is registered and when each call is answered. Call buttons shall be a minimum of 3/4 in (19 mm) in the smallest dimension. The button designating the up direction shall be on top (see Fig. 20). *Buttons shall be raised or flush. Objects mounted beneath hall call buttons shall not project into the elevator lobby more than 4 in (100 mm).*



4.10.4 Hall Lanterns. A visible and audible signal shall be provided at each hoistway entrance to indicate which car is answering a call. Audible signals shall sound once for the up direction and twice for the down direction or shall have verbal annunciators that say "up" or "down." Visible signals shall have the following features:

(1) Hall lantern fixtures shall be mounted so that their centerline is at least 72 in (1830 mm) above the lobby floor.

(2) Visual elements shall be at least 2-1/2 in (64 mm) in the smallest dimension.

(3) Signals shall be visible from the vicinity of the hall call button. In-car lanterns located in cars, visible from the vicinity of hall call buttons, and conforming to the above requirements, shall be acceptable (see Fig. 20).

4.10.5 *Raised* Characters on Hoistway Entrances. All elevator hoistway entrances shall have *raised* floor designations provided on both jambs. The centerline of the characters shall be 60 in (1525 mm) from the floor. Such characters shall be 2 in (50 mm) high and shall comply with 4.30. Permanently applied plates are acceptable if they are permanently fixed to the jambs. (See Fig. 20).

NOTE: The automatic door reopening device is activated if an object passes through either line A or line B. Line A and line B represent the vertical locations of the door reopening device not requiring contact.

Fig. 20
Hoistway and Elevator Entrances

4.10.6* Door Protective and Reopening Device. Elevator doors shall open and close automatically. They shall be provided with a reopening device that will stop and reopen a car door and hoistway door automatically if the door becomes obstructed by an object or person. The device shall be capable of completing these operations without requiring contact for an obstruction passing through the opening at heights of 5 in and 29 in (125 mm and 735 mm) from the floor (see Fig. 20). Door reopening devices shall remain effective for at least 20 seconds. After such an interval, doors may close in accordance with the requirements of ANSI A17.1-1978 and A17.1a-1979.

4.10.7* Door and Signal Timing for Hall Calls. The minimum acceptable time from notification that a car is answering a call until the doors of that car start to close shall be calculated from the following equation:

$$T = \frac{D}{1.5\ ft/s} \qquad \text{or } T = \frac{D}{445\ mm/s}$$

where T = total time in seconds and D = distance (in feet or millimeters) from a point in the lobby or corridor 60 in (1525 mm) directly in front of the farthest

call button controlling that car to the centerline of its hoistway door (see Fig. 21). For cars with in-car lanterns, T begins when the lantern is visible from the vicinity of hall call buttons and an audible signal is sounded. *The minimum acceptable notification time shall be 5 seconds.*

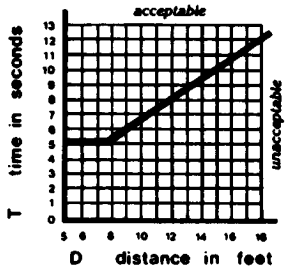


Fig. 21
Graph of Timing Equation

4.10.8 Door Delay for Car Calls. The minimum time for elevator doors to remain fully open in response to a car call shall be 3 seconds.

4.10.9 Floor Plan of Elevator Cars. The floor area of elevator cars shall provide space for wheelchair users to enter the car, maneuver within reach of controls, and exit from the car. Acceptable door opening and inside dimensions shall be as shown in Fig. 22. The clearance between the car platform sill and the edge of any hoistway landing shall be no greater than 1-1/4 in (32 mm).

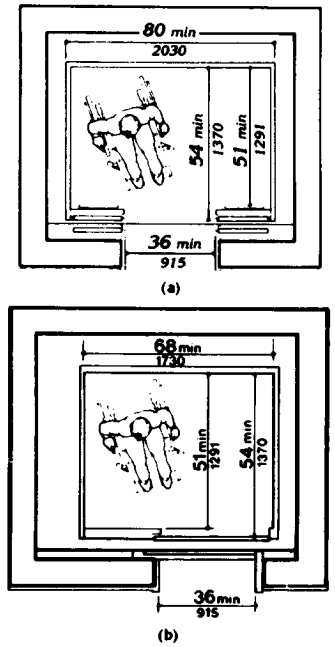
4.10.10 Floor Surfaces. Floor surfaces shall comply with 4.5.

4.10.11 Illumination Levels. The level of illumination at the car controls, platform, and car threshold and landing sill shall be at least 5 footcandles (53.8 lux).

4.10.12* Car Controls. Elevator control panels shall have the following features:

(1) Buttons. All control buttons shall be at least 3/4 in (19 mm) in their smallest dimension. They may be *raised* or flush.

(2) Tactile and Visual Control Indicators. All control buttons shall be designated by *raised* standard alphabet characters for letters, arabic characters for numerals, or standard symbols as shown in Fig. 23(a), and as required in ANSI A17.1-1978 and A17.1a-1979. Raised characters and symbols shall comply with 4.30. The call button for the main entry floor shall be



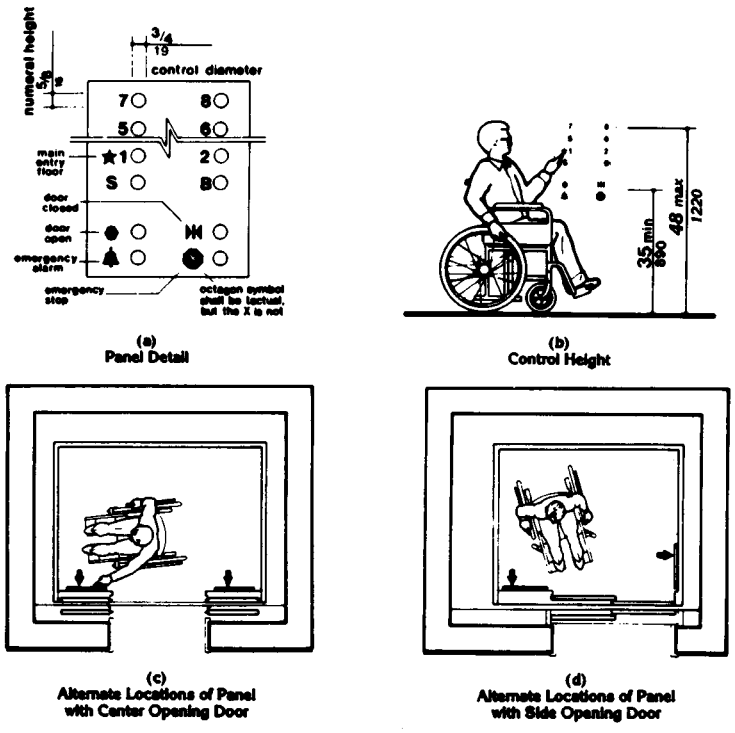


Fig. 22
Minimum Dimensions of Elevator Cars

designated by a *raised* star at the left of the floor designation (see Fig. 23(a)). All *raised* designations for control buttons shall be placed immediately to the left of the button to which they apply. Applied plates, permanently attached, are an acceptable means to provide *raised* control designations. Floor buttons shall be provided with visual indicators to show when each call is registered. The visual indicators shall be extinguished when each call is answered.

(3) Height. All floor buttons shall be no higher than *48 in (1220 mm), unless there is a substantial increase in cost, in which case the maximum mounting height may be increased to 54 in (1370 mm),* above the floor. Emergency controls, including the emergency alarm and emergency stop, shall be grouped at the bottom of the panel and shall have their centerlines no less than 35 in (890 mm) above the floor (see Fig. 23(a) and (b)).

4.10 Elevators

(a) Panel Detail

(b) Control Height

(c) Alternate Locations of Panel with Center Opening Door

(d) Alternate Locations of Panel with Side Opening Door

Fig. 23
Car Controls

(4) Location. Controls shall be located on a front wall if cars have center opening doors, and at the side wall or at the front wall next to the door if cars have side opening doors (see Fig. 23(c) and (d)).

4.10.13* Car Position Indicators. In elevator cars, a visual car position indicator shall be provided above the car control panel or over the door to show the position of the elevator in the hoistway. As the car passes or stops at a floor served by the elevators, the corresponding numerals shall illuminate, and an audible signal shall sound. Numerals shall be a minimum of 1/2 in (13 mm) high. The audible signal shall be no less than 20 decibels with a frequency no higher than 1500 Hz. An automatic verbal announcement of the floor number at which a car stops or which a car passes may be substituted for the audible signal.

4.10.14* Emergency Communications. If provided, emergency two-way communication systems between the elevator and a point outside the hoistway shall comply with ANSI A17.1-1978 and A17.1a-1979. The highest operable part of a two-way communication system shall be a maximum of 48 in (1220 mm) from the floor of the car. It shall be identified by a raised or recessed symbol and lettering complying with 4.30 and located adjacent to the device. If the system uses a handset, then the length of the cord from the panel to

the handset shall be at least 29 in (735 mm). *If the system is located in a closed compartment, the compartment door hardware shall conform to 4.27, Controls and Operating Mechanisms. The emergency intercommunication system shall not require voice communication.*

4.11* Platform Lifts.

4.11.1 Location. *Platform lifts permitted by 4.1 shall comply with the requirements of 4.11.*

4.11.2 Other Requirements. If platform lifts are used, they shall comply with 4.2.4, 4.5, 4.27, and the applicable safety regulations of administrative authorities having jurisdiction.

4.11.3 *Entrance.* *If platform lifts are used, then they should facilitate unassisted entry and exit from the lift in compliance with 4.11.2.*

4.12 Windows. *(Reserved).*

4.13 Doors.

4.13.1 General. *Doors required to be accessible by 4.1 shall comply with the requirements of 4.13.*

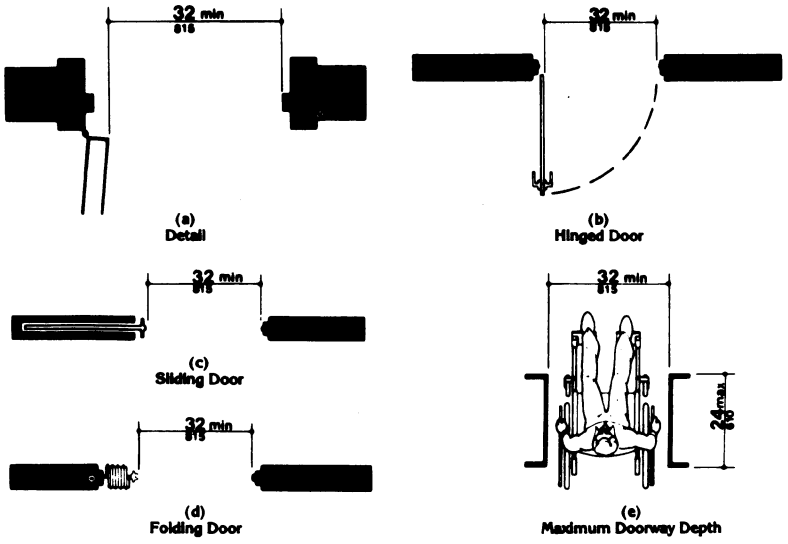
4.13.2 Revolving Doors and Turnstiles. Revolving doors or turnstiles shall not be the only means of passage at an accessible entrance or along an accessible route. *An accessible gate or door shall be provided adjacent to the turnstile or revolving door and shall be so designed as to facilitate the same use pattern.*

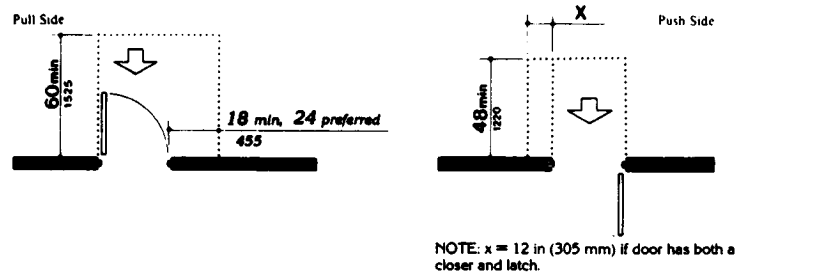
4.13.3 Gates. Gates, including ticket gates, shall meet all applicable specifications of 4.13.

4.13.4 Double-Leaf Doorways. If doorways have two *independently operated* door leaves, then at least one leaf shall meet the specifications in 4.13.5 and 4.13.6. That leaf shall be an active leaf.

4.13.5 Clear Width. Doorways shall have a minimum clear opening of 32 in (815 mm) with the door open 90 degrees, measured between the face of the door and the stop (see Fig. 24(a), (b), (c), and (d)). Openings more than 24 in (610 mm) in depth shall comply with 4.2.1 and 4.3.3 (see Fig. 24(e)).

EXCEPTION: Doors not requiring full user passage, such as shallow closets, may have the clear opening reduced to 20 in (510 mm) minimum.





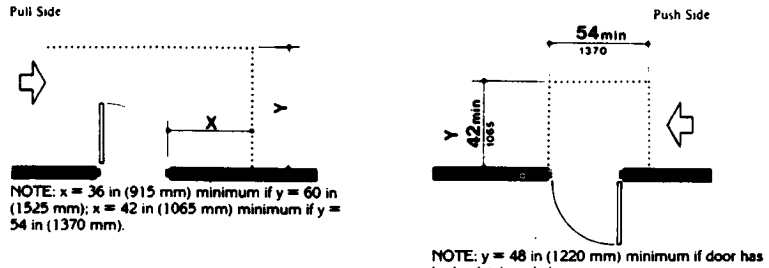


Fig. 24
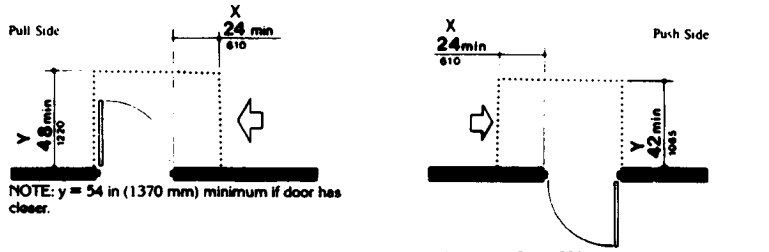
Clear Doorway Width and Depth

4.13 Doors

NOTE: x = 12 in (305 mm) if door has both a closer and latch.



(a)
Front Approaches — Swinging Doors

NOTE: x = 36 in (915 mm) minimum if y = 60 in (1525 mm); x = 42 in (1065 mm) minimum if y = 54 in (1370 mm).

NOTE: y = 48 in (1220 mm) minimum if door has both a latch and closer.

(b)
Hinge Side Approaches — Swinging Doors

NOTE: y = 54 in (1370 mm) minimum if door has closer.

NOTE: y = 48 in (1220 mm) minimum if door has closer.

(c)
Latch Side Approaches — Swinging Doors

NOTE: All doors in alcoves shall comply with the clearances for front approaches.

Slide Side Approach — Sliding Doors *and Folding Doors*

(f)
Latch Side Approach — Sliding Doors *and Folding Doors*

NOTE: All doors in alcoves shall comply with the clearances for front approaches.

Fig. 25
Maneuvering Clearances at Doors *(Continued)*

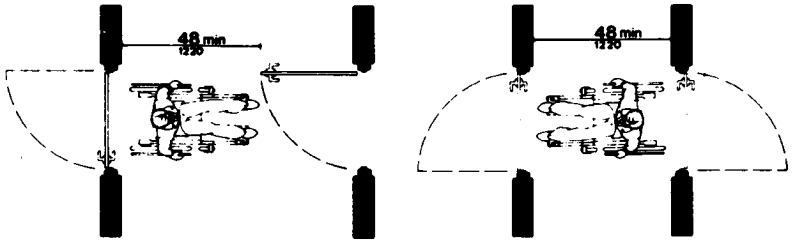

Fig. 26
Two Hinged Doors in Series

4.13 Doors

4.13.6 Maneuvering Clearances at Doors. Minimum maneuvering clearances at doors that are not automatic or power-assisted shall be as shown in Fig. 25. The floor or ground area within the required clearances shall be level and clear. Entry doors to acute care hospital bedrooms for in-patients shall be exempted from the requirement for space at the latch side of the door (see dimension "x" in Fig. 25) if the door is at least 44 in (1120 mm) wide.

4.13.7 Two Doors in Series. The minimum space between two hinged or pivoted doors in series shall be 48 in (1220 mm) plus the width of any door swinging into the space. Doors in series shall swing either in the same direction or away from the space between the doors (see Fig. 26).

4.13.8* Thresholds at Doorways. Thresholds at doorways shall not exceed 3/4 in (19 mm) in height for exterior sliding doors or 1/2 in (13 mm) for other types of doors. Raised thresholds and floor level changes at accessible doorways shall be beveled with a slope no greater than 1:2 (see 4.5.2).

4.13.9* Door Hardware. Handles, pulls, latches, locks, and other operating devices on accessible doors shall have a shape that is easy to grasp with one hand and does not require tight grasping, tight pinching, or twisting of the wrist to operate. Lever-operated mechanisms, push-type mechanisms, and U-shaped handles are acceptable designs. When sliding doors are fully open, operating hardware shall be exposed and usable from both sides. In dwelling units, only doors at accessible entrances to the unit itself shall comply with the requirements of this paragraph. Doors to hazardous areas shall have hardware complying with 4.29.3. *Mount no hardware required for accessible door passage higher than 48 in (1220 mm) above finished floor.*

4.13.10* Door Closers. If a door has a closer, then the sweep period of the closer shall be adjusted so that from an open position of 70 degrees, the door will take at least 3 seconds to move to a point 3 in (75 mm) from the latch, measured to the leading edge of the door.

4.13.11* Door Opening Force. The maximum force for pushing or pulling open a door shall be as follows:

(1) Fire doors shall have the minimum opening force allowable by the appropriate administrative authority.

(2) Other doors.

(a) exterior hinged doors: *(Reserved).*

(b) interior hinged doors: 5 lbf (22.2N)

(c) sliding or folding doors: 5 lbf (22.2N)

These forces do not apply to the force required to retract latch bolts or disengage other devices that may hold the door in a closed position.

4.13.12* Automatic Doors and Power-Assisted Doors. If an automatic door is used, then it shall comply with American National Standard for Power-Operated Doors, ANSI A156.10-1979. Slowly opening, low-powered, automatic doors shall be considered a type of custom design installation as described in paragraph 1.1.1 of ANSI A156.10-1979. Such doors shall not open to back check faster than 3 seconds and shall require no more than 15 lbf (66.6N) to stop door movement. If a power-assisted door is used, its door-opening force shall comply with 4.13.11 and its closing shall conform to the requirements in section 10 of ANSI A156.10-1979.

4.14 Entrances.

4.14.1 Minimum Number. *Entrances required to be accessible by 4.1* shall be part of an accessible route and shall comply with 4.3. Such entrances shall be connected by an accessible route to public transportation stops, to accessible parking and passenger loading zones, and to public streets or sidewalks if available (see 4.3.2(1)). They shall also be connected by an accessible route to all accessible spaces or elements within the building or facility.

4.14.2 Service Entrances. A service entrance shall not be the sole accessible entrance unless it is the only entrance to a building or facility (for example, in a factory or garage).

4.15 Drinking Fountains and Water Coolers.

4.15.1 Minimum Number. *Drinking fountains or water coolers required to be accessible by 4.1 shall comply with 4.15.*

4.15.2* Spout Height. Spouts shall be no higher than 36 in (915 mm), measured from the floor or ground surfaces to the spout outlet (see Fig. 27(a)).

4.15.3 Spout Location. The spouts of drinking fountains and water coolers shall be at the front of the unit and shall direct the water flow in a trajectory that is parallel or nearly parallel to the front of the unit. The spout shall provide a flow of water at least 4 in (100 mm) high so as to allow the insertion of a cup or glass under the flow of water.

4.15.4 Controls. Controls shall comply with 4.27.4. *Unit controls shall be front mounted or side mounted near the front edge.*

4.15.5 Clearances.

(1) Wall- and post-mounted cantilevered units shall have a clear knee space between the bottom of the apron and the floor or ground at least 27 in (685 mm) high, 30 in (760 mm) wide, and 17 in to 19 in (430 mm to 485 mm) deep (see Fig. 27(a) and (b)). Such units shall also have a minimum clear floor space 30 in by 48 in (760 mm by 1220 mm) to allow a person in a wheelchair to approach the unit facing forward.

(2) Free-standing or built-in units not having a clear space under them shall have a clear floor space at least 30 in by 48 in (760 mm by 1220 mm) that allows a person in a wheelchair to make a parallel approach to the unit (see Fig. 27(c) and (d)). This clear floor space shall comply with 4.2.4.

4.16 Water Closets.

4.16.1 General. Accessible water closets shall comply with 4.16. For water closets in *accessible* dwelling units, see 4.34.5.2.

4.16.2 Clear Floor Space. Clear floor space for water closets not in stalls shall comply with Fig. 28. Clear floor space may be arranged to allow either a left-handed or right-handed approach.

4.16.3* Height. The height of water closets shall be 17 in to 19 in (430 mm to 485 mm), measured to the top of the toilet seat (see Fig. 29(b)). *Seats shall not be sprung to return to a lifted position.*

4.16.4* Grab Bars. Grab bars for water closets not located in stalls shall comply with Fig. 29 and 4.26.

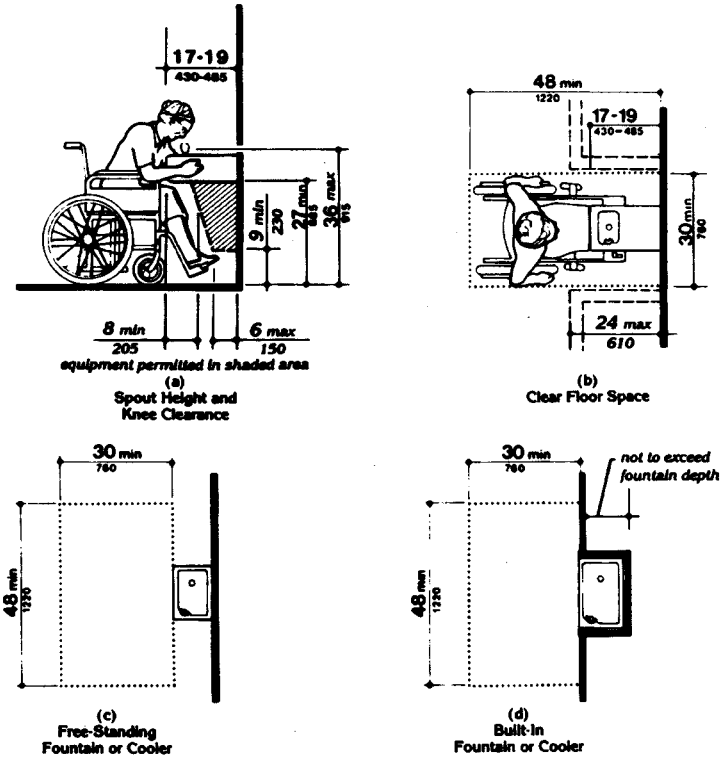

Fig. 27
Drinking Fountains and Water Coolers

37

4.16 Water Closets

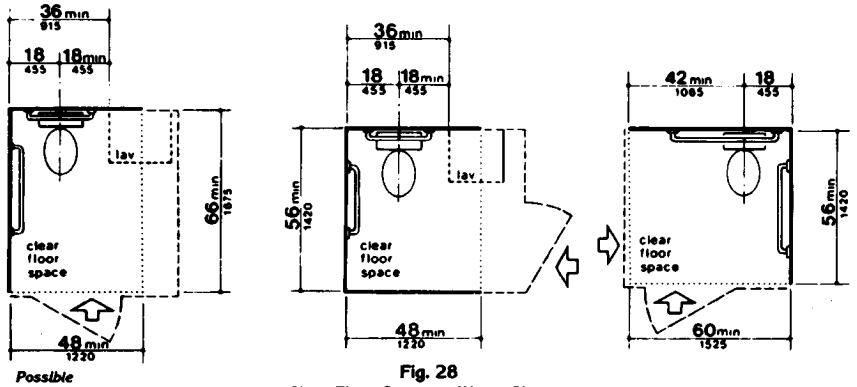

Fig. 28
Clear Floor Space at Water Closets

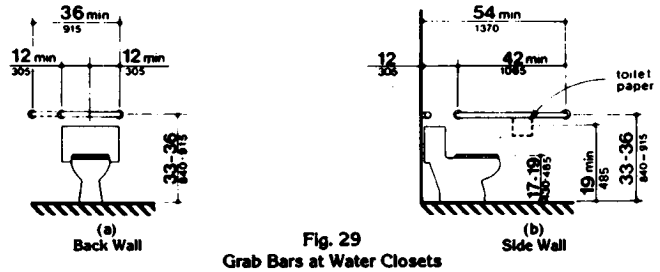

Fig. 29
Grab Bars at Water Closets

4.16.5* Flush Controls. Flush controls shall be hand operated *or automatic* and shall comply with 4.27.4. Controls for flush valves shall be mounted on the wide side of toilet areas no more than 44 in (1120 mm) above the floor.

4.16.6 Dispensers. Toilet paper dispensers shall be installed within reach, as shown in Fig. 29(b). *Dispensers that control delivery, or that do not permit continuous paper flow, shall not be used.*

4.17 Toilet Stalls.

4.17.1 Location. Accessible toilet stalls shall be on an accessible route and shall meet the requirements of 4.17.

4.17.2 Water Closets. Water closets in *accessible* stalls shall comply with 4.16.

4.17.3 Size and Arrangement. The size and arrangement of toilet stalls shall comply with Fig. 30(a). Toilet stalls with a minimum depth of 56 in (1420 mm) (see Fig. 30(a)) shall have wall-mounted water closets. If the depth of toilet stalls is increased at least 3 in (75 mm), then a floor-mounted water closet may be used. Arrangements shown for stalls may be reversed to allow either a left- or right-hand approach.

EXCEPTION: In instances of alteration work where provision of a standard stall (Fig. 30(a)) is structurally impracticable or where plumbing code requirements prevent combining existing stalls to provide space, an alternate stall (Fig. 30(b)) may be provided in lieu of the standard stall.

4.17.4 Toe Clearances. In standard stalls, the front partition and at least one side partition shall provide a toe clearance of at least 9 in (230 mm) above the floor. If the depth of the stall is greater than 60 in (1525 mm), then the toe clearance is not required.

4.17 Toilet Stalls

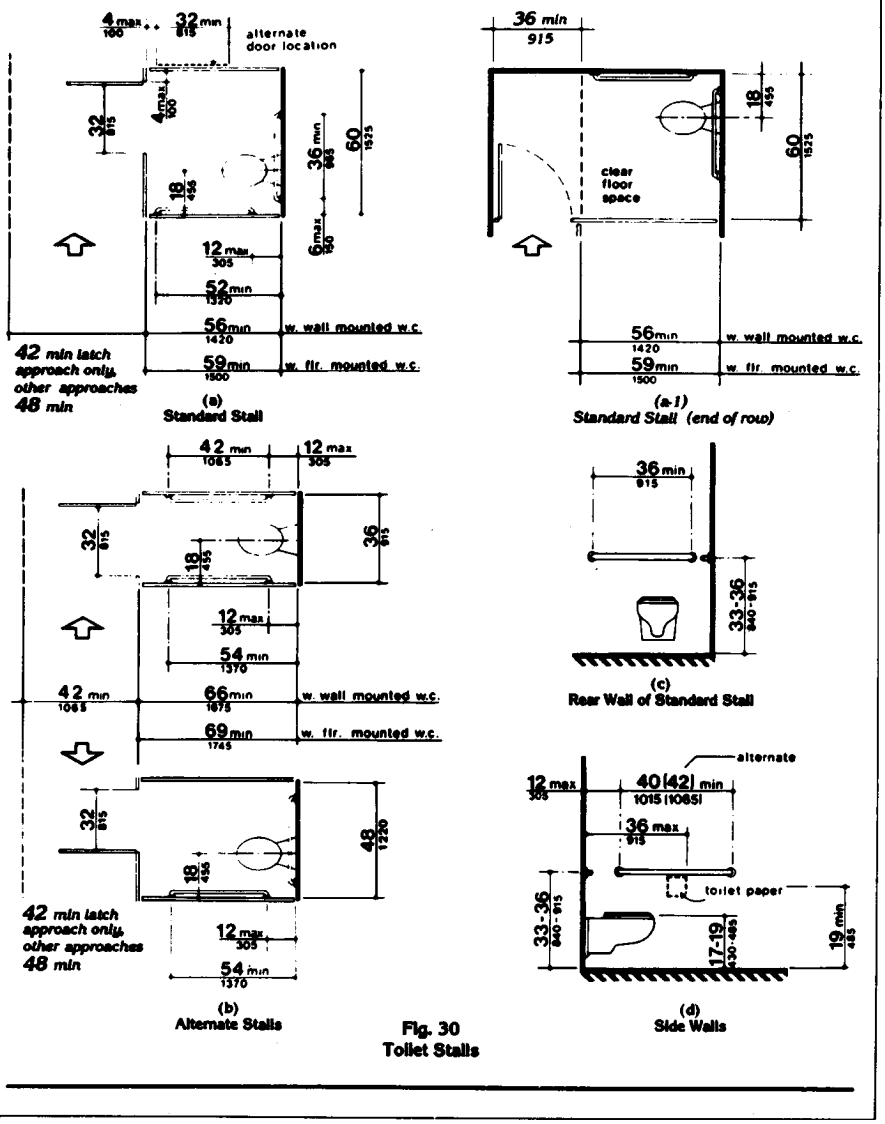

Fig. 30
Toilet Stalls

39

4.17 Toilet Stalls

4.17.5* Doors. Toilet stall doors shall comply with 4.13. *If toilet stall approach is from the latch side of the stall door, clearance between the door side of the stall and any obstruction may be reduced to a minimum of 42 in (1065 mm).*

4.17.6 Grab Bars. Grab bars complying with the length and positioning shown in Fig. 30(a), (b), (c), and (d) shall be provided. Grab bars may be mounted with any desired method as long as they have a gripping surface at the locations shown and do not obstruct the required clear floor area. Grab bars shall comply with 4.26.

4.18 Urinals.

4.18.1 General. Accessible urinals shall comply with 4.18.

4.18.2 Height. Urinals shall be stall-type or wall-hung with an elongated rim at a maximum of 17 in (430 mm) above the floor.

4.18.3 Clear Floor Space. A clear floor space 30 in by 48 in (760 mm by 1220 mm) shall be provided in front of urinals to allow forward approach. This clear space shall adjoin or overlap an accessible route and shall comply with 4.2.4. *Urinal shields that do not extend beyond the front edge of the urinal rim may be provided with 29 in (735 mm) clearance between them.*

4.18.4 Flush Controls. Flush controls shall be hand operated or automatic, and shall comply with 4.27.4, and shall be mounted no more than 44 in (1120 mm) above the floor.

4.19 Lavatories and Mirrors.

4.19.1 General. The requirements of 4.19 shall apply to lavatory fixtures, vanities, and built-in lavatories.

4.19.2 Height and Clearances. Lavatories shall be mounted with *the rim or counter surface no higher than 34 in (865 mm) above the finished floor. Provide* a clearance of at least 29 in (735 mm) from the floor to the bottom of the apron. Knee and toe clearance shall comply with Fig. 31.

4.19.3 Clear Floor Space. A clear floor space 30 in by 48 in (760 mm by 1220 mm) complying with 4.2.4 shall be provided in front of a lavatory to allow forward approach. Such clear floor space shall adjoin or overlap an accessible route and shall extend a maximum of 19 in (485 mm) underneath the lavatory (see Fig. 32).

4.19.4 Exposed Pipes and Surfaces. Hot water and drain pipes under lavatories shall be insulated or otherwise covered. There shall be no sharp or abrasive surfaces under lavatories.

4.19.5 Faucets. Faucets shall comply with 4.27.4. Lever-operated, push-type, and electronically controlled mechanisms are examples of acceptable designs. Self-closing valves are allowed if the faucet remains open for at least 10 seconds.

4.19.6* Mirrors. Mirrors shall be mounted with the bottom edge *of the reflecting surface* no higher than 40 in (1015 mm) from the floor (see Fig. 31).

4.20 Bathtubs.

4.20.1 General. Accessible bathtubs shall comply with 4.20. For bathtubs in *accessible* dwelling units, see 4.34.5.4.

4.20.2 Floor Space. Clear floor space in front of bathtubs shall be as shown in Fig. 33.

4.20.3 Seat. An in-tub seat or a seat at the head end of the tub shall be provided as shown in Fig. 33 and 34. The structural strength of seats and their attachments shall comply with 4.26.3. Seats shall be mounted securely and shall not slip during use.

4.20.4 Grab Bars. Grab bars complying with 4.26 shall be provided as shown in Fig. 33 and 34.

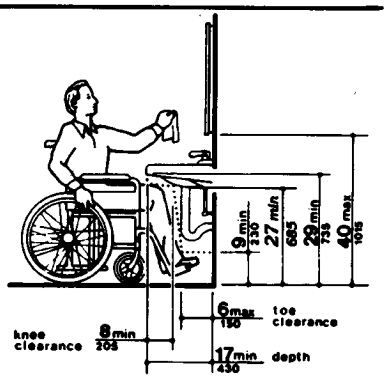

Fig. 31
Lavatory Clearances

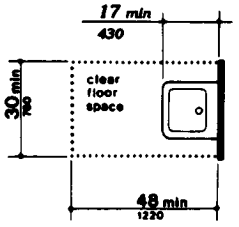

Fig. 32
Clear Floor Space at Lavatories

4.20 Bathtubs

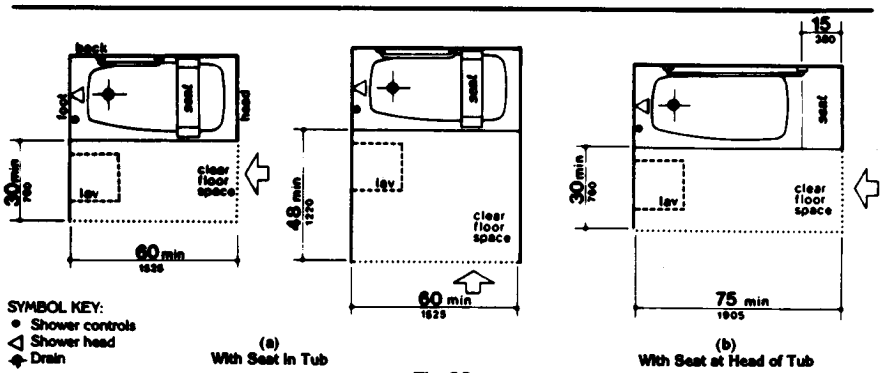

Fig. 33
Clear Floor Space at Bathtubs

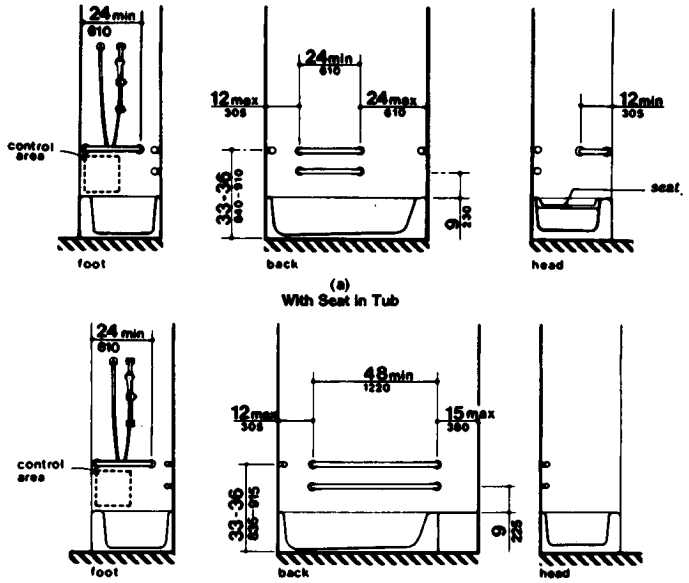

Fig. 34
Grab Bars at Bathtubs

41

4.20 Bathtubs

4.20.5 Controls. Faucets and other controls complying with 4.27.4 shall be located as shown in Fig. 34.

4.20.6 Shower Unit. A shower spray unit with a hose at least 60 in (1525 mm) long that can be used as a fixed shower head or as a hand-held shower shall be provided.

4.20.7 Bathtub Enclosures. If provided, enclosures for bathtubs shall not obstruct controls or transfer from wheelchairs onto bathtub seats or into tubs. Enclosures on bathtubs shall not have tracks mounted on their rims.

4.21 Shower Stalls.

4.21.1° General. Accessible shower stalls shall comply with 4.21. For shower stalls in *accessible* dwelling units, see 4.34.5.5.

4.21.2 Size and Clearances. Shower stall size and clear floor space shall comply with Fig. 35(a) or (b). The shower stall in Fig. 35(a) shall be 36 in by 36 in (915 mm by 915 mm). The shower stall in Fig. 35(b) will fit into the space required for a bathtub.

4.21.3 Seat. A seat shall be provided in shower stalls 36 in by 36 in (915 mm by 915 mm) and shall be as shown in Fig. 36. The seat shall be mounted 17 in to 19 in (430 mm to 485 mm) from the bathroom floor and shall extend the full depth of the stall. The seat shall be on the wall opposite the controls. The structural strength of seats and their attachments shall comply with 4.26.3.

4.21.4 Grab Bars. Grab bars complying with 4.26 shall be provided as shown in Fig. 37.

4.21.5 Controls. Faucets and other controls complying with 4.27.4 shall be located as shown in Fig. 37. In shower stalls 36 in by 36 in (915 mm by 915 mm), all controls, faucets, and the shower unit shall be mounted on the side wall opposite the seat.

4.21.6 Shower Unit. A shower spray unit with a hose at least 60 in (1525 mm) long that can be used as a fixed shower head or as a hand-held shower shall be provided.

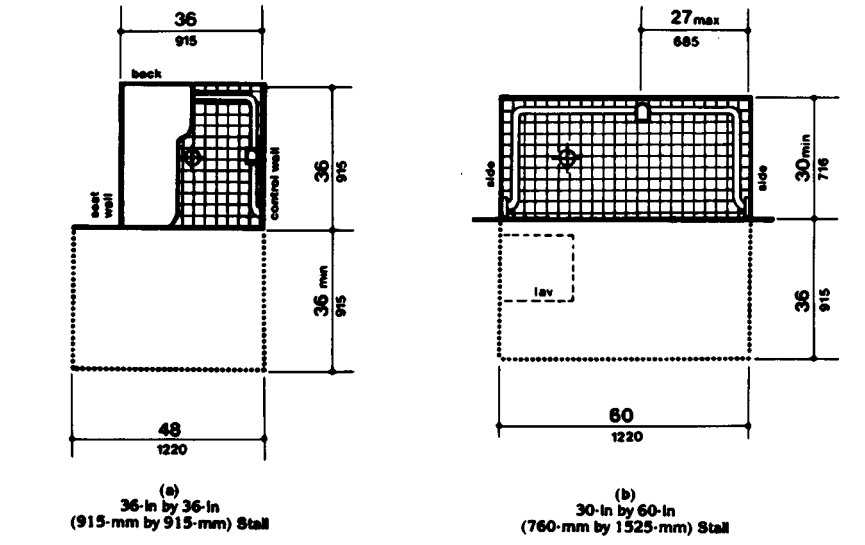

Fig. 35
Shower Size and Clearances

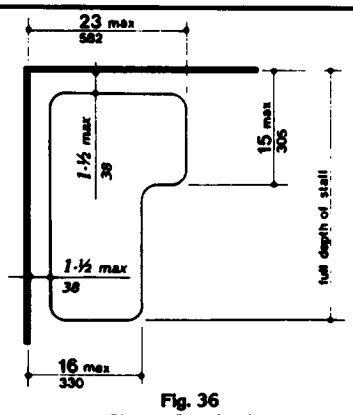

Fig. 36
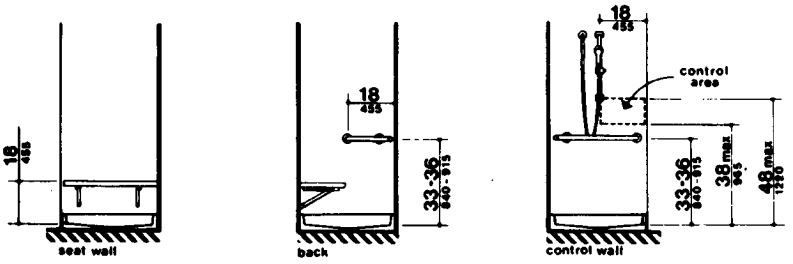
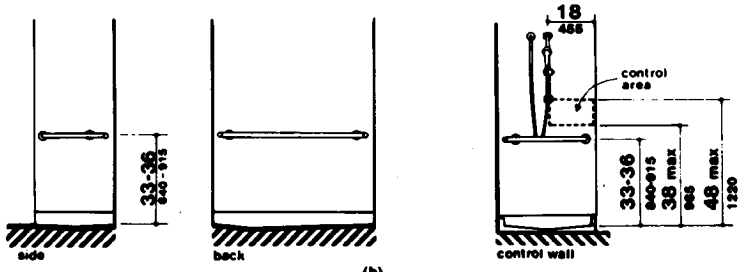
Shower Seat Design

EXCEPTION: In unmonitored facilities where vandalism is a consideration, a fixed shower head mounted at 48 in (1220 mm) above the shower floor may be used in lieu of a hand-held shower head.



4.21.7 Curbs. If provided, curbs in shower stalls 36 in by 36 in (915 mm by 915 mm) shall be no higher than *1/2 in (13 mm).* Shower stalls that are 30 in by 60 in (760 mm by 1525 mm) shall not have curbs.

4.21.8 Shower Enclosures. If provided, enclosures for shower stalls shall not obstruct controls or obstruct transfer from wheelchairs onto shower seats.



4.22 Toilet Rooms.

4.22.1 Minimum Number. *Toilet facilities required to be accessible by 4.1* shall comply with 4.22. Accessible toilet rooms shall be on an accessible route.

4.22.2 Doors. All doors to accessible toilet rooms shall comply with 4.13. Doors shall not swing into the clear floor space required for any fixture.

(a)
36-in by 36-in (915-mm by 915-mm) Stall

(b)
30-in by 60-in (760-mm by 1525-mm) Stall

Fig. 37
Grab Bars at Shower Stalls

4.22 Toilet Rooms

4.22.3 Clear Floor Space. The accessible fixtures and controls required in 4.22.4, 4.22.5, 4.22.6, and 4.22.7 shall be on an accessible route. An unobstructed turning space complying with 4.2.3 shall be provided within an accessible toilet room. The clear floor space at fixtures and controls, the accessible route, and the turning space may overlap.

EXCEPTION: In toilet rooms with only one water closet and one lavatory, a clear floor space of 30 in by 60 in (815 mm by 1525 mm) may be used in lieu of the unobstructed turning space.

4.22.4 Water Closets. If toilet stalls are provided, then at least one shall comply with 4.17; its water closet shall comply with 4.16. If water closets are not in stalls, then at least one shall comply with 4.16.

4.22.5 Urinals. If urinals are provided, *then* at least one shall comply with 4.18.

4.22.6 Lavatories and Mirrors. If lavatories and mirrors are provided, *then* at least one of each shall comply with 4.19.

4.22.7 Controls and Dispensers. If controls, dispensers, receptacles, or other equipment is provided, *then* at least one of each shall be on an accessible route and shall comply with 4.27.

4.23 Bathrooms, Bathing Facilities, and Shower Rooms.

4.23.1 Minimum Number. Bathrooms, bathing facilities, or shower rooms *required to be accessible by 4.1* shall comply with 4.23 and shall be on an accessible route. For adaptable bathrooms in accessible dwelling units, see 4.34.5.

4.23.2 Doors. Doors to accessible bathrooms shall comply with 4.13. Doors shall not swing into the floor space required for any fixture.

4.23.3 Clear Floor Space. The accessible fixtures and controls required in 4.23.4, 4.23.5, 4.23.6, 4.23.7, 4.23.8, and 4.23.9 shall be on an accessible route. An unobstructed turning space complying with 4.2.3 shall be provided within an accessible bathroom. The clear floor spaces at fixtures and controls, the accessible route, and the turning space may overlap.

EXCEPTION: In bathrooms with only one water closet, one lavatory, and one bathtub or shower, a clear floor space of 30 in by 60 in (760 mm by 1525 mm) may be used in lieu of the unobstructed turning space.

4.23.4 Water Closets. If toilet stalls are provided, then at least one shall comply with 4.17; its water closet shall comply with 4.16. If water closets are not in stalls, then at least one shall comply with 4.16.

4.23.5 Urinals. If urinals are provided, then at least one shall comply with 4.18.

4.23.6 Lavatories and Mirrors. If lavatories and mirrors are provided, then at least one of each shall comply with 4.19.

4.23.7 Controls and Dispensers. If controls, dispensers, receptacles, or other equipment is provided, *then* at least one of each shall be on an accessible route and shall comply with 4.27.

4.23.8 Bathing and Shower Facilities. If tubs or showers are provided, then at least one accessible tub that complies with 4.20 or at least one accessible shower that complies with 4.21 shall be provided.

4.23.9° Medicine Cabinets. If medicine cabinets are provided, at least one shall be located with a usable shelf no higher than 44 in (1120 mm) above the floor space. The floor space shall comply with 4.2.4.

4.24 Sinks.

4.24.1 General. *Sinks required to be accessible by 4.1* shall comply with 4.24. Sinks in kitchens of accessible dwelling units shall comply with 4.34.6.5.

4.24.2 Height. Sinks shall be mounted with the counter or rim no higher than 34 in (865 mm) from the floor.

4.24.3 Knee Clearance. Knee clearance that is *at least* 27 in (685 mm) high, 30 in (760 mm) wide, and 19 in (485 mm) deep shall be provided underneath sinks.

4.24.4 Depth. Each sink shall be a maximum of 6-1/2 in (165 mm) deep.

4.24.5 Clear Floor Space. A clear floor space at least 30 in by 48 in (760 mm by 1220 mm) complying with 4.2.4 shall be provided in front of a sink to allow forward approach. The clear floor space shall be on an accessible route and shall extend a maximum of 19 in (485 mm) underneath the sink (see Fig. 32).

4.24.6 Exposed Pipes and Surfaces. Hot water and drain pipes exposed under sinks shall be insulated or otherwise covered. There shall be no sharp or abrasive surfaces under sinks.

4.24.7 Faucets. Faucets shall comply with 4.27.4. Lever-operated, push-type, touch-type, or electronically controlled mechanisms are acceptable designs.

4.25 Storage.

4.25.1 General. *Fixed* storage facilities such as cabinets, shelves, closets, and drawers *required to be accessible by 4.1* shall comply with 4.25.

4.25.2 Clear Floor Space. A clear floor space at least 30 in by 48 in (760 mm by 1220 mm) complying with 4.2.4 that allows either a forward or parallel approach by a person using a wheelchair shall be provided at accessible storage facilities.

4.25.3 Height. Accessible storage spaces shall be within at least one of the reach ranges specified in 4.2.5 and 4.2.6. Clothes rods shall be a maximum of 54 in (1370 mm) from the floor (see Fig. 38).

4.25.4 Hardware. Hardware for accessible storage facilities shall comply with 4.27.4. Touch latches and U-shaped pulls are acceptable.

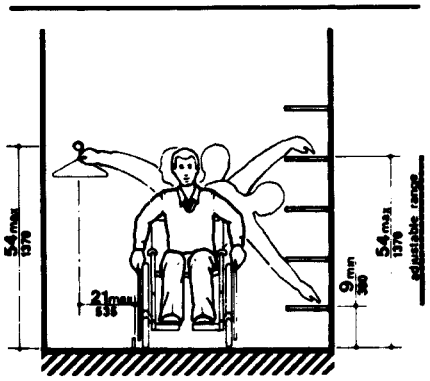


Fig. 38
Storage Shelves and Closets

4.26 Handrails, Grab Bars, and Tub and Shower Seats.

4.26.1* General. All handrails, grab bars, and tub and shower seats *required to be accessible by 4.1, 4.8, or 4.9* shall comply with 4.26

4.26.2* Size and Spacing of Grab Bars and Handrails. The diameter or width of the gripping surfaces of a handrail or grab bar shall be 1-1/4 in to 1-1/2 in (32 mm to 38 mm), or the shape shall provide an equivalent gripping surface. If handrails or grab bars are mounted adjacent to a wall, the space between the wall and the grab bar shall be 1-1/2 in (38 mm) (see Fig. 39(a), (b), and (c)). Handrails may be located in a recess if the recess is a maximum of 3 in (75 mm) deep and extends at least 18 in (455 mm) above the top of the rail (see Fig. 39(d)).

4.26.3 Structural Strength. The structural strength of grab bars, tub and shower seats, fasteners, and mounting devices shall meet the following specification:

(1) Bending stress in a grab bar or seat induced by the maximum bending moment from the application of 250 lbf (1112N) shall be less than the allowable stress for the material of the grab bar or seat.

(2) Shear stress induced in a grab bar or seat by the application of 250 lbf (1112N) shall be less than the allowable shear stress for the material of the grab bar or seat. If the connection between the grab bar or seat and its mounting bracket or other support is considered to be fully restrained, then direct and torsional shear stresses shall be totaled for the combined shear stress, which shall not exceed the allowable shear stress.

(3) Shear force induced in a fastener or mounting device from the application of 250 lbf (1112N) shall be less than the allowable lateral load of either the fastener or mounting device or the supporting structure, whichever is the smaller allowable load.

(4) Tensile force induced in a fastener by a direct tension force of 250 lbf (1112N) plus the maximum moment from the application of 250 lbf (1112N) shall be less than the allowable withdrawal and the supporting structure.

(5) Grab bars shall not rotate within their fittings.

4.26.4 Eliminating Hazards. A handrail or grab bar and any wall or other surface adjacent to it shall be free of any sharp or abrasive elements. Edges shall have a minimum radius of 1/8 in (3.2 mm).

4.27 Controls and Operating Mechanisms.

4.27.1 General. Controls and operating mechanisms *required to be accessible by 4.1* shall comply with 4.27.

4.27.2 Clear Floor Space. Clear floor space complying with 4.2.4 that allows a forward or a parallel approach by a person using a wheelchair shall be provided at controls, dispensers, receptacles, and other operable equipment.

4.27.3* Height. The highest operable part of all controls, dispensers, receptacles, and other operable equipment shall be placed within at least one of the reach ranges specified in 4.2.5 and 4.2.6. Except where the use of special equipment dictates otherwise, electrical and communications system receptacles on walls shall be mounted no less than 15 in (380 mm) above the floor.

4.27.4 Operation. Controls and operating mechanisms shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate controls shall be no greater than 5 lbf (22.2 N).

4.28 Alarms.

4.28.1 General. *Alarm systems required to be accessible by 4.1 shall comply with 4.28.*

4.28.2* Audible Alarms. If provided, audible emergency alarms shall produce a sound that exceeds the prevailing equivalent sound level in the room or space by at least 15 decibels or exceeds any maximum sound level with a duration of 30 seconds by 5 decibels, whichever is louder. Sound levels for alarm signals shall not exceed 120 decibels.

4.28.3* Visual Alarms. If provided, electrically powered internally illuminated emergency exit signs shall flash as a visual emergency alarm in conjunction with audible emergency alarms. The flashing frequency of visual alarm devices shall be less than 5 Hz. If such alarms use electricity from the building as a power source, then they shall be installed on the same system as the audible emergency alarms.

4.28 Alarms

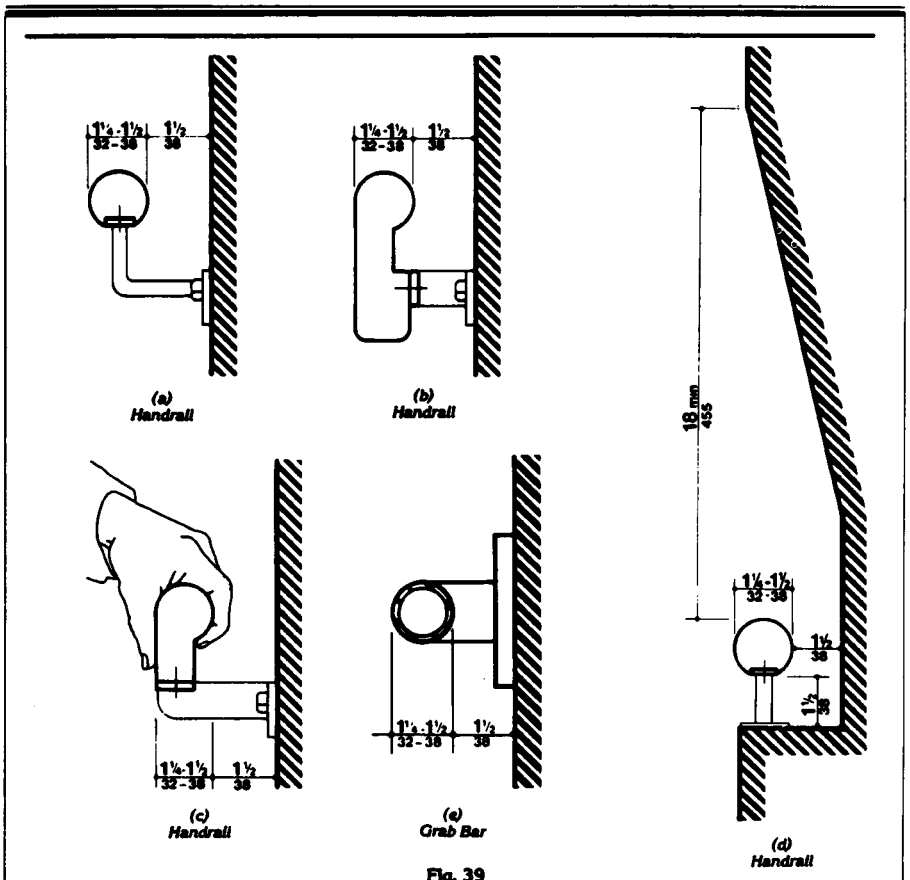

Fig. 39
Size and Spacing of Handrails and Grab Bars

EXCEPTIONS:

(1) Visual alarm devices that are mounted adjacent to emergency exit signs may be used in lieu of flashing exit signs.

(2) Specialized systems utilizing advanced technology may be substituted for the visual systems specified above if equivalent protection is afforded handicapped users of the building or facility.

4.28.4* Auxiliary Alarms. Accessible sleeping accommodations shall have a visual alarm connected to the building emergency alarm system or shall have a standard 110-volt electrical receptacle into which such an alarm could be connected. Instructions for use of the auxiliary alarm or connection shall be provided.

4.29 Tactile Warnings.

4.29.1 General. Tactile warnings *required to be accessible by 4.1* shall comply with 4.29.

4.29.2* Tactile Warnings on Walking Surfaces. *(Reserved).*

4.29.3* Tactile Warnings on Doors to Hazardous Areas. Doors that lead to areas that might prove dangerous to a blind person (for example, doors to loading platforms, boiler rooms, stages, and the like) shall be made identifiable to the touch by a textured surface on the door handle, knob, pull, or other operating hardware. This textured surface may be made by knurling or roughing or by a material applied to the contact surface. Such textured surfaces shall not be provided for emergency exit doors or any doors other than those to hazardous areas.

4.29.4 Tactile Warnings at Stairs. *(Reserved).*

4.29.5* Tactile Warnings at Hazardous Vehicular Areas. *(Reserved).*

4.29.6* Tactile Warnings at Reflecting Pools. *(Reserved).*

4.29.7* Standardization. Textured surfaces for tactile *door* warnings shall be standard within a building, facility, site, or complex of buildings.

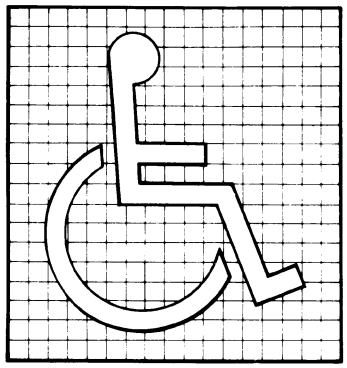
4.30 Signage.

4.30.1* General. ***Signage shall comply with 4.30 as specified in 4.1.***

4.30.2* Character Proportion. Letters and numbers on signs shall have a width-to-height ratio between 3:5 and 1:1 and a stroke width-to-height ratio between 1:5 and 1:10.

4.30.3* Color Contrast. Characters and symbols shall contrast with their background — either light characters on a dark background or dark characters on a light background.

4.30.4* Raised Characters or Symbols. Letters and numbers on signs shall be raised 1/32 in (0.8 mm) minimum and shall be sans serif characters. Raised characters or symbols shall be at least 5/8 in (16 mm) high, but no higher than 2 in (50 mm). Symbols or pictographs on signs shall be raised 1/32 in (0.8 mm) minimum.



4.30.5 Symbols of Accessibility. Accessible facilities *required to be* identified *by 4.1, shall use* the international symbol of accessibility. The symbol shall be displayed as shown in Fig. 43.

4.30.6 *Mounting Location and Height.* *Interior signage shall be located alongside the door on the latch side and shall be mounted at a height of between 54 in and 66 in (1370 mm and 1675 mm) above the finished floor.*

4.31 Telephones.

4.31.1 General. *Public telephones required to be accessible by 4.1 shall comply with 4.31.*

4.31.2 Clear Floor or Ground Space. A clear floor or ground space at least 30 in by 48 in (760 mm by 1220 mm) that allows either a forward or parallel approach by a person using a wheelchair shall be provided at telephones (see Fig. 44). The clear floor or ground space shall comply with 4.2.4. Bases, enclosures, and fixed seats shall not impede approaches to telephones by people who use wheelchairs.

(a)
Proportions

(b)
Display Conditions

Fig. 43
International Symbol of Accessibility

4.31.3* Mounting Height. The highest operable part of the telephone shall be within the reach ranges specified in 4.2.5 or 4.2.6.

4.31.4 *Protruding Objects.* *Telephones shall comply with 4.4.*

4.31.5* Equipment for Hearing Impaired People. Telephones shall be equipped with a receiver that generates a magnetic field in the area of the receiver cap. *Volume controls shall be provided in accordance with 4.1.2.*

4.31.6 Controls. Telephones shall have pushbutton controls where service for such equipment is available.

4.31.7 Telephone Books. Telephone books, if provided, shall be located *in a position that complies with the reach ranges specified in 4.2.5 and 4.2.6.*

4.31 Telephones

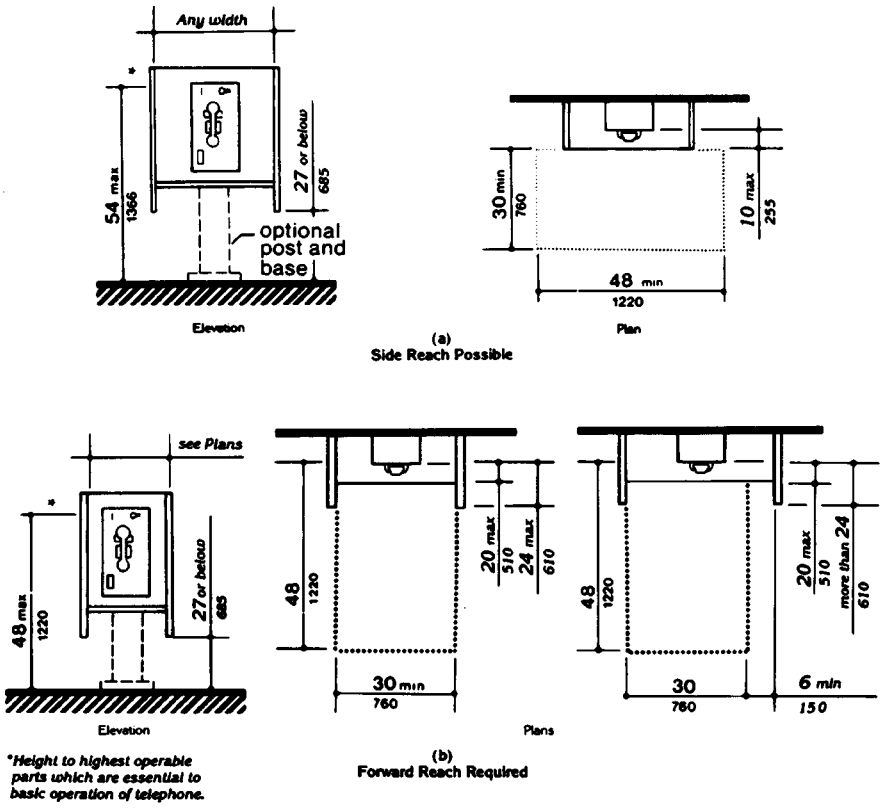


Fig. 44
Mounting Heights and Clearances for Telephones

4.31.8 Cord Length. The cord from the telephone to the handset shall be at least 29 in (735 mm) long.

4.32 Seating, Tables, and Work Surfaces.

4.32.1 Minimum Number. Fixed or built-in seating, tables, or work surfaces *required to be accessible by 4.1 shall comply with 4.32.*

4.32.2 Seating. If seating spaces for people in wheelchairs are provided at tables, counters, or work surfaces, clear floor space complying with 4.2.4 shall be provided. Such clear floor space shall not overlap knee space by more than 19 in (485 mm) (see Fig. 45).

4.32.3 Knee Clearances. If seating for people in wheelchairs is provided at tables, counters, and work surfaces, knee spaces at least 27 in (685 mm) high, 30 in (760 mm) wide, and 19 in (485 mm) deep shall be provided (see Fig. 45).

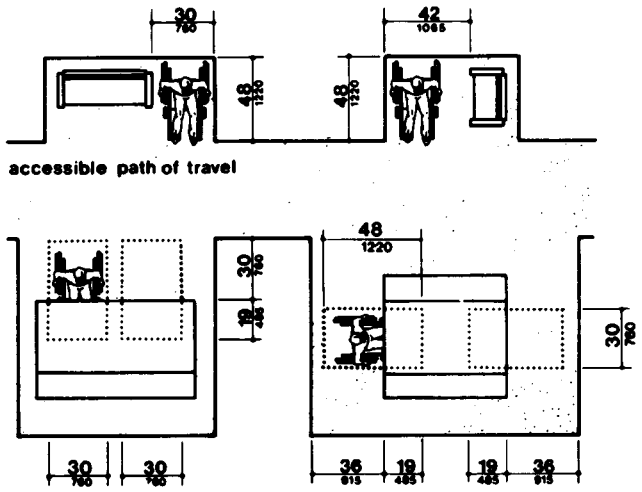

Fig. 45
Minimum Clearances for Seating and Tables

4.32.4° Height of Work Surfaces. The tops of tables and work surfaces shall be from 28 in to 34 in (710 mm to 865 mm) from the floor or ground.

4.33 Assembly Areas.

4.33.1 Minimum Number. Assembly *and associated areas required to be accessible by 4.1 shall comply with 4.33.*

4.33.2° Size of Wheelchair Locations. Each wheelchair location shall provide minimum clear ground or floor spaces as shown in Fig. 46.

4.33.3° Placement of Wheelchair Locations. Wheelchair areas shall be an integral part of any fixed seating plan and shall be dispersed throughout the seating area. They shall adjoin an accessible route that also serves as a means of egress in case of emergency and shall be located to provide lines of sight comparable to those for all viewing areas.

EXCEPTION: Accessible viewing positions may be clustered for bleachers, balconies, and other areas having sight lines that require slopes of greater than 5 percent. Equivalent accessible viewing positions may be located on levels having accessible egress.

4.33.4 Surfaces. The ground or floor at wheelchair locations shall be level and shall comply with 4.5.

4.33.5 Access to Performing Areas. An accessible route shall connect wheelchair seating locations with performing areas, including stages, arena floors, dressing rooms, locker rooms, and other spaces used by performers.

4.33.6° Placement of Listening Systems. If the listening system provided serves individual fixed seats, then such seats shall be located within a 50 ft (15 m) viewing distance of the stage or playing area and shall have a complete view of the stage or playing area.

4.33.7° Types of Listening Systems. Audio loops and radio frequency systems are two acceptable types of listening systems.

4.34 Dwelling Units.

4.34.1 General. The requirements of 4.34 apply to dwelling units *required to be accessible by 4.1.*

4.34.2° Minimum Requirements. An accessible dwelling unit shall be on an accessible route. An accessible dwelling unit shall have the following accessible elements and spaces as a minimum:

(1) Common spaces and facilities serving individual accessible dwelling units (for example, entry walks, trash disposal facilities, and mail boxes) shall comply with 4.2 through 4.33.

4.34 Dwelling Units

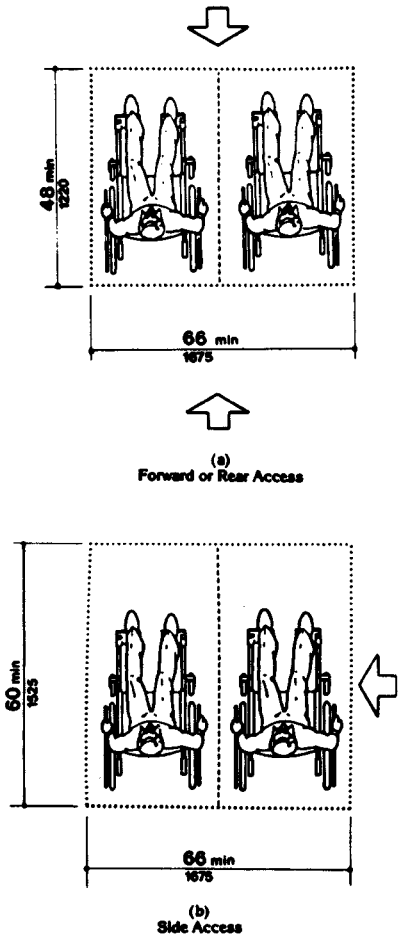

Fig. 46
Space Requirements for Wheelchair Seating Spaces in Series

(2) Accessible spaces shall have maneuvering space complying with 4.2.2 and 4.2.3 and surfaces complying with 4.5.

(3) At least one accessible route complying with 4.3 shall connect the accessible entrances with all accessible spaces and elements within the dwelling units.

(4) *See 4.1.1(5)(d) — Parking.*

(5) *Removed and reserved.*

(6) Doors to and in accessible spaces that are intended for passage shall comply with 4.13, *except that the provisions of 4.13.9 apply only to the doors at accessible entrances to the unit itself.*

(7) At least one accessible entrance to the dwelling unit shall comply with 4.14.

(8) Storage in accessible spaces in dwelling units, including cabinets, shelves, closets, and drawers, shall comply with 4.25.

(9) All controls in accessible spaces shall comply with 4.27. Those portions of heating, ventilating, and airconditioning equipment requiring regular, periodic maintenance and adjustment by the resident of a dwelling shall be accessible to people in wheelchairs. If air distribution registers must be placed in or close to ceilings for proper air circulation, this specification shall not apply to the registers.

(10) Emergency alarms *as required by 4.1 and* complying with 4.28.4 shall be provided in the dwelling unit.

(11) *Removed and reserved.*

(12) At least one full bathroom shall comply with 4.34.5. A full bathroom shall include a water closet, a lavatory, and a bathtub or a shower.

(13) The kitchen shall comply with 4.34.6.

(14) If laundry facilities are provided, they shall comply with 4.34.7.

(15) The following spaces shall be accessible and shall be on an accessible route:

(a) The living area.

(b) The dining area.

(c) The sleeping area, or the bedroom in one bedroom dwelling units, or at least two bedrooms or sleeping spaces in dwelling units with two or more bedrooms.

(d) Patios, terraces, balconies, carports, and garages, if provided with the dwelling unit.

4.34.3 Adaptability. The specifications for 4.34.5 and 4.34.6 *include* the concept of adaptability. *Accessible dwelling units may be designed for either permanent accessibility or adaptability.*

4.34.4 Consumer Information. To ensure that the existence of adaptable features will be known to the owner or occupant of a dwelling, the following con-

50

sumer information shall be provided in each *adaptable* dwelling unit available for *occupancy:*

(1) Notification of the alternate heights available for the kitchen counter and sink, and the existence of removable cabinets and bases, if provided, under counters, sinks, and lavatories.

(2) Notification of the provisions for the installation of grab bars at toilets, bathtubs, and showers.

(3) Notification that the dwelling unit is equipped to have a visual emergency alarm installed.

(4) Identification of the location where information and instructions are available for changing the height of counters, removing cabinets and bases, installing a visual emergency alarm system, and installing grab bars.

(5) Notification that the dwelling unit has been designed in accordance with this *Uniform Federal Accessibility Standards.*

In addition, the *parties who will be responsible for making adaptations* shall be provided with the following information:

(1) Instructions for adjusting or replacing kitchen counter and sink heights and for removing cabinets.

(2) A scale drawing showing methods and locations for the installation of grab bars.

(3) A scale drawing showing the location of adjustable or replaceable counter areas and removable cabinets.

(4) Identification of the location of any equipment and parts required for adjusting or replacing counter tops, cabinets, and sinks.

(5) Instructions for installing a visual emergency alarm system, if the dwelling unit is equipped for such an installation.

4.34.5* Bathrooms. *Accessible or* adaptable bathrooms shall be on an accessible route and shall comply with the requirements of 4.34.5.

4.34.5.1 Doors. Doors shall not swing into the clear floor space required for any fixture.

4.34.5.2 Water Closets.

(1) Clear floor space at the water closet shall be as shown in Fig. 47(a). The water closet may be located with the clear area at either the right or left side of the toilet.

(2) The height of the water closet shall be at least 15 in (380 mm), *and no more than 19 in (485 mm),* measured to the top of the toilet seat.

(3) Structural reinforcement or other provisions that will allow installation of grab bars shall be provided in the locations shown in Fig. 47(b). If provided, grab bars shall be installed as shown in Fig. 29 and shall comply with 4.26.

(4) The toilet paper dispenser shall be installed within reach as shown in Fig. 47(b).

4.34.5.3 Lavatory, Mirrors, and Medicine Cabinets.

(1) The lavatory and mirrors shall comply with 4.22.6.

(2) If a cabinet is provided under the lavatory in adaptable bathrooms, then it shall be removable to provide the clearances specified in 4.22.6.

(3) If a medicine cabinet is provided above the lavatory, then the bottom of the medicine cabinet shall be located with a usable shelf no higher than 44 in (1120 mm) above the floor.

4.34.5.4 Bathtubs. If a bathtub is provided, then it shall have the following features:

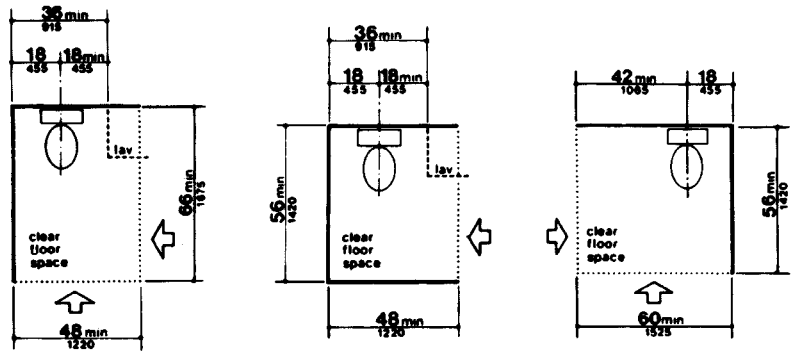
(1) Floor space. Clear floor space at bathtubs shall be as shown in Fig. 33.

(2) Seat. An in-tub seat or a seat at the head end of the tub shall be provided as shown in Fig. 33 and 34. The structural strength of seats and their attachments shall comply with 4.26.3. Seats shall be mounted securely and shall not slip during use.

(3) Grab bars. Structural reinforcement or other provisions that will allow installation of grab bars shall be provided in the locations shown in Fig. 48. If provided, grab bars shall be installed as shown in Fig. 34 and shall comply with 4.26.

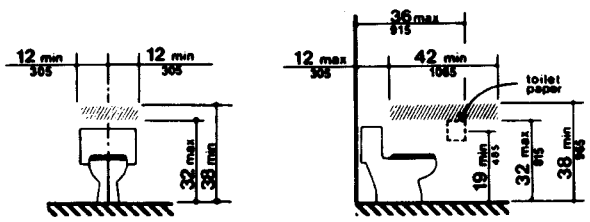
(4) Controls. Faucets and other controls shall be located as shown in Fig. 34 and shall comply with 4.27.4.

(5) Shower unit. A shower spray unit with a hose at least 60 in (1525 mm) long that can be used as a fixed shower head or as a hand-held shower shall be provided.



4.34.5.5 Showers. If a shower is provided, it shall have the following features:

(1) Size and clearances. Shower stall size and clear floor space shall comply with either Fig. 35(a) or (b). The shower stall in Fig. 35(a) shall be 36 in by 36 in (915 mm by 915 mm). The shower stall in Fig. 35(b) will fit into the same space as a standard 60 in (1525 mm) long bathtub.



(2) Seat. A seat shall be provided in the shower stall in Fig. 35(a) as shown in Fig. 36. The seat shall be 17 in to 19 in (430 mm to 485 mm) high measured from the bathroom floor and shall extend the full depth of the stall. The seat shall be on the wall opposite the controls. The structural strength of seats and their attachments shall comply with 4.26.3. Seats shall be mounted securely and shall not slip during use.

(3) Grab bars. Structural reinforcement or other provisions that will allow installation of grab bars shall be provided in the locations shown in Fig. 49. If provided, grab bars shall be installed as shown in Fig. 37 and shall comply with 4.26.

4.34 Dwelling Units

NOTE: The hatched areas are reinforced to receive grab bars.

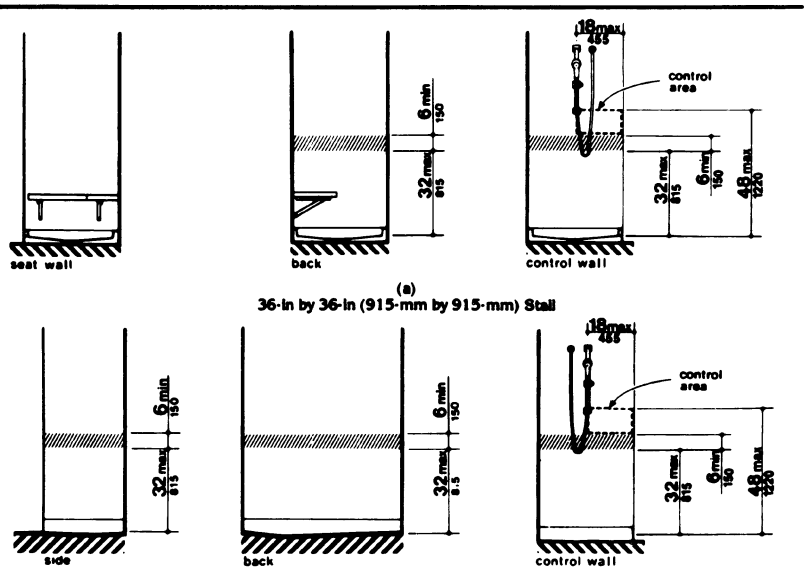
Fig. 48
Location of Grab Bars and Controls of Adaptable Bathtubs

(4) Controls. Faucets and other controls shall be located as shown in Fig. 37 and shall comply with 4.27.4. In the shower stall in Fig. 35(a), all controls, faucets, and the shower unit shall be mounted on the side wall opposite the seat.

(5) Shower unit. A shower spray unit with a hose at least 60 in (1525 mm) long that can be used as a fixed shower head at various heights or as a hand-held shower shall be provided.

4.34.5.6 Bathtub and Shower Enclosures. Enclosures for bathtubs or shower stalls shall not obstruct controls or transfer from wheelchairs onto shower or bathtub seats. Enclosures on bathtubs shall not have tracks mounted on their rims.



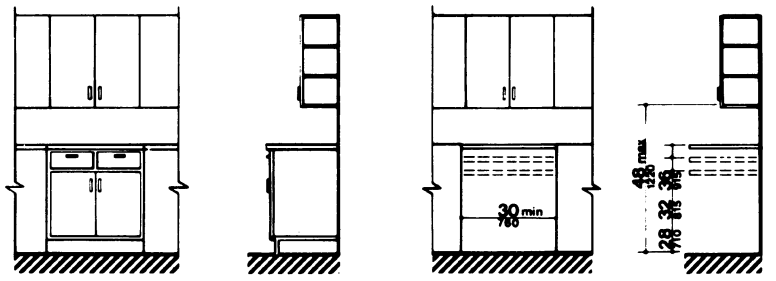
4.34.5.7 Clear Floor Space. Clear floor space at fixtures may overlap.

4.34.6 Kitchens. *Accessible or adaptable* kitchens and their components shall be on an accessible route and shall comply with the requirements of 4.34.6.

4.34.6.1* Clearance. Clearances between all opposing base cabinets, counter tops, appliances, or walls shall be 40 in (1015 mm) minimum, except in U-shaped kitchens, where such clearance shall be 60 in (1525 mm) minimum.

4.34.6.2 Clear Floor Space. A clear floor space at least 30 in by 48 in (760 mm by 1220 mm) complying with 4.2.4 that allows either a forward or a parallel approach by a person in a wheelchair shall be provided at all appliances in the kitchen, including the range or cooktop, oven, refrigerator/freezer, dishwasher, and trash compactor. Laundry equipment located in the kitchen shall comply with 4.34.7.

4.34 Dwelling Units



(a)
36-in by 36-in (915-mm by 915-mm) Stall

(b)
30-in by 60-in (750-mm by 1525-mm) Stall

NOTE: The hatched areas are reinforced to receive grab bars.

Fig. 50
Counter Work Surface

54

4.34.6.3 Controls. All controls in kitchens shall comply with 4.27.

4.34.6.4 Work Surfaces. At least one 30 in (760 mm) section of counter shall provide a work surface that complies with the following requirements (see Fig. 50):

(1) The counter shall be *mounted at a maximum height of 34 in (865 mm) above the floor, measured from the floor to the top of the counter surface, or shall be* adjustable or replaceable as a unit to provide alternative heights of 28 in, 32 in, and 36 in (710 mm, 815 mm, and 915 mm), measured from the top of the counter surface.

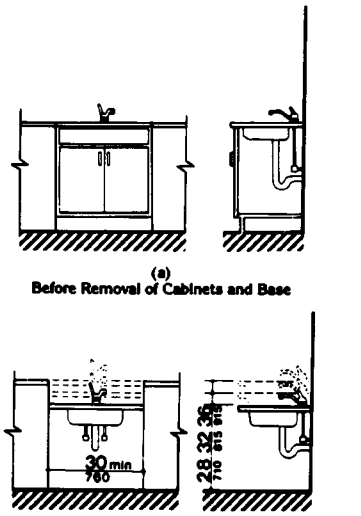
(2) Base cabinets, if provided, shall be removable under the full 30 in (760 mm) minimum frontage of the counter. The finished floor shall extend under the counter to the wall.

(3) Counter thickness and supporting structure shall be 2 in (50 mm) maximum over the required clear area.

(4) A clear floor space 30 in by 48 in (760 mm by 1220 mm) shall allow a forward approach to the counter. Nineteen inches (485 mm) maximum of the clear floor space may extend underneath the counter. The knee space shall have a minimum clear width of 30 in (760 mm) and a minimum clear depth of 19 in (485 mm).

(5) There shall be no sharp or abrasive surfaces under such counters.

4.34.6.5* Sink. The sink and surrounding counter shall comply with the following requirements (see Fig. 51):



(1) The sink and surrounding counter shall be *mounted at a maximum height of 34 in (865 mm) above the floor, measured from the floor to the top of the counter surface, or shall* be adjustable or replaceable as a unit to provide alternative heights of 28 in, 32 in, and 36 in (710 mm, 815 mm, and 915 mm), measured from the floor to the top of the counter surface or sink rim. The total width of sink and counter area shall be 30 in (760 mm).

(2) Rough-in plumbing shall be located to accept connections of supply and drain pipes for sinks mounted at the height of 28 in (710 mm).

(3) The depth of a sink bowl shall be no greater than 6-1/2 in (165 mm). Only one bowl of double-or triple-bowl sinks needs to meet this requirement.

(4) Faucets shall comply with 4:27.4. Lever-operated or push-type mechanisms are two acceptable designs.

(5) Base cabinets, if provided, shall be removable under the full 30 in (760 mm) minimum frontage of the sink and surrounding counter. The finished flooring shall extend under the counter to the wall.

(a)
Before Removal of Cabinets and Base

(b)
Cabinets and Base Removed and Height Alternatives

Fig. 51
Kitchen Sink

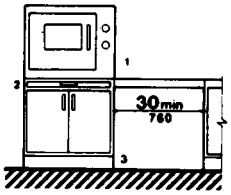
(6) Counter thickness and supporting structure shall be 2 in (50 mm) maximum over the required clear space.

(7) A clear floor space 30 in by 48 in (760 mm by 1220 mm) shall allow forward approach to the sink. Nineteen inches (485 mm) maximum of the clear floor space may extend underneath the sink. The knee space shall have a clear width of 30 in (760 mm) and a clear depth of 19 in (485 mm).

(8) There shall be no sharp or abrasive surfaces under sinks. Hot water and drain pipes under sinks shall be insulated or otherwise covered.

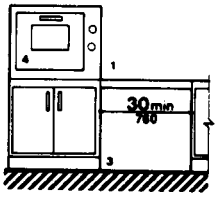
4.34.6.6* Ranges and Cooktops. Ranges and cooktops shall comply with 4.34.6.2 and 4.34.6.3. If ovens or cooktops have knee spaces underneath, then they shall be insulated or otherwise protected on the exposed contact surfaces to prevent burns, abrasions, or electrical shock. The clear floor space may overlap the knee space, if provided, by 19 in (485 mm) maximum. The location of controls for ranges and cook-tops shall not require reaching across burners.

4.34 Dwelling Units



4.34.6.7° Ovens. Ovens shall comply with 4.34.6.2 and 4.34.6.3. Ovens shall be of the self-cleaning type or be located adjacent to an adjustable height counter with knee space below (see Fig. 52). For side-opening ovens, the door latch side shall be next to the open counter space, and there shall be a pull-out shelf under the oven extending the full width of the oven and pulling out not less than 10 in (255 mm) when fully extended. Ovens shall have controls on front panels; they may be located on either side of the door.

4.34.6.8° Refrigerator/Freezers. Refrigerator/freezers shall comply with 4.34.6.3. *Provision shall be made for refrigerators which are:*



(1) Of the vertical side-by-side refrigerator/freezer type; or

(2) Of the over-and-under type and meet the following requirements:

(a) Have at least 50 percent of the freezer space below 54 in (1370 mm) above the floor.

(a)
Side-Hinged Door

(b)
Bottom-Hinged Door

SYMBOL KEY:
1. Countertop or wall-mounted oven.
2. Pull-out board preferred with side-opening door.
3. Clear open space.
4. Bottom-hinged door.

Fig. 52
Ovens without Self-Cleaning Feature

(b) Have 100 percent of the refrigerator space and controls below 54 in (1370 mm).

Freezers with less than 100 percent of the storage volume within the limits specified in 4.2.5 or 4.2.6 shall be the self-defrosting type.

4.34.6.9 Dishwashers. Dishwashers shall comply with 4.34.6.2 and 4.34.6.3. Dishwashers shall have all rack space accessible from the front of the machine for loading and unloading dishes.

4.34.6.10° Kitchen Storage. Cabinets, drawers, and shelf areas shall comply with 4.25 and shall have the following features:

(1) Maximum height shall be 48 in (1220 mm) for at least one shelf of all cabinets and storage shelves mounted above work counters (see Fig. 50).

(2) Door pulls or handles for wall cabinets shall be mounted as close to the bottom of cabinet doors as possible. Door pulls or handles for base cabinets shall be mounted as close to the top of cabinet doors as possible.

4.34.7 Laundry Facilities. If laundry equipment is provided within individual accessible dwelling units, or if separate laundry facilities serve one or more accessible dwelling units, then they shall meet the requirements of 4.34.7.1 through 4.34.7.3.

4.34.7.1 Location. Laundry facilities and laundry equipment shall be on an accessible route.

4.34.7.2 Washing Machines and Clothes Dryers. Washing machines and clothes dryers in common use laundry rooms shall be front loading.

