Re: CEQA Appeal for 11472 West Laurelcrest Drive, Los Angeles, California; CF 19-1134

Dear Council President Martinez and Councilmembers:

This firm represents Sunshine Hill Residence Association ("Appellant" or "Association"). Appellant has cited to a variety of reference materials in the letters submitted to the City thus far. This letter is intended to provide the City with copies of the cited source documents to ensure that are made part of the Administrative Record. See Exhibits 1-21.

I may be contacted at 310-982-1760 or at jamie.hall@channellawgroup.com if you have any questions, comments or concerns.

Sincerely,

Jamie T. Hall

ORDINANCE NO. 177404

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subdivision 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. Protected Tree Relocation and Replacement. All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph to read:

Protected Tree - Any of the following Southern California native tree species, which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. The term "Tree Expert" set forth in Section 17.02 of the Los Angeles Municipal Code is amended to read:

Tree Expert - A person with at least four years of experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R of this Code. Provided, however, that in no event shall the reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in this article or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth in Subdivision 3 of this subsection, when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency, in consultation with the City's Chief Forester, determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the

determination, the protected tree's removal would be permissible; or

(iii) A building permit has been issued for the property upon which the protected tree is located, the permit is still in effect, and the removal or relocation is not prohibited by the permit.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters that cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report required pursuant to Section 17.06 C, acceptable to the Advisory Agency and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of the tree; or

(v) It has no apparent aesthetic value, which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at the location.

2. Supplemental Authority. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of the tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In that event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, except as to Subdivision 1(b)(iii) above, shall require retention of a protected tree at its existing location, if the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within the property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this article, except where the protected tree is relocated pursuant to Subdivision 2(a) above. The size of each replacement tree shall be a 15-gallon, or larger, specimen, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in a manner to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that the trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of the bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree that is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of the trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision where a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation of the tree. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06 B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any protected tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving the tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel where a protected tree is located shall be considered complete unless it includes a report pertaining to preserving the tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness in preserving the tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is amended to read:

I. When a protected tree exists on a proposed parcel, the preservation of the tree at its existing location, its relocation for preservation purposes, or the removal of the tree shall be regulated in the same manner as that provided under subdivision

regulations set forth in this chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or this article. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where the protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of

Public Works or its designated officer or employee, except as otherwise provided in this section.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed that may affect the protected tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where the Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory Agency pursuant to Article 7 of Chapter I of this Code; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the determination the protected tree's removal would be permissible; or

3. A building permit has been issued for any property and is still in effect with respect to the property under consideration and its implementation would necessitate the removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided in this section or unless the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if the Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters, which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at the location prevents the reasonable development of the subject property; or,

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the

protected tree, the tree is in danger of falling, notwithstanding the tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) Additional Authority. The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace the tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. In size, each replacement tree shall be at least a 15-gallon, or larger, specimen, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In that event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of the new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article, which permits the removal of one or more protected trees. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. WITHHOLDING OR REVOCATION OF BUILDING PERMITS FOR ILLEGAL REMOVAL OR RELOCATION OF PROTECTED TREES.

(a) The Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this section, shall have the authority to request the Superintendent of Building to withhold issuance of building permits, except for permits that are necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of ten years as requested by the Bureau and to revoke

any building permit issued for which construction has not commenced with respect to any property on which any protected tree has been removed or relocated in violation of Section 46.00 of this Code.

The request shall be made in writing by the Director of the Bureau of Street Services or his/her designee and shall specifically state the start date and end date of the period of time the Bureau, or the Board of Public Works on appeal, have deemed necessary pursuant to Subsection (c) of this section. The period shall commence on the date the Bureau first becomes aware of the removal of the tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection (b) of this section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of the notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in the property as revealed by a title search with respect to the property. A copy of the notice shall also be recorded by the Bureau with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection (b) above. At the hearing, if the facts indicate, the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal or relocation of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection (b) above. In the event the Bureau finds that a protected tree was removed or relocated in violation of Section 46.00 of this Code, it shall specify to the Superintendent of Building the length of time the issuance of building permits shall be withheld and whether building permits for which construction has not commenced shall be revoked. In making its determination, the Bureau shall consider the following factors: the number of trees removed or relocated, the size and age of the trees removed or relocated, the knowledge and intent of the owners of the property with respect to the removal or relocation and prior violations of law with respect to removal or relocation of protected trees. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days of the hearing.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to request the Superintendent of Building to revoke or withhold issuance of building permits, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, any action by the Department of Building and Safety resulting from any of the provisions of this section, including building permit revocation, shall not be appealable to the Board of

Building and Safety Commissioners.

(e) Any final determination of the Bureau or the Board of Public Works on appeal, to request the Superintendent of Building to withhold issuance of building permits or to revoke a building permit, shall be forwarded to the Superintendent within ten days of the Bureau or Board's determination and shall also be set forth in an affidavit, which shall be recorded by the Bureau with the County Recorder within ten days of the Bureau or Board's determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this section, the definition of "protected tree" set forth in Section 46.01 this Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify this information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of this Code for establishing fees.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of FEB 28 2006.

DECLARATION OF POSTING ORDINANCE

I, MARIA C. RICO, state as follows: I am, and was at all times hereinafter mentioned, a resident of the State of California, over the age of eighteen years, and a Deputy City Clerk of the City of Los Angeles, California.

Ordinance No. **177404** - **Amending various provisions of Articles 2 and 7 of Chapter 1 and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees** - a copy of which is hereto attached, was finally adopted by the Los Angeles City Council on **February 28, 2006**, and under the direction of said City Council and the City Clerk, pursuant to Section 251 of the Charter of the City of Los Angeles and Ordinance No. 172959, on **March 14, 2006**, I posted a true copy of said ordinance at each of three public places located in the City of Los Angeles, California, as follows: 1) one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; 2) one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; 3) one copy on the bulletin board located at the Temple Street entrance to the Hall of Records of the County of Los Angeles.

Copies of said ordinance were posted conspicuously beginning on **March 14, 2006** and will be continuously posted for ten or more days.

I declare under penalty of perjury that the foregoing is true and correct.

Signed this **14th** day of **March 2006** at Los Angeles, California.

Maria C. Rico

Maria C. Rico, Deputy City Clerk

Ordinance Effective Date: **April 23, 2006** **Council File No.** **03-1459 & S1**

Rev. (2/21/06)

VERBAL MOTION

I HEREBY MOVE that Council ADOPT the following recommendation of the City Planning Commission (Item No. 37, CF 03-1459 & 03-1459-S1) relative to amending the Los Angeles Municipal Code (LAMC) to add certain native trees to the class of "protected tree" formerly solely oak tree), SUBJECT TO THE APPROVAL OF THE MAYOR:

1. FIND that this action is exempt from California Environmental Quality Act, pursuant to Article II, Section 2(m) of the City's Guidelines.

2. ADOPT the January 18, 2006 Findings of the City Planning Commission as the Findings of the Council.

3. PRESENT and ADOPT the accompanying ORDINANCE, approved by the Interim Director of Planning (on behalf of the City Planning Commission) amending the LAMC to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions. CPC 2004-2290 CA

   Fiscal Impact Statement: None submitted by the Planning Department. Neither the City Administrative Officer nor the Chief Legislative Analyst has completed a financial analysis of this report.

(Planning and Land Use Management Committee waived consideration of the above matter)

MOTION

I **MOVE** that the matter of EXEMPTION, COMMUNICATION FROM THE CITY PLANNING COMMISSION and ORDINANCE FIRST CONSIDERATION relative to amending the Los Angeles Municipal Code (LAMC) to add certain native trees to the class of "protected tree" (formerly solely oak tree), Item 37 (CF 03-1459 and CF 03-1459-S1) on today's Council Agenda, Tuesday, February 28, 2006, be AMENDED to ADOPT the following ADDITIONAL RECOMMENDATIONS:

1. DIRECT the Bureau of Street Services to report on a quarterly basis on the number of violations of the City's Protected Trees Ordinance, as codified in the Los Angeles Municipal Code (LAMC), and the nature of those violations occurring at but not limited to, small lot, multi-family, and large developments, the number of violations occurring per Council District, permits issued for removal, and the number of trees illegally removed.

2. DIRECT the Bureau of Street Services and the City Administrative Officer (CAO), to report on a quarterly basis on the resources needed to properly enforce the City's Protected Trees Ordinance.

February 28, 2006

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles CA 90012

VIA HAND

Council File(s): 03-1459 and 03-1459-S1
(Supplemental Agenda Item #37)

Honorable Members:

I am at a complete loss to understand why the entire City Council, its PLUM Committee, and its Planning Commission, as well as the rest of the bureaucracy, are incapable of uttering three little phrases;

Southern California Black Walnut
Western Sycamore
California Bay

I am still researching the history of these proposed ordinances, but so far, going back to their genesis in 2003, I am unable to find references to these trees in any publicly noticed hearing or meeting. This includes the tapes of some recent PLUM and Planning Commission meetings. Instead, the only captions I can find during the entire process until mid-January refers to amendments to the "Oak Tree Ordinance".

The Items before you today aren't about Oak Trees. They never have been. They are about three new trees, none of which is a protected species, and

about hijacking the Oak Tree ordinance in order to block peoples right to build homes on their property.

It was not until my wife and others filed formal complaints over Brown Act violations that anything happened. And even then, we received a masterpiece of obfuscation from the City Attorney denying relief and kinda' sorta' defending the captioning practices of the City.

Even the caption of your Items today is technical and unclear - read it for yourselves. And, I would submit, even this modest change in captioning is only after some taxpayers cried foul that the very core purpose of the Brown Act (to let citizens know clearly and in plain language the business of the government before action is taken) is being deliberately subverted. (The supporting documents are attached).

As further evidence of the manipulative manner which marks the movement of these Items, I was under the impression that the next step in the process after recommendation by the City Planning Commission was to go to the PLUM Committee. This is seemingly reflected in the transmittal letter from the Planning Commission dated January 18, 2006, which is addressed to Barbara Greaves, Legislative Analyst for the PLUM Committee. I had even ascertained that there was a tentative date of March 7 for the Items to be on the PLUM Committee Agends.

Suddenly, we discovered late Friday afternoon that the PLUM Committee is being bypassed, and the Items show up on a Supplemental Council Agenda with virtually no notice to those who are not insiders. And on that Supplemental Agenda, there is a note that "Planning and Land Use Committee waived consideration of the above matter". With no public meeting, with no notice, and with no vote, how on earth can the PLUM committee waive consideration of the matter?

I urge the Council to act in the spirit of open and transparent government, instead of at best marginally technically legal persiflage, and to defeat this proposed ordinance. There are no endangered species at stake here, start over and do the process right.

Thank you for your time and consideration in this matter. Unfortunately I cannot attend today's meeting because these last minute scheduling changes make it virtually impossible for those of us who work to change everything at the drop of a hat to attempt to attend government meetings. Therefore this letter.

Sincerely,

Tony Butka

Mr. Dion O'Connell
CITY OF LOS ANGELES, Deputy City Attorney
800 City Hall East 8th Floor
200 North Main Street, Los Angeles, CA 90012

RE: Brown Act Violations and Support for PROH-LA Complaint

Dear Mr. O'Connell:

I am writing this letter to support the formal objection letter (attached) filed with your office by PROH-LA regarding a Brown Act Violation (Planning Commission Meeting 1/12/06 Item #4) and to expand information about other potential violations of the Act.

1. Planning Commission Meeting. I attended the Planning Commission meeting on January 12, 2006. To my recollection, during the brief discussion/deliberation period on this item, there was no mention or reference to any other trees but Oak Trees by either the speakers or the Commissioners or Planning Department staff members present. However, the Oak Trees Ordinance and Oak Trees were referred to constantly during the meeting. Others attending the meeting [the public] for other items would not at all be clear about the proposed inclusion of three trees in the Oak Tree Ordinance based on the limited public hearing discussion, the public notices issued or based on the Commission agenda handed out. We have ordered a copy of the Commission's taped minutes for review, in this regard.

2. Other Violations of the Brown Act by City Agencies/Committees? I also want to alert you to the probability that these same Brown Act violations (also described in PROH-LA's letter) also apply to the discussions/decisions/actions taken by several other City Charter-related organizations/agencies, among them, the City Planning Committee, the City Community Forestry Advisory Committee and the Neighborhood Councils in Northeast LA.

   - *City Planning Committee*. What about the various meetings of the Planning Committee? The agenda items and public announcements, I gather, have referenced "The Oak Tree Ordinance Changes." I have not yet seen a public announcement or an agenda-title with the words – California Walnut trees, Sycamore, or California bay trees (what is this tree?).

   - *City Community Forestry Advisory Committee*. Its last three agendas posted online as public notices name the "Native Tree Protection Ordinance" on their agenda, and the Chair of the Committee as the reporter on the topic. I wanted to know more about this native tree protection ordinance. So, I visited the City's online ordinance archives. I found no reference to either an existing or a pending "Native Tree Protection Ordinance." This is curious because much of the proposed Oak Tree Ordinance changes originated in this City advisory

committee and its advisory members have heavily lobbied for the Oak Tree Ordinance changes, and this is particularly true in our neighborhoods in NELA. This Forestry Committee is proposed to play a significant role in the proposed Ordinance changes.

Here is one further concern about the Forestry Committee and its activities. Recently, a member of the City Community Forestry Advisory Committee publicly admonished (in a Yahoo group email system) PROH-LA for voicing its opinion about and reasons for its opposition to the proposed changes to the Oak Tree Ordinance. This advisory committee member further asked for Yahoo group email readers *not to sign the PROH-LA online opposition petition.* Said Forestry Committee member used the bottom of one her Yahoo email messages in this regard to remind readers that she was a member of and held the leadership role in the City's Community Forestry Advisory Committee.

Was this member acting on behalf of the City of Los Angeles to discourage public comment and prevent PROH-LA from collecting signatures?

- *GPNC (the Glassell Park Neighborhood Council).* Public notices about GPNC meeting discussions on the Oak Tree Ordinance do not name the other trees being considered under proposed changes. In an area where Walnut trees are prevalent, how would GPNC stakeholders know about the pending changes regarding the three other trees being considered for strict protection? According to the GPNC posted minutes for its GPNC Land Use Committee meeting in late Fall 2005, a decision to support the Ordinance changes may have been made without a quorum. According the minutes, very stakeholders were in attendance and the vote to support the Oak Tree Ordinance changes was made without discussion. The City Attorney's office provided NCs with guidance as to who are NC stakeholders according to the City Charter (residents, workers and property owners). Regarding property owners, NCs cannot include some but not all property owners. In other words, NCs cannot exclude vacant landowners as "official stakeholders."

I encourage the City Attorney to review the information and questions raised here and in the PROH-LA letter about "improper process" and therefore "improper outcomes" relative to the Brown Act and the proposed Oak Tree Ordinance changes. I agree with PROH-LA and its call for starting the policy discussion over again, requiring open and fair public discourse coupled with advance and broad notification of public meetings and opportunities to attend.

And, furthermore, the Attorney's office should publicly clarify and ensure that property owners of vacant land are protected equally under the City Charter, the State of California Brown Act and the work of the Neighborhood Councils as well as other Citizen advisory committees.

In Northeast LA, we continue to have our land rights high-jacked to a "silent process." Things are consistently *not transparent* in NELA when it comes to land use issues. Why? Is there is a pattern here in NELA of denying open public debate on land use issues? A review of recent ordinance legislation and the level and adequacy of public discourse is in order.

It may be the case that nearly 50% of vacant landowners have Spanish or Asian surnames (quick review of 2004-05 list of owners-titles). Many low-income, working class and immigrant reside in NELA and they have not been included in land use ordinance discussions. Shouldn't they?

What kind of open and transparent public debate took place for these policies?

- 2005 Retaining Wall Ordinance (passed March 2005)
- The proposed NELA Open Space Hillside ICO (in process. 2004-present)
- The proposed Oak Tree Ordinance changes (in process, 2003-present)
- Also, much of NELA vacant land was rezoned to RE-20 and RE-40, as we have learned from affected vacant landowners, without their participation in the zoning changes and without advance notice?

I look forward to hearing back from your office on these issues. Perhaps, the City needs to start the policy formulation discussion on the proposed Oak Tree Ordinance over again. If this course were to take place, I further recommend that the proposed inclusion of the additional three trees be dropped from the Oak Tree Ordinance discussions and considerations. They do not match the status of the well-know oak tree and should not be treated in the same manner. There is much debate to be held on this given the opportunity for public scrutiny.

If it would help in your review of these matters, I would be happy to provide you with documentation.

Regards.

RE: **Brown Act Violation**
(Planning Commission Meeting 1/12/06 Item #4)

Dear Deputy O'Connell,

I would like to lodge a formal complaint that the Planning Commission violated the Brown Act on January 12, 2006 when it approved a new revision to the ordinance regarding "Oak Trees." Government Code Section 54954.2 ("Brown Act") requires that a "brief general description of each item of business to be transacted or discussed at the meeting" be posted 72 hours before the meeting.

For this meeting Item #4's description did not adequately provide the public notice of the business to be transacted. Specifically, the Agenda description alerts the public that the commission would be reviewing amendments to the municipal code regarding Oak Trees. What it fails to mention, and consequently fails to notice the public, is that the new ordinance would go beyond Oak Trees to include other species of trees (Southern California Black Walnut, Western Sycamore, and California Bay). This omission, in my opinion, invalidates the vote taken on regulating the species of trees beyond the scope of the noticed agenda.

The exact language found on the January 12th Committee Agenda reads:

Proposed draft Ordinance (Appendix A), amending Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Los Angeles Municipal Code, to bring provisions of the Code regarding Oak Trees in conformance with revisions to Section 46 (Oak Tree Regulations) and Section 96.303.5 of the Municipal Code.

The agenda should have included in its description that the ordinance:

1. expands the number of species protected from one to four, preferably listing the specific species,
2. eliminates the minimal lot size for effected parcels,
3. decreases the size of protected trees from eight to four inches in diameter and includes multi-trunk trees measuring "cumulative diameter",
4. allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed,
5. the ordinance more narrowly defines who may be considered a tree expert under the municipal code, and lastly
6. requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

As you know, a major objective of the Brown Act is to facilitate public participation in all phases of local government decision making and to curb misuse of democratic process by secret legislation by public bodies. (Sacramento Newspaper Guild vs. Sacramento County Bd. of Suprs. (1968) 263 Cal. App. 2d 41. 50 [69 Cal. Rptr. 480].) When the agenda item only lists Oak Trees as the subject matter it relegates the other species and items in the ordinance to being part of "secret legislation."

I would appreciate if you would advise the planning department and planning commission that it is a disservice to the people of Los Angeles to continue to list this item as "Oak Tree Regulations." The actions of the commission need to be declared null and void and the process needs to start over with an accurate description regarding the changes this new ordinance proposes.

Furthermore, I would request that public hearings be scheduled throughout the City advising the public that the City is considering protecting Southern California Black Walnut trees, Western Sycamore trees and California Bay trees just as they do Oak Trees.

I look forward to hearing from you and expect that the Commission's actions will be considered invalid.

Respectfully,

Bradley.

Re: Response to Allegations of Brown Act Violations

Dear Dr. Bagasao:

This office has received your correspondence faxed January 19, 2006, in which you request the City to correct alleged violations of the Brown Act during the City Planning Commission (CPC)'s meeting that took place on January 12, 2006. You, and several other individuals whose letters were written in substantially the same format as yours, allege that Agenda Item No. 4's description did not adequately provide the public notice of the business to be transacted. The agenda description at issue read as follows, in pertinent part:

CPC-2004-2290-CA
CEQA: ENV-2004-2291-CE
Plan: Citywide
Community Impact Statement: Yes.
Silver Lake Neighborhood Council in support.
Continued from 11-10-05
PUBLIC HEARING CLOSED

Proposed draft Ordinance (Appendix A), amending Sections 12.21A12, 17.02, 17.05H7, 17.05R, 17.06B13, 17.06C, 17.51 I of the Los Angeles Municipal Code, to bring provisions of the Code regarding Oak Trees in conformance with revisions to Section 46 (Oak Tree Regulations) and Section 96.303.5 of the Los Angeles Municipal Code.

FEB-8-2006 13:13 FROM:CITY ATTY 213 978 8787 TO:9132334311 40 P:2/3

This office has reviewed the allegations and the relief sought. After researching the matter and after discussion with our attorneys who regularly staff the CPC meetings, our office has determined that there is no basis for the relief that you seek. Government Code section 54954.2(a) provides, in pertinent part:

> "At least 72 hours before a regular meeting, the legislative body of the local agency ... shall post an agenda containing a brief general description of each item of business to be transacted or discussed at the meeting ... A brief general description of an item generally need not exceed 20 words. ..."

The brief general description set forth in Agenda Item No. 4 of the City Planning Commission's meeting held January 12, 2006, satisfied the requirements set forth in the Brown Act in that it sufficiently informed interested members of the public about the subject matter under consideration so that they could determine whether to monitor or participate in the meeting.

Finally, please note that the ordinance will be considered, with public comment, in an upcoming meeting of the City Council's Planning and Land Use Management Committee. The agenda description will be modified to reflect that the ordinance now relates to protected trees instead of simply oak trees, and thereafter the matter will be placed on a future agenda for a meeting of the full City Council. Thank you.

Sincerely,

D. JAMES O'CONNELL
Deputy City Attorney

Re: Response to Allegations of Brown Act Violations

Dear Dr. Bagasao:

This letter is a follow-up to the letter sent to you on February 8, 2006 by Dion O'Connell, of this Office, on the above referenced subject. Please be advised that the item you referenced in your correspondence is set for a hearing before the City Council on Tuesday, February 28, 2006.

Sincerely,

KEITH W. PRITSKER
Deputy City Attorney

Planning and Land Use Management Committee

CITY PLAN CASE NO. 2004-2290 CA

Transmitted herewith is an ordinance (Appendix A), which amends the Los Angeles Municipal Code to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions.

On January 12, following a public hearing, the City Planning Commission adopted the Planning Department staff report and findings, and **approved the proposed ordinance (Appendix A) with recommendations**. The recommendations included that the City Attorney ensure that the penalty for illegal removal of protected trees run with the land, that building permits are withheld as part of the enforcement procedure, that the enforcement language be clarified if possible, and that a maintenance fee for trees planted as a mitigation be included in the Public Works section of the Municipal Code. The Commission also requested staff to develop guidelines to assist applicants in understanding the requirements and procedures.

This action was taken by the following vote:

Moved:	Usher
Seconded:	Freer
Ayes:	Cardoso, Hughes, Kay, Kezios, Roschen, Woo
Absent:	Iriando

Vote: 6-0

Gabriele Williams, Commission Executive Assistant II
City Planning Commission

Attachments: Findings, Appendix A (Ordinance)

cc: Keith Pritsker, Deputy City Attorney

FINDINGS

That the City Council:

Adopt the staff report of November 10, 2005, as its report on the subject;

Adopt the findings in the staff report dated November 10, 2005.

The City Planning Department recommends that the City Council, in accordance with Charter Section 558, find that the attached, proposed ordinance (Appendix A) is:

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species. RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

APPENDIX A

PROPOSED ORDINANCE FOR DISCUSSION

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the twenty-sixth unnumbered paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph after the thirtieth unnumbered paragraph defining "Problem Areas":

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the forty-fifth unnumbered paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. **Protected Tree Regulations.** No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04.to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected

tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety.Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00.of this Code. Said request shall be made I writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County

Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Section 96.303.5 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department of Public Works to verify such information by entry upon the subject property.

Sec. . The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the Main Street entrance to the City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that the foregoing ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

PLEASE SCHEDULE FOR COUNCIL ON FEBRUARY 28, 2006

BLURB

03-1459
03-1459-S1

EXEMPTION, COMMUNICATION FROM CITY PLANNING COMMISSION and ORDINANCE FIRST CONSIDERATION amending the Los Angeles Municipal Code to add certain native trees to the class of "protected tree" (formerly solely oak tree).

Recommendations for Council action, SUBJECT TO THE APPROVAL OF THE MAYOR:

1. FIND that this action is exempt from California Environmental Quality Act, pursuant to Article II, Section 2(m) of the City's Guidelines.

2. ADOPT the January 18, 2006 Findings of City Planning Commission as the Findings of the Council.

3. PRESENT and ADOPT the accompanying ORDINANCE, approved by the Interim Director of Planning (on behalf of the City Planning Commission) amending the Los Angeles Municipal Code (LAMC) to add certain native trees to the class of "protected tree" formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions.

CPC2004-2290 CA

(The Planning and Land Use Management Committee waived consideration of the above matter.)

Fiscal Impact Statement: None submitted by the Planning Department. Neither the City Administrative Officer nor the Chief Legislative Analyst has completed a financial analysis of this report.

From: Barbara Greaves
To: Jolaine Harkless
Subject: Re: CF 03-1459 Protected Tree Ordinance

Also, for this recommendation, make sure the attorney in attendance/or Chair makes this recommendation in Committee.

>>> Jolaine Harkless 02/21 8:24 PM >>>
Barbara, I've heard that this ordinance is scheduled for City Council on Feb. 28th. If so, I want to make sure that the Council agenda indicates, among other things, that the City Council should adopt the Findings of the City Planning Commission in its communication dated January 18, 2006 as the Findings of the Council. If you're not the correct person to discuss this with, can you refer me to the correct person. Thank you.
>>> Barbara Greaves 02/10/06 11:56 AM >>>
Everything accounted for in your note below except for the staff report dated 11-10-05. I do not have the CPC file here.

I see everything on the file you noted below, but the staff report from 11-10-05. I will check 03-1459-S1 for that report and let you know.

>>> Michael O'Brien 02/10 6:57 AM >>>
Received a call from Jolaine Harkless. Does the CF contain the CPC action on this item (1-18-06), the staff report of 1-12-06, and the staff report of 11-10-05?

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R06-0042

FEB 08 2006

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Management Committee for further action. Moreover, on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance that might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use

RECEIVED
CITY CLERK'S OFFICE

2006 FEB -9 AM 8:29

CITY CLERK

BY _____ DEPUTY

Management Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff. PLUM met on October 3, 2005, to consider additional modifications to the draft ordinance. The matter was then referred to the City's Planning Commission, which met on this matter in December 18, 2005, and January 13, 2006. The Commission issued a report to the City Council on January 18, 2006, seeking additional clarifications. There are two items in the Planning Commission's action that are not included in this ordinance. The first relates to a procedural matter of the Department of Building and Safety. Inasmuch as that can be handled by the Department and does not need ordinance authority, we have not included that in the ordinance. The second issue regards a fee to ensure maintenance of relocated or replaced protected trees. This matter is still the subject of discussion with the departments. In order to bring this ordinance forward for Council action as soon as possible, we bring you the attached draft. If, with further discussion, the remainder of the issues needs to be addressed by ordinance, we will transmit another draft ordinance to you.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years on parcels where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the Municipal Code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their comments have been incorporated into the language of the current draft ordinance.