4.34.7.3 Controls. Laundry equipment shall comply with 4.27.

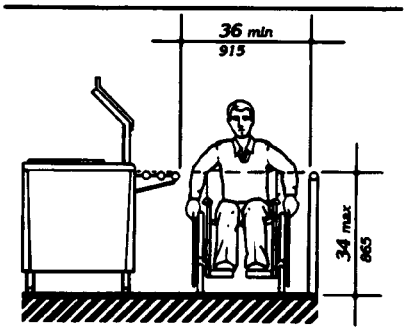


Fig. 53
Food Service Lines

5. RESTAURANTS AND CAFETERIAS.

5.1 General. *In addition to the requirements of 4.1 to 4.33, the design of at least 5 percent of all fixed seating or tables in a restaurant or cafeteria shall comply with 4.32. Access aisles between tables shall comply with 4.3. Where practical, accessible tables should be distributed throughout the space or facility. In restaurants or cafeterias where there are mezzanine levels, loggias, or raised platforms, accessibility to all such spaces is not required providing that the same services and decorative character are provided in spaces located on accessible routes.*

5.2 Food Service Lines. *Food service lines shall have a minimum clear width of 36 in (915 mm), with a preferred clear width of 42 in (1065 mm) where passage of stopped wheelchairs by pedestrians is desired. Tray slides shall be mounted no higher than 34 in (865 mm) above the floor. If self-service shelves are provided, a reasonable portion must be within the ranges shown in Fig. 53.*

5.3 Tableware Areas. *Install tableware, dishware, condiment, food and beverage display shelves, and dispensing devices in compliance with 4.2 (see Fig. 54).*

5.4 Vending Machines. *Install vending machines in compliance with 4.27.*

6. HEALTH CARE.

6.1 General. *In addition to the requirements of 4.1 to 4.33, Health Care buildings and facilities shall comply with 6.*

6.2 Entrances. *At least one accessible entrance that complies with 4.14 shall be protected from the weather by canopy or roof overhang. Such entrances shall incorporate a passenger loading zone that complies with 4.6.5 (see 4.13.6).*

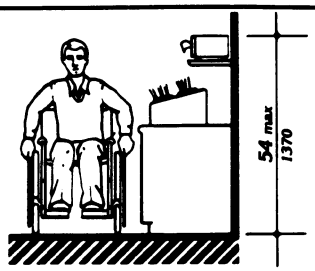

Fig. 54
Tableware Areas

6.3 Patient Bedrooms. *Provide accessible patient bedrooms in compliance with 4. Accessible patient bedrooms shall comply with the following:*

(1) *Each bedroom shall have a turning space that complies with 4.2.3, and preferably that is located near the entrance.*

(2) *Each one-bed room shall have a minimum clear floor space of 36 in (915 mm) along each side of the bed, and 42 in (1065 mm) between the foot of the bed and the wall.*

(3) *Each two-bed room shall have a minimum clear floor space of 42 in (1065 mm), preferably 48 in (1220 mm), between the foot of the bed and the wall; 36 in (915 mm) between the side of the bed and the wall; and 48 in (1220 mm) between beds.*

(4) *Each four-bed room shall have a minimum clear floor space of 48 in (1220 mm) from the foot of the bed to the foot of the opposing bed; 36 in (915 mm) between the side of the bed and the wall; and 48 in (1220 mm) between beds.*

(5) *Each bedroom shall have a door that complies with 4.13.*

6.4 Patient Toilet Rooms. *Provide each patient bedroom that is required to be accessible with an accessible toilet room that complies with 4.22 or 4.23.*

7. MERCANTILE.

7.1 General. *In addition to the requirements of 4.1 to 4.33, the design of all areas used for business transactions with the public shall comply with 7.*

7.2 Service Counters. *Where service counters exceeding 36 in (915 mm) in height are provided for standing sales or distribution of goods to the public, an auxiliary counter or a portion of the main counter shall be provided with a maximum height of between 28 in to 34 in (710 mm to 865 mm) above the floor in compliance with 4.32.4.*

7.3 Check-Out Aisles. *At least one accessible check-out aisle shall be provided in buildings or facilities with check-out aisles. Clear aisle width shall comply with 4.2.1 and maximum adjoining counter height shall not exceed 36 in (915 mm) above the floor.*

7.4 Security Bollards. *Any device used to prevent the removal of shopping carts from store premises shall not prevent access or egress to those in wheelchairs. An alternate entry that is equally convenient to that provided for the ambulatory population is acceptable.*

8.0 Libraries

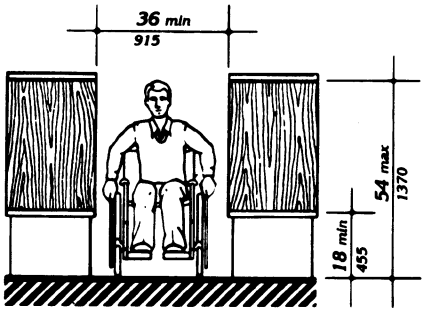

Fig. 55
Card Catalog

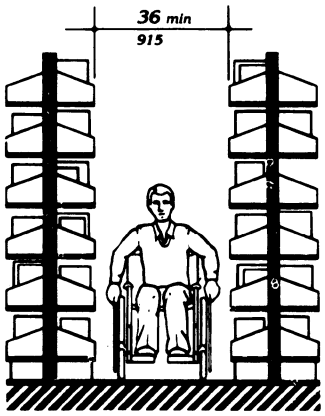

Fig. 56
Stacks

8. LIBRARIES.

8.1 General. *In addition to the requirements of 4.1 to 4.33, the design of all public areas of a library shall comply with 8, including reading and study areas, stacks, reference rooms, reserve areas, and special facilities or collections. As provided, elements such as public toilet rooms, telephones, and parking shall be accessible.*

8.2 Reading and Study Areas. *At least 5 percent or a minimum of one of each element of fixed seating, tables, or study carrels shall comply with 4.2 and 4.32. Clearances between fixed accessible tables and study carrels shall comply with 4.3.*

8.3 Check-Out Areas. *At least one lane at each check-out area shall comply with 4.32. Any traffic control or book security gates or turnstiles shall comply with 4.13.*

8.4 Card Catalogs. *Minimum clear aisle space at card catalogs, magazine displays, or reference stacks shall comply with Fig. 55. Maximum reach height shall comply with 4.2, with a height of 48 in (1220 mm) preferred, irrespective of reach allowed.*

8.5 Stacks. *Minimum clear aisle width between stacks shall comply with 4.3, with a minimum clear aisle width of 42 in (1065 mm) preferred where possible. Shelf height in stack areas is unrestricted (see Fig. 56).*

9. POSTAL FACILITIES.

9.1 General. *In addition to the requirements of 4.1 to 4.33, the design of U.S. postal facilities shall comply with the requirements of 9. In addition, employee toilet rooms, water fountains, lunchrooms, lounges, attendance-recording equipment, medical treatment rooms, emergency signals, and switches and controls shall be made accessible or adaptable in accordance with the requirements of these standards.*

9.2* Post Office Lobbies. *Where writing desks or tables are provided, a minimum of at least one writing desk or table that complies with 4.32 must be provided. Clear passageways in front of customer service counters shall be not less than 48 in (1220 mm) clear width to permit maneuvering of a wheelchair. Letter drops shall be mounted at heights that comply with 4.2.*

(1) *All fixed partitions must be installed to withstand a 250-pound force applied at any point and from any direction. Avoid designs that call for, or may necessitate, non-fixed partitions in circulation routes of handicapped people.*

(2) *Walls where handrails are provided for handicapped people must be capable of supporting handrails designed to support a 250-pound pull force in any direction.*

58

9.3 *Self-Service Postal Centers.* *Parcel post depositories, stamp vending machines, multi-commodity vending machines, and currency-coin changing machines shall be installed so that the operating mechanisms of all machines comply with 4.2 and 4.27. All mechanisms must be installed to permit close parallel approach by a wheelchair user.*

9.4 *Post Office Boxes.* *At least 5 percent of the post office boxes in a facility shall be accessible to wheelchair users. The total number of accessible post office boxes provided shall include a representative number of each of the standard USPS boxes currently being installed. Accessible post office boxes shall be located in the second or third set of modules from the floor, approximately 12 in to 36 in (305 mm to 915 mm) above the finished floor. Aisles between post office boxes shall be a minimum of 66 in (1675 mm) clear width.*

9.5 *Locker Rooms.* *Lockers in easily accessible areas must be provided for use by handicapped people. When double-tier lockers are used, only the bottom row of lockers may be assigned for use by wheelchair users. When full length lockers are used, all hooks, shelves, etc., intended for use by people in wheelchairs shall be located no higher than 48 in (1220 mm) above the finished floor. Lockers intended for use by handicapped people shall be equipped with latches and latch handles that comply with 4.27. Unobstructed aisle space in front of lockers used by handicapped people shall be a minimum of 42 in (1065 mm) clear width.*

9.6 *Attendance-Recording Equipment.* *Time clocks, card racks, log books, and other work assignment or attendance-recording equipment used by people in wheelchairs must be installed at a height no more than 48 in (1220 mm) above the finished floor. Counter space at check-in areas must be no more than 36 in (915 mm) above the finished floor.*

Appendix

APPENDIX

This appendix contains additional information that should help the designer to understand the minimum requirements of the standard or to design buildings or facilities for greater accessibility. The paragraph numbers correspond to the sections or paragraphs of the standard to which the material relates and are therefore not consecutive (for example, A4.2.1 contains additional information relevant to 4.2.1). Sections for which additional material appears in this appendix have been indicated by an asterisk.

A4.2 Space Allowances and Reach Ranges.

A4.2.1 Wheelchair Passage Width.

(1) Space Requirements for Wheelchairs. Most wheelchair users need a 30 in (760 mm) clear opening width for doorways, gates, and the like, when the latter are entered head-on. If the wheelchair user is unfamiliar with a building, if competing traffic is heavy, if sudden or frequent movements are needed, or if the wheelchair must be turned at an opening, then greater clear widths are needed. For most situations, the addition of an inch of leeway on either side is sufficient. Thus, a minimum clear width of 32 in (815 mm) will provide adequate clearance. However, when an opening or a restriction in a passageway is more than 24 in (610 mm) long, it is essentially a passageway and must be at least 36 in (915 mm) wide.

(2) Space Requirements for Use of Walking Aids. Although people who use walking aids can maneuver through clear width openings of 32 in (815 mm), they need 36 in (915 mm) wide passageways and walks for comfortable gaits. Crutch tips, often extending down at a wide angle, are a hazard in narrow passageways where they might not be seen by other pedestrians. Thus, the 36 in (915 mm) width provides a safety allowance both for the disabled person and for others.

(3) Space Requirements for Passing. Able-bodied people in winter clothing, walking straight ahead with arms swinging, need 32 in (815 mm) of width, which includes 2 in (50 mm) on either side for sway, and another 1 in (25 mm) tolerance on either side for clearing nearby objects or other pedestrians. Almost all wheelchair users and those who use walking aids can also manage within this 32 in (815 mm) width for short distances. Thus, two streams of traffic can pass in 64 in (1625 mm) in a comfortable flow. Sixty inches (1525 mm) provide a minimum width for a somewhat more restricted flow. If the clear width is less than 60 in (1525 mm), two wheelchair users will not be able to pass but will have to seek a wider place for passing. Forty-eight inches (1220 mm) is the minimum width needed for an ambulatory person to pass a nonambulatory or semiambulatory person. Within this 48 in (1220 mm) width, the ambulatory person will have to twist to pass a wheelchair user, a person with a seeing eye dog, or a semiambulatory person. There will be little leeway for swaying or missteps (see Fig. A1).

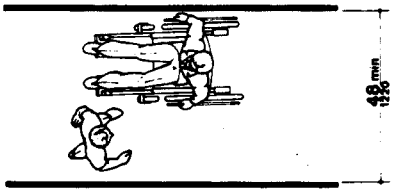

Fig. A1
Minimum Passage Width for One Wheelchair and One Ambulatory Person

A4.2.3 Wheelchair Turning Space. This standard specifies a minimum space of 60 in (1525 mm) diameter for a pivoting 180-degree turn of a wheelchair. This space is usually satisfactory for turning around, but many people will not be able to turn without repeated tries and bumping into surrounding objects. The space shown in Fig. A2 will allow most wheelchair users to complete U-turns without difficulty.

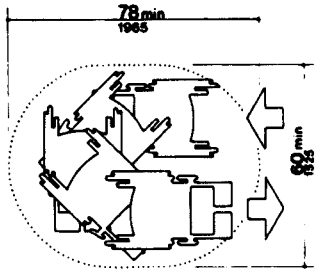
A4.2.4 Clear Floor or Ground Space for Wheelchairs. The wheelchair and user shown in Fig. A3 represent typical dimensions for a large adult male. The space requirements in this standard are based upon maneuvering clearances that will accommodate most larger wheelchairs. Fig. A3 provides a uniform reference for design not covered by this standard.

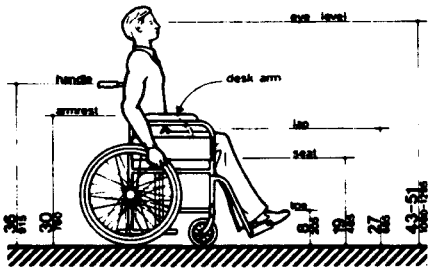
A4.2.5 & A4.2.6 Reach. *Reach ranges for persons seated in wheelchairs may be further clarified by Fig. A3(a). These drawings approximate in the plan view information shown in Fig. 4, 5, and 6 in other views.*

A4.3 Accessible Route.

A4.3.1 General.

(1) Travel Distances. Many disabled people can move at only very slow speeds; for many, traveling 200 ft (61 m) could take about 2 minutes. This assumes a rate of about 1.5 ft/s (455 mm/s) on level ground. It also assumes that the traveler would move continuously. However, on trips over 100 ft (30 m), disabled people are apt to rest frequently, which substantially increases their trip times. Resting periods of 2 minutes for every 100 ft (30 m) can be used to estimate travel times for people with severely limited stamina. In





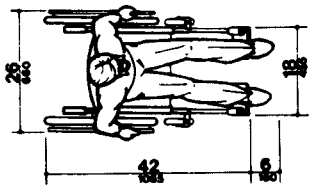


Fig. A2
Space Needed for Smooth U-Turn in a Wheelchair

NOTE: Footrests may extend further for very large people.

Fig. A3
Dimensions of Adult-Sized Wheelchairs

inclement weather, slow progress and resting can greatly increase a disabled person's exposure to the elements.

(2) Sites. Level, indirect routes or those with running slopes lower than 1:20 can sometimes provide more convenience than direct routes with maximum allowable slopes or with ramps.

A4.3.10 Egress. In buildings where physically handicapped people are regularly employed or are residents, an emergency management plan for their evacuation also plays an essential role in fire safety.

A4.4 Protruding Objects.

A4.4.1 General. Guide dogs are trained to recognize and avoid hazards. However, most people with severe impairments of vision use the long cane as an aid to mobility. The two principal cane techniques are the touch technique, where the cane arcs from side to side and touches points outside both shoulders; and the diagonal technique, where the cane is held in a stationary position diagonally across the body with the cane tip touching or just above the

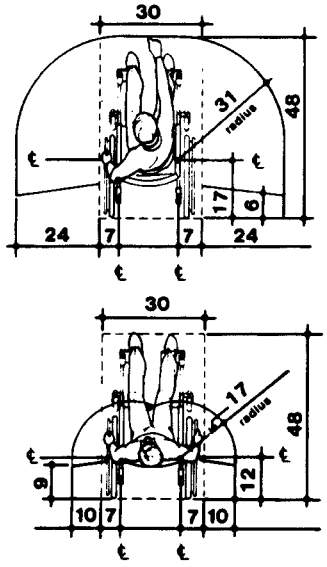

Fig. A3 (a)

A4.4 Protruding Objects

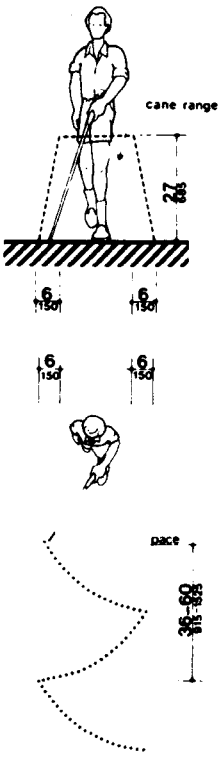

Fig. A4
Cane Technique

ground at a point outside one shoulder and the handle or grip extending to a point outside the other shoulder. The touch technique is used primarily in uncontrolled areas, while the diagonal technique is used primarily in certain limited, controlled, and familiar environments. Cane users are often trained to use both techniques.

Potential hazardous objects are noticed only if they fall within the detection range of canes (see Fig. A4). Visually impaired people walking toward an object can detect an overhang if its lowest surface is not higher than 27 in (685 mm). When walking alongside projecting objects, they cannot detect overhangs. Since proper cane and guide dog techniques keep people away from the edge of a path or from walks, a slight overhang of no more than 4 in (100 mm) is not hazardous.

A4.5 Ground and Floor Surfaces.

A4.5.1 General. Ambulant and semiambulant people who have difficulty maintaining balance and those with restricted gaits are particularly sensitive to slipping and tripping hazards. For such people, a stable and regular surface is necessary for safe walking, particularly on stairs. Wheelchairs can be propelled most easily on surfaces that are hard, stable, and regular. Soft, loose surfaces such as shag carpet, loose sand, and wet clay, and irregular surfaces, such as cobblestones, can significantly impede wheelchair movement.

Slip resistance is based on the frictional force necessary to keep a shoe heel or crutch tip from slipping on a walking surface under the conditions of use likely to be found on the surface. Although it is known that the static coefficient of friction is the basis of slip resistance, there is not as yet a generally accepted method to evaluate the slip resistance of walking surfaces.

Cross slopes on walks and ground or floor surfaces can cause considerable difficulty in propelling a wheelchair in a straight line.

A4.5.3 Carpet. Much more needs to be done in developing both quantitative and qualitative criteria for carpeting. However, certain functional characteristics are well established. When both carpet and padding are used, it is desirable to have minimum movement (preferably none) between the floor and the pad and the pad and the carpet, which would allow the carpet to hump or warp. In heavily trafficked areas, a thick, soft (plush) pad or cushion, particularly in combination with long carpet pile, makes it difficult for individuals in wheelchairs and those with other ambulatory disabilities to get about. This should not preclude their use in specific areas where traffic is light. Firm carpeting can be achieved through proper selection and combination of pad and carpet, sometimes with the elimination of the pad or cushion, and with proper installation.

A4.6 Parking and Passenger Loading Zones.

A4.6.3 Parking Spaces. High-top vans, which disabled people or transportation services often use, require higher clearances in parking garages than automobiles. *When optional van spaces are provided within a garage, only the spaces themselves and a vehicle route to them require the specified clearances.*

A4.6.4 Signage. Signs designating parking places for disabled people can be seen from a driver's seat if the signs are mounted high enough above the ground and located at the front of a parking space.

A4.8 Ramps.

A4.8.1 General. Ramps are essential for wheelchair users if elevators or lifts are not available to connect different levels. However, some people who use walking aids have difficulty with ramps and prefer stairs.

A4.8.2 Slope and Rise. The ability to manage an incline is related to both its slope and its length. Wheelchair users with disabilities affecting arms or with low stamina have serious difficulty using inclines. Most ambulatory people and most people who use wheelchairs can manage a slope of 1:16. Many people cannot manage a slope of 1:12 for 30 ft (9 m). Many people who have difficulty negotiating very long ramps at relatively shallow slopes can manage very short ramps at steeper slopes.

A4.8.5 Handrails. The requirements for stair and ramp handrails in this standard are for adults. When children are principal users in a building or facility, a second set of handrails at an appropriate height can assist them and aid in preventing accidents.

A4.10 Elevators.

A4.10.6 Door Protective and Reopening Device. The required door reopening device would hold the door open for 20 seconds if the doorway remains unobstructed. After 20 seconds, the door may begin to close. However, if designed in accordance with ANSI A17.1-1978, the door closing movement could still be stopped if a person or object exerts sufficient force at any point on the door edge.

A4.10.7 Door and Signal Timing for Hall Calls. This paragraph allows variation in the location of call buttons, advance time for warning signals, and the door-holding period used to meet the time requirement.

A4.10.12 Car Controls. Industry-wide standardization of elevator control panel design would make all elevators significantly more convenient for use by people with severe visual impairments.

In many cases, it will be possible to locate the highest control on elevator panels within 48 in (1220 mm) from the floor.

A4.10.13 Car Position Indicators. A special button may be provided that would activate the audible signal within the given elevator only for the desired trip, rather than maintaining the audible signal in constant operation.

A4.10.14 Emergency Communications. A device that requires no handset is easier to use by people who have difficulty reaching.

A4.11 Platform Lifts.

Platform lifts include porch lifts and other devices used for short-distance, vertical transportation of people in wheelchairs. At the present time, generally recognized safety standards for such lifts have not been developed. Care should be taken in selecting and installing lifts to ensure that they are free from hazards to users or to other individuals who may be in the vicinity where they are being operated.

A4.13 Doors.

A4.13.8 Thresholds at Doorways. Thresholds and surface height changes in doorways are particularly inconvenient for wheelchair users who also have low stamina or restrictions in arm movement, because complex maneuvering is required to get over the level change while operating the door.

A4.13.9 Door Hardware. Some disabled persons must push against a door with their chair or walker to open it. Applied kickplates on doors with closers can reduce required maintenance by withstanding abuse from wheelchairs and canes. To be effective, they should cover the door width, less approximately 2 in (51 mm), up to a height of 16 in (405 mm) from its bottom edge and be centered across the top.

A4.13.10 Door Closers. Closers with delayed action features give a person more time to maneuver through doorways. They are particularly useful on frequently used interior doors such as entrances to toilet rooms.

A4.13.11 Door Opening Force. Although most people with disabilities can exert at least 5 lbf (22.2N), both pushing and pulling from a stationary position, a few people with severe disabilities cannot exert even 3 lbf (13.3N). Although some people cannot manage the allowable forces in this standard and many others have difficulty, door closers must have certain minimum closing forces to close doors satisfactorily. Forces for pushing or pulling doors open are measured with a push-pull scale under the following conditions:

(1) Hinged doors: Force applied perpendicular to the door at the door opener or 30 in (760 mm) from the hinged side, whichever is farther from the hinge.

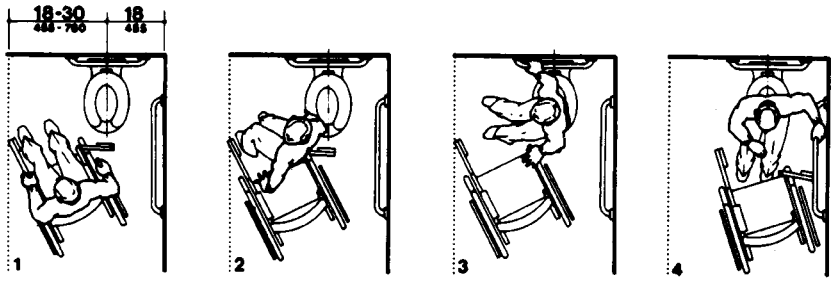
(2) Sliding or folding doors: Force applied parallel to the door at the door pull or latch.

(3) Application of force: Apply force gradually so that the applied force does not exceed the resistance of the door.

In high-rise buildings, air-pressure differentials may require a modification of this specification in order to meet the functional intent.

A4.13.12 Automatic Doors and Power-Assisted Doors. Sliding automatic doors do not need guard rails and are more convenient for wheelchair users and visually impaired people to use. If slowly opening automatic doors can be reactuated before their closing cycle is completed, they will be more convenient in busy doorways.

A4.15 Drinking Fountains and Water Coolers



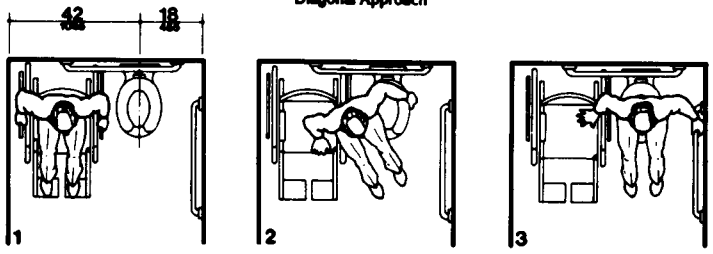
A4.15 *Drinking Fountains and Water Coolers.*

A4.15.2 *Drinking fountains with two spouts can assist both handicapped people and those people who find it difficult to bend over.*

A4.16 Water Closets.

A4.16.3 Height. Preferences for toilet seat heights vary considerably among disabled people. Higher seat heights may be an advantage to some ambulatory disabled people but a disadvantage for wheelchair users and others. Toilet seats 18 in (455 mm) high seem to be a reasonable compromise. Thick seats and filler rings are available to adapt standard fixtures to these requirements.

A4.16.4 Grab Bars. Fig. A5(a) and (b) show the diagonal and side approaches most commonly used to transfer from a wheelchair to a water closet. Some wheelchair users can transfer from the front of the toilet, while others use a 90-degree approach. Most people who use the two additional approaches can also use either the diagonal approach or the side approach.



1 Takes transfer position, swings footrest out of the way, sets brakes.

2 Removes armrest, transfers.

3 Moves wheelchair out of the way, changes position (some people fold chair or pivot it 90° to the toilet).

4 Positions on toilet, releases brake.

(a)
Diagonal Approach

1 Takes transfer position, removes armrest, sets brakes.

2 Transfers.

3 Positions on toilet.

(b)
Side Approach

Fig. A5
Wheelchair Transfers

A4.16.5 Flush Controls. Flush valves and related plumbing can be located behind walls or to the side of the toilet, or a toilet seat lid can be provided if plumbing fittings are directly behind the toilet seat. Such designs reduce the chance of injury and imbalance caused by leaning back against the fittings. Flush controls for tank-type toilets have a standardized mounting location on the left side of the tank (facing the tank). Tanks can be obtained by special order with controls mounted on the right side. If administrative authorities require flush controls for flush valves to be located in a position that conflicts with the location of the rear grab bar, then that bar may be split or shifted toward the wide side of the toilet area.

A4.17 Toilet Stalls.

A4.17.5 Doors. To make it easier for wheelchair users to close toilet stall doors, doors can be provided with closers, spring hinges, or a pull bar mounted on the inside surface of the door near the hinge side.

A4.19 Lavatories and Mirrors.

A4.19.6 Mirrors. If mirrors are to be used by both ambulatory people and wheelchair users, then they must be at least 74 in (1880 mm) high at their topmost edge. A single full length mirror can accommodate all people, including children.

A4.21 Shower Stalls.

A4.21.1 General. Shower stalls that are 36 in by 36 in (915 mm by 915 mm) wide provide additional safety to people who have difficulty maintaining balance because all grab bars and walls are within easy reach. Seated people use the walls of 36 in by 36 in (915 mm by 915 mm) showers for back support. Shower stalls that are 60 in (1525 mm) wide and have no curb may increase usability of a bathroom by wheelchair users because the shower area provides additional maneuvering space.

A4.23 Bathrooms, Bathing Facilities, and Shower Rooms.

A4.23.9 Medicine Cabinets. Other alternatives for storing medical and personal care items are very useful to disabled people. Shelves, drawers, and floor-mounted cabinets can be provided within the reach ranges of disabled people.

A4.26 Handrails, Grab Bars, and Tub and Shower Seats.

A4.26.1 General. Many disabled people rely heavily upon grab bars and handrails to maintain balance and prevent serious falls. Many people brace their forearms between supports and walls to give them more leverage and stability in maintaining balance or for lifting. The maximum grab bar clearance of 1-1/2 in (38 mm) required in this standard is a safety clearance to prevent injuries from arms slipping through the opening. It also provides adequate gripping room.

A4.26.2 Size and Spacing of Grab Bars and Handrails. This specification allows for alternate shapes of handrails as long as they allow an opposing grip similar to that provided by a circular section of 1-1/4 in to 1-1/2 in (32 mm to 38 mm).

A4.27 *Controls and Operating Mechanisms.*

A4.27.3 *Height.* *Fig. A6 further illustrates mandatory and advisory control mounting height provisions for typical equipment. Note distinction between built-in equipment (considered real property) and movable equipment (considered chattel, and not covered by the Architectural Barriers Act of 1968).*

A4.28 Alarms.

A4.28.2 Audible Alarms. Audible emergency signals must have an intensity and frequency that can attract the attention of individuals who have partial hearing loss. People over 60 years of age generally have difficulty perceiving frequencies higher than 10,000 Hz.

A4.28.3 Visual Alarms. The specifications in this section do not preclude the use of zoned or coded alarm systems. In zoned systems, the emergency exit lights in an area will flash whenever an audible signal rings in the area.

A4.28.4 Auxiliary Alarms. Locating visual emergency alarms in rooms where deaf individuals may work or reside alone can ensure that they will always be warned when an emergency alarm is activated. To be effective, such devices must be located and oriented so that they will spread signals and reflections throughout a space or raise the overall light level sharply. The amount and type of light necessary to wake a deaf person from a sound sleep in a dark room will vary depending on a number of factors, including the size and configuration of the room, the distance between the source and the person, whether or not the light flashes, and the cycle of flashing. A 150-watt flashing bulb can be effective under some conditions. Certain devices currently available are designed specifically as visual alarms for deaf people. Deaf people may not need accessibility features other than the emergency alarm connections and communications devices. Thus, rooms in addition to those accessible for wheelchair users also should be equipped with emergency visual alarms or connections.

A4.29 Tactile Warnings.

A4.29.2 Tactile Warnings on Walking Surfaces. *(Reserved).*

A4.29.3 Tactile Warnings on Doors to Hazardous Areas. Tactile signals for hand reception are useful if it is certain that the signals will be touched.

A4.29.5 Tactile Warnings at Hazardous Vehicular Areas. *(Reserved).*

4.29 Tactile Warnings

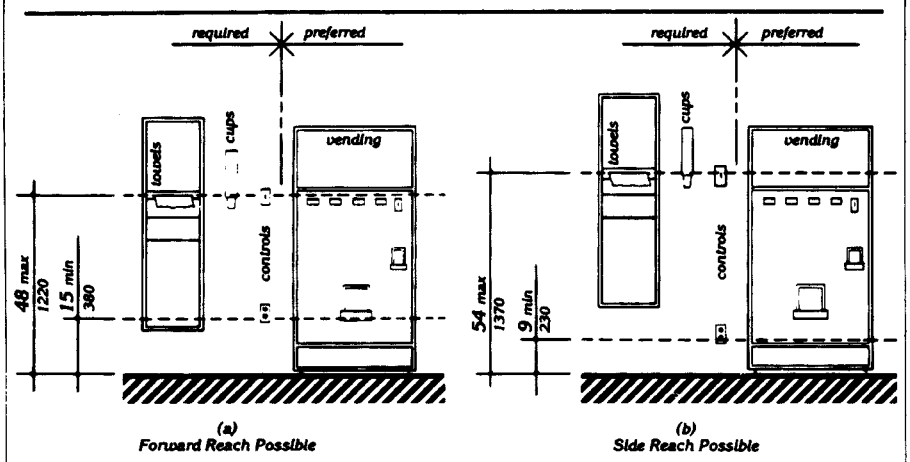


Fig. A6
Control Reach Limitations

A4.29.6 Tactile Warnings at Reflecting Pools. *(Reserved).*

A4.29.7 Standardization. Too many tactile warnings or lack of standardization weakens their usefulness. Tactile signals can also be visual signals to guide dogs, since dogs can be trained to respond to a large variety of visual cues.

A4.30 Signage.

A4.30.1 General. In building complexes where finding locations independently on a routine basis may be a necessity (for example, college campuses), tactile maps or prerecorded instructions can be very helpful to visually impaired people. Several maps and auditory instructions have been developed and tested for specific applications. The type of map or instructions used must be based on the information to be communicated, which depends highly on the type of buildings or users.

Landmarks that can easily be distinguished by visually impaired individuals are useful as orientation cues. Such cues include changes in illumination level, bright colors, unique patterns, wall murals, location of special equipment, or other architectural features (for example, an exterior view).

Many people with disabilities have limitations in movement of their head and reduced peripheral vision. Thus, signage positioned perpendicular to the path of travel is easiest for them to notice. People can generally distinguish signage within an angle of 30 degrees to either side of the centerline of their face without moving their head.

A4.30.2 Character Proportion. The legibility of printed characters is a function of the viewing distance, character height, the ratio of the stroke width to the height of the character, the contrast of color between character and background, and print font. The size of characters must be based upon the intended viewing distance. A severely nearsighted person may have to be much closer to see a character of a given size accurately than a person with normal visual acuity.

A4.30.3 Color Contrast. The greatest readability is usually achieved through the use of light-colored characters or symbols on a dark background.

A4.30.4 Raised or Indented Characters or Symbols. Signs with descriptive materials about public buildings, monuments, and objects of cultural interest can be raised or incised letters. However, a sighted guide or audio-tape device is often a more effective way to present such information. Raised characters are easier to feel at small sizes and are not susceptible to maintenance problems as are indented characters, which can fill with dirt, cleaning compounds, and the like.

Braille characters can be used in addition to standard alphabet characters and numbers. Placing braille

characters to the left of standard characters makes them more convenient to read. Standard dot sizing and spacing as used in braille publications are acceptable. Raised borders around raised characters can make them confusing to read unless the border is set far away from the characters.

A4.31 Telephones.

A4.31.3 Mounting Height. In localities where the dial-tone first system is in operation, calls can be placed at a coin telephone through the operator without inserting coins. The operator button is located at a height of 46 in (1170 mm) if the coin slot of the telephone is at 54 in (1370 mm).

A generally available public telephone with a coin slot mounted lower on the equipment would allow universal installation of telephones at a height of 48 in (1220 mm) or less to all operable parts.

A4.31.5 Equipment for Hearing Impaired People. Other aids for people with hearing impairments are telephones, teleprinter, and other telephonic devices that can be used to transmit printed messages through telephone lines to a teletype printer or television monitor.

A4.32 Seating, Tables, and Work Surfaces.

A4.32.4 Height of Work Surfaces. Different types of work require different work surface heights for comfort and optimal performance. Light detailed work such as writing requires a work surface close to elbow height for a standing person. Heavy manual work such as rolling dough requires a work surface height about 10 in (255 mm) below elbow height for a standing person. The principle of a high work surface height for light detailed work and a low work surface for heavy manual work also applies for seated persons; however, the limiting condition for seated manual work is clearance under the work surface.

Table A1 shows convenient work surface heights for seated persons. The great variety of heights for comfort and optimal performance indicates a need for alternatives or a compromise in height if people who stand and people who sit will be using the same counter area.

A4.33 Assembly Areas.

A4.33.2 Size of Wheelchair Locations. Spaces large enough for two wheelchairs allow people who are coming to a performance together to sit together.

A4.33.3 Placement of Wheelchair Locations. The location of wheelchair areas can be planned so that a variety of positions within the seating area are provided. This will allow choice in viewing and price categories.

A4.33.6 Placement of Listening Systems. A distance of 50 ft (15 m) allows a person to distinguish performers' facial expressions.

Table A1
Convenient Heights of Work Surfaces for Seated People*

Conditions of Use	Short Women in	Short Women mm	Tall Men in	Tall Men mm
Seated in a wheelchair:				
Manual work:				
Desk or removable armrests	26	660	30	760
Fixed, full-size armrests†	32‡	815	32‡	815
Light, detailed work:				
Desk or removable armrests	29	735	34	865
Fixed, full-size armrests†	32‡	815	34	865
Seated in a 16-in (405-mm) -high chair:				
Manual work	26	660	27	685
Light, detailed work	28	710	31	785

*All dimensions are based on a work-surface thickness of 1-1/2 in (38 mm) and a clearance of 1-1/2 in (38 mm) between legs and the underside of a work surface.

†This type of wheelchair arm does not interfere with the positioning of a wheelchair under a work surface.

‡This dimension is limited by the height of the armrests; a lower height would be preferable. Some people in this group prefer lower work surfaces, which require positioning the wheelchair back from the edge of the counter.

A4.33.7 Types of Listening Systems. A listening system that can be used from any seat in a seating area is the most flexible way to meet this specification. Earphone jacks with variable volume controls can benefit only people who have slight hearing losses and do not help people with hearing aids. At the present time, audio loops are the most feasible type of listening system for people who use hearing aids, but people without hearing aids or those with hearing aids not equipped with inductive pickups cannot use them. Loops can be portable and moved to various locations within a room. Moreover, for little cost, they can serve a large area within a seating area. Radio frequency systems can be extremely effective and inexpensive. People without hearing aids can use them, but people with hearing aids need custom-designed equipment to use them as they are presently designed. If hearing aids had a jack to allow a by-pass of microphones, then radio frequency systems would be suitable for people with and without hearing aids. Some listening systems may be subject to interference from other equipment and feedback from hearing aids of people who are using the systems. Such interference can be controlled by careful engineering design that anticipates feedback and sources of interference in the surrounding area.

A4.34 Dwelling Units

A4.34 Dwelling Units.

A4.34.2 Minimum Requirements. Handicapped people who live in accessible dwelling units of multi-family buildings or housing projects will want to participate in all on-site social activities, including visiting neighbors in their dwelling units. Hence, any circulation paths among all dwelling units and among all on-site facilities should be as accessible as possible. An accessible second exit to dwelling units provides an extra margin of safety in a fire.

A4.34.5 Bathrooms. Although not required by these specifications, it is important to install grab bars at toilets, bathtubs, and showers if it is known that a dwelling unit will be occupied by elderly or severely disabled people.

A4.34.6 Kitchens.

A4.34.6.1 Clearance. The minimum clearances provide satisfactory maneuvering spaces for wheelchairs only if cabinets are removed at the sink.

A4.34.6.5 Sink. Installing a sink with a drain at the rear so that plumbing is as close to the wall as possible can provide additional clear knee space for wheelchair users.

A4.34.6.6 Ranges and Cooktops. Although not required for minimum accessibility, countertop range units in a counter with adjustable heights can be an added convenience for wheelchair users.

A4.34.6.7 Ovens. Countertop or wall-mounted ovens with side-opening doors are easier for people in wheelchairs to use. Clear spaces at least 30 in (760 mm) wide under counters at the side of ovens are an added convenience. The pullout board or fixed shelf under side-opening oven doors provides a resting place for heavy items being moved from the oven to a counter.

A4.34.6.8 Refrigerator/Freezers. Side-by-side refrigerator/freezers provide the most usable freezer compartments. Locating refrigerators so that their doors can swing back 180 degrees is more convenient for wheelchair users.

A4.34.6.10 Kitchen Storage. Full height cabinets or tall cabinets can be provided rather than cabinets mounted over work counters. Additional storage space located conveniently adjacent to kitchens can be provided to make up for space lost when cabinets under counters are removed.

A9. Postal Facilities.

A9.2 ***Post Office Lobbies.*** *Furniture as chattel is not covered under the Architectural Barriers Act of 1968, but the requirements for lobby furniture and equipment are imposed by the United States Postal Service for greater accessibility in its customer lobbies.*

Note: Unedited copies of the American National Standards Institute standard, A117.1-1980, "Specifications for Making Buildings and Facilities Accessible to and Usable by Physically Handicapped People," are available from the American National Standards Institute, Inc., 1430 Broadway, New York, New York 10018.

TABLE OF CONTENTS

- Part I: Introduction
- Part II: Executive Summary of Recommended Standards
- Part III: Recommended Standards, Scoping and Technical Provisions: X01 General
- X02 New Construction: Minimum Requirements: X02.1 Public Sidewalks
- X02.2 Protruding Objects
- X02.3 Street Fixtures and Furniture
- X02.4 Sidewalk/Street Transitions
- X02.5 Pedestrian Street Crossings
- X02.6 Vehicular Ways and Facilities
- X03 Temporary Facilities and Construction
- Part IV: Appendices

X02.6 Vehicular Ways and Facilities

X02.6.1 On-street parking.

X02.6.1.1 Minimum number required.

(A) Accessible spaces. Where on-street public convenience parking is provided in commercial districts and at civic facilities, accessible on-street parking spaces shall be included in the total provided in the project or project area in accordance with proposed ADAAG Section 208.2 and shall be dispersed within the project area.

Discussion: The committee deferred consideration of scoping for the provision of accessible parking in residential neighborhoods, where on-street parking may be permitted but not designated. Accessible parking spaces for individual residents may be designated as reserved upon request to the appropriate jurisdiction in order to ensure that convenient accessible curbside parking is available.

(B) Van accessible spaces. Where perpendicular or angled parking is provided, one in every eight accessible parking spaces within the project area, but not less than one, shall be a van parking space with an access aisle that is not less than 96 inches (2440 mm) wide.

Discussion: A vast amount of public parking in urban areas is located along public streets and within the public right-of-way. A portion of this parking needs to be accessible. For consistency, the committee agreed to use the same ratios as are already in use for parking lots.

X02.6.1.2 Location. Accessible spaces and van accessible spaces shall be dispersed within the project area and shall be provided at locations with minimum street and sidewalk slope to the extent this is consistent with reasonable dispersion within the area.

EXCEPTIONS:

1. Accessible on-street spaces shall be permitted to be clustered if equivalent or greater access is provided, with respect to distance from an accessible entrance, user cost, and convenience.

2. Accessible on-street parking shall be permitted to be combined with off-street parking under the same jurisdiction serving the same project area if equal or greater access is provided in terms of distance from an accessible entrance, user cost, and convenience.

Advisory: *The placement of accessible on-street parking spaces should take into account the type and composition of buildings and facilities located within the project area that is served by the on-street parking. Typically, no single site is served and therefore, parking should be dispersed throughout the project area. When accessible parking is dispersed within the project area, the spaces should be located in close proximity to the entrances of buildings or facilities located within the project area. In select circumstances, a project area may contain only one or two buildings within a project area (example: a municipal library that encompasses an entire city block, with only one public entrance), in which case the accessible parking spaces are permitted to be clustered together at the single entrance in order to provide equal or greater access. Also, if off-street parking is provided serving the same project area (example: a municipal park has both on-street parking as well as a lot serving the park), the total number of accessible parking spaces may be provided in the lot in lieu of the on-street parking spaces in order to provide equal or greater access to the park.*

X02.6.1.3 Minimum width and length. Accessible spaces shall not be smaller in width or length than that specified by the local jurisdictions for other spaces and in no case less than 8 feet (2449 mm) wide and 18 feet (5490 mm) long.

X02.6.1.4 Parallel parking spaces. Where accessible parallel parking is provided, a parallel access aisle at least 60 inches (1525 mm) wide shall be provided at street level the full length of the accessible parking space. The parallel access aisle shall connect at the head or foot of the parking space to a 60-inch wide minimum perpendicular access aisle that shall extend the full width of the parking space. Two parallel parking spaces may share a perpendicular access aisle. The vehicular travel lane shall not encroach on any required access aisle. The area between any curb and the *pedestrian access route* shall comply with Section X02.1.5 in order to allow the deployment of a side lift from a wheelchair accessible space and shall be connected to the pedestrian access route.

EXCEPTION: Where the width of the public pedestrian right-of-way between the extension of the normal curb and boundary of the public right-of-way is less than 12 feet (3660 mm), a parallel access aisle is not required at parallel parking spaces.

X02.6.1.5 Perpendicular or angled parking spaces. Where perpendicular or angled parking is provided, a parallel access aisle at least 60 inches (1525 mm) wide shall be provided at street level the full length of the accessible parking space. At van accessible parking spaces, a parallel access aisle at least 96 inches wide shall be provided at street level the full length of the van accessible parking space. Two perpendicular parking spaces may share an access aisle.

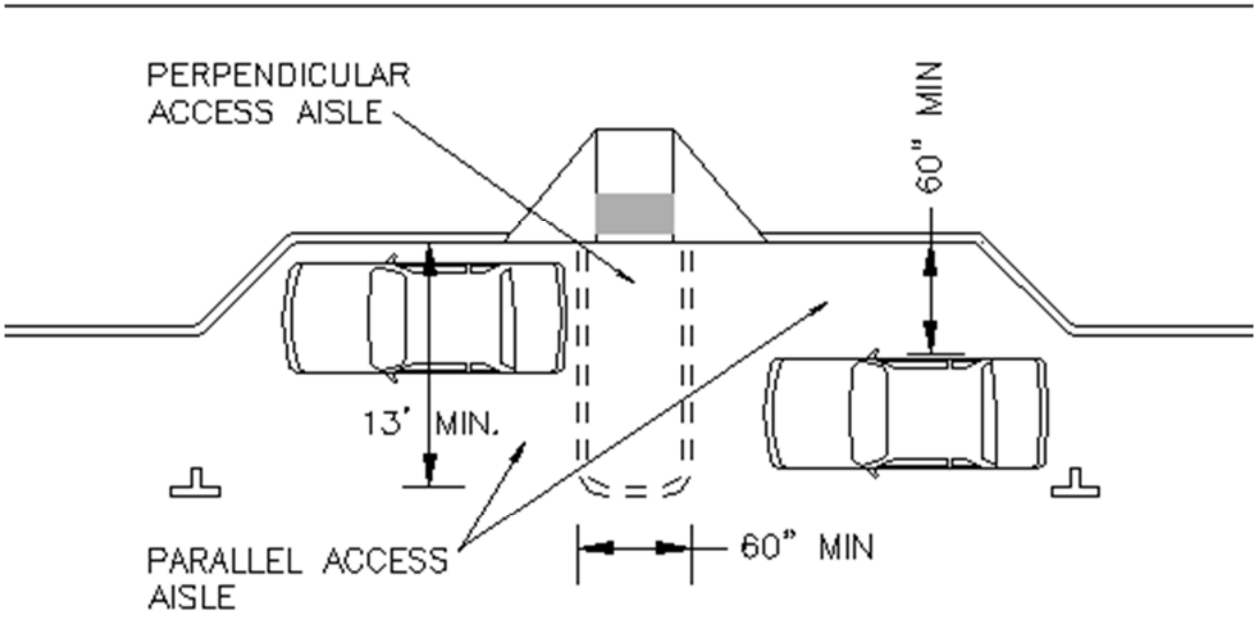
Advisory:*Where angled parking is provided, the entire area comprising the parking space and the access aisle should be marked uniformly to allow the driver to determine which side to park in to allow for egress from the vehicle for the person with a disability. An alternative is to provide a marked access aisle on both sides of the marked parking space.*

X02.6.1.6 Slope. The slope of the accessible space, van accessible space, access aisle for the accessible space, and access aisle for the van accessible space shall not exceed 1:48 slope in any direction.

EXCEPTION: Where steep terrain prevents the provision of on-street parking with compliant slopes, off-street parking in compliance with proposed ADAAG Section 502 may be provided as long as an accessible connection to the pedestrian access route is provided.

Discussion: For many people with disabilities, a sloped parking space is useless because of the potential hazards it presents. Not only may a sloped space be hazardous to use, a sloped space can damage a van lift.

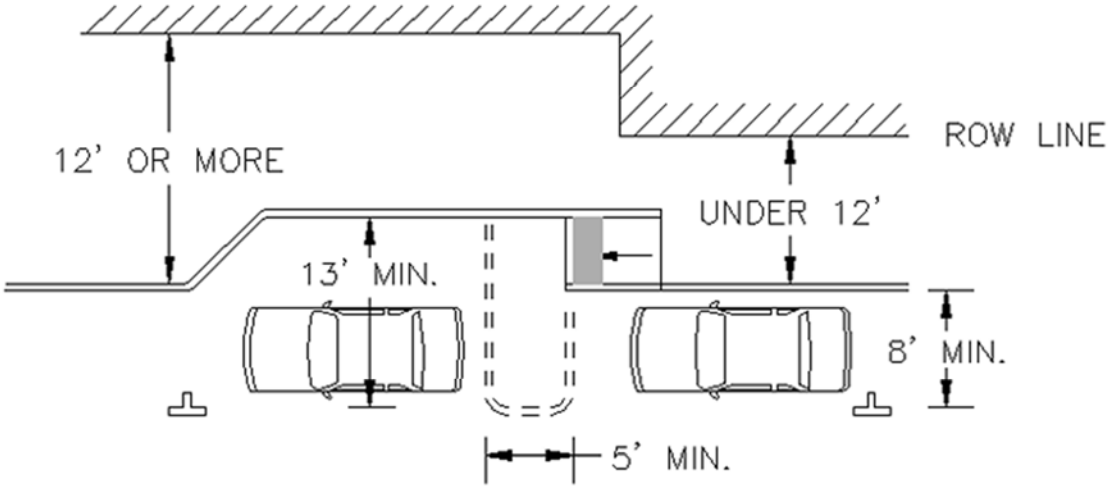
X02.6.1.7 Curb ramps. A *curb ramp* complying with Section X02.4 shall connect the access aisle to the pedestrian access route.



X02.6.1.8 Parking space signage. Parking spaces required to be accessible shall be designated as reserved by a sign that complies with proposed ADAAG Section 502.6. Van accessible spaces shall contain an additional sign "Van Accessible" mounted below the symbol of accessibility. Signs shall be located within the width or length of the space they serve and located within 3 feet (915 mm) of the head of the parking space so as not to interfere with the operation of a side lift or a passenger side transfer.

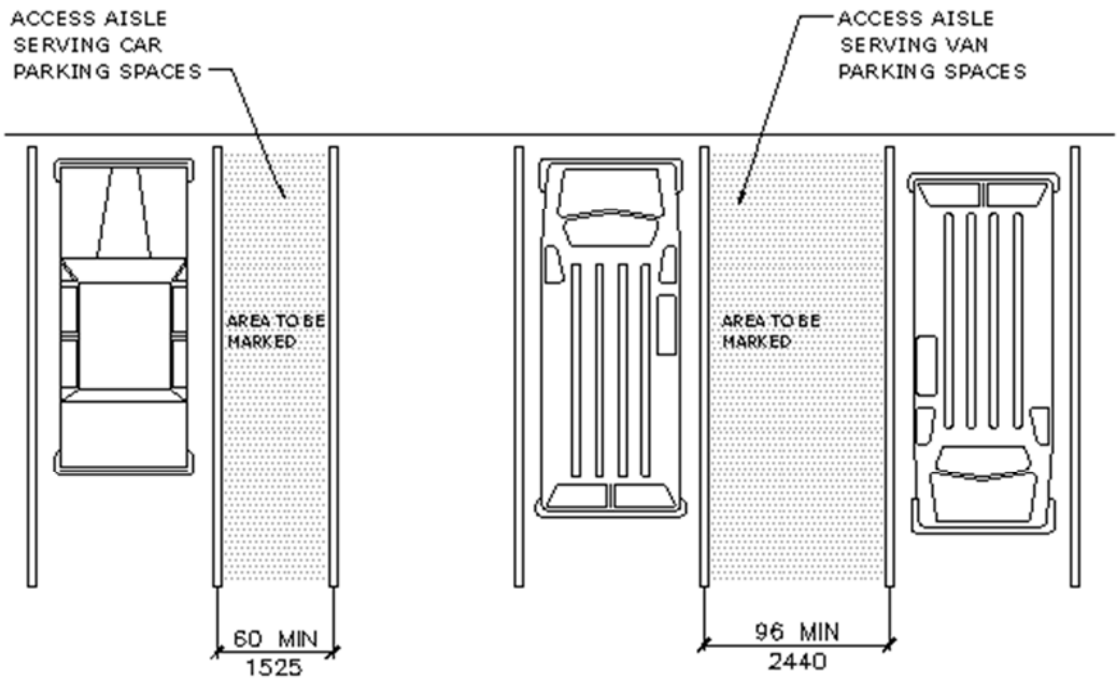
X02.6.1.9 Markings. Access aisles shall be marked so as to discourage parking in them.

X02.6.1.10 Obstructions. Obstructions such as *street furniture*, fire hydrants, parking meters, signs, mailboxes, landscaping, and trash receptacles shall not be placed adjacent to the accessible space in a manner that may interfere with the operation of a side lift or a passenger side transfer.



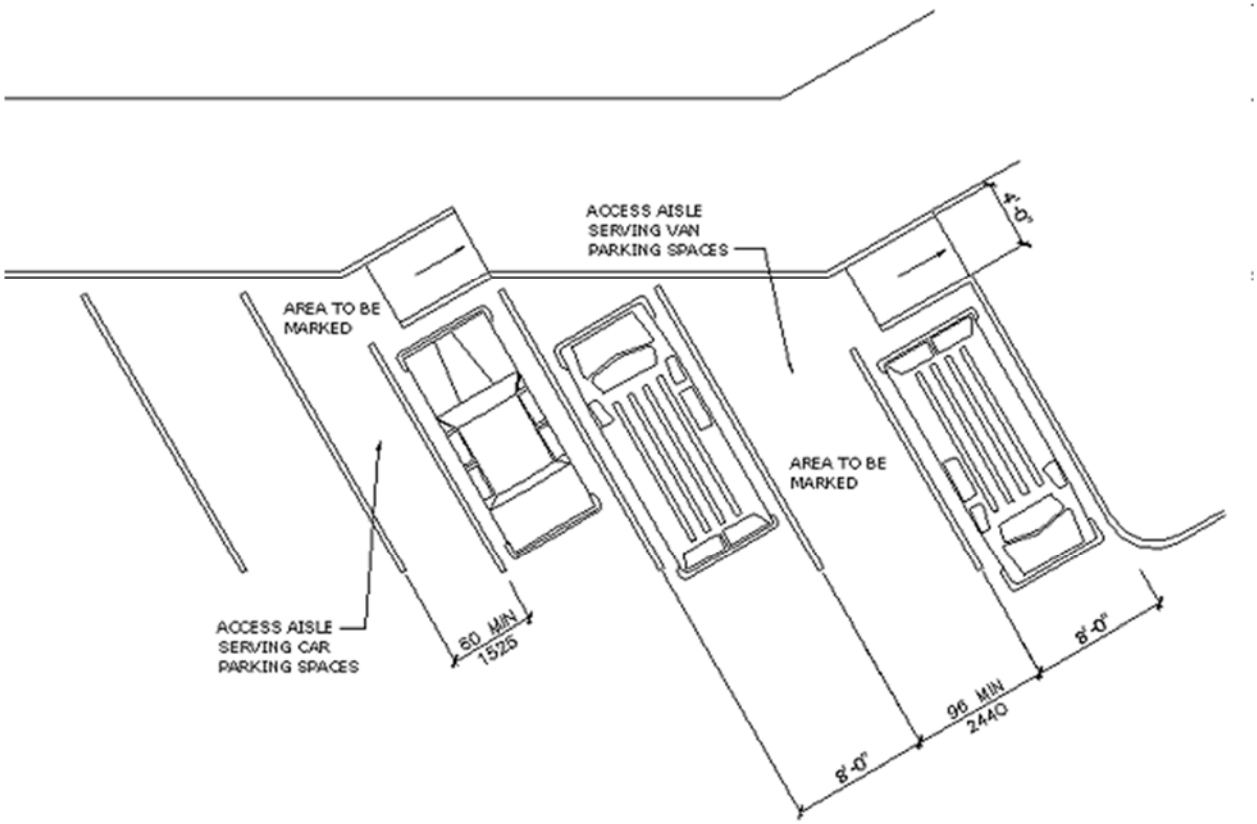
Discussion: The committee also discussed problems with accessible spaces being located next to a public sidewalk cluttered with street furniture such as trash receptacles, sign posts, trees, etc. Since various types of vehicles are driven by people with disabilities, the public sidewalk next to the parking space needs to be clear of obstructions in case it is needed for a side lift or passenger side transfer directly to the public sidewalk.

Figure X02.6 A Parallel Parking



Two accessible parallel parking spaces sharing a perpendicular access aisle between the two spaces. The access aisle is 5' wide, minimum. In one space, the vehicle is shown parked close to the curb, while in the other space, the car is parked closer to traffic to allow exiting the vehicle on the curb side.

Figure X02.6 B Parallel Parking Space without Access Aisle



A single accessible parallel parking space with a 5' access aisle at the rear of the space. Dimensions depict the exception proposed in this report to not require the access aisle if there is less than 12' of available right of way from the normal curb line to the right of way line.

Figure X02.6 C Perpendicular Parking

A single perpendicular accessible parking space with a 5' access aisle to the right of the space. On the right, the figure shows two van accessible perpendicular parking spaces with a common 8' access aisle between them.

Figure X02.6 D Angle Parking

Two angle accessible parking spaces with a 5' access aisle between them and two van accessible angle parking spaces with an 8' access aisle between them. The figure depicts a total of 4 parking spaces with a curb ramp for each access aisle.

X02.6.2 Parking meters.

X02.6.2.1 General. Where public meters are provided, each shall comply with the requirements set forth in this section.

X02.6.2.2 Controls. The centerline of controls on all parking meters shall be no more than 42 inches (1065mm) above the *pedestrian access route*. Controls and operating mechanisms shall be operable from the pedestrian access route with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate controls shall be no greater than 5 pounds.

Discussion: The 42-inch high dimension for parking control mounting height was selected to be consistent with the mounting height for pedestrian push buttons on traffic signal poles.

X02.6.2.3 Clear space. Where parking meters serve accessible parking spaces required under this section, a stable, firm, and slip-resistant clear ground space complying with proposed ADAAG Section 305 shall be provided at the controls. Where only a parallel approach is provided, controls shall be within 10 inches horizontally of, and centered on, the clear ground space. Where only a forward approach is provided, controls shall abut and be centered on the clear ground space.

Discussion: Some committee members felt that a larger clear ground space is necessary in the public right-of-way. See discussion under X02.3.1.3.

X02.6.2.4 Location. A parking meter shall be located within 3 feet (915 mm) of the head or foot of the parking space so as not to interfere with the operation of a side lift or a passenger side transfer.

EXCEPTION: Where meters are not provided at the accessible space, but payment for parking in the accessible space is included in a centralized collection box/paying station, the accessible space shall be connected to the centralized collection point with a pedestrian access route.

X02.6.2.5 Display. Where instructions such as hours of operation are provided, they shall not be displayed solely on a horizontal surface of the meter.

Discussion: Parking meter instructions are frequently located on a horizontal plate mounted near the top of the meter. These instructions can not be viewed by a person in a wheelchair or a person of short stature.

X02.6.3 Passenger Loading Zones

X02.6.3.1 General. Where passenger loading and drop-off zones are provided in the *public right-of-way* for use by the general public, each shall meet the requirements set forth in this section.

X02.6.3.2 Minimum number of curb ramps. Where a curb adjoins a passenger loading zone serving multiple vehicle pull-up spaces (e.g., at transportation facilities), a minimum of one *curb ramp* complying with Section X02.4 shall be provided at intervals not to exceed 100 feet (30mm).

X02.6.3.3 Width and length. Loading zones shall not be smaller in width or length than that specified by the local jurisdiction and in no case less than 8 feet wide and 20 feet long (2440 by 6100mm).

X02.6.3.4 Access Aisle. Each passenger loading zone shall provide a parallel access aisle at least 60 inches wide and 20 feet long (1525 x 6100mm) adjacent and parallel to the vehicle pull-up space. The access aisle shall connect to the *pedestrian access route* in compliance with Section X02.

X02.6.3.5 Signage. Where signage is provided, it shall comply with Section X02.3.8.

Advisory: *Signing an accessible loading zone is not required. However, if signage is provided, it shall comply with specifications for accessibility.*

X02.6.4 Motorist aid communication systems.

X02.6.4.1 General. Where motorist aid communication systems are provided, each shall comply with the requirements set forth in this section.

Advisory*: When communication systems such as call boxes are located in an urban area and parking is provided, an accessible parking space should be located near the system and connected to the system with an pedestrian access route .*

X02.6.4.2 Controls and operating mechanisms. Controls and operating mechanisms shall comply with the following requirements:

(A) Controls and operating mechanisms shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate controls shall be no greater than 5 pounds (22.2 N).

Discussion: The committee received comments from a manufacturer of a user-powered motorist aid communication system that it was not possible for their system to achieve the recommended 5 pounds maximum operating force, given the limitations of current technology. These mechanical systems use the energy imparted by the pull of a mechanical lever, using the downward pull force of a person's body weight, to generate the power required to transmit the 'help' message. Representatives indicated that some public entities wish to select systems that are able to generate their own power, due to the remote location of the installations, and noted their efforts to re-engineer their system to reduce operating force. Although the committee was sympathetic to the concerns expressed and recognized the limitations which currently exist, they were also concerned that a higher allowable force required on a control or operating mechanism might preclude its use by some people with disabilities. Furthermore, the committee did not have sufficient research to justify the appropriateness of an alternate force requirement and anticipated that those limitations might be reduced with future industry research. Thus, the committee chose to retain the 5 pound recommendation and invited the manufacturer to seek an exception in comment to the Access Board when the proposed rule is issued by the Board.

(B) Operable parts that are labeled shall be labeled in Braille complying with proposed ADAAG Section 703.5 and in large print (3/16 of an inch based on the letter I) and shall utilize a "sans serif" font.

(C) Controls shall be centered on the clear ground space and shall comply with proposed ADAAG Section 308 except that the highest operable part shall be 48 inches (1220 mm) maximum above the finished surface at the system location.

Discussion: The 48-inch dimension for the highest operable part is retained to avoid creating a roadside safety concern for vehicles leaving the roadway. Once there, the device must be designed such that persons with a variety of disabilities can use it. The user of the device is not always the driver, hence the need for Braille and large print instructions.

X02.6.4.3 Clear ground space. A stable, firm, and slip-resistant clear ground space a minimum of 72 inches by 72 inches (1830 mm by 1830 mm), with a slope no greater than 1:48 in any direction and with at least 2-inch (51mm) edge protection except at the entrance from the pedestrian access route, shall be provided at the controls and shall comply with proposed ADAAG Section 306.

Discussion: A clear ground space of 72 inches by 72 inches is required since users are typically required to leave the roadway, approach a communication system in the public right-of-way, and then make a 180 degree turn to return to their vehicle. It would be undesirable to require users to back out of a location and return to the vehicular way without a clear view of traffic. All turns will have to be made within the confines of the clear ground space due to the requirement for edge protection.

X02.6.4.4 Motor vehicle turnouts. A motor vehicle turnout with a minimum paved area of 16 feet (4880 mm) wide by 23 feet (7015 mm) long, and not exceeding a 1:48 slope in any direction, shall be

provided and shall connect to the clear ground space at the motorist aid communication system with a pedestrian access route. Where shoulder texturing is used, it shall be discontinued at the turnout.
Discussion: A person with a disability needing assistance needs sufficient space to pull out of the traffic lanes, exit their vehicle, and traverse an accessible route to the communication device. A vehicle turnout is required to ensure that enough space is available for a person with a disability to exit their vehicle, travel around the vehicle if necessary, and travel to the motorist communication device.
X02.6.4.5 Two-way communication. Where two-way voice communication is provided, the system shall comply with proposed ADAAG Section 704 and Section 708 and shall include volume controls and a permanent text telephone (TTY). The system shall also provide for VCO and HCO.
X02.6.4.6 Handsets. Handsets, if provided, shall be hearing aid compatible with inductive coupling capability and shall not cause interference with hearing aids. Handset cords shall be at least 29 inches (735 mm) long.
X02.6.4.7 Volume control. Volume controls, if provided, shall provide a gain adjustable to a minimum of 20dB. For incremental volume control, at least one intermediate step of 12dB of gain shall be provided. An automatic reset shall be provided.
Discussion: Because the roadway is a very noisy environment, at least 20dB of gain is necessary for some callers to be able to hear above the ambient noise level.
X02.6.4.8 TTY. Text telephone (TTY) communications, if provided, shall include automatic notification to the recipient that the call is a TTY call, and visual notification to the user that the call has been received.

X02.6.5 Overlooks and viewing areas.
Discussion: The committee noted that overlooks and viewing areas often occur as part of the public right-of-way, particularly as a vehicular pull-off from the roadway coupled with an area which permits the passenger to exit his or her car and to look at the scenery. The committee recognized that the Access Board's Regulatory Negotiation Committee for Outdoor Developed Areas proposed recommendations for such areas in their report published in September 1999. Rather than duplicate the work of that committee, the PROWAAC recommends that overlooks and viewing areas follow the same technical specifications as those proposed in 16.10 of the Report on Outdoor Developed Areas.

X02.6.6 Vertical and horizontal deflection measures.
X02.6.6.1 General. Where no *pedestrian access route* is provided within the *public right-of-way*, a passage of at least 36 inches (915 mm) must be provided between the vertical deflection and the curb or gutter, free of changes in level and with a *cross slope* not to exceed 1:48. Parking shall not be permitted at these locations.
Discussion: Although the committee did not provide any technical or scoping provisions for vertical or horizontal deflections, per se, they did acknowledge that there are situations where there is no pedestrian access route (or public sidewalk) on the adjacent side of the roadway and pedestrians, including wheelchair users, often use the roadway for walking. In those instances, the presence of a deflection in the roadway which traverses the entire width of the roadway will present a major barrier for wheelchair users. Thus, the committee recommended in those situations that a clear width of 36 inches without vertical deflection be provided at the outer width of the roadway to permit passage of a wheelchair user.
X02.6.6.2 Location. Reserved.
Advisory: *Vertical deflection measures are devices placed in the roadway that use the forces of vertical acceleration to discourage speeding by motorists. Vertical deflection measures include, but are not limited to, speed bumps, speed humps, speed tables and raised intersections. Horizontal deflection measures are devices placed in the roadway that use the forces of lateral acceleration to discourage speeding by motorists. Horizontal deflection measures include, but are not limited to, traffic circles, chicanes, and lateral shifts. The committee heard significant testimony from the public during each of its public meetings from individuals with a variety of disabilities, most notably spinal cord injuries or neurological conditions, about the installation of vertical or horizontal deflection measures. Anecdotal evidence presented by those testifying argued that the vertical and horizontal deflection measures were not only painful, but often exacerbated existing conditions when riding as a passenger in a motor vehicle. While the committee was not presented with data sufficient to make a policy recommendation in the area of a final recommended guideline, the committee did acknowledge and recognize that the impact of these traffic calming measures on persons with disabilities as motor vehicle passengers, rather than pedestrians, using the roadway or public rights-of-way, had not been fully addressed or researched. The committee further acknowledged that any traffic device which is intended to jolt or jar a driver in a vehicle with sufficient notice to alter (reduce) their driving speed, would similarly be felt by a person who is a passenger in the same vehicle. In the absence of research and in the face of*

anecdotal evidence, the committee suggests that entities consider other traffic calming measures which might achieve the same result of improved traffic safety in the design of a specific roadway and/or intersection. The Access Board has also received comments from operators of vehicles with low floors. These vehicles appear to be gaining popularity within the taxi industry for transporting persons with disabilities, and for personal vehicles adapted for use by a person with a disability. These operators report problems associated with bottoming out on various vertical deflection measures.

Recommended question: The committee recommends that the Access Board ask a question in the proposed rule about knowledge of any existing research in these areas.

Research need: The committee recommends that the Access Board establish a priority in its next budget/research cycle to study the effects of vertical and horizontal deflections used as traffic calming measures on persons with disabilities, especially those with spinal cord injuries or other neurological conditions, when they are passengers in motor vehicles (including paratransit and other public transportation vehicles).

X02.6.7 Motor vehicle turnouts. Reserved.

Advisory:A motor vehicle turnout is a widened, unobstructed shoulder which allows slow moving or non-functioning motor vehicles to pull out of the through lane to give passing opportunities to following vehicles. Where motor vehicle turnouts are provided, it is desirable for the turnout to have a minimum paved area of 16 feet (4880) wide by 23 feet(7015 mm) long and slopes not exceeding a 1:48 slope in any direction. This dimension will allow the turnout to also be used by a person with a disability who needs to service their vehicle. If use by people with disabilities can be accommodated at the turnout, any shoulder texturing such as rumble strips should be discontinued at the turnout.

Discussion: There was discussion about requiring all motor vehicle turnouts to be accessible by requiring minimum dimensions and level slope and grade. However, this was viewed by many on the committee as being impractical in the mountainous regions where turnouts are typically provided. Therefore, the committee decided to include only advisory language at this time.

MARCH 2016

The Future of Human Mobility

TSTS

PREFACE

Dear Readers,

Welcome to the March issue of Volume 7 of our online peer-reviewed International Journal of the Society of Transportation and Traffic Studies (JSTS). This issue presents 5 interesting papers from various countries, Indonesia, Sri Lanka, United States of America and Thailand. Two papers deal with road network development and ridesharing, an ongoing and emerging issues in developing countries. Two deal with the improvement of pavement materials which are becoming an issue as environmental concerns are putting constraints on the use of new natural resources. One interesting paper from the US, addresses the critical subject of road safety, Guidelines for Road Diet Conversions. Road diets are about conversions of four-lane undivided roads into three lanes (two through lanes plus a centre turn lane). The fourth lane may be converted to bicycle lanes, sidewalks, or on-street parking.

Again, we thank all authors who contribute to these issues of our journal and we express our gratitude to members of the International Editorial Board and reviewers for their valuable comments and continued supports. A big thanks must go to the Editorial staff under the guidance of Assoc. Prof. Dr. Jittichai Rudjanakanoknad and Assoc. Prof. Dr. Pawinee Iamtrakul who prepared the backroom work for this issue. We trust our readers will enjoy and benefit from the articles in our online publication.

With Best wishes from all of us,

Professor Pichai Taneerananon
Chair of Editorial Board

Journal of Society for Transportation and Traffic Studies (JSTS)

Abstract: Distribution, one of major outbound logistics functions draws attention due to high cost incurred. This study investigates the planning of a real time distribution operation achieving three objectives simultaneously. Route optimization, truck utilization and equal delivery make-span have been accompanied in order to address the problem giving financial benefits to company and satisfying the stake-holders. It is a real challenge to fulfill these three objectives concurrently; however, this research provides promising solution for the problem combining both exact and heuristics techniques. Heuristics techniques exploits to cluster the customers ensuring equal delivery make-span and Dijikstra algorithm has been modified to generate optimal route in terms of distance and delivery quantity. Algorithm was developed in C++. Results reveal that proposed route planning reduces the cost by 11.5 % included with 50% reduction of fleet size and 37% saving of travel distance.

Keywords: Outbound logistics, Distribution, Exact, Heuristic

1. INTRODUCTION

Management of the logistics function is a crucial process for any supply chain as to function it efficiently and effectively. Under the phenomenon of globalization, deregulation, and time based competition the pressure for cost reduction and productivity improvement is ever increasing and a must for private companies as well as for the economy as a whole (Derigs, 2002). One of the most important aspects of supply chain management is maintenance of effective and efficient distribution network in order to fulfill customer requirements and expectations while achieving cost benefits. Efficient and effective logistic is all about providing the right products to the right place at the right time with the right cost (Lim, 2000).

Distribution network is an interrelated arrangement of people, storage facilities and transportation which brings products from producer to consumer. Good distribution can be used to achieve a variety of supply chain objectives ranging from low cost to high responsiveness. As a result, companies in the same industry often select very different distribution networks (Chopra, 2001).

A fast and reliable distribution network is essential for a successful company to provide goods and services to their customers right time with right quantities. Simultaneously they should highly force on distribution network optimization to sustain in highly competitive market. Complexity of the distribution networks are ever growing and in global context, therefore, many research studies have been conducted to optimize distribution network operations with efficient tools to support its decisions leading to a maximal service level at minimal costs.

According to the theoretical or mathematical programming view routing means the determination of optimum set of cycles within the graph or network. Different configurations of the underlying graphical structure, different objectives as well as different constrains have led researches to develop great varieties of optimization problems (Derigs, 2002). Optimization can be done considering single objective as well as multiple objectives. Mostly it would be cost optimization of distribution process. Moreover, the objectives may not always be limited to cost, it has extended to balancing of work load in terms of time and distance, capacity optimization can be taken into account by simply adding new objectives (Jozefowiez et al, 2008). Techniques used to solved mathematically formulated problems varies from exact algorithms to Meta-heuristics algorithms. Further many researches (Jozefowiez et al, 2008. Dharmapriya et al, 2012) accompanied hybrid of meta-heuristics in order to yield promising results in this context.

This study expands its focus into different objectives (Route optimization, truck utilization and equal delivery make-span) so as to address a current requirement of one of Sri Lankan companies. Due to the computational difficult of this problem both exact and heuristics approaches have been accompanied.

2. DATA ANALYSIS METHOD

2.1 Approaches

The proposed approach was developed integrating two main techniques such as exact algorithms and heuristics techniques at two different stages to achieve the objectives of the study.

Exact algorithm: Dijikstra algorithm was used to get the shortest path from Distribution Centre (DC) to Dealer point (DP)s. Dijikstra is the most efficient algorithm to get the shortest path for a single source problem. This algorithm itself can't provide a solution for the whole problem which only helps to derive the shortest path from DC to DP.

Heuristic Approach: To schedule the distribution operation with optimal assignment and equal delivery make-span, heuristic approach has been adopted by developing new order capturing policy. This was done with the experience gained by the current order capturing policy and redesigned it to achieve objectives of the study by

accommodating average distances. New order capturing policy is given in Table 2.

2.2 Methodology

Figure 1 shows the steps of the sequential procedure of the entire methodology. Initially clusters were identified with the heuristics technique and routes were derived within the cluster upon vehicle capacity, size of the order and optimal sub structure concept. The steps of the algorithm are clearly explained in the example given below.

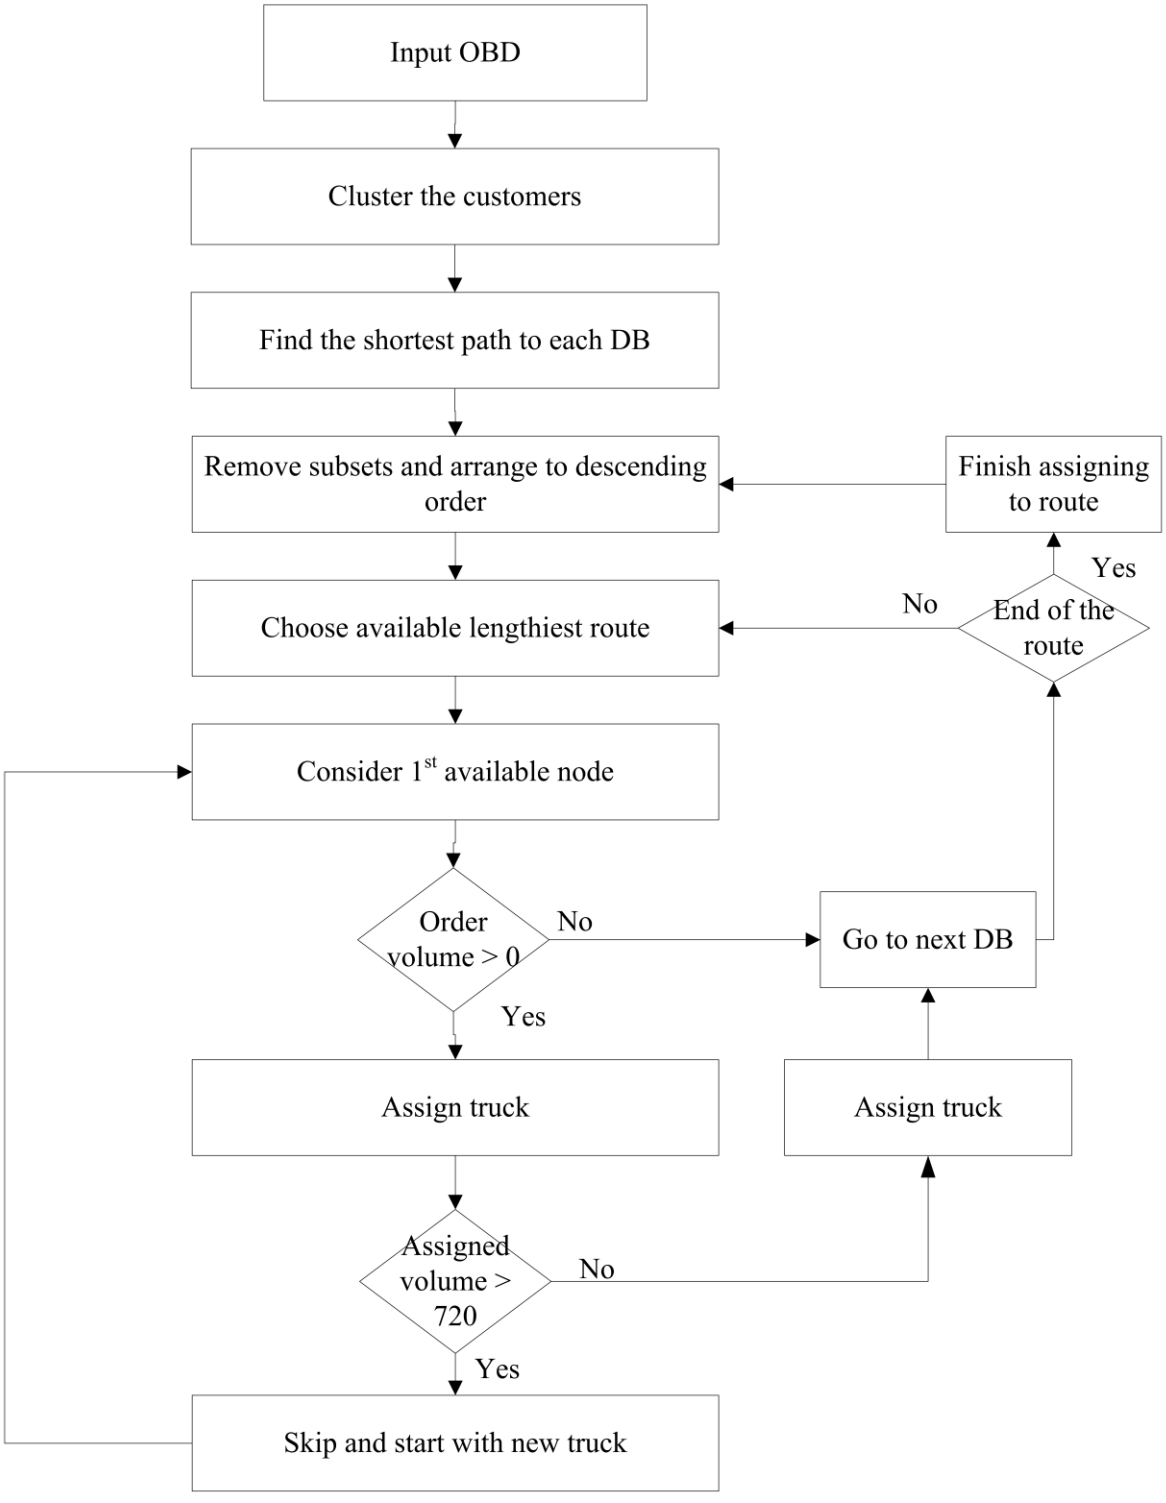

Figure 1. Flow Chart of algorithm

Example:

The steps of the proposed methodology are presented in Figure 1. Assume A,B,C,E,F,X,Y,Z,P,Q,R,S are DPs of network and O is the DC as indicated in Figure 2. Orders have been captured from all DPs except B and Y. Order placed by each DP is given in the Table 1.

Q	233
R	256
S	240

Step 1: Generating the shortest path from O to each DP using Dijikstra algorithm.

[O,A], [O,A,B,C], [O,A,B,C,E], [O,A,B,C,E,F], [O,A,B,C,X], [O,A,B,C,X,Y,Z], [O,P], [O,P,Q], [O,P,Q,R], [O,P,Q,R,S]

Step 2: Here author has used the technique called optimal substructure. If an optimum solution can be made from the solutions of its sub problems, it is called optimum substructure. Then these sub problems can be incorporated to main problem and remove these subsets and keep unique routes.

[O,A,B,C,E,F], [O,A,B,C,X,Y,Z], [O,P,Q,R,S]

Step 3: Re-arrange these routes according to the descending order.

[O,A,B,C,X,Y,Z], [O,A,B,C,E,F], [O,P,Q,R,S]

Step 4: These routes might contain the nodes which don't have orders. That means their order quantity is zero and they should be skipped when orders are assigned to trucks.

Start from the lengthiest route and assign orders to truck until its capacity exceeded. If truck capacity exceeded then next node should be started to assign a new truck and process continues until its capacity exceeded.

Truck 1:- [A+C+X] = [250+240+222=712]
Truck 2:- [Z] =274
Truck 3:- [E+F] = [210+285=495]
Truck 4:- [P+Q+R] = [212+233+256=701]
Truck 5:- [S] =240

In this example truck 1 and 4 have been allocated to full truck loads and truck 2, 3 didn't have suitable nodes to be paired since they were at the end of each route.

3. RESULTS

This section presents a comparison between the present system and the proposed schedule of the developed system on a sample of Outbound Delivery.

Case study: Sample 1

Order capturing policy
The entire distribution network was divided into 25 zones based on Sri Lankan district division and they were again assigned to seven days of the

week referring to the average travel distance to each zone. Average distance to each zone is calculated by taking the average displacement of all dealer points within the zone. For example, if Zone A consists of 3 DPs called X, Y, Z with distances of 10, 20, 30 average was calculated by [(10 + 20 +30) / 3]. Accordingly, following order capturing policy was developed considering the kilometer range as indicated in Table 2. This is the primary heuristics mechanism of getting fairly equal length for each route.

Table 2. Order capturing policy

Day	Average kilometer range	Zones
Monday	0-51	Gampaha, Kurunegala
Tuesday	52-100	Colombo ,Kandy, Matale,Puttalam, Kegalle
Wednesday	101-150	Kaluthara, Nuwara Eliya, Ratnapura
Thursday	151-200	Anuradhapura, Galle, Polonnaruwa, Trincomalee
Friday	201-250	Badulla, Hambantota, Matara, Monaragala, Vavuniya
Saturday	251-300	Batticaloa, Kilinochchi, Mannar
Sunday	301-400	Ampara, Jaffna, Mullattivu

Table 3 shows a sample of outbound delivery has been fed to both current system and the developed algorithm.

Table 3. Sample Outbound Delivery

Code	DP	Demand (in cases)
90	Colombo 06	231
57	Colombo 3	198
91	Moratuwa	232

14	Kengalla	203
80	Kundasale	221
33	Peradeniya	222
13	Teldeniya	202
87	Ukuwela	228
47	Chilaw	236
48	Nainamadama	237
46	Puttalam	235

Delivery plan for above delivery sample given by the transport coordinator of current system is given in Table 4. Table 4 summarizes the details of demand points, travel distance, size of the vehicle used and related transportation cost factor. Accordingly, 16 trucks have been assigned while travelling 1292km creating the transportation cost of Rs.144, 788.

The same sample was fed to the developed algorithm and results are shown in Table 5 in the same format of Table 4. The proposed system has given priority to 32 CBM trucks considering their economic of scale.

Table 4. Truck assignment under existing system

Demand points	Travelled distance (km)	capacity of fleet (CBM)	Transportation cost (Rs)
Battaramulla & Rajagiriya	68	22	8759
Colombo 3	63	16	7804
Colombo 06 & Mount Lavinia	72	22	8775
Thalawathugoda	74	16	7913
Moratuwa	79	16	8371
Piliyandala & Polgasovita	90	22	11091
Hettipola	40	16	5751
Peradeniya	89	16	8958
Kengalla & Teldeniya	110	22	12689
Chilaw & Putalam	106	22	12689
Ukuwela	104	16	7508
Katugastota & Galaha	109	22	12111
Kandy	94	16	9457
Galagedara	75	16	8500
Kundasale	102	16	9333
Nainamadama	21	16	5079
Total	1292.5		144,788.00

Table 5. Output of Program

Truck No.	Travelled distance (km)	Capacity of the fleet	Transport Cost
1	75	32	13050
2	94	32	16356
3	106	32	18444
4	117	22	14508
5	74	32	12876
6	113	16	12882
7	112	32	19488
8	118	32	20532
Total	809		128,136.00

Results were compared and presented in table 6 in terms of Total number of trucks used, travelled distance and transportation cost. According to the results presented Table 6, it is clearly shown that new algorithm has optimized the distribution network and order assignment. No of trucks have been reduced by 50% and total kilometers have been reduced by 37% compare to the existing system. Cost reduction is 11.5% and Rs.16,652 has been reduced from original value. This significance reduction of the proposed system is mainly due to the newly implemented operation policy, fully utilization of vehicle capacity and the selection of most economical vehicle.

Table 6. Comparison between existing and proposed system

Parameter	Existing system	Proposed system
No of Trucks	16	8
Total travelled distance (km)	1292.5	809
Total cost (Rs)	144,788.00	128,136.00

In addition to minimizing the transportation cost, one of the main objectives of this study is to derive routes with equal delivery makespan. Variation of the length of truck routes in the previous and the existing system is given in Figure 3 and Figure 4 respectively.

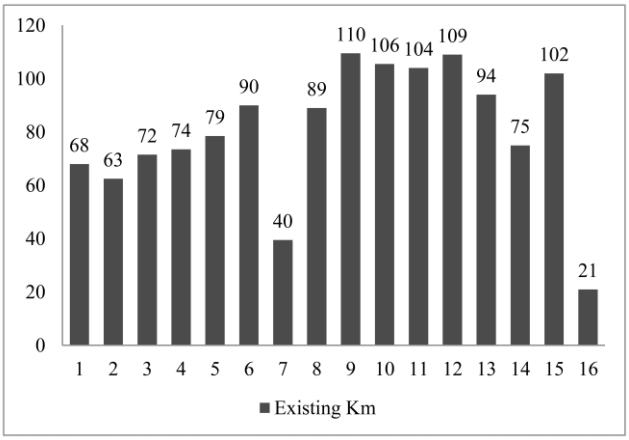

Figure 3. Distance variance of routes of the existing system

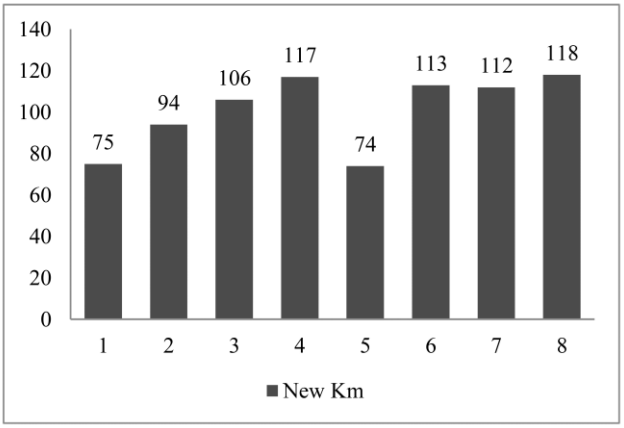

Figure 4. Travelled distance variance under new system

These results illustrate the success of proposed algorithm. Under existing situation there is a variation of 89km between lengthiest route and shortest route. But when it comes to the new system that variance has been reduced from almost 50%, which is from 89km to 44km.

4. CONCLUSION

This research has contributed to widen the boundaries of distribution optimization achieving three different objectives simultaneously. Practically, it is challenging to optimize the distribution operation with multiple objectives, however, using exact algorithms (Dijikstra) and heuristic approach objectives were achieved to a satisfactory level. Order coupling is done in the best possible way, reducing the fleet size by 50% and cost by 37%. Experience based heuristic approach ensures the total length of each route is within the acceptable km range. In addition, proposed system was able to distribute equal work load among the all transport contractors.

This research could be further developed by considering time window instead of equal delivery make span. However, distance is not the only factor affecting to same workload. Though the distances are similar there might be some routes which take more travel time than others due to traffic and road conditions. Therefore, time window would be more practicable solution to this kind of scenario.

Abstract: Recent increase in number of singly hired para-transit usage in Sri Lanka favors ride shared para-transit modes. Applicability of ridesharing is studied in a selected corridor by examining the attitude of the passengers and drivers. The undergraduates of University of Moratuwa (passengers) were selected as the population and one of the access road (between Katubedda junction and university) was selected as the study area with Three-Wheel (3W) mode as common para-transit mode in Sri Lanka. Structured questionnaire was used to gather users (3W passengers) preference and drivers willingness along with road side survey on 3W movements to study the existing situation in the study area. The study focused on effects of ridesharing on three aspects while identifying barriers for ridesharing implementation; (1) demand for 3W, (2) monetary benefit for 3W operators and (3) Environment. It is found that implementing ridesharing with pool of three passengers and with fare of LKR (Sri Lankan currency-Rupees) 20 (less than ⅓ of the current fare, LKR 70) per head; (1) increases 3W ridership by 42%, (2) increases daily profit of the drivers by 13.3% compared to the existing (average vehicle occupancy=1.4) operating cost and (3) Reduces emission cost per user by 50% per passenger. Barriers to ridesharing from users are reluctant to share rides with unknown passengers (stranger-danger) and also with opposite gender while that of from operators is the fear from peer operators like other 3W drivers and bus operators. Implementing ridesharing is certainly a win-win case for both users and operators.

Keywords: Ridesharing, Para transit, Three wheel, User behavior, Questionnaire survey

1. INTRODUCTION

Ridesharing is not a new concept to the world's transportation. The roots of ridesharing goes back to the era of world war II where USA introduced 'car sharing clubs' to conserve resources, especially as rubber as it was a need of that era (Chan & Shaheen, 2012). Ever since, the concept of ridesharing has been used by people to protect resources to cope up with the challenges they faced. Today, it has evolved to the extent of 'technology enabled ride matching' where passengers can log on to websites to find another passengers who travel to the same destination.

The concept of ridesharing is a way of increasing the occupancy of the vehicle traveled and thus it will reduce the number of vehicle-kilometers traveled than a passenger travels individually. Also ridesharing is a promising approach to save the consumption of energy and it is a solution to assuage the traffic congestion while satisfying the transportation needs of the general public.

Three-Wheel (3W) is a commonly used Para-transit mode in Sri Lanka comparable to Tuk-Tuk in Thailand. 3W contribute 13.4% of all the vehicle modes in 2010 and it is tend to increase even further (DMT, 2013). The same trend is applicable to most of the other individually used modes such as cars. This may lead to higher traffic congestion, increased travel time and environment pollution due to the emission of greenhouse gasses.

As far as the impacts to the environment and safety are concerned, 3W is not the best mode for Studying for ride sharing. However, considering the nature of the selected study corridor (Figure 2), there are only two options available for captive riders namely bus and 3W. During morning (± 08:00am SL time) peak, when university community rushing towards the university, buses stopped at "Katubedda junction" at least for about 10 min to get it packed using higher demand which forces some, affordable, users to switch to 3W. With passengers this utilize the following aspects can be highlighted.

The objectives of the research were to (1) quantify the future demand for 3W under ridesharing, (2) identify monetary benefit for 3W operators and (3) quantify environmental benefit while attempted to identify barriers in implementing ridesharing.

2. CONCEPT OF RIDESHARING

Numerous number of studies have been done in the areas of ridesharing, passenger and operator attitude towards ridesharing, benefits of ridesharing and barriers to implement ridesharing. However, there were no previous research done on ridesharing using 3Ws in Sri Lanka. Most of the previous research is based on carpooling. In the developed countries, standard modes like cars and vans are used for ride sharing whereas in developing countries relatively cheaper modes are used for ride sharing (in this case 3Ws). Comparing car and a 3W for the purpose of ride sharing, both modes in terms of ride sharing have few commonalities; (a) Spatial limitation (route choice), (b) temporal limitation (time of demand need to fall into a window). Therefore, in this study, "car pool" and similar concept were reviewed for applying those to the '3W-Ridesharing'.

2.1 Types of Ridesharing

Ride sharing is considered under different concepts. Srivastava (2012) categorized it using car as depicted below in Figure1.

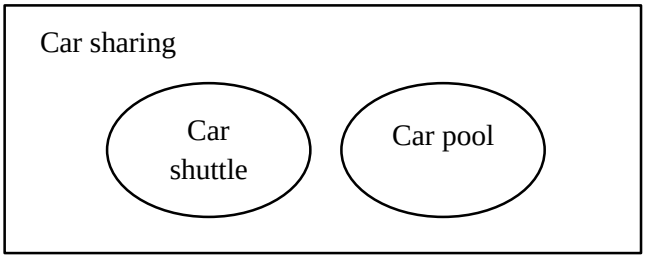

Figure 1. Venn diagram for Car Sharing, Shuttle and Pooling Relationship

Srivastava, (2012) explains that car sharing is a way of traveling which involves two or more passengers ride in a car. This category includes family trips, escorting friends who travel to the

same destination or to a destination en route. Whereas car shuttle is about one or more passengers ride on the car for monetary considerations where there is a designated driver for the vehicle. Thirdly he explains about carpooling which is about a group of car owning people traveling in one vehicle regularly from one region to the other with a rotating basis of using their own vehicle. Comparing the above three explanations, ridesharing using 3Ws has more or less the same attributes which has in car shuttles.

2.2 Benefits of Ridesharing

It is imperative that passengers shift towards ridesharing only if there are clear benefits for them. This is also declared by Dewan & Ahmad (2007) and Horowitz & Sheth (1976), where they explain ridesharing will only increase significantly if there exist clear and direct incentives to the participants. Brownstone & Golob (1991) state that this is one of the function comes under Transport Demand Management (TDM) in USA, where they focus on the means which they can provide incentives to the passengers to promote ridesharing. Their research identifies the following four incentives / privileges that can be enjoyed by the commuters if they share rides;

- Reserved or other preferential parking for ride sharers.
- Direct carpooling and/or vanpooling cost subsidies by employers.
- Guaranteed rides home for ride sharers.
- Ability to travel on high occupancy vehicle lanes (HOV lanes)

Brownstone & Golob, (1991) claim that with all the above mentioned incentives, there would be a reduction in drive- alone commuters between 11 and 18 percent. Also it was found that commuters who have large households with multiple workers, longer commuters and larger work sites are more likely to ride share.

Horowitz & Sheth (1976) claim that studies on ridesharing incentives are based on the presumption that solo drivers can be induced to carpool by offering them direct incentives. Value of arrangement such as ridesharing is immense. Implementing real-time ridesharing in Beijing (China), 120 million liters of gasoline can be saved. The amount saved is equal to 2.3 million kilograms of carbon dioxide gas. Also this proposed service serves 25% additional taxi users while saving 13% of the total distance traveled as indicated by (Ma, et al., 2013). Dewan & Ahmad (2007) conducted a similar study and found that if carpooling system is implemented in New Delhi - India, it will be able to save 301,307 kiloliters of gasoline per year.

2.3 Barriers for Ridesharing

This section identifies the barriers towards ridesharing in the context of the countries such as USA, Canada. Amey (2010) identifies the challenges for ride share from a variety of perspectives which are described below.

2.3.1 Economic barriers

- Favorable economics of all other modes

Amey (2010) argues that ridesharing (in this research, author defines carpooling as ridesharing) has been challenged by the subsidies given for the other modes of transport (i.e. employer-paid parking, transit, vanpooling and cycling). It is discussed that parking subsidies are given to HOVs (High Occupancy Vehicles) to encourage ridesharing. But, with the employer-paid parking, employees will no longer feel the impact which parking price make on their disposable income and they tend to drive alone. Transits and van pooling can also be identified as modes of ridesharing which reduce the number of vehicle kilometers traveled in the network whereas cycling is an ‘emissions free’ mode of transport. Ergo transits, vanpooling and cycling can be identified as sustainable modes of transport as same as ridesharing (carpooling).

2.3.2 Social/ Behavioral barriers

- Stranger – danger

It is found that ridesharing between unknown travelers represents a small portion of shared-rides that takes place. According to (Amey, 2010), surveys have found that as little as 3% to 10% of shared-rides occur between / among

unknown passengers whereas the majority of the shared-rides occur between / among family members, co-workers and neighbors. The statistics clearly states the phenomenon of 'stranger danger' has affected.

- Reliability of service

Amey (2010) points out that the perception of low reliability of the ride share arrangements is one of the largest behavioral challenges to overcome. Typically the passengers agree to share rides with a single driver for a long period of time with small changes as needed. In case the driver has an unexpected appointment of emergency, the passengers may not have a way to complete the return trip, which is unacceptable for many commuters. Both the passenger and the driver should understand the emergencies and adjust their perception to build-up the relationship over the time so that both of the parties will get benefited.

3. METHODOLOGY

3.1 Study Area

Access roads to the main entrance of University of Moratuwa were considered for this study to investigate ridesharing applicability. As depicted in Figure 2, among the three access roads (1) Campus road from Katubedda junction - AR1, (1) Campus road from Piliyandala - AR2 and Molpe road - AR3, AR1 was selected due to high 3W movements compared to others. There are two main three-wheel parks located at "Katubedda junction" and at the University. Two busses are being operated in the selected road link (route number 255, 255/1) with a 10 minute headway on average.

3.2 Sample of the Study

The population for this study was university community consists of staff members, post graduates and undergraduates of University of Moratuwa (6,000 students in total) as majority of the 3W users along AR1 are fall in to that category. The appropriate sample size was considered as 361 with 95%confidence level and 5% margin of error (Krejcie & Morgan, 1970) and the responses were collected from a structured online questionnaire. From the 3W number plate survey it was found that there are 37 three-wheel operate in the day time. From that a random sample of 17 three-wheel drivers were interviewed with the aid of structured questionnaire. The research was carried out in three stages (1) Online questionnaire survey, (2) road side number plate survey and (3) interview with three-wheel drivers.

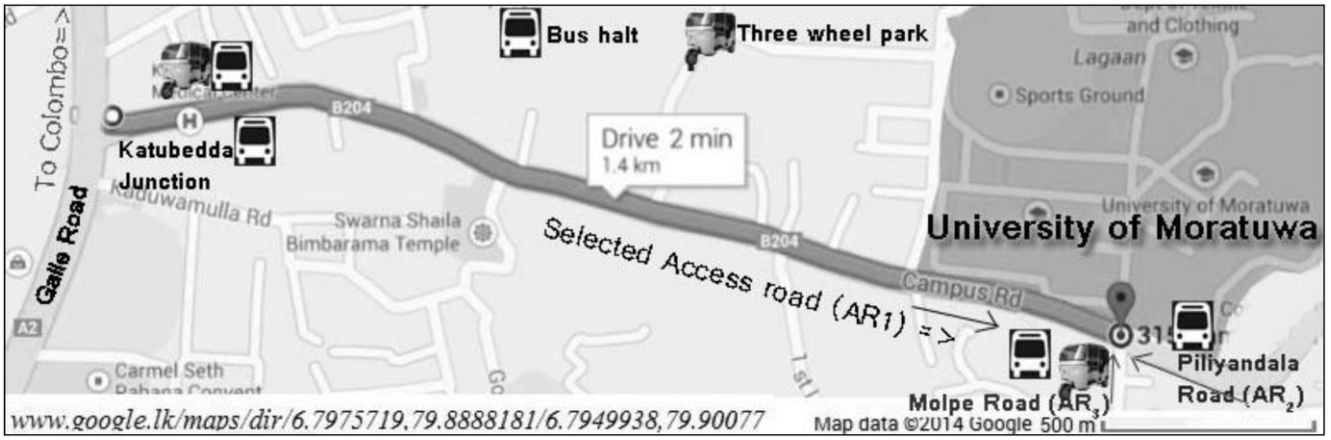

Figure 2. Location of the study area *(URL: http://goo.gl/maps/QvPEd)*

3.3 Online Questionnaire Survey for Passengers

An online questionnaire was prepared and circulated via emails to collect responses from the academic staff members, non-academic staff members, post graduates and the undergraduates of University of Moratuwa, who employed/studied in the university during the period of the research (Dec 2013 – Jan 2014). The online questionnaire survey was three fold. The first part of the questionnaire was addressed to collect passenger's demographics (age, employment category, income etc.) and present travel related characteristics (vehicle ownership, general access mode to the university etc.).

In the second part of the questionnaire, respondents were asked about their willingness to share ride under different circumstances given below;

- Sharing a ride with a friend(s).
- Sharing a ride with a person in university other than friends.
- Willingness to wait for some other person to join with rideshare.
- Willingness to share rides if one of the colleagues/ friends has already joined with ride sharing.

Seven level likert scale was used to identify the willingness of the passengers towards ridesharing.

Table 1. Measurement of variables and scale

Level	Level Value
Definitely will not	1
Very unlikely	2
Somewhat unlikely	3
Cannot say	4
Somewhat likely	5
Very likely	6
Definitely will	7

3.4 Three-wheel Number Plate Survey

A three-wheel number plate survey was conducted for 12 hours on a day time to identify the present 3W movements of the study area along with bus counts bus arriving and departing patterns were observed at the two bus stops adjacent to each 3W parks (as shown in Figure 2). The survey was conducted from 08:00am to 08:00pm on a Wednesday (18th Dec 2013). The survey was conducted using four enumerators who were strategically located at places so that the observer can observe both bus movements and 3W movements. Two of the observers gathered data about the busses (bus arrival time and departing time) and 3Ws (departing time, number of passengers on board) while other two observers observe only about the arriving time of the 3Ws and alighting passengers from each 3W.

This survey results were used to analyze the demand for 3Ws in different times of the day. Also it was used to identify the trips which were run between the selected access road and beyond the selected access road. These results were then cross-checked with planned interview with the 3W drivers (explained below). The average 3W occupancy was also measured using the data in order to identify the current situation along the selected corridor.

3.5 Personal Interviews With 3W Operators

Finally an interview was conducted with the 3W drivers from the 3W parks at Katubedda junction and in front of the main entrance of the university. The demographics factors of drivers and average daily trips operated within the selected corridor (AR1) were collected in addition to their opinion on ridesharing and barriers to it.

3.6 Analyzing the Effectiveness of Implementing Ridesharing

To calculate the variation of the trips under the existing system and proposed system of ridesharing, responders were asked a question about their current frequency as well as the future frequency of using 3Wers in the selected corridor. The below Table 2 shows the frequency related options given to the respondents and corresponding numerical values as per weekly basis.

The respondents were asked about their usage of 3Wers under the existing operating system and under ridesharing. In the existing system the

vehicle occupancy can be vary from 1 to 3 depending on passenger's choice with LKR 70 per trip whereas in ridesharing it is expected to keep the vehicle occupancy at 3, so that 3 passengers can get together and share the fare. In ridesharing situation, it is expected to offer this service at a reduced fare of about LKR 60 which translates the fare per passenger as LKR 20. Based on Q1 and Q2, as given in Table 3, the respondents were subdivided into several categories as illustrated below in Figure 3.

Table 2. Frequency of 3W usage

Frequency	Frequency of trips per week
Never1/ Rarely	0
1 time / week	1
2 times / week	2
3 times / week	3
4 times / week	4
5 times / week	5
6 times / week	6
1 time / day	7
2 times / day	14
3 times / day	21
4 times / day	28

Table 3: Questions about trip frequency

(Q1) Existing system	(Q2) Ridesharing
In any case if you use a 3Wer for the last trip, how often do you use a 3Wer to complete the last trip? (Respondent were allowed to select a frequency as shown in Table 2)	If Three-wheel ride-sharing exists with reduced fare, what will be your future trip frequency using three-wheel? (Responder were allowed again a frequency from Table 2)

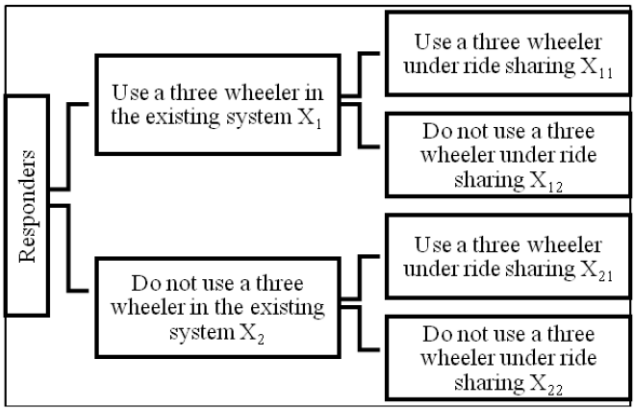

Figure 3. Method of analyzing the effectiveness of ridesharing

The above categorizations, shown in Figure 3, were elaborated below.

X1 : Expected number of trips by the students in the existing system

X2 : Expected number of trips by the students in the existing system who do not use a 3W to come to university (= 0)

X11: Expected number of trips by the students who continue to use a 3W to come to university when ride sharing is implemented.

X12: Expected number of trips by the students who do not willing to use ridesharing though they use a 3W in the existing system

X21: Expected number of trips by the students who newly attracted to 3W by the implementation of ride sharing

X22: Expected number of trips by the students who do not want to use 3W in any given method (= 0)

By multiplying the number of responses for each category (from Figure 3) with relevant trip frequency value (from Table 3), the expected number of 3W passenger trips can be calculated. The calculated total passenger trip divided by vehicle occupancy is the 3W demand (D) also known as number of 3W trip would be generated by the users. Therefore, existing demand for 3W (D_1) will be calculated using Equation 1 as given below where the current average occupancy of the 3W (O_1) was found to be 1.4 from road side occupancy count made during number plate survey.

$$D1 = (X_1 / O_1) \quad (1)$$

The future demand for 3W combined from normal and ridesharing (D_2) can then be calculated using Equation 2 as given below where ridesharing vehicle occupancy (O_2) is assumed to be three (3) while that of normal 3W (continued to operate under existing scenario) is assumed to be one (1).

$$D_2 = [(X_{11}+X_{21})/O_2] + X_{12} \quad (2)$$

Ridesharing could be said applicable if newly attracted 3W demand (D_2 - D_1) promises the benefit to the 3W operators in terms of net profit.

3.7 Calculating the Environmental Impacts

The emission cost for any vehicle operates in a given corridor can be calculated by the Equation 3 (Kumarage & Weerawardana, 2013) given below. It has been taken in to account that volumes of specific emissions are directly proportionate to the quantity of the type of fuel consumed. The emission cost for a vehicle type j on a link k during the time period t can be expressed as;

$$TEC_{j,k,t} = V_{j,k,t} \times F_{j,t} \times E_{j,k} \times D_{j,k} \quad (3)$$

Where:

$TEC_{j,k,t}$ = Emission cost by a vehicle type j on link k during time period t.

$V_{j,k,t}$ = Flow of vehicle type j on link k during time period t.

$F_{j,k}$ = Fuel consumed per unit distance traveled by vehicle type j at on a link k.

$D_{j,k}$ = Estimated value of emission cost per liter of fuel for vehicle type j at on link k

According to Department of National Planning of Sri Lanka (2001), it is calculated that the total emission cost per liter of fuel for a 3W was LKR 0.62.

4. RESULTS AND DISCUSSION

Altogether 364 responses were collected from the questionnaire survey and during data refining, there were 7 responses found with errors. Therefore only 357 (=364-7) responses were taken for the rest of the analysis. Out of those responses 334 responders were undergraduates of the University of Moratuwa. Since negligible number of responses from others (staff members and post graduates), the responses only from the undergraduates (334) were considered in this research. Out of the 334 responders, again only 189 responders were using the selected study corridor (AR1) to university thus this study analyzed only those 189 responses.

4.1 Future Demand for Three-Wheel Trip Under Ridesharing

The calculations based on the data collected is summarized in the table given below. The values which will be taken for the analysis is highlighted in Table 4.

Table 4. Summary of the data collected and calculations

Frequency		(1)		(2)		(1/1)		(1/2)		(2/1)		(2/2)	
Description	f	X_1	f X_1	X_2	f X_2	X_{11}	f X_{11}	X_{12}	f X_{12}	X_{21}	f X_{21}	X_{22}	f X_{22}

5 times / week (5)	5	2	10	0	0	10	50	0	0	1	5	0	0
6 time / week (6)	6	0	0	0	0	1	6	0	0	3	18	0	0
7 times / week (7)	7	10	70	0	0	13	91	0	0	13	91	0	0
14 times / week (14)	14	8	112	0	0	8	112	1	14	10	140	0	0
21 times / week (21)	21	0	0	0	0	2	42	0	0	2	42	0	0
28 times / week (28)	28	0	0	0	0	2	56	0	0	0	0	0	0
		Σ f X_1	274	Σ f X_2	0	Σ f X_{11}	436	Σ f X_{12}	16	Σ f X_{21}	403	Σ f X_{22}	0

Demand for 3W under existing and future could be then calculated using Table 4 and equations (1) and (2) as shown below.

D1 = (X1 / O1)
D1 = 274/1.4
D1 = 196 trips per week

D2 = [(X11+ X21)/O2] + X12
D2 = (436+403)/3 +16
D2 = 280+16 trips per week

Though calculation of future demand (D2) has two components (ride sharing and conventional 3W ride). The majority of the trips are generated through ride sharing (280) and while continued to using 3W under conventional method is only 16 and it is neglected for rest of the calculations.

The 'x' axis of Figure 4 represents the frequency of using a 3W per week while the 'y' axis on the left indicates the number of responses for each trip frequency in the existing system and ridesharing one and the 'y' axis on the right indicates the cumulative 3W trips traveled per week.

Based on interview conducted with 3W drivers, it was found that they run 15 trips on average in a given day. According to Figure 4, the cumulative trips traveled per week in the existing system is 196 while the cumulative trips per week in ridesharing has increased to 280. Therefore implementation of ridesharing will increase 42% ([280-196]/196) of the total trips traveled than in the existing system. With the increase of 42% of trips, a 3W operator will be able to increase his 3W trips on a given day from 15 to 22.

4.2. Monetary Benefit Three-Wheel Operators

According to daily basis calculation shown in Table 4, a 3W driver will have at least 22 trips per day if ridesharing is implemented. The Table 4 also attempts to calculate the monetary benefit in implementing ridesharing for a single operator per day where fuel economy* is assumed to be remained same even though weight (kg) carried under ridesharing would be higher than existing system as the vehicle occupancy increases. It is clear that ridesharing will increase their daily profits by 13.3%.

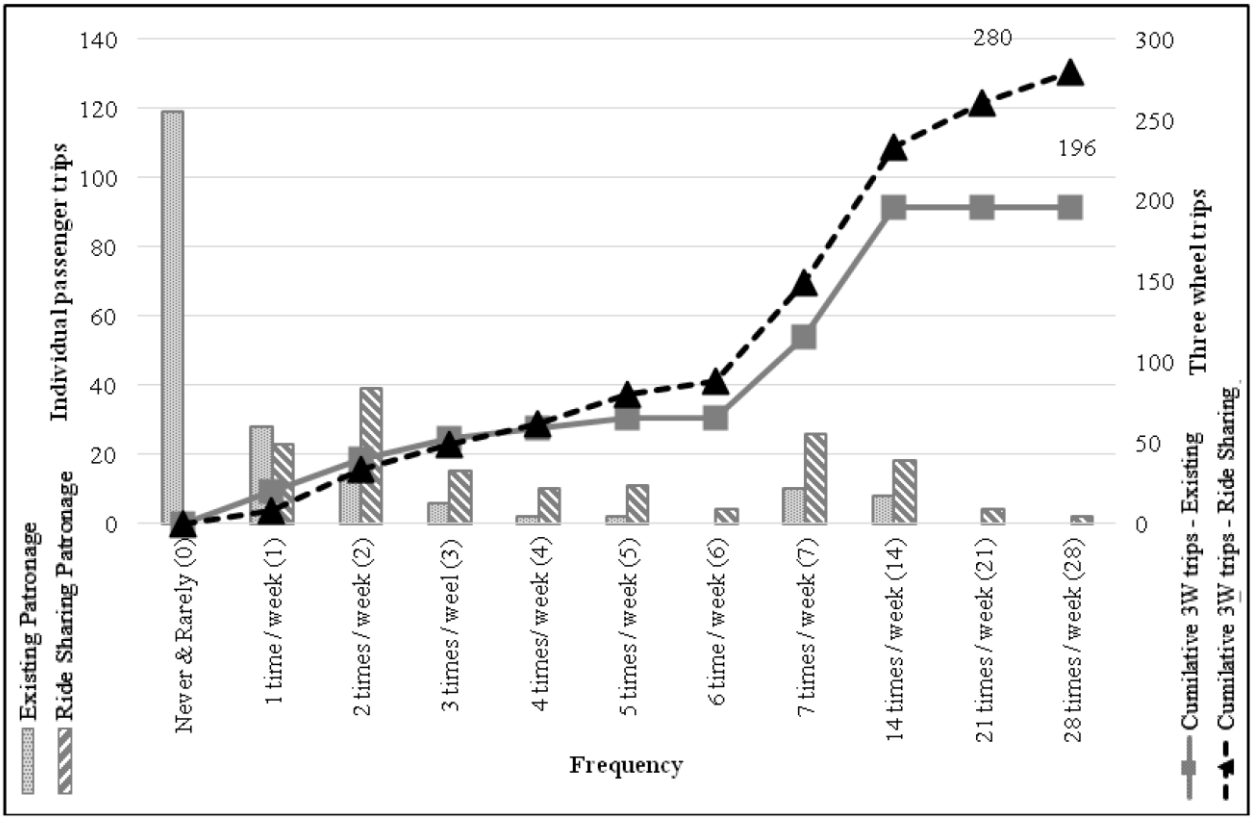

Figure 4. Comparison of Existing system and Ridesharing

Table 5. Monetary benefits to 3W operator on daily basis

Criteria	Calculation method	Cost elements		% increase / decrease
		Existing	Ridesharing	
Fare per trip (LKR)	a	70	60	14.2%↓
No of 3W trips	b	15	22	42%↑
Trip Distance – two way(km)	c	2.8	2.8	-
Fuel Price (LKR)	d	162		
Fuel Economy (km/liter)*	e	22 (Assumed same)		-
Maintenance cost (LKR per km)	f	1.92 (Assumed same)		-
Calculation				
Daily Income (LKR)	g = a×b	1,050.00	1,320.00	25.7%↑
Daily fuel usage (liters)	h = b×c/e	1.91	2.80	46.6%↑
Daily fuel expenses (LKR)	i = h×d	309.27	453.60	46.6%↑
Maintenance cost (LKR)	j = b×c×f	80.64	118.27	46.6%↑
Daily profit (LKR)	l = g-i-j	660.09	748.13	13.3%↑

Table 6. Conversion of Environmental Impacts into Monetary Values

Criteria	Calculating method	Existing	Ridesharing
Fuel Economy (km/ Liter)	a = Fj,k	15	22
Trip distance (km)	b = Dj,k	2.8	2.8
Number of Trips per week	c = Vj,k,t	196	280
Vehicle occupancy	d = O	1.4	3.0
Total number of passengers/week	g = Vj,k,t × O	274	840
Fuel Consumption per week (liters)	h = Vj,k,t × Dj,k / Fj,k	25.0	35.6
Per passenger fuel usage (liter / passenger)	i = F/E	0.09	0.04
Emission cost per liter of gasoline (LKR)	Ej,k	0.62	0.62
Emission cost per week (LKR)	TECj,k,t = Vj,k,t×Fj,k×Ej,k×Dj,k	15.5	22.1
Per passenger emission cost (LKR / passenger)	K = TECj,k,t /G	0.06	0.03

4.3 Environmental Benefit

Though implementation of ridesharing will increase the number of trips run by 3Ws in the selected corridor, it is quantified in Table 5 that ridesharing save both per user costs of fuel and emission (monetary value) approximately by 50%. The Equation (3) was used to calculate the emission cost per week.

4.4. Barriers for Ridesharing

4.4.1 Stranger – danger

The behavior of 'stranger-danger' is observed in this study based the responses from the online questionnaire. Cultural barrier from gender is also observed from Figure 5. Especially female users are reluctant to share rides with strangers when analyzing the cumulative curves.

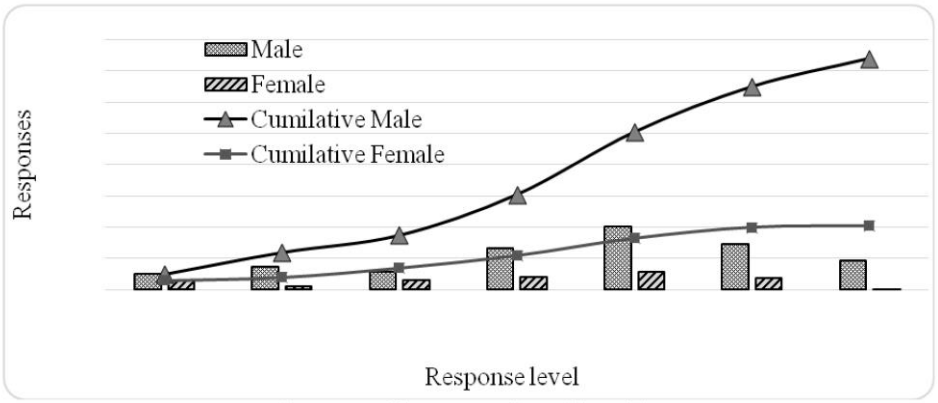

Figure 5. Willingness to share rides with strangers

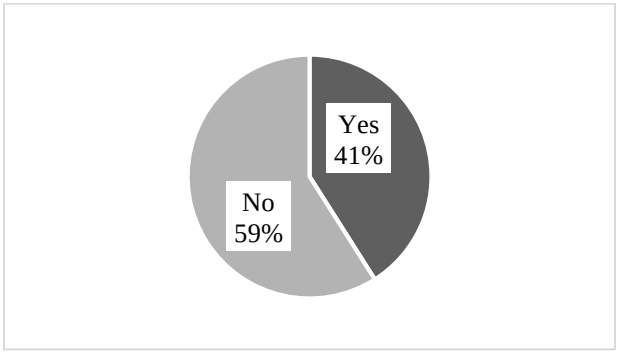

Figure 6. Willingness of operators to change to ridesharing

4.4.2 Reluctance to change

Explained the fact that ridesharing increases three-wheel trips to the drivers, the drivers were not convinced to brace the concept and implement ridesharing. Interview with drivers reveals that 59% (Figure 6) of the drivers were reluctant to implement ridesharing as they believe that there will be some 3W operators will continue to operating under current model and then it turn out to be peer pressure for ridesharing operators. They also mentioned that implementing ridesharing may create issues with the bus operators as more passengers would shift for 3W from bus thus reduces income for bus operators.

5. CONCLUSION

Based on research analysis and findings, implementing ridesharing is certainly as a win-win case for both users and operators and ridesharing is highly applicable along this selected corridor with following proven benefits;

- Increases future demand for three-wheel (ridership) under ridesharing by 42%,
- increases daily profit of a driver by 13.3% under ridesharing with vehicle occupancy of 3.0 and fare per trip of LKR 60, translated to LKR 20 per head, compared to the existing operation with average vehicle occupancy of 1.4 and fare per trip of LKR 70,
- Energy efficient by saving about 50% of fuel cost per passenger while saving emission cost per user also by 50%.

Users from Sri Lanka shows the following barriers in implementing ridesharing; (1) Attitudinal issue of ‘stranger-danger’ (insecure feeling with unknown passenger) and (2) cultural issue of ‘gender’ (dislike to travel with opposite gender) while 3W operators are also reluctant to implement ridesharing as they believe that there will be some 3W operators will continue to operate under current model and then it turn out to be peer pressure for ridesharing operators. They also mentioned that implementing ridesharing may shift a portion of passengers from ‘bus’ to ‘3W’ and they believe this would create unnecessary problems between 3W operators and bus drivers.

Abstract: Road diets, which convert four-lane highways to three-lane cross sections, are an innovative solution to address mobility and safety concerns under budgetary constraints. These improvements can assist in the development of multimodal corridors with minimal impact on automobile mobility, while retaining the original right of way. Past research has focused on evaluating road diet safety, but minimal guidance exists on determining when such conversions are appropriate from an operational perspective. The proposed guidelines focused on evaluating and comparing the operation of three- and four-lane roads at signalized intersections to provide basic guidance as to when the road diet conversion is appropriate. One of the important findings of this research is the expansion of the usable range for road diets. Prior experience has limited road diet application to roadways with ADTs less than 17,000 vehicles per day. This research identifies the importance of side street volumes and supports the utilization of road diets on roadways with volumes up to 23,000 vehicles per day. This paper provides comprehensive guidance for road diet evaluation including operational performance, correctable safety problems and identifies a list of evaluation elements that should be examined when in-depth analysis of alternatives is required.

Keywords: Road diets, safety, highway design

1. INTRODUCTION

Rural and urban roadways are becoming increasingly congested throughout the US and other countries, and solutions frequently seek to improve modal options including, bike, pedestrian and transit facilities. A typical approach for solving this problem has been the addition of lanes, but this approach is an expensive and environmentally disruptive practice that frequently offers only short-term relief. The need for innovative solutions in addressing mobility and safety concerns in an environment with budgetary constraints is paramount. Such innovative solutions seek to develop multimodal corridors while retaining the original right of way and among them is the concept of road diet, where the number of travel lanes is reduced. Road diets usually involve restriping a four-lane undivided road as a three-lane road with two through lanes and a two-way left-turn lane (TWLTL). This creates surplus roadway width that can be used to widen existing lanes, create bicycle lanes, supply on street parking, widen sidewalks, or provide opportunities for landscaping and aesthetic improvements.

On roadways with high access density, the inside through lane on a four-lane undivided roadway often acts like a de facto turn-lane. This operation can block through traffic, diminishing operations, as well as introduce crash patterns such as rear end crashes and sideswipe crashes resulting from the stopped left-turn traffic. The introduction of a TWLTL can often meet the left-turn demand for both directions of travel in a single lane. This modification can then improve safety and mobility by removing turning traffic from the through lanes. Therefore, road diets are a design tool that can be used within existing right of way at a very low cost to improve mobility, and they frequently have no or few negative impacts.

Road diets have been shown to improve operating efficiency and safety for all users. Case study review has shown road diets to be effective on roads with an average daily traffic (ADT) of up to 25,000 vpd, while other studies have indicated that capacity is not affected by the elimination of the lane and often no increase in congestion is observed (Burden and Lagerway 1999; Welch 1999). Improvements in livability conditions and associated benefits are elements to be considered during road diet conversions, as review of past case studies has indicated (Rosales and Knapp 2005). Road diets make it easier for pedestrians to cross the road at both signalized and unsignalized intersections, increase feeling of a "safer and more comfortable" street, encourage an increase in pedestrian and bicyclist traffic, and encourage economic growth and redevelopment at a quicker pace (Rosales and Knapp 2005).

Past research has focused primarily on case study evaluation of road diets and on safety performance of these treatments. However, there is little literature providing guidance on the details of the designs or information as to when such conversions will work. The first attempt in defining operational guidelines for road diet conversions was completed in 2001 relying on evaluating before-after conditions on existing road diet projects completed at that time (Knapp and Giese 2001). The study recommended that a road diet conversion could be considered feasible for roads with an ADT between 15,000 and 17,500 vpd. A more recent attempt to improve on these guidelines was completed in 2006 again based on assessing existing road diets and identifying associated benefits (Rosales 2006). However, the step-by-step process developed is general in nature and does not provide specific guidance regarding volumes or left-turn percentages indicating when such a project could result in improved operational and safety conditions.

The need to identify criteria to be considered for establishing road diets is critical and should be addressed so that state and local agencies can expand their use. A review of all State DOT design manuals did not identify any guidance for road diet conversions, which can hinder their adoption. This study provides such guidance in determining the appropriateness of road diet conversions and identifies parameters to be considered during such evaluations.

2. METHODOLOGY

Typically, road diet conversions will operate at acceptable levels as long as the signalized intersections do not present any operational problems. Therefore, this analysis focused on evaluating and comparing the operation of three- and four-lane roads at signalized intersections. In order to adequately evaluate signalized intersection operations, a full range of mainline and side street volumes, as well as left turn percentages, needed to be evaluated. Evaluation of a full range of these parameters examines a wide array of the potential operating conditions for road diet roadways. The analysis conducted through micro simulation to compare operational performance of three-lane and four-lane sections through the full range of volume combinations. A total of 480 combinations were used for the simulations, i.e. 10 volume scenarios for eight left-turn percentages and six cross street volumes. These scenarios included:

- Mainline volumes ranging from 6,000 to 24,000 vpd with 2,000 vpd increments and assuming that 10 percent of the volume will occur during the peak hour. One directional split (50/50) was utilized.
- Cross street volumes were varied between 3,000 to 13,000 vpd with 2,000 vpd increments. There was only one directional split (50/50) and a 10 percent estimate of left and right turns was used.
- Left-turn percentages were used ranging between 5 to 40 percent with increments of 5 percent.
- Right-turn percentage was set at 15 percent and not varied as right-turn volume has minimal effect on capacity of the through movement.
- All cross-street scenarios utilized a three-lane cross-section which limited the capacity of the cross street.

Simulations were performed with the CORridor SIMulation (CORSIM) and vehicular delay was calculated for each approach independently. The data obtained from the simulation analysis was then used to develop predictive models of intersection delay that could be used in establishing potential guidelines for the implementation of road diets. The Statistical Package for the Social Sciences (SPSS) was utilized to develop these models.

3. RESULTS

The analysis completed here was used to develop prediction models that could allow for establishing guidelines and identifying the conditions under which road diets could improve the operational efficiency of the roadway. Linear regression models were used to model the delay for each condition, i.e. three- and four-lane options, and identify the variables that could predict these differences. The variables considered include the volumes of the main and side streets as well as left-turn percentage.

The model for the three-lane included all three variables of concern and had a good predictive power with an R2 of 0.48. The model coefficients are summarized in Table 1. The four-lane model also utilized all three variables but the predictive power was lower (R2=0.28). The variables included in the equations reflect the effect of traffic volumes on delays and their signs indicate that increasing volumes will result in greater delays. The same is true for the left-turn percentage where larger percentages will lead to greater delays.

Table 1. Coefficients for Predictive Models

Variable	Three-lane		Four-lane	
	Parameter	P value	Parameter	P value
Intercept	-29.113	0.00	-47.968	0.00
Main street volume (vph)	0.013	0.00	0.022	0.00
Side street volume (vph)	0.025	0/00	0.037	0.00
Left-turn percentage (number)	0.313	0/00	0.314	0.00

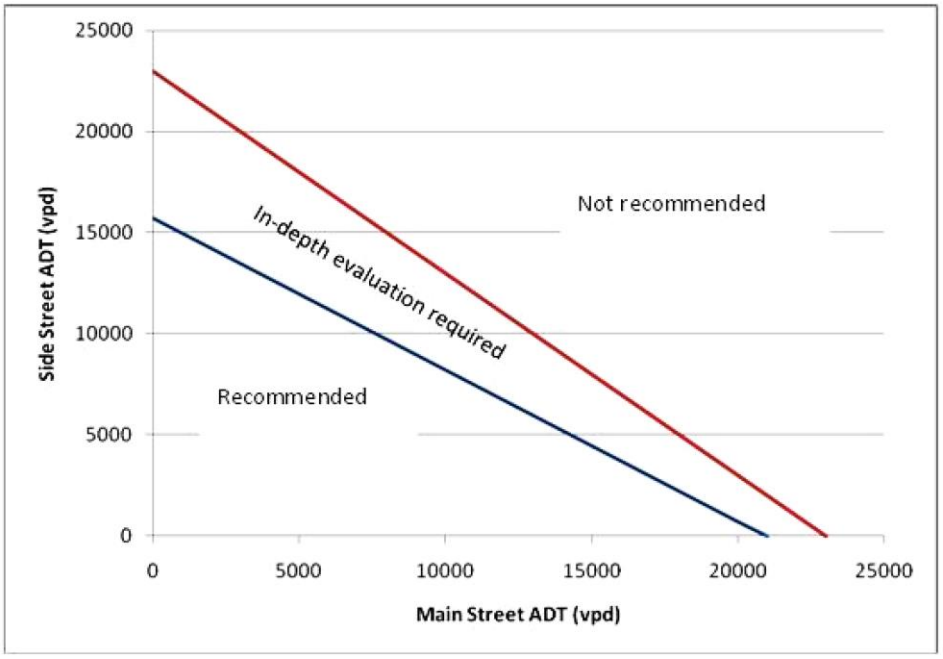

Figure 1. Guideline for operational performance at signalized intersections

These models can be used to define the scenarios where the three- and four-lane options produce a delay difference of zero, i.e. both options will perform equally well. This will produce the line of equality which can then be used to establish the regions where road diets are advisable and those where they are not. Figure 1 presents this concept with the blue line identifying when delays are the same for both options. The combinations below the blue line indicate lower delays associated with the implementation of a road diet. The red line in the figure identifies the volume combinations where the roadway will operate under capacity with a road diet and is based on the critical lane volumes between three and four-lanes are equal. Utilizing these concepts, Figure 1 defines three areas with respect to road diet installations. The lower area called "Recommended" identifies the volume combinations where the road-diet will perform below capacity and result in operational gains. The upper area "Not-recommended" identifies the volume combinations where the roadway will operate above capacity, and will have higher delays than the four-lane alternative. Undesired congestions could be the result from a road diet operating in this range. The area between the two lines is considered as the area requiring additional investigation to determine the feasibility of a road diet conversion. A road diet in this area will operate under capacity, but may have higher delays than the four-lane section. Thus analysis should be completed to determine the impacts that would result from the road diet.

The operational guidance developed is based only on main and side street volumes, since it was determined that the operation of the signalized intersection is the critical aspect for a road diet conversion based on the analysis conducted here and since road diets will result in improved conditions at unsignalized intersections. While left-turn percentage was shown to be a significant parameter for the capacity and delay of an intersection, it has the same effect for both the four-lane and three-lane sections and therefore provides no differentiation between the alternatives, i.e., the left-turn percentage does not contribute any additional delay to the difference between the two options.

The evaluation of the unsignalized intersections indicated that for all scenarios evaluated, the road diet results in lower delays along the side street, which could outweigh the minor increases along the main street. It was therefore deemed appropriate to not develop a similar guidance as the one shown in Figure 1 for unsignalized intersections. Therefore, unsignalized intersections or access points are not a significant determinant of the success or failure or a road diet

project. Even unsignalized access points with high volumes of left turn traffic on the major street will continue to operate at acceptable levels of service while signalized intersections may fail due to the reduced mainline capacity. The primary concern for unsignalized access points is overlapping left turn movements within the two-way left turn lane, which is avoided with the four-lane section. The existing KYTC auxiliary turn lane policy currently addresses this concern by recommending against the use of TWLTLs for access point densities greater than 85 access points per mile (KYTC 2009).

4. GUIDELINES

The data analyzed here was utilized to develop guidelines for road diet conversions. The guidelines have been developed as a standalone document and they can be used to determine the steps required for a road diet conversion (Stamatiadis et al. 2011). A brief description of the guidelines is provided here.

4.1 Road Diet Conversions

The guidelines focus on the determination of whether a road diet application is appropriate considering operational, safety, and other factors that could have a bearing on the decision to implement a road diet conversion. To achieve this, a flow chart was developed that identifies the various steps to be taken when such decision is evaluated (Figure 2).

The flow chart allows the user to identify the appropriate action to be undertaken to determine whether the road diet will improve the operations, safety or other performance issues. To address this, lists of possible problems correctable by a road diet implementation are identified (Table 2). In addition to these lists, the required items for conducting an in-depth evaluation are also identified in order to allow for a complete evaluation of the implications from a road diet implementation.

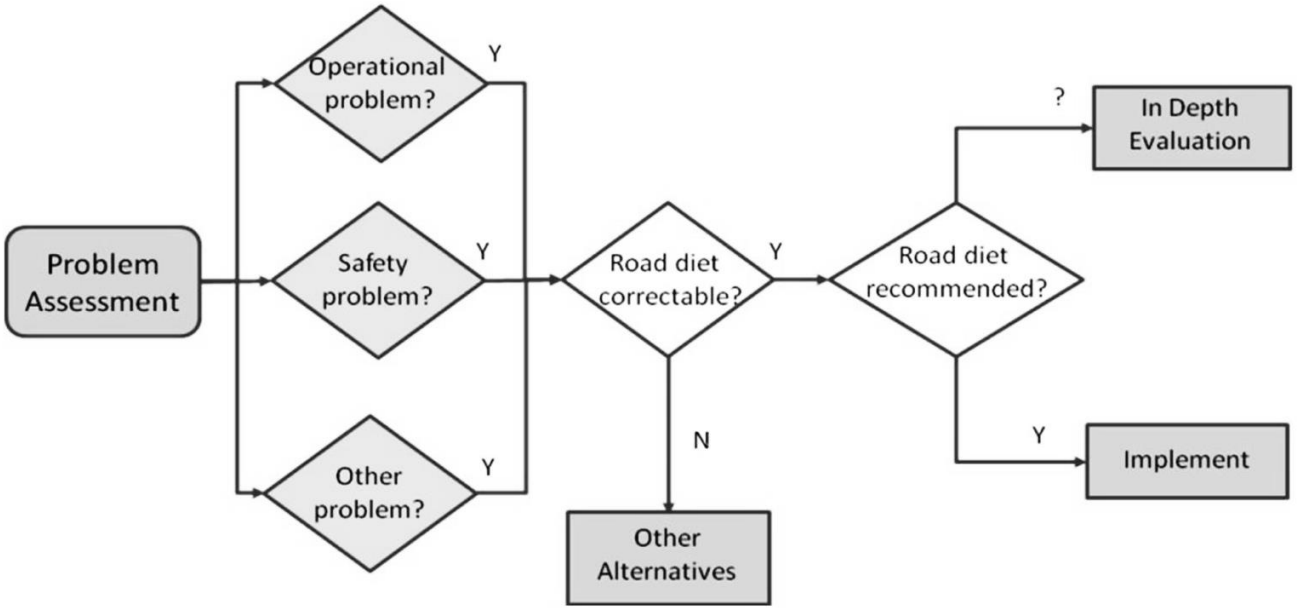

Figure 2. Decision-Action Flow Chart for Road Diet Evaluations

Table 2. Road Diet Correctable Problems

Category	Problem	Rationale
Operational	Delays associated with left-turning traffic	Separation of left-turning traffic have shown to improve delays at signalized intersections
	High side street delays at unsignalized intersections	Side street traffic requires shorter gaps due to the consolidation of left-turns into one lane
	Other operational problems	Potential inclusion of bicycle lane could reduce delays
Safety	Rear end crashes with left-turning traffic	Removal of stopped turning vehicles from the through lane could reduce rear end crashes
	Sideswipe crashes	Elimination of need to change lanes to avoid delays behind a left-turning vehicle in the inside through lane reduces sideswipe crashes
	Left-turn crashes due to offset left turns	Elimination of the negative offset between opposing left- turn vehicles and increase of available sight distance reduces left-turn crashes
	Bicycle and pedestrian crashes	Bicycle lane separates bicycles from traffic; pedestrians have shorter distance to cross and can use a refuge area (if one provided)
Other	Bicycle/pedestrian accommodation due to lack of facilities	Opportunity to provide appropriate or required facilities increasing use by such users
	Aesthetics	Provision for landscaped medians and other treatments as see fit
	Traffic calming	Potential for uniform speeds and consistency; opportunity to encourage pedestrian activity

4.2 Road Diet Considerations

Typical considerations for road diet conversions include traffic volumes of the main and side streets and main street left-turn percentages. However, compatibility of the treatment with roadway functional classification, access frequency and land use should also be considered when determining the feasibility of a road.

Road diets may be proposed to address both safety and operational issues on roadways. The guidelines provide criteria to be considered in determining whether a road diet conversion is appropriate. These criteria include operational performance ranges that would support a road diet project as well as safety considerations that need to be evaluated. The operational performance identifies three ranges: 1) Volume combinations where the road diet is recommended because it will improve the operational performance (i.e. delays will be lower with the road diet), 2) Volume combinations where the road diet is not recommended because the operational performance deteriorates (i.e. delays will increase), and 3) Volume combinations where an in-depth evaluation is needed. The last range identifies cases where the road diet will operate under capacity, but may have higher delays than the four-lane section. Thus analysis should be completed to determine the impacts that would result from the road diet.

The crashes that could be affected by a road diet implementation were also identified. These included:

- Sideswipe crashes, which can result from vehicles changing lanes to avoid delays behind a left-turning vehicle in the inside through lane. These types of crashes can occur at midblock access points and major intersections. Road diets eliminate these

types of crashes by removing the turning vehicle from the through lane. Sideswipes can also occur between vehicles traveling on the two-way left-turn lane and those attempting to enter it but these crashes are not a frequent occurrence as prior research and case studies indicate.

- Rear end crashes, which can be the result of vehicles traveling in the inside through lane behind a stopping or stopped left-turning vehicle. A road diet reduces these types of crashes by removing the stopped turning vehicle from the through lane. Road diets are anticipated to reduce rear end crashes on roadways with high volumes of left-turn traffic; however, increased congestion resulting from the lane reduction may increase rear end crashes on the main street under other conditions.
- Left-turn crashes, which can result from restricted sight distance caused by opposing turning traffic. Road diets address these types of crashes by providing a dedicated left turn lane and correcting the negative offset between opposing left-turn vehicles.

There are additional elements that should be considered when road diets are evaluated including:

- multimodal operations, which can be improved with the implementation of a road diet,
- pedestrian safety, which can be improved with the addition of the refuge within the two-way left-turn lane,
- operational consistency where more uniform speeds along the corridor can be achieved, and
- livability, which can be improved by increasing opportunities for residential and commercial growth with a road diet.

4.3 Design Considerations

Various design aspects of the road diet conversion have been identified including recommended cross sections (dimensions of elements and possible components) along with methods to properly transition to and from the road diet to the existing roadway cross section. Transitions are recommended to occur at major change points, such as intersections, since they could allow for a more appropriate accommodation of turning movements. However, if necessary, transitions can occur at midblock sections, where it is recommended to place this away from intersections and/or high volume access points that would place stopped turning traffic in the through lanes of the merging traffic.

If not designed properly, these transitions can increase crashes removing any safety benefit of the road diet. All transitions should follow AASHTO's Policy on Geometric Design for Highways and Streets and MUTCD guidance for the reduction of through lanes.

An additional design issue of concern is the potential of high access densities to increase the likelihood of conflicts between traffic turning into and exiting the access point. This could affect safety along the corridor, since there is the potential for rear end crashes from vehicles slowing down to negotiate entering the access point and overlapping of left-turns between the main street and adjacent access points. According to KTC Auxiliary Turn Lane Policy, a non-traversable median and turn restrictions are recommended when a corridor exceeds 85 access points per mile (based on number of access points on both sides of the street).

Prior to the implementation of a road diet, it is recommended that a capacity analysis be completed for the major signalized intersections on the corridor to ensure that they would operate acceptably with a revised lane configuration. Analysis based on Highway Capacity Manual (HCM) methodologies is sufficient to check intersection capacities. For special cases, such as closely spaced intersections, coordinated signal systems, or corridors with at-grade rail crossings, micro-simulation is recommended to adequately evaluate arrival patterns and queue formation and dissipation.

4.4 Road Diet Not Recommended

The guidelines provide a list of conditions when a road diet may not be appropriate. These conditions include corridors where the operational efficiency may degrade as a result of the road diet, corridors where at-grade rail crossings or other conditions exists that may create queues that require a long time to dissipate; and high crash rates resulting from conditions not correctable by road diets. The latter condition reflects cases where crashes such as right angles are a problem. The use of a road diet will not address such crashes. Other scenarios include cases where adequate transitions cannot be developed or if left-turn lanes already exist on the corridor.

The expert panel analysis was the next safety analysis performed for each case study using all the information and analyses conducted as input. The expert panel reviewed each documented crash after the completion of the given project and determined the potential influence of project design features on crash. This approach utilized specific crash data (including location, crash type, environmental conditions, etc.) and the expertise of panelists, who first examined the potential influence of the driver, roadway, environmental, and vehicular factors on crash occurrence. The second examination determined the likelihood of the crash being associated with the project design and to each design element. The expertise of the panel included highway safety, highway design, planning, project development, crash reconstruction, traffic operations, and human factors.

5. CONCLUSIONS

This paper provides the background and process used to develop a set of guidelines to determine when road diet conversions are feasible. A structured approach was followed that considered the operational evaluation of three- and four-lane roads and identified parameters significant to the successful operation of road diets.

An important aspect of the work completed here is the extension of the usable range of volumes where road diets could be beneficial. Past work recommended their application for roads with an ADT up to 17,500 vpd. The current research indicates that such conversions could work for roads with greater volumes, up to 23,000 vpd. Moreover, the findings here identify the effect of the side street volume, indicating that both volumes need to be considered when determining whether such a conversion should be considered.

Road diets may also improve the operational efficiency of signalized and unsignalized intersections on a corridor. Operational improvements are typically seen when high ADTs and high left-turn percentages are present on the primary and cross-street. Typically road diets are shown to have reduced delays and reduced queues when high left-turn percentages AND high volumes are present.

The data analysis focused on the safety and operational characteristics of each case study and is based on the before and after crash analysis, the crash type expectation analysis, the speed comparisons, and the expert panel analysis. The overall results for each case study are presented in Table 2, where the safety, operational, and expert panel analyses are summarized. The safety and operational results are assessed relative to their influence on safety with a designation of an algebraic sign (+ or -) to denote the differences between the after and before conditions of the project and statewide differences. The negative numbers indicate an improvement in safety or a lower operating speed than the design speed. The positive cells are also shaded to highlight the cases where deterioration in safety was noted or the operating speeds were higher than the design speed. Finally, the expert panel scores are presented for each case study (scoring range 0: no influence, 1: least influence, 5: most influence).

Abstract: Bicycle lanes have become an integral part of the highway networks of many countries including Sri Lanka. They are encouraged as a pollution free, economic and healthy mode of transport throughout the world. So it is high time that a proper guideline for the same is introduced taking into account the local conditions of this country. Bicycle lanes are so far introduced to the road projects of Sri Lanka on ad hoc basis without consideration of the proper guidelines such as continuation of bicycle lanes on the road network, intersection treatment, avoidance of abrupt termination etc. Sri Lanka being a developing country with more or less a feudal framework of thinking, there is a social stigma towards the bicycling as a poor man's vehicle. In such a context, how should a design engineer in cooperate this green technology into our local highway projects so the common man can be immensely benefitted and our cities will be left with some fresh air to breath in the coming days of the future? This research was aimed at addressing these issues and finally coming up with a proper guideline to implement bicycle lanes in the future road projects carried out by Road Development Authority.

Keywords: Bicycle lanes, Bicycle lane design, Non motorized transport

1. INTRODUCTION

1.1 General Background

Bicycle lanes are introduced to Sri Lanka as an integral part of the highway network. In an environment where the world is fast moving to the greener technologies, this introduction will offer many benefits to a country that is trying to emerge as a middle income economy in South Asia. In such a context stripping out the cons and associating the pros of this concept becomes an inevitable endeavor faced by the highway designers in the future. In Sri Lanka, bicycle lanes are so far introduced to the highways on ad hoc basis. The actual performance of such bicycle lanes is in question.

1.2 Objectives

Objectives of this research are as follows.

- Have the bicycle lanes/paths implemented been successful in the recent projects?
- What is the public opinion of the bicycle lanes?
- What could be the reasons for failures if any?
- Recommendations for the implementation for bicycle facilities in the future projects.

1.3 Scope of the Study

This study is restricted to the study of common objectives and design concepts of bicycle lanes and attempts to make recommendations on the implementation of bicycle lanes in the future road projects carried out by Road Development Authority.

2. LITERATURE REVIEW

2.1 Necessity of Bicycle Facilities

Bicycle facilities toady have become an inevitable part in highway design. In addition to the promotion of non motorized transport to save energy, it serves as a low cost alternative for the ever increasing travel demand. Michael Replogle [1991:1] says NMVs offer low cost private transport, emit no pollution, use renewable energy, emphasize use of labor rather than capital for mobility, and are well suited for short trips in most cities regardless of income, offering an alternative to motorized transport for many short trips. Thus, they are appropriate elements in strategies dealing with poverty alleviation, air pollution, management of traffic problems and motorization, and the social and economic dimensions of structural adjustment. NMVs have a most important role to play as a complementary mode to public transportation.

While most of the Sri Lankans are not so poor to afford the subsidized public transport costs, cycling is dominant in many areas outside Colombo. Bicycle population is dominant especially in North Central, North and East provinces. But no separate bicycle facilities are provided in these remote areas. This is explained by Michael Raplogle stating: In many low income Asian cities where NMVs predominate, there has been little need to create a separate cycle network because large numbers of NMVs define their own legitimacy to right-of-way. However, as motorization increases, or as traffic congestion worsens, it becomes increasingly important to develop modal separation in high traffic flow corridors. This is particularly vital in mixed traffic cities where NMV use is declining due to competition from growing motorized traffic.

2.2 Types of Bicycle Facilities

Bicycle facilities are incorporated into the traditional highway design in various magnitudes. They can be bicycle lanes running in the both sides of a highway, which are demarcated by lane marking, or separate bicycle paths. Four types of bicycle facilities are given in the Highway Design Manual [2006:1000-2] categorizes the bicycle facilities into four major groups.

2.2.1 Shared Roadway (No Bikeway Designation) In some instances, entire street systems may be fully adequate for safe and efficient bicycle travel and signing and pavement marking for bicycle use may be unnecessary. In other cases, prior to designation as a bikeway, routes may need improvements for bicycle travel. Many rural

highways are used by touring bicyclists for intercity and recreational travel. It might be inappropriate to designate the highways as bikeways because of the limited use and the lack of continuity with other bike routes. However, the development and maintenance of 1.2 m paved roadway shoulders with a standard 100 mm edge line can significantly improve the safety and convenience for bicyclists and motorists along such routes.

2.2.2 Class I Bikeway (Bike Path)
Generally, bike paths should be used to serve corridors not served by streets and highways or where wide right of way exists, permitting such facilities to be constructed away from the influence of parallel streets. Bike paths should offer opportunities not provided by the road system. They can either provide a recreational opportunity, or in some instances, can serve as direct high-speed commute routes if cross flow by motor vehicles and pedestrian conflicts can be minimized. The most common applications are along rivers, ocean fronts, canals, utility right of way, abandoned railroad right of way, within college campuses, or within and between parks. There may also be situations where such facilities can be provided as part of planned developments. Another common application of Class I facilities is to close gaps to bicycle travel caused by construction of freeways or because of the existence of natural barriers (rivers, mountains, etc.).

2.2.3 Class II Bikeway (Bike Lane)
Bike lanes are established along streets in corridors where there is significant bicycle demand, and where there are distinct needs that can be served by them. The purpose should be to improve conditions for bicyclists in the corridors. Bike lanes are intended to delineate the right of way assigned to bicyclists and motorists and to provide for more predictable movements by constructing bike lanes is to better accommodate bicyclists through corridors where insufficient room exists for safe bicycling on existing streets. This can be accomplished by reducing the number of lanes, reducing lane width, or prohibiting parking on given streets in order to delineate bike lanes. In addition, other things can be done on bike lane streets to improve the situation for bicyclists, that might not be possible on all streets (e.g., improvements to the surface, augmented sweeping programs, special signal facilities, etc.). Generally, pavement markings alone will not measurably enhance bicycling.
If bicycle travel is to be controlled by delineation, special efforts should be made to assure that high levels of service are provided with these lanes.

2.2.4 Class III Bikeway (Bike Route).
Bike routes are shared facilities which serve either to:

(a) Provide continuity to other bicycle facilities (usually Class II bikeways); or
(b) Designate preferred routes through high demand corridors.

As with bike lanes, designation of bike routes should indicate to bicyclists that there are particular advantages to using these routes as compared with alternative routes. This means that responsible agencies have taken actions to assure that these routes are suitable as shared routes and will be maintained in a manner consistent with the needs of bicyclists. Normally, bike routes are shared with motor vehicles.

The use of sidewalks as Class III bikeways is strongly discouraged.

It is emphasized that the designation of bikeways as Class I, II and III should not be construed as a hierarchy of bikeways; that one is better than the other. Each class of bikeway has its appropriate application.

In selecting the proper facility, an overriding concern is to assure that the proposed facility will not encourage or require bicyclists or motorists to operate in a manner that is inconsistent with the rules of the road.

An important consideration in selecting the type of facility is continuity. Alternating segments of Class I and Class II (or Class III) bikeways along a route are generally incompatible, as street crossings by bicyclists are required when the route changes character. Also, wrong-way bicycle

travel will occur on the street beyond the ends of bike paths because of the inconvenience of having to cross the street.

In this research, only the Bike Lanes are considered for the analysis as it is the one introduced to Sri Lankan highways for the time being.

2.3 Pros of Bicycle Facilities

Winnipeng City [3] defines cons of bicycle lanes as follows. Bike lanes help define road space, decrease the stress level of bicyclists riding in traffic, encourage bicyclists to ride in the correct direction of travel, and signal motorists that cyclists have a right to the road. Bike lanes help to better organize the flow of traffic and reduce the chance that motorists will stray into cyclists' path of travel. Bicyclists have stated their preference for marked on-street bicycle lanes in numerous surveys. In addition, several real-time studies (where cyclists of varying abilities and backgrounds ride and assess actual routes and street conditions) have found that cyclists are more comfortable and assess a street as having a better level of service for them where there are marked bike lanes present.

In summary, bike lanes do the following:

- support and encourage bicycling as a means of transportation;
- help define road space;
- promote a more orderly flow of traffic;
- encourage bicyclists to ride in the correct direction, with the flow of traffic;
- give bicyclists a clear place to be so they are not tempted to ride on the sidewalk;
- remind motorists to look for cyclists when turning or opening car doors;
- signal motorists that cyclists have a right to the road;
- reduce the chance that motorists will stray into cyclists' path of travel;
- make it less likely that passing motorists swerve toward opposing traffic;
- decrease the stress level of bicyclists riding in traffic.

2.4 Width of Bicycle Lanes

Road Development Authority recently incorporated Bicycle Lanes and Bicycle Paths into their design strategy. The general bicycle lane width maintained by Road Development Authority is 1.5m for bicycle lanes.

Toronto draft bicycle design guidelines [4] recommends following widths for bicycle lanes.

Where curbs are present, the bicycle lane width, the distance from the face of the curb to the centre of the lane line, should be between 1.5 metres and 2.0 metres. On paved shoulders without curbs, the bicycle lane width, the distance from the edge of the pavement to the centre of the lane line, should be between 1.2 metres and 1.7 metres. A wide bicycle lane (1.8 to 2.0 metres where curbs are present; 1.5 to 1.7 metres without curbs) is recommended under one or more of the following conditions:

- where lateral obstructions, such as utility poles, are within 300 mm of the edge of curb;
- where the bike lane is on a bridge or underpass;
- where the posted speed limit is 60 km/h or greater;
- where the adjacent traffic lane is 3.6 m or greater;
- where the bike lane is between two traffic lanes;
- or all contra-flow bicycle lanes.

Where on-street parking is permitted, the preferred combined width of the parking zone and bicycle lane is 4.2 metres. The minimum combined width is 3.8 metres.

2.5 Intersection Treatment

Bicycle lanes should be a component of a network of bicycle lanes that maintains the integrity of the system. Toronto Draft Bicycle Lane Design Guidelines [4] proposes following lane marking in non signalized intersections.

The bike lane striping is discontinued across the leg of the intersecting street. If the approach with

the bike lane features a stop line and crosswalks, the bike lane continues all the way to the stop line with, in most cases, the final 15 metres demarcated by a broken white line. The two exceptions are:

- where a nearside bus stop is present, the broken line begins 20 metres from the stop line; and,
- where right turns are not permitted, the solid line continues all the way to the stop line.

The solid lane line should resume immediately downstream of the farside crosswalk. The diamond and bicycle logo pavement marking should be placed within the first 15 meters of the lane.

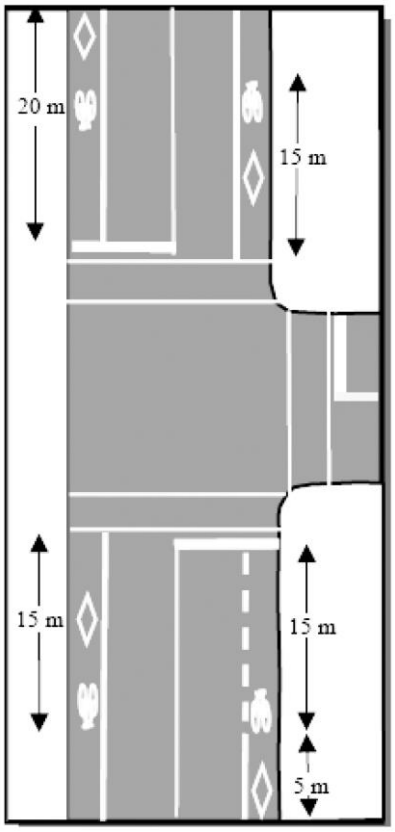

Figure 1. Typical dimensions for an intersection treatment (non-signalized - four ways)

2.6 Crashing with Car Door Opening

On street parking is either allowed or illegally enjoyed in many of the urban highways in Sri Lanka. In places where the on street parking is allowed, the bicyclist is at risk the crashing with suddenly swung open doors of the cars. Maryland SHA Bicycle and Pedestrian Design Guidelines [5] describe this situation as follows.

In locations where bike lanes are adjacent to on-street parking, consideration should be given to the possibility that bicyclists may crash into car doors that are suddenly swung open. This type of crash is typically more likely in locations with higher parking turnover, such as main streets, streets near restaurants and retail, etc. This is not typically a concern on residential streets. Bicyclists encountering an opened door must either stop short of the door, swerve into an adjacent travel lane or risk riding into the open door or being struck by the opening door. This act is commonly referred to as "dooring" by bicyclists. Bicyclists have been injured and killed due to dooring events.

To mitigate or reduce the possibility of a dooring event a number of communities have experimented with various pavement markings, regulatory signs, and or warning signs to prevent dooring incidents. The following mitigation measures have been analyzed in locations with high parking turnover, and 7 or 8 foot parking lanes adjacent to bicycle lanes; or locations with a history of dooring accidents or complaints of dooring "close calls." SHA may consider using these measures on urban streets with frequent on-street parking turnover, on an experimental basis.

2.6.1 Dooring Warning Sign

This sign can be located adjacent to existing parking regulation signs to increase theirvisibility to motorists. An example of a dooring warning sign is shown in below Figure 2.

Figure 2. A typical door warning sign

2.6.2 Modified Bicycle Lane Marking

Based upon a study performed in San Francisco, CA, marking the door zone with extension lines as shown in Figure 2.3 may encourage bicyclists to ride towards the left side of the bicycle lane outside of the door zone. Engineering judgment should be utilized to determine the frequency of placement of the door zone extension lines. Consideration may also be given to utilizing a smaller bicycle lane symbol and arrow which would be placed on the extreme left side of bicycle lane.

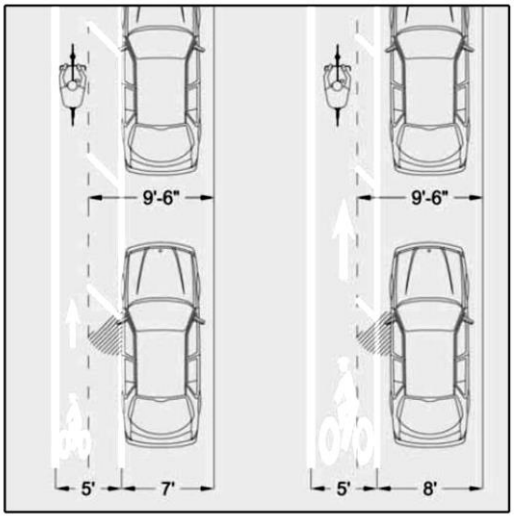

Figure 3. Modified bicycle lane marking with door zone

3 EXPERIMENTAL DETAILS

3.1 Method of Data Collection

Data were collected by the opinion surveys conducted in town areas where a bicycle lane would be beneficial. Questionnaire forms were prepared as this regard.

3.2 Groups for Opinion Surveys

Following 4 groups were selected to collect data.

- General public - Any conclusion for the integration of a new facility to a highway should incooperate the public opinion. Therefore the views of general public were extracted in an opinion survey. This survey was conducted in Malabe Town.
- School Children - School children are a potential group that can use bicycles. So an opinion survey was conducted at Boys' Model School, Malabe.
- University Students - University Students are another potential group that can use bicycles. So an opinion survey was conducted at Sri Lanka Institute of Information Technology by among the second year engineering students.
- Bicyclists - These are the people who really use bicycles for their day to day activities. Their contribution to this study cannot be overlooked at any rate. So an opinion survey was conducted with them in Malabe-Kaduwela Road.

4. DISCUSSION

4.1 Failure of the Bicycle as a Transport Mode in Sri Lanka

Long ago, one may be familiar with the bicyclists who had the dominance of our national road network. This is not the case with the recent development. This notion can be justified with the survey data collected in this research. No wonder none of the persons questioned in the category of general public responded affirmatively for their bicycle usage. While the data spectrum collected would not represent the total picture of the country's transport profile, it may be argued that the data collected were from Malabe where moderate income earning people reside. So it may be suggested that the bicycle is no more the common man's vehicle in this country, at least in the highly urbanized west. This is further consolidated with the fact that according to the survey, none of the school children use bicycle as a transport mode. In SLIIT none use the bicycle. This is a clear indication that supports the previous argument that bicycle is not used as a common transport mode among the moderate income group of this country.

In University of Moratuwa, mere 6% and in University of Colombo mere 10% of the students questioned used the bicycle as a transport mode to travel to the university. The indication given in both universities is tangible to note that the share

of the bicycle as a transport mode is very low compared to other transport modes such as public transport which was used by 72% of the general public and 60% of the school children. This clearly shows that despite various strategies used by road agencies to promote the bicycle usage, the bicycle has failed as a transport

4.2 Reasons for the Failure of the Bicycle

An astounding reality that was revealed from this research was the fact that while the bicycle usage was that much low among various groups, the bicycle possession was substantial, accounting to 83% among general public, 69% among school children, 44% among SLIIT, 38% among University of Moratuwa students and 32% among University of Colombo students. The question emerges here as to why the bicycle usage is such low while a fair number of people owned the bicycle. It may be argued that there should be a problem in our road system.

The failure of the bicycle as a common transport mode can be affiliated to various factors such as poor road condition, no facilities for the bicyclists, long distances, no safe parking, sweating and social stigma to name a few. Sweating was the major problem for school children and SLIIT students accounting to 62% and 40% respectively, while the two universities considered had their fair share. This is noted as a crucial factor in this research as Sri Lanka being a tropical country should focus its attention on these issues before investing heaps of money for the implementation of bicycle lanes. Social stigma played the least influential factor among educated masses i.e. SLIIT and the both universities while it was high among the school children where class differences as a shadow of the colonial past still haunted. It was further noted that many were reluctant to use the bicycle as a transport mode due to the long distance that they had to cycle. This was 38% among school children, 49% among SLIIT students, 29% among University of Moratuwa students and 25% among University of Colombo students. Parking was a major issue for the school children among whom 46% admitted that as a problem. This is true as the school in question did not have a safe parking place for the bicycles. This problem was not significant among students of SLIIT and both Universities where safe parking places actually existed.

4.3 Potential of a Bicycle Population

It may be argued with caution that there is a potential bicycle population in this country who really considered bicycling is convenient even in the current road network. That was 42% among bicyclists, 50% among school children and 34% among SLIIT students, while University of Moratuwa and University of Colombo held it to be 41% and 42%. The reasons for this notion could be many, among which short distance, traffic congestion, lack of doorstep transport, economy, lack of sufficient public transport and physical exercise were assessed. Short distance was the major factor for selecting the bicycle among almost all the groups. This gives a clear indication that people are ready to use the bicycle for short distances under improved road condition. Economy and physical exercise were other two major factors. A very important finding here was that bicycle was used as there was no public transport for the door step. It may be argued here that this stresses the need of improving byroads along with the national road network so the bicycles can be used effectively by those who are under privileged to have doorstep transport.

4.4 Ups and Downs for the Bicyclists in the Current Road System

Now it may be suggested that there is a potential bicycle population who would use the bicycle provided their expectations are met in the road network. A major factor those who were questioned mentioned for the convenience of the bicyclists was the separate bicycle lane. This was as high as 94% among school children. The next important point was the wide roads, which was admitted by 65% of the bicyclists and 72% of school children. May be the wide roads could reduce the negative effects of motorized traffic to the bicycles. Built up shoulders and good road surfaces did not have that much weight compared to the other factors.

The problems that prevented this potential bicycle

population from actually taking a bicycle and riding on the road were numerous. Heavy congestion and poor driver discipline were the major factors according to the survey. Bicyclists' affirmative response was as high as 79% for heavy congestion while the SLIIT students' affirmative response was as high as 89% for safety. Lack of an exclusive bicycle lane apart from the road and lack of priority while considerable, did not have that of weight compared to the other factors.

4.5 New Proposals to Encourage Bicycles

Now the problem is shortened to the fact that while the presence of bicycles in our road network is minimal, there is a potential bicycle user population who do not actually takes a bicycle and rides owing to the various problems of the current road network. This research may not be able to address all of them, such as traffic congestion which requires major strategic planning and policy decisions to mitigate the effects. Four options were put forward for the assessment i.e. Exclusive bicycle lane, Separate bicycle lane, Raised bicycle lane and green shelter. Exclusive bicycle lane was preferred by many, accounting to 46% of school children, 50% of SLIIT students, 46% of University of Moratuwa students and 49% of University of Colombo students. Raised bicycle lane was the second best choice accounting to 21% of school children, 42% of SLIIT students, 37% of University of Moratuwa students and 36% of University of Colombo students. Separate bicycle lane was the least preferred. Green shelter had its fair share of preference accounting to 35% of school children, 26% of SLIIT students, 32% of University of Moratuwa students and 24% of University of Colombo students.

4.6 Lane Width

From the literature review, following lane widths may be suggested.

- Where curbs are present, the bicycle lane width, the distance from the face of the curb to the centre of the lane line, should be between 1.5 metres and 2.0 metres.
- On paved shoulders without curbs, the bicycle lane width, the distance from the edge of the pavement to the centre of the lane line, should be between 1.2 metres and 1.7 metres.
- A wide bicycle lane (1.8 to 2.0 metres where curbs are present; 1.5 to 1.7 metres without curbs) is recommended under one or more of the following conditions:
    - where lateral obstructions, such as utility poles, are within 300 mm of the edge of curb;
    - where the bike lane is on a bridge or underpass;
    - where the posted speed limit is 60 km/h or greater;
    - where the adjacent traffic lane is 3.6 m or greater;
    - where the bike lane is between two traffic lanes;
    - -for all contra-flow bicycle lanes.

4.7 Intersection Treatment

It was observed in our intersections the ad hoc bicycle lanes vanish due to the space constraints, without being a part of an integrated bicycle lane network. So it is suggested that a proper intersection treatment system such as that of Toronto or Chicago as given in the literature review be adopted. In this research, it is proposed to adapt to a lane marking system as shown below.

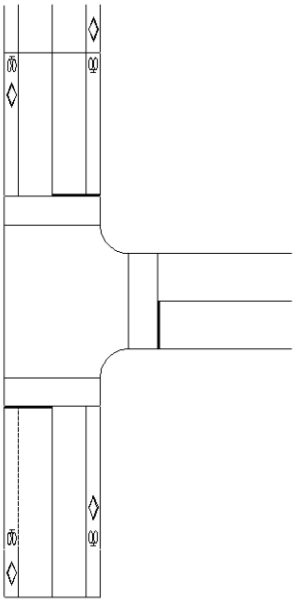

Figure 3. Lane Marking Suitable for a 3 way Intersection

This basic system can be improved to include 4 way intersections, roundabouts, signalized intersections etc. as the need arises.

4.8 Dooring Warning System

It is suggested that the warning symbol and the modified lane marking given in the literature review be adopted where the parking is allowed with the bicycle lane.

4.9 Necessity of Bicycle Parking Places

Majority of the school children accounting to be 46% admitted their inability to use the bicycle due to the fact there is no safe parking in the school. So the bicycle parking is a major issue in this country where proper bicycle parking facilities are not provided. Therefore, Alexandria government's bicycle parking technique is proposed.

4.10 By road Improvements

15% of the school children, 20% of the SLIIT students, 21% of the University of Moratuwa students and 4% of the University of Colombo students wanted to bicycle as they did not have the doorstep transport. So this is a clear indication that people use the bicycle to come to the main road hence the by roads should also be improved to cyclable condition along with the major road improvements.

4.11 Measures to Increase Bicycling Share

The suggestions of the people who were surveyed were assessed to increase the bicycling share of the transport system and highest demand was the concession on prices. This needs further investigation by means of a separate research.

The second highly demanded requirement was to provide more facilities for the bicyclists such as continuation of the bicycle lane etc. Parking shed had their fair share of demand while that for the giving priority for bicyclists was comparatively high. Bicycle registration system had the least demand of all.

5. CONCLUSION & RECOMMENDATIONS

It was explained in the discussion that there is still a fair demand for the bicycle but the common people are reluctant to use this economical transport mode due to various problems. Following recommendations can be made with regard to the literature review and data analysis.

- Where curbs are present, the bicycle lane width, the distance from the face of the curb to the centre of the lane line, should be between 1.5 metres and 2.0 metres.
- On paved shoulders without curbs, the bicycle lane width, the distance from the edge of the pavement to the centre of the lane line, should be between 1.2 metres and 1.7 metres.
- A wide bicycle lane (1.8 to 2.0 metres where curbs are present; 1.5 to 1.7 metres without curbs) is recommended under one or more of the following conditions:
    - where lateral obstructions, such as utility poles, are within 300 mm of the edge of curb;
    - where the bike lane is on a bridge or underpass;
    - where the posted speed limit is 60 km/h or greater;
    - where the adjacent traffic lane is 3.6 m or greater;
    - where the bike lane is between two traffic lanes;
    - -for all contra-flow bicycle lanes.
- Intersection treatment should be carried out as per the standards used in developed countries as given in this research.
- Dooring warning system should be implemented appropriately where parking is allowed with bicycle lanes.
- Proper bicycle parking places should be provided where a potential bicycle population is expected such as schools and universities.
- By road improvements should be carried out along with the main road improvements to facilitate the bicyclists use the road.
- Raised bicycle lanes, separated from the motorized way should be provided

wherever possible.

- Green shelter should be provided for the bicycle lanes so the sweating would be minimized.
- Since the convenient bicycling distance varies, it is proposed that at least 4km bicycle lane should be provided surrounding the institutions like universities where a potential bicycle usage is anticipated, in case the whole road is not provided with a bicycle lane.

STABILIZATION OF EXPANSIVE CLAY SOIL USING BUTON ROCK ASPHALT THE OTHER UTILIZATION OF BUTON ROCK ASPHALT

Gatot Rusbintardjo
Department of Civil and Environment Engineering
Faculty of Engineering
Universitas Islam Sultan Agung (UNISSULA)
Semarang Indonesia.
E-mail: gatotrsb@gmail.com

Abstract: Subgrade is the lowest layer of the pavement that must eventually support all the loads that come onto the pavement structure. Therefore, it is essential to make sure that the layer is stable and has sufficient shearing strength to withstand the traffic induced stresses without excessive deformation. If the subgrade soil is poor, sufficient shearing strength, then it must be stabilized to improve its properties. In this paper Buton Rock Asphalt (BRA) was studied to stabilize the expansive clay subgrade soil of Semarang-Purwodadi road in North-East Central Java Province of Indonesia. Amount of 2%, 4%, 6%, and 8% of BRA by weight of soil were added. As comparison or control, natural sand in amount of 5 to 25% in increments of 5% by weight of soil was also added. Laboratory works show that BRA can improve bearing capacity of soil far higher than the natural sand resulted. By adding 8% by weight of soil, BRA can improve bearing capacity of those of expansive clay soil, measure by using CBR, from the value of CBR 1.6% to 5.97% or increase 373%, while 20% of sand only increasing the CBR of soil become 3.90% or increase 244%. Increasing of CBR by adding BRA is in linear line with the line equiation y = 51.54x + 2.126. This mean if the percentage of BRA also 20% the CBR value of BRA-stabilized soil is 12.43% and suitable as well as very good for subgrade material.

Keywords: Buton Rock Asphalt, Stabilizer, Expansive soil, Improve, Bearing Capacity, Strength.

1. INTRODUCTION

Soil is one of nature's most abundant construction materials. Almost all construction is built with or upon soil. Found from Aggrebind.com/wp-content/…./10/Soil-Stabilization-from Caterpilar.pdf. Introduction to Soil Stabilization (2010), when unsuitable construction conditions are encountered, the following four options can be selected to be conducted: (1) Find a new construction site; (2) Redesign the structure so it can be constructed on the poor soil; (3) Remove the poor soil and replace it with good soil; (4) Improve the engineering properties of the site soil. Option (4) is being used more often today and is expected to dramatically increase in the future.

Improving on-site (in-situ) soil's engineering properties is referred to as either "soil modification" or "soil stabilization" The term of "modification" implies a minor change in the properties of soil, while stabilization means that the engineering properties of the soil have been changed enough to allow field construction to take place.

There are two primary methods of soil stabilization used today:, namely mechanical and chemical or additive method. The most common form of "mechanical" soil stabilization is compaction of soil, while the addition of cement, lime, bituminous, or other agents is referred to as a "chemical" or "additive" method of soil stabilization.

There are two basic types additives used during chemical soil stabilization: mechanical additives and chemical additives. Mechanical additives such as soil cement mechanically alter the soil by adding a quantity of material that has the engineering characteristics to upgrade the load-bearing capacity of the existing soil. Chemical additives such as lime chemically alter the soil itself, thereby improving the load-bearing capacity of the soil.

Buton Rock Asphalt (BRA), the natural asphalt discovered in Buton island located in South-East of Sulawesi Island of Indonesia, that consider as the new soil stabilizer was studied to use as soil stabilizer and will be described in this paper (Buton Asphalt Indonesia, Co. Ltd. 2006). How much the influence of BRA in improving the properties of soil as soil additive will be described in this paper, and will compare with sand, the other natural material that have been used as soil stabilizer.

2. OBJECTIVE OF THE RESEARCH

The objective of this paper is to promote the suitability of BRA in providing sufficient strength to the expansive subgrade soil, in order suitable to be used as good subgrade.

3. BUTON ROCK ASPHALT (BRA)

BRA is the natural asphalt discovered in Buton Island located in South-East Sulawesi. The areas in Buton Island which have much deposit of rock asphalt are Lawele, Kabungka, Waisnu, Wariti, and Epe. From those five areas, Lawele and Kabungka have much rock asphalt. Natural rock asphalt is found firstly in 1926 by Hetzel, a Dutch geologist. Survey conducted by Ministry of Energy and Mineral Resources Republic of Indonesia show that deposit of natural rock asphalt are estimated around 650 to 700 million tones (Buton Asphalt Indonesia, Co. Ltd. 2006). Deposit of rock asphalt can only be found in 1 to 1.5 meter depth from the land surface as shown in the Figure 1, and bitumen content in the rock asphalt range about 10 to 40%. Since the first time are discovered and mined, still only 3.4 million tons of rock asphalt has been explored.

For this research, BRA was supplied by Buton Aspal Indonesia (BAI) Co. Ltd. in form of coarse grain and was packed in bag contains 25kg per bag (Figure 2). BAI Co. Ltd. takes BRA from Lawelle quarry. Gradation of BRA and it other properties were shown in Table 1.