California Environmental Quality Act (CEQA)

This ordinance is exempt from the requirements of CEQA under the general exemption found in the City CEQA Guidelines Article 2, Section 1 because there is no possibility of it having a significant adverse effect on the environment. Consequently,

should the Council approve the ordinance it should also find that it is exempt from CEQA pursuant to the City Guidelines.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By Claudia culling
CLAUDIA CULLING
Senior Assistant City Attorney

CC:KP:fa (#105209)

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subdivision 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. Protected Tree Relocation and Replacement. All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph to read:

Protected Tree - Any of the following Southern California native tree species, which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. The term "Tree Expert" set forth in Section 17.02 of the Los Angeles Municipal Code is amended to read:

Tree Expert - A person with at least four years of experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R of this Code. Provided, however, that in no event shall the reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in this article or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth in Subdivision 3 of this subsection, when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency, in consultation with the City's Chief Forester, determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect; and pursuant to the

determination, the protected tree's removal would be permissible; or

(iii) A building permit has been issued for the property upon which the protected tree is located, the permit is still in effect, and the removal or relocation is not prohibited by the permit.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters that cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report required pursuant to Section 17.06 C, acceptable to the Advisory Agency and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of the tree; or

(v) It has no apparent aesthetic value, which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at the location.

2. Supplemental Authority. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of the tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In that event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, except as to Subdivision 1(b)(iii) above, shall require retention of a protected tree at its existing location, if the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within the property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this article, except where the protected tree is relocated pursuant to Subdivision 2(a) above. The size of each replacement tree shall be a 15-gallon, or larger, specimen, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in a manner to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that the trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08 G as its procedural guide in satisfaction of the bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree that is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of the trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision where a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation of the tree. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06 B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any protected tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving the tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel where a protected tree is located shall be considered complete unless it includes a report pertaining to preserving the tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness in preserving the tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is amended to read:

I. When a protected tree exists on a proposed parcel, the preservation of the tree at its existing location, its relocation for preservation purposes, or the removal of the tree shall be regulated in the same manner as that provided under subdivision

regulations set forth in this chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or this article. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where the protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of

Public Works or its designated officer or employee, except as otherwise provided in this section.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed that may affect the protected tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where the Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory Agency pursuant to Article 7 of Chapter I of this Code; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the determination the protected tree's removal would be permissible; or

3. A building permit has been issued for any property and is still in effect with respect to the property under consideration and its implementation would necessitate the removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided in this section or unless the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if the Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters, which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at the location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the

protected tree, the tree is in danger of falling, notwithstanding the tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) Additional Authority. The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace the tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. In size, each replacement tree shall be at least a 15-gallon, or larger, specimen, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In that event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of the new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article, which permits the removal of one or more protected trees. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. WITHHOLDING OR REVOCATION OF BUILDING PERMITS FOR ILLEGAL REMOVAL OR RELOCATION OF PROTECTED TREES.

(a) The Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this section, shall have the authority to request the Superintendent of Building to withhold issuance of building permits, except for permits that are necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of ten years as requested by the Bureau and to revoke

any building permit issued for which construction has not commenced with respect to any property on which any protected tree has been removed or relocated in violation of Section 46.00 of this Code.

The request shall be made in writing by the Director of the Bureau of Street Services or his/her designee and shall specifically state the start date and end date of the period of time the Bureau, or the Board of Public Works on appeal, have deemed necessary pursuant to Subsection (c) of this section. The period shall commence on the date the Bureau first becomes aware of the removal of the tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection (b) of this section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter; the hearing to be held on a date specified in the notice. A copy of the notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in the property as revealed by a title search with respect to the property. A copy of the notice shall also be recorded by the Bureau with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection (b) above. At the hearing, if the facts indicate, the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal or relocation of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection (b) above. In the event the Bureau finds that a protected tree was removed or relocated in violation of Section 46.00 of this Code, it shall specify to the Superintendent of Building the length of time the issuance of building permits shall be withheld and whether building permits for which construction has not commenced shall be revoked. In making its determination, the Bureau shall consider the following factors: the number of trees removed or relocated, the size and age of the trees removed or relocated, the knowledge and intent of the owners of the property with respect to the removal or relocation and prior violations of law with respect to removal or relocation of protected trees. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days of the hearing.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to request the Superintendent of Building to revoke or withhold issuance of building permits, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, any action by the Department of Building and Safety resulting from any of the provisions of this section, including building permit revocation, shall not be appealable to the Board of

Building and Safety Commissioners.

(e) Any final determination of the Bureau or the Board of Public Works on appeal, to request the Superintendent of Building to withhold issuance of building permits or to revoke a building permit, shall be forwarded to the Superintendent within ten days of the Bureau or Board's determination and shall also be set forth in an affidavit, which shall be recorded by the Bureau with the County Recorder within ten days of the Bureau or Board's determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this section, the definition of "protected tree" set forth in Section 46.01 this Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify this information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of this Code for establishing fees.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R06-0042

FEB 08 2006

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Management Committee for further action. Moreover, on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance that might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use

Management Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff. PLUM met on October 3, 2005, to consider additional modifications to the draft ordinance. The matter was then referred to the City's Planning Commission, which met on this matter in December 18, 2005, and January 13, 2006. The Commission issued a report to the City Council on January 18, 2006, seeking additional clarifications. There are two items in the Planning Commission's action that are not included in this ordinance. The first relates to a procedural matter of the Department of Building and Safety. Inasmuch as that can be handled by the Department and does not need ordinance authority, we have not included that in the ordinance. The second issue regards a fee to ensure maintenance of relocated or replaced protected trees. This matter is still the subject of discussion with the departments. In order to bring this ordinance forward for Council action as soon as possible, we bring you the attached draft. If, with further discussion, the remainder of the issues needs to be addressed by ordinance, we will transmit another draft ordinance to you.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years on parcels where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the Municipal Code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their comments have been incorporated into the language of the current draft ordinance.

California Environmental Quality Act (CEQA)

This ordinance is exempt from the requirements of CEQA under the general exemption found in the City CEQA Guidelines Article 2, Section 1 because there is no possibility of it having a significant adverse effect on the environment. Consequently,

should the Council approve the ordinance it should also find that it is exempt from CEQA pursuant to the City Guidelines.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By Claudia culling
CLAUDIA CULLING
Senior Assistant City Attorney

CC:KP:fa (#105209)

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subdivision 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. Protected Tree Relocation and Replacement. All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph to read:

Protected Tree - Any of the following Southern California native tree species, which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. The term "Tree Expert" set forth in Section 17.02 of the Los Angeles Municipal Code is amended to read:

Tree Expert - A person with at least four years of experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R of this Code. Provided, however, that in no event shall the reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in this article or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth in Subdivision 3 of this subsection, when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency, in consultation with the City's Chief Forester, determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the

determination, the protected tree's removal would be permissible; or

(iii) A building permit has been issued for the property upon which the protected tree is located, the permit is still in effect, and the removal or relocation is not prohibited by the permit.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters that cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report required pursuant to Section 17.06 C, acceptable to the Advisory Agency and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of the tree; or

(v) It has no apparent aesthetic value, which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at the location.

2. Supplemental Authority. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of the tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In that event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, except as to Subdivision 1(b)(iii) above, shall require retention of a protected tree at its existing location, if the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within the property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this article, except where the protected tree is relocated pursuant to Subdivision 2(a) above. The size of each replacement tree shall be a 15-gallon, or larger, specimen, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in a manner to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that the trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08 G as its procedural guide in satisfaction of the bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree that is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of the trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision where a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation of the tree. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06 B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any protected tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving the tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel where a protected tree is located shall be considered complete unless it includes a report pertaining to preserving the tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness in preserving the tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is amended to read:

I. When a protected tree exists on a proposed parcel, the preservation of the tree at its existing location, its relocation for preservation purposes, or the removal of the tree shall be regulated in the same manner as that provided under subdivision

regulations set forth in this chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or this article. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where the protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of

Public Works or its designated officer or employee, except as otherwise provided in this section.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed that may affect the protected tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where the Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory Agency pursuant to Article 7 of Chapter I of this Code; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the determination the protected tree's removal would be permissible; or

3. A building permit has been issued for any property and is still in effect with respect to the property under consideration and its implementation would necessitate the removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided in this section or unless the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if the Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters, which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at the location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the

protected tree, the tree is in danger of falling, notwithstanding the tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) Additional Authority. The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace the tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. In size, each replacement tree shall be at least a 15-gallon, or larger, specimen, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In that event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of the new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article, which permits the removal of one or more protected trees. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. WITHHOLDING OR REVOCATION OF BUILDING PERMITS FOR ILLEGAL REMOVAL OR RELOCATION OF PROTECTED TREES.

(a) The Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this section, shall have the authority to request the Superintendent of Building to withhold issuance of building permits, except for permits that are necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of ten years as requested by the Bureau and to revoke

any building permit issued for which construction has not commenced with respect to any property on which any protected tree has been removed or relocated in violation of Section 46.00 of this Code.

The request shall be made in writing by the Director of the Bureau of Street Services or his/her designee and shall specifically state the start date and end date of the period of time the Bureau, or the Board of Public Works on appeal, have deemed necessary pursuant to Subsection (c) of this section. The period shall commence on the date the Bureau first becomes aware of the removal of the tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection (b) of this section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of the notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in the property as revealed by a title search with respect to the property. A copy of the notice shall also be recorded by the Bureau with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection (b) above. At the hearing, if the facts indicate, the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal or relocation of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection (b) above. In the event the Bureau finds that a protected tree was removed or relocated in violation of Section 46.00 of this Code, it shall specify to the Superintendent of Building the length of time the issuance of building permits shall be withheld and whether building permits for which construction has not commenced shall be revoked. In making its determination, the Bureau shall consider the following factors: the number of trees removed or relocated, the size and age of the trees removed or relocated, the knowledge and intent of the owners of the property with respect to the removal or relocation and prior violations of law with respect to removal or relocation of protected trees. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days of the hearing.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to request the Superintendent of Building to revoke or withhold issuance of building permits, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, any action by the Department of Building and Safety resulting from any of the provisions of this section, including building permit revocation, shall not be appealable to the Board of

Building and Safety Commissioners.

(e) Any final determination of the Bureau or the Board of Public Works on appeal, to request the Superintendent of Building to withhold issuance of building permits or to revoke a building permit, shall be forwarded to the Superintendent within ten days of the Bureau or Board's determination and shall also be set forth in an affidavit, which shall be recorded by the Bureau with the County Recorder within ten days of the Bureau or Board's determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this section, the definition of "protected tree" set forth in Section 46.01 this Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify this information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of this Code for establishing fees.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

CITY PLAN CASE NO. 2004-2290 CA

Transmitted herewith is an ordinance (Appendix A), which amends the Los Angeles Municipal Code to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions.

On January 12, following a public hearing, the City Planning Commission adopted the Planning Department staff report and findings, and **approved the proposed ordinance (Appendix A) with recommendations**. The recommendations included that the City Attorney ensure that the penalty for illegal removal of protected trees run with the land, that building permits are withheld as part of the enforcement procedure, that the enforcement language be clarified if possible, and that a maintenance fee for trees planted as a mitigation be included in the Public Works section of the Municipal Code. The Commission also requested staff to develop guidelines to assist applicants in understanding the requirements and procedures.

CITY CLERK'S OFFICE

2016 JAN 20 AM 11: 07

CITY CLERK

BY _____ DEPUTY

FINDINGS

That the City Council:

Adopt the staff report of November 10, 2005, as its report on the subject;

Adopt the findings in the staff report dated November 10, 2005.

The City Planning Department recommends that the City Council, in accordance with Charter Section 558, find that the attached, proposed ordinance (Appendix A) is:

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species, RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. in accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

APPENDIX A

PROPOSED ORDINANCE FOR DISCUSSION

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of; and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the twenty-sixth unnumbered paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph after the thirtieth unnumbered paragraph defining "Problem Areas":

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the forty-fifth unnumbered paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 he Los Angeles Municipal Code is an ded to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authorit, .** The Board of Public Works may gra .. a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected

tree was removed or relo_ ed in violation of Section 46.00 of this e. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made I writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed; the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County

Recorder. No such affi[illegible]t shall be recorded, however, until an[illegible]gal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Section 96.303.5 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department of Public Works to verify such information by entry upon the subject property.

Sec. . The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the Main Street entrance to the City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that the foregoing ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

RECOMMENDATION REPORT

CITY PLANNING COMMISSION	CASE NO:	CPC-2004-2290-CA
	CEQA:	ENV-2004-2201-CE
	LOCATION:	Citywide
DATE: January 12, 2006	COUNCIL DISTRICTS:	All
TIME: after 8:30a.m. *	PLAN AREAS:	All
PLACE: Room 1010 City Hall 200 North Spring St., Los Angeles, CA 90012	RELATED FILES:	n/a

PUBLIC HEARING REQUIRED—CONTINUED FROM MEETING OF NOVEMBER 10, 2005

REQUEST: Continued consideration of staff report and proposed amendments to the Zoning Code first heard November 10, 2005, regarding amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Los Angeles Municipal Code.

SUMMARY: The proposed amendments to the Zoning Code will bring the provisions of the Code regarding Oak Trees in conformance with revisions to Section 46 (Oak Tree Regulations) and 96.303.5 of the Municipal Code.

RECOMMENDATION:

1. Adopt the staff report as its report on the subject.
2. Adopt the attached findings.
3. Approve the proposed amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, and 17.52 I (Appendix A) and recommend their adoption by the City Council.

Appendix A—Staff report and proposed Amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I, and 46.00 through 46.06, and 96.303.5 of the Municipal Code from November 10, 2005.

ADVICE TO PUBLIC: *The exact time this report will be considered during the meeting is uncertain since there may be several other items on the agenda. Written communications may be mailed to the Commission Secretariat, 200 North Main Street, Room 532, Los Angeles, CA 90012 (Phone No.213/978-1300). While all written communications are given to the Commission for consideration, the initial packets are sent the week prior to the Commission's meeting date. If you challenge these agenda items in court, you may be limited to raising only those issues you or someone else raised at the public hearing, or in written correspondence on these matters delivered to this agency at or prior to the public hearing. As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability, and upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or other services may be provided upon request. To ensure availability of services, please make your request no later than three working days (72 hours) prior to the meeting by calling the Commission Secretariat at 213/978-1300.

SUMMARY

On November 10, 2005, the Commission considered a staff report and proposed ordinance amending Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code. These Sections need to be revised to be consistent with the revisions proposed for Sections 46.00 through 46.06 and 96.303.5 of the Los Angeles Municipal Code under the Authority of the Board of Public Works and the Department of Building and Safety. These latter sections contain the City's oak tree regulations (proposed to be changed to the "protected tree regulations") and are not under the purview of the Department of City Planning nor the City Planning Commission.

Considerable testimony was given at the Commission meeting. The commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

This report addresses the issues raised at the November 10 meeting and recommends adoption of the attached ordinance, Appendix A.

FINDINGS

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species, RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's

CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

STAFF REPORT

REQUEST

On November 10, 2005, the Commission considered the staff report and proposed ordinance to add protections to certain trees (in addition to oak trees) and to revise the existing protections to oak trees. The ordinance amends Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code, all of which make reference to oak trees. The Commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

DISCUSSION

Species to be protected. The task force during its deliberations in 2003 considered all local species of native trees for possible protection. The task force settled on the addition of only three trees to the list of protected trees, because these three trees, the Southern California Black Walnut (Juglans californica var. californica), the Western Sycamore (Platanus racemosa), and the California Bay (Umbellularia californica), formed a suite of trees diagnostic of the Southern California environment. Only in Southern California do these three trees grow together. Other trees considered have a greater natural range and are not typical solely of Southern California. In addition, the Southern California Black Walnut is already protected under the Mt. Washington Specific Plan, and it is listed as a species of concern whose existence on a project should be considered under the California Environmental Quality Act.

Size. The committee recognized that protecting only trees 8" or more in diameter have the result of protecting only large trees, and would be purely aesthetic in nature. In order to ensure continuing existence of these trees in the area, smaller sizes need to be protected. Four inches was arrived at by considering the case of the Southern California Black Walnut, which typically grows as a multi-trunk tree after fires. Establishing a diameter size of four inches would protect walnuts; a larger size would miss almost all walnuts that survived after fires.

Hardships accruing to developers. Developers are already familiar with the current requirements to survey trees eight inches or more in diameter. The proposed amendment would merely mandate a slightly longer report. For a typical single family residence, which usually would have only one protected tree on the property, a consultant's report would cost less than $200.00, which is only a fraction of building fees and typical project costs.

Status of trees on adjoining properties. Since adjoining properties are not typically surveyed for development purposes, trees on adjoining properties would not be required to be identified as a part of the development application package for any property. Development on a property may require a neighboring tree to be pruned, ground to be cut or filled, etc. In such a case, the property owner has the general legal right to prune both above ground and below ground parts of a tree that extend over and under his property, to cut and fill ground, etc., provided that these actions do not cause the tree to die. Section 46 defines "removed" or "removal" as "any act which will cause a protected tree to

die." If a property owner wished to undertake such extensive pruning, grading, etc., that would cause a protected tree to die, then that property owner would need a permit to undertake such an action. The property owner might also be liable to the adjacent property owner for destruction of a tree on the neighboring property.

Oversight of the regulations and enforcement of the regulations. The Street Tree Division of the Board of Public Works is responsible for oversight of the regulations. Enforcement comes in several ways. One, applicants for building permits are required to list protected trees on their site plans. Two, as part of any required environmental review, a plot plan of the site showing all trees must be submitted, and a mitigation for removal of any protected trees is required, in accordance with Code requirements. Three, citizen complaints to the Street Tree Division may cause the Street Tree Division itself to survey the trees on an affected parcel. Building permits will be withheld until the applicant evidences compliance with the protected tree regulations—usually, a sign-off from the Street Tree Division.

Enforcement is ultimately under the purview of both the Board of Public Works and the Department of Building and Safety. The Board can request the Department to withhold building permits on a property for violation of the protected tree regulations, or revoke a permit issued for which construction has not commenced, after a public hearing on the matter. This penalty can be for up to ten years, depending on the severity of violation of the protected tree regulations.

Urgency of adopting the proposed regulations. The proposed regulations are not urgently required to prevent an imminent threat to any particular tree or group of trees. However, the regulations should be adopted as soon as possible, in order to dovetail with the Mayor's "million trees" initiative.

Options for "replacement" of trees. The remover of trees can replace the trees on the site from which the trees were removed, provided that there is enough space on the site for them to be planted. If there is not enough space, the remover can purchase replacement trees and donate them to the Street Tree Division, which will plant them in available, appropriate, places. Alternatively, as a policy matter, the Street Tree Division will accept a monetary donation that approximates the value of the trees removed.

Whether a citation for non-permitted removal of protected trees continues with a change of ownership. Section 46.06 states that "the authority of the Bureau to act [to request that Building and Safety withhold or revoke building permits] shall not apply to a purchaser... who in good faith and for valuable consideration has acquired title subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent [of the Bureau to act.]"

CONCLUSION

The proposed ordinance (included in Appendix A) provides technical corrections to the "Oak Tree" (now "Protected Tree") provisions of the Zoning Code, to bring them into consistency with the amended provisions of Section 46 of the Municipal Code.

ENVIRONMENTAL IMPACT

The attached proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City of Los

Angeles CEQA Guidelines (ordinances which have no negative impact on the physical environment). Individual projects will continue to undergo specific environmental review at the time of their proposal.

APPENDIX A

PROPOSED ORDINANCE FOR DISCUSSION

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the twenty-sixth unnumbered paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph after the thirtieth unnumbered paragraph defining "Problem Areas":

Protected Tree : Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the

forty-fifth unnumbered paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. **Protected Tree Regulations.** No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the

appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the

City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a

report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

NOTE: The following Sections are for the Commission's reference, and not part of the Staff request for Commission adoption.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip

line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property,

provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made I writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act

pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal.. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Section 96.303.5 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department of Public Works to verify such information by entry upon the subject property.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

REFER TO STAFF

At its Special Meeting held October 3, 2005 (continued from November 5, 2003 and May 12, 2004 meetings), the Planning and Land Use Management Committee considered the following:

CF 03-1459 — Report from the City Attorney and revised draft Ordinance relative to amending various provisions of Articles 2 and 7 of Chapter I, and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees; and reports from the Department of Public Works, Bureau of Street Services and Environmental Affairs Department relative to proposed amendments to the Oak Tree Ordinance (153478), as initiated by Motion (LaBonge - Garcetti).

CF 03-1459-S1 — Reports from the Department of Public Works, Bureau of Street Services and Environmental Affairs Department relative to proposed amendments to the Oak Tree Ordinance (153478), pursuant to Motion (Garcetti - LaBonge).

The Committee instructed that the Motions be referred for consideration by the Planning Department and City Planning Commission, and that recommendations be forwarded to City Council.

REPORT NO. R05-0288

AUG 16 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

Recyclable and made from recycled waste

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations**. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to

a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required

shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip

line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of the ordinance that amends this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of the ordinance that amends this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of the ordinance that amends this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is hereby amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit

pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify such information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board at the Main Street entrance to Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

RULE 38 RESPONSE FOR A DRAFT ORDINANCE AMENDING OAK TREE CODE PROVISIONS

The latest version of the draft ordinance submitted for review (second review) does not include the comments made by the Department of Building and Safety in response (first review) to the City Attorney's letter of August 11, 2004, and therefore, pursuant to Council Rule 38, the Department of Building and Safety (LADBS) has again reviewed the proposed draft ordinance amending the oak tree code provisions and have the following comments:

Page 1, Section 1 of the ordinance. Currently, the permit application does not have a "reverse side" where a plot plan is shown. Please remove the phrase "on the reverse side of any" and replace it with "attached to the" since the automation of building permits, all plot plans are now attached to the building permits.

Page 1, Section 1 of the ordinance. It is not clear how the City's Chief Forester (George Gonzalez) is to notify the Department of Building and Safety prior to the issuance of a Certificate of Occupancy. To be assured that all the conditions set forth by the Advisory Agency are met and that the Department of Building and Safety is able to issue the Certificate of Occupancy, please replace the last sentence of the paragraph in Subsection 12 of Section 12.21 A with the following procedure:

> A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtain from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the

JUL 0 5 2005
PLAN & LAND USE MGT.

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

construction, a written document signed certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Page 2, Section 3 of the ordinance. The proper name in accordance with the California Department of Pesticide Regulation is "Agricultural Pest Control Advisor," therefore, please add the word "control" between the words "pest" and "advisor" so that, the definition of the term "Tree Expert" reads: "A person ....who holds a valid California license as an Agricultural Pest Control Advisor or ..."

Page 2, Section 5 of the ordinance. For clarity since both terms are used in this subsection, please add the word "removed" to the second sentence of the first paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 2, Section 5 of the ordinance. The title of the first numbered paragraph "Required Determinations" of Subsection R should be in bold text.

Page 3, Section 5 of the ordinance. Please replace the upper case (I) with lower case (i) in two places on this page and fix the format of the first (i) paragraph on the page to be consistent with the other paragraphs.

Page 3, Section 5 of the ordinance. Items (i), (ii) and (iii) of Subdivision 1 (a) of Subsection R of Section 17.05 refers to "effective date of this Code Section." Please clarify the "effective date" between the effective date of the ordinance of 6/14/62, which added the Code Section 17.05, and the effective date of the ordinance of 4/12/80, which added the Subsection R of Section 17.05 (regarding oak trees). In either case, you may want to replace the term "effective date of this Code Section" with one of the dates, so long as the intent is clear.

Page 3, Subdivision 1 (b) of Section 5 of the ordinance. The first paragraph refers to "The removal of the protected tree would not result in an undesirable, irreversible soil erosion ...which cannot be mitigated to the satisfaction of the City..." It is not clear as to who in the "City" needs to be satisfied. Is there a specific department of the City? Chief Forester? Inspector from LADBS? Please indicate the intent, by specifying who in the "City" needs to be satisfied.

Page 4, Subdivision 3 of Section 5 of the ordinance. Is the word "accept" the correct term? What is the intent of the phrase "accept as to Subsection R1(b) (iii) above," mean? Is the intent to keep the existing protected tree where it is if it is a Historical Monument, unless the tree "is in danger of falling due to an existing and irreversible condition"? If so, than please reword the sentence to convey the intent.

Page 4, Subdivision 3 of Section 5 of the ordinance. Please explain the difference between a protected tree "officially designated as an Historical Monument" (Subsection R3) versus a protected tree "subject to historical preservation requirements" (Subsection R1)? Please explain the logic between the first sentence of Subsections R1 and R3, these two subsections seems to

CF 03-1459 AND 03-1459-S1– PROPOSED AMENDMENTS TO THE OAK TREE ORDINANCE (ORDINANCE 153,478) - REVISED

Dear Councilmember Reyes:

RECOMMENDATIONS

In response to motions 03-1459 (LaBonge/Garcetti) and 03-1459-S1 (Garcetti/LaBonge), the Department of Public Works, Environmental Affairs Department, and Community Forestry Advisory Committee recommend that the City Council instruct the City Attorney to prepare the following revisions to the City's Oak Tree Ordinance No. 153,478 in order to more adequately protect our remnant native woodlands, one of the City's most valuable natural resources. The recommended revisions are as follows:

1. Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Protected Trees".

2. Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

3. Require a permit for protected tree removal/relocation on all property within the City boundaries regardless of property lot size.

4. Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at four and one-half feet above ground level.

PLAN & LAND USE MGT.
FEB 12 2004

5. Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

6. Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

7. Increase the monetary fine for violating the ordinance.

8. Include civil penalties, such as prohibiting development of property if protected trees are removed without a permit.

9. Require a tree pruning permit for all protected tree pruning in the City of Los Angeles.

FISCAL IMPACT STATEMENT

The number of permits that will be required to be issued will increase due to the larger number of trees that are protected and the need for a permit to be issued for all protected trees to be pruned. As there is a fee for the issuance of these permits, the program will be self-supporting and have no impact to the General Fund.