4. RESEARCH METHODOLOGY

This research was conducted in the Geotechnical Laboratory, Faculty of Engineering, Universitas Islam Sultan Agung (UNISSULA) of Semarang, Indonesia. Soil to be stabilized is expansive clay soil take from the subgrade of Semarang-Purwodadi road, the 64 km length of provincial road located in North-East Central Java Province of Indonesia.

To be able to get the correct conclusion that BRA is suitable for soil stabilizer, sand, another natural material was also used to stabilize the same soil. The improvement of strength and properties of soil after adding with stabilizer material was determined by using Atterberg Limit, California Bearing Ratio, and Direct Shear Test tests.

The amount of 2 to 8% in increments of 2% of BRA and 5 to 25% in increments of 5% of natural sand by weight of soil were added.

5. LABORATORY EXPERIMENTS

5.1 Expansive soil

Laboratory works was commenced with Atterberg Limit test for original soil, which the result is given in Table 2, and shows that Plasticity Index (PI) value is 33.9% is categorized high, and the soil can be classified as expansive clay.

Table 2. The results of Atterberg Limit tests for the expansive soil

Test	Result
Liquid Limit (LL)	75.9%
Plastic Limit (PL)	42%
Plasticity Index (PI) = LL – PL	= (75.9 – 42)% = 33.9%

5.2 Soil - BRA and soil-sand stabilization

Laboratory works of Soil–BRA stabilization was commenced by activating bitumen that contain in the BRA in order to be able to blend with soil. Activated bitumen in the BRA was conducted by adding bunker oil. Bunker oil is, used ship lubricating oil, adds to the BRA, mixed and then keeps in the shady place for 48 hours. After 48 hours, bitumen in the BRA will melt, and the particles of BRA become soft. As have been mentioned, amount of 2, 4, 6, and 8% of this melt and soft BRA then were added to the soil used as additive or stabilizer.

Laboratory test of the mix of soil-BRA and soil-sand were also commenced with Atterberg Limit test, and followed with CBR and Direct Shear test.

6. RESULT AND ANALYSIS

6.1 Soil-BRA Stabilization

6.1.1 Atterberg Limit

The Atterberg test results were given in Table 3 and Figure 3 show that the values of Plasticity Index (PI) lower with increasing of BRA content in the soil. These results correspond to the hypothesis that the lower of PI value, the less potential of soil to become expansive. This means that the more BRA adding, the less expansive of the soil. Decreasing of PI value is caused by decreasing of pores in the soil.

Table 3. Plasticity Index (PI) of soil-BRA

% of Buton-NRA	LL	PL	PI
0%	75.9	42	33.9
2%	71	39	32
4%	69	38	32
6%	69	4	25
8%	68	44	24

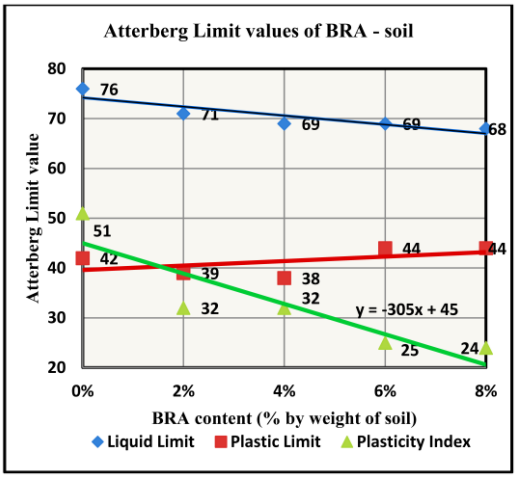

Figure 3. Atterberg values of soil-BRA

6.1.2 California Bearing Ratio (CBR) test

The results of CBR test for BRA stabilize expansive soil were given in Table 4 and shown statistically in Figure 4. The hypothesis said that the more BRA content, the higher the CBR value is. Regression model give coefficient of determination, R-square, R2 = 0.9662 and coefficient of correlation R = 0.9830. Those values of regression model show that between BRA content and CBR have strong correlation, and the contribution of BRA to CBR value is above 90%, and can be concluded that the CBR value of Soil-BRA is fit with the hypothesis.

CBR values of BRA stabilized soil also have linear line with line equation y = 51.45x + 2.126. This mean, if the BRA content adds to 20%, the CBR value will become 12.43%, suitable and very good for subgrade material.

Table 4. CBR value of soil-BRA

% BRA	CBR (%)
0%	1.6
2%	3.5
4%	4.8
6%	5.05
8%	5.97

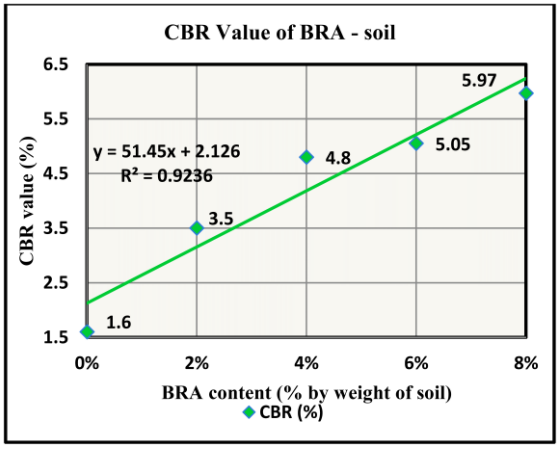

Figure 4. CBR value of soil-BRA

6.1.3 Direct shear test

The results of direct shear test of BRA stabilized soil given in Table 5 and graphically show in Figure 5 and Figure 6 both for cohesion value and angle of internal friction Ø value respectively. Attention should be paid to this direct shear test results. Normally, the higher value of cohesion of soil, the lower value of Ø is. However, soil-stabilized with BRA show the different result, where the higher cohesion also the higher angle of internal friction Ø. This result can be explained as follows: when BRA was added to the soil and thoroughly blend, the particles of soil will be bind by melt bitumen of BRA because the mix of soil-BRA becomes cohesive. Nevertheless, this cohesion is false cohesion, since the rocks particles contain in BRA make the particles of BRA – soil mixtures are clotted, hard, and make it like granular material. That is why the angle of internal friction Ø higher if the BRA content high.

Table 5. Cohesion and angle of internal friction of soil-BRA

% of BRA	Cohesion (c) (kg/cm^2)	Angle of internal friction Ø
0%	0.49	14
2%	0.31	37
4%	0.40	41
6%	0.51	43
8%	0.73	46

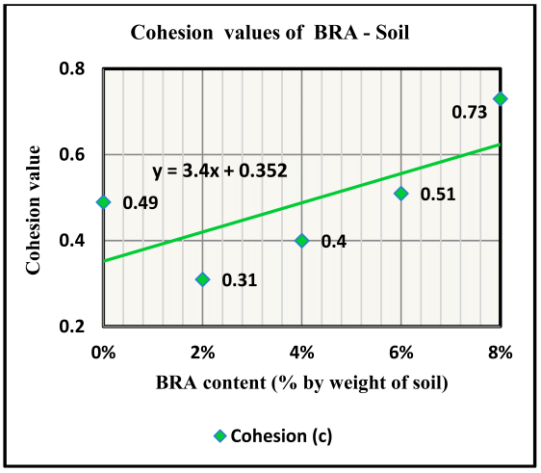

Figure 5. Cohesion value of soil-BRA

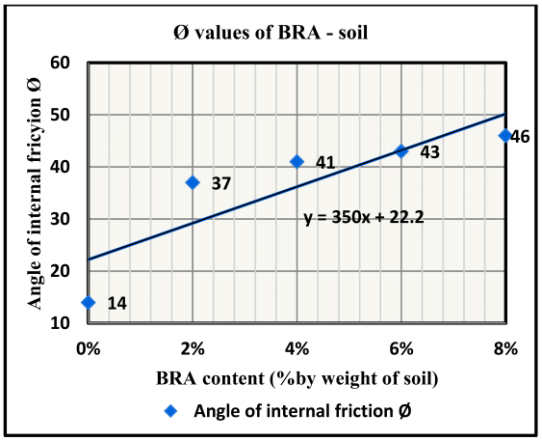

Figure 6. Angle of internal friction of soil-BRA

6.2 Soil-Sand Stabilization

6.2.1 Atterberg Limit

Similar to the soil-BRA, Plasticity Index (PI) lower with increasing of sand content in the soil. The Atterberg test results of soil-sand were given in Table 6 and Figure 7 also show that the values of PI decrease with increasing of percentage of sand content. These results correspond to the hypothesis that the lower of PI value, the less potential of soil to become expansive. This means that the more sand adding, the less expansive of the soil. Decreasing of PI value is caused by decreasing of pores in the soil.

Table 6. Plasticity Index (PI) of soil-sand

% of BRA	LL	PL	PI
0%	75.9	42	33.9
5%	72	46.3	25.7
10%	71	33.31	37.9
15%	60	31.79	28.21
20%	59	29.15	29.85
25%	52	28.18	23.82

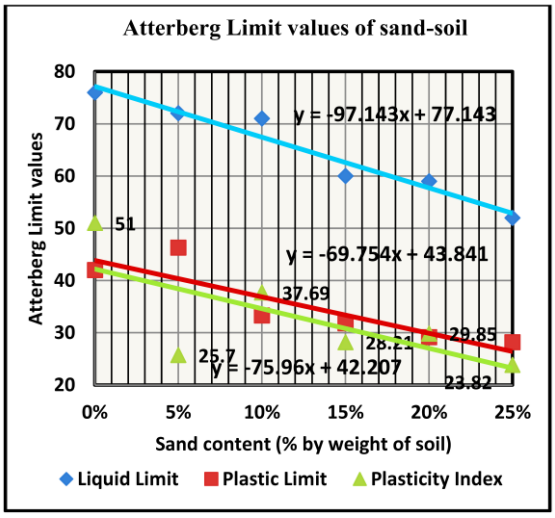

Figure 7. Atterberg Limit value of soil-sand

6.2.2 California Bearing Ratio (CBR) test

The results of CBR test for sand stabilize expansive soil shown statistically in Table 7 and Figure 8. The hypothesis said that the more stabilizer content, the higher the CBR value is. Regression model give coefficient of determination, R-square, R2 = 0.8527 and coefficient of correlation R = 0.9234. Those values of regression model show that between sand content and CBR have strong correlation, and the contribution of sand to CBR value is 85%, and can be concluded that the CBR value is fit with the hypothesis.

Table 7. CBR value of soil-sand

% BRA	CBR (%)
0%	1.6
5%	2.7
10%	2.95
15%	3.58
20%	3.9
25%	4.92

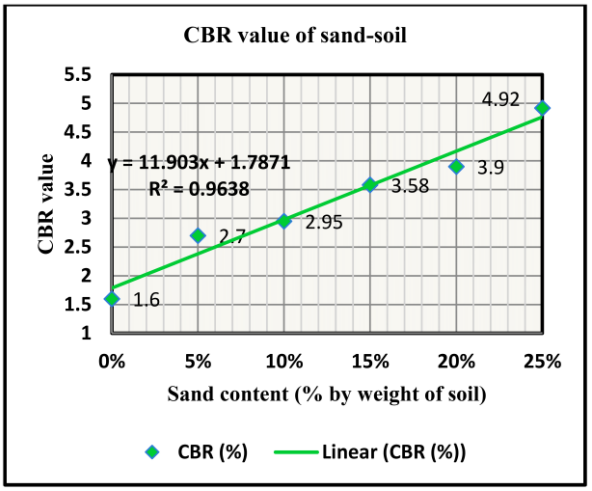

Figure 8. CBR value of sand stabilized soil

6.2.3 Direct shear test

The results of direct shear test for sand stabilized soil given in Table 8 and Figure 9 as well as Figure 10 both for cohesion value and angle of internal friction Ø respectively. The results show the normal value where the higher cohesion value, the lower angle of internal friction Ø. Original soil (0% sand content) have cohesion value 0.49 kg/cm2 and angle of internal friction Ø = 14°. The more sand content, the lower cohesion value and the higher Ø value is, since sand is naturally cohesion less material.

Table 8. Cohesion and angle of internal friction of soil-sand

% of BRA	Cohesion (c) (kg/cm^2)	Angle of internal friction Ø
0%	0.49	14
5%	0.31	15
10%	0.29	16
15%	0.27	17
20%	0.24	20
25%	0.20	24

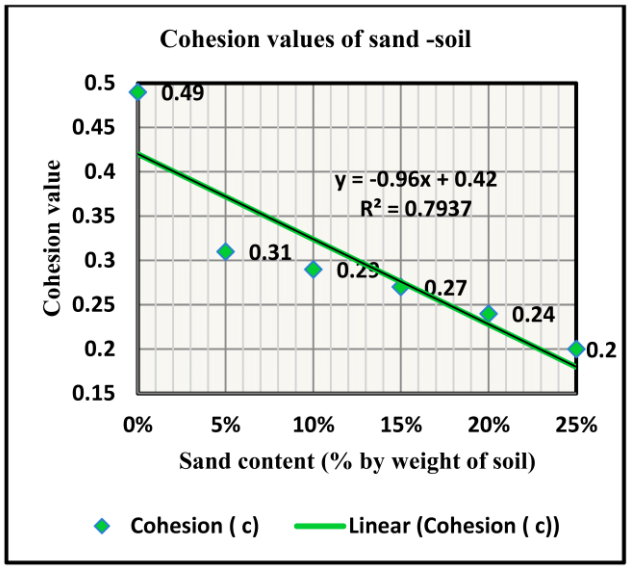

Figure 9. Cohesion values of sand stabilized soil

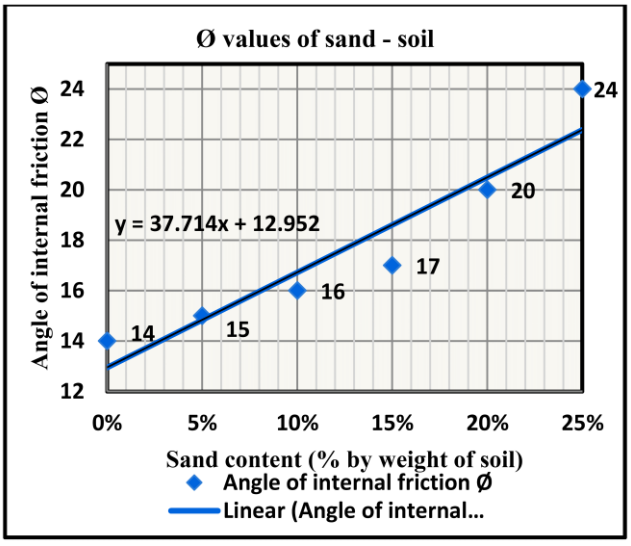

Figure 10. Angle of Internal Friction Ø values of sand stabilized soil

7. CONCLUSIONS

From the entire test results of those two soil stabilizer, the conclusions can be drawn as follows:

- Plasticity Index (PI). With 8% of BRA content in the soil, soil-BRA have PI value 24 similar to the 25% of sand content in the soil-sand where PI value is 23.82 ~ 24. Since the PI have linear value, where the higher stabilizer content, the lower of PI value, and the lower of PI, the less expansive of soil, therefore the higher of BRA content, the less expansive of the soil-BRA will be.
- BRA increase CBR of expansive clay soil significantly and according to AASHTO soil classification categorized as good material for subgrade pavement.
- The cohesion value of soil-BRA high with the higher of BRA content. But this condition cannot be concluded that soil become more cohesive if the BRA is added. As has been explained above and referring to the conclusion point 1 above as well as the angle of internal friction value, the cohesion value of soil-BRA is false value. When bitumen in the BRA become dry, the particles of BRA become clotted and hard, the soil-BRA become a granular material and not cohesive.
- Angle of internal friction Ø. Ø value show that the soil is not cohesive, the higher Ø value, and the less cohesive of soil. The results of the research show that the higher BRA, the higher of the Ø value.

8. SUGGESTIONS AND RECOMMENDATIONS

From the above test results and conclusions, the author considered to recommends and suggests using BRA to stabilize expansive subgrade soil of the entire road pavement, flexible or rigid, because:

- Many road pavement structures deteriorate early because there was no strengthening of subgrade soil.
- BRA has naturally ready and low cost because not require industrial process compare to cement, lime or petroleum asphalt.
- More than 600 hundred million deposit of BRA still have not explored yet.
- Using other methods which have been used to strengthen subgrade soil, like geotextile was proved not succeeding.

PROJECT TITLE	LOG REFERENCE
Venice Blvd Great Street Pilot Demonstration Project	ENV-2016-4488-CE

PROJECT LOCATION
Venice Blvd between Inglewood Blvd and Beethoven St

DESCRIPTION OF NATURE, PURPOSE, AND BENIFICARIES OF PROJECT: The subject project will provide traffic safety, bicycle and pedestrian improvements within the project limits within the public right of way. The proposed permanent treatments include pedestrian signals and curb ramps at four intersections, and the proposed temporary treatments include new protected bicycle lanes, street furniture and landscaping. The proposed bicycle and pedestrian amenity benefit the safety and travel access, and will not result in impacts to biological, or cultural resources.

JUSTIFICATION FOR PROJECT EXEMPTION:

The project has two components: permanent improvements and a temproary pilot project. The permanent installation consists of pedestrian signals and curb ramps. This qualifies as an exemption because; it as a minor alteration of existing street, and pedestrian trail [Class 1 (3)]; it installs a traffic signal [Class 1 (15)]; and it modernizes an existing street by constructing an improvement [Class 1 (20)].

The pilot project consists of temporary installation of protected bicycle lanes, street furniture and landscaping. This qualifies an exemption because; it involves basic data collection, field testing and research [Class 6 (2)]; it is a minor public alteration to condition of land to install landscaping [Class 4 (3)]; and it creates bicycle lanes on an existing right-of-way [Class 4 (13)]. There are no unusual circumstances that might prevent application. See attached narrative (Attachment A) for further discussion.

Attachment A
Venice Blvd Streetscape Improvement Project

Why is this project exempt from CEQA?

The permanent component of the project, taken in the entirety of the action of pedestrian improvements to be installed within existing public right of way is categorically exempt under the California Environmental Quality Act (CEQA). The elements include pedestrian signals, curb ramps. These elements are all exempt under Class 1(3), Class 1(15), and Class 1 (20) of the City CEQA Guidelines and Class 1, Section 15301 of the State CEQA Guidelines.

The pilot project, taken in the entirety of the action of temporary installation of streetscape improvements to be installed within existing public right of way is categorically exempt under the California Environmental Quality Act (CEQA). The elements include protected bicycle lanes, street furniture and landscaping improvements. These elements are all exempt under Class 4(3), Class 4(13) and Class 6(2) of the City CEQA Guidelines and Class 1, Section 15301 and Class 4, Section 15304 (b) and (h) of the State CEQA Guidelines. See attachement B, Complete Streets Pilot Program form as to how the temporary pilot satisfies the Class 6(2) exemption criteria.

Section 15301 of the CEQA Guidelines exempts all Class 1 activities that include operation and minor alteration public facilities except where such activities involve the negligible or no expansion of use beyond that existing uses at the time of the lead agency's determination. As the project is limited to bicycle and pedestrian enhancements in existing public right of way, it constitutes no expansion of use, and therefore Class 1 exemption applies.

The City CEQA Guidelines provides that Class 1 activities that involve operation, and minor alteration of an existing street are exempt from CEQA except where the activities will involve removal of a scenic resource including but not limited to a stand of trees, a rock outcropping or a historic building.
In addition the City CEQA Guidelines states that activities that involve basic date collection, research, experimental management and resource evaluation activities which do not result in a serious major disturbance to an environmental resource are exempt under CEQA. These may be for strictly information gathering purposes, or as part of a study leading to an action which a public agency has not yet approved, adopted, or funded. Furthermore, Section of the 15300.2. of the CEQA Guidelines provides a list of exceptional circumstances that if are present for activities covered under the Class 4 categorical exemptions would preclude the application of the exemption. The exceptions include the reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances, the presence of hazardous waste, impact to resource located on an officially designated scenic highway, impact to a historic resource, or cumulative impacts caused be success projects in the same place over time. The following narrative substantiates through facts why these exceptions do not apply.

Aesthetic , Historical Resources and Hazardous Waste Sites

The street will be altered with limited tree removal of four Tipuana Tipu trees within the median at Ocean View Ave, Boise Ave. and Meier St. to accommodate median access ramps at the crosswalks. Taken together the trees to be removed are not located in a manner to be considered a stand of trees that would constitute an aesthetic resource. In addition, the Urban Forestry Division (UFD) will be replacing the four Tipuana Tipu trees on a 2:1 replacement ratio with 8 trees that are to be planted in the median along Venice Blvd. along the project corridor. The removal of trees will not constitute a removal of a scenic resource, and therefore does not render the activity ineligible for a Class 1 exemption.

Venice Boulevard is also not a designated scenic highway. The project activity is restricted to the public right of way on an existing state highway, and work would not be conducted within any site that is included on lists compiled pursuant to Section 65962.5 of the Government Code.

Biological

The removal of the four Tipuana Tipu trees were assessed to determine if the tree removal would result in impacts to biological resources, or nesting birds due to unusual circumstances. The four street trees are located in the middle of a high volume urban arterial. The exposure to high traffic noise environment is not likely to support suitable habitat for nesting birds in any of the four trees. Nonetheless, UFD routinely inspects trees to verify that there are no nesting birds prior to tree removal. If a protected native bird nest is found, the City shall delay tree removal and disturbance activities of the observed protected bird species nests during the active breeding season which generally runs from March 1- August 31.

In addition, UFD will be replacing the four Tipuana Tipu trees on a 2:1 replacement ratio with 8 trees that are to be planted in the parkway along Venice Blvd. along the project corridor, which may be more suitable habitat for nesting birds in the future. This activity would also not contribute to cumulative impacts of habitat due to tree removal.

Noise

The City will restrict demolition, construction, and striping on Venice Blvd in locations near sensitive uses (such as residences) to daytime hours in accordance with the city's noise regulations. The installation process would not be expected to exceed ambient noise by more than 5 dBA for more than 10 continual days, thus there will be no noise impact on the neighborhood immediately surrounding the project area.

Traffic

The project has two components: a permanent installation and a pilot project to be installed along a 0.9 mile stretch of Venice Boulevard in Mar Vista. It is currently three lanes in each direction, a parking lane and a Class II bike lane facility. The Los Angeles Department of Transportation will install long term pedestrian improvements, consisting of signals and ramps at Mountain View Ave, Ocean View Ave, Boise Ave and Meier St. These treatments will not contribute to traffic delay. The Venice Pilot Project consists of a road diet, with travel lanes being repurposed in each direction, using striping/paint and other temporary materials to install protected and buffered bike lanes. Other elements of the pilot project include street furniture and landscaping. The materials can easily be removed and the street returned to its original state when the pilot has completed.

The temporary pilot may result in travel delays but they are no unusual circumstances that would exacerbate travel impacts beyond the temporary restriping. The pilot is necessary to test the feedback of travel behavior and operational characteristics as a result of striping changes and physical barriers that make walking and biking more attractive. See attached "Complete Streets Pilot Program (Attachment B) for additional discussion.

Water Supply

The selection of landscaping would be climate appropriate and would require only minimal irrigation to establish, therefore there are no unusual circumstances with this project that would impact water supply.

ATTACHMENT B

Application

Complete Streets Pilot Program

The purpose of this application is to request the use of a Class 6 Categorical Exemption (CE) for the pilot project described below. In order to satisfactorily grant the CE, the applicant must ensure that the answers to the questions below can be supported by substantial evidence. Please attach any additional documents as needed as Exhibits to this application.

Should the Department of City Planning (Department), after reviewing this application, find that the project satisfies the requirements of the Class 6 Categorical Exemption, the Department will notify the applicant and prepare and submit the Class 6 CE to the Los Angeles County recorder for filing.

Date of Application: October 28, 2016

Project Contact: **Max Eftekhari**

Project Title: Venice Blvd Great Street Pilot Demonstration Project

Project Description:

The Venice Pilot Project seeks to create more public gathering spaces, make it safer and easier for people to cross the street, increase protection for pedestrians and cyclists, unify the north and south sides of the streets and give Venice Blvd the feeling of a neighborhood street.

1) A road diet, with travel lanes being repurposed in each direction, will be temporarily installed on Venice Blvd using striping/paint and other temporary materials to install protected and buffered bike lanes. Other elements of the pilot project include street furniture and landscaping.
2) Independent of the Venice Pilot Project, the Los Angeles Department of Transportation (LADOT) will install long term pedestrian improvements, consisting of signals and ramps at Mountain View Ave, Ocean View Ave, Boise Ave and Meier St.

The Pilot was developed in coordination between Mayor Garcetti's Great Streets Initiative, Council District 11 and LADOT with the support of community organizations and private consultants. The project developed after 442 community surveys, 4 public workshops, 3 outreach displays, 2 walk/bike rides and regular input from the Mar Vista Community Council.

1. Describe the purpose of the data collection, research, experimental management or resource evaluation (hereinafter, collectively, "research") that the project proposes to undertake:

   The City of Los Angeles cannot accurately predict what the results of the Venice Pilot Project using traditional methods of traffic modeling. Existing traffic modeling is based on the delay-based measurement of Level of Service which cannot effectively predict changes in travel behavior. Transportation research shows that as more bicycle

facilities are installed, more people will bike. One study projects 3.6 percent bicycle commute mode share when more bicycle facilities are completed.[1]

Additionally, the Federal Highway Administration acknowledges that active transportation is increasing, and communities' desire more livable spaces, pedestrian and bicycle facilities, and transit options. Thus, citing a multitude of research on the topic they have deemed road diets to be a "Proven Safety Countermeasure" for all users of the streets.[2]

A pilot project proposes to evaluate the effects of the listed additions on the neighborhood and surrounding area's mobility, economy, public health, safety, civic engagement and neighborhood character by analyzing the level of pedestrian and bicycle activity, rates of speeding and transit ridership.

2. Describe generally the type (and format) of evidence that is expected to be collected as a result of the research:

   The research will consist on both qualitative and quantitative measures of the above listed criteria. Measurements will be taken before and after the installation of the pilot project in order to determine the behavioral shifts that may contribute to more walking and biking, and a safer street as a result of the design. This will include but not limited to travel speed survey, transit ridership, traffic counts, pedestrian and bicycle counts, business and pedestrian surveys.

3. Has the City approved, funded, adopted or otherwise committed to the future permanent implementation of the project?

   No

4. Describe the status of the project:

   The Make It Mar Vista neighborhood group was awarded a Great Streets Challenge Grant in 2015. They staged a community engagement event where they demonstrated possible street configurations within the existing right of way.

   The project is currently in the design stage of pilot operations. In addition, the LADOT is pursuing relinquishment of Venice Blvd. from the Caltrans State Highway System, and long term improvements, pedestrian signals and crosswalks, are in final design stage and can be installed independent of temporary design features.

5. Describe when the project would be installed, how long the project would remain in place and how the time period is necessary to conduct the proposed research:

   The project will be installed February 2017 at the earliest for a length of 24 months from the time of completion of temporary striping. In order to conduct valuable research and see any marked result, traffic patterns and peoples' behaviors will need time to adjust. Based off previous pilot projects, this adjustment period last up to a year. The pilot project will need to extend beyond this time in order to measure the impacts and collect data this is available within the reporting periods.

   Not only does measuring at least a year's worth of traffic patterns and travel behavior provide a greater picture of the project's performance, it also accounts for seasonal variation. Travel behavior and traffic patterns fluctuate in

[2] Road Diet Informational Guide - Safety | Federal Highway Administration. (n.d.). Retrieved June 29, 2016, from http://safety.fhwa.dot.gov/road_diets/info_guide/ch1.cfm#s11

reaction to the weather and holidays. Thus, the time period will compensate for any extreme lows and highs in the data.

Independently of the Venice Pilot Project, the Los Angeles Department of Transportation will install long term pedestrian improvements, consisting of signals and ramps at Mountain View Ave, Ocean View Ave, Boise Ave and Meier St.

Note: Due to the varying lengths of time that are required to obtain different types of information there is no predetermined acceptable length of time but the proposed period of time should be no longer than is reasonably necessary to conduct the proposed research, based on the professional judgment of a licensed traffic engineer.

6. Is the project reversible? Yes No
Describe the extent to which the project will be reversible and the degree to which the project will or will not involve capital improvements that cannot be reversed:

The temporary features will not involve capital improvements above or underground utility lines, water or sewage systems. Additionally, the temporary features will not involve changes to the sidewalk, curb cuts or medians along the corridor. The pilot will use temporary materials and paint them to redesign the street. The materials can easily be removed and the street returned to its original state.

Independently of the Venice Pilot Project, the Bureau of Engineering will install long term pedestrian improvements, consisting of signals and ramps at Mountain View Ave, Ocean View Ave, Boise Ave and Meier St.

7. Identify the names and titles of the traffic engineers and/or professional planners that will be involved in the research. Indicate whether they are city staff or associated with a consultant firm:

City staff will include traffic engineers and professional planners throughout the process. Planners will include Valerie Watson and David Somers. Transportation planners and engineers assigned to this project include Cullen McCormick, Max Eftekhari, and Roberto Sanchez. Other city staff from the Mayor's office and the council offices will be assisting the project's installation such as Naomi Iwasaki, Carter Rubin, and Lily O'Brien.

Carter Rubin, Project Manager, Mayor's Office, Great Streets Initiative
Cullen McCormick, Fehr and Peers, private consultant firm
Max Eftekhari, Transportation Engineer Associate III, Department of Transportation
Valerie Watson, Transportation Planning Associate II, Department of Transportation
Roberto Sanchez, Transportation Engineer Associate III, Department of Transportation

8. Will the project result in a serious or major disturbance to an environmental resource?

Yes No Explain your answer below:

The pilot projects takes place on 0.9 miles stretch of Venice Boulevard in Mar Vista. The temporary pilot may result in travel delays but they are no unusual circumstances that would exacerbate travel impacts beyond the temporary restriping.

The pilot is necessary to test the feedback of travel behavior and operational characteristics as a result of striping changes and physical barriers that make walking and biking more attractive.

9. Indicate in the checkboxes below whether the project is applicable to any of the exceptions to categorical exemptions under Section 15300.2 of the CEQA Guidelines:

Yes	No	
	X	Location-Is the project located in a particularly sensitive environment where location exception applies?
	X	Cumulative Impact- Will there or have there been successive projects of the same type in the same place, and overtime is becoming environmentally significant?
	X	Significant Effect- Is there a reasonable possibility that the project will have a significant effect on the environment due to unusual circumstances?
	X	Scenic Highway- Could the project cause damage to the environment within a highway officially designated as a state scenic highway?
	X	Hazardous Waste Site- Is the project located on a site which is included on any list compiled pursuant to Section 65962.5 of the government code?
	X	Historical Resources- Could the project cause a substantial adverse change in the significance of a historical resource?

Describe how none of the exceptions in the table above apply to the project:

The proposed changes will not be permanent in nature, and the related activities of roadway restriping, and installing protective elements, landscaping and street furniture will be exclusive to the public right of way. Installing the project would require activities that similar to basic operation and maintenance of city streets. The materials and process involved in these activities would not result in any individual or cumulative impact to the environment.

Venice Boulevard is also not a designated scenic highway. The project activity of installing temporary striping and land cape materials will be restricted to the public right of way of an existing state highway, and so would not result in a substantial adverse change in the significant of a historic resource. In addition, work would not be conducted within any site that is included on lists compiled pursuant to Section 65962.5 of the Government Code.

List of Exhibits (if applicable):

Venice Boulevard GREAT STREETS Mar Vista

WHAT ARE WE DOING? A Safer Mar Vista for All!

PROJECT OVERVIEW

Completion: May 2017

Cost $1.8 million to improve street safety, access and mobility for all road users, support local businesses, and create a more welcoming neighborhood street.

Snapshot of new street design at Venice Boulevard between Ocean View and Grand View in Mar Vista

KEY CHANGES

Four New Pedestrian Crosswalks

OBJECTIVE: Improve safety for everyone who travels on Venice Blvd., shorten distances to safe crossing points and provide greater parking access.

DESIGN: New signals and crosswalk striping increases driver's ability to see pedestrians crossing.

INSTALLATION: The new signals and crosswalks will be installed on Venice Blvd at Mountain View Ave, Ocean View Ave, Boise St, and Meier St.

Protected and Buffered Bicycle Lanes

OBJECTIVE: Provide robust protection for people traveling by bicycle on Venice Blvd, reduce sidewalk bicycle riding, and improve safety for all road users.

DESIGN: Protected bicycle lanes have a physical barrier between bicyclists and moving vehicles of a parking lane and bollards; buffered bicycle lanes have a painted buffer.

INSTALLATION: Protected and buffered bicycle lanes will be installed with the new road design.

Pedestrian Head Starts and High-Visibility Crosswalks

OBJECTIVE: To increase pedestrian visibility and safety at all existing intersections.

DESIGN: Pedestrians will receive a walk signal a few seconds before drivers get a green light; high-visibility continental crosswalks will be installed at all existing intersections.

INSTALLATION: Signals will be re-timed and crosswalks will be restriped along with all of the other improvements.

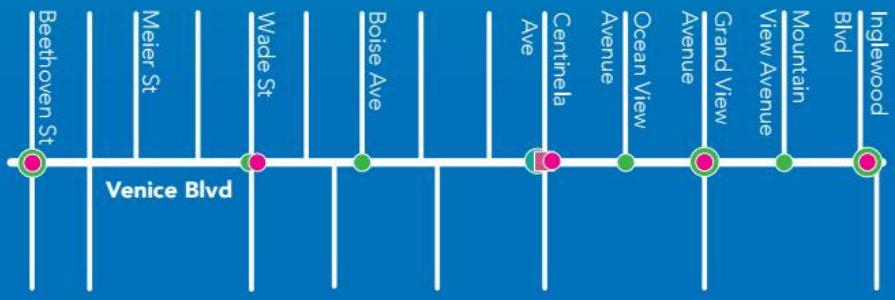
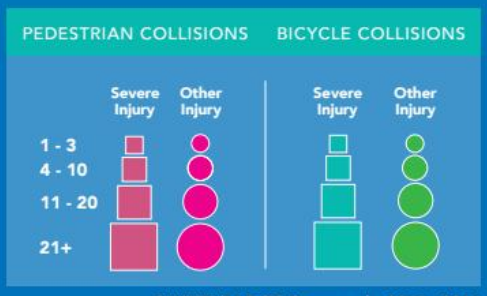
Venice Boulevard

GREAT STREETS
Mar Vista



WHY ARE WE DOING IT?



CREATING SAFER STREETS

- Venice Blvd has a higher rate of injuries compared to similar streets in LA.
- Since 2011 there have been **48 pedestrians and bicyclists injured** from crashes along Venice Blvd in Mar Vista.
- A city speed survey found that **15% to 18% of drivers were driving over the 40 MPH** speed limit on Venice Blvd, which poses a threat to the health and safety of people using the street, especially children and older adults who are walking.
- Venice Blvd is on the Citywide High-Injury Network (HIN) of streets that account for two-thirds of all deaths and injuries to people walking and biking.
- The planned street design has been used to improve safety for all road users across the U.S. including Los Angeles to improve safety for all road users.

VISION ZERO LOS ANGELES | 2015-2025

CITY OF LOS ANGELES
INTER-DEPARTMENTAL MEMORANDUM

Date: August 22, 2016

To: The Honorable Mike Bonin, Chair
Transportation Committee
Los Angeles City Council

From: Gary Lee Moore, PE, ENV SP
City Engineer
Bureau of Engineering

Seleta J. Reynolds, General Manager
Department of Transportation

Subject: **RELINQUISHMENT OF STATE ROUTE 187 (VENICE BOULEVARD) BETWEEN LINCOLN BOULEVARD AND CADILLAC AVENUE**

SUMMARY

At its meeting of February 24, 2016, the Transportation Committee considered a Motion (Bonin-O'Farrell, CF 16-0147, Attachment A), which directed the Department of Transportation (LADOT) and the Bureau of Engineering (BOE) to prepare a report relative to the relinquishment to the City of Los Angeles State Route 187 (SR-187) otherwise known as Venice Boulevard between Lincoln Boulevard and Cadillac Avenue, and State Route 1 (SR-1) otherwise known as Lincoln Boulevard between the southern city limit of the City of Santa Monica and Route 105. The City and the California Department of Transportation (Caltrans) agreed to defer the relinquishment of Lincoln Boulevard to a later date as Caltrans has not issued the final Relinquishment Assessment Report (RAR) for SR-1.

The Motion was drafted in response to a resolution (Bonin-Krekorian, CF 15-0002-S48, Attachment B) supporting Assembly Bill (AB) 810, which authorizes the California Transportation Commission (CTC) to streamline the relinquishment process to facilitate the implementation of the City's Great Streets initiative on Venice Boulevard, among other objectives. In response to the Transportation Committee instructions, BOE and LADOT entered into discussions with Caltrans.

The relinquishment process transfers control of portions of the state highway system owned and operated by the California Department of Transportation (Caltrans) to local jurisdictions when it is in the mutual interests of both parties. Caltrans policy encourages relinquishments of portions of state highways that can be characterized as conventional city streets and that do not serve regional or statewide transportation needs, as they represent opportunities to reduce ongoing maintenance costs and tort liability, among other benefits to the State. This incentive drives the State "to negotiate with local agencies a level of work or contribution to facilitate the relinquishment".

Because the proposed relinquishment would be accomplished by legislative enactment[1], Caltrans is not obligated to bring SR-187 to a "state of good repair"[2], which had been the City's

---

[1] California Streets and Highways Code, Section 73, identifies four types of relinquishments: Legislative Enactment, Superseded by Relocation, Collateral Facilities, and Nonmotorized Transportation Facilities. The latter three types of relinquishments require a formal initiation process that culminates with a Project Initiation Document (PID), in which the costs and funding for

standard in previous negotiations. Caltrans has characterized its proposed financial contribution of $14M for street improvements and sidewalks and ramps and an additional $0.5M for a previously programmed project for a total of $14.5M as the "cost to relinquish"[3]. The City's estimate for rehabilitation of Venice Boulevard is $21.5M to bring the entire 5.4-mile stretch of roadway into compliance with current City standards.

RECOMMENDATIONS

That the City Council, subject to approval of the Mayor:

1. FIND that the relinquishment of Venice Boulevard (State Route 187) from Lincoln Boulevard to Cadillac Avenue to Caltrans is in the best interest of the City and approve the relinquishment and District Agreement No 07-5097.
2. AUTHORIZE the Mayor to execute District Agreement No 07-5097 with Caltrans, subject to review by the City Attorney as to form and legality, for the relinquishment of Venice Boulevard between Lincoln Boulevard and Cadillac Avenue.
3. AUTHORIZE the Director of the Office of Accounting, Board of Public Works, to receive $14,500,000 from Caltrans for the relinquishment of Venice Boulevard between Lincoln Boulevard and Cadillac Avenue and to deposit the funds as follows:
    a. $13,000,000 into the Subventions and Grants Fund No. 305, Department No. 50, and appropriated into a new account within the Fund entitled "Venice Boulevard Relinquishment"; and,
    b. $1,500,000 into the Transportation Trust Fund No. 655, Department No. 94, and appropriated into a new account within the Fund entitled "Venice Boulevard Great Streets Improvements".
4. AUTHORIZE the Department of Transportation to issue non-participating change orders as part of ongoing transportation construction contracts in order to expedite the construction and enhance safety at five intersections along the Great Street section of Venice Boulevard.
5. AUTHORIZE the Director of the Office of Accounting, Board of Public Works, to make any technical accounting corrections or clarifications to the above instructions in order to effectuate the intent of the Mayor and City Council.

DISCUSSION

Background

In 2007, the City considered a similar proposal at the request of the request of Council District 11 for "Greening the Boulevard", a Master Plan concept prepared by the Mar Vista Community

---

the relinquishment are discussed. Deletion of Routes by Legislative Enactment, in contrast, is not as clearly defined and is subject to differences in interpretation. A PID is required only if there is a cost to relinquish, as in the present case.

[2] California Streets and Highways Code, Section 73, defines a street to be "in a 'state of good repair' when it is a safe, drivable, well-maintained road. Capacity increasing improvements or betterments are not included when bringing a highway to a state of good repair" (Project Development Procedures Manual [PDPM], 12/12/14, Ch. 25, "Relinquishments"). The Bureau of Street Services defines "state of good repair" as streets having a Pavement Condition Index or PCI rating of 71 or higher on a 100-point scale.

[3] Ibid. "Cost to relinquish" is defined as "a level of work or financial contribution to facilitate the relinquishment." Caltrans proposes transferring $10.5M previously programmed for improvements to SR-187 in FY2018 in the State Highway Operation and Protection Program or SHOPP (Attachment E) and an additional $4M to the City as its financial contribution to facilitate the relinquishment.

Council. Over four months, Public Works and LADOT prepared a Class C-level estimate[4] totaling $46.9M for Venice Boulevard (Attachment D), which Caltrans rejected. Renewed interest in the relinquishment was spurred by the designation of Venice Boulevard between Beethoven Street and Inglewood Boulevard as one of 15 Great Streets, part of the Mayor's Great Streets initiative. The Great Streets initiative was one of the justifications cited for AB 810, adopted on October 7, 2015. The passage of AB 810 demonstrates support for Great Streets at the State level. Locally, Council District 11, the Mar Vista Community Council and other community stakeholders support the Venice Boulevard Great Street concept.

Venice Boulevard from Abbot Kinney Boulevard to 12th Street is also on the City's High Injury Network (HIN), so designated because of a disproportionate number of fatalities and serious injuries involving pedestrians. LADOT has proposed the installation of safety-enhancement and traffic calming measures for HIN streets as part of its Vision Zero initiative to achieve zero traffic fatalities by 2025. The pilot program proposed for Venice consists of a road diet between Beethoven and Inglewood, reducing six traffic lanes to four. The existing Class II bike lane would become a protected bike lane with bollards, and four mid-block crossings with traffic signals would be installed near unsignalized intersections. Temporary modifications for even a pilot program would require encroachment permits, entailing a lengthy review process that could jeopardize funding for time-sensitive projects. Another project supported by Council District 11, the installation of gateway signs at Bledsoe Avenue and Redwood Avenue, would face a budget shortfall if encroachment permits were required.

Accepting the relinquishment would enable the City to implement improvements and modifications that align with the City's Great Streets and Vision Zero initiatives without the need for encroachment permits[5]. These benefits should be factored into the costs of ADA-compliance and the rehabilitation, maintenance and protection of the 5.4-mile segment between Lincoln and Cadillac, as quantified in the City's revised Class "O"-level estimate[6] (Table 1).

2016 Estimate Methodology

The updated estimate represents a reasonable, but not exhaustive, effort to capture those costs and should not be construed as the cost of reconstructing SR-187 to current City standards. The following sources were used to assist in the development of the City's Class O estimate:

1. 2008 Class C level estimate (Attachment D);
2. Site visits;
3. Mapping applications such as Navigate LA and Google Maps Street View;
4. Caltrans data on projects completed after 2008[7];

---

[4] Definitions for cost estimates used in this report come from BOE's Project Delivery Manual (PDM). Developed during the pre-design phase, the Class "C" level estimate is based on a rough idea of the project's size and location and also based upon similar projects in the same area. The Class C estimate includes BOE labor percentages from BOE budget templates. The Class C estimate is used to develop BOE's annual Work Programs and three-year Master Schedules.

[5] Caltrans had already committed $0.5M for its share of a project to install left-turn phasing at the intersection of Venice and Grandview. The Relinquish Agreement would include this financial commitment.

[6] The Class "O" level estimate as an "opinion of cost" developed based on a preliminary understanding of the project.

[7] Caltrans furnished a list of projects awarded or completed between 2008 and 2015 on SR-187 but not the project budgets. Site visits confirmed that Venice from Lincoln to just east of Sepulveda Boulevard saw street improvements since 2008. The most intensive project was initiated at the Director's order to address pavement failures between Lincoln to Sepulveda in 2011, with subsequent resurfacing work in 2015. A sidewalk repair project was completed in 2012, but the work does not conform to current ADA standards. Without as-built plans, the City was unable to determine the expected performance life of the improvements. The 2013 Caltrans Pavement Condition Survey Inventory and the 2013 SHOPP application indicate that both left and right lanes from Lincoln to Sawtelle Boulevard are largely in "good condition" with "no distress observed". However, pavement quality diminishes significantly east of Sepulveda.

5. 2013 application for State Highway Operation and Protection Program (SHOPP) funding in 2014 programming year [Attachment E];
6. Input from the BOE, Bureau of Street Services (BSL), Bureau of Street Lighting (BSL) and LADOT.

Table 1: City Estimate* of Cost to Relinquish SR-187 (2016)

Item	Description	Quantity	Unit	Unit Price	Item Total
1	Mobilization (10% of Subtotal)	1	LS		$ 1,209,700.00
2	Field Office	1	LS		$ 10,000.00
3	Contamination clean up	1	LS		$100,000.00
	Annual median landscaping maintenance	*1*	*LS*		*$139,462.00*
Remove:					
4	Curb and Gutter (a=2')	2,890	LF	$ 22.00	$ 63,580.00
5	Conc. Sidewalk	137,200	SF	$ 5.50	$ 754,600.00
6	Driveway	12,150	SF	$ 10.00	$ 121,500.00
7	6" AC Pavement	1,200	SF	$ 44.00	$ 52,800.00
8	8" Conc. Pavement	27,000	SF	$ 12.00	$ 324,000.00
9	Unclassified Excavation	5,000	CY	$ 70.00	$ 350,000.00
Construct:					
10	Conc. Int. Curb and Gutter (a=2', b=8')	2,890	LF	$ 38.00	$ 109,820.00
11	Conc. Curb	5,000	LF	$ 30.00	$ 150,000.00
12	Driveway	24,860	SF	$ 27.50	$ 683,650.00
13	Conc. Sidewalk (t=4")	137,610	SF	$ 11.00	$ 1,513,710.00
14	4" CMB	159,340	SF	$ 2.00	$ 318,680.00
15	AC Pavement (0.2' Hot Mix)	45,000	TON	$ 80.00	$ 3,600,000.00
16	AC Pavement (Cold Plane 0.2')	300,000	SY	$ 1.00	$ 300,000.00
16	AC Pavement (Crack Treatment)	35	Ln-Mi		$ 125,000.00
17	8" Conc. Pavement (Bus Pad)	25	EA	$ 12,960.00	$ 324,000.00
18	8" CMB	1,200	SF	$ 3.50	$ 4,200.00
19	Upgrade Drainage inlets/Grates	1	LS	$ 5,000.00	$ 5,000.00
20	Adjust Maintenance Holes and Valves to Grade	1	LS	$ 70,000.00	$ 70,000.00
21	Traffic Control /Management / Public Information	1	LS	$ 660,000.00	$ 660,000.00
22	Traffic Striping	1	LS		$ 300,000.00
23	Street Lighting	1	LS		$ 510,000.00
24	Portable Changeable Message Sign	1	LS		$ 28,000.00
25	Traffic Signal / Detectors	1	LS		$ 101,750.00
26	Relocate Electrical pull boxes, poles	1	LS		$ 500,000.00
27	Curb Ramps	150	EA	$ 5,000.00	$ 750,000.00
28	Tree Removals	58	EA	$ 1,000.00	$ 58,000.00
29	Furnish & Plant 24" Box Size Tree	116	EA	$ 1,200.00	$ 139,200.00
30	Storm water	1	LS	$ 150,000.00	$ 150,000.00
31	Road signs	1	LS	$ 10,000.00	$ 10,000.00
32	Utilities Right of Way	1	LS	$ 10,000.00	$ 10,000.00
	Subtotal:				**$ 13,407,190.00**
	Contingency (20%):				$ 2,681,438.00
	Design, Bid & Award, Construction Management & Inspection (40%):				$ 5,362,876.00
	Total:				$ 21,451,504.00
	Total Rounded Project Cost				**$ 21,500,000.00**

*Estimate does not include costs for utility relocations.

Key:
Grey - items on City's initial estimate but not counted by Caltrans in its SHOPP funding application
Yellow - items identified by both City and Caltrans (higher quantity prevails)
Blue - items on Caltrans' SHOPP funding application but not counted on City's initial estimate

BOE updated the quantities and unit costs from the 2008 estimate, cross-referencing data published in the SHOPP application (see footnote). The 2008 estimate assumed extensive structural work involving the removal and reconstruction of existing concrete, necessitating more excavation and base material and asphalt concrete based on evidence of base failure – which Caltrans partially addressed in 2011. The 2016 estimate would allow for the resurfacing of up to approximately five (5) miles and the reconstruction of certain sections within the limits of the relinquishment where resurfacing would be insufficient.

The 2008 estimate also included the cost of upgrading traffic signals, street lighting and landscaping. The street lighting request included as Line Item No. 23 for $510,000 is for funding to complete the conversion of high- to low-voltage circuitry for LED lighting. This serves the City's long term goal of reducing energy consumption and enhancing public safety.

The City's estimate includes soft costs and contingency, which the funding conveyed by the relinquishment agreement would not cover. Furthermore, the relinquishment agreement would transfer the cost of maintenance of landscaping, lighting, tree trimming, etc. from Caltrans to the City. Currently, the City receives $139,462 for annual maintenance for Venice under Delegated Maintenance Agreement 19-5939, dated January 1, 2005, and updated on January 23, 2013 (Attachment F).

Assumptions and Qualifications

The estimate incorporates sidewalks, curbs, driveways and other items not listed in the SHOPP application (grey), as well as items listed in the SHOPP application not included in initial estimates (blue). Where the City and Caltrans diverge in quantities or costs for overlapping items, BOE inserted the greater quantity (yellow).

In contrast to previous relinquishments that relied on a Class C estimate, the patchwork nature of improvements and the composite approach to developing the Class O estimate complicate predictions about the useful life of recently completed improvements to SR-187. Road failures and maintenance costs are difficult to project without boring and in-depth testing, and this could equate to substantial costs for the City in the future.

ADA Compliance

The Relinquishment Assessment Report for SR-187 (Attachment G) clearly states that "[s]idewalks and curb ramps and driveways are not fully in compliance with Americans with Disabilities Act (ADA) of 1990 and Section 4450 of the California Government Code. ADA standards are required on all resurfacing projects" (p. 18).

Examples of non-compliant sidewalks

The City has estimated that sidewalk improvements would cost at a minimum $4.4M (Line Items Nos. 4 – 14).

Other Risks

The RAR identifies potential liability issues on pp. 17-18 in addition to ADA compliance. Namely, SR-187 is located within a liquefaction zone and Seismic Zone 4.

In addition to the risks outlined in the RAR, the State's Office Environmental Engineering (OEE) memo dated May 13, 2016 (Attachment H) summarizes the findings of a literature survey evaluating the potential for releasing hazardous substances or petroleum products on Rosemead Boulevard and Venice Boulevard. For Venice, the report identified twenty properties with groundwater contamination, three of which show groundwater information on the State's Geotracker application as shown in Table 2. The City's Geotechnical Engineering Division (GED) noted that three of the twenty sites are located at the intersection of Venice and Sepulveda, with the Mobil station having tanks adjacent to SR-187. Remediating underground [fuel] storage tanks (USTs), hydrocarbon plumes and possible lead-contaminated soil would cost an estimated $100,000 (Line Item No. 3) or more, pending more extensive excavation or regulatory requirements.

Table 2: Potential Sites for Groundwater Contamination

Site	Distance from SR-187	Status	Determination
Chevron #9-0545	10 ft	Open but eligible for closure	Low threat criteria met by the regional board.
TWS Products	500 ft	Open-remediation site; quarterly groundwater monitoring has been requested	Soil and groundwater impacted by VOCs and hydrocarbons
Thrifty #247	2500 ft	Open-remediation site under semi-annual monitoring	Gradient plume may be migrating on a southwesterly direction toward Venice

Coordination with Culver City
BOE and LADOT recommend early outreach to Culver City to facilitate the relinquishment. As shown in Exhibit A - Relinquishment Map 3 (Attachment I) of the draft Relinquishment Agreement (Attachment C), the southerly portion of Venice Boulevard between Bledsoe Avenue to Overland Avenue is within Culver City's jurisdiction. Although Caltrans could relinquish the City's portion of SR-187 independently of Culver City, the City's proposed modifications would likely have traffic impacts on Culver City, suggesting the need for coordinated mitigation measures.

FISCAL IMPACT

The City will receive $14,500,000 from Caltrans for the relinquishment of Venice Boulevard between Lincoln Boulevard and Cadillac Avenue. A minimum estimated amount of $7,000,000 in improvements along Venice Boulevard would remain to be addressed. It is anticipated that the additional funds could be secured by pursuing outside grant funding opportunities.

VENICE
OPEN HOUSE
BLVD

Welcome to the Venice Blvd Great Street Open House!

Here's what will be happening tonight...

What's New on the Great Street

This station will bring you up to speed on the recently added turn lanes, colored paint, and other changes to make Venice Blvd safer and easier to use

The Data Lab

Here, we'll have the latest findings from the ongoing Venice Blvd project evaluation related to safety and traveling the corridor. LADOT staff will be on hand to answer your questions and help explain the data

Comment Station

LADOT is committed to a transparent and accessible process, and we look forward to sharing our findings and hearing your experiences. That's why the Comment Station will offer multiple ways for you to provide your feedback and connect with City staff

Recent Project Milestones

JULY 2017
1-Month Open House

LADOT issues a 1-Month Data Summary regarding speeding drivers. Data demonstrates a decrease in the number of drivers speeding above the 40mph speed limit. In addition, the latest data shows that the majority of trips through Venice Blvd are within 30 to 90 seconds of pre-project times

LADOT hosts a community Open House to discuss the key facets of the Venice Blvd project, one month after installation. Over 200 members of the community attend the event and many individuals shared their feedback on the project

SEPTEMBER 2017
3-Month Project Update

LADOT issues a 3-Month Data Summary. Preliminary data provided by LAPD shows a small decrease in the number of collisions and injury collisions on Venice Blvd. Additionally, the data update shows that the majority of trips on the corridor are now within zero to 60 seconds of pre-project times

OCTOBER 2017
Right-Turn Modifications

LADOT implements right-turn modifications at Grand View Blvd, Boise Ave, and Mountain View Ave along the corridor to provide better visibility

DECEMBER 2017
Left-Turn/LAFD Modifications

LADOT installs double left-turn lanes on Venice Blvd at Centinela Ave to allow more vehicles to turn during each green light

LADOT works with LAFD to provide emergency transponders that allow the fire department to temporarily change light signals that allow them to travel faster. LADOT studied emergency travel times and found that LAFD vehicles had an average speed of 39MPH along the Venice Blvd Great Street. Non-emergency vehicles had an average speed of 28MPH, meaning that emergency vehicles are traveling through the corridor at faster rates during emergencies

JANUARY 2018
Green Paint

LADOT installs green paint on the bike lanes to highlight areas where cars and bicycles mix for better visibility.

LADOT · VISION ZERO LOS ANGELES | 2015-2025 · GREAT STREETS LA · MIKE BONIN Getting Things Done for Our Neighborhoods Councilmember, 11th District

VENICE
FREQUENTLY ASKED QUESTIONS
BLVD

Q **LADOT said this project was a 1 year pilot. What happens in June 2018? How and when will you determine whether this is a successful pilot?**

A Once the first year of the pilot project is complete in late May 2018, LADOT will perform a detailed analysis on the range of data gathered to understand the project benefits and impacts over this initial project time period. This will include the travel trend information that has been reported at the 1, 3, and 6-month timeframe, and will also include more data sources to compare to the project benchmarking report prepared in 2015. The following information will be gathered to measure desired outcomes for the project.

- **Increased Economic Activity**
- **Business operator & customer perceptions**
- **Business tax information, if available**
- **Improved Access & Mobility**
- **Driving, walking, & biking traffic volumes**
- **Vehicle speed**
- **Travel mode split**
- **Travel time through the corridor**
- **Pedestrian and bike rider observations**
- **Enhanced Neighborhood Character**
- **Neighborhood perceptions**
- **Streetscape elements**
- **Safer & More Secure Communities**
- **Crime statistics**
- **Safety perceptions**
- **Traffic collisions**

Gathering and analyzing all of this information will take some time. Most of these data require a minimum of 1-2 months to collect and synthesize. However, the longest lead time will be for traffic collisions data, which may take longer for full processing and validation from the Statewide Integrated Traffic Records System (SWITRS). Project staff will also require 1 month to develop this information into a report and present key findings to LADOT management and the Council Office.

Together, Councilmember Mike Bonin and LADOT General Manager Seleta Reynolds will consider the report findings alongside comments received throughout the process by LADOT, the Council Office, the Mayor's Office, and the Mar Vista Community Council and make a decision about the future of the project. The potential paths forward for the project include the following:

1. **Ending the pilot project and returning the street to the original configuration.**
2. **Making further changes to the corridor based on feedback and data and then continuing the pilot project.**
3. **Making the temporary project installations permanent.**

VENICE
FREQUENTLY ASKED QUESTIONS
BLVD

Q **LADOT installed the project 9 months ago. Why are we just looking at the 6-month data now?**

A Data collection and analysis takes time. In order to ensure data is collected and analyzed appropriately and accurately, the project team goes through multiple reviews before presenting information publicly, which results in a necessary delay. LADOT is committed to analyzing and presenting information in an accurate manner. Additionally, data collected at the 1, 3, and 6-month time period are very preliminary. LADOT will be conducting a more comprehensive review of project impact at the 1-year time frame to inform project next steps.

Q **Did you provide data at the 1-month and 3-month time period?**

A Yes. LADOT hosted an open house on July 22, 2017 to present preliminary 1-month data, and published a 3-month data report on the project website (https://www.veniceblvdmarvista.org/evaluation/). Additionally, LADOT mailed a hard copy of the 3-month data to the Mar Vista community.

Q **Have there been more crashes on Venice since the project was installed?**

A Preliminary analysis of available data shows that total crashes over the time period from May – December in 2017 along this portion of Venice Blvd have decreased by 1 collision (from 19 to 18) compared to that same time period in 2016. Minor injury collisions have increased by 2 collisions (from 13 to 15) during that same time period. This data is too low to be statistically significant, and our transportation engineers will perform a more detailed analysis of crash types and movements of involved parties in order to determine whether these crashes have any relation to the project design at the 1-year time frame.

Q **But I've observed many more traffic crashes than you show in your data. How can that be accurate?**

A LADOT is committed to a rigorous and reliable analysis of pre- and post-project conditions. In order to perform this type of analysis, we require collision data that is consistently collected in the same manner for the pre-project period and the post-project period. Traffic crashes that are reported through Traffic Collision Reports (TCRs) generated by LAPD and validated through the Statewide Integrated Traffic Records System (SWITRS) are the transportation industry standard for reliable collision analysis.

VENICE
FREQUENTLY ASKED QUESTIONS
BLVD

Q **What outreach has been done to date?**

A Over the course of 2015, LADOT, CD11, and the Mayor's Office conducted 12 community events to discuss the project and its potential design elements. This includes:

- 01/2015 - Community Canvas at local grocery stores, community meetings, and events
- 01/25/15 - Pop-up workshop at the Mar Vista Farmers Market
- 04/03/15 - 04/6/15 - Mobile Pop-up Workshop at Grand View Market
- 04/06/15 - 04/12/15 - Mobile Pop-up Workshop at Venice Grind
- 04/16/15 - Mobile Pop-up Workshop at Venice High School
- 04/20/15 - Mobile Pop-up Workshop at Mar Vista Branch Library
- 04/19/15 - Mobile Pop-up Workshop at the Farmers Market
- 05/02/15 - Family bike ride and mobile pop-up workshop
- 08/2015 - Invitation (email/posts) to the Community Open House
- 08/06/15 - Community Open House
- 08/09/15 - Booth and pop-up parklet at CicLAvia
- 11/28/15 - Pop-up protected bike lane and parklet at Make It Mar Vista
- Regular attendance at the MVCC Great Streets Ad Hoc Committee meetings

Q **How will LADOT provide more clarity for drivers and other users about the lane changes along the Venice Blvd Great Street?**

A LADOT has posted educational signs that provide guidance on how to use the new and improved Venice Boulevard in numerous locations along the corridor.

Q **Has pedestrian activity increased since the street reconfiguration? Has bike activity?**

A LADOT will evaluate pedestrian and bicycle activity as part of the 1-year pilot evaluation.

VENICE BLVD

FREQUENTLY ASKED QUESTIONS

Q What do you mean by “injury collisions”?

A In the Statewide Integrated Traffic Records System (SWITRS), collisions are coded based on their severity. There are five total classifications, detailed below:

- **Property Damage Only**
- **Complaint of Pain:** This classification could contain authentic internal or other non-visible injuries and fraudulent claims of injury. This includes: 1. Persons who seem dazed, confused, or incoherent (unless such behavior can be attributed to intoxication, extreme age, illness, or mental infirmities). 2. Persons who are limping but do not have visible injuries; 3. Any person who is known to have been unconscious as a result of the collision, although it appears he/she has recovered; 4. Persons who say they want to be listed as injured but do not appear to be so.
- **Other Visible Injury:** This includes: bruises (discolored or swollen); places where the body has received a blow (black eyes and bloody noses); and abrasions (areas of the skin where the surface is roughened or blotchy by scratching or rubbing which includes skinned shins, knuckles, knees, and elbows).
- **Severe Injury:** An injury other than a fatal injury which results in broken bones, dislocated or distorted limbs, severe lacerations, or unconsciousness at or when taken from the collision scene. It does not include minor laceration.
- **Fatality:** Death as a result of injuries sustained in a collision or an injury resulting in death within 30 days of the collision.

The large majority of collisions on Venice Blvd have been in the first three categories. The last two categories - collectively referred to as “KSI” (Killed or Seriously Injured) - are the most reliably reported data and used to understand transportation safety trends for a particular area over a longitudinal study, typically 2 - 5 years.

Q How has LADOT worked to improve emergency response times on Venice?

A LADOT communicates directly with the Los Angeles Fire Department (LAFD) to address any concerns and work towards minimizing impact to their operations. LADOT has provided transponders that preempt traffic signals so LAFD can move through the intersections quicker. LAFD reports that the preemption is making a difference on Venice Blvd for their fire vehicles. In late December 2017, LADOT data indicates that LAFD vehicles are consistently moving 30-40% faster than general traffic, with an average speed of 39 mph along Venice Blvd compared to an average speed of 28 mph for non-emergency vehicles. Due to this success, LAFD is working with LADOT to procure additional transponders for other fire stations in Los Angeles.

Q Can you install a protected bike lane and keep a third travel lane?

A The current roadway width would not allow for such a configuration. A buffer between the parking lane and bicycle lane is necessary to provide a separation for opening passenger car doors. Additionally, the new street design helps accomplish the project's overall goal to calm traffic and improve safety on the street.

VENICE
FREQUENTLY ASKED QUESTIONS
BLVD

Q **Has the project on Venice increased cut-through traffic on neighboring streets? Where did you conduct before/after counts to assess cut-through traffic?**

A

Traffic was counted at the following locations:

- Palms Blvd east of Beethoven St
- Palms Blvd east of Inglewood Blvd
- Charnock Rd west of Inglewood Blvd
- Victoria Ave west of Centinela Ave
- Pacific Ave west of Inglewood Blvd
- Venice Blvd at Centinela Ave

Data were collected for 24 hours (from 12:00am to 11:59pm) on the following days:

- Tuesday, September 22, 2015 (pre-project benchmarking)
- Monday, June 26, 2017 (1 month post-project evaluation)
- Tuesday, August 22, 2017 (3 months post-project evaluation)
- Thursday, January 11, 2018 (6 months post-project evaluation)

Since the installation of the pilot project, traffic has remained consistent or trended upward slightly on the four examined streets parallel to Venice Blvd (Palms Blvd, Charnock Rd, Victoria Ave, and Pacific Ave). One exception is Palms Blvd east of Beethoven St. Traffic volumes on this segment climbed after the Venice Blvd Great Street's construction but have trended downward since the Great Street project adjustments were completed in December 2017. LADOT will continue to monitor this traffic volume to see if it is still fluctuating or has begun to settle by the one-year mark. The one-year analysis will also include an evaluation of volume thresholds for street classifications, and whether LADOT recommends mitigation strategies for cut-through traffic.

Q **Have you tried to increase enforcement on the street? How successful has enforcement been in managing crash severity?**

A

LAPD has very limited resources for enforcement, and each traffic captain has discretion over details that focus on educating on and enforcing against traffic violations for people walking, bicycling, and driving. Even if this enforcement were to be enhanced, these details would still only cover limited days and times on Venice Blvd. Studies show that enforcement, while a critical tool in improving safety, has a very limited and short-term impact by itself. Combining education and enforcement with re-designed streets is the most effective method for comprehensively improving behavior and leading to safer outcomes.

Q **What studies were done (environmental or traffic) before this project was installed?**

A

As part of the Great Streets benchmarking analysis, we studied traffic counts, speeds, collisions, and travel times. This is a pilot demonstration, therefore it is exempt from an environmental process. If it is made permanent, there will be an environmental assessment and accompanying public process.

VENICE BLVD

FREQUENTLY ASKED QUESTIONS

Q **How are you measuring impacts to businesses?**

A The LA Great Streets Initiative conducted a benchmarking report in 2015 - 2016 and studied: types of businesses, revenues, commercial real estate values, business perceptions, median income, and more, and will conduct a follow up review after the 1-year pilot is complete.

Q **How much did this project cost?**

A This project cost approximately $1.8M. Approximately 95% of the cost was for the new traffic signals, pedestrian access ramps, upgrades to the median island, and other civil intensive work.

Q **How does this design impact people with disabilities?**

A LADOT is working with the Department of Disability to identify and develop accommodations at key locations for this project.

Q **Venice Boulevard is an evacuation route. How does this street design impact evacuation in emergencies?**

A Evacuation routes as a result of disaster can be safely implemented on any major roadway, regardless of the street design. In many instances, we convert the entire roadway into a one-way street flowing away from a disaster zone.

Emergency Vehicle Transponders

These additions help the Los Angeles Fire Department respond faster to emergencies by making traffic lights green for their vehicles.

Green Bike Lane Paint

This improvement highlights areas where cars and bicycles mix near intersections and driveways to improve safety.

Turn Lane Modifications

Right-turn lanes at Grand View Blvd and left-turn lanes at Centinela Ave were modified to allow more vehicles to turn and provide better visibility.

VENICE BLVD

SUMMARY OF DATA FINDINGS

Rush Hour Travel Time

What is it?

This is the average time, in minutes, it takes to drive the Venice Blvd Great Street during the morning and evening rush hours. It is collected in both travel directions: eastbound (Beethoven St to Inglewood Blvd) and westbound (Inglewood Blvd to Beethoven St).

How is it Collected?

A data collector drives the corridor. They start recording the time it takes to drive the corridor at one end and stop recording at the other end of the corridor. This process is repeated for as many trips as possible during the 2-hour data collection period. The trips are averaged together to develop a typical travel time. Data is collected using GPS and/or a stopwatch.

When and where is it Collected?

Data were collected along the Venice Blvd Great Street between 7am and 9am (the AM peak period) and again from 4pm to 6pm (the PM peak period) on the following days:

- Tuesday, August 4, 2015 (pre-project benchmarking)
- Thursday, July 13, 2017 (1 month post-project evaluation)
- Thursday, August 24, 2017 (3 months post-project evaluation)
- Thursday, January 11, 2018 (6 months post-project evaluation)

What did we Learn?

The time it takes to drive the corridor has increased slightly, by about 30 seconds, for all travel directions and time periods except eastbound PM. Eastbound PM travel times on the Venice Blvd Great Street initially increased by nearly 5 minutes. Since the Great Street project adjustments were completed in December 2017, travel time in the eastbound PM direction is decreasing.

24-Hour Travel Time

What is it?

This is the average time it takes to travel the Venice Blvd Great Street at each hour of a typical weekday. It was analyzed in both travel directions: eastbound (Beethoven St to Inglewood Blvd) and westbound (Inglewood Blvd to Beethoven St).

How is it Collected?

The data are collected and processed by a third-party big data service, INRIX. The data are collected using GPS signals from a sample of mobile device users traveling the corridor, who have allowed their location data to be shared. The data are anonymized and averaged to provide an estimate of the time it takes to travel the corridor at each hour of the day.

When and where is it Collected?

The data were collected along the Venice Blvd Great Street on Mondays, Tuesdays, Wednesdays, Thursdays, and Fridays during two 12-day periods for comparison:

- January 9 – 20, 2017
- January 8 – 19, 2018

What did we Learn?

The time it takes to travel westbound on the Venice Blvd Great Street has remained relatively constant from 2017 to 2018. In 2017, the slowest time to travel the corridor westbound was between 2pm and 3pm. In 2018, westbound travel during this time decreased by about half a minute.

Travel time in the eastbound direction has also remained relatively similar between 2017 and 2018 with the exception of the PM rush hour. During this time, it can take 30 seconds to one minute longer to travel the corridor eastbound. More investigation and analysis over different time periods is needed to make conclusive observations from this data analysis.

Emergency Responder Travel Time

What is it?

This is the average time it takes Los Angeles Fire Department (LAFD) vehicles to travel the Venice Blvd Great Street while responding to emergencies. In addition to traveling at higher speeds, LAFD vehicles are equipped with transponders that allow them to trigger green lights. The travel time is averaged from a sample of actual LAFD responses in both directions on the Venice Blvd Great Street.

How is it Collected?

During an emergency response, a transponder onboard the LAFD vehicle records the distance traveled over the Venice Blvd Great Street as well as the vehicle's travel time. Distance and travel time are used to calculate the emergency vehicle's general speed. Several emergency vehicle runs are analyzed to create an average emergency vehicle travel speed. The average emergency vehicle travel speed is compared to the average speed of non-emergency vehicles over the same corridor.

When and where is it Collected?

Emergency vehicle travel times were collected from a sample of LAFD responses on the Venice Blvd Great Street during the week of December 24, 2017 to December 31, 2017. They were compared to average speeds of non-emergency vehicles during the same period on the corridor.

What did we Learn?

During the evaluation period, LAFD vehicles had an average speed of 39MPH along the Venice Blvd Great Street. Non-emergency vehicles had an average speed of 28MPH. This means that LAFD vehicles traveled about 40% faster than regular traffic. LAFD acknowledges this effort as a success, and they are working with LADOT to identify additional transponders for additional fire stations in Los Angeles.

Travel Speed

What is it?

This is the "85th percentile" speed. It is the speed that 85 percent of surveyed motorists are traveling at or below on the Venice Blvd Great Street. Under state law, this speed is used to set speed limits. The current posted speed limit on the Venice Blvd Great Street is 40MPH, and the target operating speed, as defined in the City of Los Angeles Mobility Plan 2035, is 35MPH.

How is it Collected?

Using a radar gun, the data collector records the speed of 50 random westbound vehicles and 50 random eastbound vehicles on Venice Blvd. The speed samples for both travel directions are recorded and broken into percentile scores. The travel speed that is most commonly reported is the 85th percentile speed, which, as described above, is used to set speed limits in California.

When and where is it Collected?

Data were collected between approximately 11am and 12pm at Venice Blvd and Colonial Ave (just west of Centinela Ave) on the following days:

- Tuesday, September 22, 2015 (pre-project benchmarking)
- Thursday, July 13, 2017 (1 month post-project evaluation)
- Thursday, August 24, 2017 (3 months post-project evaluation)
- Thursday, January 11, 2018 (6 months post-project evaluation)

What did we Learn?

Before construction of the Venice Blvd Great Street, the 85th percentile speed was 41MPH, which is just above the speed limit of 40MPH. Travel speeds then dropped into the range between the speed limit and the target operating speed of 35MPH. Since the Great Street project adjustments were completed in December 2017, travel speeds have increased to pre-project, or faster, levels.

Traffic Volumes

What is it?

This is the average number of vehicles that pass over a certain section of road, in both directions, on a given weekday. It was collected on Venice Blvd and streets parallel to Venice Blvd to examine whether traffic may be diverting to other streets since the Venice Blvd Great Street's construction.

How is it Collected?

A pneumatic tube is laid down across all lanes of a street at the desired traffic counting location. It is connected to a sensor that records each time a vehicle passes over the pneumatic tube. It counts each pass as one vehicle.

When and where is it Collected?

Traffic was counted at the following locations:

- Palms Blvd east of Beethoven St
- Palms Blvd east of Inglewood Blvd
- Charnock Rd west of Inglewood Blvd
- Victoria Ave west of Centinela Ave
- Pacific Ave west of Inglewood Blvd
- Venice Blvd at Centinela Ave

Data were collected for 24 hours (from 12:00am to 11:59pm) on the following days:

- Tuesday, September 22, 2015 (pre-project benchmarking)
- Monday, June 26, 2017 (1 month post-project evaluation)
- Tuesday, August 22, 2017 (3 months post-project evaluation)
- Thursday, January 11, 2018 (6 months post-project evaluation)

What did we Learn?

Traffic has remained consistent or trended upward slightly on the four examined streets parallel to Venice Blvd (Palms Blvd, Charnock Rd, Victoria Ave, and Pacific Ave). One exception is Palms Blvd east of Beethoven St. Traffic volumes on this segment climbed after the Venice Blvd Great Street's construction but have trended downward since the Great Street project adjustments were completed in December 2017.

Traffic on Venice Blvd has decreased since building the Great Street project. Before the project's construction, about 33,000 auto trips passed through the Great Street on a typical weekday. That number has reduced to under 30,000 as of the most recent data.

Traffic Collisions

What is it?

LADOT conducted a preliminary 6-month collision analysis for the Venice Blvd pilot project using available data from the Statewide Integrated Traffic Records System (SWITRS). Multiple degrees of collision severity exist that range from property damage to fatality. For a robust safety analysis, fatal and severe injury collisions are the most reliable source of information to make informed decisions on transportation projects. Other injury collisions are not reliably reported. Industry standards for robust, statistically defensible safety analysis call for a minimum of one to two years of collision data before making informed decisions on the impact or benefit of a project. One 6-month post-analysis of all injury & collision data is not sufficient to make informed decisions.

How is it Collected?

Law enforcement officers file Traffic Collision Reports (TCR) at the time of collisions that detail the location and characteristics of the collision. Collision data are entered into a statewide database (SWITRS), and much of this data is made available for analysis and investigation.

When and where is it Collected?

The post-project data was collected from May 20, 2017 – December 31, 2017, and comes from the SWITRS database. In order to compare to pre-project conditions, LADOT analyzed SWITRS data from the same time period (May 20 – December 31) for the past 5 years, back to 2012. To understand trends, LADOT also graphed all available collision since May 20, 2012.

What did we Learn?

- The number of collisions in each analysis period are too low to make defensible conclusions on safety trends from this data. More collision data will need to be collected and analyzed at the 1-year mark
- Total collisions for motor vehicles and bicycles are below 2016 levels for the analysis period, but are up for pedestrians.
- Injury collisions for bicycles are below 2016 levels, but up for motor vehicles and pedestrians
- Injury collisions appear to be concentrated during AM and PM peak periods.
- Only 4 bike and pedestrian injury collisions have occurred since LADOT installed the project. 3 of these are right turn collisions that occurred in June & July.
- LADOT transportation engineers will perform a detailed collision analysis for pre and post-project collisions at the 1-year mark to analyze parties involved, movement preceding collision, and other collision factors to develop a detailed understanding of any safety benefits or impacts of the project.

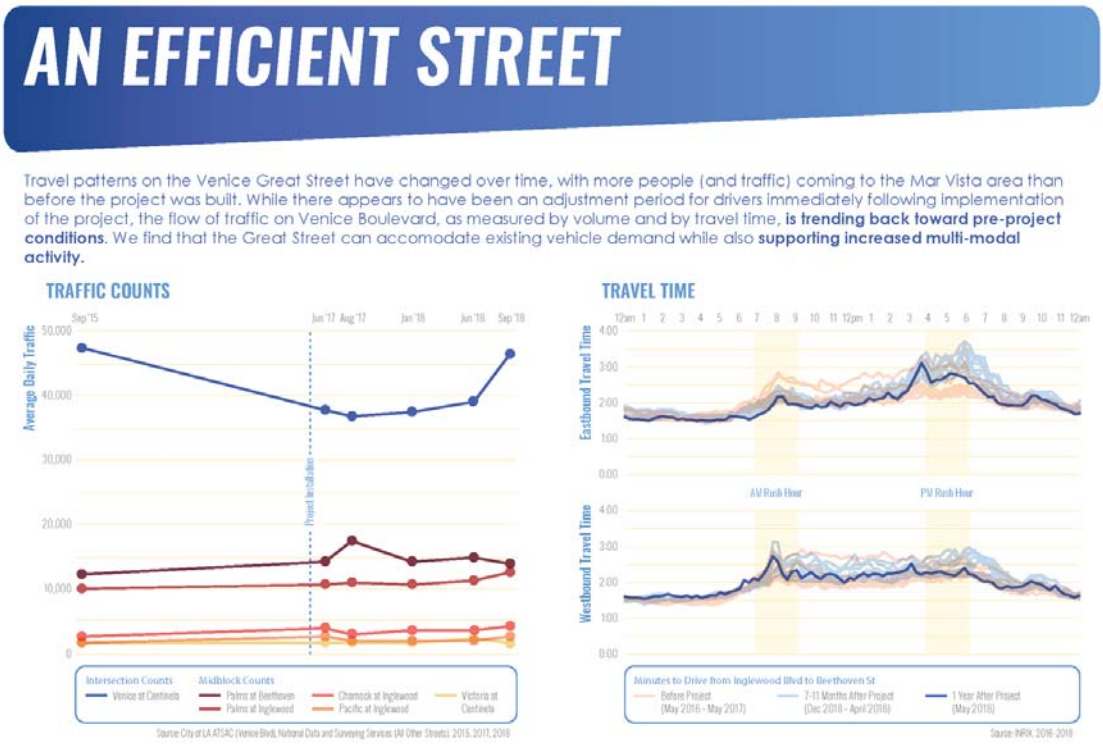
DATA & EVALUATION

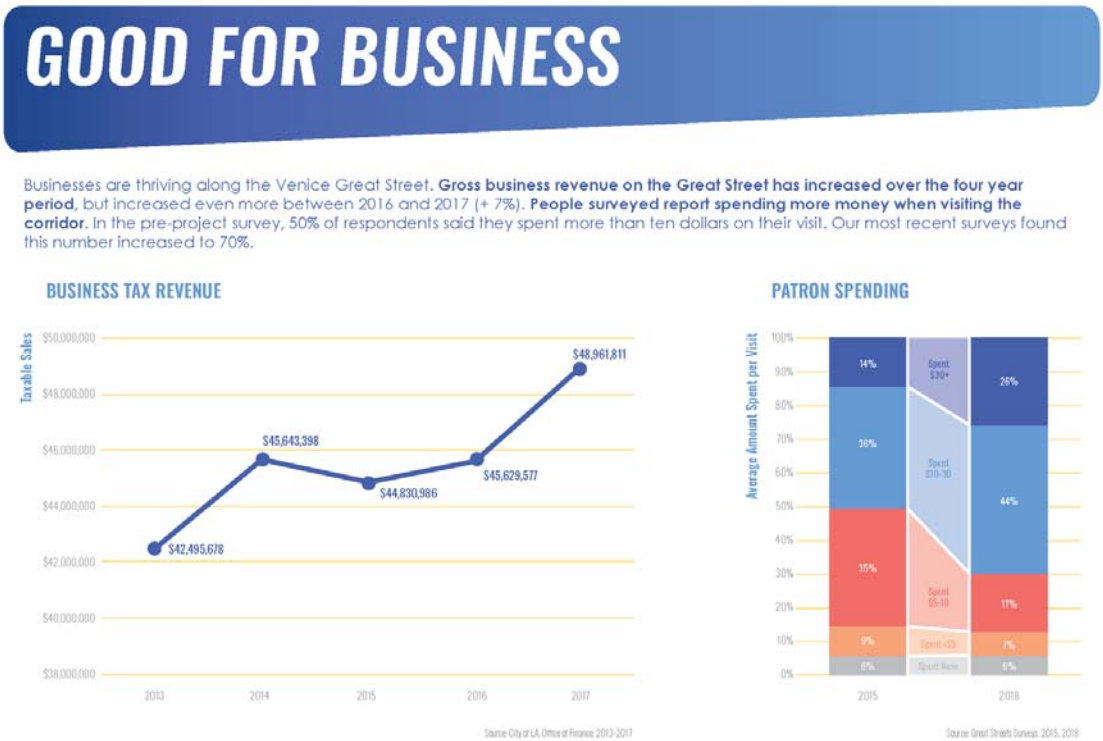
LADOT released project progress reports to the community at the one month, three month, and six month post-project period. LADOT committed to providing a comprehensive evaluation after the one-year pilot period was completed.

May 2018 marked the completion of the one-year pilot period. At that time, LADOT began collecting data to compare to pre-project conditions set in the Venice Boulevard Benchmarking Report (http://www.fehrandpeers.com/wp-content/uploads /2016/10/VeniceBlvd.pdf).

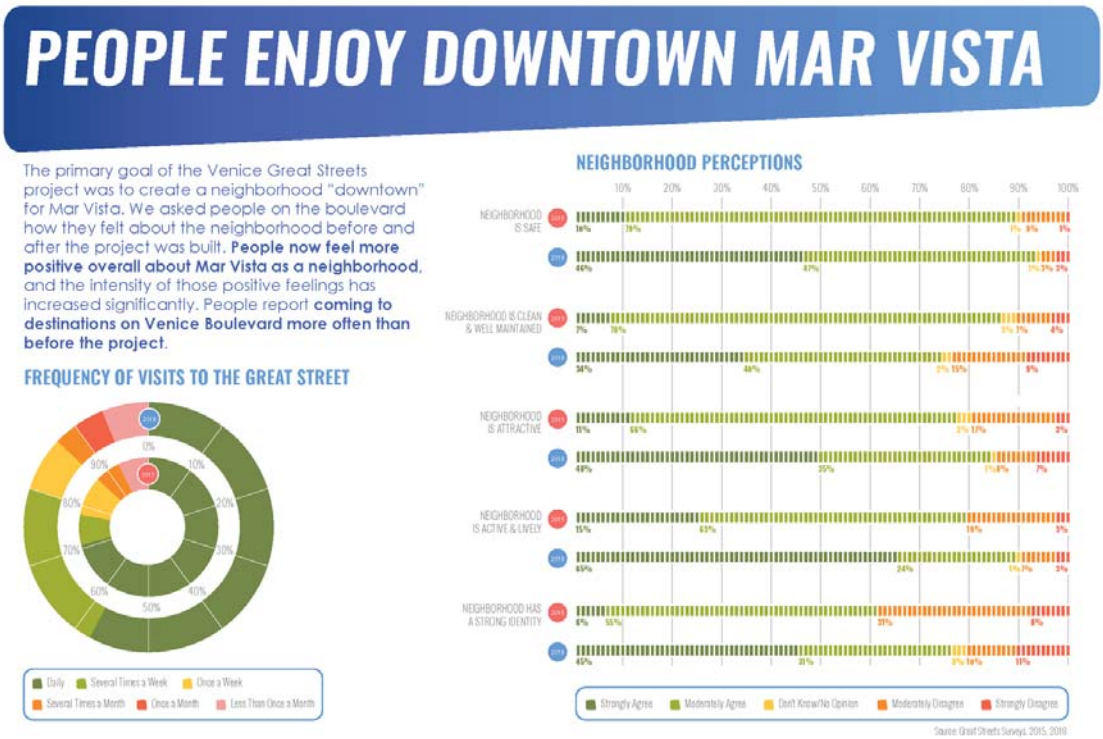


In December 2018 LADOT completed the one-year evaluation report (/s/VeniceBlvd_1-Year_Report_FINAL_.pdf).

Some of the reports key findings:



THE PROJECT IS SAFE



THE PROJECT IS EFFICIENT

THE PROJECT IS GOOD FOR BUSINESS

PEOPLE ENJOY DOWNTOWN MAR VISTA

The one-year evaluation report is downloadable here (/s/VeniceBlvd_1-Year_Report_FINAL_.pdf).

The report appendix, which includes the raw data that was obtained for analysis is downloadable here (/s/Appendices-COMPLETE_.pdf).

The six-month evaluation can be accessed here (https://static1.squarespace.com/static/595fd8fa5016e119d794e4b1/t/5aac103e758d46afd587c814/1521225803908/Venice_Boards.pdf).

(http://www.ladot.lacity.org)

VENICE BLVD GREAT STREETS PROJECT

LADOT is committed to evaluating the progress of the Venice Blvd Great Streets project in Mar Vista. In July 2017, LADOT released a one-month data reveal. In September 2017, LADOT released the three-month data reveal, and in March 2018, LADOT hosted a six-month open house to present the half year data findings and to receive public feedback. LADOT committed to report the project's benefits and impacts after a full year of data could be collected.

Since the one-year mark on May 20, 2018, LADOT began assembling the data needed to conduct a detailed evaluation of the project across the six goals of the Great Streets Initiative - increased economic activity, improved access and mobility, enhanced neighborhood character, greater community engagement, improved environmental resilience, and a safer and more secure community. This data was compared to the baseline conditions established in the Venice Boulevard Benchmark Report (http://www.fehrandpeers.com/wp-content/uploads/2016/10/VeniceBlvd.pdf).