DISCUSSION

The City of Los Angeles enacted the Oak tree ordinance (Ordinance 153,478) in 1980 to protect its remaining native Oak tree woodlands. In spite of this ordinance, the City continues to suffer a decline to its native Oak tree woodlands due to development, disease, and other factors. With even fewer native trees and woodlands remaining, the time has come to strengthen the oak tree ordinance, giving protection to a wider range of native trees as well as smaller trees that have not yet reached maturity. A stronger, more inclusive ordinance would give the Department of Public Works greater abilities to protect our native trees and preserve this important part of the City's natural history.

Staff from the Department of Public Works' Street Tree Division and the Departments of Environmental Affairs and City Planning met with representatives from the Community Forest Advisory Committee in January and February of 2003 to discuss the current tree protection ordinances and how they could be revised to better protect and preserve the City's remaining native trees and woodlands.

Item #1: Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Protected Trees".

Oaks are not the only native trees that inhabit the City of Los Angeles. Other Southern California native tree species include the Southern California Black Walnut, Western Sycamore, and California Bay. These species are currently without any legal protection from development and other urban pressures even though they also are an important part of the City's natural history. Urbanization is considered such a severe threat to Southern California walnut woodlands that the State of California

and the Nature Conservancy are working together to acquire vegetative/habitat data on these woodlands, and the California Native Plant Society is evaluating the Southern California Black Walnut for inclusion on their watch list for plants with limited distribution. The Western Sycamore and California Bay both occur in riparian habitats, which are key habitats for reducing the impact of upland sources of pollution to water bodies and as wildlife habitats. Protection of these additional species of native trees is warranted, and their inclusion necessitates the change of the ordinance title to "Protected Trees" to more properly represent the scope and contents of the newly revised ordinance.

Item #2: Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

The definition of a tree expert currently includes only someone who holds a valid California license as an agricultural pest control advisor or landscape architect. Although there are individuals in both categories that have the necessary expertise to assess oak and other trees and prepare reports on them, Registered Consulting Arborists (American Society of Consulting Arborists) are also very well qualified to determine the health and condition of trees and should, therefore, be included in the definition of tree expert.

Item #3: Require a permit for protected tree removal/relocation on all property within the City boundaries regardless of property lot size.

The current Oak Tree Ordinance applies only to trees located on lots larger than one acre in size. This severely limits the applicability of this ordinance due to the highly subdivided and built-out nature of our City. Although new developments generally fall into this category of lot size, many of these trees are on smaller lots, and these native trees should be protected regardless of the size of the lot on which they live.

Item #4: Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at four and one-half feet above ground level.

The definition of an oak tree in the current City ordinance includes only those specimens whose trunks measure eight inches in diameter four and one-half feet above ground level. Some of the other native trees, specifically the Southern California Black Walnut, exhibit different growth habits and quite often have multiple trunks rather than a single one. To ensure that the ordinance protects these trees as well as smaller single-trunk trees, we recommend that the tree definition be changed to include all specimens that have a trunk or trunks that cumulatively measure two inches in diameter at a level of four and one-half feet above the ground.

Item #5: Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

When oak trees are allowed to be removed under the current ordinance, they are replaced on a one-for-one basis. This leaves a deficit in the amount of benefits that the City obtains from this tree for many years as oaks are slow-growing trees and the environmental benefits afforded by a mature tree are much greater than those of a small tree. Therefore, the ordinance should be revised to take a more balanced approach based on a calculation utilizing a trunk volume or canopy coverage formula. For example, to mitigate the removal of a tree with an eight-inch diameter trunk, eight trees each with a trunk diameter of one inch would be required. For Southern California Black Walnuts planted as seeds, the trunk diameter of the replacement tree will be calculated as that of a five year old tree.

Item #6: Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Replacement trees allowed under the current ordinance must be a minimum of 15-gallons in size. Although this is a good approach for many species, some of the native species, especially the Southern California Black Walnut, do not grow well in nursery containers. Because of this, they are generally not available in nursery-size containers and even if they were, the individuals would be unlikely to mature to healthy trees due to improperly developed roots. To account for these growth requirements, the ordinance needs to allow for smaller trees, or in the case of the Southern California Black Walnut, tree seeds to be used as replacements if this would afford a greater chance of long-term survival than the use of larger size trees. Benefits derive from these replacement trees only if they survive long term! To increase the probability of survival, replacement trees would need to be maintained and monitored for an establishment period of at least five years. Any replacement trees failing to survive this five-year establishment period should be replaced. Survival of sprouts from seeds and small stock may require frequent monitoring and cages or other devices to facilitate long-term survival.

Item #7: Increase the monetary fine for violating the ordinance.

Item #8: Include civil penalties, such as prohibiting development of property if protected trees are removed without a permit.

The current ordinance lacks adequate enforcement mechanisms. Often, a developer will pay the small fines involved in illegally removing an oak tree as this is economically advantageous over preserving the trees. There is also little to prevent a developer's "scorched earth" approach of removing everything from a property prior to applying for development permits so they can then say that nothing currently exists on the property at the time of application. By increasing the monetary fine and including civil penalties, such as prohibiting development of property by withholding building and occupancy permits for a specified period of time if a "Protected Tree" is removed without a permit, the trees will be better protected.

Item #9: Require a tree pruning permit for all protected tree pruning in the City of Los Angeles.

The final recommended change would require a tree pruning permit for all protected tree pruning in the City of Los Angeles regardless of where that tree is located. This will help to ensure that oaks are trimmed at the proper time of year, which is during the dry season from mid- to late-summer, according to ISA standards, by properly trained and reputable tree trimmers. This will lead to healthier, longer-lived trees, which will provide greater environmental benefits to the City. This protection of all of the protected trees within the City will help to preserve the last remnants of our native woodlands.

If you have any questions, please contact George Gonzalez, Chief Forester, Street Tree Division, at (213) 485-5675 or Melinda Bartlett, Division Director, Water and Natural Resources Division at (213) 978-0858.

Sincerely,

William A. Robertson, Director
Bureau of Street Services

Detrich B. Allen, General Manager
Environmental Affairs Department

contradict each other.

Page 4, Subdivision 4(a) of Section 5 of the ordinance. The property is to replace one protected tree with "at least two protected trees..." The definition of the term "protected tree" states in part "...native tree species which measures four inches or more ...four and one-half feet above the ground..." and the second sentence states, "Each replacement tree shall be ...one inch or more in diameter at a point one foot above the base..."seem to be in conflict.

Page 4, Subdivision 4 (b) of Section 5 of the ordinance. Does the convenant and agreement (C/A) have to be approved by the Advisory Agency or someone from City Planning, prior to recording the C/A? If so, then should it be mentioned in the ordinance? Also, is the C/A on a form provided by either Advisory Agency or City Planning? If so, then should that be mentioned as well?

Page 5, Section 6 of the ordinance. Why is it necessary to show the location of "large trees"? Is there a definition of what is considered a "large tree"?

Page 6, Section 8 of the ordinance. For clarity, the term "removed" should be added to the last sentence of paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 6, Section 10 of the ordinance. Please clarify what type of permit is referenced in Section 46.02 by amending the title of Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMIT TO RELOCATE OR REMOVE PROTECTED TREES.

Page 6, Section 10 of the ordinance. Is the last sentence of the second paragraph referring to a plan which shows all the grading work in compliance with Division 70 of Article 1 of Chapter IX of this Code being proposed to obtain from LADBS a permit to do grading work? If so, then please provide a definition of the term "grading permit plan."

Page 8, Section 11 of the ordinance. This amendment to Section 46.04 appears to increase the fees by applying the fees of Section 12.37 I.1 to include three other variety of trees, besides the oak tree. This amendment would require a fiscal impact report and may require this ordinance to be heard in Budget and Finance Committee, if it is to remain.

Pages 8 and 9, Section 12 of the ordinance. Please replace the misspell word "Superintendant" with "Superintendent of Building" and remove "of the Department of Building and Safety."

Pages 8 and 9, Section 12 of the ordinance. Please make the following changes to Subsections A and D of Section 46.06 as shown below. It would be very difficult to effectively enforce the intent of this ordinance unless the following changes are made to the procedure of these

Subsections. The changes are shown in underline/strikeout format (underline text is new language and strikeout shows text to be removed).

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Chief of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections B and C of this Section, shall have the authority to request ~~recommend~~ to the ~~Superintendant~~ Superintendent of Building ~~of the Department of Building and Safety~~ to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued ~~unless expired, for which rights have not been obtained~~ which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection C of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection B of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

D. The applicant or permittee may appeal to the Board of Public Works any determination ~~recommendation~~ by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination ~~recommendation~~ as provided for in Subsection C above. Further, that any action by the Department of Building and Safety resulting from any of the provision of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

Page 9, Section 12 of the ordinance. Please delete the last sentence of Subsection B of Section

4606, because it is impossible for anyone, especially LADBS, to be aware not to issue a building permit for the "period **preceding**"(?) the hearing, determination or appeal, since no one can predict the future.

Page 9, Section 12 of the ordinance. Please delete the third sentence of Subsection C of Section 4606, because it is redundant with Subsection A of this Section.

Page 9, Section 12 of the ordinance. In Subsection E of Section 4606, it refers to an affidavit to be recorded with the County Recorder. What is the purpose of the affidavit? Would the affidavit state that the "Bureau recommends to refuse to issue Public Works permit for the relocation or removal of Protected Trees"? Or, does the affidavit state that the owner will not obtain a building permit to construct a building on the lot for the next 10 years from year "one" to year "ten" as described in Subsection A of this section? If this affidavit is recorded, then is there a method in which LADBS will be either given a copy of the recorded affidavit or somehow notified by the Bureau of its "final action"? Please remove the last sentence of this subsection, since the issuance of the building permit is already mentioned in Subsection A of this Section.

Page 10, Section 13 of the ordinance. To effectively enforce this provision a "Tree expert" such as someone from the Bureau of Street Services, Street Trees should do the verification inspection. Please replace the word "Department" with "Bureau of Street Services, Department of Public Works" in the third sentence of Item 5 of Section 96.303 and modify the last sentence by removing the phrase "as specified in Section 98.0412 (a) of the Municipal Code" and "by the Department" so the sentence will read:

> A fee shall be collected for any inspection required to verify the declaration.

Please contact me at (213) 482-0440 or Steve Ikkanda at (213) 482-6715 should you have any questions regarding this letter.

PLANNING and LAND USE MGT.

MOTION

JUL 0 8 2003

The City of Los Angeles continues to suffer a decrease in its Oak tree and native tree species woodland habitat due to disease, development and other factors. The City's Oak Tree ordinances were first adopted on April 12, 1980 in order to establish clear standards for the preservation of these beautiful and culturally significant living monuments.

There are various other provisions that require updating. For example, the current tree replacement requirement, a minimum fifteen gallon Oak tree replacement per removal, does not adequately mitigate the loss of Oak tree woodlands. Additionally, the current definition of "Tree Expert," a licensed pest control advisor or landscape architect, needs to be updated to allow for the most knowledgeable Oak tree professionals and Consulting Arborists to be included.

Preservation of Oak trees targets signature trees of only one of the City's native plant communities, and other species should be considered for enhanced protections along the lines of the City's Oak Tree ordinances.

Regulations to preserve trees have significantly changed and progressed, both in California and across the country, due to increased scientific knowledge of trees and public awareness of the importance of native tree species. An opportunity exists to update City laws pertaining to Oak trees to better protect our remaining stock of these historic treasures to ensure that future generations can take part in their legacy.

I THEREFORE MOVE that the departments of Public Works, City Planning and Environmental Affairs be instructed to work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City arborists to preserve native tree species that share common ecosystems while maintaining a more diverse species base.

City of Los Angeles
200 N. Spring Street
Los Angeles, CA 90012

September 29, 2005

File 03-1459

Dear Councilmember Reyes,

We have continued to follow the progress of this Ordinance to become the City's "Native Tree Protection Ordinance" now that it is proposed to include four species of native trees. We are in full support of the initiative put forward by Council Members Labonge and Garcetti to increase existing protection for the oak species and to give similar protection to other native trees in our City.

The City's Community Forest Advisory Committee (CFAC) convened a Task Force in 2003 to initiate a review of the City's Oak Tree Ordinance and to make recommendations as to possible amendments to it. In May, last year, we were pleased to support the proposed revisions to the Ordinance when the matter came to the PLUM Committee.

The City is prepared to educate the public who may be affected by the amendments to this ordinance, as recommended by the PLUM Committee. This is a reasonable ordinance that does not place a hardship on developers. There is a requirement for documentation of trees; for permits to remove them; and, for replacement of any tree that is given a permit to be removed.

The reasons that we need to protect other native tree species today are the same reasons that convinced us of the need to protect oaks almost 25 years ago. During the past twenty-five years we have lost innumerable trees that give us our unique Southern Californian identity. Our Southern California black walnut trees are unique, existing in four counties of Southern California and nowhere else in the world. They are highly threatened as a plant community, according

to the Department of Fish and Game, yet thousands of individual walnut trees are axed every brush clearance season.

We thank those who have worked to bring these amendments this far. We ask you to recognize the great value of our plant communities and the habitat they provide and to preserve them for future generations to enjoy, while we still have the opportunity to do so and to move this motion forward.

Yours truly,

Clare Marter Kenyon, Chair
Community Forest Advisory Committee

Dear Ed Reyes and Honorable Members of the PLUM Committee,

I am writing this letter to express my personal support of the proposed ordinance submitted to you by the LA Community Forest Advisory Committee. During my experiences as a community activist I have had occasion to feel the inadequacies of the current Los Angeles Tree Protection Ordinance. I have looked to neighboring cities such as Sierra Madre with appreciation for their comprehensive tree guidelines. I think it is about time that the City of Los Angeles caught up with its neighbors by incorporating a thorough ordinance to help promote and protect our green environment, that will benefit all of our citizens in the long run. I appreciate the hard work that must have gone into these proposed guidelines, and I hope you will honor us all by supporting it.

September 29, 2005

The Honorable Ed Reyes, Chair
Planning and Land Use Management Committee
200 N. Spring Street
Los Angeles, CA 90012

Dear Councilmember Reyes,

We are writing to urge you to approve the proposed ordinance that the City's Community Forest Advisory Committee has put forward, in support of greater protection for our native oaks as well as for expanding the list or protections to include the Juglans Californica; the Western Sycamore, Platanus Racemosa; and the California Bay, Umbellularia Californica in the city of Los Angeles.

For some time, the City of Los Angeles has protected native oaks on parcels of an acre or more in size. Recently, the Community Forest Advisory Committee convened a task force of interested parties to recommend changes to the City's oak tree protection ordinance.

We are losing natural habitat at an alarming rate and, of course, there is a commensurate loss of wildlife. In fact, the California black walnuts, with a world-wide distribution of four counties in southern California, are being destroyed faster than they can be inventoried.

Thank you for the good work you do.

Sincerely,

Melanie Penny

Subject: Protectection of native oaks

Dear Honorable Ed Reyes:

I am writing in regard to the proposed ordinance for the protection of native oak trees. I urge you to ratify it; and in any possible way- increase it. As a long time residence of Mount Washington, I have directly observed illegal cutting of the protected native oaks on properties directly adjacent to my home. The penalties were insignificant and the perpetrators have continued excessive over building.

Again, please approve this ordinance and strengthen it.

Thank you.

Sincerely,

Re: Oak Tree Ordinance

Dear Councilmember Reyes:

We are in support of the expansion of the Oak Tree Ordinance to include other species. We are thrilled that the ordinance now includes parcels, regardless of size.

But, we continue to have great concern that the ordinance doesn't include other than SFR zoning. We urge you to include properties that are multi-family zoned. There continue to be parcels, both large and small, in our established neighborhoods that developers are trying to max out the number of units. Usually, there are trees "in the way". Developers continue to view trees as obstructions and liabilities rather than assets.

We also are concerned that developers will work around the tree protection by manipulating the zoning.

If the protection extends to all zoning, there will be no question that the City wants developers to maintain the established trees that this ordinance covers. The message will be clear and not complicated.

Illegal Removal:

We are thrilled with the provision of 10 year moratorium on development if a "protected tree" is removed illegally. But, it sounds too good to be true and wonder if the Department of Building and Safety will have the courage to enforce this provision. We are also concerned that a developer will remove the trees and then leave it to Building & Safety to "discover" the violation. We already have the experience with a developer presenting a site plan with no trees indicated—yet there are dozens of these protected trees on this site. Only community diligence and knowledge of the site caught him. There is not a provision for the City to proactively inventory these trees.

Communities continue to be skeptical about developers promises without significant punishment. In about 1982, the City imposed and the developer

agreed to keep over mature and rare trees on the known as Hathaway Hills. The day after he received a building pe....it to build about 35 houses on these R3 lots, he removed EVERY tree. His punishment, nothing. Granted, in the years since this experience the rules have changed, but the community's lesson was to never believe what developer's say. Not being able to develop sites for 10 years sounds very good to us. But, how can we be assured that a developer won't cry "hardship" causing the City to relent. Hathaway Hill continues to be virtually treeless and continues to be a sore thumb in a community rich in tree canopy.

Moving Trees:
The Theodore Payne Foundation did a study on the success, or lack of success, in moving mature trees. 89% of moved trees die within 2 years. Not good enough to use as an alternative. Seems to us like an easy way to get around this ordinance. Developers will obey the letter of the rule, but not the spirit.

Until developers embrace the idea that trees are assets, the City of Los Angeles must do what other cities have done, write strong protection into the ordinances and then have the courage to enforce them and severely punish offenders.

Sincerely,

MaryAnn Kuk

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R05-0288

AUG 16 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and, Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

CITY CLERK'S OFFICE

2005 AUG 17 PM 12: 32

CITY CLERK

BY _____ DEPUTY

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the municipal code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their early comments were incorporated into the language of the current draft ordinance. They have been asked by this office's most recent letter to make their comments directly to the Council's Planning and Land Use Committee.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By
DAVID MICHAELSON
Chief Assistant City Attorney

DM:KP (#105209)

Enclosure

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to

a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required

shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip

line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of the ordinance that amends this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of the ordinance that amends this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of the ordinance that amends this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is hereby amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit

pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify such information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board at the Main Street entrance to Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

RULE 38 RESPONSE FOR A DRAFT ORDINANCE AMENDING OAK TREE CODE PROVISIONS

The latest version of the draft ordinance submitted for review (second review) does not include the comments made by the Department of Building and Safety in response (first review) to the City Attorney's letter of August 11, 2004, and therefore, pursuant to Council Rule 38, the Department of Building and Safety (LADBS) has again reviewed the proposed draft ordinance amending the oak tree code provisions and have the following comments:

Page 1, Section 1 of the ordinance. Currently, the permit application does not have a "reverse side" where a plot plan is shown. Please remove the phrase "on the reverse side of any" and replace it with "attached to the" since the automation of building permits, all plot plans are now attached to the building permits.

Page 1, Section 1 of the ordinance. It is not clear how the City's Chief Forester (George Gonzalez) is to notify the Department of Building and Safety prior to the issuance of a Certificate of Occupancy. To be assured that all the conditions set forth by the Advisory Agency are met and that the Department of Building and Safety is able to issue the Certificate of Occupancy, please replace the last sentence of the paragraph in Subsection 12 of Section 12.21 A with the following procedure:

> A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtain from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the

construction, a written document signed certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Page 2, Section 3 of the ordinance. The proper name in accordance with the California Department of Pesticide Regulation is "Agricultural Pest Control Advisor," therefore, please add the word "control" between the words "pest" and "advisor" so that, the definition of the term "Tree Expert" reads: "A person ....who holds a valid California license as an Agricultural Pest Control Advisor or ..."

Page 2, Section 5 of the ordinance. For clarity since both terms are used in this subsection, please add the word "removed" to the second sentence of the first paragraph, so that it reads:

The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 2, Section 5 of the ordinance. The title of the first numbered paragraph "Required Determinations" of Subsection R should be in bold text.

Page 3, Section 5 of the ordinance. Please replace the upper case (I) with lower case (i) in two places on this page and fix the format of the first (i) paragraph on the page to be consistent with the other paragraphs.

Page 3, Section 5 of the ordinance. Items (i), (ii) and (iii) of Subdivision 1 (a) of Subsection R of Section 17.05 refers to "effective date of this Code Section." Please clarify the "effective date" between the effective date of the ordinance of 6/14/62, which added the Code Section 17.05, and the effective date of the ordinance of 4/12/80, which added the Subsection R of Section 17.05 (regarding oak trees). In either case, you may want to replace the term "effective date of this Code Section" with one of the dates, so long as the intent is clear.

Page 3, Subdivision 1 (b) of Section 5 of the ordinance. The first paragraph refers to "The removal of the protected tree would not result in an undesirable, irreversible soil erosion ...which cannot be mitigated to the satisfaction of the City..." It is not clear as to who in the "City" needs to be satisfied. Is there a specific department of the City? Chief Forester? Inspector from LADBS? Please indicate the intent, by specifying who in the "City" needs to be satisfied.

Page 4, Subdivision 3 of Section 5 of the ordinance. Is the word "accept" the correct term? What is the intent of the phrase "accept as to Subsection R1(b) (iii) above," mean? Is the intent to keep the existing protected tree where it is if it is a Historical Monument, unless the tree "is in danger of falling due to an existing and irreversible condition"? If so, than please reword the sentence to convey the intent.

Page 4, Subdivision 3 of Section 5 of the ordinance. Please explain the difference between a protected tree "officially designated as an Historical Monument" (Subsection R3) versus a protected tree "subject to historical preservation requirements" (Subsection R1)? Please explain the logic between the first sentence of Subsections R1 and R3, these two subsections seems to

contradict each other.

Page 4, Subdivision 4(a) of Section 5 of the ordinance. The property is to replace one protected tree with "at least two protected trees..." The definition of the term "protected tree" states in part "...native tree species which measures four inches or more ...four and one-half feet above the ground..." and the second sentence states, "Each replacement tree shall be ...one inch or more in diameter at a point one foot above the base..." seem to be in conflict.

Page 4, Subdivision 4 (b) of Section 5 of the ordinance. Does the convenant and agreement (C/A) have to be approved by the Advisory Agency or someone from City Planning, prior to recording the C/A? If so, then should it be mentioned in the ordinance? Also, is the C/A on a form provided by either Advisory Agency or City Planning? If so, then should that be mentioned as well?

Page 5, Section 6 of the ordinance. Why is it necessary to show the location of "large trees"? Is there a definition of what is considered a "large tree"?

Page 6, Section 8 of the ordinance. For clarity, the term "removed" should be added to the last sentence of paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 6, Section 10 of the ordinance. Please clarify what type of permit is referenced in Section 46.02 by amending the title of Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMIT TO RELOCATE OR REMOVE PROTECTED TREES.

Page 6, Section 10 of the ordinance. Is the last sentence of the second paragraph referring to a plan which shows all the grading work in compliance with Division 70 of Article 1 of Chapter IX of this Code being proposed to obtain from LADBS a permit to do grading work? If so, then please provide a definition of the term "grading permit plan."

Page 8, Section 11 of the ordinance. This amendment to Section 46.04 appears to increase the fees by applying the fees of Section 12.37 I.1 to include three other variety of trees, besides the oak tree. This amendment would require a fiscal impact report and may require this ordinance to be heard in Budget and Finance Committee, if it is to remain.

Pages 8 and 9, Section 12 of the ordinance. Please replace the misspell word "Superintendant" with "Superintendent of Building" and remove "of the Department of Building and Safety."

Pages 8 and 9, Section 12 of the ordinance. Please make the following changes to Subsections A and D of Section 46.06 as shown below. It would be very difficult to effectively enforce the intent of this ordinance unless the following changes are made to the procedure of these

Subsections. The changes are shown in underline/strikeout format (underline text is new language and strikeout shows text to be removed).

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The, Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Chief of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections B and C of this Section, shall have the authority to request ~~recommend~~ to the ~~Superintendant~~ Superintendent of Building ~~of the Department of Building and Safety~~ to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued ~~unless expired~~, for ~~which rights have not been obtained~~ which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection C of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection B of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

D. The applicant or permittee may appeal to the Board of Public Works any determination ~~recommendation~~ by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination ~~recommendation~~ as provided for in Subsection C above. Further, that any action by the Department of Building and Safety resulting from any of the provision of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

Page 9, Section 12 of the ordinance. Please delete the last sentence of Subsection B of Section

4606, because it is impossible for anyone, especially LADBS, to be aware not to issue a building permit for the "period **preceding**"(?) the hearing, determination or appeal, since no one can predict the future.

Page 9, Section 12 of the ordinance. Please delete the third sentence of Subsection C of Section 4606, because it is redundant with Subsection A of this Section.

Page 9, Section 12 of the ordinance. In Subsection E of Section 4606, it refers to an affidavit to be recorded with the County Recorder. What is the purpose of the affidavit? Would the affidavit state that the "Bureau recommends to refuse to issue Public Works permit for the relocation or removal of Protected Trees"? Or, does the affidavit state that the owner will not obtain a building permit to construct a building on the lot for the next 10 years from year "one" to year "ten" as described in Subsection A of this section? If this affidavit is recorded, then is there a method in which LADBS will be either given a copy of the recorded affidavit or somehow notified by the Bureau of its "final action"? Please remove the last sentence of this subsection, since the issuance of the building permit is already mentioned in Subsection A of this Section.

Page 10, Section 13 of the ordinance. To effectively enforce this provision a "Tree expert" such as someone from the Bureau of Street Services, Street Trees should do the verification inspection. Please replace the word "Department" with "Bureau of Street Services, Department of Public Works" in the third sentence of Item 5 of Section 96.303 and modify the last sentence by removing the phrase "as specified in Section 98.0412 (a) of the Municipal Code" and "by the Department" so the sentence will read:

> A fee shall be collected for any inspection required to verify the declaration.

Please contact me at (213) 482-0440 or Steve Ikkanda at (213) 482-6715 should you have any questions regarding this letter.

RULE 38 RESPONSE FOR A DRAFT ORDINANCE AMENDING OAK TREE CODE PROVISIONS

The latest version of the draft ordinance submitted for review (second review) does not include the comments made by the Department of Building and Safety in response (first review) to the City Attorney's letter of August 11, 2004, and therefore, pursuant to Council Rule 38, the Department of Building and Safety (LADBS) has again reviewed the proposed draft ordinance amending the oak tree code provisions and have the following comments:

Page 1, Section 1 of the ordinance. Currently, the permit application does not have a "reverse side" where a plot plan is shown. Please remove the phrase "on the reverse side of any" and replace it with "attached to the" since the automation of building permits, all plot plans are now attached to the building permits.

Page 1, Section 1 of the ordinance. It is not clear how the City's Chief Forester (George Gonzalez) is to notify the Department of Building and Safety prior to the issuance of a Certificate of Occupancy. To be assured that all the conditions set forth by the Advisory Agency are met and that the Department of Building and Safety is able to issue the Certificate of Occupancy, please replace the last sentence of the paragraph in Subsection 12 of Section 12.21 A with the following procedure:

> A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtain from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the

BY _____ DEPUTY

construction, a written document signed certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Page 2, Section 3 of the ordinance. The proper name in accordance with the California Department of Pesticide Regulation is "Agricultural Pest Control Advisor," therefore, please add the word "control" between the words "pest" and "advisor" so that, the definition of the term "Tree Expert" reads: "A person ....who holds a valid California license as an Agricultural Pest Control Advisor or ..."

Page 2, Section 5 of the ordinance. For clarity, since both terms are used in this subsection, please add the word "removed" to the second sentence of the first paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 2, Section 5 of the ordinance. The title of the first numbered paragraph "Required Determinations" of Subsection R should be in bold text.

Page 3, Section 5 of the ordinance. Please replace the upper case (I) with lower case (i) in two places on this page and fix the format of the first (i) paragraph on the page to be consistent with the other paragraphs.

Page 3, Section 5 of the ordinance. Items (i), (ii) and (iii) of Subdivision 1 (a) of Subsection R of Section 17.05 refers to "effective date of this Code Section." Please clarify the "effective date" between the effective date of the ordinance of 6/14/62, which added the Code Section 17.05, and the effective date of the ordinance of 4/12/80, which added the Subsection R of Section 17.05 (regarding oak trees). In either case, you may want to replace the term "effective date of this Code Section" with one of the dates, so long as the intent is clear.

Page 3, Subdivision 1 (b) of Section 5 of the ordinance. The first paragraph refers to "The removal of the protected tree would not result in an undesirable, irreversible soil erosion ...which cannot be mitigated to the satisfaction of the City..." It is not clear as to who in the "City" needs to be satisfied. Is there a specific department of the City? Chief Forester? Inspector from LADBS? Please indicate the intent, by specifying who in the "City" needs to be satisfied.

Page 4, Subdivision 3 of Section 5 of the ordinance. Is the word "accept" the correct term? What is the intent of the phrase "accept as to Subsection R1(b) (iii) above;" mean? Is the intent to keep the existing protected tree where it is if it is a Historical Monument, unless the tree "is in danger of falling due to an existing and irreversible condition"? If so, than please reword the sentence to convey the intent.

Page 4, Subdivision 3 of Section 5 of the ordinance. Please explain the difference between a protected tree "officially designated as an Historical Monument" (Subsection R3) versus a protected tree "subject to historical preservation requirements" (Subsection R1)? Please explain the logic between the first sentence of Subsections R1 and R3, these two subsections seems to

contradict each other.

Page 4, Subdivision 4(a) of Section 5 of the ordinance. The property is to replace one protected tree with "at least two protected trees..." The definition of the term "protected tree" states in part "...native tree species which measures four inches or more ...four and one-half feet above the ground..." and the second sentence states, "Each replacement tree shall be ...one inch or more in diameter at a point one foot above the base..."seem to be in conflict.

Page 4, Subdivision 4 (b) of Section 5 of the ordinance. Does the convenant and agreement (C/A) have to be approved by the Advisory Agency or someone from City Planning, prior to recording the C/A? If so, then should it be mentioned in the ordinance? Also, is the C/A on a form provided by either Advisory Agency or City Planning? If so, then should that be mentioned as well?

Page 5, Section 6 of the ordinance. Why is it necessary to show the location of "large trees"? Is there a definition of what is considered a "large tree"?

Page 6, Section 8 of the ordinance. For clarity, the term "removed" should be added to the last sentence of paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 6, Section 10 of the ordinance. Please clarify what type of permit is referenced in Section 46.02 by amending the title of Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMIT TO RELOCATE OR REMOVE PROTECTED TREES.

Page 6, Section 10 of the ordinance. Is the last sentence of the second paragraph referring to a plan which shows all the grading work in compliance with Division 70 of Article 1 of Chapter IX of this Code being proposed to obtain from LADBS a permit to do grading work? If so, then please provide a definition of the term "grading permit plan."

Page 8, Section 11 of the ordinance. This amendment to Section 46.04 appears to increase the fees by applying the fees of Section 12.37 I.1 to include three other variety of trees, besides the oak tree. This amendment would require a fiscal impact report and may require this ordinance to be heard in Budget and Finance Committee, if it is to remain.

Pages 8 and 9, Section 12 of the ordinance. Please replace the misspell word "Superintendant" with "Superintendent of Building" and remove "of the Department of Building and Safety."

Pages 8 and 9, Section 12 of the ordinance. Please make the following changes to Subsections A and D of Section 46.06 as shown below. It would be very difficult to effectively enforce the intent of this ordinance unless the following changes are made to the procedure of these

Subsections. The changes are shown in underline/strikeout format (underline text is new language and strikeout shows text to be removed).

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Chief of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections B and C of this Section, shall have the authority to request ~~recommend~~ to the ~~Superintendant~~ Superintendent of Building ~~of the Department of Building and Safety~~ to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued ~~unless expired~~, for ~~which rights have not been obtained~~ which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection C of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection B of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

D. The applicant or permittee may appeal to the Board of Public Works any determination ~~recommendation~~ by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination ~~recommendation~~ as provided for in Subsection C above. Further, that any action by the Department of Building and Safety resulting from any of the provision of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

Page 9, Section 12 of the ordinance. Please delete the last sentence of Subsection B of Section

4606, because it is impossible for anyone, especially LADBS, to be aware not to issue a building permit for the "period **preceding**"(?) the hearing, determination or appeal, since no one can predict the future.

Page 9, Section 12 of the ordinance. Please delete the third sentence of Subsection C of Section 4606, because it is redundant with Subsection A of this Section.

Page 9, Section 12 of the ordinance. In Subsection E of Section 4606, it refers to an affidavit to be recorded with the County Recorder. What is the purpose of the affidavit? Would the affidavit state that the "Bureau recommends to refuse to issue Public Works permit for the relocation or removal of Protected Trees"? Or, does the affidavit state that the owner will not obtain a building permit to construct a building on the lot for the next 10 years from year "one" to year "ten" as described in Subsection A of this section? If this affidavit is recorded, then is there a method in which LADBS will be either given a copy of the recorded affidavit or somehow notified by the Bureau of its "final action"? Please remove the last sentence of this subsection, since the issuance of the building permit is already mentioned in Subsection A of this Section.

Page 10, Section 13 of the ordinance. To effectively enforce this provision a "Tree expert" such as someone from the Bureau of Street Services, Street Trees should do the verification inspection. Please replace the word "Department" with "Bureau of Street Services, Department of Public Works" in the third sentence of Item 5 of Section 96.303 and modify the last sentence by removing the phrase "as specified in Section 98.0412 (a) of the Municipal Code" and "by the Department" so the sentence will read:

> A fee shall be collected for any inspection required to verify the declaration.

Please contact me at (213) 482-0440 or Steve Ikkanda at (213) 482-6715 should you have any questions regarding this letter.

Dear Mr. O'Brien,

I was just writing to say that I support the proposed amendment of the Oak Tree Ordinance. I truly believe that we are not doing a good enough job protecting these amazing trees. Way too often I see the destruction and removal of these oak trees and there seems to be little, if any, retribution from the offender. We definitely need stronger laws and enforcement tools.

Sincerely,

Cheryl Rietveld

Los Angeles, CA 90012

Council File No.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees. The Departments of Building and Safety, Planning, Public Works and Environmental Affairs have received copies of this ordinance and will be providing their comments directly to you.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

Terree A. Bowers

MAY 9 - 2004

ORDINANCE NO. _____

An Ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Article 2 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 12.21A.12. to read:

12. **Protected Tree Relocation and Replacement.**

All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan shown on the reverse side of any building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy will not be issued unless the conditions set forth by the Advisory Agency relative to protected trees are met.

Sec. 2. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by deleting the definition of "Oak Tree" in Section 17.02 and adding the following definition:

Protected Tree - Any of the following Southern California native tree species which measures eight inches or more in diameter, four and one-half feet above the ground level at the base of the tree:

a. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

b. Southern California Black Walnut (Juglans californica var. californica)

c. Western Sycamore (Platanus racemosa)

d. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

old and revised 6-21-05

Sec. 3. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.05H.7. to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 4. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.05R to read:

R. Protected Tree Regulations.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of this Code Section; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and

pursuant thereto the oak tree's removal would be permissible; or (Phrase Amended by Ord. No. 173,268, Eff. 7/1/00, Oper. 7/1/00.)

(iii) A building permit has been issued prior to the effective date of this Code Section, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition; or

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of said tree; or

(v) It has no apparent aesthetic value which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at said location.

2. Supplemental Authority. In the event the Advisory Agency determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree.

Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, accept as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two protected trees of a variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section

17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency and shall also consult the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 5. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.06B.13. to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 6. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.06C. to read:

C. Protected Tree Reports.

No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 7. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 8. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.01 to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures eight inches or more in diameter, four and one-half feet above the ground level at the base of the tree:

a. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

b. Southern California Black Walnut (Juglans californica var. californica)

c. Western Sycamore (Platanus racemosa)

d. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 9. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PERMITS.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise

provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or the Board of Zoning Appeals prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone; or

4. The presence of the protected tree interferes with utility services and roadways within or without the subject property and the only reasonable alternative to the interference is the removal of the tree; or

5. It has no apparent aesthetic value which will contribute to the appearance and design of the surrounding properties, or is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at said location.

(c) Additional Authority. The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal or relocation of five or less protected trees. Any permit for the removal or relocation of more than five such trees shall require an additional fee for each additional unit of five or fewer trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I, 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 11. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by adding Section 46.06 thereto, said Section to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The Bureau of Street Services shall have the authority, after notice and hearing, to withhold issuance of a building permit for a period of time up to 10 years and to revoke any permit issued, unless expired, for which rights have not been obtained with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who is good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection B of this Section.

B. The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder. No building permit shall be issued during the period preceding the hearing and determination by the Department and any appeal therefrom.

C. The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. In conducting such hearing, the procedural rules set forth in Division 3 of Article 8 of Chapter IX of the Los Angeles Municipal Code shall apply. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall determine the length of time the issuance of a building permit shall be withheld. I so determining, the Bureau shall consider the following factors: the

number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days thereafter.

D. The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit. The appeal must be filed with the Board within 30 days of the date of mailing of the notice of determination as provided for in Subsection C above.

E. Any final determination of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall beset forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 12. Section 96.303(5) of the Los Angeles Municipal Code is hereby amended to read as follows:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department to verify such information by entry upon the subject property. A fee, as specified in Section 98.0412(a) of the Municipal Code shall be collected by the Department for any inspection required to verify the declaration.

. . .

Sec. 13. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

REPORT NO. R05-0212

JUN 21 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background:

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

PLAN & LAND USE MGT.

Recyclable and made from recycled waste.

RECEIVED
CITY CLERK'S OFFICE

2005 JUN 22 AM 6:34

CITY CLERK

BY _____ DEPUTY

Summary of Ordinance Provisions:

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the municipal code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral:

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their early comments were incorporated into the language of the current draft ordinance. They have been asked by this office's most recent letter to make their comments directly to the Council's Planning and Land Use Committee.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By
DAVID MICHAELSON
Chief Assistant City Attorney

DM:KP:fa (#105209)

Transmittal

ORDINANCE NO. _____

An Ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Article 2 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 12.21A.12. to read:

12. **Protected Tree Relocation and Replacement.**

All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan shown on the reverse side of any building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy will not be issued unless the conditions set forth by the Advisory Agency relative to protected trees are met.

Sec. 2. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by deleting the definition of "Oak Tree" in Section 17.02 and adding the following definition:

Protected Tree - Any of the following Southern California native tree species which measures eight inches or more in diameter, four and one-half feet above the ground level at the base of the tree:

a. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

b. Southern California Black Walnut (Juglans californica var. californica)

c. Western Sycamore (Platanus racemosa)

d. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.05H.7. to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 4. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.05R to read:

R. Protected Tree Regulations.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of this Code Section; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and

pursuant thereto the oak tree's removal would be permissible; or (Phrase Amended by Ord. No. 173,268, Eff. 7/1/00, Oper. 7/1/00.)

(iii) A building permit has been issued prior to the effective date of this Code Section, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition; or

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of said tree; or

(v) It has no apparent aesthetic value which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at said location.

2. Supplemental Authority. In the event the Advisory Agency determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree.

Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, accept as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two protected trees of a variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section

17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency and shall also consult the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 5. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.06B.13. to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 6. Article 7 of Chapter I of the Los Angeles Municipal Code is hereby amended by modifying Section 17.06C. to read:

C. Protected Tree Reports.

No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 7. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 8. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.01 to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures eight inches or more in diameter, four and one-half feet above the ground level at the base of the tree:

a. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

b. Southern California Black Walnut (Juglans californica var. californica)

c. Western Sycamore (Platanus racemosa)

d. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 9. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PERMITS.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise

provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or the Board of Zoning Appeals prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone; or

4. The presence of the protected tree interferes with utility services and roadways within or without the subject property and the only reasonable alternative to the interference is the removal of the tree; or

5. It has no apparent aesthetic value which will contribute to the appearance and design of the surrounding properties, or is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at said location.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal or relocation of five or less protected trees. Any permit for the removal or relocation of more than five such trees shall require an additional fee for each additional unit of five or fewer trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I, 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 11. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by adding Section 46.06 thereto, said Section to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The Bureau of Street Services shall have the authority, after notice and hearing, to withhold issuance of a building permit for a period of time up to 10 years and to revoke any permit issued, unless expired, for which rights have not been obtained with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who is good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection B of this Section.

B. The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder. No building permit shall be issued during the period preceding the hearing and determination by the Department and any appeal therefrom.

C. The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. In conducting such hearing, the procedural rules set forth in Division 3 of Article 8 of Chapter IX of the Los Angeles Municipal Code shall apply. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall determine the length of time the issuance of a building permit shall be withheld. I so determining, the Bureau shall consider the following factors: the

number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days thereafter.

D. The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit. The appeal must be filed with the Board within 30 days of the date of mailing of the notice of determination as provided for in Subsection C above.

E. Any final determination of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall beset forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 12. Section 96.303(5) of the Los Angeles Municipal Code is hereby amended to read as follows:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department to verify such information by entry upon the subject property. A fee, as specified in Section 98.0412(a) of the Municipal Code shall be collected by the Department for any inspection required to verify the declaration.

. . .

. . .

. . .

. . .

. . .

Sec. 13. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

Dear Chairperson Kenyon:

It has come to our attention that your committee has developed a plan to revise the City of Los Angeles' Oak Tree Ordinance. We understand that such a revision would increase the number and types of trees to be protected and would include Walnut, Sycamore and Bay trees, also native to Southern California.

The Silver Lake Neighborhood Council would like to offer our support for this plan and urge its passage as soon as possible to better protect these native trees in a time of rampant development.

Very truly yours,

Jason Lyon, Co-Chair Rusty Millar, Co-Chair Martin Hittelman, Secretary

Silver Lake Neighborhood Council Governing Board

CF 03-1459 AND 03-1459-S1– PROPOSED AMENDMENTS TO THE OAK TREE ORDINANCE (ORDINANCE 153,478) - REVISED

Dear Councilmember Reyes:

RECOMMENDATIONS

In response to motions 03-1459 (LaBonge/Garcetti) and 03-1459-S1 (Garcetti/LaBonge), the Department of Public Works, Environmental Affairs Department, and Community Forestry Advisory Committee recommend that the City Council instruct the City Attorney to prepare the following revisions to the City's Oak Tree Ordinance No. 153,478 in order to more adequately protect our remnant native woodlands, one of the City's most valuable natural resources. The recommended revisions are as follows:

1. Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Protected Trees".

2. Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

3. Require a permit for protected tree removal/relocation on all property within the City boundaries regardless of property lot size.

4. Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at four and one-half feet above ground level.

PLAN & LAND USE MGT.
FEB 12 2004

5. Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

6. Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

7. Increase the monetary fine for violating the ordinance.

8. Include civil penalties, such as prohibiting development of property if protected trees are removed without a permit.

9. Require a tree pruning permit for all protected tree pruning in the City of Los Angeles.

FISCAL IMPACT STATEMENT

The number of permits that will be required to be issued will increase due to the larger number of trees that are protected and the need for a permit to be issued for all protected trees to be pruned. As there is a fee for the issuance of these permits, the program will be self-supporting and have no impact to the General Fund.

DISCUSSION

The City of Los Angeles enacted the Oak tree ordinance (Ordinance 153,478) in 1980 to protect its remaining native Oak tree woodlands. In spite of this ordinance, the City continues to suffer a decline to its native Oak tree woodlands due to development, disease, and other factors. With even fewer native trees and woodlands remaining, the time has come to strengthen the oak tree ordinance, giving protection to a wider range of native trees as well as smaller trees that have not yet reached maturity. A stronger, more inclusive ordinance would give the Department of Public Works greater abilities to protect our native trees and preserve this important part of the City's natural history.

Staff from the Department of Public Works' Street Tree Division and the Departments of Environmental Affairs and City Planning met with representatives from the Community Forest Advisory Committee in January and February of 2003 to discuss the current tree protection ordinances and how they could be revised to better protect and preserve the City's remaining native trees and woodlands.

Item #1: Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Protected Trees".

Oaks are not the only native trees that inhabit the City of Los Angeles. Other Southern California native tree species include the Southern California Black Walnut, Western Sycamore, and California Bay. These species are currently without any legal protection from development and other urban pressures even though they also are an important part of the City's natural history. Urbanization is considered such a severe threat to Southern California walnut woodlands that the State of California

and the Nature Conservancy are working together to acquire vegetative/habitat data on these woodlands, and the California Native Plant Society is evaluating the Southern California Black Walnut for inclusion on their watch list for plants with limited distribution. The Western Sycamore and California Bay both occur in riparian habitats, which are key habitats for reducing the impact of upland sources of pollution to water bodies and as wildlife habitats. Protection of these additional species of native trees is warranted, and their inclusion necessitates the change of the ordinance title to "Protected Trees" to more properly represent the scope and contents of the newly revised ordinance.

Item #2: Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

The definition of a tree expert currently includes only someone who holds a valid California license as an agricultural pest control advisor or landscape architect. Although there are individuals in both categories that have the necessary expertise to assess oak and other trees and prepare reports on them, Registered Consulting Arborists (American Society of Consulting Arborists) are also very well qualified to determine the health and condition of trees and should, therefore, be included in the definition of tree expert.

Item #3: Require a permit for protected tree removal/relocation on all property within the City boundaries regardless of property lot size.

The current Oak Tree Ordinance applies only to trees located on lots larger than one acre in size. This severely limits the applicability of this ordinance due to the highly subdivided and built-out nature of our City. Although new developments generally fall into this category of lot size, many of these trees are on smaller lots, and these native trees should be protected regardless of the size of the lot on which they live.

Item #4: Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at four and one-half feet above ground level.

The definition of an oak tree in the current City ordinance includes only those specimens whose trunks measure eight inches in diameter four and one-half feet above ground level. Some of the other native trees, specifically the Southern California Black Walnut, exhibit different growth habits and quite often have multiple trunks rather than a single one. To ensure that the ordinance protects these trees as well as smaller single-trunk trees, we recommend that the tree definition be changed to include all specimens that have a trunk or trunks that cumulatively measure two inches in diameter at a level of four and one-half feet above the ground.

Item #5: Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

When oak trees are allowed to be removed under the current ordinance, they are replaced on a one-for-one basis. This leaves a deficit in the amount of benefits that the City obtains from this tree for many years as oaks are slow-growing trees and the environmental benefits afforded by a mature tree are much greater than those of a small tree. Therefore, the ordinance should be revised to take a more balanced approach based on a calculation utilizing a trunk volume or canopy coverage formula. For example, to mitigate the removal of a tree with an eight-inch diameter trunk, eight trees each with a trunk diameter of one inch would be required. For Southern California Black Walnuts planted as seeds, the trunk diameter of the replacement tree will be calculated as that of a five year old tree.

Item #6: Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Replacement trees allowed under the current ordinance must be a minimum of 15-gallons in size. Although this is a good approach for many species, some of the native species, especially the Southern California Black Walnut, do not grow well in nursery containers. Because of this, they are generally not available in nursery-size containers and even if they were, the individuals would be unlikely to mature to healthy trees due to improperly developed roots. To account for these growth requirements, the ordinance needs to allow for smaller trees, or in the case of the Southern California Black Walnut, tree seeds to be used as replacements if this would afford a greater chance of long-term survival than the use of larger size trees. Benefits derive from these replacement trees only if they survive long term. To increase the probability of survival, replacement trees would need to be maintained and monitored for an establishment period of at least five years. Any replacement trees failing to survive this five-year establishment period should be replaced. Survival of sprouts from seeds and small stock may require frequent monitoring and cages or other devices to facilitate long-term survival.

Item #7: Increase the monetary fine for violating the ordinance.

Item #8: Include civil penalties, such as prohibiting development of property if protected trees are removed without a permit.

The current ordinance lacks adequate enforcement mechanisms. Often, a developer will pay the small fines involved in illegally removing an oak tree as this is economically advantageous over preserving the trees. There is also little to prevent a developer's "scorched earth" approach of removing everything from a property prior to applying for development permits so they can then say that nothing currently exists on the property at the time of application. By increasing the monetary fine and including civil penalties, such as prohibiting development of property by withholding building and occupancy permits for a specified period of time if a "Protected Tree" is removed without a permit, the trees will be better protected.

Item #9: Require a tree pruning permit for all protected tree pruning in the City of Los Angeles.

The final recommended change would require a tree pruning permit for all protected tree pruning in the City of Los Angeles regardless of where that tree is located. This will help to ensure that oaks are trimmed at the proper time of year, which is during the dry season from mid- to late-summer, according to ISA standards, by properly trained and reputable tree trimmers. This will lead to healthier, longer-lived trees, which will provide greater environmental benefits to the City. This protection of all of the protected trees within the City will help to preserve the last remnants of our native woodlands.

If you have any questions, please contact George Gonzalez, Chief Forester, Street Tree Division, at (213) 485-5675 or Melinda Bartlett, Division Director, Water and Natural Resources Division at (213) 978-0858.

SUBJECT: CF:03-1459 – PROPOSED AMENDMENTS TO THE OAK TREE ORDINANCE (ORDINANCE 153.478)

RECOMMENDATIONS

The Department of Public Works, Environmental Affairs Department, and Community Forest Advisory Committee recommend that the City Council instruct the City Attorney to prepare revisions to the City's Oak Tree Ordinance in order to more adequately protect our remnant native woodlands, one of the City's most valuable natural resources. The recommended revisions are as follows:

Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Preserved Trees".

Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

Require a permit for preserved tree removal/relocation on all property within the City boundaries regardless of property lot size.

PLAN & LAND USE MGT.

JAN 14 2004

Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at three and one-half feet above ground level.

Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Increase the monetary fine for violating the ordinance.

Include civil penalties, such as prohibiting development of property if Oak trees are removed without a permit.

Require a tree pruning permit for all Oak tree pruning in the City of Los Angeles.

FISCAL IMPACT STATEMENT

The number of permits that will be required to be issued will increase due to the larger number of trees that are protected and the need for a permit to be issued for all oak trees to be pruned. As there is a fee for the issuance of these permits, the program will be self-supporting and have no impact to the General Fund.

DISCUSSION

The City of Los Angeles enacted the Oak tree ordinance (Ordinance 153,478) in 1980 to protect its remaining native Oak tree woodlands. In spite of this ordinance, the City continues to suffer a decline to its native Oak tree woodlands due to development, disease, and other factors. With even fewer native trees and woodlands remaining, the time has come to strengthen the oak tree ordinance, giving protection to a wider range of native trees as well as smaller trees that have not yet reached maturity. A stronger, more inclusive ordinance would give the Department of Public Works greater abilities to protect our native trees and preserve this important part of the City's natural history.

Staff from the Department of Public Works' Street Tree Division and the Departments of Environmental Affairs and City Planning met with representatives from the Community Forest Advisory Committee in January and February of 2003 to discuss the current tree protection ordinances and how they could be revised to better protect and preserve the City's remaining native trees and woodlands.

Item #1: Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbe llularia californica) in the ordinance and change the ordinance title to "Preserved Trees".

Oaks are not the only native trees that inhabit City of Los Angeles. Other Southern California native tree species include the Southern California Black Walnut, Western Sycamore, and California Bay. These species are currently without any legal protection from development and other urban pressures even though they also are an important part of the City's natural history. The inclusion of these trees

necessitates the change of the ordinance title to "Preserved Trees" to more properly represent the scope and contents of the newly revised ordinance.

Item #2: Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

The definition of a tree expert currently includes only someone who holds a valid California license as an agricultural pest control advisor or landscape architect. Although there are individuals in both categories that have the necessary expertise to assess oak trees and prepare oak tree reports, Registered Consulting Arborists (American Society of Consulting Arborists) are most qualified to determine the health and condition of trees and should, therefore, be included in the definition of tree expert.

Item #3: Require a permit for preserved tree removal/relocation on all property within the City boundaries regardless of property lot size.

The current Oak Tree Ordinance applies only to trees located on lots larger than one acre in size. This severely limits the applicability of this ordinance due to the highly urbanized and fragmented nature of our City. Although new developments generally fall into this category of lot size, all remaining native trees should be protected regardless of the size of the lot on which they live.

Item #4: Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at three and one-half feet above ground level.

The current definition of an oak tree includes only those specimens whose trunks measure eight inches in diameter four and one-half feet above ground level. Some of the other native trees, specifically the Southern California Black Walnut, exhibit different growth habits and quite often have multiple trunks rather than a single one. To ensure that the ordinance protects these trees as well as smaller single-trunk trees, we recommend that the tree definitive be changed to include all specimens that have a trunk or trunks that cumulatively measure two inches at a level of three and one-half feet above the ground.

Item #5: Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

When oak trees are allowed to be removed under the current ordinance, they are replaced on a one-for-one basis. This leaves a deficit in the amount of benefits that the City obtains from this tree for many years as oaks are slow-growing trees and the environmental benefits afforded by a mature tree are much greater than those of small tree. Therefore, the ordinance should be revised to take a more balanced approach based on a calculation utilizing a trunk volume or canopy coverage formula.