LADOT has completed the one-year evaluation study. The report can be downloaded here (/s/VeniceBlvd_1-Year_Report_FINAL_.pdf).

PROJECT INFO

The Venice Boulevard project is the result of several years of outreach and design piloted in May 2017. This new street configuration, from Beethoven Street to Inglewood Boulevard, includes two vehicle lanes in each direction, a bicycle lane physically protected by a parking lane, new high-visibility crosswalks, leading pedestrian intervals for early pedestrian crossing, and four new signals and crossing points across Venice Boulevard. Other amenities such as bus stops , bike racks, murals, and landscaping amplified the project.

Learn More → (/project-info)

PROJECT UPDATES

LADOT initiated modifications through community feedback and evaluation to further improve the project safety and increase vehicle throughput since May 2017. LADOT will continue to provide updates on any further changes to the project's design and operation, including related community initiatives, like the planned intersection mural at Grand View Avenue and Pacific Avenue.

Learn About the Mar Vista Great Streets Project

PROJECT OVERVIEW

After a collaborative process involving the Mayor's Office, City Council staff, Los Angeles City staff, and a technical committee, Venice Boulevard in Mar Vista as one of the first 15 Great Streets corridors. Councilmember Mike Bonin facilitated community outreach and the Great Streets Initiative identified a vision for the corridor focused around safety for pedestrians and bicyclists, and a project that is supportive of business and enhances the identity of the neighborhood.

In August 2015, safety improvements along Venice Boulevard gained additional attention when the street was placed on the Vision Zero High-Injury Network. In January 2017, the City of Los Angeles selected this stretch of Venice Boulevard as a Priority Corridor in the City's first-ever Vision Zero Action Plan. Vision Zero uses collision data to prioritize safety improvements aimed at ending preventable traffic deaths by 2025.

This section of Venice Boulevard has experienced a high rate of traffic related injuries and fatalities. From 2003 to 2016, 360 collisions involving injury occurred on Venice Boulevard. Over half of the serious injuries involved people walking and biking. Five people lost their lives.

The Project Features the Following Key Enhancements and Benefits:

Protected and buffered bicycle lanes: On Venice Boulevard between Beethoven Street and Inglewood Boulevard.

New Crossing Points: LADOT installed four new crosswalks on Venice Boulevard at Mountain View Avenue, Ocean View Avenue, Boise Street, and Meier Street, with new signals to provide more safe crossing opportunities for pedestrians. The high visibility crosswalk striping will increase the visibility of people crossing the street.

Pedestrian head-start signals: LADOT modified nine intersections on Venice Boulevard to provide pedestrians a head-start when crossing the street.

Upgraded Sidewalks and High Visibility Crosswalks: The Bureau of Street Services (BSS) enhanced safety by grinding sidewalks and expanding tree wells. LADOT installed new crosswalks across Venice Boulevard and upgraded existing crosswalks to enhance their visibility.

Bus Stop Improvements: The City of Los Angeles installed two solar-powered bus benches with USB ports and one bus shelter with USB ports and free WiFi at Venice Avenue and Centinela Avenue.

Community Art Installations: As part of the Great Streets Initiative, community artists have painted more than 10 wall murals, 4 utility box murals, and are in the process of installing the City's first ever intersection mural. LADOT also launched its first Creative Catalyst program on Venice Boulevard. Alan Nakagawa, LADOT's Artist-in-Residence, worked with local artists to develop street haiku signs, installed along the entire Venice Boulevard corridor, as well as the City's first Street Perfume project. Learn more about the innovative project, see the articles below:

- **How one LA bus stop became a lab for experimental perfumes - City Lab (https://www.citylab.com/life/2017/07/how-one-la-bus-stop-became-a-lab-for-experimental-perfumes/535041/)**

NEIGHBORHOOD INPUT:

Between 2015 and 2016, the Great Streets Initiative, Council District 11, and LADOT facilitated extensive outreach, canvassing at the Mar Vista Farmers Market, going door-to-door along business corridors, facilitating mobile workshops, holding a community open house, and temporarily building out the proposed design of the project during the November 2015 "Make It Mar Vista" community event.

The following represents some of the outreach events were coordinated during this period:

01/2015 - Community canvas at local grocery stores, community meetings, and events
01/25/15 - Pop-up workshop at the Mar Vista Farmers Market
04/03/15 - 04/6/15 - Mobile pop-up workshop at Grand View Market
04/06/15 - 04/12/15 - Mobile pop-up workshop at Venice Grind
04/16/15 - Mobile pop-up workshop at Venice High School
04/20/15 - Mobile pop-up workshop at Mar Vista Branch Library

PROJECT UPDATES

6-MONTH OPEN HOUSE

March 14, 2018

On March 14, 2018, LADOT hosted an open house at the Mar Vista Recreation Center to discuss project updates, present the latest data from the 6-month project evaluation, and receive comments and input heading into the project one-year evaluation. Over 100 community members attended. You can view the display boards here (/s/Venice_Boards.pdf).

IMPROVING EMERGENCY RESPONSE TIMES

December 2017

LADOT provided transponders to the Los Angeles Fire Department that preempt traffic signals so LAFD vehicles can move through the intersections quicker. LAFD reports that the preemption made a difference on Venice Boulevard, and data shows they are moving 30 to 40 percent faster than general traffic.

FACILITATING MOVEMENT THROUGH VENICE BOULEVARD

December 2017

LADOT reconfigured the left-turn lanes on Venice Boulevard at Centinela Avenue from one lane to two lanes. This allows more vehicles to make left turns in one signal cycle, which streamlined movement through Venice Boulevard.

IMPROVING RIGHT HAND TURNS AT INTERSECTIONS

October 2, 2017

LADOT improved the safety of right-hand turns at certain intersections. Some intersections received a new right-hand turn

configuration and some intersections received modifications that improve visibility.

Learn more about the proposed configurations here (/s/Outreach_Venice-Right-Hands_Final-Draft.pdf).

THREE-MONTH DATA

September 20, 2017

The number of collisions and injury collisions occurring on Venice Blvd. continued to decrease three months after the reconfiguration. The data reported (/evaluation)that the number of drivers speeding along the corridor continues to drop, making downtown Mar Vista a safer and more vibrant neighborhood.

Additionally, the three month data showed that trips on the corridor are now within zero to 60 seconds of pre-project times.

MAR VISTA OPEN HOUSE

July 22, 2017

On July 22, 2017, LADOT hosted a community Open House aimed at communicating key facets of the Mar Vista project after one-month of installation. Over 200 members of the community attended the event and many individuals shared their feedback on the project.

ONE-MONTH DATA REVEAL

July 15, 2017

Data indicated a drop in the number of drivers speeding above the 40 mph limit, which is crucial because pedestrian collisions involving cars going over 40 mph are almost always fatal.

In addition, the latest data shows that trips through Mar Vista's Venice Blvd. corridor are within 30 to 90 seconds of pre-project times.

	VENICE WEST OF LOUELLA		VENICE WEST OF COLONIAL		VENICE WEST OF BARRY	
DIRECTION	EB	WB	EB	WB	EB	WB
PRE-PROJECT	45	44	41	41	45	43
POST-PROJECT	43	41	38	36	44	44
CHANGE	-2	-3	-3	-5	-1	+1

PRESENTATION TO MAR VISTA COMMUNITY COUNCIL

July 11, 2017

On July 11, 2017 LADOT and Councilmember Mike Bonin presented project updates and information (/s/2017-07-11_Venice-Blvd-Great-Street_FORWEB-htap.pdf) at the Mar Vista Neighborhood Community Council meeting. Community members provided insights and ideas into the Great Streets Project, and after full consideration of all sides, the Council voted in support of the project.

See the data and information we presented at the council meeting here. (/s/2017-07-11_Venice-Blvd-Great-Street_FORWEB-nfsd.pdf)

Traffic fatalities in Los Angeles

Source: California Highway Patrol, Los Angeles Police Department

Laura J. Nelson

Total Pedestrian Bicycle

"In 2015, Garcetti signed an executive order creating the Vision Zero initiative, which set the ambitious goal of eliminating traffic deaths on city streets by 2025. It called for reductions of 20% by 2017."

~Laura J. Nelson, Feb 27, 2018, LA Times

VISION ZERO

LOS ANGELES | 2015-2025

ACTION PLAN

JANUARY 2017

DOUBLETREE
Olive St
25
AHEAD

Dear Friends,

Every forty hours, a person is killed in a traffic collision in Los Angeles. Nearly half of the people who die on our streets are people walking and bicycling. Children and older adults account for an alarming number of deaths.

Our streets must be safe. Loss of life because of preventable traffic collisions is unacceptable, which is why I launched the Vision Zero initiative in 2015.

My goal is to eliminate traffic deaths in the City of Los Angeles by 2025 and to reduce deaths by 20 percent by the end of 2017. Over the past year, City leaders have mounted a comprehensive, data-driven effort to better understand the root cause of collisions and to identify and prioritize corridors where deaths and injuries occur with troubling frequency to focus the City's efforts.

The result of these efforts is the City's first Vision Zero Action Plan. This plan lays out concrete actions to help achieve our goals for a safe Los Angeles. From innovative street design to complementary education and enforcement strategies, we can reduce the likelihood of death and severe injury.

This Action Plan spells out ways for every Angeleno to get on the road to Vision Zero. Everyone has a role to play in keeping our streets safe. Working together, we can eliminate traffic deaths and make Los Angeles a safe place for every traveler.

Sincerely,

ERIC GARCETTI
Mayor

THE STORY FOR ZERO TRAFFIC DEATHS IN LOS ANGELES

EXECUTIVE SUMMARY

About Vision Zero

Every forty hours, an Angeleno loses his or her life in a traffic collision.[1] This is an alarmingly high number, especially compared with peer cities. There is no acceptable number of traffic deaths—even one is too many.

The City of Los Angeles will not be complacent about the tragic loss of human lives on its streets. The City is committed to reversing this trend to make Los Angeles a great place where people can travel safely and securely, no matter what mode of transportation they choose. The question is: How do we get there?

The answer? Vision Zero.

Fatal traffic collisions are not accidents; they can be prevented through thoughtful intervention. In August 2015, Los Angeles Mayor Eric Garcetti launched the Vision Zero Initiative by issuing Executive Directive Number 10. The directive prioritizes human life in the design of our City streets and identifies strategies for how government and the public can partner to reduce traffic deaths to zero. Together, we will eliminate fatalities by focusing on engineering, enforcement, education, and evaluation—all with a commitment to equity and engagement.

[1] Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).

Children, seniors, and people who walk and ride bicycles are at the greatest risk to die or be seriously injured in a traffic collision.

The data-driven approach identifies proven methods and solutions to decrease traffic deaths by designing and operating a road system that accounts for human error.

Vision Zero Los Angeles anchors itself on the following principles:

1. Traffic deaths are preventable and unacceptable.
2. Human error is inevitable and unpredictable.
3. Engineering, education, enforcement, and evaluation are essential to a safe system.
4. Human life is our number-one priority.
5. Speed is a fundamental predictor of crash survival.
6. Government policies at all levels should be coordinated to promote safety as the highest priority.

Analysis of collision data finds that children, seniors, and people who walk and ride bikes are at the greatest risk for collisions that result in deaths and serious injuries.[2] A disproportionate number of collisions in Los Angeles take place on a relatively small number of streets, called the *High-Injury Network*. To meet our goals and to efficiently reduce deaths, we are prioritizing projects in these communities where the highest number of fatal and severe injury collisions are happening.

Our work aims to ensure appropriate focus on equity and engagement. As a starting point, we commit to unbiased policing in all contacts with any person(s) during traffic safety enforcement activities, regardless of race, color, ethnicity, national origin, gender, gender identity, gender expression, sexual orientation, or disability. For more details on our approach for equity and engagement, see pages 27–31.

[2] Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).

The City of Los Angeles will have zero traffic deaths by 2025. This bold statement requires equally bold leadership and actions. We will achieve our desired outcomes by executing the actions and strategies (see pages 38–39). Below is a summary of focus areas for 2017.

CREATE SAFE STREETS FOR ALL

- Install life-saving improvements on the priority corridors and intersections along the High-Injury Network, such as optimizing four-hundred traffic signals and redesigning at least twelve miles of City streets every year to accommodate safe transportation for all.
- Update 100 percent of the expired speed surveys on the priority corridors by the end of 2017.
- Update all City street-design standards used by the Bureau of Public Works, the Department of Transportation, and the Department of City Planning to be consistent with the National Association of City Transportation Officials' *Urban Street Design Guide, Transit Street Design Guide,* and *Urban Bikeway Design Guide* and prioritize the safety of people walking and biking.

DEVELOP A CULTURE OF SAFETY

- Invest at least $2 million toward a comprehensive education campaign that addresses top collision factors, such as speeding and insobriety.
- Work with the Los Angeles Police Department's (LAPD's) Community Relations Office and Community Traffic Services units on enforcement efforts on the top traffic violations that contribute to the most deaths and serious injuries for people walking and biking.
- Collaborate on education and traffic-safety awareness efforts with key stakeholders, such as the Los Angeles Vision Zero Alliance, local trauma hospitals, the County of Los Angeles, AARP, and the American Automobile Association.
- Deploy LAPD officers to priority intersections and corridors to provide education and enforcement during high traffic-collision hours.

ADOPT NEW POLICY AND LEGISLATION TO STRENGTHEN SAFETY

- Pursue legislation to enhance speed enforcement.
- Develop a state legislative strategy with the Mayor, the Los Angeles City Council, and the Los Angeles–area state delegation to strengthen laws related to moving violations that contribute to fatal and severe injury collisions.
- Pursue legislation to prevent traffic collisions with people walking in crosswalks and at other controlled intersections.

RESPOND TO RELEVANT DATA

- Include Vision Zero principles in the 2017 LAPD Traffic Plan.
- Update the High-Injury Network with 2014–16 data. Continue to expand data sharing among the Departments of Transportation, Water and Power, City Planning, Los Angeles Police and Fire, and the Bureau of Public Works.
- Work with local trauma hospitals to include Emergency Medical Services data in our database to identify magnitude and locations of underreporting of collisions that result in deaths or serious injury.

We will measure our progress of the success with the following benchmarks:

2017: 20-percent reduction in traffic deaths (compared with 2016).
2020: 50-percent reduction in traffic deaths (compared with 2016).
2025: Elimination of traffic deaths Citywide.

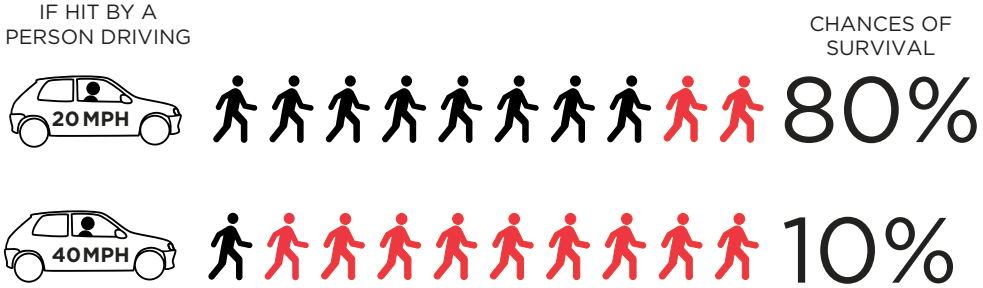
We all pay the price—financially, emotionally, socially—when someone gets hurt on our streets. Rather than live with this consequence, we instead can invest in making our roads safer so that severe injuries do not happen. Redesigning our streets, enforcing traffic laws, and changing behavior is a multimillion dollar endeavor. We will need sufficient funding to meet our ambitious goals. This plan will inform how the City will budget, allocate, and reallocate resources to achieve Vision Zero.

INTRODUCTION

Los Angeles leads its peer cities in traffic deaths per capita.

Los Angeles is facing a public health crisis: traffic deaths. Los Angeles experiences more traffic fatalities per capita than any other peer city in the United States (see table below).[3] In 2016, 260 people lost their lives from traffic violence in Los Angeles.

Data help illuminate who is most affected by traffic deaths. Thirty percent of all people killed or severely injured while walking and biking are youth and older adults. Motor vehicle crashes are the leading cause of death of children between the ages of 5 and 14.[4] We cannot stand by while our loved ones lose their lives. Los Angeles needs Vision Zero.



The data show that speed skills. Collisions will happen. Deaths do not have to be the consequence, however. We can stop deaths by focusing on controlling vehicle speeds.

YEAR 2012 DEATHS PER 100,000

City	Number of People
Los Angeles	6.27
Chicago	5.34
Portland	5.31
San Diego	5.23
San Jose	4.27
Seattle	4.26
Boston	3.61
San Francisco	3.51
New York	3.21

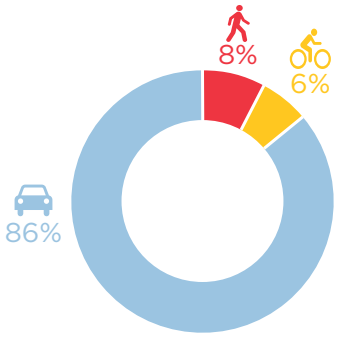
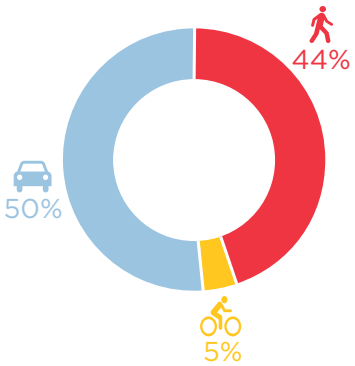
Getting to Zero



Since Vision Zero launched in 2015, we have learned a lot about traffic collisions on our streets. Bicycle and motorcycle collisions are on the rise, and high-speed arterial streets are hotspots for collisions.[5]

Through analysis of five years of collision data, we identified important trends that informed how we prioritize projects. For example, while people walking and biking are involved in only 14 percent of all traffic collisions, they represent almost 50 percent of traffic fatalities.[6] Simply protecting people from being hit while walking and biking would get us halfway to our goal of zero deaths. To do this, we will focus our early efforts on locations where collisions most often result in deaths and serious injuries for people walking and biking.



Using this data as a starting point, we conducted an analysis of City of Los Angeles streets to identify locations that account for the majority of traffic deaths for people walking and biking. We found that 65 percent of all severe and fatal collisions involving people walking and biking happen on just 6 percent of City streets.[7] These streets represent the City's initial High-Injury Network. Targeting investments along the High-Injury Network will have the greatest effect toward achieving our first benchmark of reaching a 20-percent reduction in deaths by the end of 2017.

To create projects that reach our Vision Zero goals, we are pursuing ambitious solutions in engineering, education, enforcement, and evaluation—"the 4 Es." Our work is rooted in a commitment to equity and engagement. All Angelenos have a right to safe mobility; Vision Zero ensures this by prioritizing projects that protect our most vulnerable communities.

COLLISIONS BY MODE VERSUS MODE OF PEOPLE KILLED

People Involved in Collisions

People Killed in Collisions

SOURCE: California Highway Patrol, "Annual Report of Fatal and Injury Motor Vehicle Traffic Collisions," years 2009–13 provided by the Statewide Integrated Records Systems (SWITRS), undated, https://www.chp.ca.gov/Programs-Services/Services-Information/SWITRS-Internet-Statewide-Integrated-Traffic-Records-System/SWITRS-2013-Report#2013section1.

[5] Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).
[6] Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).
[7] Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).

There is no one-size-fits all solution to the issue of traffic collisions. However, a study of best practices helped us identify proven solutions to address collision types that often result in death or serious injury. For example, left-turn restrictions may be explored in locations where those turns have caused collisions. A speed-limit reduction may be more appropriate on streets where children walk to school. Warning devices, such as a "Stop Here for Pedestrians" sign and flashing beacons, can be useful to guide drivers at complex intersections. High-visibility bicycle treatments at major intersections on the bicycle network can help clearly delineate street space and provide organization that avoids conflict between people driving and people bicycling.[8] These pairings, called *countermeasures* in the transportation field, inform project development by helping us evaluate what will be most effective at different locations with varying conditions.

COLLISION TRENDS

70 percent of fatal or serious pedestrian and bicycle collisions involved male drivers.

Pedestrian collisions on arterial streets are **seven** times more deadly than collisions on non-arterial streets.

Turning movements at traffic signals account for about **one-fifth** of fatal or severe pedestrian and bicycle collisions.

*Left turns **(12 percent)** account for about twice as many collisions as right turns **(6.2 percent)**.*

SOURCE: Vision Zero Los Angeles, *Los Angeles Vision Zero Technical Analysis: Final Report 2015* (Los Angeles: Los Angeles Department of Transportation, 2015).

[8] Vision Zero Los Angeles, *Collision and Countermeasure Analysis: Literature Review* (Los Angeles: Los Angeles Department of Transportation, March 2016).

Prioritized Intersections and Corridors

Reducing traffic fatalities by 20 percent by 2017 requires implementation of projects that will have the greatest effect toward overall fatality reduction. While the High-Injury Network is only 6 percent of our City streets, that is still more than 450 miles. To determine the locations that warrant immediate attention, we developed a scoring methodology to identify high-priority intersections and corridors along the High-Injury Network. Each intersection was assigned a score, based on the following criteria:

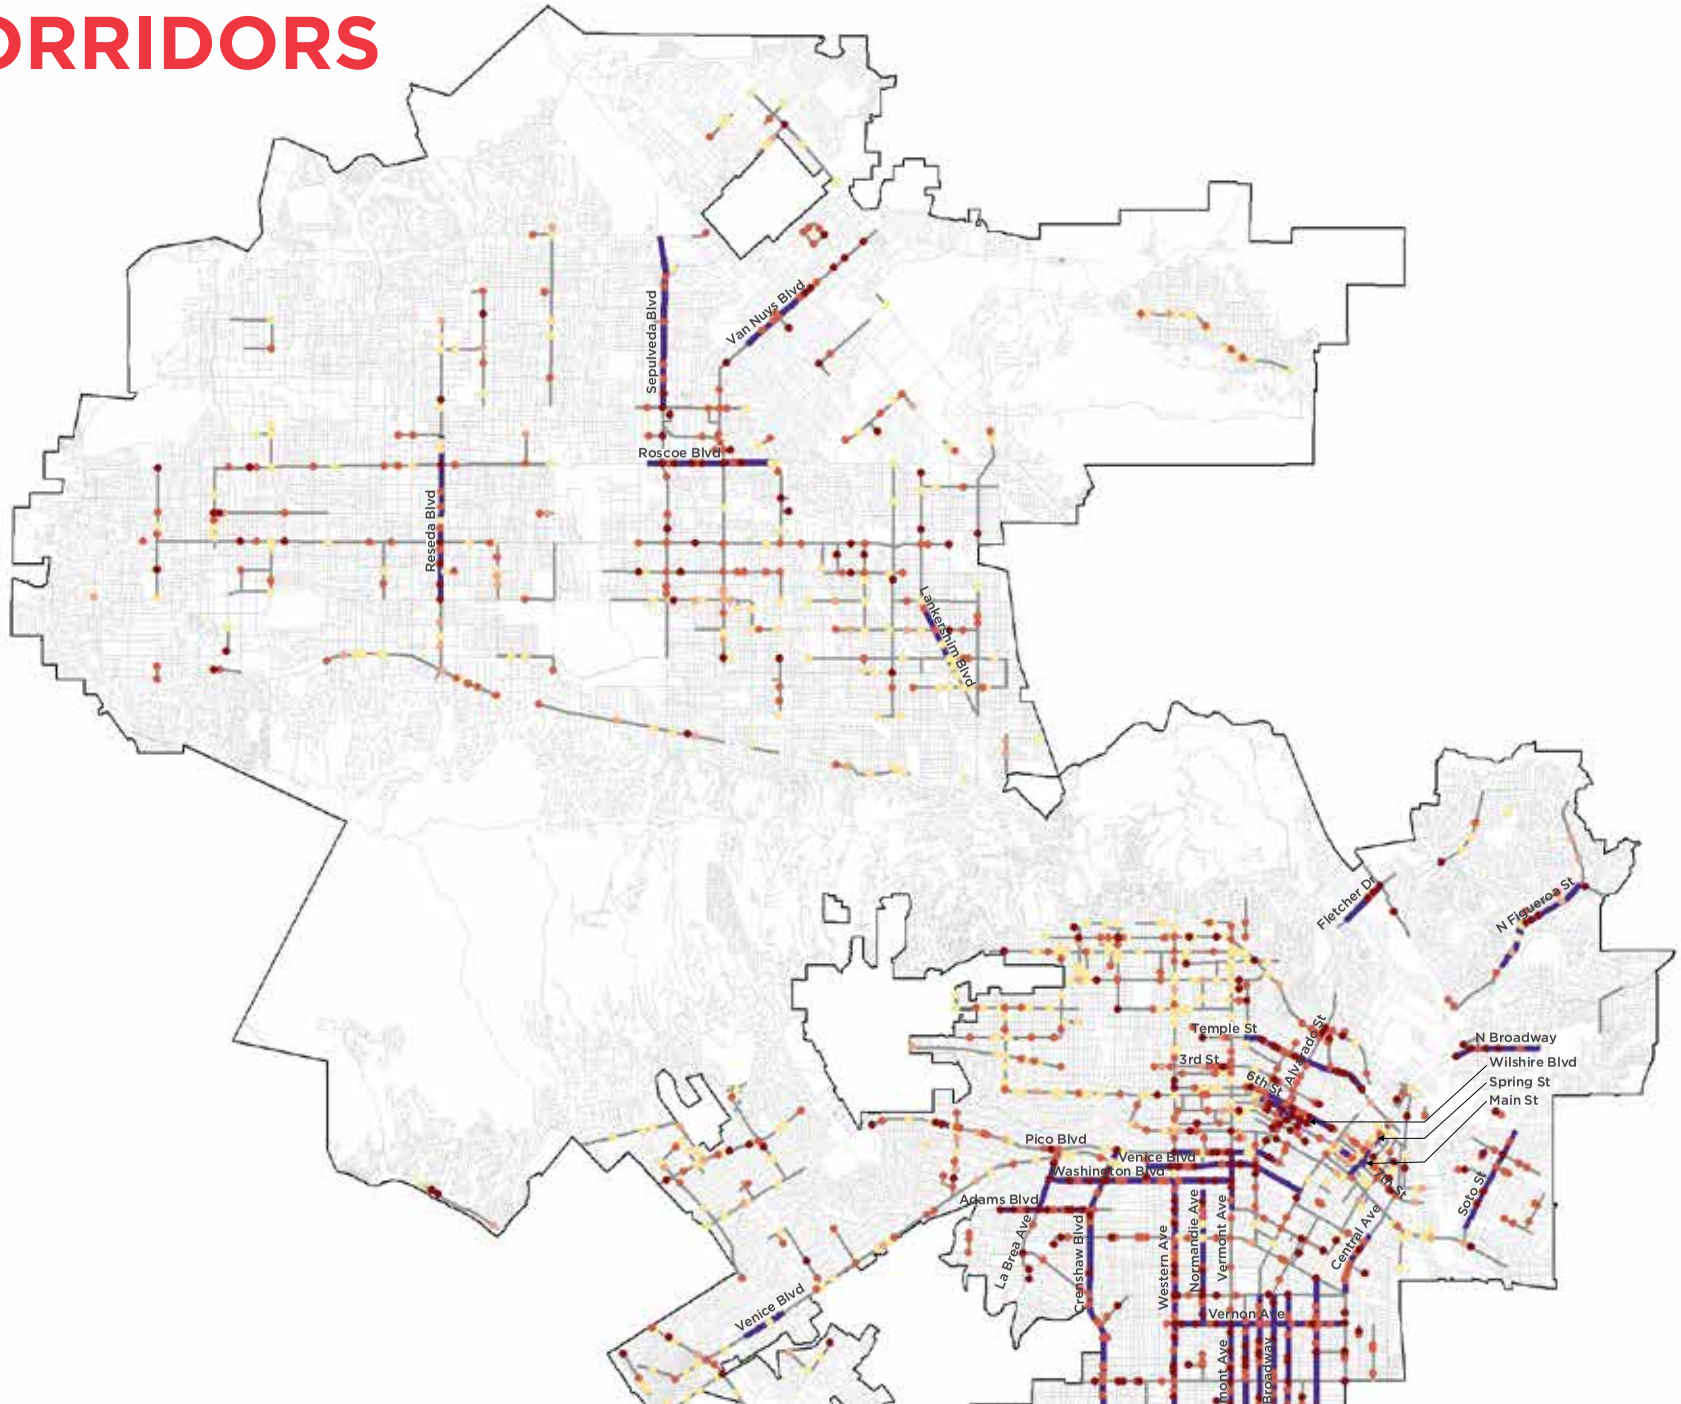
Severity: the total number of fatal or severe collisions at that intersection.

Vulnerability: the presence of a senior or a child walking or biking in a fatal or severe collision at that intersection.

Social Equity: the intersection's location in a community with negative health outcomes, as identified by the *Plan for a Healthy Los Angeles*'s Community Health and Equity Index.[9]

In addition to identifying priority intersections, we identified priority corridors based on clusters of the highest priority intersections. Analysis of these priority corridors found that they account for approximately 20 percent of all severe and fatal injuries for people walking and bicycling. Focusing our initial efforts to eliminate deaths on these corridors will allow us to reach our goal of reducing traffic fatalities by 20 percent by 2017.

The map on page 18 shows these corridors and intersections, which will inform deployment of resources in 2017. But this map is just a starting point. The project development process will include more detailed analysis and outreach before determining a final scope and limits of any engineering project on a priority corridor.



Additional data on the priority intersections and corridors can be found on the City's **GeoHub at visionzero.geohub.lacity.org.**

As the city with the most traffic deaths per capita, funding for solutions must match the severity of the problem. In fiscal year 2017, the City of Los Angeles allocated approximately $3 million to start our Vision Zero work. We have demonstrated an ability to use current resources effectively, but we will need significantly more funding to achieve our goals.

Intersection score = (# of fatalities * 1.5) + (# of severe injuries) + (child or senior either killed or severely injured walking and biking) + (in a community affected by negative health outcomes)

Projects That Work

We know what kind of projects will reduce traffic deaths. Our Vision Zero literature review has a detailed analysis of countermeasures that have been proven to save lives. For example, leading pedestrian intervals, which give a person walking a head start when crossing the street before vehicles enter the intersection, can reduce pedestrian collisions by up to 60 percent.[10] Cycle tracks, which separate people riding bikes from vehicles using a physical barrier like landscaping, are associated with a 95-percent reduction in risk of injury for people riding bikes compared with streets without biking infrastructure. Vision Zero will implement such proven countermeasures on our priority corridors to meet our benchmarks for 2017. We are committing to installing 180 high-visibility crosswalks near fifty schools on the High-Injury Network, building twenty-five concrete pedestrian islands, and completing twelve miles of street-design plans on the priority corridors by the end of 2017.

[10] Vision Zero Los Angeles, *Collision and Countermeasure Analysis: Literature Review* (Los Angeles: Los Angeles Department of Transportation, March 2016), 33.

Vision Zero in Action

This plan also complements the City's ongoing traffic-safety efforts. All City departments are constantly coordinating to deliver projects that improve traffic safety. For example, between 2013 and 2016, six of the High-Injury Network priority intersections underwent safety improvements and have demonstrated early successes in eliminating traffic deaths and serious injuries. Additionally, the City has secured funding for projects at an additional nine intersections on the High-Injury Network. The table below presents some examples of a larger body of projects that have been completed to improve traffic safety. Check the website as the City continues to provide project updates.

HIGH-INJURY NETWORK INTERSECTIONS: PROJECT EXAMPLES

STREET 1	STREET 2	PROJECT	CRASH-REDUCTION FACTOR
PROJECTS COMPLETED			
46th St.	Vermont Ave.	Full signal installed in 2013	25% reduction in pedestrian collisions
Beaudry Ave.	Temple St.	No left-turn sign installed in 2015	34% reduction in pedestrian collisions
Bonnie Brae St.	Olympic Blvd.	Full signal installed in 2013	25% reduction in pedestrian collisions
Century Blvd.	San Pedro St.	Lane reconfiguration completed in 2013	29% reduction in all collisions
Hollywood Blvd.	Highland Ave.	Pedestrian scramble	35% reduction in pedestrian collisions
Monroe St.	Virgil Ave.	Lane reconfiguration completed in 2014	29% reduction in all collisions
PROJECTS IN PROGRESS			
89th St.	Avalon Blvd.	Project planning in progress	
Alvarado St.	6th St.	Pedestrian scramble	35% reduction in pedestrian collisions
Alvarado St.	7th St.	Pedestrian scramble	35% reduction in pedestrian collisions
Avenue 41	Eagle Rock Blvd.	Rectangular rapid flashing beacon	50–80% increase in yield to pedestrians
Avenue 51	Figueroa St.	Full signal	25% reduction in pedestrian collisions
Bedford St.	Pico Blvd.	Full signal	25% reduction in pedestrian collisions
Manchester Ave.	Vermont Ave.	Protected-only left turn signal	99% reduction in left turn collisions
Patton St.	Temple St.	Rectangular rapid flashing beacon	50–80% increase in yield to pedestrians
Pico Blvd.	Wooster St.	Full signal	25% reduction in pedestrian collisions

Several early street-improvement projects have shown promising results for future Vision Zero interventions throughout Los Angeles. These successes will be the norm.

Since the installation of the scramble in November 2015, there have been zero deaths and serious injuries because of a collision.

HOLLYWOOD AND HIGHLAND SCRAMBLE

The recent safety improvement at Hollywood Boulevard and Highland Avenue is one example of an early win for Vision Zero. Prior to the intervention, Hollywood and Highland was averaging ten injury collisions per year. In November 2015, a scramble crosswalk was installed at the intersection. The scramble allows people to walk through the intersection in all directions while vehicles idle. When the signal changes, vehicles can make their movements without waiting for people to cross the street. Six months after installation, there were zero deaths or serious injury collisions. **In a broader study, scramble crosswalks have been shown to lead to a 35-percent reduction in vehicular collisions with people walking.**[11]

[11] Vision Zero Los Angeles, *Collision and Countermeasure Analysis: Literature Review* (Los Angeles: Los Angeles Department of Transportation, March 2016).

These treatments have resulted in up to a 60-percent reduction in vehicle collisions with people walking.

LEADING PEDESTRIAN INTERVALS

Leading Pedestrian Intervals give people walking a head start to cross the street before the light turns green for vehicles. This makes people more visible to drivers and reduces the chance of pedestrian-vehicle conflicts. As of 2016, twenty-two intersections throughout Los Angeles have been outfitted with Leading Pedestrian Interval signals. These treatments have resulted in up to a 60-percent reduction in vehicle collisions with people walking.[12]

[12] Vision Zero Los Angeles, *Collision and Countermeasure Analysis: Literature Review* (Los Angeles: Los Angeles Department of Transportation, March 2016).

PEDESTRIAN SAFETY PROJECT ON YALE STREET

Today, Yale Street provides safer access for people walking to nearby schools and the Gold Line Light Rail Station.

Yale Street in Chinatown received a makeover from the Bureau of Street Services as a part of the Safe Routes to School Strategic Plan. Street improvements included a raised landscape median, curb extensions, yellow continental crosswalks, Americans with Disabilities Act–compliant access ramps, roadway striping, and new signs. **Raised medians have been credited with up to a 46-percent reduction in vehicle collisions with pedestrians.** Curb extensions are proven to increase perceptions of safety and comfort for people crossing the street.[13] Today, Yale Street provides safer access for people walking to nearby schools and the Gold Line Light Rail Station.

[13] Vision Zero Los Angeles, *Collision and Countermeasure Analysis: Literature Review* (Los Angeles: Los Angeles Department of Transportation, March 2016).

VIRGIL AVENUE SAFETY PROJECT

In the two years since the project was installed, there have been zero fatal or serious injuries involving a person walking or biking.

The intersection of Virgil Avenue at Monroe Avenue was identified as a priority intersection because of a high number of collisions resulting in deaths and serious injuries. In 2014, the traffic lanes along the Virgil Avenue corridor, including the intersection at Monroe Avenue, were reconfigured to create a safe space for all modes of travel. In the two years since the project was installed, there have been zero fatal or serious injuries involving a person walking or biking. **Corridor-level safety projects, which typically involve a lane reconfigurations that better organize vehicular movements, can produce up to a 41-percent reduction in pedestrian collisions on problem corridors.**[14]

EQUITY AND ENGAGEMENT TOWARD VISION ZERO

All Angelenos deserve safe streets. Traffic deaths affect our communities more than traditional measures of crime, such as gang-related activity. In 2013, there were 201 traffic deaths in Los Angeles, compared with 149 gang-related homicides.[15] Nearly half of the streets on the High-Injury Network are neighborhoods with a greater percentage of children, seniors, people of color, immigrants, people with disabilities, or low-income households. A disproportionate percentage of serious and fatal collisions take place in Central and South Los Angeles, where people are more likely to walk, bike, or take transit as their primary mode of transportation.[16] The City's commitment to equity and engagement prioritizes communities that depend on a variety of travel modes.

[15] California Highway Patrol, "Annual Report of Fatal and Injury Motor Vehicle Traffic Collisions," years 2009–13 provided by the Statewide Integrated Records Systems (SWITRS), undated, https://www.chp.ca.gov/Programs-Services/Services-Information/SWITRS-Internet-Statewide-Integrated-Traffic-Records-System/SWITRS-2013-Report#2013section1.

[16] Los Angeles Department of City Planning, *Plan for a Healthy Los Angeles 2015: A Health and Wellness Element of the General Plan* (Los Angeles: Los Angeles Department of City Planning, April 2015).

The first step to addressing equity and engagement through Vision Zero is to build a deeper understanding of how social inequalities affect the health and safety of Angelenos. For example, race may affect the safety of people of color as they walk from place to place. In one study, blacks trying to cross the street had to wait 32-percent longer than whites because cars did not stop to allow them to cross safely.[17] Although health equity and social equity are directly related, they have different implications for safety on our streets. We must continue to better define and understand issues of social and health equity to support traffic safety in all our communities.

We can grow our understanding of these complex issues by building relationships with communities where health disparities are concentrated alongside social inequities such as poverty, unemployment, and crime. We will engage community members from the beginning of the project planning process and work to build trust. City staff will work side by side with community members to develop plans and identify grant opportunities that accomplish Vision Zero priorities. The City has already secured $500,000 from the State of California's Office of Traffic Safety for Community-Based Outreach and Education to implement the Vision Zero education campaign. The majority of these dollars will directly fund community-based organizations to help engage and educate on the topic of traffic safety along the priority corridors.

[17] Tara Goddard, Kimberly Barsamian Kahn, and Arlie Adkins, "Racial Bias in Driver Yielding Behavior at Crosswalks" (Portland, Oregon: Transportation Research and Education Center, 2014).

EQUITY

As part of our commitment to achieve equity in Vision Zero implementation, the City of Los Angeles commissioned the Prevention Institute to conduct an initial health-equity analysis that informed the development of this plan. The Prevention Institute is a national leader on the topic of health equity, which they define as "the commitment to ensuring that every person has an equal opportunity to be healthy and safe."

Their analysis evaluated our research methodology and planning efforts, and their findings led to recommendations to strengthen our work. The complete health equity analysis can be accessed at **visionzero.lacity.org/healthequity.zip**.

Recommendations from the analysis informed our approach to equity through Vision Zero. While these recommendations focused on health equity, we must also invest in strategies that promote social equity to avoid outcomes that negatively affect people of color. We have much more to learn and study on this topic. As a starting point, we commit to pursuing the following through the implementation of this Action Plan:

- Review best practices for data collection on information such as race, ethnicity, and income.
- Continue to connect additional data sources to link key environmental variables to traffic collisions.
- Include community partners in the evaluation of safety countermeasures and consider the context of individual communities throughout the City. Look at potential unintended consequences that could exacerbate inequities in communities of color and low-income communities during project evaluations.
- Continue to grow Vision Zero as a multicity department initiative that extends beyond a transportation-engineering effort.
- Adhere to the LAPD's commitment to unbiased policing in the implementation of Vision Zero–enforcement efforts.

ENGAGEMENT

Traffic safety affects all Angelenos, and everyone must be a part of the solution. Our mission is to serve the public and work side by side to solve problems by identifying issues, opportunities, and meaningful solutions. A fundamental value of Vision Zero is to maintain two-way communication at all stages: planning, design, implementation, and evaluation.

The City's engagement efforts will be tailored to suit the context of the neighborhood of each project area. However, all City-led Vision Zero street-design projects will adhere to a set of guidelines for community engagement that are currently in development. The City commits to working closely with the community to identify and ensure that community concerns are addressed in the research and planning process of a new Vision Zero project.

The City's evolving community-based outreach and education was informed by the development of the City's first Vision Zero Education and Outreach Strategy in April 2016.[18] Deploying this strategy will provide significant opportunities to tailor education activities in a culturally and context-sensitive manner. In 2017, the City will contract with local community organizations to conduct the first phase of outreach and education along ten miles of the Vision Zero priority corridors. This work will involve coordinating a street team for two-hundred hours of door-to-door engagement with at least five thousand people, developing a weeklong creative intervention along the street to bring awareness of the problems and reaching at least one million people through social and traditional media. This project will include a pre- and post-evaluation process to help measure success and impact.

While the start of this campaign will be funded by the State of California's Office of Traffic Safety, the City will need to identify a sustainable mechanism to support Vision Zero outreach and engagement efforts. Current and future strategies may include the following:

- Conduct robust, culturally competent, and linguistically appropriate outreach, engaging with community-based organizations to gain insight, learn strategies, and increase access to residents.
- Incorporate community engagement into future prioritization of specific Vision Zero project corridors.

[18] Julia Gould and Rachel Keyser, *Vision Zero: Education and Outreach Strategy* (Los Angeles: Los Angeles Department of Transportation, April 2016).

All Angelenos are invited to join in the dialogue on traffic safety as part of our Citywide education campaign and are encouraged to take action by making safe behavior a part of their everyday routine.

- Develop and scope Vision Zero projects through community-based participatory planning and design.
- Ensure funding is dedicated for community-based organizations participating in, supporting, or facilitating community engagement.
- Develop agreed-on individual project goals, potential benefits, safety improvements, mobility issues, and other considerations.
- Establish a project-notification list and centralized project clearinghouse to inform the public of project updates.
- Conduct open houses about the project, including breakout sessions where appropriate.
- Distribute a project information fact sheet to properties along any affected block face.

As we continue to refine our engagement strategy, we will draw on the City's recent successes in engaging with community members on project development. Below are three case studies that exemplify these efforts.

CASE STUDY 1: ACTIVE STREETS L.A.

Active Streets LA is a partnership between the City of Los Angeles, the Los Angeles County Bicycle Coalition, and T.R.U.S.T. South L.A. The program is developing a process that uses robust community input and engagement to shape the technical side of conceptual design for low-stress, neighborhood network street improvements for people walking and bicycling. This partnership-based model leverages the legitimacy, relationships, and community ties that localized community-based organizations bring to the table, in turn enhancing the conceptual design process and improving our responsiveness to complex community needs and experiences.

CASE STUDY 2: GREAT STREETS

In 2015, the Mayor's Great Streets Challenge Grant provided $200,000 to community groups for innovative, creative, and authentic community engagement around ideas for street improvements. Grant resources were used for demonstrating potential improvements to street corridors during community street festivals. Artists, small businesses, and local residents hosted engaging activities to draw their neighbors to the street, and then used the audience to educate attendees on the benefits of street transformations and collect surveys on preferences for improvements.

CASE STUDY 3: SAFE ROUTES TO SCHOOL GRANT APPLICATIONS

The City of Los Angeles Department of Transportation (LADOT) submitted four successful applications to the State of California's first cycle of Active Transportation Program (ATP) grants in 2014. These proposals were awarded $18.5 million in funds for Safe Routes to School infrastructure improvements around nine schools. The project development process was an unprecedented, interdisciplinary collaboration between LADOT staff; Department of Public Works, City Planning; school administrators, teachers, and parents; community members; City Council offices; Los Angeles Unified School District; and Los Angeles School Police Department.

We will also build on the recent planning efforts for the City's Mobility Plan 2035, the Plan for a Healthy Los Angeles, and Metro's plans such as its Connect US and First/Last Mile Strategic Plans. These efforts formed valuable relationships and gathered a wealth of community knowledge that will point us in the right direction. In addition, the City will continue to strengthen and form community partnerships to develop and deliver meaningful and accessible opportunities for community engagement.

Moore
Paints
PARK IN REAR

IMPLEMENTATION

The City of Los Angeles commits to working with our growing list of community organizations. Leadership and staff from Los Angeles County, our trauma hospitals, and key stakeholder groups, such as the growing Vision Zero Alliance, will be critical in achieving our Vision Zero goals.

Engineering

Streets should be designed to prevent fatal collisions to the greatest extent possible. Engineering improvements such as marked crosswalks, protected bike lanes, or enhanced signalization will improve safety for all road users.

Education

A key component to keeping our streets safe is to learn how to practice safe roadway behavior. New, widespread education efforts involving community partners will help to ensure everyone becomes a part of the culture of safety.

Enforcement

Achieving zero traffic deaths in Los Angeles would be impossible without holding everyone accountable to the laws that keep us safe. However, concern about equitable enforcement of the law is an ongoing national discussion. The City recognizes that an enforcement effort grounded in data will encourage equitable outcomes. Enforcement of Vision Zero will focus on the top driving behaviors shown to cause deaths and serious injury collisions.

Evaluation

Clear data about traffic safety problems and the efficacy of solutions are necessary to track, measure, and achieve our goals. Improving and expanding methods for data collection, analysis, and sharing will help the City to target improvements where they are needed most and deliver cost-effective results.

GOALS

Focusing our efforts on priority intersections and corridors will help us get to zero. The action items set forth in this plan are organized around four desired outcomes outlined below.

Create Safe Streets for All

People will make mistakes on our streets and sidewalks, but those mistakes should not be fatal. Smarter roadway designs reduce the likelihood of severe traffic collisions by improving visibility, separating traffic flows, and managing safe speeds. Evidence-based engineering projects will improve safety infrastructure to create secure, livable streets for all road users, especially the City's most vulnerable. Project planning will be a partnership among the City, its community partners, and, most importantly, the people living and working in each affected community.

Develop a Culture of Safety

Engineering and enforcement are crucial strategies must be employed to uphold the rules of the road that keep us safe. Detailed collision data will focus law enforcement and engineering strategies that change the behaviors that cause the deadliest collisions.

Whether walking, bicycling, or driving a vehicle, safety is everyone's responsibility. Educating about safe transportation behavior will help keep everyone safe on our streets. Partnerships with stakeholders such as community-based organizations, community leaders, and youth will help us spread the word that everyone needs to do their part to achieve Vision Zero.

Adopt New Policy and Legislation to Strengthen Safety

An updated legal framework will strengthen the foundation for reducing traffic fatalities. Vision Zero for Los Angeles will pursue local, state, and federal legislation that strengthens traffic safety policy and gives Los Angeles greater control of street safety.

Respond to Relevant Data

Understanding where and why fatal and severe collisions happen is crucial to Vision Zero. Determining priority streets and corridors allows the City to focus its efforts on reducing injuries and fatalities. Collecting and analyzing all relevant information, beyond the collision data, will improve the City's responsiveness in making changes in communities where they are needed most. Data transparency is also a great way to hold Vision Zero accountable to its commitment to equity and engagement. As the LAPD migrates its traffic-collision reporting to a digital system, the City will explore how to best make this information available to interested parties. The City remains committed to maintaining clear communication about its progress as it works toward zero fatalities.

ACTIONS AND STRATEGIES

BENCHMARKS	2017	2020	2025	Partners
Create Safe Streets for All				
Pavement preservation	• Digitize annual Street Services work plans to allow for better coordination with the Department of Transportation.	• Inspect and repair 100 crosswalks on the High-Injury Network.	• Inspect and repair 200 crosswalks on the High-Injury Network.	BSS, *LADOT*
Speed surveys	• Complete 100% of the expired surveys along the priority corridors, 75% of the High-Injury Network and 50% Citywide.	• Complete 100% of the expired surveys Citywide.	• Continue to keep all surveys active; evaluate need for new surveys.	LADOT, *LAPD*
Temporary street closures	• Provide annual Department of Water and Power work plan to allow for better coordination with other City departments; evaluate temporary sidewalk closure procedures.	• Update the Work Area Traffic Control Handbook (WATCH) to strengthen requirements for pedestrian and bicycle detours; update training modules to incorporate changes.	• Work to update state traffic control device standards to include more innovative safety treatments.	LADWP, LADOT
Bicycle network	• Identify bike network gaps during initial project development.	• Develop a system for pavement inspection/repair of bikeway facilities.	• Repair all bikeway facilities on the High-Injury Network.	LADOT, *BSS*
Traffic signs	• Maintain and upgrade speed limit signage.	• Upgrade the existing sign maintenance program.	• Create geocoded database of all department assests.	LADOT
Safe Routes to School (SRTS)	• Install 180 high-visibility crosswalks near 50 schools on the High-Injury Network.	• Complete 50 Safe Routes to School safety plans.	• Implement 50 Safe Routes to School safety plans.	LADOT
Speed mitigation around schools	• Install 11 school safety zones (15 miles per hour zone within 500 feet of school).	• Install 50 school safety zones.	• Install 100 school safety zones.	LADOT, *LAPD*
Capital safety improvements	• Build 25 concrete pedestrian islands.	• Prioritize 50 location candidates for capital projects.	• Prioritize 100 location candidates for capital projects.	BOE, *LADOT*
Street lighting	• Identify areas for lighting improvements (i.e., bus stops, mid-block crossings, and underpasses).	• Make lighting improvements on 50 percent of the High-Injury Network.	• Complete all lighting improvements on the High-Injury Network.	BSL, *LADOT*
Street design	• Complete 12 miles of street design plans.	• Complete 48 miles of street design plans.	• Complete 120 miles of street design plans.	LADOT
City design standards	• Update City design standards using Vision Zero principles.	• Update curb ramp standards.	• Identify and complete updates to additional design standards.	LADOT, BOE
Signal timing	• Optimize 400 traffic signals for all road users; pilot signal timing strategy.	• Optimize 1,600 traffic signals for all road users.	• Optimize all traffic signals for all road users.	LADOT

NOTE: Support agency in italics

ACTIONS AND STRATEGIES

BENCHMARKS	2017	2020	2025	Partners
Adopt New Policy and Legislation to Strengthen Safety				
Legislation to discourage speeding	• Consider legislation on automated speed enforcement.	• Develop speed-specific report to help legislative strategy and public buy-in.	• Explore red-light running mitigation strategies.	Mayor, *LADOT, LAPD*
Collision reporting	• Work with the State of California to improve the collision reports for more data on crashes (Form 555).	• Provide training for police officers on updated Form 555.	• Assess additional collision data needs and make appropriate changes to form.	Mayor, *LADOT, LAPD*
Traffic law compliance	• Develop a state legislative strategy that addresses violations that contribute to fatal and severe injury collisions.	• Incorporate Vision Zero education into DMV new driver material.	• Ensure that an environment that includes autonomous vehicles will prioritize safety for people walking and biking.	Mayor, *LADOT, LAPD*
Sustainable funding strategy	• Pursue Vision Zero mitigation fund for new developments along the High-Injury Network.	• Continue to incorporate Vision Zero principles in annual transportation budget.	• Identify and establish additional funding streams.	LADOT
Respond to Relevant Data				
Collision database	• Work with LAPD on a more streamlined hand-off of collision data; incorporate 2014–16 collision data to update the High-Injury Network.	• Continue to update the High-Injury Network annually.	• Expand collision data reporting to include weekly collision updates.	LADOT, LAPD, *LACDPH*
Using data	• Publish the top five traffic violations on the GeoHub. • Identify areas for education by LAPD's Community Relations Office and Community Traffic Services unit.	• Continue to add additional data overlays (e.g., race, ethnicity, income, alcohol outlet density, adjacent land use, crime hotspots)	• Expand use of GeoHub in Vision Zero project planning.	LADOT, *Mayor*
Consideration for data-driven enforcement strategy	• Emphasize traffic enforcement on major moving violations, especially those affecting youth and older adult victims; deploy enforcement and education units to high-risk intersections.	• Prioritize enforcement along High-Injury Network on the top collision factors that result in deaths and serious injury collisions.	• Reassess and prioritize enforcement along High-Injury Network on the top collision factors that result in deaths and serious injury collisions.	LAPD, LADOT *NOTE: Support agency in italics*

ACRONYMS

BOE: Bureau of Engineering
BSL: Bureau of Street Lighting
BSS: Bureau of STreet Services
DMV: California Department of Motor Vehicles
LACDPH: Los Angeles County Department of Public Health
LADOT: Los Angeles Department of Transportation
LADWP: Los Angeles Department of Water and Power
LAPD: Los Angeles Police Department

BENCHMARKS	2017	2020	2025	Partners
Develop a Culture of Safety				
Vision Zero Los Angeles education campaign	• Build a $2 million education campaign to bring awareness and create behavior change around collision factors such as speeding and impaired driving.	• Evaluate and continue education campaign.	• Create a national platform for Vision Zero.	LADOT, *Alliance, LACDPH*
Community partnerships	• Complete a $500,000 outreach campaign along Vision Zero priority corridors; continue to conduct meetings with the bicycle community and assist in the City's bicycle plan efforts.	• Develop policies, processes, and funding opportunities to support the participation of community leaders and community-based organizations in the development and implementation of Vision Zero.	• Incorporate Vision Zero messaging into outreach efforts for both City- and neighborhood-led projects.	LADOT, *Alliance, LACDPH*
Maximum media saturation for Vision Zero	• Leverage existing resources and community leaders (e.g., government leaders, City-owned assets, school-based materials, events).	• Secure public-private partnerships (e.g., public spokespersons, gas stations, repair shops, auto sales).	• Partner with a top business for a Vision Zero commercial for a major national TV event.	LADOT, *LACDPH*
Partnering with government organizations	• Continue school bicycle and pedestrian safety education programs that reinforce the rules of the road and teaches participants how to be more visible when walking, and bicycling.	• Work with driver's education providers to expand learning to "mobility education."	• Work with state legislators to incorporate mobility education, and specifically clarification about "jaywalking," into DMV license exams.	LADOT, *Mayor*
Partnering with insurance organizations	• Produce and distribute a "Road Map for Safety" that educates road users about safe ways to behave around key road features; promote use of existing driving behavior data technology.	• Partner on school-based parent/youth safety education.	• Incentivize parents to complete the safer driving training.	LADOT, *LACDPH*
Education on impaired driving	• Develop school curriculum about the dangers of distracted driving, driving under the influence, and how to stay safe walking/biking on campus.	• Deter impaired driving by targeting education and outreach at alcohol-serving establishments.	• Secure partnerships to incentivize people from driving impaired.	LADOT, *LACDPH*
Community building	• Identify and use cultural competency training for City staff with the support of community leaders; use cadets to disseminate traffic safety flyers on the High-Injury Network and COMPSTAT-identified areas.	• Develop and implement trust-building opportunities among law enforcement and low-income communities and communities of color, especially prior to deploying any additional traffic enforcement in the areas.	• Develop a "safe intersections" campaign.	LADOT, LAPD, *Alliance*
Partnering with technology	• Continue to build relationships with companies such as Waze and Google.	• Establish a Vision Zero technology fellowship.	• Work to prepare a safe road system for autonomous vehicles.	Mayor, *LADOT*
Partnering with trauma centers	• Work to identify survivors willing to share their stories.	• Create localized safety campaigns that share the personal stories of collision victims in each neighborhood.	• Collaborate on a way to help capture data on unreported collisions.	LACDPH, *LADOT*

RELATED PLANS AND STUDIES

Vision Zero is first and foremost a data-driven effort. To begin developing this plan, we conducted extensive data collection and analysis to better understand issues of traffic safety in Los Angeles. Vision Zero is also one of several complementary efforts focused on improving road safety, mobility, health, and livability in Los Angeles. Related plans and efforts that provided background to the Vision Zero Action Plan are highlighted below. A full text version of each document is available on our website **visionzero.lacity.org**

VISION ZERO LAUNCH DOCUMENT

The Vision Zero launch document is an introductory document to the Vision Zero Initiative for Los Angeles. It provides a snapshot of important information on data, the planning process, and organizational structure.

Behaviors most associated with severe and fatal collisions in Los Angeles are speeding, insobriety, and failure to yield.

VISION ZERO SAFETY STUDY AND TECHNICAL ANALYSIS

We conducted a Safety Study in March 2016 to summarize what we learned from the analysis of our collision landscape. The study analyzed the most recent and available data of reported collisions (2009–13; as validated by the State of California) to identify trends in terms of where, how, why, when, and to whom collisions are happening.

Who: Pedestrians, Bicyclists, and Motorcyclists

Fatal and severe collisions in Los Angeles disproportionately affect people who walk and ride bikes, as they are physically more exposed than people in vehicles. While people walking and bicycling are involved in 14 percent of all collisions in the City, they account for almost 50 percent of traffic deaths. Motorcycle riders are also at greater risk; they are present in only 3 percent of collisions but account for 15 percent of all traffic deaths.

Who: Drivers

The majority of drivers in severe and fatal collisions involving vulnerable road users are men. However, hit-and-runs account for more than one out of five severe and fatal collisions involving pedestrians or bicyclists. Hit-and-runs make it difficult to accurately track data about drivers involved in collisions.

Where

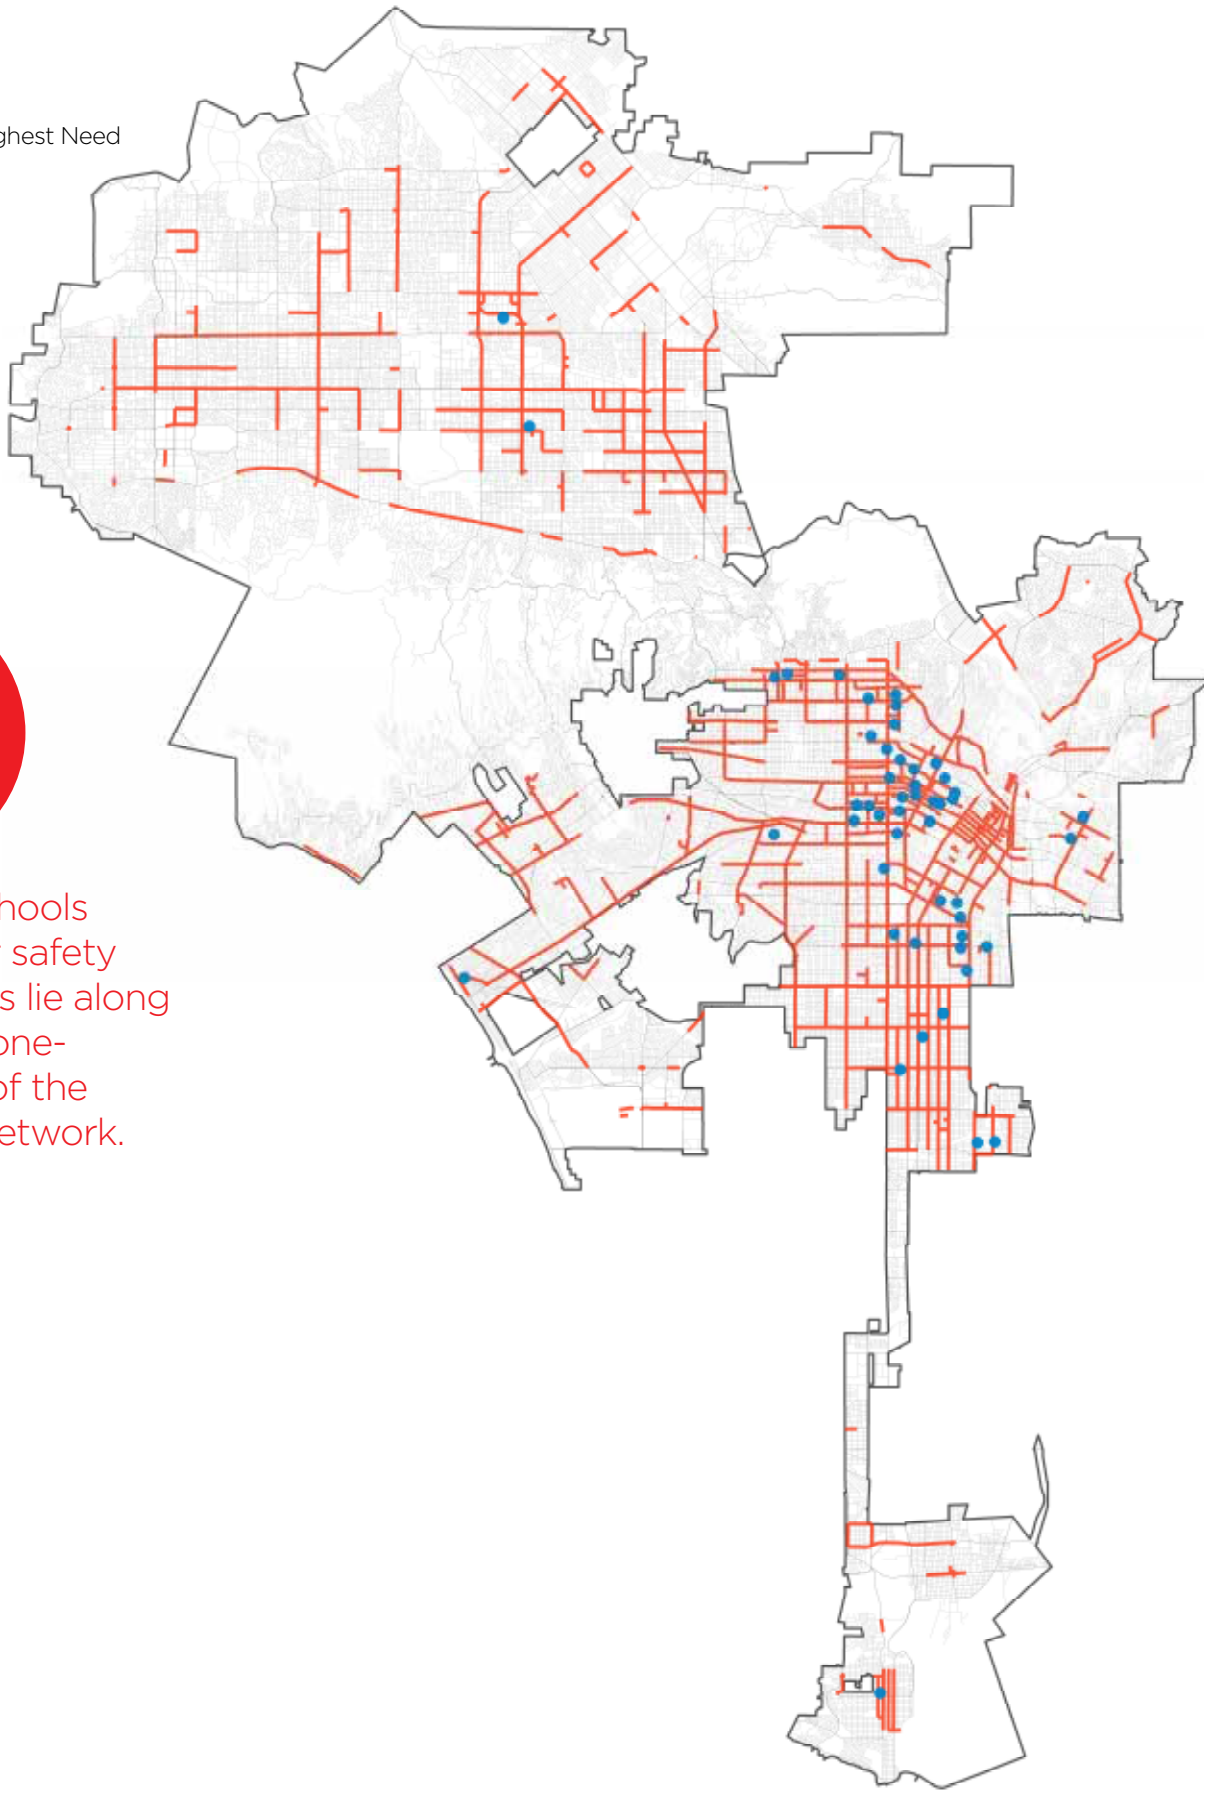
Many fatal and serious collisions take place along major arteries and at the intersections of large two-way streets where drivers, pedestrians, and cyclists compete for space.

How

Behaviors most associated with severe and fatal collisions in Los Angeles are speeding, insobriety, and failure to yield.

Why

Collisions occur on our streets for many reasons. Our collision analysis informed us where and why collisions occur. Through this analysis, we developed "collision profiles," a group of collisions with similar contributing factors, that helped us identify physical design interventions (countermeasures) that would be most effective at addressing the collisions. For example, a solution for frequent left-turn conflicts at crossing signals might be a Leading Pedestrian Interval.



When

In Los Angeles, the highest number of all collisions take place between 3:00 p.m. and 6:00 p.m. However, serious and fatal collisions are highest between 6:00 p.m. and 9:00 p.m.

COLLISION AND COUNTERMEASURE ANALYSIS: LITERATURE REVIEW

This literature review was conducted to identify best practices in the analysis and implementation of Vision Zero–related efforts. The report investigates the collision-reduction efforts of four peer cities to uncover techniques and strategies proven to be effective for Vision Zero projects.

100%

of the fifty schools prioritized for safety improvements lie along or fall within one-quarter mile of the High-Injury Network.

The Safe Routes to School Action Plan details key actions that will be taken at each of the Top 50 school locations where there is the greatest need.

SAFE ROUTES TO SCHOOL ACTION PLAN

Safe Routes to School is a key initiative in implementing Vision Zero. The plan applies a data-driven prioritization methodology to identify the Top 50 Schools with the greatest need for traffic safety improvements in Los Angeles. All of the Top 50 schools are within one-quarter mile of the High-Injury Network.

The Safe Routes to School Action Plan details key actions that will be taken at each of the Top 50 school locations, while also looking to scale City- and district-wide by 2025. Below is a summary of key strategies and actions from the Safe Routes to School Action Plan.

Key Strategies and Actions

CREATE SAFE STREETS FOR ALL

- Conduct safety assessments and prepare Safe Routes to School Plans for each of the Top 50 schools and ultimately for every Los Angeles Unified School District school.
- Install near-term safety improvements, such as crosswalk upgrades, wherever feasible.

DEVELOP A CULTURE OF SAFETY

- Develop two targeted campaigns specific to school populations to build awareness.
- Support the Walk to School Day Program and promote "Keep Walking!" activity guides.

ADOPT NEW POLICY AND LEGISLATION TO ADDRESS SAFETY

- Formalize data-exchange agreement between the City of Los Angeles and Los Angeles Unified School District.
- Install Safety Zones at all elementary and middle schools.

RESPOND TO RELEVANT DATA

- Complete a youth data analysis memorandum.
- Scope an approach to Citywide Travel Tally data collection.

HOSTEL

Vision Zero and You

Everyone has a role to play in traffic safety. From the choices you make while moving through Los Angeles to the conversations you have with a neighbor, we must all do our part to save lives. Organizations and individuals have actively worked toward creating safe streets and healthy communities in Los Angeles. Many more groups and residents are getting involved in this work every day to make Los Angeles a safer place to walk, bike, take transit, and drive.

But the City cannot accomplish this alone. To support a collective effort, the City of Los Angeles has engaged with a diverse group of organizations and individuals to partner on the road to Vision Zero. The American Automobile Association has been a key member of our Vision Zero Task Force and Education Subcommittee. We hear from parents, teachers, and principals about safety near schools through our Safe Routes to School program. Several community-based organizations have united to form the Los Angeles Vision Zero Alliance, a coalition of diverse organizations and individuals working in partnership with the City of Los Angeles to realize Vision Zero. The group is helping to bring together community members with a wide range of strengths, interests, and skills to develop a united constituency for safe and equitable streets.

Be part of the solution: Join the Vision Zero Alliance, spread the word, or attend an event.

HOW CAN YOU GET INVOLVED?

Join the Los Angeles Vision Zero Alliance.

FOCUS GROUPS

While developing this plan, we shared collision data and collected initial input from key stakeholders to better understand the ground-level experiences of those affected by traffic-safety issues.

From July through August 2016, we conducted focus groups of community stakeholders throughout Los Angeles to learn about Vision Zero, exchange information about traffic safety issues, and identify potential solutions and partners. Ten geographically based meetings with residents and neighborhood-level leaders occurred throughout the City. At each meeting, participants responded to the High-Injury Network data, shared traffic safety issues affecting their communities, and identified potential strategies for improvement through engineering, education, evaluation, and enforcement.

Additionally, we conducted four topic-based meetings with the Vision Zero Alliance, medical/public health organizations, City legislation/policy staff from partner departments, and community leaders representing vulnerable communities. These participants also responded to the High-Injury Network data and shared their experiences and ideas for how to connect their related efforts to the Vision Zero initiative.

The following is a summary of meeting locations and groups. A full, narrative summary of each meeting can be found on the Vision Zero website at visionzero.lacity.org/focusgroups2016.

26 APPENDIX: LIST OF SAFETY COUNTERMEASURES

EXECUTIVE SUMMARY

This report documents findings from a literature review and peer agency interviews conducted to investigate current best practices in data-driven traffic collision analysis and collision reduction efforts for the Vision Zero Los Angeles Safety Study.

With assistance from Fehr & Peers Transportation Consultants, staff at the Los Angeles Department of Transportation (LADOT) reviewed relevant literature to determine the most robust collision analysis methodologies, the most effective engineering countermeasures, and the most productive public outreach strategies. Staff also interviewed four peer agencies in three cities and one state to better understand how collision analysis and reduction efforts are implemented in practice.

This report is organized into three sections: Collision Data Analysis; Safety Countermeasures; and Key Partners. Each section summarizes the relevant literature and expands on the insights from the peer agency interviews. The conclusion at the end of the report describes how the findings will inform the next steps for the Vision Zero Los Angeles Safety Study.

Key findings for each section are summarized in the following pages.

Collision Data Analysis

Although peer cities conduct multi-variate collision analyses, many of their implementation decisions are driven by simpler statistical analyses and in-depth study of specific priority locations. Some of the collision analysis findings are very consistent across agencies and academic studies, and the City of Los Angeles anticipates the same or similar results:

Speed is a very common contributing factor for collisions resulting in severe and fatal injury

Most collisions occur on arterials

Left turns and right turns are extremely common factors across all collisions

Driving under the influence is a common contributing factor for collisions resulting in severe and fatal injury

Agencies take different approaches to designating high-priority locations, with some focusing more on corridors and others prioritizing intersections. To identify high-priority locations, agencies aggregate data in a variety of ways, typically based on some measure of crash rate per distance or user. The collision history at priority locations is then investigated further to help define which countermeasures are selected. The first outcome of the Vision Zero Los Angeles Safety Study will be a prioritized list of locations for safety projects.

Data assembly and analysis is challenging for every agency, but the process is considerably easier when data are collected and maintained in-house. The City of Los Angeles will continue to assemble and refresh data as a goal to make future analysis more efficient.

Safety Countermeasures

The second major element of the Vision Zero Los Angeles Safety Study includes "countermeasure pairing," the process of identifying the physical design and engineering countermeasures that would most effectively address each "collision profile," a group of collisions with similar contributing factors.

The Federal Highway Administration is the leading source of peer-reviewed, robust research to understand the effects of safety countermeasures on collisions. Countermeasures are typically organized by mode but will often improve the safety for all modes of travel.

Rather than focus on reducing the incidence of all collisions, the City will prioritize its efforts on the types of collisions that are more likely to result in a severe or fatal injury.

Each interviewed agency uses data analyses differently to guide countermeasure pairing and infrastructure investment. Collision analyses, both univariate and multi-variate, are generally used to define programmatic interventions, such as policy changes in speed limits, the use of automated enforcement, roll-out of Leading Pedestrian Intervals (LPIs) or count-down timers, and installation of additional street-lighting.

Key Partners

Public Outreach
All agencies conduct public outreach at various stages of the process. New York City, Seattle and Chicago hold public meetings to help shape the development of specific plans or projects.

New York City Department of Transportation (NYCDOT) incorporates some public input in its selection of priority locations. However, when soliciting input online, the highest levels of engagement came from areas that were overall more educated, wealthy, and active in civic processes and therefore not representative of the areas of the city with low levels of engagement but high incidence of serious and fatal collisions. Recognizing this disparity, NYCDOT relies primarily on the results of data analysis to determine high-priority locations. Public comment was found to be most helpful augmenting patterns and trends revealed in the data analysis.

Education & Enforcement
All four agencies conduct education/ enforcement efforts in partnership with their police departments, which take the form of high-visibility public education coupled with enforcement.

The New York Police Department (NYPD) has been particularly effective reducing severe and fatal crash injuries by aligning enforcement efforts with the results of their data analysis. Recognizing that speeding and failure to yield were common collision factors among severe and fatal injuries, NYPD has launched a citywide campaign against these dangerous driving behaviors.

Next Steps

The City will continue to develop the database that includes all collisions in the most recently available ten-year period, as well as key environmental variables These data, currently available on the City's GeoHub (*geohub.lacity.org*), will be continually updated as new information becomes available.

The purpose of the forthcoming Vision Zero Los Angeles Safety Study is twofold. First, the City will identify a list of prioritized locations along the High Injury Network (HIN) for the development of safety projects.

The second major element of the analysis includes "countermeasure pairing," the process of identifying the physical design and engineering countermeasures that would most effectively address each "collision profile," a group of collisions with similar contributing factors.

At the priority locations, the City will work with local communities to scope detailed projects using the identified collision profiles and appropriate countermeasures.

INTRODUCTION

On August 24, 2015, Mayor Eric Garcetti launched Executive Directive 10, *Vision Zero*, with the goals of reducing citywide traffic deaths by 20 percent by 2017 and eliminating all traffic deaths by 2025. To meet these ambitious targets, the City has adopted a data-driven approach, focusing efforts where they are likely to have the most effect on reducing severe and fatal crash injuries.

This data-driven approach begins with a review of successful strategies. LADOT staff has reviewed the literature to determine the best collision analysis methodology for Los Angeles and summarized the effectiveness of various safety countermeasures.

In addition to the literature review, LADOT staff interviewed four peer agencies whose publications and plans related to Vision Zero are most relevant for Los Angeles' approach to reducing severe and fatal injuries. Although Los Angeles is a relatively early adopter of Vision Zero, many other cities have been employing innovative safety strategies and have already seen impressive gains. The following page includes a short description of each agency's Vision Zero effort.

The rest of this report is organized into three sections: Collision Data Analysis; Safety Countermeasures; and Key Partners. Each section summarizes the relevant literature and expands on the insights from the peer agency interviews. The conclusion at the end of the report describes how the findings will inform the next steps for the Vision Zero Los Angeles Safety Study.

New York City Department of Transportation (NYCDOT)

New York City is a national leader in Vision Zero and broader pedestrian and bicycle safety interventions. The *NYCDOT 2010 Pedestrian Safety Study and Action Plan* details the City's comprehensive multivariate collision analysis and provides recommended countermeasures to address the crash patterns identified in the analysis. This document, along with borough-specific pedestrian safety action plans released in 2015 and complementary outreach and implementation efforts, set the standard for Vision Zero initiatives.

Seattle Department of Transportation (SDOT)

Since 2008, Seattle has released an annual report with an increasingly comprehensive descriptive analysis of the City's collision data. Additional reports produced by the City emphasize data-driven solutions to collision challenges and project implementation, including the *Road Safety Action Plan*, the *Pedestrian Master Plan, the Bicycle Master Plan*, and before/after evaluations of implemented projects. Seattle also has a comprehensive citywide collision database that it plans to use to undertake a multi-variate collision analysis in the coming years.

Chicago Department of Transportation (CDOT)

Chicago completed a pedestrian crash analysis in 2011 and a bicycle crash analysis in 2012, followed by several implementation-oriented studies including the *Chicago Pedestrian Plan* and the *Chicago Forward Action Plan*. The *Chicago Pedestrian Plan* introduced a "zero in ten" policy, which functioned as a predecessor to Vision Zero by setting a goal of reducing traffic-related fatalities and severe injuries to zero within ten years. Recent implementation-focused initiatives include a roll-out of automated speed and red-light camera enforcement, as well as the accelerated construction of protected bicycle facilities.

Florida Department of Transportation (FDOT)

The Florida Department of Transportation has an ongoing initiative to reduce collisions, injuries, and fatalities on its roadways across all modes. Recent third-party reports have used robust statistical analysis to identify collision trends and pair effective safety countermeasures. The *Pedestrian and Bicycle Strategic Safety Plan* emphasized pedestrian and bicycle safety.

COLLISION DATA ANALYSIS

The first major step of the Vision Zero Los Angeles Safety Study includes assembling a comprehensive collision database and conducting an analysis to better understand trends and patterns, a process that will culminate with a list of prioritized project locations. The literature review and peer agency interviews helped identify current best practices in collision data assembly and analysis.

The literature differentiates collision analysis into multiple types: collision risk, collision frequency, collision severity, and collision contributing factors. There is extensive research on the wide range of statistical analysis methodologies developed for each of these purposes, summarized in published reviews by Lord and Mannering (2010), Savolainen et al (2011), and Mannering and Bhat (2014). Additional research focuses on identifying the most appropriate statistical model to tackle specific collision questions related to collision risk and frequency, collision severity, contributing collision factors, or contributing roadway design factors for one or more modes (Kim et al., 1995, Poch and Mannering, 1996, Wang and Nihan, 2004, Schneider et al., 2010, Zhang et al., 2012, Aziz et al., 2013, Sasidharan and Menendez, 2014).

Despite this wide breadth of statistical methodologies in the literature, many of the implementation decisions of peer cities are driven by simpler statistical analyses and in-depth study of specific priority locations. The type of priority location is also different for each peer city. Some identify intersections, corridors, and areas, while others primarily look at corridors and include intersection treatments within those corridors. After choosing the type of high-priority location, agencies aggregate data in a variety of ways, typically based on some measure of crash rate or injury rate per distance or user.

The work of the collision analysis begins by collecting and assembling data. Interviews with peer cities revealed that this is challenging for every agency, but the process is considerably easier when data are collected and maintained in-house. In partnership with the Los Angeles County of Public Health, the City is currently developing a database that includes all collisions in the most recently available ten-year period, as well as key environmental variables, many of which are highlighted here in the literature review and summary of peer agency interviews.

Peer Agency Interviews

This section summarizes the collision data assembly and analysis processes described by the four peer agencies during their interviews. No single agency has established a process that would be entirely transferable to Los Angeles, but elements of their different approaches helped inform the methodology developed for Los Angeles. Conversations with the peer agencies shaped how the collision database variables are constructed, how the collision data are categorized and represented, and what parameters are used to guide the hierarchical clustering analysis.

New York City Department of Transportation (NYCDOT)
New York City was one of the first U.S. cities to adopt a Vision Zero policy, and New York City Department of Transportation is at the forefront of collision analysis. In 2010, they released the *New York City Pedestrian Safety Study & Action Plan* and accompanying Technical Document. The report presents findings from a descriptive collision analysis and multi-variate collision analysis, which was employed to develop crash profiles based on collisions characteristics and features of the built environment where the collisions occurred. In this report, and in reports released thereafter, there is significant focus on the importance of the physical characteristics of the streets, which help guide the project development process for addressing the collisions at a particular intersection, corridor, or area.

In the interviews with NYCDOT, staff also emphasized the citywide socio-demographic factors that were found to be associated with higher pedestrian crash frequencies through the multi-variate analysis. For example, New York City neighborhoods with higher percentages of minority residents also have a higher likelihood of collisions resulting in someone being killed or severely injured while walking, even though minorities themselves are not overrepresented in those collisions citywide. Individuals with less education and those who are foreign born have a higher likelihood of being hit by a car while walking. Asian Americans over 65 years of age have almost twice the pedestrian fatality rate of non-Asian American seniors.

In 2015, NYCDOT released five borough-specific updates to the collision analysis and implementation process. These reports identify priority corridors, intersections, and areas for each borough based on the levels of serious and fatal injury collisions within a given borough (e.g., corridors in Manhattan are not compared to corridors in Staten Island). Priority locations were identified by ranking corridors by pedestrians killed or severely injured from collisions per mile and intersections by total number of pedestrians killed or severely injured from collisions.

In the past, NYCDOT has experienced a lag in receiving collision data from the state, limiting the availability of up-to-date collision information. However, in 2016 the New York Police Department (NYPD) is moving to electronic data collection. The creation of data capture fields has been closely coordinated with NYCDOT to ensure that the important data for identifying collision trends is captured and easily transferred in real time for Vision Zero analysis. This will essentially eliminate the data lag, and NYCDOT highly recommends other Vision Zero cities pursue this with their police departments.

Seattle Department of Transportation (SDOT)
SDOT completed a pedestrian collision analysis in 2006 which compared 2006 collision data to a five-year average from 2001-2005. The City completed a pedestrian and bicycle collision analysis in 2007 which compared 2007 collision data to a five-year average from 2002-2006. Since these analyses, in compliance with a section of the municipal code requiring annual reporting on traffic collisions, SDOT has released annual Traffic Reports beginning in 2008, which summarize all traffic collision data for the previous year, organized by mode. These reports provide a descriptive analysis of current year trends compared to trends across previous years. The most recent analysis was released in 2014 and looks at 2013 data.

SDOT is also in the process of completing a multi-variate collision analysis using ten years of historic bicycle and pedestrian data. One initial finding from this analysis, which SDOT staff shared during the interview, is an unexpectedly high number of severe bicycle collisions occurring on steeply graded streets. The preceding action of the collision was often a vehicle making a left turn and failing to yield to an oncoming bicyclist. SDOT staff surmised that the drivers might be misjudging the bicyclists' speed of travel as they ride downhill. Another finding from the SDOT analysis was that although most pedestrian collisions occur at intersections, mid-block pedestrian collisions are more severe.

SDOT currently identifies priority corridors based on a corridor-level crash rate of total crashes per million vehicles entering the corridor, using a screenline count for each corridor. Priority corridors are defined as 1.5 standard deviations above the City's mean collision rate. Differing lengths of corridors complicates this process, and staff are working to develop an approach that takes corridor length into account.

SDOT differs from the other peer agencies interviewed in that they receive collision data directly from the Seattle Police Department and maintain collision records at the city level. They also maintain and update all built environment data in an in-house database, which significantly reduces the effort of assembling and cleaning data. This allows for regular updates to the analysis and for new analyses to be undertaken rapidly. The biggest challenge is the sheer quantity of data that needs to be sifted through for any given analysis.

Chicago Department of Transportation (CDOT)
Two documents establish the foundation of Chicago Department of Transportation's crash reduction efforts: a pedestrian collision study in 2011 and a bicycle collision study in 2012. The analyses are primarily descriptive and include some spatial components to identify corridor and intersection hotspots.

CDOT undertakes additional data analysis as part of its implementation process for specific programmatic efforts. For example, Chicago has a speed camera and red light camera program, which rely on data analysis to determine where the cameras will be installed.

From the 2011 collision analysis and annual updates, CDOT prioritizes high-crash corridors based on the total number of pedestrian crashes per mile, with fatal and severe injury crashes receiving higher weight than other crash types.

CDOT encounters the same challenges in collision data delay experienced by New York City. Collision data come from the state, and they are made available up to two years after the calendar year concludes. Therefore, CDOT's collision data analysis has been limited and currently does not include any multi-variate analysis. The department aims to pursue this in the future.

Florida Department of Transportation (FDOT)
Florida Department of Transportation is the lead state agency for Pedestrian and Bicycle Safety. FDOT differs from the other three peer agencies in its geographic scale, conducting collision analyses at both the state and city level. Despite the differences of scale, however, we found that many of the lessons from FDOT mirror those from the other peer agencies.

FDOT's data analysis efforts are driven by the overarching goal of reducing severe and fatal injury crashes for all modes by five percent per year from the preceding five-year average, starting with 2006-2010 as the baseline. FDOT collects, analyzes, and reports on data-driven trends both internally and externally. Data are contained within a web-based geographic information system (GIS) that allows internal users to pull reports for specific geographies based on specific data features, including collision types and environmental factors. FDOT generates regular reports for particular types of crashes, such as nighttime collisions, and for particular corridors where a crash problem has been identified.

In December 2013, FDOT published the *Comprehensive Study to Reduce Pedestrian Crashes in Florida*. This report examined pedestrian crash data from 2008-2010 (a total of 6,434 crashes) and identified collision patterns using two types of analysis: a mixed logit model and a Kernel density clustering analysis to identify collision hotspots throughout the state. The report also presented countermeasures that most effectively pair with specific types of collisions in certain roadway contexts.

Fifteen variables were included in the mixed logit model, capturing a variety of crash factors and environmental factors. Overall, the analysis found that while the majority of pedestrian crashes occurred in urban areas, fatal crashes were disproportionately high in rural areas, and the proportion of all crashes that were fatal decreased with urbanization.

In addition to the *Comprehensive Study to Reduce Pedestrian Crashes in Florida*, FDOT has released several other reports related to collision analysis. The 2013 *Florida Pedestrian and Bicycle Strategic Safety Plan* includes a preliminary crash analysis with descriptive statistics only and sets priority counties based on the highest number of pedestrian fatalities and injuries between 2007 and 2011.

SAFETY COUNTERMEASURES

Vision Zero literature stresses changing the overall strategy from reducing crash incidence to reducing injury severity and shifting the burden from the individual road users to the cities and their roadway design (Belin et al 1997, Tingval and Haworth 1999). Rather than focus on reducing the incidence of all collisions, the City will prioritize its efforts on the types of collisions that are more likely to result in a severe or fatal injury. Therefore, an intersection with fewer serious and fatal injuries, even if there are more total crashes, is an acceptable outcome of Vision Zero interventions.

To this end, the second major element of the Vision Zero Los Angeles Safety Study (after the project location prioritization) includes "countermeasure pairing," the process of identifying the physical design and engineering countermeasures that would most effectively address each "collision profile," a group of collisions with similar contributing factors. The Vision Zero Los Angeles initiative will use a hierarchical clustering to develop these LA-specific collision profiles, based on variables assembled in the data analysis process. This methodology, assessed in research by Depaire, Wets and Vanhoof (2008) and Anderson (2009), is similar to regression analysis in that it identifies how variables interact, but it is simpler to implement and more efficiently employed with large datasets.

Significant research has been conducted to better understand and quantify the safety effects of specific countermeasures (Schneider et al., 2010, Chen et al., 2011, Chen et al., 2014). Safety researchers consistently identify reducing speed as the primary countermeasure to collisions that result in severe or fatal injury, arguing that the road system was designed for a higher level of force than can be tolerated by human physiology without sustaining injury or death (Belin et al., 1997, Tingval and Haworth., 1999, Johansson, 2009).

Refer to the Appendix for a comprehensive list of safety countermeasures, along with summaries of effectiveness research.

Peer Agency Interviews

This section summarizes the countermeasure pairing and project implementation processes described by the four peer agencies during their interviews. No single agency has established a process that would be entirely transferrable to Los Angeles, but elements of their different approaches will help inform the methodology developed for Los Angeles. Conversations with the peer agencies will shape which countermeasures are selected, how the countermeasures are applied, and what parameters are used to prioritize project locations.

New York Department of Transportation (NYCDOT)
NYCDOT released a *Vision Zero Action Plan* in 2014 and a *Vision Zero Year One* progress report in 2015. The 2015 report discusses the actions NYCDOT took within the first year of Action Plan implementation. Additionally, NYCDOT recently released the five 2015 Borough Pedestrian Action Plans, which serve as the primary guiding documents for each borough to implement countermeasures. The Borough Plans summarize the pedestrian collision analysis; identify priority corridors, intersections, and areas; highlight the outreach undertaken within the borough (discussed more in the following section); and present engineering, education, and enforcement countermeasures.

The identified countermeasures are largely informed by the overall findings from the 2010 and 2015 collision analyses, which point to systemic safety challenges that must be addressed at the policy level with changes such as speed limits and redirected enforcement priorities. Specific location-countermeasure pairing occurs during the implementation process on a case by case basis, once the priority areas, corridors, and intersections undergo scoping for design change. This allows for engineering judgement, feasibility considerations, and the needs and desires of the community to be considered in project definition.

Overall, NYCDOT has aggressively targeted speeding via the use of automated enforcement, signal timing updates to align with a 25 mph speed limit, aggressive ticketing, and additional speed limit signs. The department has also installed leading pedestrian intervals and pedestrian street lighting on a programmatic scale.

Researchers have investigated the safety benefits of certain adopted countermeasures in New York City using before and after data and treatment/control groups. For example, Chen et al (2011) evaluated the effects of on-street bicycle lanes, finding that the installation of bicycle lanes did not lead to an increase in collisions in New York City. The study compared data from time periods before and after the installation of bicycle lanes on the streets where lanes were constructed and on streets where no new facilities were added. Chen et al (2014) found that intersections with Barnes' Dance phases (all-way pedestrian crossings or "scrambles") had fewer pedestrian-involved crashes than those without, but in some cases had more multiple vehicle crashes, controlling for built environment characteristics.

Seattle Department of Transportation (SDOT)

Once SDOT identifies priority corridors, the agency pairs specific countermeasures during the implementation process on a case by case basis. This allows SDOT to factor in engineering judgement, feasibility considerations, and considerations of the needs and desires of the community. Overall, the department has taken an aggressive approach to reducing speed via road diets and lane narrowing.

Also guiding the implementation of countermeasures are several plans published between 2009 and 2015 that demonstrate additional efforts to reduce collisions in Seattle. In 2007, the city passed an ordinance adopting a Complete Streets policy. The subsequent 2009 *Pedestrian Master Plan* includes some safety-related goals, but it does not establish explicit targets for crash reduction. Similarly, countermeasures are included in a toolbox of strategies, but they are not specifically tied to locations where they would be most effective.

The 2012 *Road Safety Action Plan* identifies the goal of zero traffic-related fatalities and injuries by 2030 and organizes strategies to reach this goal into six focus areas. One of these focus areas includes engineering and roadway design; the other five center on behavioral issues such as driving while impaired or distracted. The 2014 Traffic Report includes an update on the Road Safety Action Plan, describing the "Be Super Safe" campaign to target the behaviors identified in the Road Safety Action Plan that contribute to collisions. This section of the 2014 *Traffic Report* analyzes the collision trends related to these behaviors.

Also in 2012, Seattle released the 2012 *Action Agenda*, a document that includes policies and actions relating to all modes of transportation, to be completed within a two-year timeframe. It includes performance measures related to five core principles, one of which is safety. Within the safety chapter, an interim goal of less than 10 fatalities by 2014 is established, working towards the previously established goal of zero fatalities by 2030. This *Action Agenda* was updated in 2013, which provides a check-in on the actions completed in 2012.

In 2014, SDOT released the *Seattle Bicycle Master Plan*, with an accompanying *Bike Master Plan Implementation Plan* 2015-2019, released in 2015. The 2014 *Master Plan* is an update from the previous 2007 *Bike Master Plan* and focuses on safety as well as providing more comfortable facilities to encourage more Seattle residents to ride a bicycle. The 2014 *Master Plan* identifies specific corridors that would help complete a network of bicycle facilities for Seattle. The 2015 *Implementation Plan* focuses on project funding, delivery, evaluation, and public engagement. It lays out a prioritization tool – with safety weighted highest – that each project would be scored against in order to establish which projects are built first.

Most recently, SDOT published the *Vision Zero Plan*, which outlines the coordinated efforts to address the most severe crash corridors first. It describes a set of countermeasures that are included to some extent in the documents above, specifically framed around the way they improve safety for all road users. This document clearly articulates the role of the Seattle Police Department and demonstrates commitment to the Vision Zero goal from both agencies.

SDOT makes an effort to demonstrate the effects of countermeasures when they are implemented. The department releases a report after each major corridor project, identifying the crash trends before and after implementation, as well as operational information such as speed and volume. This method of evaluation is similar to the before-and-after method used in NYC.

Chicago Department of Transportation (CDOT)
CDOT identifies high-crash corridors through its collision analysis, and it applies countermeasures on a case-by-case basis during specific project design and scoping. The agency considers intersections as part of high-crash corridors, looking to intersection-only countermeasures only when the intersection stands out as an anomaly with a significant number of fatal or severe pedestrian collisions. The department relies largely on countermeasures that change the cross-section of the street, such as road diets, paired with treatments at all the intersections along the corridor, such as signal modifications.

Programmatic countermeasures, such as the implementation of Leading Pedestrian Intervals (LPIs), countdown timers, and other signal modifications have their own prioritization models to direct funding when it becomes available.

Implementation of automated enforcement is also directed by a separate analysis and prioritization process. The Children's Safety Zones program, established in 2012, was authorized by city ordinance to implement speed cameras specifically within ¼ mile of schools and parks. This program, along with a red-light camera program, relies on specific data analysis to determine where the cameras will be installed, which provides a defensible prioritization model for implementation.

For speed cameras, the analysis uses rolling three-year totals of different crash types, with youth and speed-related crashes weighted twice and locations that occur in Census tracts with high residential youth populations scored higher. These factors are added up to generate a safety zone score, and the highest scores are targeted first.

Several other guiding plans assist CDOT in its countermeasure implementation. CDOT released the *Chicago Pedestrian Plan* and the *Streets for Cycling Plan 2020*, which identify strategies for improving infrastructure and general conditions for pedestrians and bicyclists.

Chicago also released the 2012 *Chicago Forward Action Agenda* and updated this document in 2013. These documents address the goals and activities related to all modes within the department, including a focus on "safety first" and stated performance measures of eliminating all collision fatalities within ten years and reducing pedestrian and bicycle crash injuries by 50 percent each within five years.

The *Complete Streets Chicago Design Guidelines*, released in 2013, established a toolkit of engineering countermeasures designed to improve safety and convenience for all modes, with a "pedestrian-first modal hierarchy," followed by transit riders, bicyclists, and automobiles.

Florida Department of Transportation (FDOT)
FDOT implements engineering countermeasures both programmatically and on a project-by-project basis. FDOT also emphasizes education and enforcement countermeasures, which are discussed in the Public Outreach section of this report.

On a programmatic level, FDOT identified a number of focus treatments that it installs at high crash locations as funding becomes available. These engineering countermeasures include enhanced striping and signing, pedestrian scale lighting at signalized intersections, rumble strips (freeway roads) and rumble strips (non- freeway roads), paved shoulders, new signal heads to provide one signal head per lane, signal head back plates for better visibility, pedestrian countdown timers, Pedestrian Hybrid Beacons and Rapid Rectangular Flashing Beacons at currently-unsignalized locations.

On a project level, FDOT uses its collision data analysis to identify the top 20 collision sites within each of seven state districts. The agency then requests that each district investigate the conditions at these locations and identify the appropriate countermeasures based on local conditions.

FDOT is also focused on developing an estimate of pedestrian volumes on its roadways. This will allow them to prioritize future safety efforts where there is high pedestrian activity and the highest potential for collision prevention.

The *Florida Pedestrian and Bicycle Strategic Safety Plan*, released in 2013, sets a five year plan to dedicate resources and funding to the areas that have the greatest opportunity to reduce pedestrian and bicycle crashes. This report includes goals, objectives, and performance metrics related to implementation of a comprehensive pedestrian and bicycle collision reduction effort.

As an accompanying report, FDOT published the *Pedestrian and Bicycle Safety Coalition Strategic Safety Plan Implementation* in July 2015, which provides updates on the implementation of the plan, identifying the progress made and the people responsible for completing each strategy for each objective.

Less used by FDOT, but perhaps more relevant to the LADOT process, the 2013 *Comprehensive Study to Reduce Pedestrian Crashes in Florida* pairs countermeasures to common crash types. These countermeasures are summarized in the Literature Review section of the report.

KEY PARTNERS

Public Outreach
All agencies conduct public outreach at various stages of the process. New York City, Seattle and Chicago hold public meetings to help shape the development of specific plans or projects.

New York City Department of Transportation (NYCDOT) incorporates some public input in its selection of priority locations. However, when soliciting input online, the highest levels of engagement came from areas that were overall more educated, wealthy, and active in civic processes and therefore not representative of the areas of the city with low levels of engagement but high incidence of severe and fatal collisions. Recognizing this disparity, NYCDOT relies primarily on the results of data analysis to determine high-priority locations. Public comment was found to be most helpful augmenting patterns and trends revealed in the data analysis.

Education & Enforcement
Education and enforcement are important complements to the engineering efforts of a Vision Zero campaign. All four agencies conduct education/enforcement efforts in partnership with their police departments, which take the form of high-visibility public education coupled with enforcement. The New York Police Department (NYPD) has been particularly effective reducing severe and fatal crash injuries by aligning enforcement efforts with the results of the data analysis. Recognizing that speeding and failure to yield were common collision factors among severe and fatal injuries, NYPD has launched a citywide campaign against these dangerous driving behaviors.

Peer Agency Interviews

This section summarizes the public outreach, education, and enforcement efforts of the four peer agencies. No single agency has established a process that would be entirely transferrable to Los Angeles, but elements of their different approaches will help shape the City's strategy.

New York City Department of Transportation (NYCDOT)
NYCDOT has solicited public input on its Vision Zero activities through a variety of means. Their interactive web-based Vision Zero Public Input Map allowed residents to identify pedestrian safety issues by location. The website was open for a three month comment period between May and July 2014, with resulting levels of engagement varying across the five boroughs, but generally very high. Similar to other traditional outreach methods, the highest levels of engagement came from areas that were overall more educated, wealthy, and active in civic processes.

Equity concerns about this type of disparate engagement in the public outreach process are, in large part, mediated by the use of a collision analysis to direct implementation. The areas that received fewer comments via the website were often priority areas identified through the data analysis. NYCDOT prioritized its investments based primarily on the collision data analysis rather than public website comments to ensure that countermeasures are implemented where crash problems are highest, regardless of anecdotal data.

In addition to the website, NYCDOT conducted public events such as town hall meetings and pedestrian safety workshops in each borough as part of the process of developing the Borough Pedestrian Action Plans. These conversations helped inform the types of countermeasures that would be appropriate and supported in particular neighborhoods.

NYCDOT also implements education and enforcement activities. In the Bronx Borough Pedestrian Action Plan, for example, education countermeasures include street team outreach along priority corridors, areas, or intersections, targeted child education within these areas, and paid placement messaging targeted towards nighttime drivers. Additionally, NYCDOT has developed a new "Street Ambassadors" unit, composed of 10 staff members who will do street level outreach, data collection, and education to assist in the project development. These activties used to occur on an ad-hoc, project specific basis, but are now institutionalized within the department's regular project development activities.

Enforcement activities are carried out in partnership with the NYPD, and they are a crucial part of the Vision Zero initiative. NYPD has been particularly effective shifting its focus of enforcement from quality of life issues (i.e. "fix-it" tickets) to instead driving behavior that is directly tied to severe and fatal injuries. Leveraging the results of the data analysis, which concluded that speeding and failure to yield were common collision factors among severe and fatal injuries, NYPD has launched a citywide campaign against these dangerous driving behaviors.

Seattle Department of Transportation (SDOT)
SDOT engages the public through outreach at various points in its planning efforts, largely during the design process rather than as part of the data analysis process.

For every project, SDOT conducts several rounds of public meetings. SDOT first goes to the community with a description of the safety issues (backed by data) and solicits feedback from the public on their experiences. SDOT then returns to the community with several design alternatives that aim to address the safety issues and the concerns raised in the first round of meetings. Based on feedback from the second round of meetings, SDOT develops final project plans and returns to the community with next steps.

SDOT engages diverse communities across Seattle by contracting with local community development organizations to reduce language and cultural barriers. In some cases, the department uses community liaisons to lead multilingual outreach efforts and holds simultaneous translation at public meetings. SDOT is working to develop relationships with community groups that will help reach a broader diversity of Seattle resident.

SDOT's enforcement effort is carried out in partnership with SPD, and it is formatted similarly to other cities' initiatives in that it focuses on public engagement and education first, followed by citation-based enforcement. High-visibility enforcement events are held where collisions occur and target the specific behaviors observed at those locations.

Chicago Department of Transportation (CDOT)
CDOT has a robust public education and enforcement strategy. Education efforts include a Safe Routes to School program and a seasonal Bicycling Ambassadors program, which serves as a "street team" at public events and summer camps. CDOT also engages in public outreach around the development of its plans, primarily relying on town hall-style meetings geographically dispersed throughout the city.

CDOT does not incorporate outreach in its data analysis process. The identification of high-crash corridors and priority locations is based on data analysis rather than community input.

CDOT has been partnering with the Chicago Police Department (CPD) Traffic Enforcement unit since 2008 to conduct high-visibility enforcement efforts with a focus on drivers that fail to stop for pedestrians in the crosswalk. These efforts begin as public outreach and education, transitioning into citation-based enforcement in a subsequent phase of activity. CDOT and CPD determine education and enforcement locations based on pedestrian injury data combined with officer knowledege of the local area.

Florida Department of Transportation (FDOT)
FDOT's public outreach efforts center on education campaigns and enforcement initiatives. These serve both as countermeasures as well as opportunities to engage the public in a conversation about traffic safety and the state's ongoing efforts to reduce injuries and fatalities.

Education campaigns initiated by FDOT include high visibility paid media on transit buses, bus shelters, billboards and TV/radio; community engagement teams at local events to distribute flyers about traffic safety and collateral materials like reflective armbands or bicycle spoke lights; and enhanced training with emergency responders to understand how to best handle pedestrian, bicycle, and vehicle collision injuries. Education materials are tailored for language and cultural differences depending on the community context. FDOT's education efforts have an online presence and a social media presence that is often used to hear feedback from the public and respond.

In addition to data analysis, FDOT uses both observational surveys and public option surveys taken at outreach events to identify high-priority locations.

Enforcement efforts coordinated by FDOT include high visibility enforcement at the top ten corridors and top ten intersections within each county, in partnership with county law enforcement and city police departments. All enforcement events begin with a public outreach campaign coupled with additional officer training specific to pedestrian and bicyclist safety. Once the media campaign ends (campaigns are usually around 10 days), officers begin the education phase, the longest phase of the effort. Following the education phase, officers move to a warning phase, and then, when necessary, a citation phase (warranted where there is a continued pattern of serious offenses).

FDOT emphasized the importance of inter-agency partnerships during the interview. In addition to the partnerships with the police departments and emergency responders necessary to execute the education and enforcement initiatives described above, FDOT has established partnerships with the state health department to bring in health and injury data that would otherwise be unavailable through the normal collision reporting process.

CONCLUSION

The next step for the City's Vision Zero effort is to move forward with the Vision Zero Los Angeles Safety Study, which will identify key trends and statistics related to injury outcomes and contributing factors for collisions Citywide.

The first outcome of this study will be a list of prioritized locations along the High Injury Network (HIN) for the development of safety projects. The second major element of the analysis includes "countermeasure pairing," the process of identifying the physical design and engineering countermeasures that would most effectively address each "collision profile," a group of collisions with similar contributing factors. At the priority locations, the City will partner with local communities to scope detailed projects using these identified collision profiles and appropriate countermeasures.

This work is already underway with the development of a database that includes all collisions in the most recently available ten-year period, as well as key environmental variables, many of which were highlighted in the literature review and peer agency interviews. These data, currently available on the City's GeoHub (*geohub.lacity.org*), will be continually updated as new information becomes available.

APPENDIX: LIST OF SAFETY COUNTERMEASURES

There are many resources on safety countermeasures, and a wide range of technical approaches to evaluate their effectiveness. The most comprehensive resource is the Federal Highway Administration's (FHWA) Crash Modification Factors Clearinghouse, a database of studies on most safety countermeasures. Typically effectiveness is measured and reported by a crash reduction factor (CRF), the percentage reduction in collisions that could be expected after implementing a given countermeasure.

The Clearinghouse often contains multiple studies with a range of CRFs. In order to get the best estimate of effectiveness, we consulted two additional resources: The FHWA *Toolbox of Countermeasures and Their Potential Effectiveness for Pedestrian Crashes* (February 2013) and the Pedestrian and Bicycle Information Center's *Evaluation of Bicycle-Related Roadway Measures: A Summary of Available Research* (February 2014). Each of these resources provides a thorough review of the quantitative research to date by selecting only those CRFs that have been derived from studies based on rigorous research methods.

The following sections include a comprehensive list of safety countermeasures, along with summaries of effectiveness research on each countermeasure. The list of safety countermeasures is grouped according to the following categories:

- Signalization
- Geometric (Road Design)
- Signs, markings, operational
- Speed control measures, miscellaneous

This list includes all countermeasures discussed in the FHWA Toolbox with the associated CRF, as well as additional countermeasures identified in the sources described above. In some cases, countermeasures lack a quantified CRF but show some safety-related effects; these have also been included in the description below. This review does not reflect details about the feasibility or appropriateness of a proposed countermeasure for a specific location. Location-specific constraints and existing facilities must be considered when determining the most appropriate countermeasure for a given location.

Signalization

Pedestrian countdown heads
Definition: Signal head that provides pedestrian countdown, as opposed to traditional WALK/DON'T WALK signal head.

CRF: 25% reduction in pedestrian collisions

Additional research has shown that pedestrian countdown timers have reduced pedestrian collisions by between 52% and 70%.

Flashing beacons (includes RRFB signals)
Definition: Flashing beacons highlighting crosswalks and pedestrian crossing signs through the addition of a flashing light. Rectangular Rapid Flash Beacons provide a high-visibility, brighter strobe-like flashing frequency.

Research focused on the rate of drivers yielding to pedestrians has demonstrated an increase in the yield rates in most cases.

While research has focused mainly on the installation of flashing beacons as a pedestrian safety measure, these benefits could be applied to bicyclists as well. Studies have shown that flashing beacons increase the rate of drivers yielding to pedestrians by 50 – 80%.

Leading pedestrian phase / Leading pedestrian intervals (LPI)
Definition: Traffic signals timed to allow pedestrians a short head start in crossing the intersection to minimize conflicts with turning vehicles.

CRF: 5% reduction in pedestrian collisions

Additional research demonstrated a 59% reduction in the number of pedestrian collisions after implementation of the treatment.

Permissive or permissive/protected left-turn phasing conversion
Definition: Protected left-turn phasing provides an exclusive phase for left-turning vehicles to enter the intersection separate from any conflicting vehicle or pedestrian movements. Permissive/protected left-turn phasing provides the exclusive left-turn phase in addition to a phase permitting left turns simultaneously with conflicting through movements.

CRF: 99% reduction in left-turn collisions (convert permissive or permissive/protected to protected only); 16% reduction in left-turn collisions (convert permissive to permissive/protected)

Additional research has demonstrated that implementing a left turn phase can reduce the pedestrian crash rate by 34% .

Pedestrian hybrid beacon (HAWK signal)
Definition: Pedestrian-activated warning light located on a mast arm over a pedestrian crossing. The beacon stays dark until activated. It has one yellow lens and two red lenses to indicate to drivers that a pedestrian is in the crosswalk.

CRF: 29% reduction in all collisions; 69% reduction in vehicle/pedestrian collisions.

As with flashing beacons, research on pedestrian hybrid beacons has focused on benefits to pedestrians, but these benefits could have broader implications for other users, such as bicyclists. Research from 21 crossings in Tucson, AZ demonstrated a statistically significant decrease of 69% in pedestrian collisions after installation of HAWK signals. While not the primary focus of the research, bicycle collisions also decreased after installation.

Signal timing improvements (to match ITE specified intervals)
Definition: Shorter signal cycle lengths and longer walk intervals.

CRF: 37% reduction in fatal and injury pedestrian collisions.

In one study in which pedestrian crossing times were increased at over 200 intersections, the pedestrian collision rate decreased by 50%.

Signalization (continued)

Pedestrian detection to extend crossing time when pedestrian is detected within the intersection
Definition: Sensors that detect when pedestrians are present in a crossing and automatically increase crossing time when necessary.

Research examining the impact of automated pedestrian detection and crossing time extension on pedestrian collision rates has not yielded statistically significant results.

Pedestrian scrambles / Exclusive pedestrian phasing
Definition: Restricts all vehicular movements to provide an exclusive signal phase allowing pedestrians to cross in all directions, including diagonally.

CRF: 35% reduction in pedestrian collisions

Accessible Pedestrian Signals (APS)
Definition: Pedestrian signals that provide audible or tactile cues to aid visually or cognitively impaired pedestrians in safely crossing the street.

Research on accessible pedestrian signals has not focused on the impact of the treatment on pedestrian collisions. However, research has shown that they are effective in decreasing start delay and increasing the number of crossings that stay within the crosswalk.

New traffic signals at unsignalized intersections, when warranted
Definition: Traffic signal installed at previously unsignalized intersection.

CRF: 25% reduction in all collisions

Research has shown that pedestrian collision rates increased by 12% at treatment sites, compared to an increase of 60% at control sites. However, the findings were not statistically significant.

Removal of unwarranted traffic signals
Definition: Traffic signals replaced with all-way stop signs.

CRF: 17% reduction in pedestrian collisions (research is specific to one-way streets).

Optimize signal timing for bicyclists (Green Wave)
Definition: Signal timing optimized for bicyclist speeds, reducing number of times bicyclists encounter red signals along a stretch of road.

Signal timing changes have been shown to reduce pedestrian and bicyclist injury collisions by 37%.

Additional countermeasures
The following countermeasures are currently being used, but research is not yet available to indicate the effectiveness in reducing bicycle collisions.

- Bicycle signal detection (pushbutton, loop detector)
- Bicycle scramble scramble phase (not currently permitted by FHWA)
- Bicycle signal heads
- Leading bicycle interval
- Separate bicycle signal phase

Geometric

Intersection conversion to roundabout
Definition: Roundabout installed at a previously unsignalized intersection or to replace a former traffic signal. Roundabouts are large circular islands, placed in the middle of an intersection, which direct flow in a continuous circular direction around the intersection. Roundabouts can reduce the number of conflict points, compared to an uncontrolled intersection, and decrease vehicle speeds due to intersection geometry.

CRF: 27% reduction in collisions for conversion from unsignalized intersection to roundabout.

Research from the United States and Europe has demonstrated increased safety concerns for bicyclists after the installation of roundabouts, including:

- 48% increase in risk of injury for bicyclists
- 700% increase in risk of bicycling injury

Additional research from the Crash Modification Factors Clearinghouse shows a 73% reduction in pedestrian collisions after conversion of intersections to roundabouts, but it does not specify if those intersections were signalized or unsignalized prior to installation of the treatment.

Refuge islands/raised median/ pedestrian refuge islands
Definition: Curbed sections in the center of the roadway that are physically separated from vehicular traffic. Raised medians or refuge islands shorten crossing distances across wider roadways.

CRF: 46% reduction in pedestrian collisions (raised median at marked crosswalk); 39% reduction in pedestrian collisions (raised median at unmarked crosswalk); 56% reduction in pedestrian collisions (refuge island)

Research has shown that pedestrian collisions rates were 33% lower on streets with 10 foot medians than on streets with painted medians.

A study demonstrated that mid-block pedestrian collisions decreased by 73% after the installation of a pedestrian refuge island.

In a study comparing locations with raised medians to those without, the pedestrian collision rate at marked crosswalks was 0.74 in locations with a raised median and 1.37 for sites without a median. At unmarked crossings the pedestrian collision rate was 0.17 at sites with raised medians and 0.28 at sites without a raised median.

Temporary painted medians
Definition: Pavement striping that separates lanes of traffic but does not provide a raised surface.

No research is available that demonstrates the impact of installing a temporary painted median as a countermeasure for pedestrian collisions. However, research has shown that pedestrian collisions rates were 33% lower on streets with 10 foot raised medians than on streets with painted medians.

Raised pedestrian crossing/ raised crosswalks/speed tables & raised crosswalks
Definition: Pedestrian crossings that are elevated to the level of the sidewalk, with ramps on each vehicle approach.

CRF: 30% reduction in all collisions, 36% reduction in fatal and injury collisions across all modes intersection to minimize conflicts with turning vehicles.

Corner bulb outs and curb extensions
Definition: Raised devices, usually constructed from concrete and/or landscaping, that reduce the corner radius or narrow the roadway in order to reduce traffic speeds and shorten crossing distances.

No research is available that demonstrates the impact of installing curb extensions as a countermeasure for pedestrian collisions, though research shows decreases in pedestrian crossing delay and increases in drivers yielding to pedestrians.

Geometric (continued)

Closed crosswalk removal/new crosswalks
Definition: Removal of existing crosswalks, or installation of new crosswalks.

Research conducted between the 1970s and 2000s produced results stating that pedestrian collision rates were higher in marked crosswalks than in unmarked crosswalks. A 2002 study investigated the importance of various factors such as the presence of a median, ADT, and the number of lanes, demonstrating that the impact of crosswalk installation or removal on pedestrian safety is context-specific. Additional countermeasures explored within this document, including lighting, type of pavement markings, and signs, should also be considered.

On-street parking reconfiguration
Definition: Removing on-street parking near intersections and driveways, or reconfiguring parking to minimize conflict points with bicyclists.

Research has shown that biking on a road without parked cars reduces risk of bicyclist injury by 37%, when compared to roads with on-street parking. An analysis of before and after conditions at a parking reconfiguration treatment site showed that potentially dangerous actions (drivers parking in bike lane, wrong way travel) decreased, but there were no collisions before or after the treatment.

Roadway cross section reduction from 4 to 3 lanes (road diet)
Definition: Reduction in number of travel lanes in roadway from 2 lanes in each direction to 1 lane in each direction with a center turning lane.

CRF: 29% reduction in all collisions

Research has shown that for every 10 foot increase in street width, the likelihood that a bicycle collision will occur increases by 38%. In one study of over 300 road diet intersection sites in New York City, researchers found an increase in the number of bicycle collisions, but this did not account for volumes before or after implementation of the treatment.

Additional research on road diets has shown a 41% reduction in pedestrian collisions at treatment sites.

Temporary removable pedestrian refuge island with sign (curb) on two-lane road
Definition: Small, painted, raised surface in the center of the roadway, with high-visibility pedestrian crossing signs.

No research is available that demonstrates the impact of installing a temporary removable pedestrian island as a countermeasure for pedestrian collisions, though one study demonstrates reduction in speeds after installation of the treatment.

New traffic signals at unsignalized intersections, when warranted
Definition: Traffic signal installed at previously unsignalized intersection.

On-street parking reconfiguration
Definition: Removing on-street parking near intersections and driveways, or reconfiguring parking to minimize conflict points with bicyclists.

Research has shown that biking on a road without parked cars reduces risk of bicyclist injury by 37%, when compared to roads with on-street parking. An analysis of before and after conditions at a parking reconfiguration treatment site showed that potentially dangerous actions (drivers parking in bike lane, wrong way travel) decreased, but there were no collisions before or after the treatment.

Separated bike lane (cycle track)
Definition: Designated bicycle lanes, separated from vehicle traffic by a physical barrier, usually bollards, landscaping, parked cars, or through elevated separation.

Several studies have examined the effectiveness of cycle tracks as a bicycle collision countermeasure. The highlights of this research is outlined below:

Geometric (continued)

Statistically insignificant decrease in bicyclist injury rates on street segments, but a statistically significant increase of 24% at intersections. 63% decrease in rear-end vehicle-bicycle collisions, 41% decrease between left-turning bicycles and other bicycles, 38% decrease in collisions between bicycles and parked cars. 120% increase in rear-end collisions between two bicycles, 140% increase in collisions between bicycles and right-turning vehicles, 48% increase between bicycles and left-turning vehicles.

Cycle tracks associated with 28% reduction in risk of injury when compared to streets without bicycle facilities.

89% decrease in risk of bicyclist injury, when compared to major streets without bicycle infrastructure and with on-street parking.

95% decrease in risk of bicyclist injury when compared to streets without biking infrastructure.

This research, while supporting the positive impact of cycle tracks as a countermeasure to bicycle collisions, points to the need for additional considerations to increase bicyclist safety at intersections and other bicycle-vehicle conflict points.

Separate shared-use or bicycle path
Definition: Off-street path, either for exclusive use by bicyclists or by bicyclists and pedestrians, usually with minimal street crossings, and designated by signs and/or pavement markings.

Shared-use paths associated with an 88% decrease in injury risk for children and 86% decrease in injury risk for adults, when compared to bicycling in the street.

Wide curb lane
Definition: Provision of a wider curb lane that accommodates bicyclists and vehicles, where a dedicated bike lane or other bicycle facility is not possible. Research on wide curb lanes has not focused on collision rates, and studies about the lateral passing distance between vehicles and bicycles demonstrates varying results on safety impacts for bicyclists.

Traffic diverters
Definition: Physical barrier placed diagonally across an intersection, which restricts the flow of vehicular traffic, but allows for pedestrians and bicyclists to cross the intersection.

96% decrease in the risk of bicyclist injury on streets with traffic diverters, when compared with other roadway segments.

Additional countermeasures
The following countermeasures are currently being used, but research is not yet available to indicate the effectiveness in reducing collisions.

- Lane narrowing
- Curb ramps
- Rumble strips
- Paved shoulder
- Curb radius reduction
- Mini-circles
- Chicanes
- Full or partial street closures
- Streetcar track/bike lane alignment
- Protected intersections
- Medians and crossing refuge islands
- Driveway reconfigurations (narrowing, restricting turn movements, improving driveway definition)

Signs, Markings, Operational

Intersection lighting/crosswalk lighting
Definition: Lighting between the crosswalk and oncoming vehicles, usually 10 feet before the crosswalk.

CRF: 27% reduction in injury collisions across all modes; 21% reduction in all collisions

Segment lighting
Definition: Quality and consistent placement of streetlights for drivers, as well as pedestrian-scale lighting for sidewalks.

CRF: 23% reduction in injury collisions across all modes; 20% reduction in all collisions

Right turn on red restriction
Definition: Right turns prohibited on red to reduce conflicts between pedestrians and right-turning vehicles.

CRF: 3% reduction in all collisions

Additional analysis of collision rates before and after implementation of permitted right turns on red in the eastern United States demonstrates that allowing right turns on red increased pedestrian collision rates between 43% and 107%.

Left turn restriction
Definition: Left turns prohibited to reduce conflicts between pedestrians and left-turning vehicles.

CRF: 10% reduction in pedestrian collisions

Parking restriction near intersections
Definition: Parking spaces removed near crossing locations to allow for improved sightlines for both pedestrians and drivers.

CRF: 30% reduction in pedestrian collisions

Advance stop or yield lines, pedestrian yield signs
Definition: Pedestrian yield signs or warning signs for drivers installed either on a post or in the roadway in advance of the crossing. Advance stop or yield lines stop indicate that a driver should stop or yield before approaching the pedestrian crossing. They are usually placed 4 feet away from the crossing.

While studies have not examined the impact of these treatments on the pedestrian collision rate, research indicates that these advanced stop and yield lines are effective in increasing the rate at which drivers yield to pedestrians.

Pavement friction (textured pavement)
Definition: Textured pavement or a textured overlay on pavement to provide additional cues to drivers that they are reaching a pedestrian crossing, or other key area such as a tight radius corner.

CRF: 3% reduction in fatal or injury pedestrian collisions
Targeted enforcement efforts (along corridors for yielding in marked crosswalks)
Definition: Police enforcement efforts targeted at drivers at specific pedestrian crossings, or as part of a broader enforcement campaign.

CRF: 23% reduction in pedestrian collisions

High-visibility crosswalk (includes continental crosswalks)
Definition: Distinct pavement markings, such as a continental, zebra or ladder pattern, or a reflective inlay or thermoplastic tape.

CRF: 48% reduction in pedestrian collisions; 37% reduction in pedestrian collisions when high-visibility crosswalks are installed in school zones.

Research demonstrated a 37% reduction in pedestrian collisions after the installation of high-visibility crosswalks.

A study of high-visibility crosswalks in New York City shows a 48% reduction in the pedestrian collision rate after installation of the treatment.

Decorative and colored crosswalks
Definition: Crossing pavement markings in colors other than white.

A study of strong yellow/green crosswalks concluded that using the colored crosswalks had no impact on safety.

High-visibility crosswalk in

Signs, Markings, Operational (continued)

conjunction with illuminated overhead crosswalk sign
Definition: A high-visibility sign on mast arms over the roadway that calls additional attention to the crossing.

Research on this treatment has not focused on collision rates, but research has found an increased rate of drivers yielding to pedestrians after installation of a high-visibility crosswalk with illuminated overhead sign.

Pedestrian warning signage
Definitions: Signs such as "Yield Here to Pedestrians" or "Stop Here for Pedestrians" that can be placed at the roadway surface level in advance of the crosswalk, on posts, or overhead.

Research on this countermeasure has not specifically examined pedestrian collision rates, but one study has found an 80% decrease in pedestrian-motorist conflicts after installation of a "Stop Here for Pedestrians" sign.

Shared bus-bike lane
Definition: Lanes designated for use only by public transit buses, bicycles and usually right-turning vehicles.

The only study available demonstrated a statistically insignificant decrease in the rate of bicycle crashes.

Intersection and segment lighting
Definition: Quality and consistent placement of streetlights for drivers and bicyclists.

Research has shown a lack of lighting associated with 111% increase in likelihood of bicyclist fatality, and 100% increase in likelihood of incapacitating injury for bicyclists. In another study, roadway lighting associated with 60% reduction in bicyclist injury collisions.

Shared lane markings
Definition: Pavement markings on travel lanes, also called Sharrows, which indicate that road space should be shared between bicycles and vehicles.

Studies investigating the impact of sharrows on bicyclist safety show varied results. Research conducted was not focused on the rate of collisions, but several studies did demonstrate that the installation of sharrows increased the lateral distance between bicyclists and drivers, as well as the distance between bicyclists and parked cars. Additionally, sharrows have been associated with a reduction in the number of bicyclists riding on the sidewalk and riding against the flow of traffic. However, additional research showed no change in behavior after the installation of sharrows.

Bike lanes
Definition: Five to seven foot wide designated lanes for bicyclists adjacent to vehicle travel lanes, delineated with pavement markings.

Studies dating back to the mid-1970s have produced varying results on the safety impacts of bike lanes, the highlights of which are outlined below:

- Overall reduction in bicycle collisions, with an increase in the rate of collisions due to bicyclists making improper left turns
- Increase in bicycle collisions associated with turning movements in the first year, with sharp reductions in subsequent years
- Reduction in bicycle collisions along roadway segments, with increases at some intersections
- Statistically insignificant increases in bicyclist injuries and collisions, and statistically significant 73% increase in collisions involving bicycles and right-turning vehicles
- Increase in number of bicycle collisions at treatment sites versus control sites at intersections. Collisions on roadway segments decreased for treatment sites, but decreased much more significantly for control sites. However, this study did not account for bicycle volumes.

This research points the need for special consideration at intersections and other conflict points between bicyclists and vehicles to minimize collisions.

Signs, Markings, Operational (continued)

Warning and regulatory signs for drivers ("Share the Road," "No Parking in Bike Lane")
Definition: Posted signs that provide warning and regulatory messages alerting drivers to the presence of bicyclists and shared roadway facilities.

Research on the use of these signs has not focused on bicycle collision reduction, but studies have shown they may hold promise in increasing bicycle safety based on the passing distance of vehicles before and after sign installation.

Buffered bike lanes
Definition: Designated lanes for bicyclists, five to seven feet wide, separated from vehicle travel lanes and/or parked cars by pavement markings, usually 3 feet wide and with a double-line, chevron or diagonal line pattern.

In one study of a two-way buffered bike lane in Washington, D.C., the rate of bicycle crashes increased by one crash per year (accounting for the increase in bicycle use) after installation. However, the study also suggested that confusing signage at intersections may have led to the increase in collision rates.

Bike box
Definition: Designated area for bicycles to wait at red traffic signals in front of queuing vehicles, usually marked with green pavement, with the intent of reducing delay at signals, increasing visibility of bicyclists, and in some cases, facilitating left-turn positioning for bicyclists.

One study of 10 intersections showed that bicyclist-motorist conflicts decreased by 9%. However, that study and others have shown that bike boxes are not effective in encouraging drivers to yield to bicyclists more often, and in many cases drivers encroach on the bike box space.

Green colored pavement
Definition: Green markings, created with paint, epoxy, thermoplastic, or colored asphalt, used to designate bike lanes, cycle tracks, bike boxes, conflict zones or intersection crossings.

One study showed a statistically insignificant reduction in the rate of vehicle-bicyclist conflicts, as well as a significant increase in the rate of drivers yielding to bicyclists, following the installation of a green bike lane. Other studies on the use of green pavement at and across intersections were inconclusive: in some cases drivers yield to bicyclists more often, but in other cases less often.

Additional countermeasures

The following countermeasures are currently being used, but research is not yet available to indicate the effectiveness in reducing bicycle collisions.

- Automated speed enforcement (ASE)
- Right turn pockets
- Smart Lighting
- Contraflow bike lanes (for one-way streets)
- Bicycle route and bicycle boulevard signage
- Pavement markings (bike symbol, bike detector marking, yield lines)
- Two-stage turn queue box
- Right turn on red restriction
- Targeted enforcement efforts
- Parking restrictions near intersections and driveways

Speed Control Measures, Miscellaneous

Speed limit reductions
Definition: Speed limit reductions performed street by street or implemented as part of a speed reduction zone (often found near schools and parks) or bicycle boulevard program.

Research on speed limit reductions has shown a 56% decrease in pedestrian collisions along roadway segments at treatment sites, compared with a 6% increase at control sites. The same study found a 45% decrease in pedestrian collisions from speed limit reductions at intersections, though the findings were not significant in the case of intersections.

Research shows that the likelihood of a bicyclist fatality in vehicle-bicycle collisions increases by over 1,000% if the vehicle is traveling over 40 mph, when compared to speeds under 20 mph. If the vehicle is traveling between 20 and 30 mph, risk of bicyclist fatality increases 93% and over 300% for vehicles traveling between 30 and 40 mph. In a study on the implementation of 20 mph speed limit zones, bicyclist injuries decreased by 17% and severe injuries or fatalities decreased by 38%.

In another study of streets with vehicles traveling under 30 mph, there was a 48% reduction in the risk of bicyclist injury when compared with streets with speeds over 30 mph.

Speed tables and humps
Definition: Asphalt protrusions 3-4 inches high that extend the width of the roadway, varying in length depending on type. Speed humps are rounded, while speed tables have a flat top.

Research compiled in the Evaluation of Pedestrian-Related Roadway Measures report provides mixed results regarding the impact of speed hump installation on pedestrian collisions, with some studies finding increases (though statistically insignificant) and others finding decreases.

Additional research included in the FHWA Crash Modification Factor Clearinghouse demonstrates a decrease of between 40% and 50% in all collision types after speed hump installation.

Portable speed trailer/and radar speed display signs
Definition: Portable speed trailers that display the speed limit as well as the speed of the approaching vehicle in real-time, and in some cases have changeable message display boards.

Research on this countermeasure has not focused specifically on collision rates, but has shown increases in drivers yielding to pedestrians.

Hazard identification and response program
Definition: Publicly-run program that allows for two-way communication between jurisdictions and the public, including temporary signage alerting bicyclists to potential hazards, as well as technology solutions that allows the public to submit real-time information (often via cell phone) on hazards, such as debris in the road.

Construction sites – one particular type of hazard – have been associated with a 167% increase in the risk of bicycling injury.

Additional countermeasures
The following countermeasures are currently being used, but research is not yet available to indicate the effectiveness in reducing bicycle collisions.

Shared space

Visual narrowing (using street trees, paving treatments, roadway markings)

Railings and channelization

Ongoing maintenance (sweep bike and curb lanes, repair potholes)

Visual narrowing (using street trees, paving treatments, roadway markings)

Acknowledgements

We would like to sincerely thank Nat Gale and Seleta Reynolds at LADOT for providing us with the opportunity to work on developing this strategy. A special thanks to Brian Oh for his project guidance and to Jacqui Swartz, Tim Black, and Chelsea Richer for their data support throughout the process. Thank you to members of the Education Subcommittee, Vision Zero Alliance, and all other interviewees for taking the time to provide their insights, which greatly informed the content of this strategy.

A Note from the Authors

Julia Gould and Rachel Keyser are Coro Fellows in Public Affairs with Coro Southern California, a nonprofit, nonpartisan educational foundation. The Coro Fellowship in Public Affairs is a nine-month, graduate level, experienced based program, cross-sectoral fellowship to train effective leaders in public affairs. Founded in 1942, with the goal of training young leaders to strengthen the democratic system, Coro has expanded its centers to six cities across the country, with the fellowship in public affairs running in five.

Executive Summary

This document outlines specific recommendations to guide Vision Zero's education and outreach efforts in Los Angeles. The strategy was developed through both qualitative and quantitative research methods, examining best practices around public outreach and road safety campaigns, technical collision data, and the experiences of Los Angeles stakeholders.

These findings indicate that a successful Vision Zero education and outreach strategy will use multi-faceted mediums, message-tested content, and will be grounded in behavior change theory to target high-risk populations and behaviors at both the individual and institutional levels. Mass-media and on-the-ground education efforts will need to be tailored to specific population segments based on campaign priorities and additional market research. Messaging content should stem from the underlying factors that drive dangerous behavior, as well as barriers to the successful adoption of Vision Zero core principles. Overall, the campaign should seek to not only raise awareness of Vision Zero, but change behaviors through shifting social norms around transportation and traffic safety.

While this strategy pulled heavily from best practices and the work of other Vision Zero focus cities, interviews with 46 Los Angeles stakeholders help make it specific to the lived experiences and cultures of the diverse communities in this city.

The strategy first overviews components from the New York City and San Francisco Vision Zero education and marketing strategies, best practices around road safety campaigns, and behavior change theories related to injury prevention. Next, the document outlines the main findings from stakeholder interviews with regards to messaging and outreach strategies. Finally, the report establishes a set of branding and message content recommendations, including a phased-in messaging strategy, core messages, and example advertisement sketches.

Introduction

Less than a year since Mayor Eric Garcetti's Executive Directive, Vision Zero Los Angeles is on the cusp of final development and implementation. As part of this directive, four subcommittees--engineering, enforcement, evaluation, and education--will be responsible for developing the content of the Vision Zero Action Plan to be released in August.

As a foundation for the education component of the Vision Zero Los Angeles Action Plan, this strategy is deeply grounded in relevant literature, collision data, best practices, and perhaps most importantly, first-hand experiences from Los Angeles stakeholders. Synthesizing and analyzing this data informed the following recommendations for a successful campaign specific to Los Angeles.

Although Vision Zero emphasizes a shift in responsibility from individual behaviors to city-driven policy, education and outreach to Los Angeles's diverse communities is nonetheless an integral component of achieving Vision Zero's goals in reducing traffic fatalities. When considering the slow pace of engineering improvements and limitations of enforcement measures, education and outreach efforts become all the more critical in immediately addressing traffic deaths and injuries occurring on our streets.

Guiding Principles

This education and outreach strategy is founded on three main purposes that guide both the content and mediums of messaging and education efforts. These purposes were created with the recognition that in order for Vision Zero to be successful it will need to encompass a multiphase *social marketing campaign* that addresses social norms around transportation and traffic safety.

Therefore, the education and outreach strategy will seek to:

1. **Increase overall awareness** of Vision Zero, the issue of traffic safety, and impacts of dangerous road behavior;
2. **Facilitate a Los Angeles culture shift** toward shared responsibility in road safety, the preventability of traffic deaths, and the idea that even one traffic death is unacceptable;
3. **Motivate safer traffic behavior** among all those who travel in Los Angeles, with emphasis on demographics most likely to exhibit dangerous behavior.

Vision Zero needs diverse forms of both mass-media messaging and on-the-ground outreach to increase awareness, change cultural norms, and change behavior. Social marketing campaigns (i.e. those that seek to change behavior by changing social norms) require extensive time and resources, however they are possible. Looking to the success of other public health campaigns such as anti-tobacco efforts in the United States , Vision Zero has the power to change the paradigm of traffic safety in Los Angeles, across the nation, and worldwide. This education and outreach strategy seeks to make Los Angeles a leader in this effort.

How to Use

The findings and recommendations from this document will serve as a reference for the communications consultant and education subcommittee in developing both the priorities and content of the media messaging. These recommendations should also be considered when creating content for the Vision Zero Action Plan, and in implementing on-the-ground outreach and education. While this strategy is specific to Vision Zero, the findings around

messaging and community outreach can be used as a resource for other education and outreach campaigns in Los Angeles.

SECTION 2: METHODOLOGY

We conducted in-depth interviews with 46 stakeholders from both within and outside of Los Angeles. Interviewees included:

1. Transportation experts
2. Communications specialists
3. City officials
4. Vision Zero Alliance members
5. Vision Zero Education Subcommittee members
6. Vision Zero Focus Cities

We chose these different groups of interviewees in order to have varying perspectives from people who work both in and outside of city government. As behavior change theory around public health suggests, we also wanted to include the perspective from community voices, especially those who have already been advocating for safe mobility. Finally, we spoke with experts who have worked on both private and public sector communications campaigns to learn from their experiences specific to Los Angeles.

Each interview lasted 45-90 minutes with the average interview lasting an hour. Interviewees were asked a common set of questions with variations and follow-ups as the conversation saw fit. For a full list of interview questions, please refer to Appendix D.

Our questions centered on the following topics: previous campaigns, message development and community outreach experience, message development ideas, and media/platforms. Our goals were to: 1) learn best practices from media safety campaigns they had previously worked on or had experienced, 2) to understand what would be the most effective messaging and outreach strategy for the community that they worked with, and 3) to solicit their own impressions on traffic safety and behavior change. Ultimately we sought to use these interviews as a way to develop a truly Los Angeles-specific Vision Zero education and outreach strategy that considered the needs, interests, attitudes, and values of Los Angeles' diverse range of constituents.

After compiling interview notes, (See Appendix E for Interview Notes) we then coded all of the interviews separately in order to deduce common themes. These themes were then cross-checked with each other and analyzed in order to find connections and discrepancies.

In addition to qualitative research, we also examined raw collision data from police reports made available to us by LADOT and Fehr and Peers. Using the program Tableau, we were able to draw conclusions from the various data sets on victims, collision profiles, and parties in order to focus our education and outreach strategies.

Finally, we supplemented the primary qualitative and quantitative data with a background literature review on other Vision Zero focus cities' work, behavior change theories, external collision data, and best practices around public outreach generally.

SECTION 3: LITERATURE REVIEW

Overview: New York City and San Francisco Vision Zero Education and Marketing Strategies

In reviewing prepared materials and speaking with representatives from several Vision Zero focus cities around the country, New York City and San Francisco stood out as currently having the most developed education and outreach strategies, as well as being the furthest along in their implementation. This section briefly overviews the main concepts from these two cities' plans, and outlines key takeaways for consideration in the Los Angeles strategy and its implementation.

New York City Vision Zero Marketing Plan

Following the city government's 2014 commitment to implement Vision Zero in New York City, their Vision Zero Task Force outlined a marketing strategy outlining how to pursue the "Vision Zero brand and its objectives." The plan briefly covers: results of various education efforts, earned media considerations, social marketing, and the timing and continuity of marketing. Most specifically, the plan covers target audiences, priority topics, and strategies for marketing. Key points from these three sections are summarized below, with some additional insight from a NYCDOT staff member. In 2014, the NYCDOT also released a "style guide" to help community partners keep consistent guidelines for communication and marketing around Vision Zero.

Target Audiences

Below are New York City's Vision Zero target audiences and reasons for prioritizing them.

Primary audience	
Adult male drivers, ages 20-50	• Most likely to kill or severely injure a pedestrian • Males in their 40s are most likely to be involved in a pedestrian KSI crash • Males 21-29 have highest rate of impaired driving
Secondary audiences	
Street users in priority locations	• Messaging will be most effective if targeted in corridors with highest rates of KSI collisions
Fleet operators	• The Taxi and Limousine Commission (TLC) licenses 120,000 professional drivers • With over 27,000 vehicles and 80,000 full or part time drivers, the City's fleet plays a critical role in Vision Zero • Private Fleets provide another opportunity for Vision Zero education

Large vehicle drivers	• Trucks and buses were involved in 24% of 2014's pedestrian fatalities (up from 18% from 2011-2013) • Approximately 45% of fatal bus and truck crashes involve turns within intersections
Motorcycle drivers	• In 2013, 42 motorcyclists lost their lives in traffic crashes • In 2014, 37 motorcyclists lost their lives, which is also the average of the three previous years
School-age children and their caregivers	• Being struck by a car is the most common cause of injury related death among children in New York City • Have a ready access point and partner; DOT worked with the Department of Education (DOE) to provide educational services at 620 elementary, middle, and high schools in 2014
Seniors	• People over 65 make up 12% of the city's population but 33% of pedestrian fatalities

*All data and statistics are specific to New York City.

Priority Topics and Strategies

The left column lists NYC Vision Zero's priority topics around traffic safety, while the middle column provides the specific behaviors associated with each topic. The right-hand column contains the marketing strategies being implemented to address each specific topic and its associated behaviors.

Priority topics	Specific behaviors targeted	Marketing strategies
Reckless driving - driver choices	• speeding • failure to yield	☒ outdoor media ☒ television ☒ interactive digital ads ☒ radio ☒ city-owned media ☒ bumper stickers
Pedestrian safety	Pedestrians: • mid-block crossings • watching for turning cars Drivers: • speeding • watching for pedestrians (particularly left turns)	☒ flyers ☒ schools outreach ☒ truck/bus visibility for schools ('trucks eye view' hands on demonstrations at select schools) ☒ Aging New Yorkers Outreach Plan (short film and materials targeting seniors)
Large vehicle education	• turning blind spots • interactions with pedestrian and cyclists • truck side guards • truck route compliance	• city fleet outreach (materials for drivers) • "Good Operator Awards" • truck association outreach (communications kit) • waste management outreach (communications kit)
19-190 Yield to pedestrians	• yielding to pedestrians	• print media (newspapers) • DMV buck slips and posters

		• VMS boards • city resources (websites, hold music, employee checks) • Awareness Day • Social media (week-long campaign)
25 MPH - Speed cameras	• speeding	• radio • speeding tickets (buck included) • November anniversary (press releases) • social media (week-long campaign with anniversary)
Motorcycle drivers	• safe driving practices • skills development	• viral video (with celebrity) • online media • DMV (buck slips) • flyers
Taxi and livery drivers	• speeding • failure to yield	• TLC training materials • technology for "safety" tip

Messaging

Taken from anti-smoking campaign best practices and focus group testing, the NYC Vision Zero messaging content focused on "graphic" images "clearly defining the consequences" of undesirable behavior. Focus group testing data discouraged humor in order for the public to "take it seriously."

Making it Community-specific

All photo and video work for the campaign was done in NYC, highlighting common neighborhood imagery. They used geolocating technology to associate specific facts and statistics to corresponding neighborhoods and boroughs, as well us translated messaging into relevant languages.

Message Testing

Focus groups were used for pre-campaign message testing, and random sample online testing was done post-campaign to test awareness, comprehension, and impact.

San Francisco Vision Zero Citywide Strategy for Education and Outreach

Developed by the San Francisco Vision Zero Education Subcommittee, this strategy outlines a ten-year education strategy to work in conjunction with engineering, enforcement, and data and policy subcommittee work. The plan focuses on "changing the culture of traffic safety" in San Francisco to address behavior change, with emphasis on "research-based, data-driven, and culturally competent" campaigns. San Francisco's Vision Zero education and outreach strategy was used as a basic framework for this document, specifically drawing upon the extensive research into best practices for road safety campaigns (see next section).

Four Main Areas of Focus

The SF strategy focuses on the following main areas:

1. Brand identify/mission buy-in

Brand focused on two core messages: 1) a significant, achievable goal that impacts all San Francisco residents and b) that each person in San Francisco has a role in helping achieve zero fatalities. The Vision Zero SF brand is the "entity" that embodies these two goals.

2. Multifaceted safety campaigns
In addition to the Vision Zero brand awareness campaign, the city will need to continue and develop multi-year educational campaigns that target specific audiences and specific behaviors with an aim of reducing known causes of collisions that result in severe injury and death. Some will be Vision Zero branded, and some will "in support" of Vision Zero.

3. Multifaceted safety programs
Support for standalone programs that support Vision Zero goals, for example, Safe Streets for Seniors program.

4. Engineering, enforcement and policy support
Education and outreach efforts should coordinate with and complement these other Vision Zero elements.

Education Core Principals

1. Use San Francisco specific data analysis to inform education initiatives.

2. Utilize best-practices in road safety education as well as the efforts of peer cities pursuing Vision Zero when designing initiatives.

3. Rely on public health and communications theories to ensure that there is a broad, multifaceted program that impacts all aspects of San Francisco's traffic culture.

4. Develop program focus and messaging through target-audience research and interviews.

5. Develop campaigns in a culturally sensitive manner, including using multi-lingual materials and engaging community organizations whenever appropriate.

6. Focus on ensuring the safety of vulnerable populations and the areas of the City where education and outreach are needed the most.

7. Coordinate activities based on the same vision, objectives and data.

8. Utilize data and messages that are consistent with Vision Zero.

9. Are, as much as possible, coordinated with enforcement and engineering.

10. Evaluate programs in their formative stages and conduct impact evaluation to determine program effectiveness as is feasible and as funding permits.

External Goals for Education Subcommittee

1. Measurable shift in the understanding that each person using city streets has the ability to change behaviors to support the reduction in severe and fatal injury collisions.

2. Measurable increases in awareness of key traffic laws and requirements.

3. Measurable reductions in injuries and fatalities caused by speeding, vehicles making turns, pedestrians stepping into the paths of oncoming cars and bicyclists failing to yield and other factors as identified.

4. Measurable reductions in speeding on city streets.

Focus of programs and campaigns

1. Developing a common understanding that death on our streets is unacceptable and that each person has a role in ensuring it does not happen;
2. Establishing new expectations related to behaviors on San Francisco's streets that result in changes to the way that people travel and as a result, safer streets with fewer collisions and fatalities;
3. Influencing perceptions, beliefs, and attitudes;
4. Educating about risk and protection;
5. Increasing skills and knowledge;
6. Increasing support for and helping implement safety policies; and,
7. Helping leaders support safety issues and promote a commitment to safety.

Near-term Educational Actions: Core Program

The following programs are the core of the SF education strategy, and are directed to be implemented in the next 1-3 years.

Program	Overview
Vision Zero Brand Awareness Campaign	• high visibility, mass media advertising (radio, TV, billboards, social media, collateral materials) • grassroots community outreach • sponsorship at community events • community mini-grants
Safe Streets SF: It Stops Here	• maintain existing campaign focus on laws regarding crosswalk violations
Safe Streets SF: Anti-speeding	• 2-year funding request of ATP • partnership: SFMTA, SFPD, SFDPH • high visibility enforcement with HIN focus couple with media campaign on dangers of speeding
Safe Streets SF: Safe Left-turns	• media and community outreach on left-turn safety - one of top 3 dangerous behaviors • 2-year funding request of ATP • Partnership: SFMTA, SFPD, SFDPH
Safe Bicycle Behavior Education Campaign	• top dangerous biker behaviors: • failure to stop at limit line, falter to stay in lane, faultier to stop before entering crosswalk • partnership: SF Bicycle Coalition, city agencies • stakeholder outreach, grassroots engagement, mass media ads, direct education

Safe Pedestrian Behavior Education Campaign	• five most dangerous behaviors: • failure to yield to motorist, midblock crossing, running a red light, leaving the curb suddenly, violating traffic signal • integrated: Safe Routes to Schools, Safe Streets for Seniors • partnership: Walk SF, city agencies
Safe Routes to School	• currently funded through FY 17 • partnership of multiple city agencies and community organizations providing training to 40 public schools • expand program to reach additional students and program impact
Safe Streets for Seniors	• provide safety education through senior centers, organizations and housing • in partnership with engineering outreach activities and with existing SFDPH programs for seniors
Larger Vehicle Driver Training Program	• developing standards and guidelines for companies that operate fleets of larger vehicles • training video and curriculum for drivers
Taxi training	• developing standards and guidelines for professional taxi drivers • video to be implemented into existing taxi training program

Engineering, enforcement, and policy support	• sees these efforts as "teachable moments" to help with education
	• support for materials development
	• SF Street Team
	  • "Guide to SF Streets" booklet
	  • education specific to engineering treatments

Programs for Consideration for Long-term Action

Permitting additional funding and research, the following actions are first priority for consideration after the near-term actions listed above:

- Visitor and commuter campaigns
- Expanded school programs
- Taxi and TNC related programs
- Internal/Staff programs
- Grassroots and Outreach Activities (additional)
- Other local safety campaigns (DUI, public health focus)

Outcomes:

- Increased public awareness and understanding of Vision Zero as city's commitment to eliminate traffic deaths
- Increased belief that SF street travelers can play a part
- Measurable decrease in dangerous behavior related to traffic deaths
- Increasing understanding and support for engineering treatments
- Increased capacity of stakeholders to inform and educate

Key Takeaways from NYC and SF Strategies

No two cities will implement Vision Zero in the same way, given the diversity and complexity of different populations, geography, differences in traffic data, etc. However, here are some of the key takeaways from the NYC and SF education and marketing plans that can be applied in practice in Los Angeles:

- Strategies should be data and research-driven in their development, including: best practices from previous road safety campaigns, best practices around public health outreach, behavior change theory, and message testing
- There is disagreement over the effectiveness of different kinds of messaging (i.e. positive, graphic, fear-based, etc.); messaging content should be focus-group tested and specific to the particular city and its communities
- Strategies should include a variety of media and on-the-ground community outreach and education tactics, aimed at different levels population segments (including public "influencers")
- Strategies should maintain core messaging throughout tailoring to different audiences
- Cities should take advantage of their own resources (agency resources, free ad space, etc.)

Best Practices for Road Safety Campaigns

Below is a summary of the San Francisco Vision Zero Education Subcommittee's literature review of over two dozen peer-reviewed journal articles on road safety campaigns and health communication generally.

San Francisco Road Safety Campaign Literature Review Summary

Main goals of road safety campaigns:

1. To raise awareness of an issue or to inform
2. To change attitudes
3. To change behaviors
4. To decrease the frequency and severity of accidents

Characteristics of successful road safety campaigns (in no particular order):[1]

- Are supported by other actions (legislature/policy, enforcement, rewards, incentives);
- Are based on behavior change theory;
- Break audiences into groups and tailor messages so they appeal to the different group;
- Address the existing knowledge and beliefs of target audiences that impede adoption of desired behaviors;
- Present information in line with social trends, behavior patterns or lifestyles;
- Use realistic, credible messages;
- Present the message in an unusual, new manner;
- Repeat a single message;
- Involve prior qualitative or quantitative research including pre-testing and focus groups;
- Evaluate and improve the campaign while it's being implemented;
- Use different interventions simultaneously;
- Set fairly modest, attainable goals in terms of behavior change;

[1] See reference 4, 13, 14, 20, 22, 26.

- Focus on the availability of products and services that support behavioral change;
- Utilize "media advocacy" or using the campaigns to achieve a policy change;
- Use commercial marketing and social marketing strategies.

Factors that diminish the effect of a road safety campaign are (in no particular order):[2]

- Conflicting messages;
- Delivery by source(s) lacking credibility;
- Inadequate exposure to campaign messages due to infrequent presentation and poor placement;
- Hostile message environments in which messages promoting change are outnumbered by competing messages that urge the continuation of existing behaviors;
- Insufficient training of the target audience on the skills needed to start and maintain the desired behavior change;
- Insufficient financial support for the campaign;
- Use of inappropriate or poorly researched format (e.g., boring factual messages or age-inappropriate content).

Road safety campaigns are generally more difficult than commercial campaigns because they seek to change behavior with complex variables. They must be more creative and nuanced because they have to develop a brand and involve negative demand with a small budget.

Tailoring Messaging

The better the messaging is targeted to different segments of the population, the more effective the campaign will be. Segments should be based on attitudes, values, and beliefs.

The following principles should guide decisions concerning segmentation:

- those with the greatest needs (according to crash data)
- those most ready for action and able to respond
- those easiest to reach (but this should not be at the expense of those most at risk who are difficult to reach)
- those that are the best match for the organization developing the campaign in terms of expertise and resources.

While messages may be tailored to different audiences, they should remain part of the same key core messages grounding the campaign.

Message Effectiveness

Because road safety campaigns seek to change a behavior, ads must not only be remembered, but be remembered for the *behavior being advocated.* Make sure the messages are clear, concise, and credible in order to best transfer memory into action.

People have a "psychological immune system", meaning they tend to ignore or rationalize information that makes them feel vulnerable or threatened (e.g. *That would never happen to me, I'm a careful driver.)* The best way to bypass these biases is to make sure the message is credible, meaning reflecting the beliefs and experiences of the target group, so they will personally identify with the character and associated behaviors.

[2] See references 22, 29.

Stressing the positive effects of desired behavior rather than negative consequences of undesired behavior helps make the content more relatable. Researchers have found that messaging that portrays undesirable behavior can potentially normalize that behavior. "Priming" the audience with words, images, or phrases that emphasize the benefits of desirable behavior is more effective. For example, a speeding campaign should not carry the message "if you drive too fast you will be involved in a crash, be fined, and cause serious pain and damage." Rather, it should have a positive tone, and carry the message "'obeying the speed limit is safe, it is relaxed, takes less fuel, and most people roughly keep to the speed limit anyway." Positive, emotional, and actionable ads have the most inherent appeal.

Providing a positive alternative to the undesired behavior is also an effective strategy for making the message more relatable. For example, focusing on having a "plan B" instead of driving home after drinking. This may be more difficult with behaviors like speeding, and should be message tested in focus groups to determine specific applicability.

Best practices research suggests that fear-based messaging may motivate people, but may also trigger defensive responses. Audiences may avoid the message because it's perceived as too overwhelming or they feel hopeless. If one does use fear-based messaging, it should be credible and propose a positive solution.

Messaging Exposure

Health messaging advocating for behavior change tends to be well known and largely ignored, and too many ads can seem patronizing. New research suggests that it is best for all target audiences see ads at least once, and the goals is for as many to see messaging as is affordable. Most experts suggest three to ten exposures as the most effective exposure rate. Over ten exposures is too much and over fifteen can results in negative reactions. Repeated cycles of short-term mass media exposure has been found to be effective.

The Role of Enforcement in a Successful Campaign

Enforcement best enhances the effectiveness of messaging when targeting compliance-based behaviors like speeding, failure to yield, and drinking and driving. Enforcement can also overcome feelings of being patronized in the target audience. Finally, information alone is more likely to influence behavior based on deliberate choices as opposed to habitual behavior, like wearing (or not wearing) a seatbelt, speeding to save time, or driving after drinking. In these cases, the most effective change strategies impede performance of the established behavior (through punishment or rewards) while facilitating formation of new behaviors into habits.

<u>When to link enforcement with education:</u>

1. If enforcement of compliance is possible, such as with speeding, failure to yield and drinking and driving. Less visible behaviors like fatigue are harder to combine with enforcement and may benefit more from messaging alone.
2. If a law is well known but not being followed.
3. If a campaign can lead to feeling of being patronized.
4. If the behavior in question is habitual.

Target Audiences

Behavior change can happen through direct exposure to messaging or indirect exposure by the conversation sparked from messaging. In order to change social norms, behavior change theories encourage targeting multiple levels of audiences: individuals, communities, institutions, organizations, decision-makers, and social networks. Transportation is a unique

public issue area as nearly everyone engages in it. This means there is an increased likelihood of indirect pathways influencing behavior change. Large-scale mass media campaigns with high population exposure can be particularly effective at influencing the overall population response and awareness to road safety.

The information transmitted through road safety campaigns has been shown to:[3]

1. Contribute to an increase in knowledge and a change in attitudes;
2. Increase the perception of the likelihood of detection and punishment;
3. Contribute to the acceptance of unpopular but effective measures such as enforcement;
4. Help place the issue on the social agenda, which can help drive legislation or generate public support for road safety programs;
5. Lead to the emergence of new social norms.

Also important to note is that road safety offences occur within a social context—we rarely travel in isolation, but rather share the road with others. It's impossible to be anonymous. This "social regulation" means that there is great potential for factors like norms and attitudes to affect a person's decision to commit an unsafe road behavior. Traditional legal sanctions are important, but the indirect pathways should not be underestimated.

One the most important lessons from this research is the importance of grounding road safety messaging in behavior change theory in order to maximize effectiveness. Prominent behavior change theories related to public health outreach are overviewed in the next section.

Behavior Change Theories

Best practices research encourages grounding Vision Zero in widely studied theories of behavior change. There has been a history of ineffective behavior change attempts around road safety in particular.[4] However, behavioral science has increasingly emphasized and integrated injury prevention initiatives over the past few decades. Growing research shows that targeted approaches to injury prevention that are based in behavior change theories are more effective in reducing the risk of dangerous behaviors.

There is no one dominant theory of behavior change in the public health field. Researchers advocate simultaneous use of multiple theories, with emphasis on those that apply most specifically to the particular campaign context (i.e. topic, demographics, place, etc.). See Appendix A for an overview of behavior change models and concepts related specifically to injury prevention and public outreach.

SECTION 4: INTERVIEW FINDINGS

Findings from our interviews with 46 stakeholders reveal a common set of themes around the current landscape of dangerous traffic behavior within Los Angeles, as well as effective messaging and outreach practices that will work to achieve the goals of the education and outreach strategy. They also emphasize equity and cultural relevancy considerations that Vision Zero must take into account if it is to be successful. Finally, the data suggests how Vision Zero should move forward in facilitating and leveraging effective partnerships both between agencies and sectors.

Messaging Strategies

[3] See references 6, 13, 22, 26.

Modal Conflict

Almost all of our interviewees expressed the "inherent conflict" between moving cars as fast as possible and moving people safely. They cite that within the post-war period, much of Los Angeles was built with the automobile in mind, with wide, six-lane streets meant for speed, freeways cutting through neighborhoods, narrow sidewalks, and nonexistent bicycle facilities. In recent years, there has been a culture and policy shift towards prioritizing active modes of transportation such as walking and bicycling, however much of the infrastructure continues to reflect previous eras and there is still a great concern over congestion.

The clash between people and cars is evident in community debates around traffic-calming measures such as the road diet on Rowena Ave in Silver Lake. However, recent increases in traffic fatalities has galvanized many groups to say "enough is enough," we need to do more to move people safely. Several of our interviewees expressed that if we make the road safer for pedestrians and cyclists, the roads will become safer for everyone.

- Strategy 1.0: Vision Zero messaging should consider the vehicle-centric nature of Los Angeles as well as the conflict between moving cars fast versus moving people safely.

Norm Change

An overwhelming majority of our interviewees expressed that for Vision Zero to be successful in Los Angeles we will need to change social and cultural norms around traffic behavior and traffic fatalities.

A messaging strategy that seeks to shift social norms is referred to as a "social marketing campaign." A social marketing campaign differs from a traditional communications campaign in that it is not focused solely on consumer choice--where you tell someone to do something or increase brand appeal, but is rather about changing what is socially acceptable within a community. Many interviewees cited anti-tobacco campaigns in California as successful examples of social marketing. The messaging changed what people accepted as normal and created an environment where it has become less socially acceptable to smoke in California.

As in the case of tobacco, these cultural shifts take years and are more successful when paired with effective policies such as anti-smoking laws in restaurants, parks, cities, etc. In order to be successful, the message must also get to the root of why people should care about the issue. A successful norm change campaign for Vision Zero would seek to promote the ideas that Los Angeles is a place where traffic deaths are unacceptable and preventable.

- Strategy 2.0: Messaging should be part of an overall "social marketing campaign" that seeks to change social and cultural norms around transportation and traffic safety.

Core Messages

At the heart of this social marketing campaign, there needs to be strong universal messages addressing why people should care about traffic fatalities and Vision Zero. While not the specific language used for public messaging, these core messages are the foundation for the campaign. The messages are simple and can address both why people should care and potential barriers to their interest or participation in Vision Zero. Each message is simple yet broad enough to be substantiated in various ways depending on the target communities, cultures, and lifestyles. This tailoring will be especially important in Los Angeles, considering

differences in current perceptions of traffic safety (shaped by an individual's neighborhood, communities, primary mode of transportation, country of origin and so on).

- Strategy 3.0: The campaign should have a set of simple and universal core messages that serve as a foundation for all messaging, and can be substantiated in many ways depending on the audience.

Segmentation

Segmentation of the population into different audiences is critical to understanding who your audience is and how to tailor the core messages accordingly. Interviewees discussed various ways to segment the population. One way is to segment based on the collision data in which audiences are determined from those categories with the highest incidences of collisions and in accordance with LADOT's prioritization metrics. This would include: 1) pedestrians 2) bicyclists 2) children 3) seniors, and 4) male drivers ages 18-54.

While the above approach is data-driven and addresses those who are most likely to be involved in a collision, these groups are still too broad for targeted messaging. Because the demographic data from police reports is limited, the next step would be to further segment based on lifestyle, for example how often they use certain modes of transportation versus others. An example of this type of segmentation within pedestrians: 1) recreational walkers 2) joggers 4) daily walkers 5) public transit users. For male drivers: 1) daily drivers 2) weekend drivers 3) professional drivers. This will allow for a better understanding of the differences in how each segment will be reached. For example, a daily driver may be best reached through the radio or a billboard, while a public transit user may be best reached through signs at bus stations and on their smartphone.

If further demographic or geographical data permits, these segments can then also be layered with a multicultural and community centered approach. For example, if Chinatown has a high number of pedestrians collisions, the message should be framed around the types of pedestrians within Chinatown and the best way to appeal to this group that is both culturally and contextually relevant. More discussion on social equity will appear later in this section.

Often, there will be overlapping segments such as those who drive sometimes, but also ride their bicycle recreationally on the weekends or occasionally to work. A messaging strategy should actively try to find where these overlaps exist in order to efficiently reach the largest audience possible with a single message and medium.

A final segment to take into account when developing the messages and determining their modes are the individuals' proxies. Many of our interviewees commented that people often do not care about their own mortality or find ways to rationalize it by saying *that will never happen to me.* When this occurs, sometimes the most effective way to change behavior is through communicating to their family members, significant others, friends, or peers, who can then move the individual to stop the dangerous behavior.

- Strategy 4.1: The campaign should tailor messaging to segmented target audiences.
- Strategy 4.2: Audiences should be first segmented based off the campaign priorities, and then further using additional lifestyle and demographic characteristics.
- Strategy 4.3: Segmentations should be as specific as data and resources will permit.

➽Strategy 4.4: When applicable to particular segment and behavior, messaging should target individuals exhibiting dangerous behaviors as well as those close to them.

Framing

Once the segments for Vision Zero messaging are identified, the task then revolves around framing the messages in a way that is relevant to those segments. The ultimate goal here is to change their attitudes about traffic related fatalities and their own behavior accordingly, as well as support policies and infrastructure that seek to reduce fatalities.

Quality of Life

Almost all interviewees emphasized quality of life as a central concern that was universal to every demographic and geographic group within Los Angeles. They stressed that in order for people to care about Vision Zero, the messaging had to directly relate to their lives. Quality of life directly pertains to issues like public safety, commutes, children, and the quality of the built-environment.

Family

Another universal theme which resonated with almost every interviewee was the importance of family. As mentioned earlier, people worry more about their family than they do themselves, so framing a message such as “drive like your family lives here” or “that bicyclist is your family member” might effectively remove the attachment people feel towards others on the road by personalizing it to those they care about.

Children

Children were viewed by many as a strong emotional touch point when messaging to communities about the importance of traffic safety. As one interviewee noted, “people just want to make sure their children can cross the street or walk safely to school.”

Power of Personal Stories

Many of our participants noted the power of personal stories in getting people to listen and care. They argued that although statistics can be shocking to some, often times people do not really know what they mean. If you can put a face to a statistic about someone who lost a family member or even within a positive light about someone who cycles to work everyday then you will be more successful at connecting with a broader audience.

Why Should You Care?

No matter the message, interviewees stressed the need to make people understand why they should care about Vision Zero. One interviewee noted, “at the end of the day, no one wants to get into a car accident, give people more reasons to understand why not so the issues is at the front of their minds.” That way the messages can “insert themselves into the moment of decision-making” before someone pulls out their smartphone to send a text or speeds down a street because they are late for work. The goal is to get them even for just a moment in time to stop and think before making that decision.

➽Strategy 5.0: Messaging should framed in a way that makes it personal to the targeted audience and addresses why they should care.
➽Strategy 5.1: Using themes relating to quality of life, family, and children are the most effective ways to personalize messages.

➽Strategy 5.2: Messaging should use personal stories whenever possible to humanize data.

Medium Types

Messaging mediums should be tied to the content by considering how each audience segment will most likely see or hear each message. For example, bus shelters and bus ads are logical pairings for messaging targeting pedestrians, while freeway billboards and rush hour radio spots should be tailored toward commuters. Billboards and bus shelter ads in areas with many bars and clubs might find an appropriate audience for anti-drinking and driving messaging. A comprehensive campaign will also incorporate non-traditional mediums like printing messaging on objects (e.g. coasters, water bottles, coloring books, etc.) or organizing public performances (see Non-traditional Campaign Ideas).

While it may be resource-intensive, doing market research into specific groups is necessary for effective with tailoring. For example, the research might reveal that "radio spots on these specific podcasts will target white, male cyclists between 25-35." Social media advertising should be effectively tailored with services like Nationbuilder, for both demographic factors (e.g. age, gender, etc.) and lifestyle factors (e.g. use public transit, tend to go out on the weekends, etc.).

Whether it be the result of market research or common sense, best practices encourage establishing logical pairings to tailor messaging to different population segments to make the messages stick. Considering the resource limitations, particularly with mass-media advertising, priority should be given to largest segments within Vision Zero priorities.

➽Strategy 6.0: Tailored messaging content should utilize the most logical medium for that population segment, based on how they are most likely to be exposed to messaging

Earned Media

While much of the Vision Zero messaging will be disseminated through purchased media, many of our interviewees discussed the cost-efficiency and publicity advantages of earned media (i.e. any free exposure or media coverage resulting from other campaign efforts). Media might be earned through submitting op-eds, or press releases or online videos that are widely shared and lead to news coverage by major outlets. Viral social media content can also contribute to earned media.

➽Strategy 7.0: Whenever possible, Vision Zero should utilize earned media through staged events, press releases, social media, and other tactics.

Non-traditional Campaigns

Many of our conversations with communications specialists looked at the growing prevalence and power of non-traditional campaigns as a way to communicate messages to the public. Non-traditional campaigns consist of any public installation or event that seeks to communicate to the public while also maximizing potential for earned media. This includes but is not limited to flash mobs or performances in the street, actors speaking to residents, pop-up art installations, and community murals. One peer city example of this is Washington D.C. DOT who is in the process of commissioning a mural, which would raise awareness about street harassment (for more, see Non-traditional Campaign Ideas).

- Strategy 8.0: Vision Zero should strategically invest in non-traditional campaign tactics to gain earned media, and contribute to the overall theme of innovation and creativity associated with the campaign brand.

Competition

It is important to acknowledge the advertising landscape to see what the messaging will be competing against, and when a campaign will have the most potential for success. Some considerations include the upcoming June and November elections and the holiday season, in which air time will be expensive and saturated with advertisements. Additionally, private companies are adept at disseminating and marketing condensed and targeted messages to many different audiences.

For these reasons, our interviewees emphasized the importance of simplicity in Vision Zero messaging. They noted that people are exposed to so many messages throughout their day that they do not have the time or energy to read everything. Moreover, messages should be communicated in terms that can be understood by everyone and should avoid any technical transportation or public health terms such as "data-driven, prevalence, outcomes, countermeasures, infrastructure, or bike facilities" just to name a few.

Additionally, for different age groups such a youth, seniors, and non-native English speakers, there may be varying levels in literacy and English reading capacities. In such cases, images or visuals which communicate the desired message or concept without compromising its integrity may be the solution. As one interviewee noted, "images unite where words tend to divide." Language accessibility will be discussed further in the community outreach section.

- Strategy 9.1: Media purchasing should be strategically scheduled to achieve maximum efficacy.
- Strategy 9.2: Messaging should use simple, public-facing language and avoid using technical terms.

Message Testing

Message testing should incorporate both random-sampling surveying and focus groups. Lessons learned from previous outreach campaigns reveal that surveys with larger sample sizes will help inform more generalized reactions to the content (e.g. emotional tone, choice of images, etc.), while focus groups are more helpful in providing specific reasons why audiences find the content appealing or unappealing.
When the final segmentations have been determined, a sample of each of these populations should be represented in focus groups. Messaging intended to change behaviors should be tested with focus groups and survey samples that represent the populations most likely to commit the behaviors (see *Prioritization Metrics* section*).* Messaging intended to increase general brand awareness should use focus groups and survey samples that segment populations by a variety of factors: lifestyle habits, geographic location, languages spoken, race and ethnicity, age, gender, etc.

- Strategy 10.0: Messaging content should be tested through broad-based surveys and targeted focus groups both before implementation and throughout the campaign.

Social Equity

As mentioned earlier, the Vision Zero education and outreach strategy should take certain considerations into account when communicating with underserved populations and low

income communities. We want to highlight the need for a holistic approach that does not view Vision Zero, mobility, or traffic safety within a vacuum, but rather integrally linked with a host of other issues that impact these same communities.

Issues such as concerns with law enforcement, deteriorating infrastructure, zero-car households, lack of grocery stores, crime, and homelessness all impact why and how people get around and may be more pressing than traffic safety for certain communities. For example, it may be less effective to focus education efforts on the disability community without being able to feasibly ride a wheelchair on the sidewalk. Students walking home from school in an area of high homelessness may need to step into the street to avoid encampments, putting themselves in danger of passing cars.

Messaging should account for communities' different needs and ends when it comes to mobility and traffic safety. For working class communities, safe walking and biking may mean safe access to the places that are of necessity to their daily lives, such as their work, the grocery store, or school. While safe active transportation in a more affluent area may have a more peripheral impact on their daily experience, such as getting more exercise or enjoying nature.

In sum, an education and outreach strategy will be most successful if it acknowledges these considerations *before* messaging and implementing safety programs within various communities. The goal is to meet people where they are in all aspects of traffic safety, and build awareness and behavior change from there.

➽Strategy 11.0: The education and outreach strategy must consider competing and correlating issues that impact disadvantaged communities.

Community Outreach Strategies

Best Practices for On-the-Ground Public Outreach

Unlike mass media messaging, public outreach refers to in-person Vision Zero education efforts carried out by LADOT or community partners. These outreach efforts will happen in a variety of smaller settings, and will rely heavily on community-based organizations' relationships and expertise around the communities they serve. However, public outreach efforts still need to be able to answer the question, "why should they care?". This question should be answered at individual, family, organization, and community levels. The person or group best able to answer this question will vary depending on the target audience. This section will cover findings and recommendations for on-the-ground outreach for the general public.

Engaging Individuals

Many of our interviewees experienced with on-the-ground outreach discussed effective ways of engaging community members around an issue. The most important factor is making the issue matter at an individual or family level. If the average community member cannot answer the question, "why is this worth taking time out of my day?", the turnout is likely to be low. Sometimes this means taking advantage of local "hot topics" or controversies. For example, a council district office member recounted the most well attended community meeting in recent memory was a meeting with the LAPD after a recent crime spree had hit the neighborhood. Overall, people fundamentally care about safety, their families, and their quality of life, so outreach efforts should draw a strong connection to one or more of these topics.

Incorporating a broader view of the potential benefits and costs of an initiative may also make it easier to align interests with individual community members. For example, more people were supportive of an initiative to turn Oro Street in Woodland Hills into a green street when they learned that it would raise their property values. Taking advantage of certain unintended consequences or related issue areas can be effective in addressing a wider audience.

- Strategy 1.0: On-the-ground outreach should engage individuals by taking advantage of public interest in other local issues and concerns.
- Strategy 1.1: Vision Zero should engage individuals by emphasizing the specific outcomes that align with individuals' or communities' priorities.

Communication

Many interviewees, particularly those with communications expertise, highlighted the importance of using simple, clear, and concise language. Words like "data-driven", "prevalence", and "outcomes," might seem simple enough to those familiar with the terminology, however they are not as accessible to a public audience. Additionally, relying on visuals more heavily than words can be an effective way to transcend language, particularly among non-English speakers.

However, this does not replace the need for community outreach efforts to be in languages that are prevalent in a particular community. In practice, this might look like having a translator in community meetings, having materials printed in 3-4 languages, or having opportunities for public input in non-English languages that can be translated at a later date. It is important to be judicious, intentional, and competent with translation resources. Many nonprofit and city agency representatives recommended using community-based organizations to make sure translations are culturally competent.

Whether the information comes from LADOT directly or from a community partner, it will help community members contribute to the success of a city-driven initiative if they understand the role and limitations of government. Setting clear and realistic expectations around the timeline of infrastructure improvements, for example, might cause less frustration and disappointment in the future. It also helps community members feel like active partners and remain engaged in a process if they receive follow-up communications about the outcomes or next steps following a community meeting.

- Strategy 2.0: Outreach efforts should use simple and culturally competent language.
- Strategy 2.1: When applicable and possible, verbal communication and written materials should be translated by a trusted source into all languages used by the target community.
- Strategy 2.3: Outreach to the community should be framed with clear and realistic expectations, emphasizing the role and limitations of government.

Outreach Methods

Choosing the most effective outreach venue will depend on factors like the community trust in organizations, the nature of the message, and current level of engagement of community members. It will be important for LADOT to remain aware of their "brand" within different communities, and whether or not they are the best organization to spread a message within a particular neighborhood or population. For example, council district office staff representing certain areas of the valley expressed a common "anti-establishment" sentiment in some

constituent groups, where education will be more effective from trusted source (e.g. school, nonprofit, faith-based organization).

Similarly, in communities where few people are engaged in public issues or those that have distrust of government will likely need messaging from trusted CBOs and personal networks. Alternatively, a more actively engaged community with strong participation in neighborhood council meetings might request a Vision Zero presentation from LADOT staff.

Some interviewees shared previous success with outreach by finding "natural pairing opportunities" with existing community events or practices. For example, it would make sense to have community-based advocates spread the message to Southeast Asian cultural groups who tend to walk outside after dinner and talk to neighbors. Generally, pairing with existing community events or practices will garner better audience diversity, as they require less advertising and can target people participating for multiple reasons.