Item #6: Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Replacement trees allowed under the current ordinance must be a minimum of 15-gallons in size. Although this is a good approach for many species, some of the native species do not grow well in nursery containers. Because of this, they are generally not available in nursery-size containers and even if they were, the individuals would be unlikely to mature to healthy trees due to improperly developed roots.

To account for these growth requirements, the ordinance needs to allow for smaller trees, or in some cases tree seeds, to be used as replacements if this would afford a greater chance of long-term survival than the use of larger size trees.

Item #7: Increase the monetary fine for violating the ordinance.
Item #8: Include civil penalties, such as prohibiting development of property if Oak trees are removed without a permit.

The current ordinance lacks adequate enforcement mechanisms. Often, a developer will pay the small fines involved in illegally removing an oak tree as this is economically advantageous over preserving the trees. By increasing the monetary fine and including civil penalties, such as prohibiting development of property if Oak trees are removed without a permit, the preserved trees will be better protected.

Item #9: Require a tree pruning permit for all Oak tree pruning in the City of Los Angeles.

The final recommended change would require a tree pruning permit for all Oak tree pruning in the City of Los Angeles regardless of where that tree is located. This will help to ensure that oaks are trimmed at the proper time of year, according to ISA standards, by properly trained and reputable tree trimmers. This protection of all of the oaks within the City will help to preserve the last remnants of our native woodlands.

PLANNING and LAND USE MGT.

JUL 08 2003

MOTION

The City of Los Angeles continues to suffer a decrease in its Oak tree and native tree species woodland habitat due to disease, development and other factors. The City's Oak Tree ordinances were first adopted on April 12, 1980 in order to establish clear standards for the preservation of these beautiful and culturally significant living monuments.

There are various other provisions that require updating. For example, the current tree replacement requirement, a minimum fifteen gallon Oak tree replacement per removal, does not adequately mitigate the loss of Oak tree woodlands. Additionally, the current definition of "Tree Expert," a licensed pest control advisor or landscape architect, needs to be updated to allow for the most knowledgeable Oak tree professionals and Consulting Arborists to be included.

Preservation of Oak trees targets signature trees of only one of the City's native plant communities, and other species should be considered for enhanced protections along the lines of the City's Oak Tree ordinances.

Regulations to preserve trees have significantly changed and progressed, both in California and across the country, due to increased scientific knowledge of trees and public awareness of the importance of native tree species. An opportunity exists to update City laws pertaining to Oak trees to better protect our remaining stock of these historic treasures to ensure that future generations can take part in their legacy.

I THEREFORE MOVE that the departments of Public Works, City Planning and Environmental Affairs be instructed to work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City arborists to preserve native tree species that share common ecosystems while maintaining a more diverse species base.

Conservancy Support of Proposed Oak Tree Ordinance Revisions
Council File Nos. 03-1459 and 03-1459-S1

Dear Chairperson Reyes and Members:

The Santa Monica Mountains Conservancy is in full support of the two above referenced motions on today's Planning and Land Use Management Committee agenda (items 3 and 4). The proposed expansion of the City's Oak Tree ordinances to include other native tree species is solidly grounded both ecologically and aesthetically. The proposal to allow for the civil prosecution of violators of the Oak Protection Ordinance, including a penalty of delaying development permits, is a timely and much needed revision. Each of these proposals will result in significant, lasting benefit to the City. I can be reached at the above address and at (310) 589-3200 ext. 128. Please do not hesitate to call on our staff for any assistance in these matters.

Re: Oak Tree Ordinance, November 5, 2003 Agenda, Items #2, # 3 and 4.

Dear Members of the Planning and Land Use Management Committee:

I am writing in regard to today's agenda and items numbers 2, 3 and 4.

The Mulholland Design Review Board is in favor of Item #4 and creating more stringent penalties for violations of the City's Oak Protection Ordinance. We have seen too many projects where the applicants come to the Board with projects where all of the oak and other native trees have mysteriously been cut down. The current penalties are too trivial to discourage such behavior. We ask you to put some real "teeth" into this ordinance in order to protect our precious oak trees. The benefits of oak trees to our hillsides are well known. The deep root systems hold the hillsides and act like giant sponges to absorb rain and runoff. They are drought tolerant and slow burning in the event of fires. Please help to save our oak trees.

I do not completely understand item # 3. On the surface, it too appears to be a good proposal. My only question would be in the way that "native tree species" is defined. The trees should be "native" to the area and ecosystem. For example, there may be some native palm trees from the desert areas, but palm trees are not native to the Santa Monica Mountains. In fact, palm trees are a prohibited tree to be planted in the Mulholland Scenic Parkway, although many exist there from prior to 1992 and from having been illegally planted since 1992. So, in drafting revisions to this ordinance, it should be emphasized that we should seek to preserve native tree species that are native to the particular ecosystem involved.

Finally, item # 2 also appears to be an excellent proposal. Water is going to become more scarce in the coming decades. Our City's Landscape Ordinance should be encouraging the use of native plants wherever possible. Projects such as the Tree People's Sun Valley project with Public Works, where trees are being planted for flood control should be encouraged and replicated all over the city. We would also be in favor of this motion.

Thank you for voting to approve these three motions.

Yours truly,

Lynette Berg Robe

Re: Cutting of Oak Trees on 3593 Multiview Drive

Dear Mr Gonzalez:

I am writing on behalf of the Mulholland Scenic Parkway Design Review Board, asking you to prosecute the owner of 3593 Multiview Drive, Steve Hiyoshi, to the fullest extent of the law for the unlawful cutting, mutilation, and removal of oak trees on the site. The owner violated Los Angeles Municipal Code Section 4600, the Oak Tree Ordinance, and he should be held accountable.

There is no way to mitigate the damage done to the oaks trees. Even the planting of new ones in a two to one ratio will take years to reach the size of the ones removed. We ask that you urge the City Attorney to go forward and prosecute the owner. Time after time, projects come to us where "someone," but never the applicant, has cut or removed precious oak trees from the site. People continue to violate the Oak Tree Ordinance in this way because it is so easy to escape accountability. We ask that you help to make an example in this case so that future owners of hillside property will be deterred from mutilating oak trees in this manner.

Thank you for your kind assistance.

Yours truly,

Lynette Berg Robe
Chair, Mulholland Scenic Parkway Design Review Board

November 4, 2003

Los Angeles City Council

Re: Oak Tree Protection Ordinance

Dear City Representatives,

The undersigned would like to voice our strong support of implementing tougher restrictions and penalities as part of the Oak Tree Protection Ordinance. Recently in our neighborhood a developer who did not own the property at 3593 Multiview Drive, destroyed some 30 oaks, illegally, permanently scarring the land. The sale ultimately did not go through and the developer was cited for this egregious act

However, this is a loss to the city that can not be replaced. A small fine and six months in jail is a slap on the hand to someone who has done irreparable harm. This has impacted our area in many ways including opening up the hillside to possible landslide damage, diminishing the already squeezed wildlife habitat and damaging the aesthetic of our community, which is the reason we live in this part of Los Angeles.

When will the leaders of the City of Los Angeles recognize that its precious natural resources are a benefit to the community and that this type of land misuse costs more in the long run? Tougher restrictions and penalties should be levied against those with clearly no regard for its value. In addition, a developer that has demonstrated this utter lack of regard should not be licensed to practice in Los Angeles, let alone in California.

Our heritage is being threatened by those whose only motive is profit. We should not have to explain to future generations why we took no action to save what was left in the already overgrown Los Angeles area.

Thank you for your consideration.

PLANNING and LAND USE MGT.

JUL 0 8 2003

MOTION

The City of Los Angeles continues to suffer a decrease in its Oak tree and native tree species woodland habitat due to disease, development and other factors. The City's Oak Tree ordinances were first adopted on April 12, 1980 in order to establish clear standards for the preservation of these beautiful and culturally significant living monuments.

There are various other provisions that require updating. For example, the current tree replacement requirement, a minimum fifteen gallon Oak tree replacement per removal, does not adequately mitigate the loss of Oak tree woodlands. Additionally, the current definition of "Tree Expert," a licensed pest control advisor or landscape architect, needs to be updated to allow for the most knowledgeable Oak tree professionals and Consulting Arborists to be included.

Preservation of Oak trees targets signature trees of only one of the City's native plant communities, and other species should be considered for enhanced protections along the lines of the City's Oak Tree ordinances.

Regulations to preserve trees have significantly changed and progressed, both in California and across the country, due to increased scientific knowledge of trees and public awareness of the importance of native tree species. An opportunity exists to update City laws pertaining to Oak trees to better protect our remaining stock of these historic treasures to ensure that future generations can take part in their legacy.

I THEREFORE MOVE that the departments of Public Works, City Planning and Environmental Affairs be instructed to work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City arborists to preserve native tree species that share common ecosystems while maintaining a more diverse species base.

Dear Chairperson Kenyon:

It has come to our attention that your committee has developed a plan to revise the City of Los Angeles' Oak Tree Ordinance. We understand that such a revision would increase the number and types of trees to be protected and would include Walnut, Sycamore and Bay trees, also native to Southern California.

The Silver Lake Neighborhood Council would like to offer our support for this plan and urge its passage as soon as possible to better protect these native trees in a time of rampant development.

Very truly yours,

Jason Lyon, Co-Chair Rusty Millar, Co-Chair Martin Hittelman, Secretary

CITY PLAN CASE NO. 2004-2290 CA

Transmitted herewith is an ordinance (Appendix A), which amends the Los Angeles Municipal Code to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions.

On January 12, following a public hearing, the City Planning Commission adopted the Planning Department staff report and findings, and **approved the proposed ordinance (Appendix A) with recommendations**. The recommendations included that the City Attorney ensure that the penalty for illegal removal of protected trees run with the land, that building permits are withheld as part of the enforcement procedure, that the enforcement language be clarified if possible, and that a maintenance fee for trees planted as a mitigation be included in the Public Works section of the Municipal Code. The Commission also requested staff to develop guidelines to assist applicants in understanding the requirements and procedures.

This action was taken by the following vote:

Moved: Usher
Seconded: Freer
Ayes: Cardoso, Hughes, Kay, Kezios, Roschen, Woo
Absent: Irlando

Vote: 8-0

Gabriele Williams, Commission Executive Assistant II
City Planning Commission

Attachments: Findings, Appendix A (Ordinance)

cc: Keith Pritsker, Deputy City Attorney

FINDINGS

That the City Council:

Adopt the staff report of November 10, 2005, as its report on the subject;

Adopt the findings in the staff report dated November 10, 2005.

The City Planning Department recommends that the City Council, in accordance with Charter Section 558, find that the attached, proposed ordinance (Appendix A) is:

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species, RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. in accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

APPENDIX A

PROPOSED ORDINANCE FOR DISCUSSION

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the twenty-sixth unnumbered paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph after the thirtieth unnumbered paragraph defining "Problem Areas":

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the forty-fifth unnumbered paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected

tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. . Said request shall be made I writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County

Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Section 96.303.5 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department of Public Works to verify such information by entry upon the subject property.

Sec. . The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the Main Street entrance to the City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that the foregoing ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

RECOMMENDATION REPORT

CITY PLANNING COMMISSION		CASE NO:	CPC-2004-2290-CA
		CEQA:	ENV-2004-2201-CE
		LOCATION:	Citywide
DATE: January 12, 2006		COUNCIL DISTRICTS:	All
TIME: after 8:30a.m.		PLAN AREAS:	All
PLACE: Room 1010 City Hall 200 North Spring St. Los Angeles, CA 90012		RELATED FILES:	n/a

PUBLIC HEARING REQUIRED—CONTINUED FROM MEETING OF NOVEMBER 10, 2005

REQUEST: Continued consideration of staff report and proposed amendments to the Zoning Code first heard November 10, 2005, regarding amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Los Angeles Municipal Code.

SUMMARY: The proposed amendments to the Zoning Code will bring the provisions of the Code regarding Oak Trees in conformance with revisions to Section 46 (Oak Tree Regulations) and 96.303.5 of the Municipal Code.

RECOMMENDATION:

1. Adopt the staff report as its report on the subject.
2. Adopt the attached findings.
3. Approve the proposed amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, and 17.52 I (Appendix A) and recommend their adoption by the City Council.

CONTACT INFORMATION: Michael O'Brien, City Planning Associate, 213-482-7077

Appendix A—Staff report and proposed Amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I, and 46.00 through 46.06, and 96.303.5 of the Municipal Code from November 10, 2005.

ADVICE TO PUBLIC: The exact time this report will be considered during the meeting is uncertain since there may be several other items on the agenda. Written communications may be mailed to the Commission Secretariat, 200 North Main Street, Room 532, Los Angeles, CA 90012 (Phone No.213/978-1300). While all written communications are given to the Commission for consideration, the initial packets are sent the week prior to the Commission's meeting date. If you challenge these agenda items in court, you may be limited to raising only those issues you or someone else raised at the public hearing, or in written correspondence on these matters delivered to this agency at or prior to the public hearing. As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability, and upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or other services may be provided upon request. To ensure availability of services, please make your request no later than three working days (72 hours) prior to the meeting by calling the Commission Secretariat at 213/978-1300.

SUMMARY

On November 10, 2005, the Commission considered a staff report and proposed ordinance amending Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code. These Sections need to be revised to be consistent with the revisions proposed for Sections 46.00 through 46.06 and 96.303.5 of the Los Angeles Municipal Code under the Authority of the Board of Public Works and the Department of Building and Safety. These latter sections contain the City's oak tree regulations (proposed to be changed to the "protected tree regulations") and are not under the purview of the Department of City Planning nor the City Planning Commission.

Considerable testimony was given at the Commission meeting. The commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

This report addresses the issues raised at the November 10 meeting and recommends adoption of the attached ordinance, Appendix A.

FINDINGS

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species, RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's

CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

MARK WINOGROND
Interim Director of Planning

APPROVED BY:

Jane Blumenfeld
Principal City Planner

PREPARED BY:

Michael O'Brien
City Planning Associate

STAFF REPORT

REQUEST

On November 10, 2005, the Commission considered the staff report and proposed ordinance to add protections to certain trees (in addition to oak trees) and to revise the existing protections to oak trees. The ordinance amends Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code, all of which make reference to oak trees. The Commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

DISCUSSION

Species to be protected. The task force during its deliberations in 2003 considered all local species of native trees for possible protection. The task force settled on the addition of only three trees to the list of protected trees, because these three trees, the Southern California Black Walnut (Juglans californica var. californica), the Western Sycamore (Platanus racemosa), and the California Bay (Umbellularia californica), formed a suite of trees diagnostic of the Southern California environment. Only in Southern California do these three trees grow together. Other trees considered have a greater natural range and are not typical solely of Southern California. In addition, the Southern California Black Walnut is already protected under the Mt. Washington Specific Plan, and it is listed as a species of concern whose existence on a project should be considered under the California Environmental Quality Act.

Size. The committee recognized that protecting only trees 8" or more in diameter have the result of protecting only large trees, and would be purely aesthetic in nature. In order to ensure continuing existence of these trees in the area, smaller sizes need to be protected. Four inches was arrived at by considering the case of the Southern California Black Walnut, which typically grows as a multi-trunk tree after fires. Establishing a diameter size of four inches would protect walnuts; a larger size would miss almost all walnuts that survived after fires.

Hardships accruing to developers. Developers are already familiar with the current requirements to survey trees eight inches or more in diameter. The proposed amendment would merely mandate a slightly longer report. For a typical single family residence, which usually would have only one protected tree on the property, a consultant's report would cost less than $200.00, which is only a fraction of building fees and typical project costs.

Status of trees on adjoining properties. Since adjoining properties are not typically surveyed for development purposes, trees on adjoining properties would not be required to be identified as a part of the development application package for any property. Development on a property may require a neighboring tree to be pruned, ground to be cut or filled, etc. In such a case, the property owner has the general legal right to prune both above ground and below ground parts of a tree that extend over and under his property, to cut and fill ground, etc., provided that these actions do not cause the tree to die. Section 46 defines "removed" or "removal" as "any act which will cause a protected tree to

die." If a property owner wished to undertake such extensive pruning, grading, etc., that would cause a protected tree to die, then that property owner would need a permit to undertake such an action. The property owner might also be liable to the adjacent property owner for destruction of a tree on the neighboring property.

Oversight of the regulations and enforcement of the regulations. The Street Tree Division of the Board of Public Works is responsible for oversight of the regulations. Enforcement comes in several ways. One, applicants for building permits are required to list protected trees on their site plans. Two, as part of any required environmental review, a plot plan of the site showing all trees must be submitted, and a mitigation for removal of any protected trees is required, in accordance with Code requirements. Three, citizen complaints to the Street Tree Division may cause the Street Tree Division itself to survey the trees on an affected parcel. Building permits will be withheld until the applicant evidences compliance with the protected tree regulations—usually, a sign-off from the Street Tree Division.

Enforcement is ultimately under the purview of both the Board of Public Works and the Department of Building and Safety. The Board can request the Department to withhold building permits on a property for violation of the protected tree regulations, or revoke a permit issued for which construction has not commenced, after a public hearing on the matter. This penalty can be for up to ten years, depending on the severity of violation of the protected tree regulations.

Urgency of adopting the proposed regulations. The proposed regulations are not urgently required to prevent an imminent threat to any particular tree or group of trees. However, the regulations should be adopted as soon as possible, in order to dovetail with the Mayor's "million trees" initiative.

Options for "replacement" of trees. The remover of trees can replace the trees on the site from which the trees were removed, provided that there is enough space on the site for them to be planted. If there is not enough space, the remover can purchase replacement trees and donate them to the Street Tree Division, which will plant them in available, appropriate, places. Alternatively, as a policy matter, the Street Tree Division will accept a monetary donation that approximates the value of the trees removed.

Whether a citation for non-permitted removal of protected trees continues with a change of ownership. Section 46.06 states that "the authority of the Bureau to act [to request that Building and Safety withhold or revoke building permits] shall not apply to a purchaser...who in good faith and for valuable consideration has acquired title subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent [of the Bureau to act.]".

CONCLUSION

The proposed ordinance (included in Appendix A) provides technical corrections to the "Oak Tree" (now "Protected Tree") provisions of the Zoning Code, to bring them into consistency with the amended provisions of Section 46 of the Municipal Code.

ENVIRONMENTAL IMPACT

The attached proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City of Los

Angeles CEQA Guidelines (ordinances which have no negative impact on the physical environment). Individual projects will continue to undergo specific environmental review at the time of their proposal.

APPENDIX A

PROPOSED ORDINANCE FOR DISCUSSION

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the twenty-sixth unnumbered paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph after the thirtieth unnumbered paragraph defining "Problem Areas":

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica).

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the

forty-fifth unnumbered paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the

appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the

City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a

report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

NOTE: The following Sections are for the Commission's reference, and not part of the Staff request for Commission adoption.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip

line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and,

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property,

provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by modifying Section 46.04 to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made I writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property, subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act

pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending; the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Section 96.303.5 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department of Public Works to verify such information by entry upon the subject property.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan shown on the reverse side of any building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy will not be issued unless the conditions set forth by the Advisory Agency in consultation with the City's Chief Forester relative to protected trees are met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph in its appropriate alphabetic location:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

OLD

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations**. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to

a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements**. In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required

shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip

line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of the ordinance that amends this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of the ordinance that amends this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of the ordinance that amends this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is hereby amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit

pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify such information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board at the Main Street entrance to Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

REFER TO STAFF

At its Special Meeting held October 3, 2005 (continued from November 5, 2003 and May 12, 2004 meetings), the Planning and Land Use Management Committee considered the following:

CF 03-1459	Report from the City Attorney and revised draft Ordinance relative to amending various provisions of Articles 2 and 7 of Chapter I, and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees; and reports from the Department of Public Works, Bureau of Street Services and Environmental Affairs Department relative to proposed amendments to the Oak Tree Ordinance (153478), as initiated by Motion (LaBonge - Garcetti).
CF 03-1459-S1	Reports from the Department of Public Works, Bureau of Street Services and Environmental Affairs Department relative to proposed amendments to the Oak Tree Ordinance (153478), pursuant to Motion (Garcetti - LaBonge).

The Committee instructed that the Motions be referred for consideration by the Planning Department and City Planning Commission, and that recommendations be forwarded to City Council.

CITY ATTORNEY

REPORT NO. R06-0042

FEB 08 2006

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Management Committee for further action. Moreover, on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance that might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use

Management Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff. PLUM met on October 3, 2005, to consider additional modifications to the draft ordinance. The matter was then referred to the City's Planning Commission, which met on this matter in December 18, 2005, and January 13, 2006. The Commission issued a report to the City Council on January 18, 2006, seeking additional clarifications. There are two items in the Planning Commission's action that are not included in this ordinance. The first relates to a procedural matter of the Department of Building and Safety. Inasmuch as that can be handled by the Department and does not need ordinance authority, we have not included that in the ordinance. The second issue regards a fee to ensure maintenance of relocated or replaced protected trees. This matter is still the subject of discussion with the departments. In order to bring this ordinance forward for Council action as soon as possible, we bring you the attached draft. If, with further discussion, the remainder of the issues needs to be addressed by ordinance, we will transmit another draft ordinance to you.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years on parcels where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the Municipal Code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their comments have been incorporated into the language of the current draft ordinance.

California Environmental Quality Act (CEQA)

This ordinance is exempt from the requirements of CEQA under the general exemption found in the City CEQA Guidelines Article 2, Section 1 because there is no possibility of it having a significant adverse effect on the environment. Consequently,

should the Council approve the ordinance it should also find that it is exempt from CEQA pursuant to the City Guidelines.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By Claudia Culling
CLAUDIA CULLING
Senior Assistant City Attorney

CC:KP:fa (#105209)

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subdivision 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. Protected Tree Relocation and Replacement. All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph to read:

Protected Tree - Any of the following Southern California native tree species, which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. The term "Tree Expert" set forth in Section 17.02 of the Los Angeles Municipal Code is amended to read:

Tree Expert - A person with at least four years of experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R of this Code. Provided, however, that in no event shall the reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in this article or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations.** Subject to historical preservation requirements set forth in Subdivision 3 of this subsection, when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency, in consultation with the City's Chief Forester, determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the

determination, the protected tree's removal would be permissible; or

(iii) A building permit has been issued for the property upon which the protected tree is located, the permit is still in effect, and the removal or relocation is not prohibited by the permit.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters that cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report required pursuant to Section 17.06 C, acceptable to the Advisory Agency and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of the tree; or

(v) It has no apparent aesthetic value, which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at the location.

2. Supplemental Authority. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of the tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In that event, the Advisory Agency may require a greater number of replacement trees.

3. Historical Monuments. The Advisory Agency, except as to Subdivision 1(b)(iii) above, shall require retention of a protected tree at its existing location, if the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. Requirements. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within the property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this article, except where the protected tree is relocated pursuant to Subdivision 2(a) above. The size of each replacement tree shall be a 15-gallon, or larger, specimen, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in a manner to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that the trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08 G as its procedural guide in satisfaction of the bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree that is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of the trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision where a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation of the tree. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06 B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any protected tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving the tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel where a protected tree is located shall be considered complete unless it includes a report pertaining to preserving the tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal; replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness in preserving the tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is amended to read:

I. When a protected tree exists on a proposed parcel, the preservation of the tree at its existing location, its relocation for preservation purposes, or the removal of the tree shall be regulated in the same manner as that provided under subdivision

regulations set forth in this chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or this article. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where the protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of

Public Works or its designated officer or employee, except as otherwise provided in this section.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed that may affect the protected tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where the Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory Agency pursuant to Article 7 of Chapter I of this Code; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the determination the protected tree's removal would be permissible; or

3. A building permit has been issued for any property and is still in effect with respect to the property under consideration and its implementation would necessitate the removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided in this section or unless the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if the Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters, which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at the location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the

protected tree, the tree is in danger of falling, notwithstanding the tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) Additional Authority. The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace the tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. In size, each replacement tree shall be at least a 15-gallon, or larger, specimen, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In that event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of the new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article, which permits the removal of one or more protected trees. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. WITHHOLDING OR REVOCATION OF BUILDING PERMITS FOR ILLEGAL REMOVAL OR RELOCATION OF PROTECTED TREES.

(a) The Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this section, shall have the authority to request the Superintendent of Building to withhold issuance of building permits, except for permits that are necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of ten years as requested by the Bureau and to revoke

any building permit issued for which construction has not commenced with respect to any property on which any protected tree has been removed or relocated in violation of Section 46.00 of this Code.

The request shall be made in writing by the Director of the Bureau of Street Services or his/her designee and shall specifically state the start date and end date of the period of time the Bureau, or the Board of Public Works on appeal, have deemed necessary pursuant to Subsection (c) of this section. The period shall commence on the date the Bureau first becomes aware of the removal of the tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection (b) of this section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of the notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in the property as revealed by a title search with respect to the property. A copy of the notice shall also be recorded by the Bureau with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection (b) above. At the hearing, if the facts indicate, the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal or relocation of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection (b) above. In the event the Bureau finds that a protected tree was removed or relocated in violation of Section 46.00 of this Code, it shall specify to the Superintendent of Building the length of time the issuance of building permits shall be withheld and whether building permits for which construction has not commenced shall be revoked. In making its determination, the Bureau shall consider the following factors: the number of trees removed or relocated, the size and age of the trees removed or relocated, the knowledge and intent of the owners of the property with respect to the removal or relocation and prior violations of law with respect to removal or relocation of protected trees. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days of the hearing.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to request the Superintendent of Building to revoke or withhold issuance of building permits, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, any action by the Department of Building and Safety resulting from any of the provisions of this section, including building permit revocation, shall not be appealable to the Board of

Building and Safety Commissioners.

(e) Any final determination of the Bureau or the Board of Public Works on appeal, to request the Superintendent of Building to withhold issuance of building permits or to revoke a building permit, shall be forwarded to the Superintendent within ten days of the Bureau or Board's determination and shall also be set forth in an affidavit, which shall be recorded by the Bureau with the County Recorder within ten days of the Bureau or Board's determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this section, the definition of "protected tree" set forth in Section 46.01 this Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify this information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of this Code for establishing fees.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R06-0044

FEB 08 2006

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Management Committee for further action. Moreover, on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance that might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use

Management Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff. PLUM met on October 3, 2005, to consider additional modifications to the draft ordinance. The matter was then referred to the City's Planning Commission, which met on this matter in December 18, 2005, and January 13, 2006. The Commission issued a report to the City Council on January 18, 2006, seeking additional clarifications. There are two items in the Planning Commission's action that are not included in this ordinance. The first relates to a procedural matter of the Department of Building and Safety. Inasmuch as that can be handled by the Department and does not need ordinance authority, we have not included that in the ordinance. The second issue regards a fee to ensure maintenance of relocated or replaced protected trees. This matter is still the subject of discussion with the departments. In order to bring this ordinance forward for Council action as soon as possible, we bring you the attached draft. If, with further discussion, the remainder of the issues needs to be addressed by ordinance, we will transmit another draft ordinance to you.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years on parcels where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the Municipal Code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their comments have been incorporated into the language of the current draft ordinance.