Some groups or people at specific events might have a bias for or against a particular initiative. Interviewees advised not to avoid speaking with groups who have reason to resist the initiative, but approach them with an awareness of how the initiative overlaps with their priorities. Simultaneously, finding groups or events (particularly highly trafficked ones) with compatible interests can be a way to effectively target resources. For instance, the LADOT team working on the "Watch the Road" Campaign partnered with T-Mobile to send active transportation-related messaging to participants of the LA Marathon.

- Strategy 3.0: Vision Zero should leverage community-trusted organizations and leaders to conduct outreach and education.
- Strategy 3.1: Education and outreach efforts should leverage existing events and lifestyle within specific demographics to maximize reach and resources.
- Strategy 3.2: Outreach efforts should recognize varying levels of support for Vision Zero and strive to meet people where they are.

Events and Meetings

Providing incentives, resources, and services are effective ways of attracting people to events. Specifically, providing food, childcare, and varying the times of the events will help bring in those who might not otherwise have the resources to come.

Advertising to a diversity of community partners, leveraging public-private partnerships, and providing interactive activities are methods of widening the reach of events and meetings. Creative working group activities or games can be fun ways to engage and educate at the same time. One city official recalled a four-hour "Iconothon" event that brought together designers, policy experts, and community members to brainstorm visual icons for The Noun Project. She was so engaged she only realized at the end that she was learning about traffic infrastructure throughout the event.

Interactive activities like mapping and explaining why a pedestrian takes a routine route help make people feel like they have an active voice in community improvements, while also providing valuable information to fill in gaps in technical data normally available to city agencies. Leaving participants with a tangible call to action will help them stay engaged in the process and thinking about the issue or initiative.

Events with multiple activities and organizations can be an opportunity to bring people together who normally do not interact. For example, a New York City DOT and Parks and Rec "bike bonanza" event had New York City police officers present to tag children's bicycles in

case of theft. This provided an opportunity for positive reinforcement between children and law enforcement, who might not interact under normal circumstances.

- Strategy 4.0: Education and outreach events should provide physical incentives to garner additional interest.
- Strategy 4.1: Vision Zero should advertise and partner with a diversity of organizations to get increased attendance at education and outreach events.
- Strategy 4.2: Outreach and education events should incorporate interactive activities in order to engage attendees while also acquiring valuable information.
- Strategy 4.3: Vision Zero should use education and outreach events to bring populations together who would not normally interact.

Special Populations

Below are interviewees' specific recommendations and considerations for special populations.

Seniors

- Target senior centers and senior housing
- Humor is more effective than telling seniors what to do; seniors are very sensitive about losing sense of independence related to mobility
- Should provide a variety of print materials---big font size, easy to see and understand, simplistic, be careful with bright colors
- Presentations are best way of reaching seniors, particularly from someone in an authoritative position
- Need to have materials in a variety of languages (Dept. of Aging has translation resources)
- Faith-based organizations are good partners for reaching seniors
- Be aware of multiple senses as they relate to traffic safety (e.g. some electric/hybrid vehicles don't make sounds and particularly important for seniors to be aware of)
- Biggest barriers: language (for non-English speakers) and ability to hear

Children

- Need structure and parental engagement to reach young children ('bike rodeos' are not effective)
- Can sometimes reach parents through their children (e.g. many parents might come to a bike safety class for their child, though they wouldn't for themselves)
- Social media is the most effective medium for young age groups (Instagram and Snapchat are more effective than Facebook for generations younger than Millennials)
- Remember to segment children in smaller age brackets (e.g. middle schoolers and high schoolers are very different)
- Humor is the most effective way to get Youth to share things, particularly on social media /

Disabled

- People with disabilities are often physically less visible in the built environment
- Many disabled people are living on small stipends and may have less access to transport/internet, though internet is still a prominent source of messaging
- It may take more resources for a physically disabled person to get to out of the house and transport themselves to an even than an able-bodied person

- Current mobility focus for disability community is on the physical environment (e.g. lack of proper sidewalk infrastructure means dangerous detours into the street for those in wheelchairs)
- Barrier: many people do not want to identify as disabled (particularly seniors) because of the associated stigma

Non-English speakers

- Culturally named neighborhoods often have multiple prevalent languages (e.g. in Chinatown has prominent Vietnamese and Cambodian populations)
- Visuals are an important tool for communicating to non-English speakers
- Resources for community events: in-person translators, audio set translators, materials printed in multiple languages, input mediums (e.g. big posters) that can be translated later

Typically Unengaged in Public Issues

- Find captive audiences in highly trafficked areas (e.g. gas stations, the DMV)
- Use online surveys and neighborhood blogs
- Urge friends who are more aware of the public sphere to reach out to friends and family who may not be.

➽ Strategy 5.0: Education and outreach efforts should take into account considerations for special populations.

Best Practices for Engaging Community Partners

As the Vision Zero organizer, LADOT should have an idea of the working landscape of the environment proximate to the initiative. Regarding community partners, this means having an awareness of the power dynamics (ability to influence the success of overall initiative or specific project) of partners, their relationships and current priorities. Having this understanding will help LADOT prioritize and utilize outreach resources most effectively. LADOT will need to trust and rely heavily on its community partners for outreach and education, as the implementation of a mission-driven initiative like Vision Zero will vary significantly in different places and communities.

Establishing Partnerships with Community-Based Organizations

A fundamental aspect of successful partnerships between government and community-based organizations is recognizing that both are experts in their own right, with different resources and limitations. With mutual trust and respect, they can more effectively leverage their respective strengths. Developing trusting relationships involves recognition of previous interactions between city agencies or departments and CBOs. Several interviewees representing CBOs expressed a lack of trust for LADOT based on previous experiences. Government transparency and collaboration with CBOs in the decision-making process were emphasized as key ways to strengthen working relationships. Conversely, government representatives expressed the need for CBOs to recognize the limitations of government structure and accept that catering to diverse needs involves sacrifices.

Just as successful campaigns involve making individuals care about the message, LADOT can more successfully engage community partners by establishing a connection between missions, and integrating Vision Zero into CBO's current activities. One way to find organizations with the most alignment and community-specific knowledge would be to send out an RFP to CBOs in each council district or neighborhood designation, with a focus on areas with higher collision prevalence. In this way, LADOT could spread out funding across the city and across organizations. Several interviewees iterated the need for adequate

funding for resource-intensive outreach, and suggested that the funding not be narrowly prescriptive as outreach methods will vary significantly by community.

There may also be opportunities for CBOs to get outside grants from CalTrans or other agencies to help do outreach work on a specific campaign. LADOT's "Watch the Road" campaign was able to broaden its community reach by giving campaign materials to CBOs with outside funding. In addition to physical materials, it would be effective to have workshops to train CBO staff and volunteers on Vision Zero core messaging, materials, and other available resources.

- Strategy 6.0: Successful partnerships between LADOT and CBOs should emphasize transparency, collaborative decision-making, and mutual respect.
- Strategy 6.1: Vision Zero should engage community partners by aligning priorities and existing outreach efforts.
- Strategy 6.2: Where possible, Vision Zero should extend its reach by finding external funding sources to sponsor CBO outreach efforts.

Going Upstream

Effective public outreach campaigns work to simultaneously reach the general public as well as decision-makers and influencers. By going "upstream" in addition to grassroots outreach, a campaign will have the potential to affect policy, legislation, and change wider social norms. One interviewee suggested Vision Zero leaders meet with the five most prominent print media editorial boards in the city to educate them on the purpose and appeal of the campaign. Getting the media on board will help brand the campaign positively as well as put it on the "public agenda."

Approaching elected officials will be another important step in successfully coordinating wider policy change and legislation. One approach is to seek out those elected officials whose priorities already align with Vision Zero, and seek their insight into how it could be successfully framed for their colleagues. At the end of the day it has to be something that they will feel comfortable and championing among their other priorities and to their constituents.

Additionally, educating leaders of other government agencies and departments is an effective way to take advantage of the government network. However, educating their leaders is not enough, as often information does not easily trickle down through an organization. Having compact and attractively packaged resources targeted toward city officials will help the information disseminated through the ranks of these organizations. Have these materials focus on how the campaign is a collaborative effort among departments, always keeping in mind the question, "how can I make it matter to them?".

- Strategy 7.0: Education and outreach efforts should simultaneously target the general public as well as decision-makers and influencers.
- Strategy 7.1: Vision Zero should engage elected officials and decision-makers by aligning it with their existing priorities and values.
- Strategy 7.2: Vision Zero should provide compact, attractive, and tailored resources that can be disseminated throughout city departments.

Other Partnerships

In addition to community-based organizations and formal decision-makers, Vision Zero can expand its reach by leveraging additional partnerships with the private sector, neighborhood councils, alternative media, schools, and/or other cities in the region. It will be the most

resource efficient to find leaders and organizations in other sectors that have aligned priorities with the Vision Zero mission. For example, AAA or car insurance companies might be interested in supporting driver education programs. See Appendix C for more detailed, sector-specific partnership considerations.

- Strategy 8.0: Efforts to leverage partnerships should take into account advantages, considerations, and barriers for specific partners.

Concerns and barriers

The most pervasive barrier to a public outreach campaign in this area is diversity of the Los Angeles population. There is no one common identity or experience as Los Angeles is one of the largest and most diverse cities in the world. Additionally, Vision Zero is city-driven but requires a regional approach in order to target commuters who live outside of the city but often travel within it. It will be impossible to reach all of the necessary audiences through resource-intensive, on-the-ground outreach. Community partners can actively engage in a conversation with city government on how to best and realistically prioritize outreach resources. Mass media purchasing and creating a cohesive, interesting brand will be the best way to reach a broader audience.

Another unique barrier to the Vision Zero campaign is that "traffic deaths" does not automatically register for many people as public problem, or they might only recognize it as a government problem instead of a community problem. While people may think they are tragic, Vision Zero requires a mindset change around traffic deaths being *unacceptable and preventable.* Some interviewees expressed that even if people accept it as a problem, some will think that zero deaths is a naively unrealistic goal, making the campaign seem less credible.

In addition, several interviewees from both government and CBOs expressed a distrust of government and law enforcement in local communities, particularly in low-income communities of color. In places where traffic deaths have been a widespread problem for decades, some will ask, "why does the city care all of the sudden?". This plays into some fears of infrastructure improvements being the first sign of gentrification and displacement, or the idea that these improvements are not for the people who live there. Addressing these concerns will involve open communication around fear over these issues, and expressly mitigating any contributions that infrastructure improvements might have towards displacement.

Fear of "over-enforcement" and distrust of law enforcement in low-income communities of color was also a theme brought up in several interviews. Some interviewees said that the community members they represent would feel less instead of more safe with increased police presence. Some also pointed to aspects of mobility can be criminalized, for example, riding without a helmet or riding on the sidewalks due to lack or resources or infrastructure. This issue could potentially be proactively addressed with collaboration between LAPD and the Vision Zero Alliance and other CBOs involved in the outreach process.

- Strategy 9.0: Education and outreach efforts should expressly and carefully address community-specific concerns around Vision Zero, such as perceived over-enforcement or displacement.

Education Topics

The education component of Vision Zero outreach should be developed and segmented for different target audiences (see Digital Curricula in Appendix B), however should focus on the following topics:

Vision Zero Awareness

The most basic part of any Vision Zero education effort will be to explain the core ideas of the initiative and why they are important. However, unlike many public education efforts, Vision Zero is not merely reminding the audience of something they know--it will involve a paradigm shift for many people around the way they think about traffic safety and education. It will be important for educators knee-deep in Vision Zero to remember that the ideas that "traffic deaths are *unacceptable and preventable*" or that "Vision Zero prioritizes moving *people* safely more than moving *cars,"* will be novel and unpalatable to many community members. Therefore the curriculum should dedicate significant time and energy and a diversity of approaches to addressing this paradigm shift, leaving room for audience discussion to help internalize these ideas.

Make it Personal

Perhaps the most important part of any education and outreach campaign is to make people care by making it relatable to their everyday lives. This portion of the curriculum/presentations should be expressly developed for the particular audience (e.g. school children of different ages, city employees within different departments, neighborhood councils, etc.). At a human level, everyone cares about their families and their quality of life, however people will quickly forget or lose interest in things without a direct call to action for how they can incorporate these ideas into their own lives or work.

Rules of the Road

Lack of public knowledge on proper rules of the road for cyclists, pedestrians, and car drivers, was emphasized by several interviewees as a major factor contributing to dangerous behaviors. There are many "rules of the road" curricula that could be easily adapted for use with Vision Zero, however they should be honed in on knowledge areas directly affecting dangerous behaviors, for example:

- Right of way between different modes
- When and where pedestrians are allowed to cross the street legally
- When and where cyclists can ride most safely and legally
- Car speed limits

This curriculum should be tailored for different age groups and languages, but can remain consistent in content. A creative video or interactive presentation (e.g. a quiz to see how many things people get right or funny animated video) will garner more attention, particularly on social media, than simple instructional language. It may sometimes be helpful to coordinate in-person education efforts with law enforcement as part of larger Vision Zero outreach events.

Mode-specific education

While we encountered multiple interviewees representing organizations with ongoing cyclist safety trainings, there is less focus on education efforts targeted toward pedestrians and drivers. While safety trainings might be more coveted by cyclists because of the lack of

cycling infrastructure, one interviewee also expressed that most people do not hold a strong identity as a "pedestrian." A coordinated curriculum that addressed both pedestrians and drivers would target a large segment of the population that both drives and walks on a regular basis.

In addition to an adopted written curriculum for in-person education efforts, current cyclist trainings should be financially supported so they can expand their capacity and marketing reach. Short-video modules addressing all modes (many are already developed for free/purchase) should be available on the Vision Zero website for community partners to use. A short, engaging video easily shareable on social media would help target audiences who will never take the time to do or be otherwise exposed to in-person trainings.

It may be valuable to discuss a possible partnership with car insurance companies to develop and promote a driver's safety class (online or in-person) in order to reduce premium costs or receive some other benefit. These could be targeted toward drivers with history of accidents or tickets.

Lastly, more formal and digital education approaches can be complemented with creative on-the-ground education. For example, one Vision Zero focus city gave out fake tickets to pedestrians and cyclists at particularly dangerous intersections that contained funny and educational messages about traffic rules.

Integration with Engineering and Enforcement

Infrastructure improvements and increased enforcement efforts will both necessitate and offer opportunities for additional education. Both are highly visible and sometimes controversial, which can result in a more engaged public audience. However, education efforts will also need to be proactive around both of these areas, so community members understand how to use infrastructure, and the purpose of engineering and enforcement within the overall mission of Vision Zero. Controversial topics may be a gateway to educate neighborhood members who might not otherwise be interested in Vision Zero. Special attention should be given to low-income communities of color who may have distrust of law enforcement or perceive new infrastructure as a sign of rising rents and displacement.

Input Mediums

All education efforts should include opportunities for input. Not only does giving community members a voice make them more likely to feel engaged, open conversation will help internalize the lessons and draw connections to their own lives. Lastly, gauging the concerns or confusion of the public will help make future education materials and presentations more effective by addressing them proactively.

SECTION 5: MESSAGING CONTENT AND BRANDING RECOMMENDATIONS

Prioritization Metrics

Community Voted Priorities

LADOT has created a safety prioritization system in order to strategically allocate Vision Zero resources for engineering, enforcement, and education. These priorities will inform where to execute engineering countermeasures as well as how to effectively enforce traffic laws. For education, the priorities will help to identify the audiences and develop messaging content. Through community surveys and public input, LADOT determined that **1) Severity 2) Prevalence and 3) Social Equity** are their top three priorities. Given these priorities, LADOT has decided to focus their efforts as follows:

Safety Priority	Reason
Pedestrians and bicyclists	They are greatly overrepresented in KSI collisions relative to both their mode share percentage and percentage of total collisions
Children and seniors	They have a higher share of pedestrian and bicyclist (aged 11-17) victims than any other age category and are overrepresented in KSIs compared to total collisions (10% and 4% respectively)
Low income communities	They are geographically overrepresented in KSI collisions

Technical Collision Analysis (2003-2013)

While the top three priorities indicate the populations who are most impacted by dangerous traffic behavior, they do not include the specific behaviors or those most likely responsible for KSI collisions (for whom the behavior change messaging should be tailored). Since the goal of the Vision Zero education and outreach strategy is to both raise awareness and change behavior, a messaging campaign must center around the populations and behaviors that pose the most danger to others on the road. Using the technical collision analysis from Fehr and Peers as well as the raw collision data from police reports, we identify the following demographic, behavioral, and geographic priorities to focus on when developing the education and outreach strategy.

Demographics

Drivers

The data show that vehicles and thus drivers pose a disproportionate danger relative to other modes of transportation. The top two highest percentages of KSI collision types involve vehicles with vehicle/pedestrian collisions at 31% and broadside collisions at 30% of the total KSIs. Although these numbers do not indicate the at-fault party, it does demonstrate that a vehicle-involved (and thus a driver) collision significantly increases the risk of a KSI collision.

Another data point revealing the disproportionate danger posed by vehicles is the overrepresentation of both pedestrians and cyclists as KSI victims and the two leading

KSI collision types for these groups. Pedestrians and bicyclists were a small percentage of all victims (11%), yet they made up 44% of KSI victims. The two most prevalent types of KSI collisions involving a pedestrian or bicyclist are "vehicle/pedestrian" and "broadside," indicating that both of the leading KSI collisions for walkers and bicyclists involved vehicles.

Finally, pedestrians and bicyclists are also overrepresented in KSI collisions relative to the percentage of those who walk or bike to work while drivers are significantly underrepresented relative to their commuter mode share. While only 17.6% and 1.4% (19% total) of commuters walk or bike to work, 44% of KSI victims were pedestrians or cyclists and 47% of fatal collisions between 2007-2009 involved a pedestrian. Conversely, 74.8% of commuters drive to work yet drivers make up only 42% of KSI victims.[5] When you include passenger KSI victims within this count, those within vehicles still only make up 56% of KSI victims. These statistics demonstrate the need for Vision Zero messaging to target drivers since they pose a significantly higher threat to others on the road.

Males (Aged 18-54)

The second high-risk population to target when developing messaging content aimed at decreasing traffic fatalities is males and more specifically, males aged 18-54, because they are disproportionately involved in KSI collisions. Males aged 18-54 nearly double females in the number of at-fault parties in all collisions and they are over five times more likely than females to be the at-fault party in KSI collisions, with 240 at-fault male parties and 52 at-fault female parties.
Males of all ages are also overrepresented within the victim count for KSIs. While they make up a slightly higher raw number of total victims within all types of collisions, they are more than twice as likely as females to be a victim within in a KSI collision (68% versus 30%). More specifically, male drivers aged 18-54 are almost four times as likely as female drivers of the same age to be killed or severely injured in a collision.

Finally, males make up the majority of collision parties under the influence of alcohol and drugs. Males made up 86% of the parties under the influence of alcohol while females made up 14%. A similar trend exists for drug-use, where males account for 83% of parties under the influence of drugs versus 17% for female parties. Thus, while drivers impose a higher risk on others while on the road, if Vision Zero wants to target their audience further, the messaging content should also focus specifically on male drivers aged 18-54 since they are disproportionately involved and found to be at-fault within KSI collisions.

Behaviors Preceding Collision

In order to have the greatest impact, the Vision Zero messaging should target not only high risk populations, but also those behaviors, which are found to be the leading causes of KSI collisions. The high-risk behaviors that Vision Zero should consider when developing the messaging strategy are outlined below.

Speed

[5] Journey to Work (2013).

Unsafe speed was cited by the data, other research, and interviewees as one of the lead contributors to all collisions in general as well as collisions which resulted in a KSI. This is demonstrated in the data as unsafe speed was found to be a preceding behavior in 26% of all collisions. Within KSI collisions specifically, 25.3% of the collisions have the primary collision factor or other associated collision factor listed as "unsafe speed" or "following too closely."[6] Additionally, 12.8% of pedestrian or bicyclist-involved KSI collisions have the primary collision factor listed as "unsafe speed" or "following too closely". As a point of comparison, these factors account for 7.4% of non-KSI collisions involving pedestrians and bicyclists.[7]

While the data show that automobile right-of-way topped unsafe speed, there is most likely an underreporting of speed as a contributing factor due to the way in which law enforcement officers are instructed to fill out the reporting forms. For example, one major reason why the percent of speed-related collisions is so much lower when you filter for "ped/bike only" is because most pedestrian-involved collisions are marked as "pedestrian right of way" or "pedestrian violation," as instructed in the California Highway Patrol manual, even if they also involve a speeding vehicle.[8]

Unsafe speeding is becoming more and more difficult to enforce since speed limits across the city of LA have expired and need to be updated in order for LAPD's citations to hold up in the court of law. Officers from within LAPD cite that they have lost the ability to enforce approximately 75% of the streets that they used to be able to due to expired speed limits. Updating the speed limit is very difficult politically because the process often leads to a 5-10 mph increase of the stated speed limit, however the increase in necessary for law enforcement to be able to enforce speeding at all. While elected officials are currently discussing the regulations around speed surveys, messaging addressing speeding is vitally important for changing behavior in the immediate future.

Inattention

A similar pattern exists for inattention as a primary collision factor. Inattention was not cited as a contributing factor for any fatal collisions, yet national data and an overwhelming majority of the interviewees we spoke with indicated otherwise. In our interviews with 46 stakeholders, a vast majority cited "distraction" as the most prevalent cause of dangerous driving behavior among themselves and those that they know. This is backed by national data which states that 3,179 were killed in motor vehicle crashes involving distracted drivers in 2014 (USDOT), and an EERIE insurance study which found that one-third of respondents admitted to texting behind the wheel while 75% say they've seen someone else do it.

Similar to speed, inattention is likely to also be underreported as a contributing factor since law enforcement officers arrive to the scene after the collision has already taken place; thus any evidence of inattention is easily no longer apparent (cell phones are put away, etc.) However, the dangers of distracted driving are evident to traffic officers who will often pull someone over for texting and driving using the same criteria that they look for in driving under the influence.

[6] LAPD has said that "following too closely" can be interpreted as traveling to fast for conditions.
[7] Chelsea Richer, Transportation Analyst at Fehr and Peers, provided us with this analysis on quote "unsafe speeding".
[8] Ibid.

For the non-KSI reports which *do* cite inattention as a contributing factor to the collision, cell phones were the most common reason for collision due to inattention for both male and females. Twenty-six percent of female parties cited inattention due to children or pets whereas only nine percent of males cited children or pets as a reason for the collision. Taking into account, messaging should consider content specifically around distraction from cell phones, children, and pets when addressing inattentive behavior.

While our interview data is not a representative sample and the national data could differ from Los Angeles-specific incidents, the overwhelming consistency in responses around inattention/distraction indicates that this behavior plays a significant role in collisions and should be prioritized when developing an education strategy. Furthermore, it is important to consider the discrepancies which may arise from the system of reporting. For these reasons, Vision Zero messaging aimed at behavior change should target underlying factors and provide safer alternatives to speeding and inattention.

Other Considerations

Bikes: Entering into traffic/merging and wrong way travelling

The next set of target behaviors and audiences are dangerous pedestrian and cyclist behaviors. While pedestrians and cyclists pose little threat to others, addressing these behaviors can help ensure their own safety.

Aside from proceeding straight, the two most prevalent bike party behaviors preceding collisions are "entering in traffic; merging" (677 collisions) and "crossing into opposing traffic; travelling wrong way" (538 collisions). These two behaviors were also the top reasons for fatal collisions involving cyclists with 19% of fatal collisions occurring from "entering in traffic; merging" and six percent from "crossing into opposing lane; travelling the wrong way."

"Crossing into opposing lane; travelling the wrong way" is particularly significant for cyclists as it was cited as the second lowest cause for an accident in all collisions, but is cited as the third most common reason for fatal bicycle collisions.

This is further exhibited within the collision profile data where "wrong side of road" violations involving cyclists account for 121 or 44% of the total number of KSI collisions resulting from wrong way violations (of any mode), and 19% of the total number of KSI collisions involving bicyclists (of any violation category).

Although this data does not explicitly state that it was the bicyclist who was killed or severely injured or the one travelling the wrong way, "it is likely that for most of these collisions that is the case, thus indicating that the bicyclist in the bicycle KSI collisions is found to be at-fault."[9]

Pedestrian Insobriety

Similar to wrong way riding, a behavior found to be a disproportionate contributor to pedestrian fatal collisions is pedestrian insobriety. While pedestrians made up 3% of all

[9] Fehr and Peers Technical Collision Analysis (2016).

parties under the influence of alcohol in all collisions, they made up 42% of all parties under the influence involved in fatal collisions.

The majority of KSI pedestrian and bicyclist collisions were categorized as the fault of the person walking or biking. However, many of our interviewees also expressed that many drivers do not know it is in fact legal to cross anywhere there is an intersection regardless of having a painted crosswalk, and therefore are not scanning for pedestrians or cyclists.

Furthermore, pedestrians that do cross mid-block (as opposed to an intersection) were likely exhibiting rational behavior, which did not align with the existing infrastructure. For example, in some parts of the valley, crosswalks can be a quarter to a half mile apart, which means the pedestrian must walk an additional half mile in each direction if their destination is on the other side of street. The same holds true for cyclists travelling the opposite direction on one way streets because of the convenience factor, or who do it because they are fearful of turning their backs to drivers.

When designing a behavior change campaign, then, it is important to understand the difference between reckless pedestrian or cyclist behavior and behavior that makes the most rational sense given the available options. Therefore, although pedestrians and cyclists are the parties exhibiting high-risk behaviors, a successful messaging campaign must target both them and drivers; raising awareness about these occurrences while also elevating the driver's responsibility in looking out for people on the road.

Geography

The final factor to take into account when developing the messaging content of the Vision Zero campaign is the geographic location of the collisions, and how that will help further segment the population within specific neighborhoods. In terms of geography, KSI collisions involving vehicles, pedestrians, and bicyclists are dispersed widely throughout the entire city of Los Angeles. However, there is a heavier concentration of KSI collisions in the central area of the city, as Downtown LA, South LA, Westlake, Pico Union, Koreatown, East Hollywood, and Hollywood all have high concentrations of KSI collisions. Notably, these are the same areas that score high on the Community Health and Equity Index, meaning these are the same communities with the poorest health outcomes.

At the experiential level, many of the interviewees who represented various low-income communities cited high density populations and vehicle-centric infrastructure, such as wide streets, freeways and fast moving pass-through traffic as contributing factors to the higher KSI collision rates within their communities.

The higher KSI rate in certain areas is compounded further by the higher rates of walking/biking/public transit use within the same areas as shown by the Journey to Work data (2013). The populations within these communities are more likely to be transit-dependent (i.e. do not own a car) and therefore more likely to be using active modes of transportation to get to and from the transit station. A study by Metro shows that 75% of Metro riders make less than $25,000 annually and 50% of Metro riders are transit dependent.[10] Moreover, biking/walking/rolling makes up 85% of access trips to bus rapid

[10] 75% and 45% of its bus riders and train riders respectively were transit-dependent (i.e. did not own a car). Bus riders had an average annual income of $14,423 while train riders had an average annual income of $26,250, which is 26% and 47% of the county average ($55,476) respectively (Metro First Last Strategic Plan, 2014).

transit and rail stations and over 95% of total system access.[11] The higher prevalence of active transportation within low-income communities as a means to access work and economic centers, paired with the overrepresentation of pedestrians and bicyclists in KSI collisions, sheds light on the need to prioritize these communities for Vision Zero education and outreach efforts.

Further, although KSI collisions are occurring all over the city, collisions may be underreported within these communities as it has been found that low-income and undocumented individuals are less likely to report a collision due to government distrust and/or a sensitive citizenship status. Therefore it is likely that the actual number of KSI collisions in these low-income communities is much higher.[12]

Factors Driving Dangerous Behaviors on the Road

In addition to looking at the technical collision data, we also used qualitative interview data to help explain what is contributing to KSI collisions. Throughout our interviews we often came back to the question, "what's driving the dangerous behavior?". Thinking about the underlying factors contributing to dangerous behaviors allows messaging to be targeted to the root cause rather than the symptoms. Below is a list what we believe to be the major factors driving dangerous behaviors on the road. These factors, along with their positive alternatives, should be at the heart of messaging content aiming to change dangerous behavior.

Underlying factor driving dangerous behavior	Explanation and specific examples
Lack of empathy	This factor manifests itself in various ways, and probably most broadly in a "dehumanization" of others on the road. Lack of empathy for those traveling around you may lead one to see others as obstacles in their path, or to see your own travel needs as paramount to all else. This is particularly evident between people in different modes of travel, for example, a driver not giving a cyclist enough space, or pedestrians and drivers forgetting what it's like to be in the others' shoes.
Rushing	Rushing, most likely due to time pressure, leads to speeding and reckless driving (e.g. not looking carefully for pedestrians and cyclists). These behaviors have become more prominent on residential streets as people cut through them at the suggestion of mapping applications.
Recklessness	Recklessness is broader than rushing as a primary cause of dangerous behaviors. It can stem from people acting in ways they know to be dangerous and are no more convenient for their end purposes. For example, drinking and driving when one could easily ride with a designated driver, or speeding for fun or to show off.
Lack of knowledge	This is one of the most important areas to address in the educational components of Vision Zero. For instance, common misconceptions that may lead to dangerous behaviors are that it's always illegal for a

[11] First Last Mile Strategic Plan, 2014. Metro.
[12] Cottrill and Thakuriah (2010).

	pedestrian to cross an arterial without a painted crosswalk or that it's safer for a cyclist to ride against traffic.
Lack of skill	Lack of skill operating a car, motorcycle, truck, or bicycle on the road will be difficult to address without direct, in-person training. This highlights the importance of existing training programs and the need for the average car driver to be able to hone their skills. Car insurance companies may have aligned interests and could provide incentives for people with poor driving records to take classes.
Impatience	Impatience can lead to speeding, as well as distraction/inattention--probably one of the most commonly underreported causes of dangerous behavior on the road. Distraction/inattention has become significantly more prominent with the use of hand-held technology. Texting and driving is the behavior that commonly comes to mind, however talking to other passengers, thinking about things other than driving, dealing with children and pets, putting on makeup, eating, or looking at a crash scene are other examples of distraction.
Convenience	People will most often act "rationally", meaning they will take the shortest route to get to their destination. For pedestrians, that might mean a midblock crossing where there is lack of crossing infrastructure. For delivery workers in Downtown LA, that may mean bicycling the wrong way down a one way street in order to make deliveries as fast as possible.
Inadequate infrastructure	Inadequate infrastructure is one of the key factors being addressed in the Vision Zero strategy, and the one of the only factors that does not mostly rely on human behavior. Many people may recognize the need for more obvious infrastructure improvements such as new bike lanes, crosswalks, stop signs, etc. It is also important to remember the way different populations interact with infrastructure. For example, how less able-bodied people may have to go into the street because of inadequate sidewalks, or seniors may need more time to cross the street.

Prioritization Considerations

Given the collision data, relevant literature, and findings from the interviews that illuminate the underlying factors behind dangerous traffic behavior, we have determined a messaging prioritization strategy that will inform the phased-in approach of purchased media. In developing these priorities, it is important to take into account current brand perceptions and barriers, as well as the size of a targeted population relative to available resources and the investment it would take to reach them.

Current Perceptions and Challenges to Vision Zero Brand

As is the case at the start of many public health campaigns, Vision Zero currently has little brand recognition in Los Angeles. Many of the people we spoke to remarked that most people they know outside of city government or transportation advocacy circles have never heard of Vision Zero. It is also not immediately obvious that the name "Vision Zero" is referring to traffic safety. People may have existing associations with the term, such as environmental causes to lower emissions or reducing homelessness. Additionally, if members of the public learn what Vision Zero is at it's most basic level--end traffic fatalities--without

having any further background, they might see the brand as representing a campaign that is unrealistic and therefore uncredible. An effective branding campaign that utilizes mass media advertising can overcome these barriers, however the campaign must target people at their starting point, who have zero current knowledge of the brand or purpose of Vision Zero.

Consider the Size of the Pie

The share of a target segment within the overall population is an important factor to consider when prioritizing messaging resources. For example, if we are targeting bicyclists who ride on the wrong side of the road, we may wish to implement proper riding curriculum within workshops rather than create a series of TV advertisements given the relatively small number of Angelenos impacted by this type of behavior.

That being said, we recommend the messaging campaign be divided into three phases, which can happen separately or overlap. Together these phases should last 1-3 years.

Phase 1: Brand Awareness	Purpose	To increase general awareness of the Vision Zero campaign, strategies, and outcomes within Los Angeles
	Audience	General Public
	Behaviors	All
	Outcomes	1. The average person who has no connection to Vision Zero will recognize the name and be able to understand the purpose of the campaign 2. There will be an initial attitude shift around traffic fatalities in that they are 1) preventable and 2) unacceptable
Phase 2: Attitudes and Behaviors (Preliminary)	Purpose	To change dangerous driving behaviors related to speeding and distraction among male drivers
	Audience	Male Drivers (Aged 18-54) • This group will be segmented further based off of lifestyle and more specific demographics such as race and country of origin (more research will need to be done to determine these groups)
	Behaviors	Speeding and distracted driving
	Outcomes	1. Reduce instances of speeding violations and distracted driving among males (distraction will be harder to measure, but focus groups and post-surveys may help evaluate)
Phase 3: Attitudes and Behaviors (Secondary)	Purpose	To shift dangerous traffic behavior within targeted groups of pedestrians and cyclists and to create a deeper attitude shift among drivers which elevates their accountability in pedestrian and bicyclist-involved traffic collisions
	Audience	Pedestrians, Bicyclists, Drivers
	Behaviors	Pedestrian insobriety, bicyclist wrong way riding, driving in general

	Outcomes	1. Decreased pedestrian fatalities due to pedestrian insobriety, higher instances of pedestrians using taxi, friends, or rideshare services to get home from bars 2. Decreased bicyclist fatalities due to wrong way riding, decreased prevalence of wrong way riding, increased awareness of bicycle riding rules 3. Increased driver's awareness of pedestrian and bicyclist right-of-way laws 4. Shift driver's attitudes around their own accountability in saving lives regardless of whether their right-of-way is violated

Messaging Content Recommendations

The prioritization of messaging and phases must be established in coordination with the actual content of the messages. Content recommendations including Vision Zero core messages, case study advertisements, and example sketches are outlined below.

Core Messages

As discussed in the section on "Messaging Strategies," mass-marketing content will be most effective if these efforts are grounded in universal core messages. While they can be tailored to different communities and demographics, the core messages should remain consistent to become *Vision Zero Los Angeles brand*. For example, in a U.S. census marketing campaign, the three core messages were:

1. Participating in the census helps communities
2. Participating in the census is safe
3. Participating in the census is fast and easy

The first message gave a relatable, personal reason for why people would want to help the effort, or why they should care. The second two messages addressed barriers to participation that were grounded in fears that the census might not be safe for them (for example, because of their immigration status) or that it will be inconvenient. Each of these core messages was then substantiated depending on the audience with specific examples, different taglines, images, and stories.

The sections below outline three core messages for Vision Zero generally, and three core messages for Vision Zero Los Angeles. All messaging content should address at least some parts of both the general Vision Zero and Los Angeles-specific core messages. Core messages are simple and can be developed in a myriad of different ways for public consumption. The core messages both promote desired attitudes and address fundamental concerns or perceptions that might prevent people from understanding and/or adopting Vision Zero. These core messages are integrated into the messaging phases described above.

Vision Zero National Core Messages

Vision Zero represents a paradigm shift in the way the public understands traffic related fatalities. Rather than accepting traffic deaths as an unavoidable side effect of human operated vehicles, Vision Zero places the onus on city governments to slow down traffic through infrastructure adjustments, while also placing an increased responsibility on every person behind the wheel. The three core messages of Vision Zero nationally are as follows:

1. Vision Zero saves lives
2. Traffic deaths are unacceptable
3. Traffic deaths are preventable

The power of these three core messages lies not only in the paradigm shift, but in the shared responsibility that the messages invoke as well. “Traffic deaths are unacceptable” implies a collective understanding that “traffic deaths do not happen here,” thus inciting a norm change of what is expected or acceptable within our streets. In turn, this creates a culture where people slow down and are alert while driving.

As with any core message, these three messages will be tailored to specific communities, as well as to targeted audiences and behaviors. For example, a daily driver who has no desire to bike, but wants his family to be safe may respond better to “Vision Zero saves your children’s lives” or “driving slower around schools saves lives.” The same follows for people who walk and drive frequently who may respond well to “your choices matter,” while someone who only drives may resonate more with “you have the power to save a life.”

Los Angeles-Specific Core Messages

These core messages were developed considering prevalent themes from interviews with stakeholders representing diverse populations throughout Los Angeles, and relating them to the factors driving dangerous behaviors (see above section). The three core messages specific to Vision Zero Los Angeles are as follows:

1. Public streets are community space
2. You are responsible for others’ safety
3. Transportation is about moving *people*

These messages build off of the general Vision Zero core messages and go a step further to address Los Angeles-specific perceptions and attitudes that might prevent successful adoption of the Vision Zero mission. The first two messages address themes of individualism, lack of respect for public space, and sense of entitlement on the road. The last core message addresses the car-centric mentality prevalent in Los Angeles. It shifts the paradigm around the idea of a successful transportation system--from one that moves cars most efficiently to instead one that moves people most efficiently and safely.

When comparing Los Angeles to New York City, for example, where there is a scarcity of public space and so many pedestrians, cyclists, and cars, there is more necessity for the recognition of one’s presence in a communal public space. By sheer force of number and the slowness of car traffic, there is a stronger “pedestrian” identity. The recognition of an “ecosystem” of different modes of travel is also prevalent in other geographically condensed areas, like San Francisco, where less people have cars and more people are likely to use public transit or active transportation.

The messages will need to be tailored to different geographic areas, cultural groups, and behaviors. For example, in suburban areas in the valley, where there is less access and interest in public and active transit, the message “Transportation is about moving people”, will have to be careful to avoid shaming people for using their cars. Geographic areas with more cyclists could use the first two messages to target the tension between car drivers and cyclists. All messaging should use the languages most appropriate for the audience, accurately reflect the diversity of the various neighborhoods with their models, and be culturally appropriate for their target audiences.

We believe these core messages can help make Los Angeles transportation culture into one of greater accountability, community-mindedness, and a move away from cars at the top of the transportation hierarchy. These are the types of changes in attitude and perceptions

specific to Los Angeles that will help the broader culture shift necessary for a successful Vision Zero program.

Case Study Ads

"NZ Anti-Drink Driving Commercial - Legend":
https://www.youtube.com/watch?v=CtWirGxV7Q8

In this one-minute commercial spot, a young Maori man stops his friend from driving home drunk from a party. He first recognizes the situation, has an internal dialogue and a few imaginary scenarios about the potential barriers to action (a girl will think he's dumb), and consequences to inaction (his friend's ghost following him around), and then publically convinces his friend to sleep at the house.

The genius of this ad is multifaceted. Firstly, the ad focuses on one clear message (don't let friends drive drunk) and targets a specific population (young Maori men), who are vastly overrepresented in DUI collisions. The internal dialogue lets the audience into the character's mind as he considers the barriers and consequences of potential actions. The commercial then highlights the "moment of confrontation" as a brave action. The main character is put on the spot in the confrontation, but is ultimately rewarded with a positive outcome and is branded as a "legend" by the tagline. The theme of death and tragedy is approached skillfully by making it both funny and approachable, but also very personal (i.e. it's clear the character knows his friend's family).

This commercial touches on all three aspects affecting behavioral intention according to the Theory of Planned Behavior. The ad shows the main character's attitude (I shouldn't let my friend drive home drunk), addresses the beliefs about whether the important people in his life will approve or disapprove of the behavior (the girl he likes, his drunk friend, his drunk friend's family), and ultimately shows that the character is capable of carrying out the behavior (successfully confronting his friend).

"NZ Anti-texting and Driving Commercial - Hello":
https://www.youtube.com/watch?v=wM75ulDRkhI

This viral 45 second commercial depicts several shots of different passengers preventing their drivers from answering a text by instead holding the driver's hand as they reach for their phones.

The ad is relatable as it shows a common situation--two people driving in the car together, and also depicts gender and racial diversity in the actors. It takes a creative and non-patronizing approach in comparison to traditional anti-texting messaging, adding a surprise factor with the unexpected and funny action of handholding between people in a non-romantic relationship. The ad also addresses the exact moment of decision for a driver, when their phone alerts them to a text message while they are driving, and provides an unrealistic but positive alternative. It takes a new twist on the effective appeal of "put others first".

True to ecological models of behavior change theory, the ad emphasizes the relationship between the individual and their environment (in this case, the other people in the car) and their ability to impact each other. Here, the passenger asserts their own agency by preventing the driver from texting, and elicits a memorable response from the driver to in turn potentially change their attitude toward the behavior.

"NZ Speed ad- Mistakes"

In this one minute viral commercial, two male drivers stop and have a conversation in the moment before the one man who is speeding is about to hit the other driver who is pulling in front of him.

The ad targets a key speeding demographic--young to middle-aged men--and incorporates the all-important theme of family and children (one man pleads to the other that his child is in the backseat). While addressing a specific behavior of speeding, the ad takes an unconventional approach by appealing to human fallibility, with the tagline "other people make mistakes, slow down". In this case, the person who is not speeding is the person who made the more obvious mistake, but the person speeding could have prevented the collision by driving slower.

While addressing almost all of the components of the Health Belief Model of behavior change, it notably hits on the following three:

- Believe they are susceptible to the condition (perceived susceptibility)
- Believe the condition has serious consequences (perceived severity)
- Believe taking action would reduce their susceptibility to the condition or its severity (perceived benefits)

The man speeding in the ad understands that he is susceptible to other drivers' poor decisions, that speeding can have serious consequences, and that slowing down can prevent the susceptibility of those serious consequences.

"City of West Hollywood Crosswalk *Wink then Walk* Ad Series":
http://www.weho.org/services/public-safety/crime-and-safety-tips/pedestrian-safety

As part of their crosswalk safety campaign, the city of West Hollywood developed three ads to target cyclists, pedestrians, and drivers. The foundational ad, *Wink then Walk,* depicts a shirtless man in theme with the sexualized branding of other traffic safety efforts in West Hollywood (Alice in WeHoland, The Pickup trolley). The brand in itself is surprising and attention-grabbing because traffic safety is not normally associated with sexual themes.

SECTION 6: NEXT STEPS

LADOT, the Vision Zero Education Subcommittee, Vision Zero Alliance, professional consultants, and other community partners will be responsible for the coordinated development and implementation of this strategy. Below are some of the immediate next steps for both mass-media messaging and education and outreach efforts.

Messaging

The consultant will need to do further market research, either through surveys and focus groups, or other marketing firms' data, in order to further segment target audiences based off of lifestyle, race and ethnicity, behaviors, and values. Once these segments are established, the consultant, with guidance from the education subcommittee and LADOT, will develop the messaging content to be tested by the public through surveys and focus groups.

This team will also need to develop the non-traditional campaigns such as staged events or public art installations. Specific strategies for earned media should be conceived in conjunction with non-traditional campaigns. Finally, the consultant will need to develop a media schedule outlining when to purchase and launch advertisements as well as roll out the non-traditional campaigns.

Education and Outreach

LADOT and the Education Subcommittee will need to secure, prioritize, and allocate funding for organizations responsible for on-the-ground outreach efforts. Funding and other limited resources should be prioritized by mapping the landscape of those who have influence and/or interest in the overall success of Vision Zero. Those actively involved in Vision Zero should continue to leverage both internal (i.e. other city departments and agencies) and external (private sector, media, council districts, CBOs, etc.) partnerships. Vision Zero can extend its reach through these networks by compiling and developing transferable educational curricula and other materials (physical incentives and digital resources), which can be further tailored for specific use by these community partners.

SECTION 8: APPENDICES

Appendix A. Behavior Change Theories

Below is an overview of behavior change theories and concepts specific to injury prevention.

Passive Versus Active

Passive behavior change theories (BCTs) involve changing a product or the environment of the target population (e.g. water fluoridation) to achieve positive outcomes regardless of the individual's behavior. A*ctive* BCTs require an active role of target individuals. There has been historical tension between these two schools of thought, however researchers now encourage the integration of both passive and active methods of intervention.[13] For example, the widespread installation of front seat airbags required simultaneous education of parents to keep small children in the back seat. Some have warned that active BCTs can result in "blaming the victim." Messaging and outreach should take this concern into account by focusing on *empowering* individuals.

Policy-oriented Countermeasures

Many previous injury prevention interventions have been focused on the behavior of individuals that put them at risk. However, due to success with policy-oriented countermeasures it is also useful to think about how individuals can be advocates for change at within their own communities. This requires increasing education of policy changes relating to injury prevention for the general public.[14] The next two sections on ecological models describe how behavior change requires multiple levels of influence within and between individuals as well as with policies and organizational change within communities.

Ecological Models

Ecological models assume that health and well being are affected by the dynamic interaction of biology, behavior, and the environment, which unfolds over the life of individuals, families, and communities. These models also assume that demographics factors such as age, gender, race, ethnicity, and socioeconomic differences directly affect individual functioning and influence risks and resources.[15] These models reflect the importance of both individual and community level behavior change factors.

At the beginning of this century, the Institute of Medicine and US National Academy of Sciences commissioned two committees on the role of behavioral science in public health. Both committees emphasized the role of ecological models and provided foundational frameworks for how they should be integrated in practice.

Ecological Models in Action

Two key concepts of ecological models in practice are that (1) behavior affects and is affected by multiple levels of influence, and (2) individual behavior shapes and is shaped by the social environment.[16]

The levels of influence on behaviors are as follows:[17]

---

[13] Green and Kreuter, p. 23; McGinnis et al., p. 24
[14] Gielen and Sleet, p. 66
[15] Smedley and Syme, p. 2-3
[16] Rimer and Glanz, p. 10
[17] McLeroy et al., p. 4

Level of influence	Definition
Individual	
Intrapersonal	Individual characteristics that influence behavior, such as knowledge, attitudes, beliefs, and personality traits
Interpersonal	Interpersonal processes and primary groups, including family, friends, and peers that provide social identity, support, and role definition
Community	
Institutional Factors	Rules, regulations, policies, and informal structures, which may constrain or promote recommended behaviors
Community Factors	Social networks and norms, or standards, which exist as formal or informal among individuals, groups, and organizations
Public Policy	Local, state, and federal policies and laws that regulate or support safer behavior

Each level of influence can affect behavior. For example, a young man may be speeding because it gives him a greater sense of confidence (intrapersonal). His friends encourage him to speed and speeding gives him greater status within his friend group (intrapersonal and community). Understaffing of the local police department means he is less likely to get pulled over (institutional), and a failure to update speed zones means that speeding laws can't be enforced (policy).

The second key concept in ecological models says that individuals influence and are influenced by those around them. For example, the girlfriend of the young man who was speeding encourages him to slow down; this behavior changes the social norm of his friend group, ultimately changing the speeding habits of his friends as well. This same model can be also applied to reinforce positive behavior.

Individual-Level Behavior Change Theories

Below are five widely recognized individual-level behavior change theories that can be applied to injury prevention behavior change.

Health Belief Model

The Health Belief Model (HBM) is one of the oldest and most widely recognized health related behavior change theories. First developed in the 1950's, the theory has evolved into the following basic premises:

An individual will engage in preventative or safer behaviors if the following conditions are met:[18]

[18] Rimer and Glanz, p. 13

- Believe they are susceptible to the condition (perceived susceptibility)
- Believe the condition has serious consequences (perceived severity)
- Believe taking action would reduce their susceptibility to the condition or its severity (perceived benefits)
- Believe costs of taking action (perceived barriers) are outweighed by the benefits
- Are exposed to factors that prompt action (e.g., a television ad) (cue to action)
- Are confident in their ability to successfully perform an action (self-efficacy)

This model is useful in prioritizing resources toward the areas with the biggest deficits. The frequently cited Vision Zero statistic that a pedestrian has a 90 percent chance of survival if hit by a car going 20 mph, and a 10 percent survival at 40 mph tries to address the perceived severity of a particular action. Focus groups and surveys would help identify how to prioritize these variables.

Theory of Planned Behavior

The Theory of Planned Behavior states that behavioral intention--to what degree an individual intends to do something--is the most important factor in predicting their actual behavior. Behavioral intention is influenced by:

- The individual's attitudes and beliefs about the behavior (e.g. wearing a seat belt is a smart thing to do);
- The individual's beliefs about whether people who are important to them approve or disapprove of the behavior (e.g. my mother likes when I wear a seatbelt);
- The individual's belief that they can do the behavior (e.g. I can easily put on a seatbelt)

Using this framework, media content might seek to address cultural norms around a particular behavior. For example, the New Zealand anti-speeding "pinkie" campaign, which received worldwide recognition, flipped the narrative from speeding being a "cool" behavior to one of obvious overcompensation.

Stages of Change (Transtheoretical) Theory

The Stages of Change Theory argues that behavior change is not a singular event, but instead happens in non-linear, repeating stages. One may enter the process at any stage and continue cycling between stages in any order until the behavior is changed.

Stage	Definition	Potential Strategies
Precontemplation	Has no intention of taking action within the next six months	Increase awareness of need for change; personalize information about risks and benefits
Contemplation	Intends to take action in the next six months	Motivate; encourage making specific plans
Preparation	Intends to take action within the next thirty days and has taken some behavioral steps in this direction	Assist with developing and implementing concrete action plans; help set gradual goals
Action	Has changed behavior for less than six months	Assist with feedback, problem solving, social support, and

		reinforcement
Maintenance	Has changed behavior for more than six months	Assist with coping, reminders, finding alternatives, avoiding slips/relapses (as applicable)

The theory highlights the necessity for a consistent, long-term education and outreach strategy with repeated messaging.

Applied Behavioral Analysis

A subfield within psychology, Applied Behavioral Analysis seeks to address the ABCs of behavior--antecedents, behavior, and consequences. Basic principles of feedback, punishment, stimulus, etc. are present in forming and stopping behaviors. The table below exemplifies Applied behavioral analysis applied to drinking and driving.

	Drinking and driving	Potential countermeasures
Antecedents	Environmental cues, social pressure	Selecting designated driver, lessening alcohol advertisements
Behaviors	Frequency of drinking, size of typical drink consumed, time between drinking and driving	Training bartenders, having BAC readers at bars
Consequences	Social reaction, punishment	Social reinforcement for not drinking and driving, penalties for being caught

Applied behavioral analysis has been successfully used in increased use of safety belts and child restraints, reduced vehicle speeding, improved child pedestrian safety and bicycle helmet use, reduced impaired driving, improved the safe driving practices of pizza deliverers, and reduced driver errors.[19]

Social Cognitive Theory

Social Cognitive Theory (SCT) describes behavior changes as the result of a dynamic and continuous interaction of personal factors, environmental factors, and human behavior. The three most important factors to an individual changing a behavior:

- Self-efficacy (belief that they can)
- Goals
- Outcome expectancies

According to SCT, an individual's behavior changes their environment and vice versa. Behaviors are learned through watching the behaviors and outcomes of others, and personal behaviors can be influenced by providing reinforcements (rewards, punishments).

Integrating the Individual-Level Behavior Change Theories

[19] Gielen and Sleet, p. 69

Surveying the most widely accepted individual-level behavior change theories, experts agreed upon eight factors most pertinent to health-related and injury-risk behaviors. In action, these factors are:[20]

1. The person forms a strong positive intention or makes a commitment to perform the behavior.
2. There are no environmental barriers that make it impossible to perform the behavior.
3. The person possesses the skills necessary to perform the behavior.
4. The person believes that the advantages of performing the behavior outweigh the disadvantages.
5. The person perceives more normative pressure to perform the behavior than to not perform it.
6. The person perceives that performance of the behavior is consistent with his or her self-image or values.
7. The person's emotional reaction to performing the behavior is more positive than negative.
8. The person perceives that he or she has the capabilities to perform the behavior under different circumstances.

The first three are viewed as necessary and sufficient for a behavior to change, while the last five relate to the strength and direction of an individual's intentions.[21]

Community-Level Behavior Change Theories

Below is an overview of community-level and communication behavior change theories and that can be applied to injury prevention behavior change.

Community Organization and other Participatory Models

The **community organization** approach focuses on the activation of communities to engage in social decision-making and problem solving. There is a focus on using "community representatives" and "local values" in accomplishing community goals. There is literature suggesting that for injury prevention programs in particular, it may be more effective to treat the community as the source and not simply the site of these programs.[22]

Community mobilization focuses on changing those economic and social structures that influence injury risk, and is more effective if including both bottom-up (grassroots) and top-down (formally initiated) strategies. The combination of community organizations and formal leadership provides a combination of engagement, resources, technical expertise, and local knowledge.[23]

The empowerment theory says that behavior change will be greatest when those whose behaviors are being targeted are directly involved in intervention planning and decisions making. This can be achieved through working with community coalitions and tailoring program components to different demographics.

The **community-based participatory research** school of thought argues that those being researched should take an active role in the research and subsequent program

[20] Fishbein, et al, p. 4
[21] Gielen and Sleet, p. 69
[22] Gielen and Collins; McLoughlin et al.
[23] Treno

implementation. It also supports extreme sensitivity to ethical issues around individual autonomy.

The Diffusion of Innovations Theory

This theory discusses how new ideas, products, and social practices are spread within and between societies. New ideas will be adopted in chronological segments: innovators, early adopters, majority early adopters, majority late adopters, and laggards. Ideas can be adopted more quickly throughout a community or society by maximizing the following factors:

- The relative advantage of an innovation shows its superiority over whatever it replaces
- Compatibility is an appropriate fit with the intended audience
- Complexity has to do with how easy it is to implement the innovation
- Trialability pertains to whether it can be tried on an experimental basis
- Observability reflects whether the innovation will produce tangible results

Communication Theory

Communication theory looks at how messages are created, transferred, received, and adopted, and can be applied specifically to how communication affects behavior change. Public safety communications "should represent an ecological perspective and foster multi-level strategies, such as tailored messages at the individual level, targeted messages at the group level, social marking at the community level, media advocacy at the policy level, and mass media campaigns at the population level."[24] However, these communications must also be supported in the physical environment in order to have lasting impact.

Media is a major part of any communications campaign seeking to change behavior, the two primary questions being:

1. What factors affect the likelihood that a person will be exposed to a given message?
2. How do media effects vary with the amount of exposure to that message?

The answers to these questions are affected by factors such as the characteristics of the target audiences, complexity of the issue, and competing messages. Repeated exposure through multiple channels may affect its impact on individuals. People will also learn from messaging in different ways and at different speeds:[25]

- Immediate learning: directly from the message
- Delayed learning: internalized sometime after the messaging
- Generalized learning: persuasion through messaging and related concepts
- Social diffusion: messages stimulate discussion among social groups and affect beliefs
- Institutional diffusion: messages garner a response from public institutions and enhance impact

Mass media can also help put a particular item on the public agenda by framing the conversation and thought topics of the public. While funding is often scarce for public safety campaigns, it can be stretched through using existing networks, in-kind donations, and earned media.

[24] Bernhardt
[25] Rimer and Glanz

Appendix B. Education and Outreach Materials

Based on interviewees' experiences and background research, below is a non-exhaustive list of suggested materials for Vision Zero education efforts that will be helpful in collaboration with community partners.

Updated websites:	Several interviewees suggested changes and additions to the current Vision Zero and Vision Zero Alliance websites, including: • Simpler, more publically accessible language on the city's Vision Zero website (for a public audience, avoid words like "prevalence, outcomes, data-driven") • Clear list of "call to action" steps for different community groups or segments (e.g. neighborhood councils, concerned resident, community-based organization, etc.) • Access to digital education curricula and marketing materials, some of which can be adapted to fit the particular context (i.e. for a non-PDF version contact _____) • More interactive, professional, and regularly updated Vision Zero Alliance website, with additional resources (videos, list of upcoming trainings), stories and pictures (can utilize social media with relevant hashtags), and opportunities for input
Digital curricula	Creating modifiable and digitally shareable curricula for various audiences will help disseminate the Vision Zero among different groups more effectively. These should include, but are not limited to: • "Train the trainer" - Lessons for community leaders looking to integrate Vision Zero into on the ground outreach and education • General public curriculum on the topics listed in the *Education topics* section, with segments for special populations and ready-to-go presentation materials for community meetings • "Brown-bag lunch" presentations for city agency and department officials to educate employees, with modifiable part for relation to their work • In-school curriculum/presentations that could be used by guest presenters or school teachers; should be segmented for elementary, middle, high school, and college ages *For more specifics on important topics, see the *education topics* section below.
Print materials	Print materials should include overviews of broader Vision Zero messaging as well as components that can be modified to specific communities or populations. These should include but are not limited to: • Infographics (broader VZ messaging) and infographic templates to be modified for specific geographic areas/demographics • Posters, fliers, banners, etc. (LADOT should develop a "style guide" similar to NYCDOT's in order to keep logos and branding consistent across materials that may be individualized for particular groups) • Bumper stickers approved by the city council to be put on all city vehicles

Short videos	A few short, engaging videos that overview the Vision Zero core messages may be costly to produce but are one of the most effective tools for getting attention. They could be used effectively in conjunction with the curricula and presentations, or in the following outreach methods: • Opening up personal meetings with influential stakeholders who have little time (editorial boards, elected officials, etc.), to be followed by a conversation on how Vision Zero fits within their specific priorities • On the homepage of the Vision Zero and Vision Zero alliance websites • Sent out with newsletters to Neighborhood Council members or posted on blogs (e.g. Next Door)
Physical incentives	Physical incentives will be important resources to attract the public to community events, and can also be used to gain engagement through other mediums. These could include but are not limited to: • Bicycle helmets • Reflective gear for walking and riding bicycles at night • Food • Dashboard cell phone holder (could be an incentive for completing an online survey or watching a safety video, etc.) • Bumper stickers

Appendix C. Partner-Specific Considerations

Below are potential partners who may have alignment with the Vision Zero mission and/or priorities. Each group contains possible advantages, considerations, and challenges to working with these groups identified by interviewees.

Council District Offices:

Advantages:

- Can reach small groups of constituents by integrating Vision Zero messaging into current outreach efforts
- Can take advantage of ongoing controversies around traffic-related issues to garner more attention to Vision Zero
- Have more awareness of the barriers and tailoring needs for different neighborhoods (e.g. suburban/urban, residential/commercial/industrial, income-levels, etc.)
- Can gain community credibility by demonstrating and integrating specific knowledge of a broad array of community issues as well as the demographics characteristics of different geographic areas in their district

Considerations:

- Will need to understand how Vision Zero aligns with their particular offices' priorities and constituent concerns

Barriers:

- May have trouble garnering attention and support from constituents who are not already engaged in public issues.

Faith-based organizations:

Advantages:

- Have strong trust and credibility with a particular subset of a community
- Can be a trusted source in areas with "anti-establishment" sentiments
- Have a natural alignment with Vision Zero mission of protecting life

Considerations:

- Successful partnerships will often rely on the individual relationship with the religious leader(s) of the organization

Barriers:

- May be reluctant to help with a particular initiative for fear of "opening the floodgates" to many others

Media:

Advantages:

- Have the power to reach community members with varying types of influence
- Have an aligned interest in prioritizing issues of public safety
- Have a wide audience for editorial pieces that can influence the Vision Zero brand and affect its prominence in public discussion
- Television media may have ad space to donate for public service announcements
- Opportunity for gaining earned media through alternative campaigns and op-ed contributions

Considerations:

- Successful partnerships will rely on personal relationships with leadership and/or reporters in related issue/geographic areas)
- Should take advantage of any possible connections from the "Watch the Road" campaign

Barriers:

- May publish unfavorable editorials or reporting on Vision Zero to a wide public audience

Neighborhood Councils:

Advantages:

- Can demonstrate knowledge of specific places to gain credibility
- Have demonstrated some level of active engagement in the public sphere
- Have established networks of communication through the Dept. of Neighborhood Empowerment (website, liaison model, social media, NC monthly profiles, DONE newsletter, etc.)

Considerations:

- Will be more willing to participate if they feel empowered to take charge of helping their own community -- need action items (particularly with liaison model)
- Some councils are significantly more engaged than others and have different roles/levels of influence within their communities (DONE can give insight into specifics)

Barriers:

- Engaging individually with all 96 neighborhood councils will be extremely resource-intensive
- May have trouble reaching members of the community who are not already aware of their presence or actively involved in the community

Nonprofits/Vision Zero Alliance (VZA)

Advantages:

- Organizations with sustained relationship and trust within a particular community will be effective allies in reaching those with distrust of government
- Have the ability and expertise to relate mobility issues to other areas of concern (employment, poverty, etc.)
- Can incorporate Vision Zero messaging and education into current efforts

Considerations:

- VZA leadership sees an ideal function as a coalition-style council with diverse group of on-the-ground experts and full-time staff to help implement Vision Zero and keep city accountable to Action Plan; would like to have access to best practices research and staff to help with production/design/storage
- Need funding to do outreach for Vision Zero
- Direct service organizations are effective partners at reaching less publically-engaged populations

Barriers:

- Have some historical tension between different active transportation advocacy groups

Private sector:

Advantages:

- Can effectively target specific populations based on consumer habits (e.g. a company that does mail order deliveries to Mexico can target Mexican immigrants of multiple generations)
- Can be effective partners without needing government resources for advertising (particularly those interested in associating their brand with public safety or community service)
- Creative media private sector partnerships may be more difficult to secure, but can provide opportunities to help creatively frame messaging/bring message to a wider audience

Considerations:

- Public private partnerships need to emphasize consistency of Vision Zero core messages
- Have opportunities for partnerships with large companies (AARP, AAA, car insurance companies) and small businesses (local "staples", those who will benefit from safer pedestrian environment) that have aligned

Barriers:

- Business owners may be against infrastructure improvements that may negatively affect (or that they perceive will negatively affect) their business

Schools:

Advantages:

- Can be ready partners for Vision Zero efforts, particularly those in HIN areas
- LAUSD requires their schools to make a new School Safety Plan every year on any topic of choice. These safety plans are crafted by parent committees, and make a natural pairing for Vision Zero outreach efforts.

Considerations:

- Vision Zero messaging will be most effective if it's incorporated directly into the safety curriculum (Safe Routes to School had success working with LAUSD on this)
- Using competitions, highlighting innovative ideas, and finding popular teachers who have connections with student leaderships are tactics to increase student engagement
- May require trusted partners in schools to get to parents who have sensitivity to working with government entities (e.g. immigration status)

Barriers:

- Traffic safety messaging may have to compete with other safety efforts to address things like prostitution, drugs, or violence
- It will be hard to get in-classroom time devoted to Vision Zero education without integration into curriculum/previously designated safety curriculum

Other Cities:

Advantages:

- Some cities have valuable knowledge and resources from experiences doing similar public outreach campaigns (e.g. West Hollywood's crosswalk campaign and communications toolkit)
- May want to adopt Vision Zero messaging and materials because of their aligned interest in public safety and Vision Zero's attraction as a regional issue
- Have the ability to use free ad space (street banners, PSAs, etc.)

Considerations:

- Are important partners in Vision Zero gaining traction as a regional issue and because of the amount of commuter traffic from outside the city of Los Angeles

Barriers:

- May have traffic priorities that do not align with Vision Zero goals or not want to contribute resources because Vision Zero is an LA city-driven initiative

Other Los Angeles City Agencies/Departments:

Advantages:

- Some departments have already expressed interest in being a Vision Zero partner because they have aligned interests in particular populations or issue areas (e.g. Dept. of Aging) or available communications resources (Dept. of Neighborhood Empowerment)
- May have the ability to devote significant ad space (e.g. Metro donated hundreds of bus and shelter ad spots to "Watch the Road" campaign)

Considerations:

- Are vital partners in the overall success of a cross-departmental initiative like Vision Zero and efforts need to be coordinated
- Need a reason to integrate Vision Zero mission into their own priorities

Barriers:

- May have no current work that aligns with Vision Zero priorities

Appendix D. Interview Questions and Themes

Current work

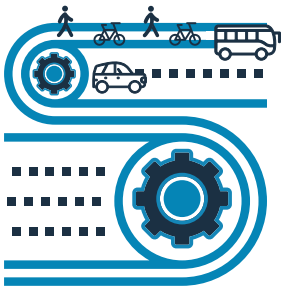
- Background on organizational mission, communities/populations/problems being addressed, scope, partners, etc.
- What work is the Alliance/your organization currently doing that is directly or indirectly related to Vision Zero?

Previous Campaigns:

- What kinds of public outreach strategies have you already employed? What was your most successful campaign and what made it so? How do you measure outcomes?
- What kinds of campaigns (internal or external) have targeted your community members in the past?
- On the spot recall: What campaigns have you seen that have really struck you personally?

Message Development Experience

- How do you identify and target people/groups based on "intangible" variables like "attitudes, value, and beliefs"?
- How do you develop messaging (focus groups, surveys, etc.)? What types of messaging have been most effective for what outcomes?
- What media platforms/outreach events work best with what type of messaging?



- How does communication change within different communities?
- What are the attitudes, value, and beliefs of your community members that you take into account in communication?
- What particular cultural (or other) considerations should be taken into account when reaching out to your community?
- What are barriers to effective communication with your community members?

Messaging Development Idea

- If we were to create a focus group for your community, who would be the best representatives?
- In terms of Vision Zero, what message would resonate most with you? With your community/constituency?
- If you had to come up with your own image or tagline for Vision Zero in the next minute, what would it be?
- What do you think drives dangerous traffic behavior within your constituency? What strategies could counteract this behavior or provide safer alternatives?

Message Platforms

- What types of traditional media purchasing have you found to be most effective?
- How have you been able to get “earned media”?
- What effective non-traditional platforms have you seen/tried?

CORE ELEMENTS

FOR VISION ZERO COMMUNITIES

INTRODUCTION

Vision Zero – the strategy to eliminate traffic fatalities and severe injuries – is being adopted by a growing number of communities across North America and beyond. While safe mobility is not a new concept, Vision Zero requires a shift in how communities approach decisions, actions, and attitudes around safe mobility.

A fundamental part of this shift is moving from a traditional approach to a Safe Systems approach toward traffic safety. A traditional approach accepts that a certain number of traffic deaths and severe injuries will occur as unavoidable consequences of mobility and focuses on changing individual behavior to reduce the frequency of these incidents. In contrast, Vision Zero is built on the basis that traffic deaths and severe injuries are preventable. Vision Zero emphasizes a Safe Systems approach, which acknowledges that people make mistakes and focuses on influencing system-wide practices, policies, and designs to lessen the severity of crashes.

Approaching the issue of safe mobility in a new way can be challenging, even when everyone agrees on the ultimate goal – in this case, safety for all road users. One limitation to the success and proliferation of Vision Zero in this moment is the lack of a unifying definition and "best practice benchmark." While an increasing number of jurisdictions may call themselves Vision Zero communities, the authentic and ongoing commitment to the fundamental shift in safety perspective can be uneven.

> *The Vision Zero Network and Institute of Transportation Engineers have partnered to develop a set of Vision Zero Core Elements to help communities set priorities, work toward tangible results in promoting safety, and benchmark their progress relative to best practices. This resource encourages leaders to focus on the most impactful actions and helps hold them accountable to their Vision Zero commitments.*

TRADITIONAL APPROACH

Traffic deaths are **INEVITABLE**

PERFECT human behavior

Prevent **COLLISIONS**

INDIVIDUAL responsibility

Saving lives is **EXPENSIVE**

VS

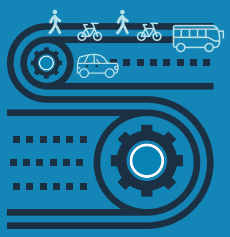
VISION ZERO

Traffic deaths are **PREVENTABLE**

Integrate **HUMAN FAILING** in approach

Prevent **FATAL AND SEVERE CRASHES**

SYSTEMS approach



Saving lives is **NOT EXPENSIVE**

VISION ZERO NETWORK

ite A Community of Transportation Professionals

Released November 2018

Thank you to the primary collaborators on this resource: Jenn Fox & Leah Shahum, *Vision Zero Network*; Jeff Lindley, *ITE*; Dana Weissman & Meghan Mitman, *Fehr & Peers*; Richard Retting, *Sam Schwartz Consulting*.

CORE ELEMENTS
FOR VISION ZERO COMMUNITIES

Leadership and Commitment

1. Public, High-Level, and Ongoing Commitment. The Mayor and key elected officials and leaders within public agencies, including transportation, public health, and police, commit to a goal of eliminating traffic fatalities and serious injuries within a specific timeframe. Leadership across these agencies consistently engages in prioritizing safety via a collaborative working group and other resource-sharing efforts.

2. Authentic Engagement. Meaningful and accessible community engagement toward Vision Zero strategy and implementation is employed, with a focus on equity.

3. Strategic Planning. A Vision Zero Action Plan is developed, approved, and used to guide work. The Plan includes explicit goals and measurable strategies with clear timelines, and it identifies responsible stakeholders.

4. Project Delivery. Decision-makers and system designers advance projects and policies for safe, equitable multi-modal travel by securing funding and implementing projects, prioritizing roadways with the most pressing safety issues.

Equity and Engagement

Elevating equity and meaningful community engagement, particularly in low-income communities and communities of color, should be a priority in all stages of Vision Zero work.

Safe Roadways and Safe Speeds

5. Complete Streets for All. Complete Streets concepts are integrated into communitywide plans and implemented through projects to encourage a safe, well-connected transportation network for people using all modes of transportation. This prioritizes safe travel of people over expeditious travel of motor vehicles.

6. Context-Appropriate Speeds. Travel speeds are set and managed to achieve safe conditions for the specific roadway context and to protect all roadway users, particularly those most at risk in crashes. Proven speed management policies and practices are prioritized to reach this goal.

Data-driven Approach, Transparency, and Accountability

7. Equity-Focused Analysis and Programs. Commitment is made to an equitable approach and outcomes, including prioritizing engagement and investments in traditionally under-served communities and adopting equitable traffic enforcement practices.

8. Proactive, Systemic Planning. A proactive, systems-based approach to safety is used to identify and address top risk factors and mitigate potential crashes and crash severity.

9. Responsive, Hot Spot Planning. A map of the community's fatal and serious injury crash locations is developed, regularly updated, and used to guide priority actions and funding.

10. Comprehensive Evaluation and Adjustments. Routine evaluation of the performance of all safety interventions is made public and shared with decision makers to inform priorities, budgets, and updates to the Vision Zero Action Plan.

To learn more about the Vision Zero Core Elements, see the Vision Zero Network's full Vision Zero Core Elements document, which includes further details and links to examples and related resources. In addition, the Vision Zero Network website and ITE Safety Resources Toolbox offer useful information on Vision Zero principles, recommended practices, and analysis strategies.

FOUR LANE TO THREE LANE REDUCTION STUDY

Appendix E - Intersection Capacity Analysis Reports Road Diet

Executive Summary

The Iowa DOT has requested a study to evaluate the feasibility of implementing a "Road Diet" along Iowa Highway 3 (Bremer Avenue) from 20th Street SW to 8TH Street SE. A road diet, also called a lane reduction or road rechannelization, is a technique in transportation planning whereby the number of travel lanes and/or effective width of the road are reduced. Road diets can improve safety, convenience and functionality for all road users. This Four Lane to Three Lane Reduction Study evaluates the feasibility of reducing the existing Bremer Avenue four lane section to a three lane section, with a two-way-left turn lane (TWLTL), and documents traffic operations for 2016 (opening year) and 2036 (design year).

The crash data for the corridor suggests that converting IA 3 to a three lane section may be effective at reducing crashes. Studies done in Iowa suggest a road diet may reduce the crash rate by half. This indicates that crashes within the corridor may decrease from 111 to 60 over a three year period.

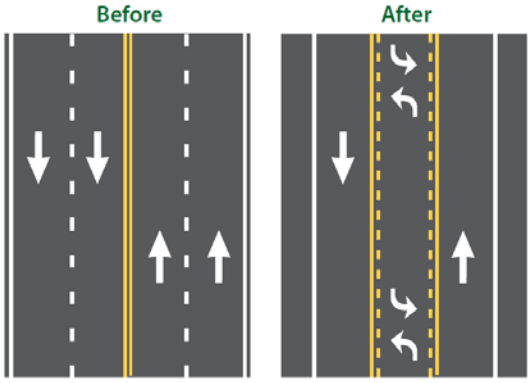
Conversion to three lanes for the existing traffic will have adequate capacity and provide acceptable Levels of Service (C or better) for all existing intersection configurations and control except for the intersection of IA 3 / 8th Street SW, which will require signalization.

Intersection turning movement volumes were projected to year 2036. For these future volumes, conversion to three lanes will have adequate capacity and provide acceptable Levels of Service (C or better) for all intersections except for Southbound 12th Street NW, Southbound 8th St NW, Eastbound IA 3 at 4th Street SW, Northbound 4th Street SW and Northbound 4th Street SE. These four intersections will need to be modified to operate with an acceptable level of service for the projected 2036 turning movement volumes.

The following modifications are proposed to improve the LOS at the four intersections:

Control Type Modifications

- Signalize the intersection of IA 3 / 12th Street SW
- Signalize the intersection of IA 3 / 4th Street SE



Geometric Modifications

- Provide dual WB left turn lanes at IA 3 / 4th Street SW
  On the WB approach, the two inside lanes can be used as the WB left turn lanes.
  On the NB approach, the parking on the west side of the street would need to be removed to be used for two receiving lanes from the WB approach.
  The SE curb return of the intersection will have to revised to accommodate the NB right turning trucks.

Based on the evaluation and conclusions from this study, a road diet that reduces the existing Bremer Avenue four lane section to a three lane section, with left turn lanes or a two-way-left turn lane (TWLTL), is recommended.

Introduction

The Iowa DOT has requested a study to evaluate the feasibility of implementing a "Road Diet" along Iowa Highway 3 (Bremer Avenue) from 20th Street SW to 8TH Street SE. A road diet, also called a lane reduction or road rechannelization, is a technique in transportation planning whereby the number of travel lanes and/or effective width of the road is reduced. Road diets can improve safety, convenience and functionality for all road users. The feasibility of this road diet was analyzed using the U.S. Department of Transportation Federal Highway Administration (FHWA) Safety Program's *Road Diet Informational Guide*. The following image provided in the *Road Diet Informational Guide* shows the most common road diet reconfiguration. The reduction of traffic lanes allows the roadway cross section to be reallocated for other uses such as cyclists, pedestrians, transit or parking.

The reallocated space can improve safety of cyclists by providing a space on the roadway to reduce potential vehicle conflicts. There are a number of benefits that can be achieved by implementing a road diet. The American Association of State Highway and Transportation Officials (AASHTO) *Guide for the Development of Bicycle Facilities 2012* provides a list of benefits for a road diet. See Table 1.

AASHTO Bicycle Facilities Guide Road Diet Benefits
The additional space gained by removing one lane can be used to provide bike lanes or shoulders on both sides of the road.
With one travel lane in each direction, top-end travel speeds are moderated by those who are following posted speed limits, which may reduce potential crash severities for all users.
It may be feasible to include a raised median or small refuge islands at some pedestrian crossing locations, making it easier for pedestrians to cross the street and reducing the likelihood of pedestrian crashes.
The reduction from two lanes to one in each direction virtually eliminates the likelihood of "multiple threat" crashes (where a driver in one lane stops to yield, but the driver in the adjacent lane continues at speed) for pedestrians and left-turning motorists and bicyclists.
Left-turn lanes provide a place for motorists and bicyclists to wait to make a left turn, reducing the incidence of left-turn and rear-end crashes.
Sideswipe crashes are reduced since motorists no longer need to change lanes to pass a vehicle waiting to turn left from the leftmost through lane.
Less traffic noise (due to reduced speeds) and greater separation from traffic for pedestrians, residents, and businesses.

Table 1 – AASHTO Bicycle Facilities Guide Road Diet Benefits

The *Road Diet Informational Guide* provides a list of positives and negatives for a road diet. See Table 2.

Road Diet Feature	Primary/Intended Impacts	Secondary/Unintended Impacts	
		Positive	Negative
Bike lanes	• Increased mobility and safety for bicyclists, and higher bicycle volumes • Increased comfort level for bicyclists due to separation from vehicles	• Increased property values	• Could reduce parking, depending on design
Fewer travel lanes	• Reallocate space for other uses	• Pedestrian crossings are easier, less complex • Can make finding a gap easier for cross-traffic • Allows for wider travel lanes	• Mail trucks and transit vehicles can block traffic when stopped • May reduce capacity • In some jurisdiction, maintenance funding is tied to the number of lane-miles, so reducing the number of lanes can have a negative impact on maintenance budgets • Similarly, some Federal funds may be reduced • If travel lanes are widened, can encourage increased speeds
Two-Way Left Turn Lane	• Provide dedicated left turn lane	• Makes efficient use of limited roadway area	• Could be difficult for drivers to access left turn lane if demand for left turns is too high
Pedestrian refuge island	• Increased mobility and safety for pedestrians	• Makes pedestrian crossings safer and easier • Prevents illegal use of the TWLTL to pass slower traffic or access an upstream turn lane	• May create issues with snow removal • Can effectively increase congestion by preventing illegal maneuvers
Buffers (grass, concrete median, plastic delineators)	• Provide barriers and space between travel modes	• Increases comfort level for bicyclists by increasing separation from vehicles • Barrier can prevent users entering a lane reserved for another mode	• Grass and delineator buffers will necessitate ongoing maintenance.

Table 2 – Road Diet Informational Guide Road Diet Benefits

The FHWA *Road Diet Informational Guide* states that road diets may reduce vehicle-to-vehicle conflicts that contribute to rear-end, left-turn, and sideswipe crashes by removing the four-lane undivided inside lanes serving both through and turning traffic. Studies indicate a 19 to 47 percent reduction in overall crashes when a Road Diet is installed on a previously four-lane undivided facility, as well as a decrease in crashes involving drivers under 35 years of age and over 65 years of age. The *Road Diet Informational Guide* also states that road diets may improve safety by reducing the speed differential. On four lane roads the speed can vary between travel lanes due to slower or stopped vehicles waiting to turn left out of the through lane. Road diets reduce the traffic speed and number of conflict points. Reducing operating speed decreases crash severity when crashes occur.

Several studies have been done to determine the potential crash reduction factors after implementing a road diet. In particular, a study done in 2006 titled *Safety Impacts of "Road Diets" in Iowa* studied 15 corridors in Iowa with several that had traffic volumes in the same range as Waverly or higher. This study was supported by comparing the road diet corridors vs. 15 control corridors that remained as four-lane undivided highways. Across these 15 Iowa corridors, the study found the following overall crash reductions percentages:

- Non-Collision (Single Vehicle) 85% reduction
- Head on 42% reduction
- Rear-end 35% reduction
- Angle, on-coming left-turn 74% reduction
- Broadside 41% reduction
- Sideswipe, same direction 49% reduction
- Unknown 84% reduction

Similarly, Iowa DOT District 2 did a conversion of IA 9 in Cresco in 2008. Based on three-years of crash data following the conversion, the IA 9 corridor saw a decrease in total crashes of 50%, a decrease in injuries of 64%, and a 52% reduction in property damage costs associated with crashes. Similar results were achieved in Clear Lake and Mason City conversions.

The Iowa DOT proposes to study reducing the existing four lane section to a three lane section with left turn lanes or a two-way-left turn lane (TWLTL). This study evaluates the feasibility of reducing the existing Bremer Avenue four lane section to a three lane section, with a two-way-left turn lane (TWLTL), and documents traffic operations for 2016 (opening year) and 2036 (design year).

Study Location

The study area lies in the southwest region of Bremer County, along IA 3 through Waverly. See Figure 1.

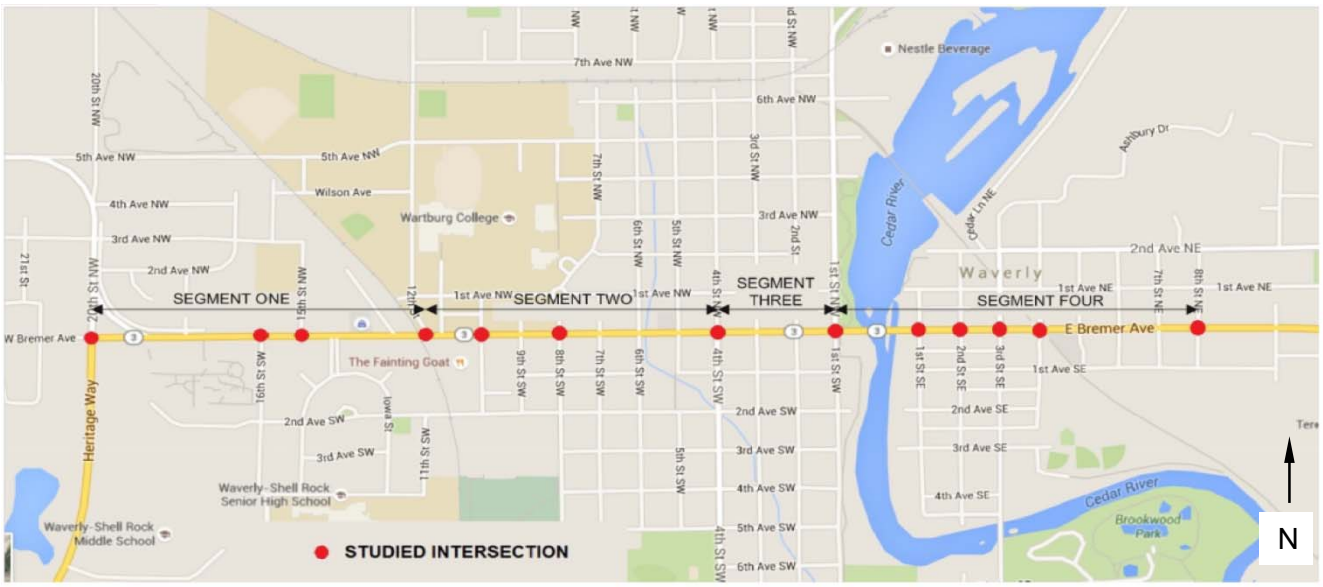


Figure 1 – Location Map

The study focuses on the following Bremer Avenue intersections from 20th Street NW to 8TH Street NE:

- IA 3 / 20th St NW
- IA 3 / 16th St SW
- IA 3 / 15th St NW
- IA 3 / 12th St NW
- IA 3 / 10th St NW
- IA 3 / 8th St NW
- IA 3 / 4th St NW
- IA 3 / 1ST St NW
- IA 3 / 1ST St NE
- IA 3 / 2ND St NE
- IA 3 / 3RD St NE
- IA 3 / 4TH St NE
- IA 3 / 8TH St NE

For the purposes of this study, IA 3 will be broken down into four segments within the study area:

- Segment One 20th Street NW to 12th Street NW
- Segment Two 12th Street NW to 4th Street NW
- Segment Three 4th Street NW to 1st Street NW
- Segment Four 1st Street NW to 8th Street NE.

Existing Roadway and Intersection Characteristics

IA 3 is currently an urban four lane road within the study area. Segment One, 20th Street NW to 12th Street NW, is 48 feet wide from face of curb to face of curb, with four 12 foot lanes.

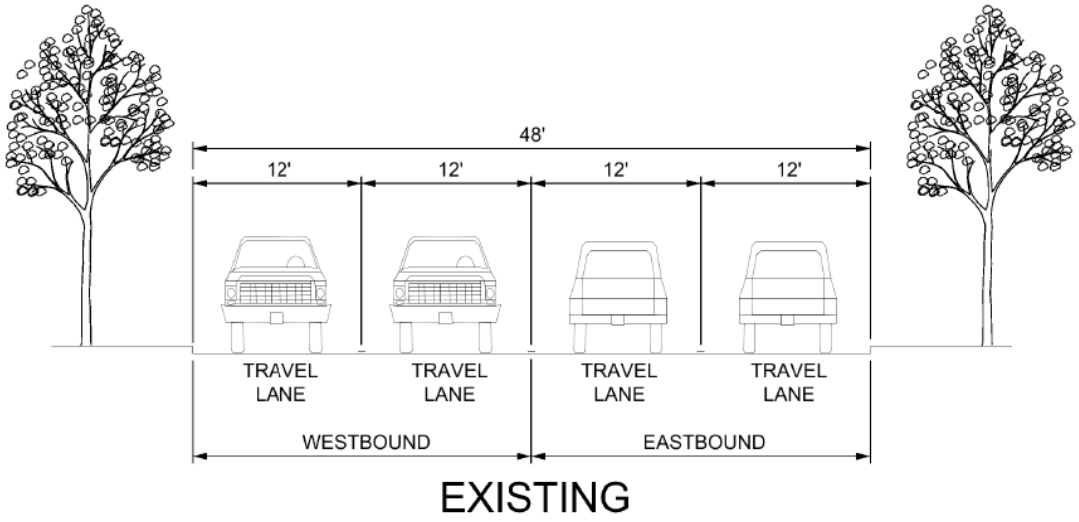

Figure 2 – Existing Segment One Roadway Typical Section

Segments Two, Three and Four, from 12th Street NW to 8th Street NE, are 66' wide from face of curb to face of curb, with four 12 foot lanes and two 9 foot parking lanes.