California Environmental Quality Act (CEQA)

This ordinance is exempt from the requirements of CEQA under the general exemption found in the City CEQA Guidelines Article 2, Section 1 because there is no possibility of it having a significant adverse effect on the environment. Consequently,

should the Council approve the ordinance it should also find that it is exempt from CEQA pursuant to the City Guidelines.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By Claudia Culling
CLAUDIA CULLING
Senior Assistant City Attorney

CC:KP:fa (#105209)

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV and Section 96.303.5 of the Los Angeles Municipal Code to assure the protection of, and to further regulate the removal of, protected trees

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subdivision 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. Protected Tree Relocation and Replacement. All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph to read:

Protected Tree - Any of the following Southern California native tree species, which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. The term "Tree Expert" set forth in Section 17.02 of the Los Angeles Municipal Code is amended to read:

Tree Expert - A person with at least four years of experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.05 R of this Code. Provided, however, that in no event shall the reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in this article or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. Required Determinations. Subject to historical preservation requirements set forth in Subdivision 3 of this subsection, when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency, in consultation with the City's Chief Forester, determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator, or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the

determination, the protected tree's removal would be permissible; or

(iii) A building permit has been issued for the property upon which the protected tree is located, the permit is still in effect, and the removal or relocation is not prohibited by the permit.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters that cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report required pursuant to Section 17.06 C, acceptable to the Advisory Agency and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

(iv) Its continued presence at its existing location interferes with proposed utility services or roadways within or without the subject property, and the only reasonable alternative to the interference is the removal of the tree; or

(v) It has no apparent aesthetic value, which will contribute to the appearance and design of the proposed subdivision; or it is not located with reference to other trees or monuments in such a way as to acquire a distinctive significance at the location.

2. Supplemental Authority. In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of the tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In that event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subdivision 1(b)(iii) above, shall require retention of a protected tree at its existing location, if the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency, in consultation with the City's Chief Forester, determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within the property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this article, except where the protected tree is relocated pursuant to Subdivision 2(a) above. The size of each replacement tree shall be a 15-gallon, or larger, specimen, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in a manner to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that the trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08 G as its procedural guide in satisfaction of the bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree that is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. Grading. The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of the trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision where a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation of the tree. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06 B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any protected tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving the tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel where a protected tree is located shall be considered complete unless it includes a report pertaining to preserving the tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness in preserving the tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is amended to read:

I. When a protected tree exists on a proposed parcel, the preservation of the tree at its existing location, its relocation for preservation purposes, or the removal of the tree shall be regulated in the same manner as that provided under subdivision

regulations set forth in this chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or this article. The term "removed" or "removal" shall include any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa):

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where the protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of

Public Works or its designated officer or employee, except as otherwise provided in this section.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed that may affect the protected tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) Exemptions. The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where the Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory Agency pursuant to Article 7 of Chapter I of this Code; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission, the appeal period established by this Code with respect to the determination has expired, the determination is still in effect, and pursuant to the determination the protected tree's removal would be permissible; or

3. A building permit has been issued for any property and is still in effect with respect to the property under consideration and its implementation would necessitate the removal or relocation.

(b) Board Authority. The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided in this section or unless the tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if the Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters, which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at the location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the

protected tree, the tree is in danger of falling, notwithstanding the tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) Additional Authority. The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace the tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. In size, each replacement tree shall be at least a 15-gallon, or larger, specimen, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In that event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of the new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article, which permits the removal of one or more protected trees. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. WITHHOLDING OR REVOCATION OF BUILDING PERMITS FOR ILLEGAL REMOVAL OR RELOCATION OF PROTECTED TREES.

(a) The Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this section, shall have the authority to request the Superintendent of Building to withhold issuance of building permits, except for permits that are necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of ten years as requested by the Bureau and to revoke

any building permit issued for which construction has not commenced with respect to any property on which any protected tree has been removed or relocated in violation of Section 46.00 of this Code.

The request shall be made in writing by the Director of the Bureau of Street Services or his/her designee and shall specifically state the start date and end date of the period of time the Bureau, or the Board of Public Works on appeal, have deemed necessary pursuant to Subsection (c) of this section. The period shall commence on the date the Bureau first becomes aware of the removal of the tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection (b) of this section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of the notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in the property as revealed by a title search with respect to the property. A copy of the notice shall also be recorded by the Bureau with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection (b) above. At the hearing, if the facts indicate, the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal or relocation of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection (b) above. In the event the Bureau finds that a protected tree was removed or relocated in violation of Section 46.00 of this Code, it shall specify to the Superintendent of Building the length of time the issuance of building permits shall be withheld and whether building permits for which construction has not commenced shall be revoked. In making its determination, the Bureau shall consider the following factors: the number of trees removed or relocated; the size and age of the trees removed or relocated, the knowledge and intent of the owners of the property with respect to the removal or relocation and prior violations of law with respect to removal or relocation of protected trees. The applicant or permittee shall be notified in writing of the Bureau's determination within 30 days of the hearing.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to request the Superintendent of Building to revoke or withhold issuance of building permits, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, any action by the Department of Building and Safety resulting from any of the provisions of this section, including building permit revocation, shall not be appealable to the Board of

Building and Safety Commissioners.

(e) Any final determination of the Bureau or the Board of Public Works on appeal; to request the Superintendent of Building to withhold issuance of building permits, or to revoke a building permit, shall be forwarded to the Superintendent within ten days of the Bureau or Board's determination and shall also be set forth in an affidavit, which shall be recorded by the Bureau with the County Recorder within ten days of the Bureau or Board's determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this section, the definition of "protected tree" set forth in Section 46.01 this Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify this information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration. The fee shall be determined and adopted in the same manner as provided in Section 12.37 I.1 of this Code for establishing fees.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall; one copy on the bulletin board located at the Main Street entrance to the Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

Re: Cutting of Oak Trees on 3593 Multivew Drive

Dear Mr Gonzalez:

I am writing on behalf of the Mulholland Scenic Parkway Design Review Board, asking you to prosecute the owner of 3593 Multiview Drive, Steve Hiyoshi, to the fullest extent of the law for the unlawful cutting, mutiliation, and removal of oak trees on the site. The owner violated Los Angeles Municipal Code Section 4600, the Oak Tree Ordinance, and he should be held accountable.

There is no way to mitigate the damage done to the oaks trees. Even the planting of new ones in a two to one ratio will take years to reach the size of the ones removed. We ask that you urge the City Attorney to go forward and prosecute the owner. Time after time, projects come to us where "someone," but never the applicant, has cut or removed precious oak trees from the site. People continue to violate the Oak Tree Ordinance in this way because it is so easy to escape accountability. We ask that you help to make an example in this case so that future owners of hillside property will be deterred from mutilating oak trees in this manner.

Thank you for your kind assistance.

Yours truly,

Lynette Berg Robe
Chair, Mulholland Scenic Parkway Design Review Board

Los Angeles City Council

Re: Oak Tree Protection Ordinance

Dear City Representatives,

The undersigned would like to voice our strong support of implementing tougher restrictions and penalities as part of the Oak Tree Protection Ordinance. Recently in our neighborhood a developer who did not own the property at 3593 Multiview Drive, destroyed some 30 oaks, illegally, permanently scarring the land. The sale ultimately did not go through and the developer was cited for this egregious act

However, this is a loss to the city that can not be replaced. A small fine and six months in jail is a slap on the hand to someone who has done irreparable harm. This has impacted our area in many ways including opening up the hillside to possible landslide damage, diminishing the already squeezed wildlife habitat and damaging the aesthetic of our community, which is the reason we live in this part of Los Angeles.

When will the leaders of the City of Los Angeles recognize that its precious natural resources are a benefit to the community and that this type of land misuse costs more in the long run? Tougher restrictions and penalties should be levied against those with clearly no regard for its value. In addition, a developer that has demonstrated this utter lack of regard should not be licensed to practice in Los Angeles, let alone in California.

Our heritage is being threatened by those whose only motive is profit. We should not have to explain to future generations why we took no action to save what was left in the already overgrown Los Angeles area.

Thank you for your consideration.

PLANNING and LAND USE MGT.

MOTION

JUL 0 8 2003

The City of Los Angeles continues to suffer a decrease in its Oak tree and native tree species woodland habitat due to disease, development and other factors. The City's Oak Tree ordinances were first adopted on April 12, 1980 in order to establish clear standards for the preservation of these beautiful and culturally significant living monuments.

There are various other provisions that require updating. For example, the current tree replacement requirement, a minimum fifteen gallon Oak tree replacement per removal, does not adequately mitigate the loss of Oak tree woodlands. Additionally, the current definition of "Tree Expert," a licensed pest control advisor or landscape architect, needs to be updated to allow for the most knowledgeable Oak tree professionals and Consulting Arborists to be included.

Preservation of Oak trees targets signature trees of only one of the City's native plant communities, and other species should be considered for enhanced protections along the lines of the City's Oak Tree ordinances.

Regulations to preserve trees have significantly changed and progressed, both in California and across the country, due to increased scientific knowledge of trees and public awareness of the importance of native tree species. An opportunity exists to update City laws pertaining to Oak trees to better protect our remaining stock of these historic treasures to ensure that future generations can take part in their legacy.

I THEREFORE MOVE that the departments of Public Works, City Planning and Environmental Affairs be instructed to work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City arborists to preserve native tree species that share common ecosystems while maintaining a more diverse species base.

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R05-0212

JUN 21 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background:

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

Summary of Ordinance Provisions:

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the municipal code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral:

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their early comments were incorporated into the language of the current draft ordinance. They have been asked by this office's most recent letter to make their comments directly to the Council's Planning and Land Use Committee.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

By
DAVID MICHAELSON
Chief Assistant City Attorney

DM:KP:fa (#105209)

Transmittal

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan shown on the reverse side of any building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy will not be issued unless the conditions set forth by the Advisory Agency in consultation with the City's Chief Forester relative to protected trees are met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph in its appropriate alphabetic location:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations**. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of this Code Section; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this Code Section, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, accept as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two protected trees of a variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National

Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PERMITS.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two protected trees of a variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I.1. of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to recommend to the Superintendent of the Department of Building and Safety, after notice and hearing, to withhold issuance of a building permit for a period of time up to 10 years and to revoke any permit issued, unless expired, for which rights have not been obtained with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection B of this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder. No building permit shall be issued during the period preceding the hearing and determination by the Bureau and any appeal therefrom.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of the Department of Building and Safety the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any recommendation by the Bureau to revoke or withhold issuance of a building permit. The appeal must be filed with the Board within 30 days of the date of mailing of the notice of recommendation as provided for in Subsection C above.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination. No building permit may be issued contrary to any such recommendation and any such permit issued shall be revoked for which rights have not been obtained.

Sec. 15. Subsection 5 of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Department to verify such information by entry upon the subject property. A fee, as specified in Section 98.0412(a) of the Municipal Code shall be collected by the Department for any inspection required to verify the declaration.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

SUBJECT: CF:03-1459 – PROPOSED AMENDMENTS TO THE OAK TREE ORDINANCE (ORDINANCE 153,478)

RECOMMENDATIONS

The Department of Public Works, Environmental Affairs Department, and Community Forest Advisory Committee recommend that the City Council instruct the City Attorney to prepare revisions to the City's Oak Tree Ordinance in order to more adequately protect our remnant native woodlands, one of the City's most valuable natural resources. The recommended revisions are as follows:

Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbellularia californica) in the ordinance and change the ordinance title to "Preserved Trees".

Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

Require a permit for preserved tree removal/relocation on all property within the City boundaries regardless of property lot size.

PLAN & LAND USE MGT.

JAN 14 2004

Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at three and one-half feet above ground level.

Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Increase the monetary fine for violating the ordinance.

Include civil penalties, such as prohibiting development of property if Oak trees are removed without a permit.

Require a tree pruning permit for all Oak tree pruning in the City of Los Angeles.

FISCAL IMPACT STATEMENT

The number of permits that will be required to be issued will increase due to the larger number of trees that are protected and the need for a permit to be issued for all oak trees to be pruned. As there is a fee for the issuance of these permits, the program will be self-supporting and have no impact to the General Fund.

DISCUSSION

The City of Los Angeles enacted the Oak tree ordinance (Ordinance 153.478) in 1980 to protect its remaining native Oak tree woodlands. In spite of this ordinance, the City continues to suffer a decline to its native Oak tree woodlands due to development, disease, and other factors. With even fewer native trees and woodlands remaining, the time has come to strengthen the oak tree ordinance, giving protection to a wider range of native trees as well as smaller trees that have not yet reached maturity. A stronger, more inclusive ordinance would give the Department of Public Works greater abilities to protect our native trees and preserve this important part of the City's natural history.

Staff from the Department of Public Works' Street Tree Division and the Departments of Environmental Affairs and City Planning met with representatives from the Community Forest Advisory Committee in January and February of 2003 to discuss the current tree protection ordinances and how they could be revised to better protect and preserve the City's remaining native trees and woodlands.

Item #1: Include other Southern California native tree species, including Southern California Black Walnut (Juglans californica var. californica), Western Sycamore (Platanus racemosa), and California Bay (Umbe llularia californica) in the ordinance and change the ordinance title to "Preserved Trees".

Oaks are not the only native trees that inhabit City of Los Angeles. Other Southern California native tree species include the Southern California Black Walnut, Western Sycamore, and California Bay. These species are currently without any legal protection from development and other urban pressures even though they also are an important part of the City's natural history. The inclusion of these trees

necessitates the change of the ordinance title to "Preserved Trees" to more properly represent the scope and contents of the newly revised ordinance.

Item #2: Include Registered Consulting Arborists (American Society of Consulting Arborists) in the definition of "Tree Expert".

The definition of a tree expert currently includes only someone who holds a valid California license as an agricultural pest control advisor or landscape architect. Although there are individuals in both categories that have the necessary expertise to assess oak trees and prepare oak tree reports, Registered Consulting Arborists (American Society of Consulting Arborists) are most qualified to determine the health and condition of trees and should, therefore, be included in the definition of tree expert.

Item #3: Require a permit for preserved tree removal/relocation on all property within the City boundaries regardless of property lot size.

The current Oak Tree Ordinance applies only to trees located on lots larger than one acre in size. This severely limits the applicability of this ordinance due to the highly urbanized and fragmented nature of our City. Although new developments generally fall into this category of lot size, all remaining native trees should be protected regardless of the size of the lot on which they live.

Item #4: Reduce the threshold of eight inches of trunk diameter measured at four and one-half feet to two inches cumulative trunk diameter measured at three and one-half feet above ground level.

The current definition of an oak tree includes only those specimens whose trunks measure eight inches in diameter four and one-half feet above ground level. Some of the other native trees, specifically the Southern California Black Walnut, exhibit different growth habits and quite often have multiple trunks rather than a single one. To ensure that the ordinance protects these trees as well as smaller single-trunk trees, we recommend that the tree definitive be changed to include all specimens that have a trunk or trunks that cumulatively measure two inches at a level of three and one-half feet above the ground.

Item #5: Calculate the tree replacement mitigation utilizing a trunk volume or canopy coverage formula.

When oak trees are allowed to be removed under the current ordinance, they are replaced on a one-for-one basis. This leaves a deficit in the amount of benefits that the City obtains from this tree for many years as oaks are slow-growing trees and the environmental benefits afforded by a mature tree are much greater than those of small tree. Therefore, the ordinance should be revised to take a more balanced approach based on a calculation utilizing a trunk volume or canopy coverage formula.

Item #6: Allow trees smaller than 15-gallons in size or seeds as replacements if the smaller sizes or seeds will have a greater chance of survival than larger sizes.

Replacement trees allowed under the current ordinance must be a minimum of 15-gallons in size. Although this is a good approach for many species, some of the native species do not grow well in nursery containers. Because of this, they are generally not available in nursery-size containers and even if they were, the individuals would be unlikely to mature to healthy trees due to improperly developed roots.

To account for these growth requirements, the ordinance needs to allow for smaller trees, or in some cases tree seeds, to be used as replacements if this would afford a greater chance of long-term survival than the use of larger size trees.

Item #7: Increase the monetary fine for violating the ordinance.
Item #8: Include civil penalties, such as prohibiting development of property if Oak trees are removed without a permit.

The current ordinance lacks adequate enforcement mechanisms. Often, a developer will pay the small fines involved in illegally removing an oak tree as this is economically advantageous over preserving the trees. By increasing the monetary fine and including civil penalties, such as prohibiting development of property if Oak trees are removed without a permit, the preserved trees will be better protected.

Item #9: Require a tree pruning permit for all Oak tree pruning in the City of Los Angeles.

The final recommended change would require a tree pruning permit for all Oak tree pruning in the City of Los Angeles regardless of where that tree is located. This will help to ensure that oaks are trimmed at the proper time of year, according to ISA standards, by properly trained and reputable tree trimmers. This protection of all of the oaks within the City will help to preserve the last remnants of our native woodlands.

If you have any questions, please contact the undersigned, or George Gonzalez, Chief Forester, Street Tree Division, at (213) 485-5675.

Sincerely,

WILLIAM A. ROBERTSON, Director
Bureau of Street Services

OFFICE OF THE CITY ATTORNEY
ROCKARD J. DELGADILLO
CITY ATTORNEY

REPORT NO. R05-0288

AUG 16 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

Recyclable and made from recycled waste.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the municipal code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their early comments were incorporated into the language of the current draft ordinance. They have been asked by this office's most recent letter to make their comments directly to the Council's Planning and Land Use Committee.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

Enclosure

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations**. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to

a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required

shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip

line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of the ordinance that amends this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of the ordinance that amends this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of the ordinance that amends this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

OFFICE OF THE CITY ATTORNEY

REPORT NO. R05-0288

AUG 16 2005

REPORT RE:

DRAFT ORDINANCE AMENDING VARIOUS PROVISIONS OF ARTICLES 2 AND 7 OF CHAPTER I AND ARTICLE 6 OF CHAPTER IV OF THE LOS ANGELES MUNICIPAL CODE AND SECTION 96.303.5 TO ASSURE THE PROTECTION OF, AND TO FURTHER REGULATE THE REMOVAL OF PROTECTED TREES

The Honorable City Council
of the City of Los Angeles
Room 395, City Hall
200 North Spring Street
Los Angeles, CA 90012

Council File Nos.: 03-1459 and 03-1459-S1

Honorable Members:

This Office has prepared and now transmits for your action the attached draft ordinance, approved as to form and legality. This draft ordinance revises the provisions of the Los Angeles Municipal Code to provide for additional protections of certain native trees.

Background

On July 8, 2003, the Council adopted a motion which instructed the Departments of Public Works, Planning and Environmental Affairs to "work with the City Attorney's office to investigate appropriate revisions to the City's Oak Tree ordinances to enable City Arborists to preserve native species that share common ecosystems while maintaining a more diverse species base." The motion was referred to the Council's Planning and Land Use Committee for further action. Moreover on September 19, 2003, the Council adopted a motion directing the Public Works and Building and Safety Departments with the assistance of the Office of the City Attorney to report to the Council's Planning and Land Use Committee on possible revisions to the Oak Tree Protection Ordinance which might include withholding of development permits for periods of time. On May 10, 2004, the Council's Planning and Land Use Committee (PLUM) met to consider various modifications to existing ordinances as directed by these motions. Both matters were continued for additional modifications by staff.

Summary of Ordinance Provisions

The new ordinance expands the number of species protected from one to four. It eliminates the minimal lot size provision for effected parcels. The ordinance decreases the size of protected trees from eight to four inches in diameter and includes multitrunk trees by measuring "cumulative diameter." It allows for the non-issuance or revocation of building permits for up to ten years where a protected tree has been removed or destroyed. The ordinance more narrowly defines who may be considered a tree expert under the municipal code. Lastly, it requires the City's Advisory Agency to consult with the City's Chief Forester before making determinations that relate to protected trees.

Council Rule 38 Referral

A copy of the draft ordinance was sent twice, pursuant to Council Rule 38, to the Departments of Building and Safety, Environmental Affairs, Planning and Public Works. Their early comments were incorporated into the language of the current draft ordinance. They have been asked by this office's most recent letter to make their comments directly to the Council's Planning and Land Use Committee.

If you have any questions, please contact Deputy City Attorney Keith Pritsker at (213) 978-8141. Either he or another member of this Office will be available when you consider this matter to answer any questions that you may have.

Sincerely,

ROCKARD J. DELGADILLO, City Attorney

ORDINANCE NO. _____

An ordinance amending various provisions of Articles 2 and 7 of Chapter I and Article 6 of Chapter IV of the Los Angeles Municipal Code and Section 96.303.5 to assure the protection of, and to further regulate the removal of protected trees.

THE PEOPLE OF THE CITY OF LOS ANGELES DO ORDAIN AS FOLLOWS:

Section 1. Subsection 12 of Subsection A of Section 12.21 of the Los Angeles Municipal Code is amended to read:

12. **Protected Tree Relocation and Replacement.** All existing protected trees and relocation and replacement trees specified by the Advisory Agency in accordance with Sections 17.02, 17.05, 17.06, 17.51 and 17.52 of this Code shall be indicated on a plot plan attached to the building permit issued pursuant to this Code. In addition, the trees shall be identified and described by map and documentation as required by the Advisory Agency. A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtains from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the construction, a written or electronic document certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Sec. 2. Section 17.02 of the Los Angeles Municipal Code is amended by deleting the paragraph defining "Oak Tree" in Section 17.02 and adding the following paragraph:

Protected Tree - Any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

(a) Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

(b) Southern California Black Walnut (Juglans californica var. californica)

(c) Western Sycamore (Platanus racemosa)

(d) California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 3. Section 17.02 of the Los Angeles Municipal Code is amended by replacing the paragraph defining "Tree Expert" in Section 17.02 with the following paragraph:

Tree Expert - A person with at least four years experience in the business of transplanting, moving, caring for and maintaining trees and who is (a) a certified arborist with the International Society of Arboriculture and who holds a valid California license as an agricultural pest control advisor or (b) a landscape architect or (c) a registered consulting arborist with the American Society of Consulting Arborists.

Sec. 4. Subdivision 7 of Subsection H of Section 17.05 of the Los Angeles Municipal Code is amended to read:

7. Where the Advisory Agency finds the project is consistent with the dwelling unit density permitted by the General Plan, and that the public health, safety or welfare and good subdivision design will be promoted by the preservation of protected trees, the Advisory Agency may permit the required area of one or more of the lots in a subdivision in an "RA," "RE," "RS" or "R1" Zone to be reduced by an amount sufficient to provide for protected tree preservation in accordance with Section 17.06 R. of this Code. Provided, however, that in no event shall such a reduction exceed 50 percent of the required lot area; no "RA" or "RE" lot shall be reduced below 50 feet in width; no "RS" or "R1" lot shall be reduced below 40 feet in width; and no lot in a designated "K" Horsekeeping District shall be reduced below 17,500 square feet.

Sec. 5. Subsection R of Section 17.05 of the Los Angeles Municipal Code is amended to read:

R. Protected Tree Regulations. No protected tree may be relocated or removed except as provided in Article 7 of Chapter I or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other parts of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

1. **Required Determinations**. Subject to historical preservation requirements set forth herein at Subdivision 3 when a protected tree exists within a proposed subdivision, the tree may be relocated or removed if the Advisory Agency in consultation with the City's Chief Forester determines the existence of either (a) or (b) below:

(a) There has been prior applicable government action in which:

(i) The removal of the tree had been approved by the Advisory Agency prior to the effective date of the ordinance that amends this subsection of the Code; or

(ii) The property upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the Area Planning Commission, the City Council, a Zoning Administrator, or the Appeal Board prior to the effective date of the ordinance that amends this subsection of the Code, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the oak tree's removal would be permissible; or

(iii) A building permit has been issued prior to the effective date of this subsection of the Code, for the property upon which the protected tree is located, the permit is still in effect, and such removal or relocation is not prohibited thereby.

(b) The removal of the protected tree would not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City's Chief Forester, and the physical condition or location of the tree is such that:

(i) Its continued presence in its existing location prevents the reasonable development of the property; or

(ii) According to a report, required pursuant to Section 17.06-C, acceptable to the Advisory Agency, and prepared by a tree expert, there is a substantial decline from a condition of normal health and vigor of the tree, and its restoration through appropriate and economically reasonable preservation procedures and practices is not advisable; or

(iii) It is in danger of falling due to an existing and irreversible condition.

2. **Supplemental Authority.** In the event the Advisory Agency in consultation with the City's Chief Forester determines, pursuant to Subdivision 1(b) above, that a protected tree may be removed or relocated, the Advisory Agency may:

(a) Require relocation elsewhere on the same property where a protected tree has been approved for removal, and where the relocation is economically reasonable and favorable to the survival of said tree. Relocation to

a site other than upon the same property may be permitted where there is no available or appropriate location on the property and the owner of the proposed off-site relocation site consents to the placement of a tree thereon. In the event of relocation, the Advisory Agency may designate measures to be taken to mitigate adverse effects on the tree.

(b) Permit protected trees of a lesser size, or trees of a different species, to be planted as replacement trees for protected trees permitted by this Code to be removed or relocated, if replacement trees required pursuant to this Code are not available. In such event, the Advisory Agency may require a greater number of replacement trees.

3. **Historical Monuments.** The Advisory Agency, except as to Subsection R1(b)(iii) above, shall require retention of a protected tree at its existing location, if said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone.

4. **Requirements.** In the event the Advisory Agency in consultation with the City's Chief Forester determines pursuant to Subdivision 1(b) above that a protected tree may be removed or relocated, the Advisory Agency shall require that:

(a) The protected tree be replaced within said property by at least two trees of a protected variety included within the definition set forth in Section 17.02 of this Code, except where the protected tree is relocated pursuant to Section 17.05-R2(a). Each replacement tree shall be a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter at a point one foot above the base, and not less than seven feet in height, measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

(b) The subdivider record those covenants and agreements approved by the Advisory Agency necessary to assure compliance with conditions imposed by the Advisory Agency and to assure protected tree preservation.