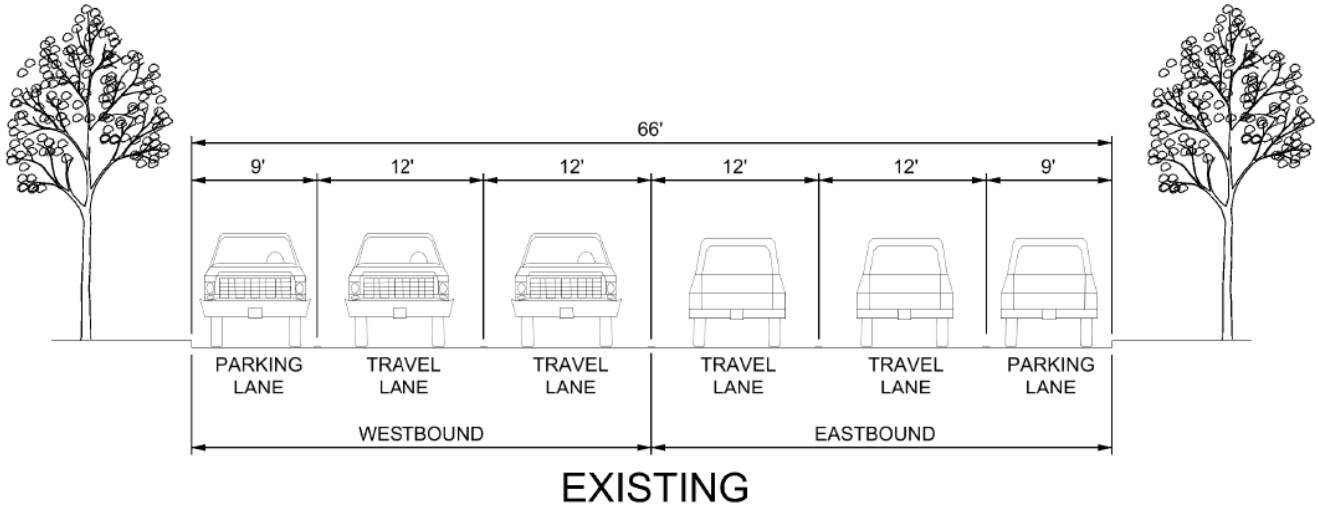

Figure 3 – Existing Segment Two, Three and Four Roadway Typical Section

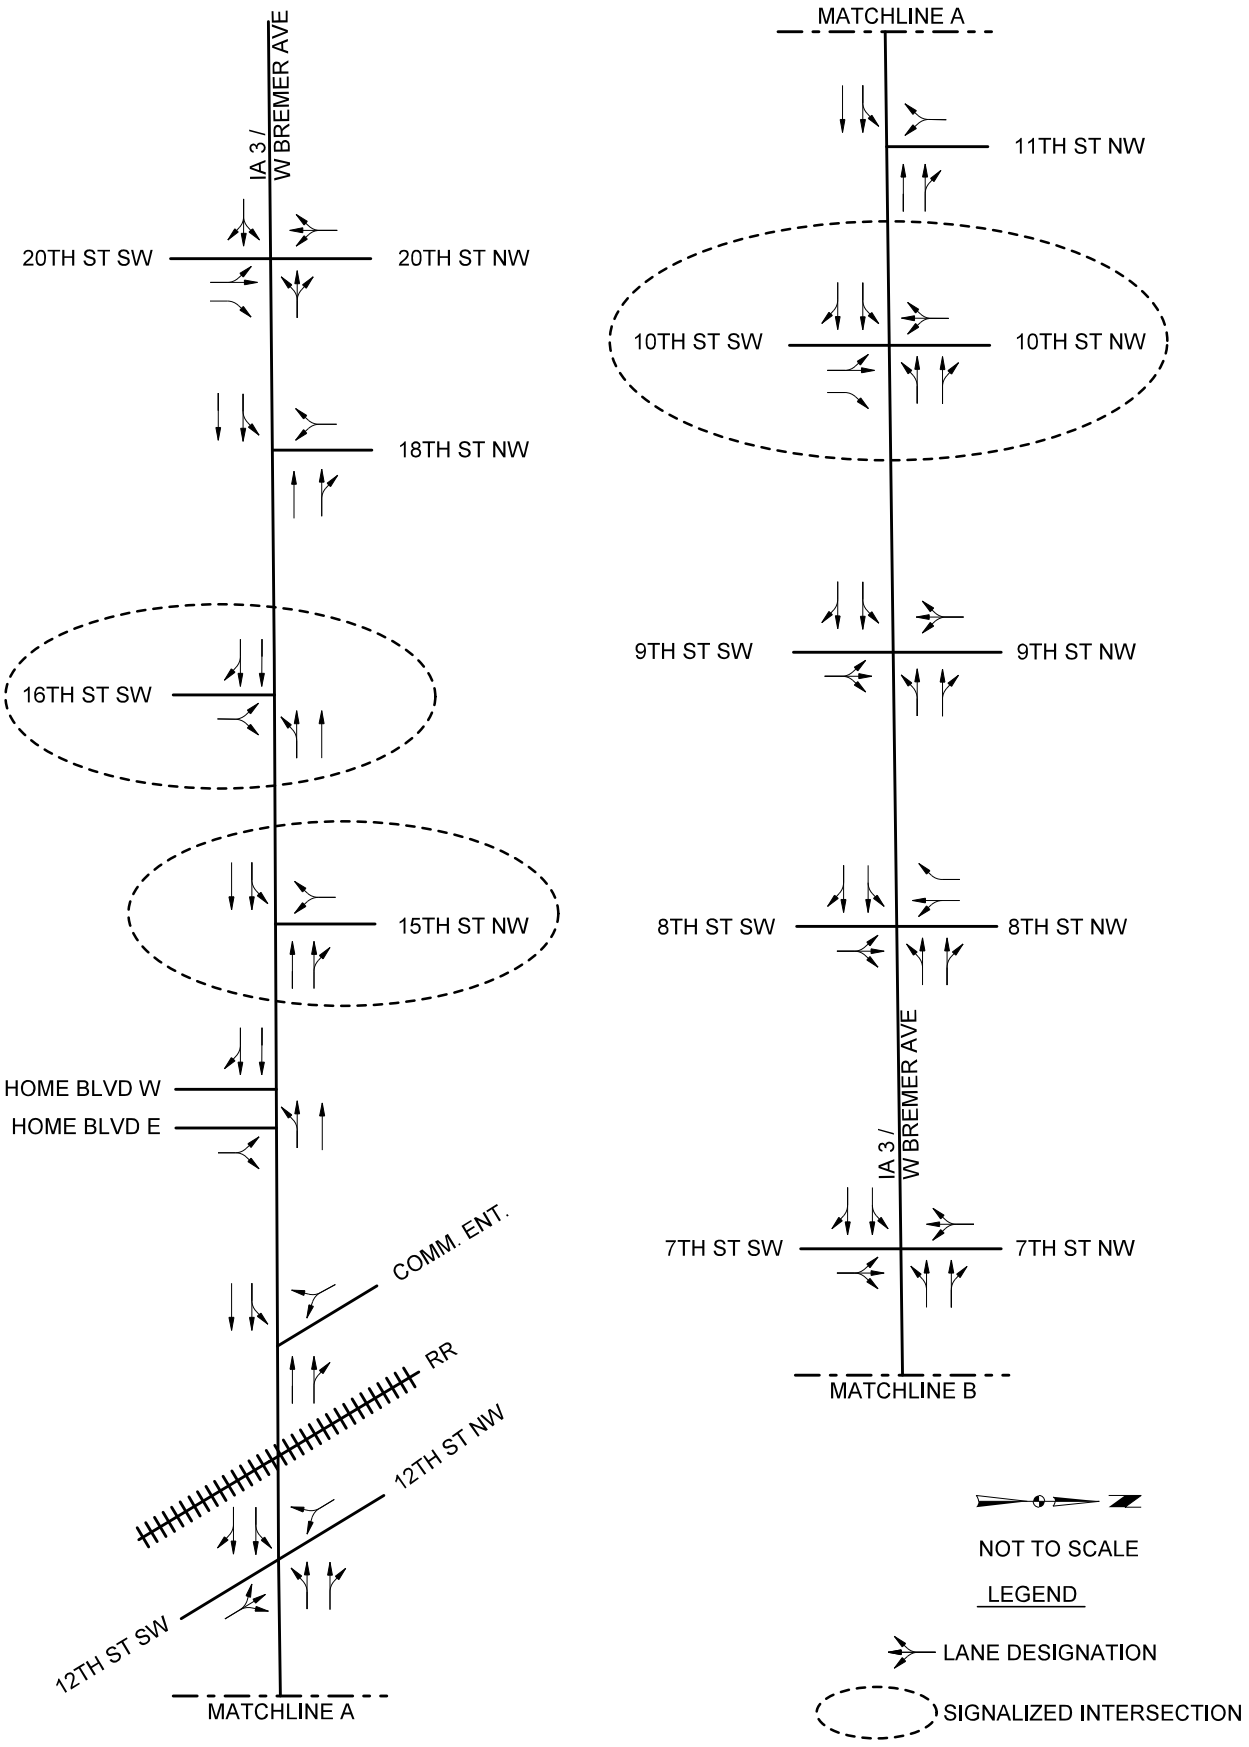
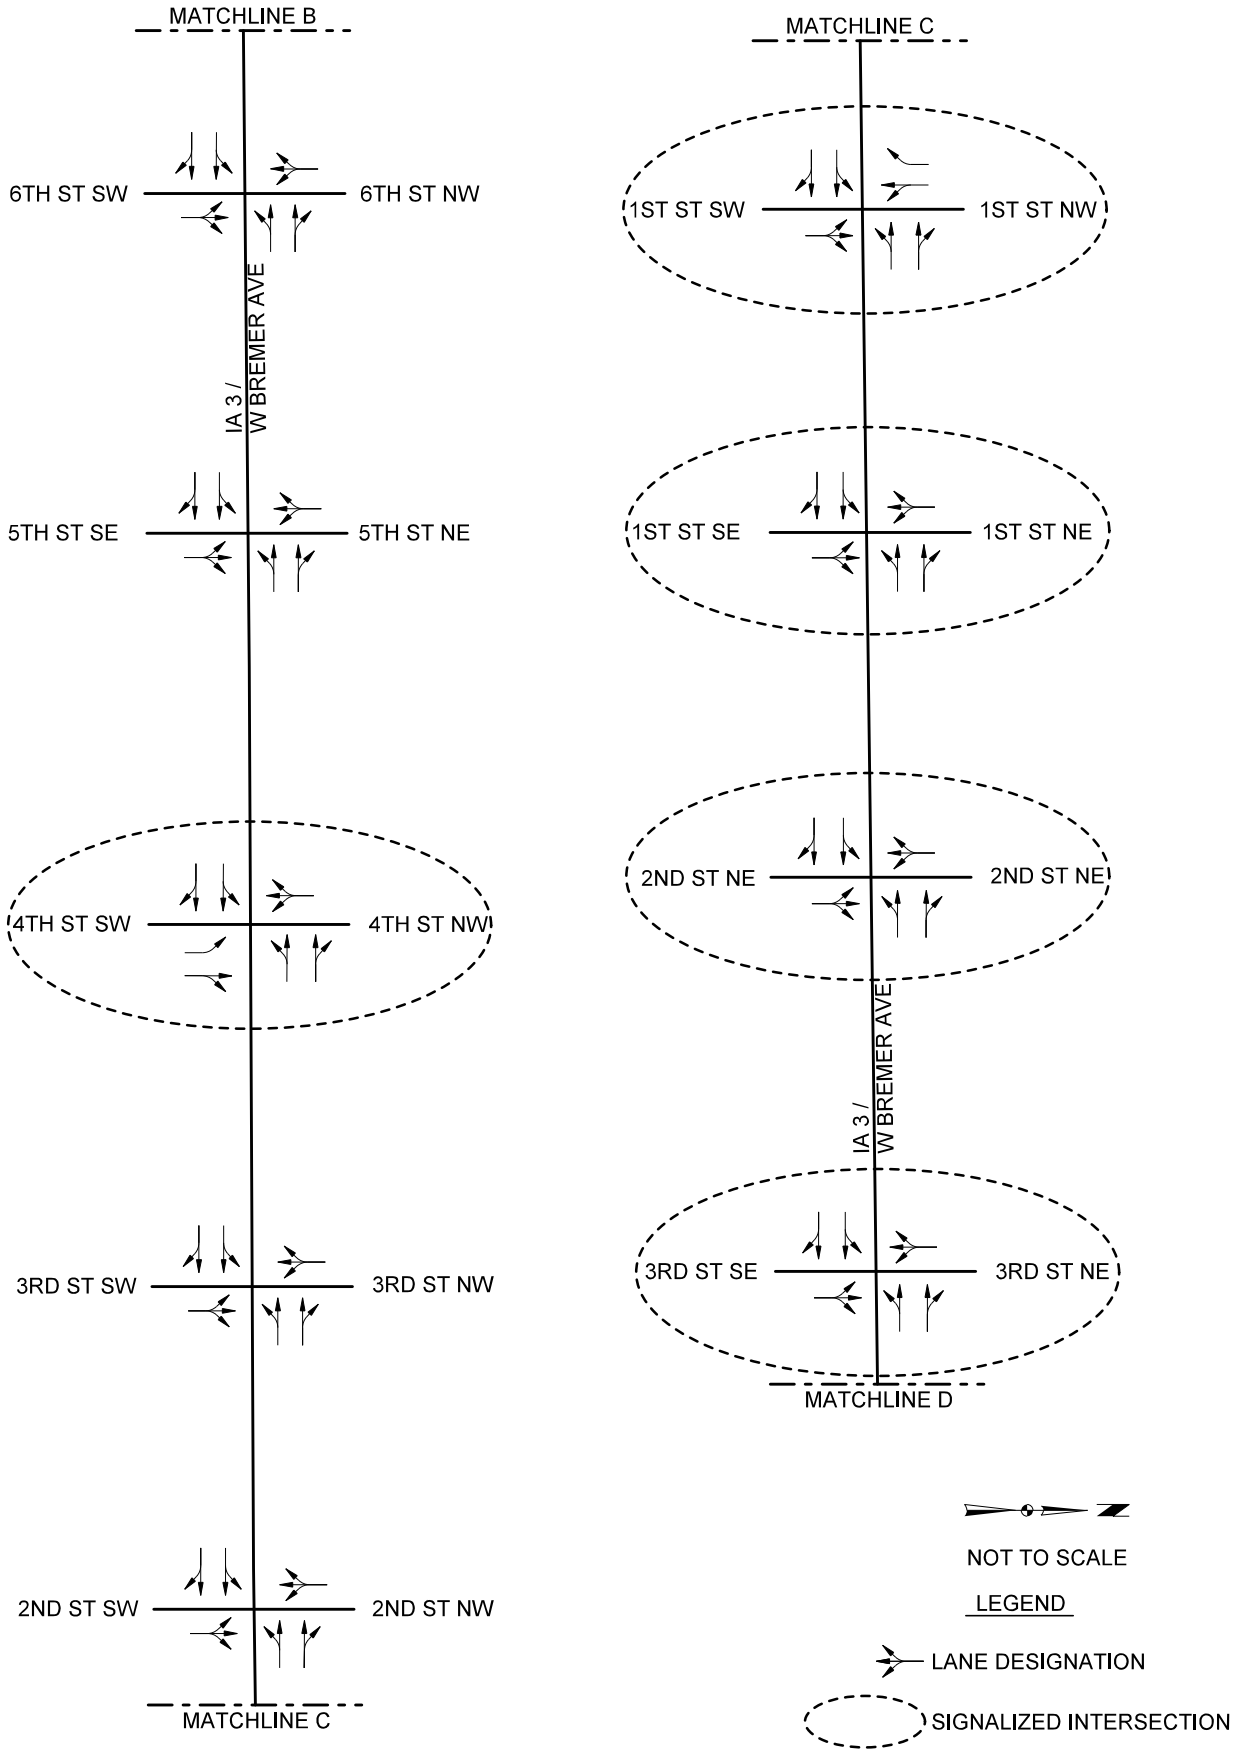


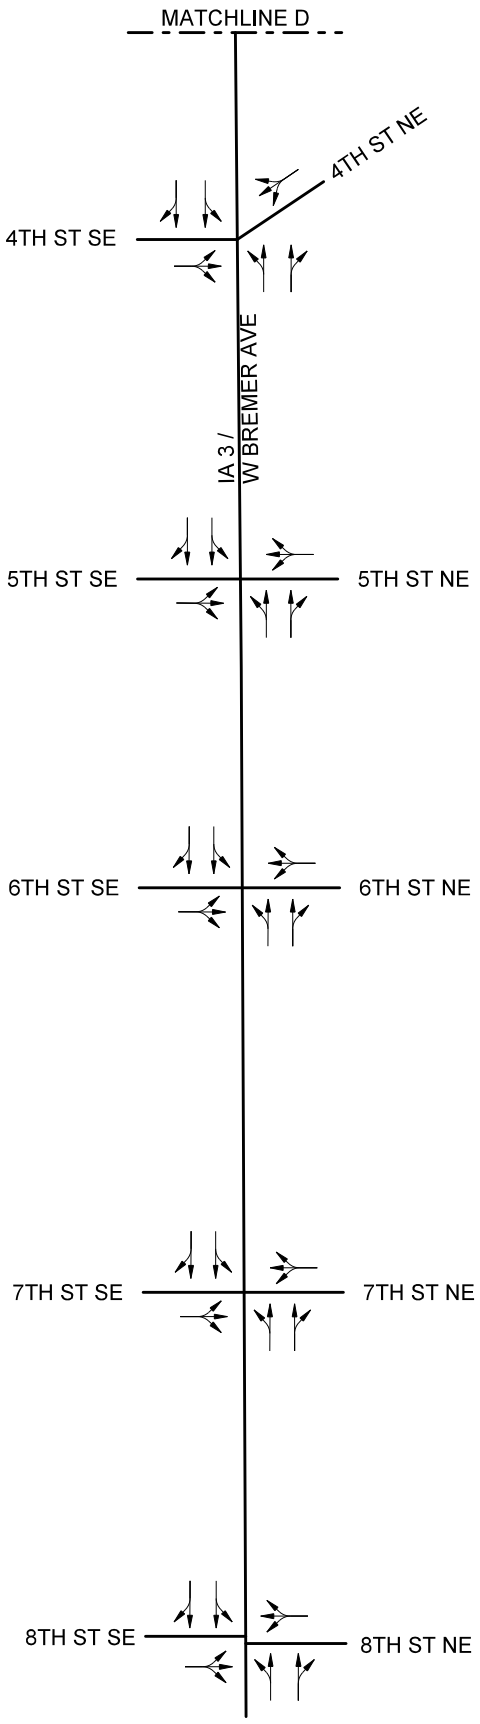
All of the intersections analyzed within the study area are signalized, except for the following.

- IA 3 / 20th St NW
- IA 3 / 12th St NW
- IA 3 / 8th St NW
- IA 3 / 4TH St NE
- IA 3 / 8TH St NE



Currently, the unsignalized intersections operate with side-street stop control and free-flowing traffic on IA 3, with the exception of the IA 3 and 20th St NW intersection, which operates under four way stop control. See Figures 4 through 6 for existing lane configurations.

Land uses are a mix of residential and commercial.



Pedestrians are accommodated with four foot sidewalks on both sides. Currently, there are no bicycle accommodations through the study area.

Proposed Roadway and Intersection Characteristics

In order to evaluate the feasibility of reducing the existing four lane roadway, the following lane modifications were developed for each roadway segment:

For Segment One, the existing four lane would be reduced to two 12 foot traffic lanes, with a 14 foot two-way left turn lane and two 5 foot shoulders.

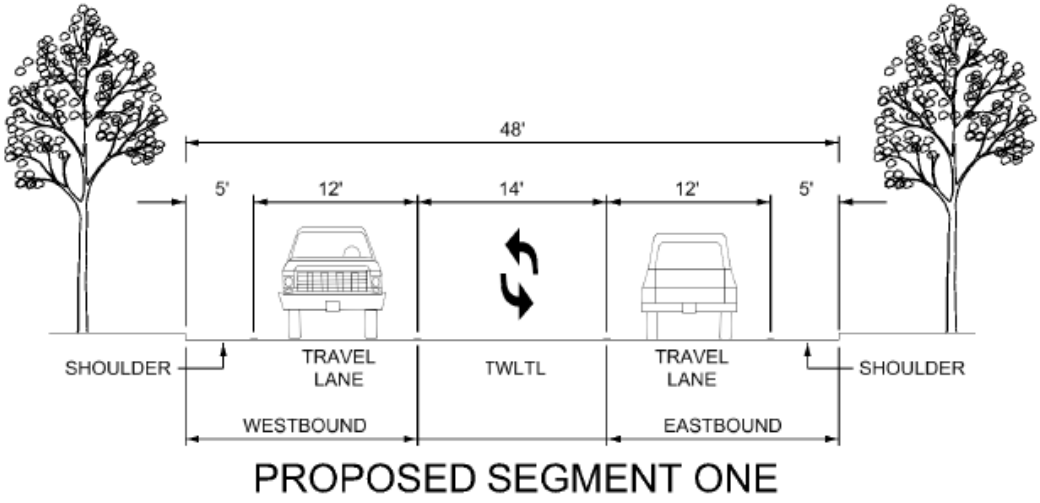

Figure 7 –Proposed Segment One Roadway Typical Section

For Segment Two, the existing four lane would be reduced to two 12 foot traffic lanes, a 14 foot two-way left turn lane, two 5 foot buffer zones and two 9 foot parking lanes.

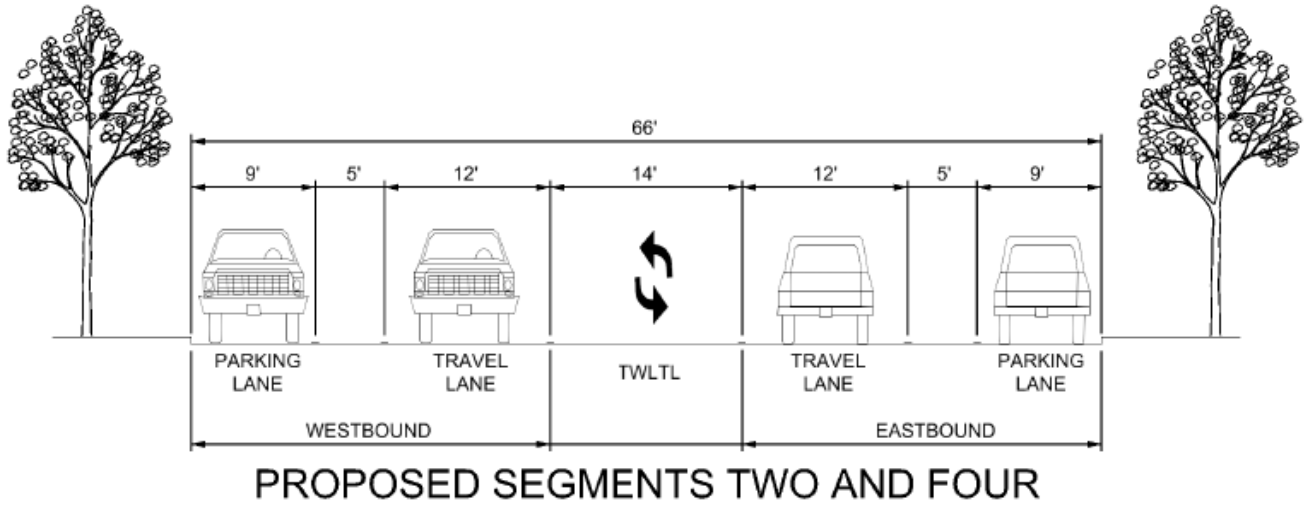

Figure 8 –Proposed Segments Two and Four Roadway Typical Section

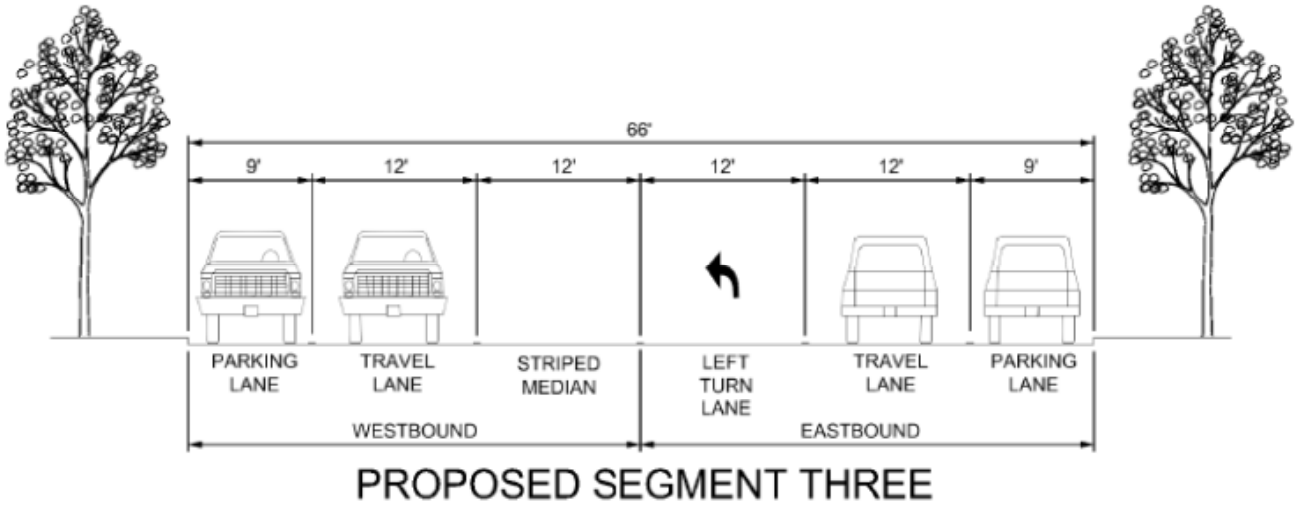
For Segment Three, the existing four lane would be reduced to two 12 foot traffic lanes, 12 foot left turn lane, 12 foot striped median and two 9 foot parking lanes. The lane transitions to adjacent segments will be done with tapers.



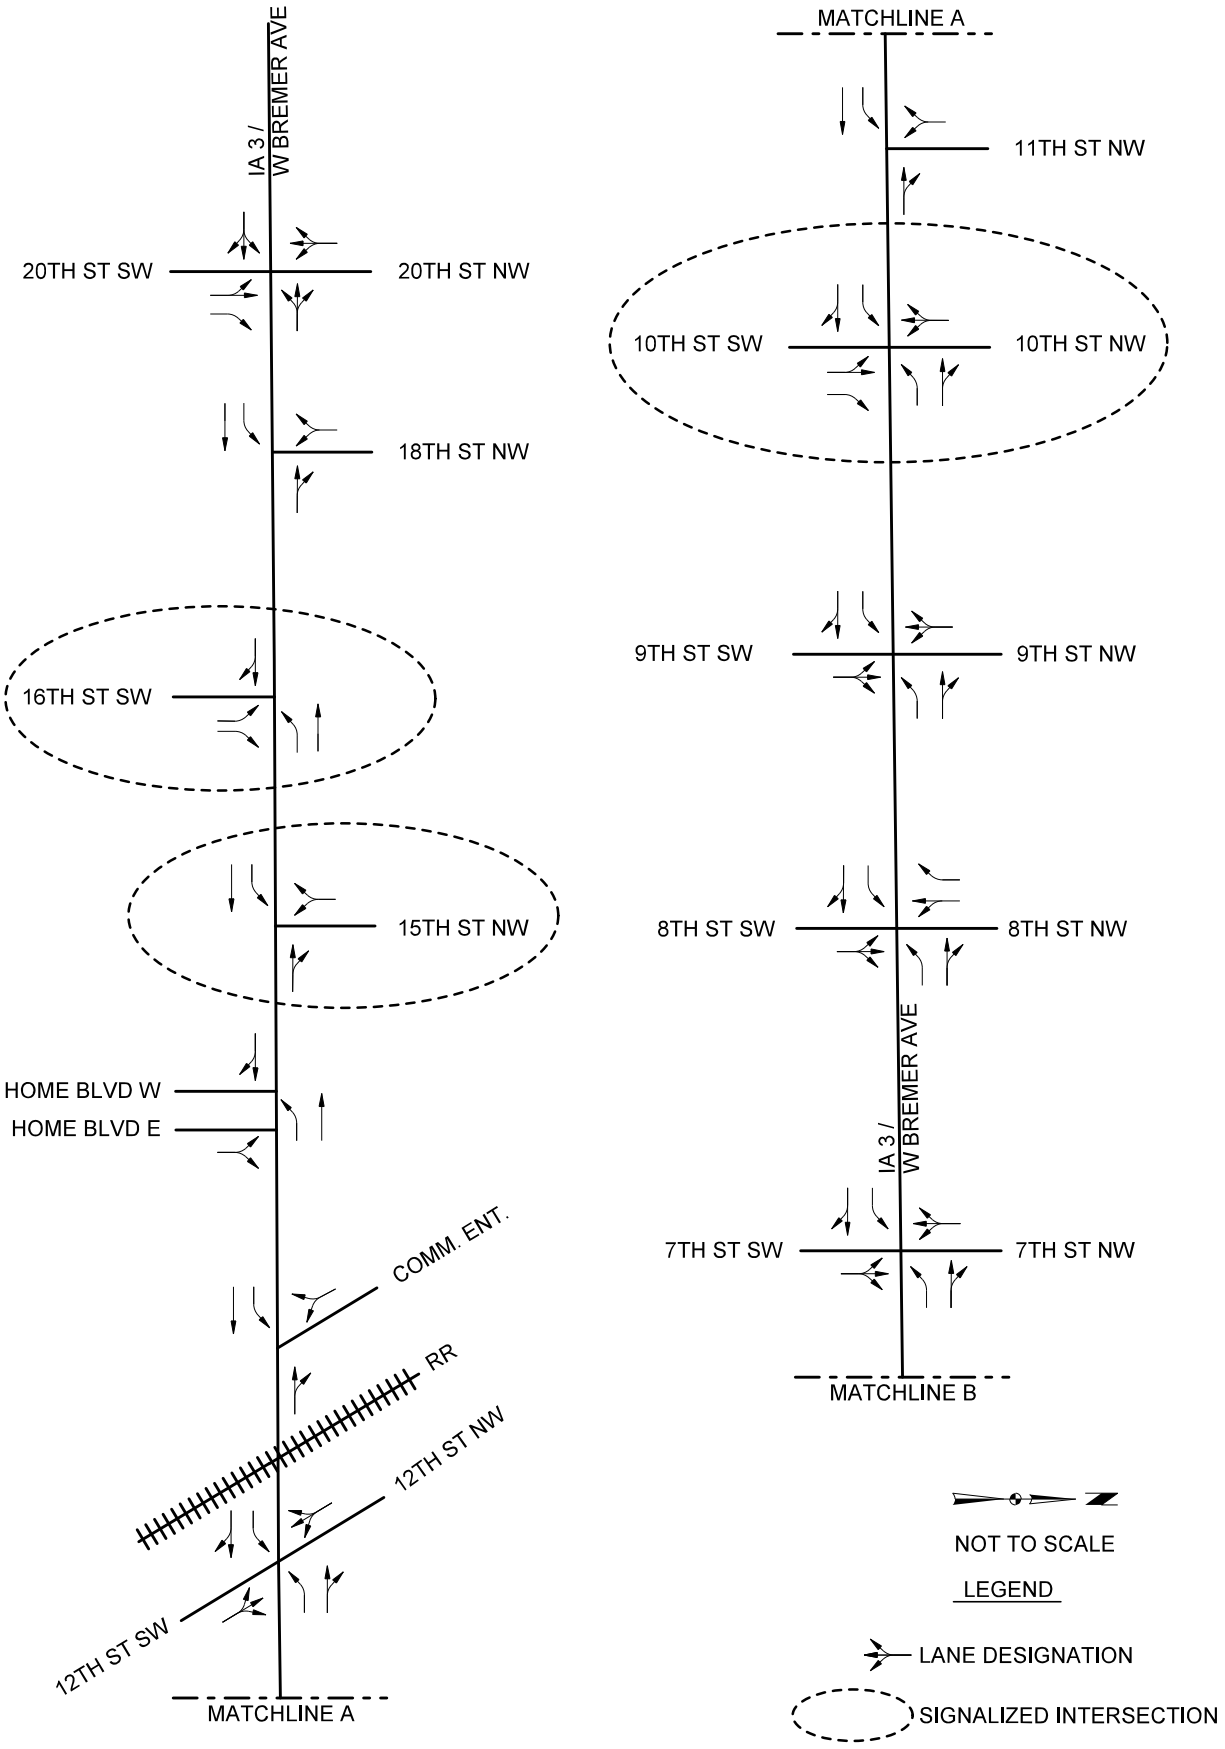


Figure 9 –Proposed Segment Three Roadway Typical Section

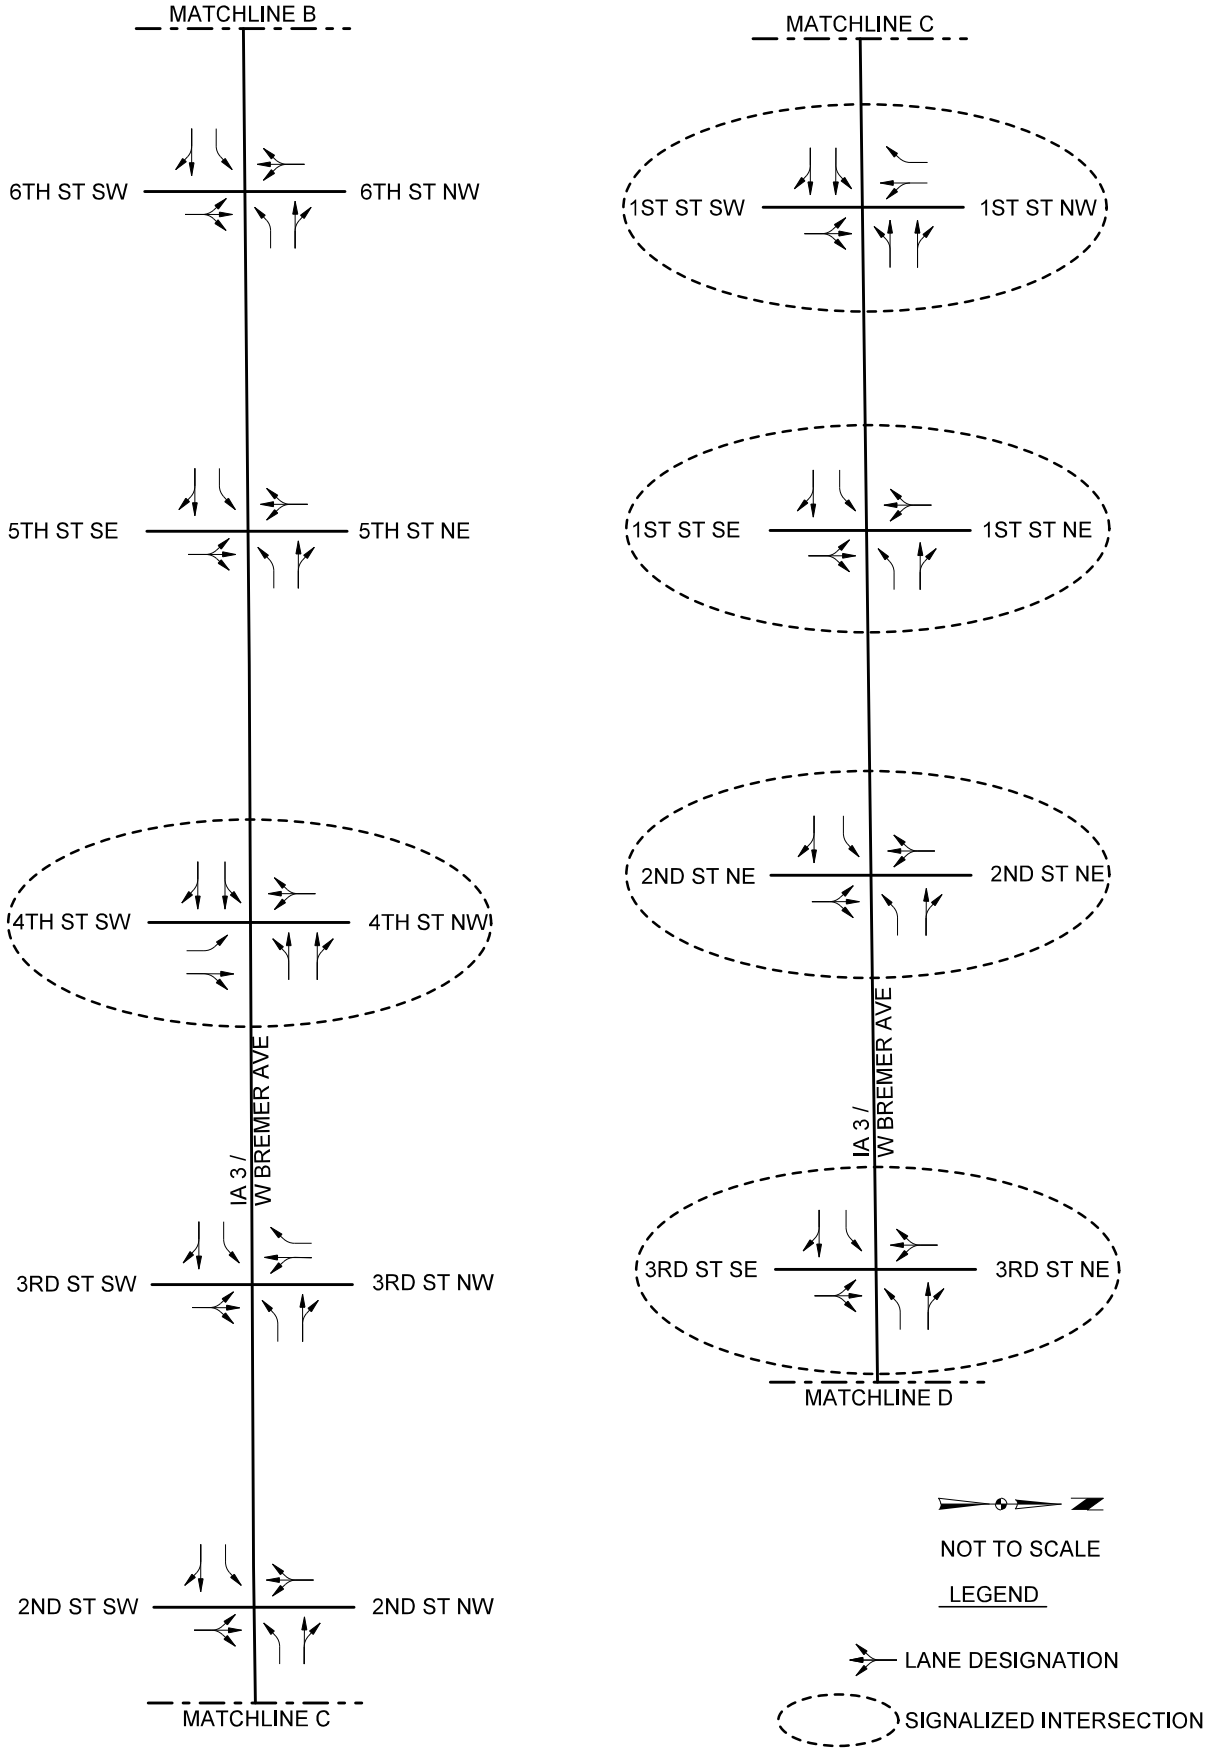
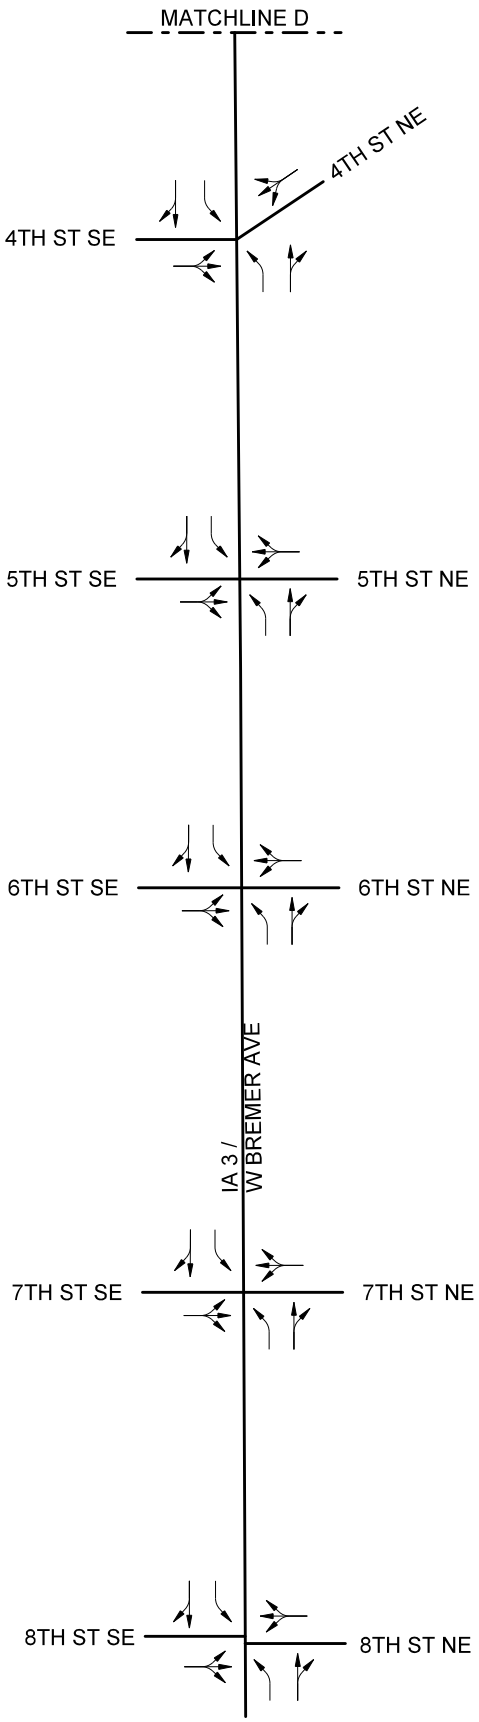


For Segment Four, the existing four lane would be reduced to two 12 foot traffic lanes, a 14 foot two-way left turn lane, two 5 foot buffer zones and two 9 foot parking lanes. See Figure 8.

See Figures 10 through 12 for proposed lane configurations.



For purposes of the analysis, the existing sideroad lane configurations and the existing intersection controls will remain the same. Traffic signal heads will be modified as necessary to accommodate the lane reduction and reconfiguration.

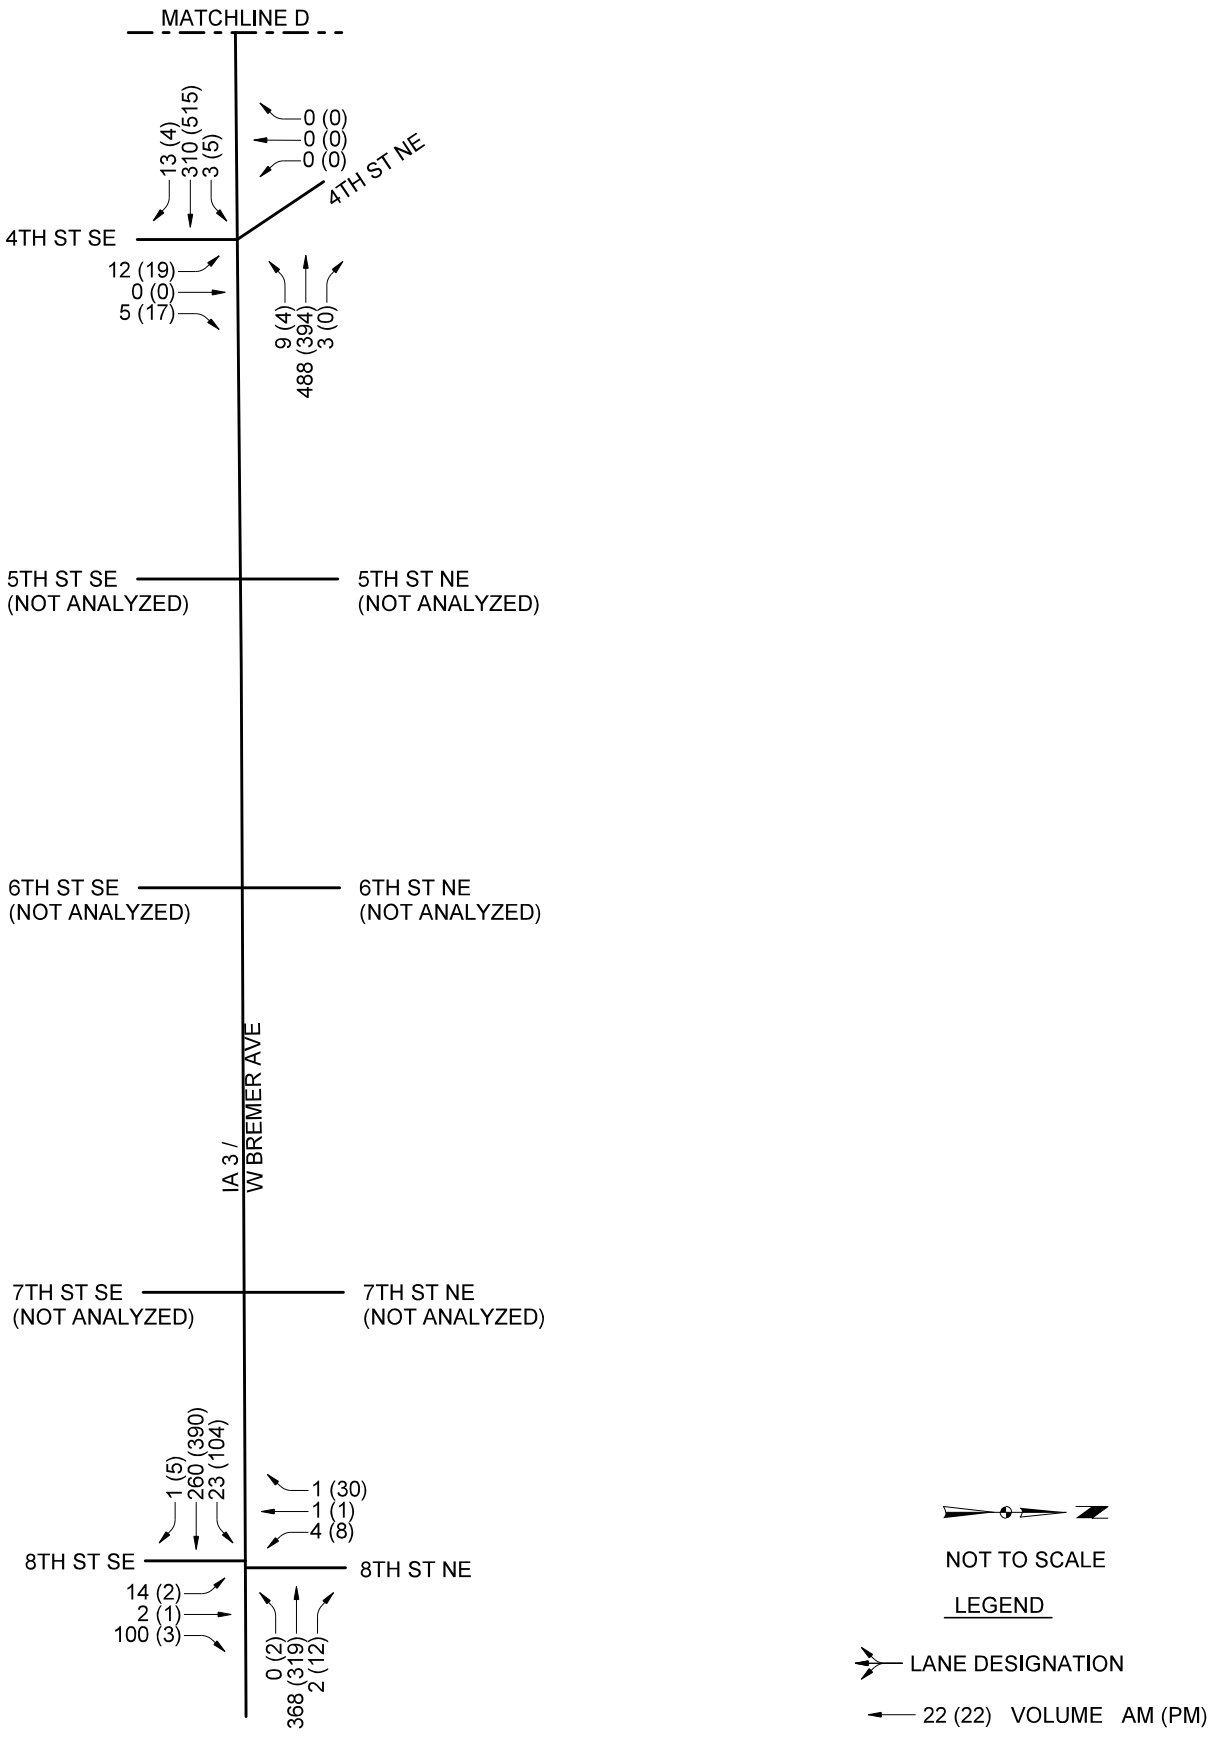
Traffic Volumes



Directional intersection traffic volumes were obtained using video detection traffic counts performed December 1, 2015 (Tuesday). For the purposes of this study the December 2015 volumes will be referred to as 2016 volumes. See Appendix A for the traffic count data. Traffic was counted from 7:00-9:00 AM and 2:30-6:30 PM. A 1% compound growth rate was assumed and traffic count volumes were factored to obtain future volumes. Pedestrian traffic was counted but was not included in the analyses. See Figures 13 through 18 for a summary of the 2016 and 2036 AM and PM peak hour traffic volumes.

Safety Analysis

Crash Analysis

Crash data for the past three (3) years, 2012 through 2014, was tabulated and analyzed for the study corridor.
The detailed crash data are provided in Appendix B. The compiled manner of crash summary and the related number of injuries and severity level data are summarized in Table 3.

Crash Data Summary Table												
	Crashes						Injuries					
	Total	Fatal	Major	Minor	Possible	PDO*	Total	Fatal	Major	Minor	Possible	Unknown
Rear-End (Front to Rear)	53			2	7	44	13			2	10	1
Sideswipe - Same Direction	23				4	19	4				4	
Angle On-coming left turn	14				2	12	3				3	
Broadside	14			1	3	10	4			1	3	
Non-Collision	6				1	5	1				1	
Head-on (Front to Front)	1					1	0					
Sideswipe - Opposite Direction	0						0					
Unknown	0						0					
Not Reported	0						0					
Total	111	0	0	3	17	91	25	0	0	3	21	1

**Property Damage Only*

Table 3 – Intersection Crash Summary Table

The manner in which two vehicles collide while in movement provides important information. Four lane undivided highways, like IA 3 in the study area, have a history of relatively high crash rates, because the inside lanes are shared by high speed through traffic and left turning vehicles. The top four manner of crashes within the study limits are:

1. Rear End (Front to Rear)
2. Sideswipe – Same Direction
3. Angle On-coming Left Turn
4. Broadside

These crash types and the number of crashes suggest that converting the existing roadway to a three lane roadway has the potential to be an effective and low cost way to reduce the crashes and injuries within the corridor. Using the crash reduction factors reported in the 2006 study *Safety Impacts of "Road Diets" in Iowa,* it can be seen in Table 4 that the potential crash reduction is significant.

Potential Crash Reduction				
	Total	% reduction	Potential Crashes w/three-lane	Potential Crashes, rounded
Rear-End (Front to Rear)	53	35%	34.45	34
Sideswipe - Same Direction	23	49%	11.73	12
Angle On-coming left turn	14	73%	3.78	4
Broadside	14	41%	8.26	8
Non-Collision	6	85%	0.9	1
Head-on (Front to Front)	1	42%	0.58	1
Sideswipe - Opposite Direction	0	49%	0	0
Unknown	0		0	0
Not Reported	0		0	0
Total	111			60

Table 4 – Potential Crash Reduction Table

In the entire City of Waverly 429 crashes were reported in the 2012-2014 period. A total of 111 of those crashes occurred on Bremer Ave (IA 3) indicated that 26% of the crashes in the City of Waverly occur on this portion of IA 3.

These 111 crashes equate to a crash rate of 575 crashes per hundred million vehicles miles of travel for the current four-lane corridor. This compares to a 2007-2011 Statewide Average Crash Rate of 293 C/HMVM along a Municipal Primary Iowa Route. The crash rate in the existing four-lane corridor is nearly double that of the average Iowa urban highway corridor.

Within this corridor IA 3/Bremer Avenue and 4th Street NW is ranked number 3 in the list of top 5 City Safety Improvement Candidate Locations – Intersections in the City of Waverly.

Pedestrian Crossings

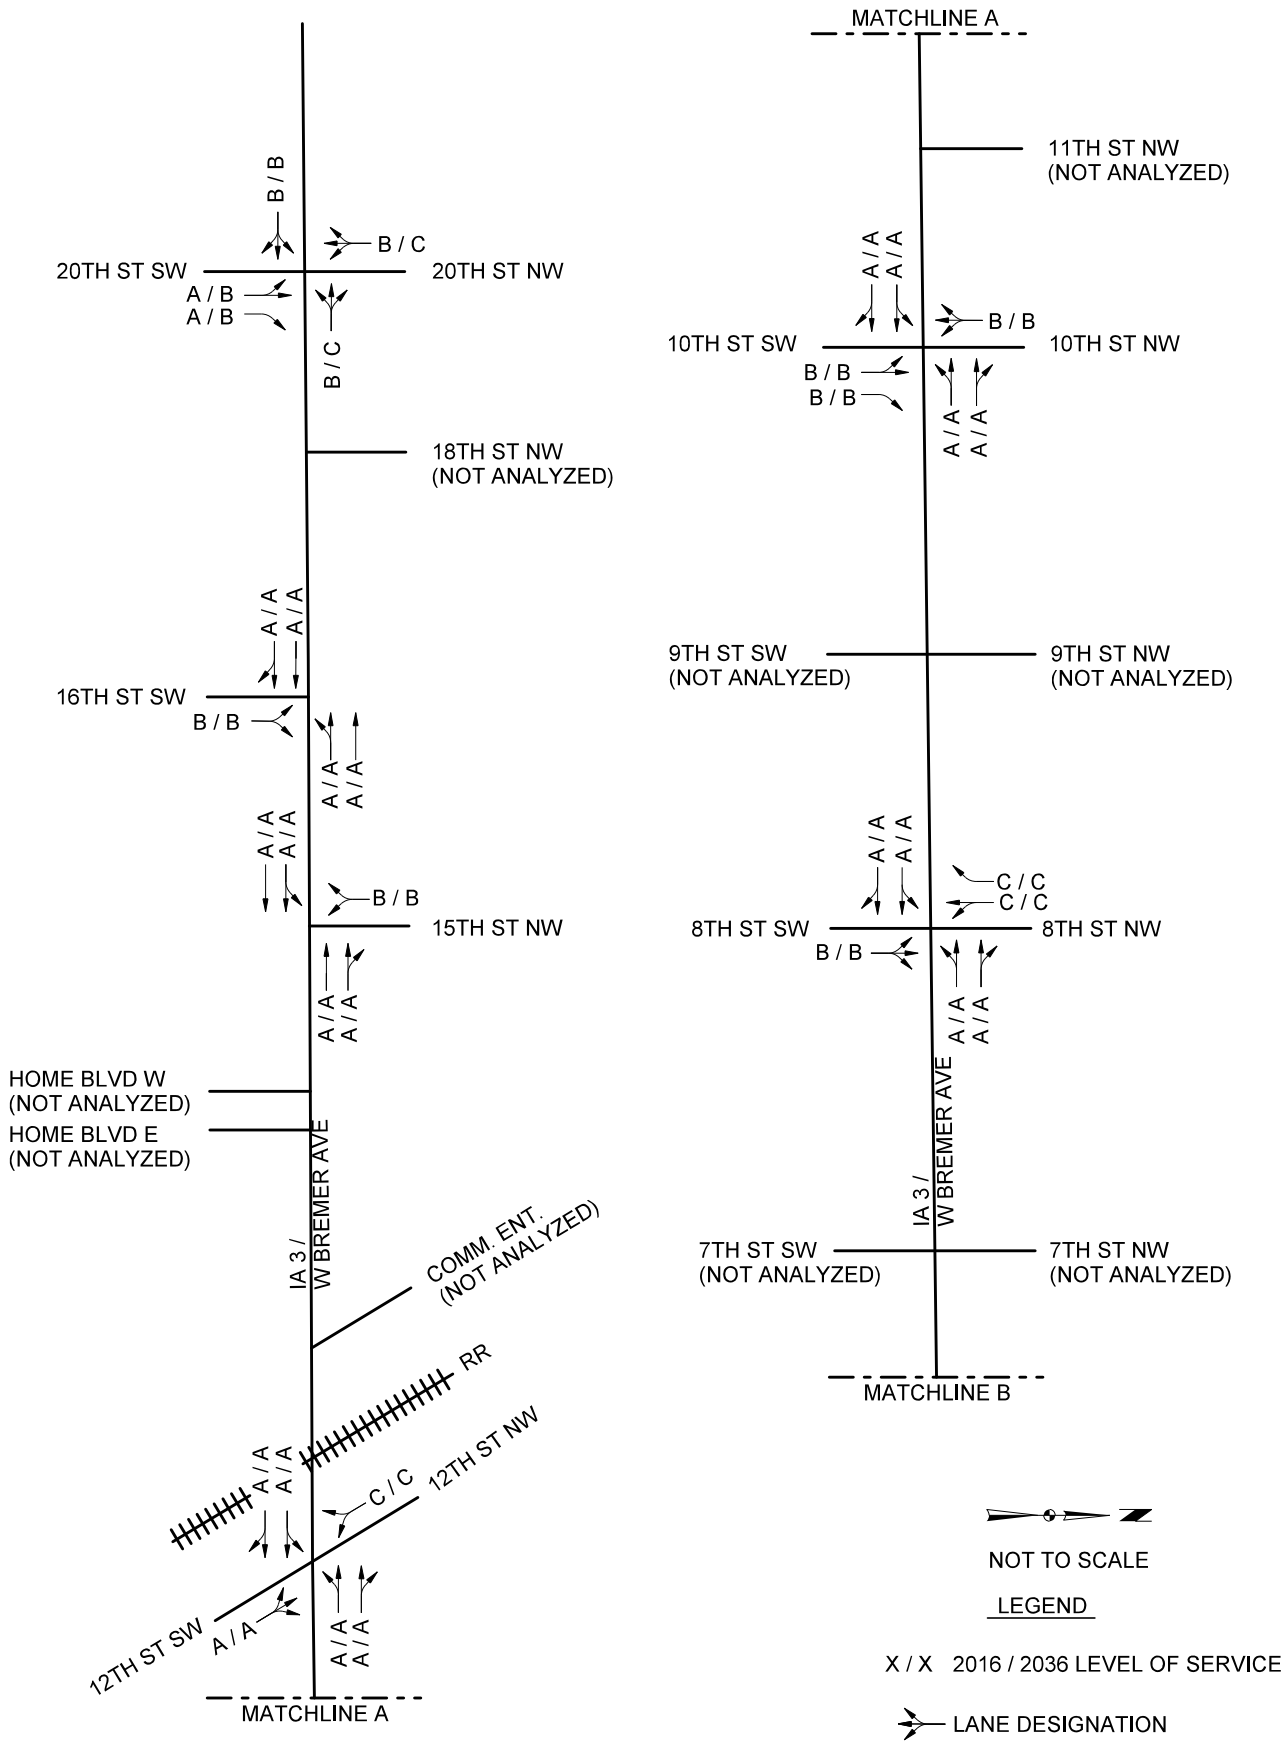
A lane reduction would provide an opportunity to improve the safety of the pedestrian crossings through the corridor. The FHWA *Road Diet Informational Guide* discusses adding corner or midblock curb bulb outs to reduce the length of the pedestrian crossing. The *Road Diet Informational Guide* also states that the bulb outs are best used with on street parking. IA 3 / Bremer Avenue provides numerous locations where this design will be ideal. The preliminary design has included curb bulb outs at the following intersections (see Appendix C for preliminary design sheets):

- IA 3 / 10th St NW
- IA 3 / 8th St NW
- IA 3 / 6th St NW
- IA 3 / 4th St NW
- IA 3 / 1ST St NE
- IA 3 / 2ND St NE
- IA 3 / 3RD St NE
- IA 3 / 4TH St NE

Intersection Analyses

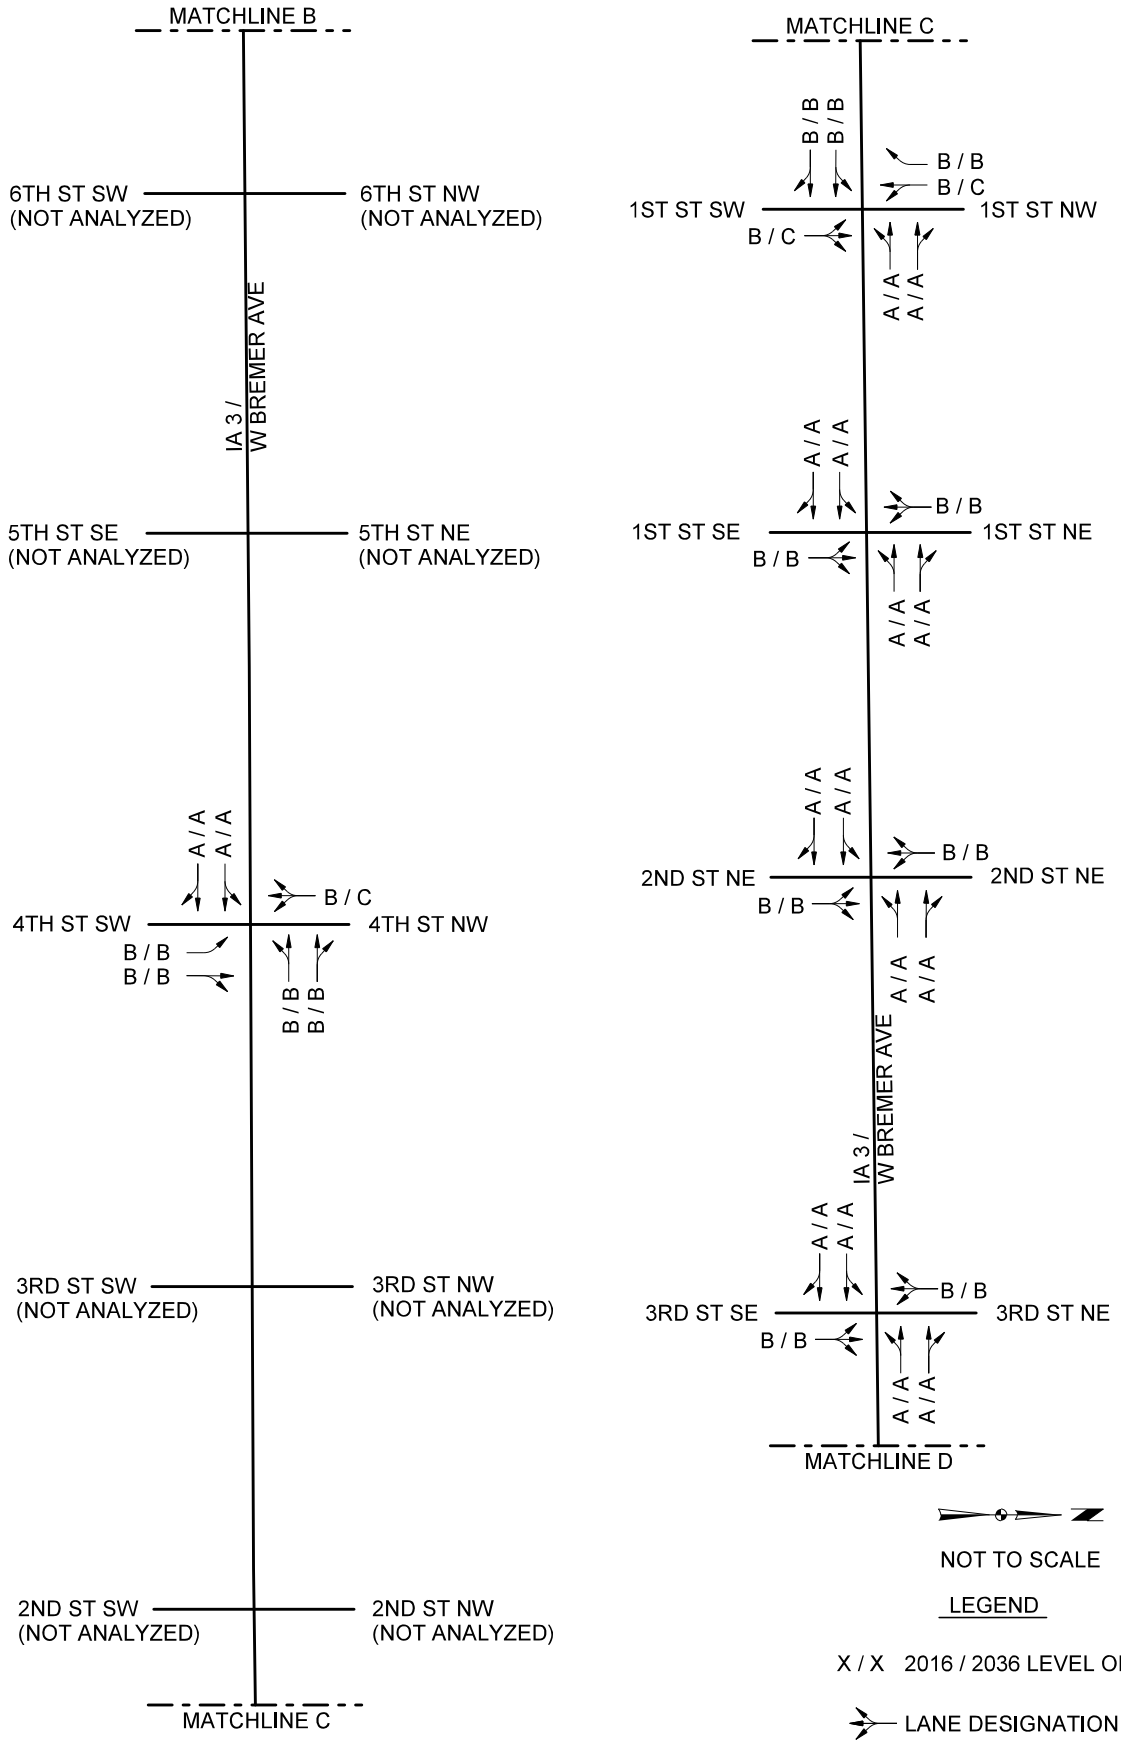
The capacity of the intersections was analyzed using the procedures outlined in the *Highway Capacity Manual 2010* (HCM). The intersections were modeled using Synchro Studio 9 with SimTraffic 9.

Level of Service (LOS) at intersections is primarily a function of peak hour turning movement volumes, intersection lane configuration, and traffic control. For intersection analysis, the HCM defines LOS in terms of the average control delay at the intersection in seconds per vehicle. Level of service is broken down into letter grades, with LOS A representing good operations and LOS F representing poor operations. LOS E is considered to be at capacity. LOS C is generally considered acceptable for design purposes. Table 5 shows the level of service correlations to seconds of delay for signalized intersections and stop control (unsignalized) intersections.



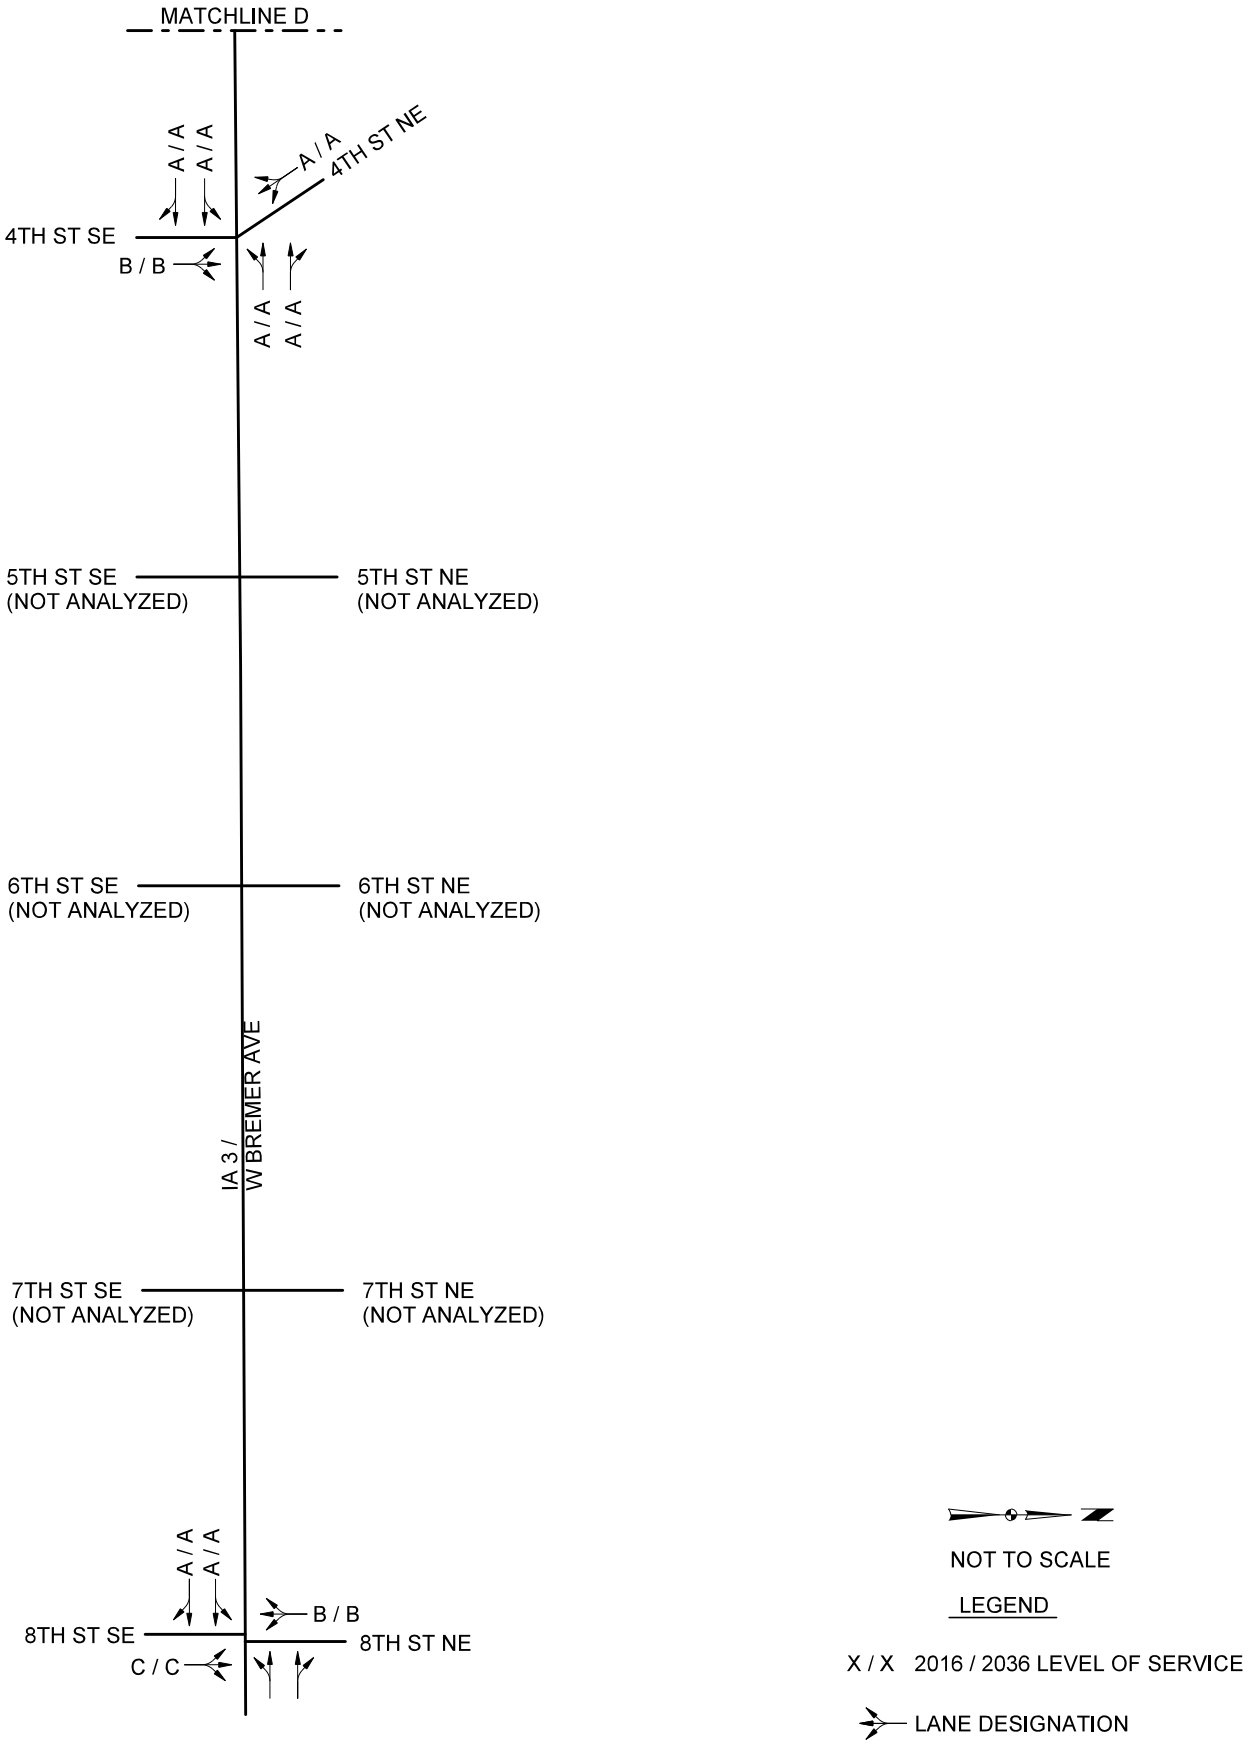
LOS	Signalized Intersection Control Delay (seconds/vehicle)	Unsignalized Intersection Control Delay (seconds/vehicle)
A	≤ 10 sec.	≤ 10 sec.
B	10 - 20 sec.	10 - 15 sec.
C	20 - 35 sec.	15 - 25 sec.
D	35 - 55 sec.	25 - 35 sec.
E	55 - 80 sec.	35 - 50 sec.
F	> 80 sec.	> 50 sec.

Table 5 – Intersection LOS Criteria



Existing Traffic Lanes Capacity Analysis

This scenario analyzed intersections using the existing traffic lane configurations for year 2016 and 2036. The 2036 traffic volumes were calculated by factoring up the existing volumes 1% per year. (See Figures 4 through 6 for lane configuration.) The LOS on the existing lane configurations is shown on Figures 19 through 21. For the detailed reports of the capacity analyses, see Appendix D. The AM traffic was analyzed but not included in the report because the PM traffic volumes are higher and the PM generally has a lower LOS.



Figures 19 through 21 show that all movements for 2016 and 2036, using the existing lane configurations, operate at a LOS C or better.

TRAFFIC IMPACT STUDY IA 3 / BREMER AVE WAVERLY, IOWA	EXISTING TRAFFIC LANES LEVEL OF SERVICE FIGURE 19	whks engineers + planners + land surveyors

TRAFFIC IMPACT STUDY IA 3 / BREMER AVE WAVERLY, IOWA	EXISTING TRAFFIC LANES LEVEL OF SERVICE FIGURE 20	whks engineers + planners + land surveyors

TRAFFIC IMPACT STUDY IA 3 / BREMER AVE WAVERLY, IOWA	EXISTING TRAFFIC LANES LEVEL OF SERVICE FIGURE 21	whks engineers + planners + land surveyors

Three Traffic Lanes Capacity Analysis

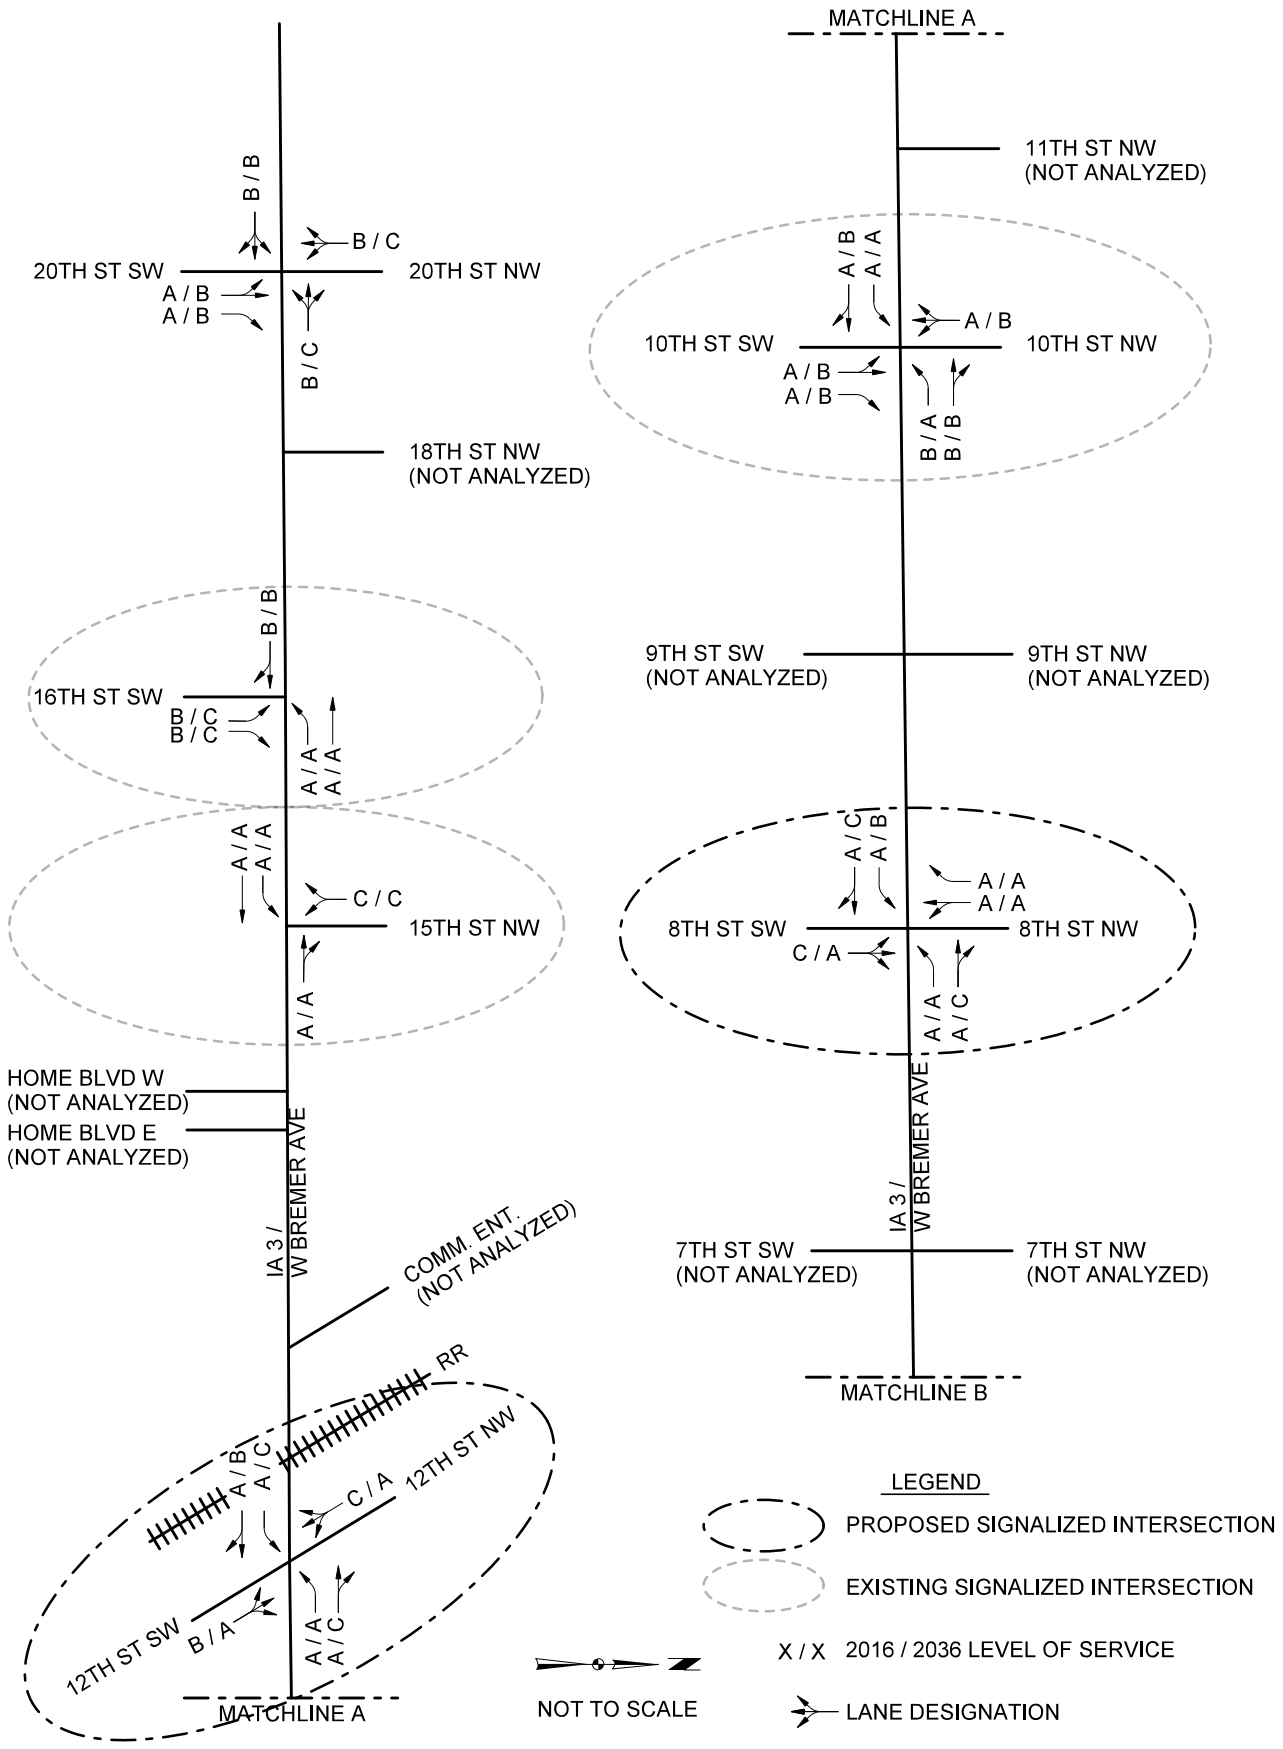
Using three lane undivided roadway configurations, turning movement traffic for the years 2016 and 2036 were analyzed. See Figures 10 through 12 for lane configurations. The existing sideroad lane configurations and control remained unchanged for the analysis.

Conversion to three lanes for the existing traffic will have adequate capacity and provide acceptable Levels of Service (C or better) for all existing intersection configurations and control except for the intersection of IA 3 / 8th Street SW, which will require signalization.

Based on the capacity analysis, all intersection turning movements for the year 2036, operating with the proposed three lane section with a two-way-left turn lane (TWLTL) on IA 3 and the existing sidestreet lane configurations, operate at a LOS C or better, with the exception of Southbound 12th Street NW, Eastbound IA 3 at 4th Street SW, Northbound 4th Street SW and Northbound 4th Street SE. These four intersections will need to be modified to operate with an acceptable level of service for the projected 2036 turning movement volumes.

The following modifications are proposed to improve the LOS at the four intersections:

Control Type Modifications



- Signalize the intersection of IA 3 / 12th Street SW
- Signalize the intersection of IA 3 / 4th Street SE

Geometric Modifications

- Provide dual WB left turn lanes at IA 3 / 4th Street SW
  - On the WB approach, the two inside lanes can be used as the WB left turn lanes.
  - On the NB approach, the parking on the west side of the street would need to be removed to be used for two receiving lanes from the WB approach.
  - The SE curb return of the intersection will have to revised to accommodate the NB right turning trucks.

With modifications, all intersection turning movements for 2036, operating with the proposed three lane section on IA 3, operate at a LOS C or better. The LOS for the proposed lane configurations with 2016 and 2036 traffic is shown on Figures 22 through 24. For the detailed capacity analyses reports, see Appendix E.

It should be noted that traffic patterns can change over time and LOS can vary. The modifications analyzed in this section may be implemented as traffic volumes increase, intersection capacity decreases and roadway users begin to experience excessive delay.