(c) The subdivider provide protected tree maintenance information to purchasers of lots within the proposed subdivision.

(d) The subdivider post a bond or other assurance acceptable to the City Engineer to guarantee the survival of trees required to be replaced or permitted or required to be relocated, in such a fashion as to assure the existence of continuously living trees at the approved replacement or relocation site for three years from the date that such trees are replaced or relocated. The City Engineer shall use the provisions of Section 17.08-G as its procedural guide in satisfaction of said bond requirements and processing. Any bond required

shall be in a sum estimated by the City Engineer to be equal to the dollar value of the replacement tree or of the tree which is to be relocated. In determining value for these purposes, the City Engineer shall consult with the Advisory Agency, the City's Chief Forester, the evaluation of trees guidelines approved and adopted for professional plantsmen by the International Society of Arboriculture, the American Society of Consulting Arborists, the National Arborists Association and the American Association of Nurserymen, and other available, local information or guidelines.

5. **Grading.** The Advisory Agency is authorized to prohibit grading or other construction activity within the drip line of a protected tree.

Sec. 6. Subdivision 13 of Subsection B of Section 17.06 of the Los Angeles Municipal Code is amended to read:

13. The approximate location and general description of any large or historically significant trees and of any protected trees and an indication as to the proposed retention or destruction of such trees.

Sec. 7. Subsection C of Section 17.06 of the Los Angeles Municipal Code is amended to read:

C. Protected Tree Reports for Tentative Tract Maps. No application for a tentative tract map approval for a subdivision wherein a protected tree is located shall be considered complete unless it includes a report, in a form acceptable to the Advisory Agency and the City's Chief Forester, which pertains to preserving the tree and evaluates the subdivider's proposals for the preservation, removal, replacement or relocation thereof. The report shall be prepared by a tree expert and shall include all protected trees identified pursuant to Section 17.06-B 13 of this Code.

In the event the subdivider proposes any grading, land movement, or other activity within the drip line of a protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and their anticipated effectiveness in preserving such tree.

Sec. 8. Subsection D of Section 17.51 of the Los Angeles Municipal Code is hereby amended to read:

D. Protected Tree Reports for Parcel Maps. No application for a preliminary parcel map approval for a parcel wherein a protected tree is located shall be considered complete unless it includes a report pertaining to preserving said tree. The report shall be prepared by a tree expert and shall evaluate the subdivider's proposals for protected tree preservation, removal, replacement and/or relocation. In the event the subdivider proposes any grading, land movement, or other activity within the drip

line of any protected tree referred to in the report, or proposes to relocate or remove any such tree, the report shall also evaluate any mitigation measures proposed by the subdivider and the anticipated effectiveness thereof in preserving such tree.

Sec. 9. Subsection I of Section 17.52 of the Los Angeles Municipal Code is hereby amended to read:

I. When a protected tree exists on a proposed parcel, the preservation thereof at its existing location, its relocation for preservation purposes, or the removal of said tree shall be regulated in the same manner as that provided under subdivision regulations set forth in this Chapter.

Sec. 10. Article 6 of Chapter IV of the Los Angeles Municipal Code is hereby amended by amending the title and Section 46.00 to read:

ARTICLE 6

PRESERVATION OF PROTECTED TREES

SEC. 46.00. PROTECTED TREE REGULATIONS.

No protected tree may be relocated or removed except as provided in Article 7 of Chapter 1 or Article 6 of Chapter IV of this Code. The term "removed" or "removal" shall include any act which will cause a protected tree to die, including but not limited to acts which inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk.

Sec. 11. Section 46.01 of the Los Angeles Municipal Code is amended to read:

SEC. 46.01. DEFINITION.

"PROTECTED TREE" means any of the following Southern California native tree species which measures four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the tree:

1. Oak tree including Valley Oak (Quercus lobata) and California Live Oak (Quercus agrifolia), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (Quercus dumosa).

2. Southern California Black Walnut (Juglans californica var. californica)

3. Western Sycamore (Platanus racemosa)

4. California Bay (Umbellularia californica)

This definition shall not include any tree grown or held for sale by a licensed nursery, or trees planted or grown as a part of a tree planting program.

Sec. 12. Section 46.02 of the Los Angeles Municipal Code is amended to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMITS TO RELOCATE OR REMOVE PROTECTED TREES.

No person shall relocate or remove any protected tree, as that term is defined in Section 46.01, where said protected tree is not regulated pursuant to Article 7 of Chapter I of this Code, without first having applied for and obtained a permit from the Board of Public Works or its designated officer or employee, except as otherwise provided herein.

An application for a permit shall indicate, in a manner acceptable to the Board of Public Works, by number on a plot plan, the location of each protected tree, and shall identify each protected tree proposed to be retained, relocated or removed. If any grading is proposed which may affect such a tree, a copy of the grading permit plan in compliance with Division 70 of Article 1 of Chapter IX of this Code shall be submitted with the application.

(a) **Exemptions.** The Board of Public Works shall exempt from and not require issuance of a permit for the relocation or removal of a protected tree where said Board is satisfied that:

1. The proposed relocation or removal of the protected tree has been approved by the Advisory agency pursuant to Article 7 of Chapter I of this Code, or has been approved by the Advisory Agency prior to the effective date of the ordinance that amends this Code Section; or

2. The land upon which the protected tree is located has been the subject of a determination by the City Planning Commission, the City Council, a Zoning Administrator or an Area Planning Commission prior to the effective date of the ordinance that amends this Code Section, the appeal period established by this Code with respect to said determination has expired, the determination is still in effect, and pursuant thereto the protected tree's removal would be permissible; or

3. A building permit has been issued for any property prior to the effective date of the ordinance that amends this Code Section and is still in effect with respect to the property under consideration and its implementation would necessitate such removal or relocation.

(b) **Board Authority.** The Board of Public Works may grant a permit for the relocation or removal of a protected tree, unless otherwise provided herein or unless said tree is officially designated as an Historical Monument or as part of an Historic Preservation Overlay Zone, if said Board determines that the removal of the protected tree will not result in an undesirable, irreversible soil erosion through diversion or increased flow of surface waters which cannot be mitigated to the satisfaction of the City; and

1. It is necessary to remove the protected tree because its continued existence at said location prevents the reasonable development of the subject property; or

2. The protected tree shows a substantial decline from a condition of normal health and vigor, and restoration, through appropriate and economically reasonable preservation procedures and practices, is not advisable; or

3. Because of an existing and irreversible adverse condition of the protected tree, the tree is in danger of falling, notwithstanding said tree having been designated an Historical Monument or as part of an Historic Preservation Overlay Zone.

(c) **Additional Authority.** The Board of Public Works or its authorized officer or employee may:

1. Require as a condition of a grant of permit for the relocation or removal of a protected tree, that the permittee replace said tree within the same property boundaries by at least two trees of a protected variety included within the definition set forth in Section 46.01 of this Code, in a manner acceptable to the Board. Each replacement tree shall be at least a 15-gallon, or larger, specimen in size, measuring one inch or more in diameter one foot above the base, and be not less than seven feet in height measured from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced.

2. Permit protected trees of a lesser size or trees of a different species to be planted as replacement trees, if replacement trees of the size and species otherwise required pursuant to this Code are not available. In such event, a greater number of replacement trees may be required.

3. Permit a protected tree to be moved to another location on the property, provided that the environmental conditions of said new location are favorable to the survival of the tree and there is a reasonable probability that the tree will survive.

Sec. 13. Section 46.04 of the Los Angeles Municipal Code is hereby amended to read:

SEC. 46.04. FEES.

A fee shall be charged for issuance of any permit pursuant to this article which permits the removal of one or more protected trees.

The fees herein shall be determined and adopted in the same manner as provided in Section 12.37 I. 1 of the Los Angeles Municipal Code for establishing fees.

Sec. 14. A new Section 46.06 is added to the Los Angeles Municipal Code to read:

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

(a) The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Director of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections (b) and (c) of this Section, shall have the authority to request to the Superintendent of Building to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued, for which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection (c) of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in subsection (b) of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit

pursuant to this Section.

(b) The Bureau shall notify the applicant or permittee in writing of its intent to act pursuant to this section. The notice shall state that the applicant or permittee may submit any evidence it deems relevant on this matter, the hearing to be held on a date specified in the notice. A copy of such notice shall also be mailed to the owner of the property, if different from the applicant or permittee, as shown on the last equalized assessment roll, and to any person holding a deed of trust, mortgage or other security interest in said property as revealed by a title search with respect thereto. A copy of said notice shall also be recorded with the County Recorder.

(c) The Bureau hearing shall be set on a date no earlier than 20 days after the date of the mailing of the notice provided for in Subsection B above. At said hearing the Bureau shall make a finding that the applicant or permittee is not a purchaser in good faith and for valuable consideration who acquired title to the property subsequent to the illegal removal of the protected tree and prior to the recordation of the notice of intent as provided for in Subsection B above. In the event the Bureau finds that a protected tree was removed in violation of Section 46.00 of this Code, it shall recommend to the Superintendent of Building the length of time the issuance of a building permit shall be withheld. In so recommending, the Bureau shall consider the following factors: the number of trees removed, the size and age of the trees removed, the knowledge and intent of the owners of the property with respect to such removal and prior violations of law with respect to protected trees removal. The applicant or permittee shall be notified in writing of the Bureau's recommendation within 30 days thereafter.

(d) The applicant or permittee may appeal to the Board of Public Works any determination by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination as provided for in Subsection (c) above. Further, that any action by the Department of Building and Safety resulting from any of the provisions of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

(e) Any final recommendation of the Bureau, or the Board on appeal, to refuse to issue a permit or revoke a permit shall be set forth in an affidavit which shall be recorded with the County Recorder. No such affidavit shall be recorded, however, until any legal challenge to the Bureau's or Board's action has been concluded and then only in a manner consistent with any final legal determination.

Sec. 15. Subsection 5. of Section 96.303 of the Los Angeles Municipal Code is amended to read:

5. The owner must also provide a declaration under penalty of perjury that he or she has inspected the property for the existence of protected trees and the number of protected trees, if any, located on the subject property. For the purposes of this Section, the definition of "protected tree" set forth in Section 46.01 of the Los Angeles Municipal Code shall apply. The declaration shall also authorize the Bureau of Street Services within the Department of Public Works to verify such information by entry upon the subject property. A fee may be collected for any inspection required to verify the declaration.

Sec. 16. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board at the Main Street entrance to Los Angeles City Hall East; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of _____.

RULE 38 RESPONSE FOR A DRAFT ORDINANCE AMENDING OAK TREE CODE PROVISIONS

The latest version of the draft ordinance submitted for review (second review) does not include the comments made by the Department of Building and Safety in response (first review) to the City Attorney's letter of August 11, 2004, and therefore, pursuant to Council Rule 38, the Department of Building and Safety (LADBS) has again reviewed the proposed draft ordinance amending the oak tree code provisions and have the following comments:

Page 1, Section 1 of the ordinance. Currently, the permit application does not have a "reverse side" where a plot plan is shown. Please remove the phrase "on the reverse side of any" and replace it with "attached to the" since the automation of building permits, all plot plans are now attached to the building permits.

Page 1, Section 1 of the ordinance. It is not clear how the City's Chief Forester (George Gonzalez) is to notify the Department of Building and Safety prior to the issuance of a Certificate of Occupancy. To be assured that all the conditions set forth by the Advisory Agency are met and that the Department of Building and Safety is able to issue the Certificate of Occupancy, please replace the last sentence of the paragraph in Subsection 12 of Section 12.21 A with the following procedure:

> A Certificate of Occupancy may be issued by the Department of Building and Safety, provided the owner of the property or authorized person representing the owner of the property (licensed contractor) obtain from the Advisory Agency in consultation with the City's Chief Forester, prior to the final inspection for the

JUL 0 5 2005
PLAN & LAND USE MGT.

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

construction, a written document signed certifying that all the conditions set forth by the Advisory Agency relative to protected trees have been met.

Page 2, Section 3 of the ordinance. The proper name in accordance with the California Department of Pesticide Regulation is "Agricultural Pest Control Advisor," therefore, please add the word "control" between the words "pest" and "advisor" so that, the definition of the term "Tree Expert" reads: "A person ....who holds a valid California license as an Agricultural Pest Control Advisor or ..."

Page 2, Section 5 of the ordinance. For clarity since both terms are used in this subsection, please add the word "removed" to the second sentence of the first paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 2, Section 5 of the ordinance. The title of the first numbered paragraph "Required Determinations" of Subsection R should be in bold text.

Page 3, Section 5 of the ordinance. Please replace the upper case (I) with lower case (i) in two places on this page and fix the format of the first (i) paragraph on the page to be consistent with the other paragraphs.

Page 3, Section 5 of the ordinance. Items (i), (ii) and (iii) of Subdivision 1 (a) of Subsection R of Section 17.05 refers to "effective date of this Code Section." Please clarify the "effective date" between the effective date of the ordinance of 6/14/62, which added the Code Section 17.05, and the effective date of the ordinance of 4/12/80, which added the Subsection R of Section 17.05 (regarding oak trees). In either case, you may want to replace the term "effective date of this Code Section" with one of the dates, so long as the intent is clear.

Page 3, Subdivision 1 (b) of Section 5 of the ordinance. The first paragraph refers to "The removal of the protected tree would not result in an undesirable, irreversible soil erosion ...which cannot be mitigated to the satisfaction of the City..." It is not clear as to who in the "City" needs to be satisfied. Is there a specific department of the City? Chief Forester? Inspector from LADBS? Please indicate the intent, by specifying who in the "City" needs to be satisfied.

Page 4, Subdivision 3 of Section 5 of the ordinance. Is the word "accept" the correct term? What is the intent of the phrase "accept as to Subsection R1(b) (iii) above," mean? Is the intent to keep the existing protected tree where it is if it is a Historical Monument, unless the tree "is in danger of falling due to an existing and irreversible condition"? If so, than please reword the sentence to convey the intent.

Page 4, Subdivision 3 of Section 5 of the ordinance. Please explain the difference between a protected tree "officially designated as an Historical Monument" (Subsection R3) versus a protected tree "subject to historical preservation requirements" (Subsection R1)? Please explain the logic between the first sentence of Subsections R1 and R3, these two subsections seems to

contradict each other.

Page 4, Subdivision 4(a) of Section 5 of the ordinance. The property is to replace one protected tree with "at least two protected trees..." The definition of the term "protected tree" states in part "...native tree species which measures four inches or more ...four and one-half feet above the ground..." and the second sentence states, "Each replacement tree shall be ...one inch or more in diameter at a point one foot above the base..."seem to be in conflict.

Page 4, Subdivision 4 (b) of Section 5 of the ordinance. Does the convenant and agreement (C/A) have to be approved by the Advisory Agency or someone from City Planning, prior to recording the C/A? If so, then should it be mentioned in the ordinance? Also, is the C/A on a form provided by either Advisory Agency or City Planning? If so, then should that be mentioned as well?

Page 5, Section 6 of the ordinance. Why is it necessary to show the location of "large trees"? Is there a definition of what is considered a "large tree"?

Page 6, Section 8 of the ordinance. For clarity, the term "removed" should be added to the last sentence of paragraph, so that it reads:

> The terms "removed" or "removal" shall include any act which will cause a protected tree to die ....

Page 6, Section 10 of the ordinance. Please clarify what type of permit is referenced in Section 46.02 by amending the title of Section 46.02 to read:

SEC. 46.02. REQUIREMENTS FOR PUBLIC WORKS PERMIT TO RELOCATE OR REMOVE PROTECTED TREES.

Page 6, Section 10 of the ordinance. Is the last sentence of the second paragraph referring to a plan which shows all the grading work in compliance with Division 70 of Article 1 of Chapter IX of this Code being proposed to obtain from LADBS a permit to do grading work? If so, then please provide a definition of the term "grading permit plan."

Page 8, Section 11 of the ordinance. This amendment to Section 46.04 appears to increase the fees by applying the fees of Section 12.37 I.1 to include three other variety of trees, besides the oak tree. This amendment would require a fiscal impact report and may require this ordinance to be heard in Budget and Finance Committee, if it is to remain.

Pages 8 and 9, Section 12 of the ordinance. Please replace the misspell word "Superintendant" with "Superintendent of Building" and remove "of the Department of Building and Safety."

Pages 8 and 9, Section 12 of the ordinance. Please make the following changes to Subsections A and D of Section 46.06 as shown below. It would be very difficult to effectively enforce the intent of this ordinance unless the following changes are made to the procedure of these

Subsections. The changes are shown in underline/strikeout format (underline text is new language and strikeout shows text to be removed).

SEC. 46.06. NON-ISSUANCE OR REVOCATION OF BUILDING PERMIT FOR ILLEGAL REMOVAL OR DESTRUCTION OF PROTECTED TREES.

A. The Bureau of Street Services shall have the authority to request the Superintendent of Building to withhold a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, if the Bureau determines that a protected tree was removed or relocated in violation of Section 46.00 of this Code. Said request shall be made in writing from the Chief of the Bureau of Street Services or his/her designee and shall specify the start date and end date of the period for which a building permit is withheld in accordance with this Section.

Further, the Bureau of Street Services, after notice and hearing pursuant to Subsections B and C of this Section, shall have the authority to request ~~recommend~~ to the ~~Superintendant~~ Superintendent of Building ~~of the Department of Building and Safety~~ to withhold issuance of a building permit, except for permits which are required by law or necessary to comply with a Department of Building and Safety Order, for a period of time up to a maximum of 10 years as requested by the Bureau and to revoke any building permit issued ~~unless expired, for which rights have not been obtained~~ which construction has not commenced with respect to any property on which any protected tree has been removed in violation of Section 46.00 of this Code. Said request shall be made in writing by the Bureau Chief or his/her designee and shall specifically state the period of time the Bureau or the Board on appeal, have deemed necessary pursuant to Subsection C of this Section. Such period shall commence on the date the Bureau first becomes aware of the removal of such tree. Provided, however, the authority of the Bureau to act shall not apply to a purchaser, or to his or her agent, who in good faith and for valuable consideration has acquired title to the property subsequent to the illegal removal of any protected trees and prior to the recordation of the notice of intent as provided for in Subsection B of this Section.

The Board of Building and Safety Commissioners does not have the authority to hear appeals regarding the withholding of any building permit pursuant to this Section.

D. The applicant or permittee may appeal to the Board of Public Works any determination ~~recommendation~~ by the Bureau to revoke or withhold issuance of a building permit, including the length of time imposed. The appeal must be filed with the Board of Public Works within 30 days of the date of mailing of the notice of determination ~~recommendation~~ as provided for in Subsection C above. Further, that any action by the Department of Building and Safety resulting from any of the provision of this Section, including building permit revocation, shall not be appealable to the Board of Building and Safety Commissioners.

Distribution and Environmental Relations of California Black Walnut (*Juglans californica*) in the Eastern Santa Susana Mountains, Los Angeles County

Don P. Mullally

10418 Gothic Avenue
Granada Hills, CA 91344

One of the largest remaining populations of southern California's native walnut, *Juglans californica*, is found in the Santa Susana Mountains of Los Angeles County. The trees are found in some unusual vegetation types. This paper describes those associations as well as the general distribution and ecology of the species in that region.

Virtually no technical biological or ecological studies, descriptive or otherwise, have been published about the eastern part of the Santa Susana Mountains. This range, one of the Transverse ranges, is situated directly west of the San Gabriel Mountains. In many respects it is biologically intermediate between the San Gabriel and Santa Monica mountains. Animals which occur in the San Gabriel and Santa Susana mountains, but not in the Santa Monica Mountains, include Stellar's Jay (*Cyanocitta stelleri*) and Merriam chipmunk (*Eutamias merriami*). Trees with similar distribution include canyon live oak (see Table 1 for scientific names), big cone Douglas fir, and interior live oak. Since 1976, this part of the mountain range has been included in Significant Ecological Area 20 of Los Angeles County.

The study area is located between the San Fernando Valley to the south and the Santa Clarita Valley to the north. The western edge is marked by Oat Mountain, a portion of Towsley Canyon, and Brown's Canyon, the eastern edge being Interstate 5 in Weldon Canyon and San Fernando Road.

The core of the Los Angeles County portion of the Santa Susana Mountains is privately owned, and access has been denied to the public. It has been used as open cattle range since at least 1930. The Orcutt Ranch comprises a major part, and it includes most of the crest of the range within the study area. For the past five years, grazing has been minimal outside the Orcutt Ranch; about fifteen wild cattle have been

observed. Presently, the former ranch is a loose union of individual land owners whose objective seems to be securing profits by sales of land to developers or other interested parties.

Recently, lower portions of Towsley Canyon have been acquired by the Santa Monica Mountains Conservancy. Most of the remainder of the study area on the north-facing slope has also been favorably evaluated by the California Department of Parks and Recreation and the Santa Monica Mountains Conservancy for the creation of an eight thousand acre state park tentatively referred to as the Santa Clarita Woodlands State Park.

California walnut woodlands have been seriously diminished by developments in southern California. Many scientists consider it an endangered community. However, the species itself does not have endangered classification and accordant protection.

Methods

Observations were made of the California black walnut and associated vegetation in conjunction with employment by the City of Los Angeles at O'Melveny City Park. O'Melveny Park, 291 ha in size, is primarily a wilderness park and is situated in Granada Hills at the southeastern corner of the mountain range. Further studies were made to facilitate studies required by the state park agencies. Emphasis has been placed on the distribution of California black walnut and its position in major vegetation types. The information in this descriptive report is considered to be introductory to further investigations involving quantitative methods.

The methods basically involved finding routes which penetrate this rugged land, exploring, making observations, keeping notes and photographing vegetation types. To measure the sizes of stands, distances were determined by pacing and lines and angles by using a compass.

During 1991 and 1992, Dr. Todd Keeler-Wolf, Vegetation Ecologist for the Natural Diversity Data Base, California Department of Fish and Games requested information concerning the vegetation types. Eventually a preliminary map was made of the vegetation types of the north slope. Much of the relevant information has been incorporated into the data base. Dr. Keeler-Wolf has also examined part of the area. The results of this study and the vegetation mapping are complementary.

Results

Results are presented in two sections. The first describes the distribution and habitats of California black walnut and associated vegetation types on the southern and northern aspects of the mountain ranges. The second describes the principal vegetation types which include walnuts, as well as other aspects of the ecology of this tree.

Ecology and Distribution On the South and East Slopes

The California black walnut sparsely populates the warm and relatively dry south slope facing the San Fernando Valley. Ground cover and understory usually consist of non-native grasslands or coastal sage scrub. Chaparral communities are scarce and have been found only in Brown's Canyon and a portion of Limekiln Canyon within the Aliso Gas Field owned by the Southern California Gas Company.

Laurel sumac and walnut frequently occur together in draws and on alluvium at the base of hills and in canyons. The sumac matures to an arborescent shrub, and the walnut frequently exists as a shrubby tree. The major stems of both species are killed by fire, and both regenerate vigorously. Following fire, however, the sumac demonstrates ad advantage by reproducing vigorously under walnut trees through seedlings. The reverse does not occur.

Laurel sumac is confined to the southern exposure by minimum temperatures. At 639 m, a freeze killed some sumac on a ridge above Sunshine Canyon. The survivors resprouted from their crowns.

Walnut trees and woodland are common along the borders of the more permanent intermittent streams. The woodlands are composed of walnut and coast live oak, arroyo willow, flowering ash, toyon, and Mexican elderberry. Ash is usually confined to dry upslope perimeters. Western sycamores are occasional, and big leaf maples are scarce. The canopy is a mixture of the tree species of the stream bed, the banks, and the riparian zone.

The California walnuts are interspersed in the woodlands and on the borders of stands of oaks or willows. These patterns of distribution are found along Bee Canyon Creek in the northern half of O'Melveny City Park and along Limekiln Canyon Creek within the Aliso Gas Field. They are also repeated on the north slope of the range.

Occasionally a walnut tree is found growing down to within one or two vertical meters of stream beds; however, the beds change elevation frequently by at least 1 m due to erosion and deposition. When rooted near the beds of the wetter intermittent streams, native walnuts not only

acquire sufficient moisture but apparently avoid root immersion and fungal disease by sending roots upslope into drier soil. Similarly, walnuts which exist on the periphery of park lawns usually thrive. At O'Melveny Park, mature native walnuts which were left to exist in irrigated lawns died within 10 years.

The density of walnut woodlands increases in the drier intermittent streams and canyons which channelize rainwater only during major rainstorms. With the exception of Mexican elderberry, other tree species are scarce in this environment. Essentially pure stands of walnut woodland frequently occupy such canyons. This pattern is represented along Bull Creek above Neon Way in O'Melveny Park, above Bull Creek, and in canyons west of the buildings and lawns in the park.

In arid locations on mountainsides, even relatively small canyons or ravines have more California walnuts than the surrounding slopes. The species seems to be particularly well adapted to relatively dry canyons.

On the south slope, the trees are relatively abundant in small canyons with one side facing to some degree east. They occur in small woodlands and savannas. These patterns may be observed in portions of the Aliso Gas Field and in O'Melveny City Park.

Though populations of walnuts are sparse on south and west slopes, *Juglans californica* is the principal tree species on these slopes. Mexican elderberry is usually the only other tree present. The ecological requirements of the California walnut seem to be more similar to those of Mexican elderberry and flowering ash than to any other species of local trees.

The north slopes of east-west canyons frequently support dense vegetation, including walnuts, scattered coast live oak, toyon, poison oak, hollyleaf redberry, and coastal sage scrub.

Along intermittent streams, California walnut and associated plants tolerate high salinity and alkalinity throughout the dry season. The salinity becomes evident as intermittent stream beds become white with evaporite salts as surface water disappears. The salts are derived from marine sedimentary rocks Miocene in age or younger which form these mountains. Locally the most common substrates are soft shale, sandstone, and mudstone.

No mature California walnut trees were observed to die from brush fires or the severe drought of 1986-1991 in O'Melveny or Limekiln city parks. Though fire frequently killed all the stems, new stems invariably grew from the crowns. Following the Limekiln fire, a riparian tree

developed new stems up to 4.5 m long during the following growing season.

Ecology and Distribution on the North Slope

East of Oat Mountain, the north slope of the Santa Susana Mountains holds one of the largest and most unusual hardwood forests in southern California. Big cone Douglas fir is abundant and a member of these mixed evergreen forests in the higher parts of major canyons. According to the environmental impact report for Sunshine Canyon (Ultrasystems, 1989-90), 577 ha located in Sunshine Canyon support at least 7,742 Coast live oaks, 2,700 Canyon live oaks, and 1,300 big cone Douglas firs. A similar report for the Towsley canyon drainage, 1062 ha in size, lists 20,854 valley oaks, 5,801 canyon live oaks, 28,467 coast live oaks, 9,670 big cone Douglas firs, and 1,410 western sycamores (McClelland Consultants, 1990). Most of the trees exist in the southern (upper) one third of the canyon. Species of trees not counted in the Towsley report are California black walnut, interior live oak, scrub oak, flowering ash, big leaf maple, Mexican elderberry, toyon, and arroyo willow. All of these are also common.

Between Sunshine and Towsley canyons, a much larger number of trees of these species exist principally within Rice, East, Wiley, and upper Bee canyons. Black cottonwood occurs on the north side of The Old Road near the Weldon overpass on Interstate 5. White alder and hollyleaf cherry are notable for their absence from the study area.

On the north slope, walnut is primarily a member of open woodlands of various types, including riparian, and grasslands. It is frequent in coastal sage scrub on north, west, and east slopes but very scarce in chaparral. Walnuts are found within or on the borders of coastal sage scrub in East and Rice Canyons, along San Fernando Road, and in the lower parts of Towsley Canyon. South facing slopes of scrub located on this side of the range are nearly devoid of walnut except near canyon bottoms; walnuts are more abundant on west than south slopes.

Mature coast live and valley oak woodlands commonly have a thin understory which may include young trees such as oaks, Mexican elderberry, toyon and flowering ash. Understory shrubs often include poison oak, hillside gooseberry, hollyleaf redberry, snowberry, white nightshade, and purple nightshade. With sufficient sunlight, bush monkey flower, California sagebrush, and hairy leaf ceanothus may be present. A correspondence seems to exist between availability of soil moisture and the quantity of understory. Openings in the woodland

frequently support, in addition to the above, California buckwheat, yerba santa, white sage, chaparral yucca, and heart-leaved penstemon.

California walnut trees and woodland usually have little understory vegetation other than grasses. Scrub vegetation is common between widely separated walnuts but is replaced beneath them by grasses. Shrubs are more abundant near walnuts with increased soil moisture; that is, near streams, springs, and slopes with high levels of underground moisture.

Fire seems to be important to the establishment of large populations of *Juglans californica*. The species recovers faster following fire than does coastal sage scrub. Following fires, scrub is often replaced by grasses which require less water. In woodland, fires kill many young trees and shrubs, lessening competition. Fires also cause local "hot spots" wherein mature oaks and other trees are destroyed. Opening are thus created in the forest which are ideal for colonization by California walnut.

One conclusion resulting from this study is that repeated fires have opened large areas of woodland in the headwaters of Rice Canyon for colonization by walnut. As a result, this tree is found in association with most of the dominant forest trees of these mountains. Some of these associations are unusual if not unique and are described later in this paper. The results of fire are also evident in other canyons and on the north-northeast side of Oat Mountain. The situation on Oat Mountain is particularly unusual because fire enable the development of a unique, extensive community of snowberry chaparral. Walnut, young oaks, and other trees are numerous in this chaparral and are converting this chaparral, which is evidently a seral stage, back to woodland. Major fires burned through the study area in 1937 and 1970. Localized fires occur much more frequently.

Fires have promoted colonization by walnuts and otherwise affected the vegetation on the steep north slope just south of the Weldon Overpass on Interstate 5. Evidence of fires includes occasional charred logs and tree bark, old fire scars on mature oaks, standing dead large *Pseudotsuga*, ramets of walnut and toyon, and abundant poison oak.

Gaps in the woodland near Weldon Overpass are usually occupied by walnut trees and stands. Under the canopy, seedlings of walnut, coast live oak, and toyon are unusually abundant for the study area as a whole. Cattle have seldom grazed these steep slopes, perhaps accounting for the abundance of seedlings.

A shortage of old oaks near the Weldon Overpass may constitute evidence of purposeful removal of oaks from this accessible location. It

is a matter of record that Mission San Fernando had great need of oak and harvested throughout northwestern San Fernando Valley. The foothills of the San Gabriel and Santa Susana Mountains were probably major sources.

Community Patterns

Stands of California black walnut—These include pure stands and stands which include a very few trees of other species, namely flowering ash, coast live oak, and Mexican elderberry. Understory is usually herbaceous, dominated by annual grass, and less often by shrubs and sub-shrubs. Some of the stands have over 80% canopy and are sufficiently dense to be described as forest.

Walnut savannas are particularly characteristic of south and west slopes; woodland exist in relatively dry canyons on the south slope of the range. On the northern exposure of the range, larger stands of walnut woodland and forest are located at intervals throughout the area: Oat Mountain at 900-1100 m, Bee Canyon at 480-700 m, Rice Canyon at 600-840 m, East Canyon at 500-660 m, Wiley Canyon at 540-690 m, and lower Towsley Canyon at 390-700 m. Several large woodlands are located in Towsley Canyon near Interstate 5 and the park. Two of them are approximately 3.3 and 2.5 ha in size. Large stands of walnut are also located in upper Rice Canyon, one being at the head of the canyon west of the intersection of the Oat Mountain Motorway and the Corral Sunshine Motorway.

Walnut woodlands and forest seldom exceed 2 ha in size. They are usually surrounded by savanna, grasslands, or coastal sage scrub. Having been through fires, nearly all the trees grow as ramets.

Within the life spans of the trees, there is no evidence to indicate that relatively dry stands of walnut are successional stages or precursors of oak or other woodlands. Under such conditions, large stands of California black walnut are climax vegetation. If stems are killed by fire, the walnuts regenerate as ramets. On mesic north-facing slopes, pure stands of walnut woodland and forest may include a few seedling or sapling coast live oaks. These stands may evolve into woodlands composed of both walnut and oak.

On the north slope of Oat Mountain and again 1.8 km to the east and 100 m north of Oat Mountain Motorway, walnuts exist within an unusual chaparral dominated by snowberry. Western chokecherry is a component of the chaparral, and this species has not been observed elsewhere in this range.

Above about 900 m, walnut trees are smaller than those growing in the foothills. Reduced size may result from a shortened growing season and reduced average temperatures during the growing season. Mexican elderberry shows similar stunting.

Cold winters and considerable snow characterize elevations above 800 m. However, there is no evidence that sub-freezing temperatures have destroyed tissues of sizable walnut trees. The effect on seedlings is unknown.

The largest and probably the oldest tree trunks are genets located to the east and west of the Nature Center in the lower portion of Towsley Canyon, elevation 450 m. Genets of large size also exist on the relatively broad bottom of Rice and East Canyons (45-490 m). In these locations, oak woodlands seem to have sheltered many walnut trees from the worst effects of fire. In addition, the trees are sheltered from upslope firestorms. Ramets predominate on the surrounding hillsides. In the study area many more walnut trees exist in mixed associations of trees than in pure stands.

Occurrence with coast live oak—Woodland dominated by coast live oak and California black walnut is one of the most common vegetation types in the Santa Susana Mountains. It is best developed in canyons and on the north slope of the range occurring as intervals from the base of the mountains to at least 790 m. Occasionally this vegetation type is in the riparian zone.

One of the better accessible examples is located on the north slope near the Weldon Canyon Overpass on Interstate 5. Few of these woodlands are even mixtures. Usually they are weighted toward either walnut or oak. Furthermore, flowering ash is usually present as an important member of the woodland, introducing an unusual configuration to the community.

A few woodlands of coast live oak have essentially full canopies and do not admit sufficient sunlight to support walnuts. Technically they are forests. Examples are located at the confluence of East and Rice canyons, in upper Bee Canyon, lower Leaming Canyon, Sunshine Canyon and in a small tributary of Towsley Canyon situated one ridge to the west of Wiley Canyon.

In oak-walnut woodlands, *Juglans californica* commonly creates a pattern which may be termed an edge effect: Walnuts exist beside or surround a tree or small stand of another species, most commonly Coast live oak. However, the edge effect has also been noted in conjunction with valley and canyon oaks, California bay laurel and big cone Douglas fir. For the edge effect to be expressed, an opening for walnuts must

exist in the woodland with sufficient sunlight. The borders of woodland communities are particularly favorable.

In open or unforested locations, young specimens of both walnut and coast live oak are abundant on the banks of streams. Small meadows in woodland and the banks of roads are also excellent habitat for oak and walnut seedlings.

Young oaks are also common beneath the canopy of mature oaks and several meters in the open beyond the canopy. Apparently much germination of this species occurs close to seed trees, resulting in the enlargement of stands as well as replacement of trees that have died. This process seems to be most effective in small stands or groves.

However, walnut seedlings and saplings are rare under oaks, and they do not seem to grow beyond sapling size unless an oak succumbs. Young walnuts are frequent peripheral to the canopies of mature oak and walnut trees which are located in openings in the riparian zone near the bottoms of canyons and on slopes with abundant subsurface moisture.

In drier woodlands, the origin of stands of walnut is obscured by the relative absence of seedlings and young trees. This study coincided with the severe drought of 1986-1991. It is possible, perhaps probable, that the drought was responsible for the scarcity of seedlings. In O'Melveny City Park, seedling walnuts were noted near seed trees during the summer following the fire of December, 1988. They had disappeared by November. Predators, of course, cannot be ruled out. Preliminary observations indicate increases in numbers of seedlings this year. If this finding is substantiated, the increase is probably due to the heavy rains of January to April, 1991.

Walnut and oaks frequently establish as seedlings only a few meters apart. The walnuts remain on the outer margin of enlarging oaks by being faster growing and by sending forth long stems which are more horizontal than vertical. Thus an edge effect is maintained. No dead large walnut trees which obviously died from inadequate light have been found beneath large oaks.

From September, 1991, to February, 1992, large numbers of walnut seeds were observed on the surface of a thatch of dead, horizontal non-native annual grasses some 7-12 cm deep. Heavy rains had failed to dislodge most of the seeds or cause their burial in thatch or soil. This thatch factor may be partially responsible for poor recruitment of *Juglans californica*.

Occurrence with valley oak—The valley oak tends to form pure stands of savanna and woodland. A few stands 0.5-1.0 ha in size are

sufficiently dense to be termed forest. Most of the stands are located on the summit of the axis of the range and on low angle north slopes above 700m. The species is also commonly a constituent of old growth woodlands on low angle north slopes at similar elevations. These include canyon and coast live oaks, big cone Douglas fir, and other trees.

California walnuts rarely exist within stands of valley oak woodland and forest. However, they are frequent on edges, including road banks, and in woodland bordering intermittent streams which traverse stands of oaks.

In the western headwaters of Rice Canyon located 1 km northeast of the intersection of the Oat Mountain Motorway and the fire road, mixed hardwood woodlands exist adjacent to valley oak woodlands. Dominant trees include valley, coast live, and canyon oaks, California black walnut, flowering ash, and California bay laurel. The understory includes young trees, poison oak, snowberry, hollyleaf redberry, and hillside gooseberry. Extensive understory rarely exists beneath pure stands of valley oaks within these mountains.

Woodlands of the type described above are rare. A few mature valley oaks are embedded in walnut-ash woodlands located beside the East Canyon Motorway near the top of that canyon. Along the Corral Sunshine Motorway located on the ridge south of Bee Canyon, walnuts border valley oaks and form stands in grasslands surrounded by oak woodlands. Similar vegetation occurs west of the junction of the Sunshine and Oat Mountain motorways.

It is evident that past fires have created large openings in oak woodlands enabling colonization by walnuts and other trees. The scarcity of walnut and understory in many stands of valley oak is attributed to marginal soil moisture during dry weather, aggravated by competition with oaks for soil moisture.

With the exception of the north slope, Oat Mountain at 1034-1094 m holds woodland and savanna composed of valley oak and California lack walnut, with the oak more abundant.

Occurrence in the big cone Douglas fir-canyon live oak-coast live oak forest—This vegetation type forms dense forests on steep slopes at the heads of canyons and in narrow canyons with permanent streams. Examples are at the heads of Sunshine, East and Wiley canyons and at several locations in the large Rice Canyon drainage and in Bee Canyon. California bay laurel and big leaf maple are frequently present in the community. Apparently California walnut is excluded due to

insufficient sunlight. However, walnuts exist in ecotones on the borders of the community which receive more sunlight.

Pseudotsuga-oak woodlands which have been severely damaged by fire have openings which occasionally have been colonized by walnuts. Though such locations are scarce, an excellent example is present near the crest of the north slope located south of the Weldon Overpass on Interstate 5.

Occurrence with flowering ash—Flowering ash locally attains an unusually large size. Trees of 30 cm DBH and approximate heights of 14 m are not unusual. Ash trees are distributed throughout the study area at elevations of 420-1000 m. However, optimal growth occurs on the north slope at 480-660 m. Ashes seem to be more tolerant than walnuts to low soil moisture and tend to be located on drier slopes than walnut. They are scarce on south slopes. However, ashes may be peripheral to the riparian zone along streams.

Woodlands dominated by walnut and ash exist on easterly and northerly slopes in East Canyon at 500-600 m, on northerly and westerly slopes at the head of Leaming Canyon at 547-665 m, on two northerly slopes in the middle of Rice Canyon at 500-630 m, in upper Rice Canyon at 699-851 m, and on two northerly slopes in Towsley Canyon near the old oil field at 517-669 m. The woodlands in Towsley are approximately 2.3 and 3.5 ha in size. Other such woodlands occur in O'Melveny Park. Coast live oak and toyon are frequently minor elements in the woodlands. Small groves of walnut or ash are frequently embedded in the middle of the larger stands of walnut-ash woodland.

All of the walnut trees in walnut-ash woodlands exist in ramet form. The trunks of ash trees seem to survive fire better than those of walnut. Fire possibly had an important role in community formation by eliminating previously existing forms of vegetation. This community seems to be unique and confined to this part of the Santa Susana Mountains.

Occurrence with California bay-laurel—Bay-laurel is found near sufficient soil moisture in all of the major canyons and is particularly abundant near springs, permanent water, and the more reliable intermittent streams. It is usually in association with canyon, coast live, and valley oaks, big leaf maple, and big cone Douglas fir. Occasionally, however, it forms vegetation types with California black walnut, floering ash, and walnut-coast live oak. Small areas (½ ha or less) of this association are embedded in the walnut-ash woodlands in Towsley and East and Rice canyons and on the north and west slopes of Oat Mountain. However, it is more extensive and distinct along streams in

the central and western portions of the headwaters of Rice Canyon Creek, at 700-850 m. The woodlands are surrounded by valley and coast live oak savanna and woodlands and mixed hardwood woodlands. Bay laurel forms ramets following fire. Flowering ash and California bay laurel also frequently form groves or pure stands one hectare or less in size.

Discussion

It has been established that *Juglans californica* can be locally dominant in woodlands of coastal southern California (Swanson, 1967; Leskinen, 1972; Griffin and Critchfield, 1972; Griffin, 1977; Campbell, 1980; Keeley, 1990). These woodlands have been classified as "the coast live oak phase" (Griffin, 1977) of the "southern oak woodland" (Munz and Keck, 1959). The present study has revealed that California black walnut also exists as a co-dominant in valley oak woodlands and mixed evergreen forests which have been opened by fires. Trees of the mixed evergreen forest include *Pseudotsuga macrocarpa*, *Quercus chrysolepis*, *Umbellularia californica*, and *Acer macrophyllum*.

From his studies, Quinn (1989) states that the walnut is the only tree present in many stands located in the San Jose and Puente Hills, and that the stands attain a vegetative cover of 100%. He calls such stands forests and notes that the Natural Diversity Data Base (Holland, 1986) includes the category California Walnut Forest. Walnut forests were also observed in the Santa Susana Mountains. They are usually less than two hectares in size and rarely have understory other than grasses and other herbaceous plants.

All of the walnut forests and woodland situated in the eastern Santa Susana Mountains have experience fires, and most of the trees have multiple trunks. Keeley (1990) has suggested that at Mount Washington, closed canopies constitute evidence of a fire-free environment.

Sizable California walnut trees with single trunks (genets) were found to be most abundant in relatively broad canyon bottoms. Quinn (1989) concluded that walnuts in canyon bottoms have a fewer number of trunks than hillside trees.

Quinn (1989) also emphasized that burned walnuts invariably resprout to form new trees with multiple trunks. The results of this study agree with those conclusions.

Walnut woodlands develop optimally on northern exposures in soil derived from Tertiary (Miocene-Pliocene) marine shales (Leskinen, 1972; Keeley, 1990). This study is in agreement but also stresses the

occurrence of woodland on east slopes and in canyons with intermittent streams draining in easterly directions. The woodlands may be almost pure stands or mixed hardwood stands.

During the drought of 1986-1990, seedlings and saplings were most common on stream banks and in the riparian zone. They were practically absent on drier slopes supporting oak and walnut woodlands. The lack of seedlings at Brea (Swanson, 1967) was attributed to low precipitation in that region. Keeley (1990) attributed gaps in age classes of walnut trees to annual variations in recruitment and mortality due to precipitation. Thus, it is evident that years of insufficient precipitation and droughts interfere with the ability of *Juglans californica* to form seeds, or with the ability of the seedlings to grow deep roots reaching sufficient moisture to survive the first dry season.

Some of the ecological requirements of California black walnut are characteristic of other species in the genus. As described, *Juglans californica* is a prominent tree in the riparian zone as well as on dry slopes. *Juglans hindsii* of central California always occurs on moist valley soils (Jepson, 1917). Peattie (1990) states that the tree is confined to the banks of rivers and streams. In the southwest, *Juglans major* and *J. rupestris* grow on the banks of streams and in bottom lands, washes, and draws (Peattie, 1990; Vines, 1960). These species also form groves (stands), and *J. rupestris* is frequently the only tree in dry washes (Peattie, 1990). Along the Flambeau River of Wisconsin, *Juglans cinerea* is part of the streamside community (Braun, 1950).

Thus many species in *Juglans* are adapted to conditions along rivers and stream which course through canyons, draws, and bottom lands. *Juglans californica* is no exception to this general rule even though it may be scarce along rivers which course through broad valleys. However, it is exceptional to the degree that it successfully exists on dry hillsides and uplands as pure stands, single trees and as a constituent of woodland communities.

Axelrod (1937) concluded from his studies of the Pliocene Mt. Eden beds that ancestral *Juglans californica*, though abundant, was confined to the banks and edges of streams, marshes and lakes. Ancestral walnuts most likely existed in washes, along stream banks, and in the riparian zone. Evidence now indicates that since Mt. Eden times, this walnut has evolved to tolerate dry summers and exist upon dry slopes presently characteristic of the hills of cismontane southern California.

The characteristic of forming pure stands seems to have existed in the ancestor of *J. californica, J. rupestris,* and *J. major.* These species exist in arid southwestern climates, grow best in full sun, reproduce

poorly or sporadically from seeds, and are capable of developing multiple stems (Peattie, 1990).

In the Santa Susana Mountains, deposits of limestone are frequent and are favorable to growth of *J. californica*. [Editor's note: This is also true in the San Jose Hills west of Pomona.] *Juglans rupestris* is confined to streams in limestone regions (Peattie, 1990).

Ancestral flowering ash was also present at Mt. Eden (Axelrod, 1937). However, Axelrod does not indicate that this tree existed near water in association with walnut trees. It may be that in the Pliocene ash was already adapted to exist in chaparral or woodland communities.

Summary

California black walnut is abundant in the Santa Susana Mountains within Los Angeles County. The species is thinly distributed on arid and hot slopes on the southern side of the range. In the canyons, however, walnuts are relatively abundant along intermittent streams and small canyons which conduct runoff during major rainstorms. During the dry season, the species tolerates high alkalinity and salinity.

On the north slope, the tree is a component of one of the largest and most unusual mixed evergreen and hardwood forests in southern California. Pure and nearly pure woodlands and forests of California black walnut are common. It grows in woodland and savanna with *Quercus agrifolia*, *Q. lobata*, *Fraxinus dipetala*, and *Umbellularia californica*. Walnut also borders other vegetation types including chaparral, arroyo willow, coast live oak forest, dense valley oak woodland and forest and big cone Douglas fir-canyon oak forest. Following fire or other disturbance, walnut colonizes openings in these vegetation types. Walnuts are particularly well adapted to existing in openings and on the edges of other plant communities.

Vegetation types dominated by combinations of California black walnut, flowering ash, and California bay laurel are considered to be very rare, perhaps even confined to the Santa Susana Mountains. All of these species also segregate to form pure stands.

Walnut woodlands are also common on east slopes and in canyons with intermittent streams draining in easterly directions. The woodlands may be almost pure stands or walnut-oak stands.

Though walnuts are common on dry hillsides and occasionally form pure stands, they are also a component of riparian woodlands. They exist down to within 2 m of the beds of major intermittent streams. Conditions of marginal soil moisture during the dry season are

considered to usually preclude the existence of walnuts in valley oak woodlands.

Fires have created openings in oak and big cone Douglas fir woodlands, coastal sage scrub, and chaparral. These openings facilitate colonization by California black walnut. All of the walnut woodlands have experienced fire, and the trees resprout following the fire.

Large pure stands are not destroyed by fire, and stands occurring on relatively dry slopes apparently are not sites for the germination of other species of trees or the process of succession. Stands are climax vegetation for at least the life span of the trees. On mesic north slopes, coast live oaks may develop within mature walnut woodland. Genets are common on the broad bottoms of major canyons. Because of fires, ramets are predominate on hills and canyon walls.

During the drought of 1986-1991, seedlings were most abundant in riparian zones. In this zone large numbers were observed near the periphery of the canopies of mature walnuts and *Quercus agrifolia*. On arid hillsides, seedlings were very scarce near these trees. Insufficient precipitation and droughts seems to be major causes for years of poor recruitment in *Juglans californica*.

Locally walnut trees rarely exist within stands of chaparral dominated by *Adenostema*, *Ceanothus*, and *Arctostaphylos*. Near the summit of Oat Mountain, they are common in chaparral composed of *Symphoricarpos mollis*.

In common with *Juglans major* and *J. rupestris* of the southwest, *Juglans californica* exists in streamside and riparian environments. These species are also similar in that they can form essentially pure stands. Of the three species, *Juglans californica* is the only one that exists on dry hillsides as stands and as a dominant and co-dominant component of woodland communities.

Acknowledgments

I am grateful to a number of people who have provided assistance: Dr. Todd Keeler-Wolf and Dr. Jon E. Keeley accompanied me on inspections of the vegetation and encouraged me to finish this report. My wife, Mary Patterson, gave of her time and expertise on the computer to type and retype the manuscript. Steve Hartman and the California Native Plant Society diverted me into a stronger interest in botany. Hank Aubin and Gary Cordova, Supervisors of Aliso Gas Field of the Southern California Gas Company, allowed me to use the company road to reach the summits of the Santa Susana Mountains.

No appreciation is expressed to hired hands of the so-called Orcutt Ranch for accosting me on the ranch and trying to keep me out of their woods.

5. SUGGESTED REFERENCES 11

1. INTRODUCTION AND PURPOSE

The conservation of special status native plants and their habitats, as well as sensitive natural communities, is integral to maintaining biological diversity. The purpose of these protocols is to facilitate a consistent and systematic approach to botanical field surveys and assessments of special status plants and sensitive natural communities so that reliable information is produced and the potential for locating special status plants and sensitive natural communities is maximized. These protocols may also help those who prepare and review environmental documents determine when botanical field surveys are needed, how botanical field surveys may be conducted, what information to include in a botanical survey report, and what qualifications to consider for botanical field surveyors. These protocols are meant to help people meet California Environmental Quality Act (CEQA)[1] requirements for adequate disclosure of potential impacts to plants and sensitive natural communities. These protocols may be used in conjunction with protocols formulated by other agencies, for example, those developed by the U.S. Army Corps of Engineers to delineate jurisdictional wetlands[2] or by the U.S. Fish and Wildlife Service to survey for the presence of special status plants[3].

Department of Fish and Wildlife Trustee and Responsible Agency Mission

The mission of the California Department of Fish and Wildlife (CDFW) is to manage California's diverse wildlife and native plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. CDFW has jurisdiction over the conservation, protection, and management of wildlife, native plants, and habitat necessary to maintain biologically sustainable populations (Fish & G. Code, § 1802). CDFW, as trustee agency under CEQA Guidelines section 15386, provides expertise in reviewing and commenting on environmental documents and provides protocols regarding potential negative impacts to those resources held in trust for the people of California.

Certain species are in danger of extinction because their habitats have been severely reduced in acreage, are threatened with destruction or adverse modification, or because of a combination of these and other factors. The California Endangered Species Act (CESA) and Native Plant Protection Act (NPPA) provide additional protections for such species, including take prohibitions (Fish & G. Code, § 2050 *et seq.*; Fish & G. Code, § 1908). As a responsible agency, CDFW has the authority to issue permits for the take of species listed under CESA and NPPA if the take is incidental to an otherwise lawful activity; CDFW has determined that the impacts of the take have been minimized and fully mitigated; and the take would not jeopardize the continued existence of the species (Fish & G. Code, § 2081, subd. (b); Cal. Code Regs., tit. 14 § 786.9, subd. (b)). Botanical field surveys are one of the preliminary steps to detect special status plant species and sensitive natural communities that may be impacted by a project.

Definitions

Botanical field surveys provide information used to determine the potential environmental effects of proposed projects on special status plants and sensitive natural communities as required by law (e.g., CEQA, CESA, and federal Endangered Species Act (ESA)).

Special status plants, for the purposes of this document, include all plants that meet one or more of the following criteria:

- Listed or proposed for listing as threatened or endangered under the ESA or candidates for possible future listing as threatened or endangered under the ESA (50 C.F.R., § 17.12).
- Listed or candidates for listing by the State of California as threatened or endangered under CESA (Fish & G. Code, § 2050 et seq.)[4]. In CESA, “endangered species” means a native species or subspecies of plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease (Fish & G. Code, § 2062). “Threatened species” means a native species or subspecies of plant that,

[4] Refer to current online published lists available at: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109390&inline

although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by CESA (Fish & G. Code, § 2067). "Candidate species" means a native species or subspecies of plant that the California Fish and Game Commission has formally noticed as being under review by CDFW for addition to either the list of endangered species or the list of threatened species, or a species for which the California Fish and Game Commission has published a notice of proposed regulation to add the species to either list (Fish & G. Code, § 2068).

- Listed as rare under the California Native Plant Protection Act (Fish & G. Code, § 1900 et seq.). A plant is rare when, although not presently threatened with extinction, the species, subspecies, or variety is found in such small numbers throughout its range that it may be endangered if its environment worsens (Fish & G. Code, § 1901).
- Meet the definition of rare or endangered under CEQA Guidelines section 15380, subdivisions (b) and (d), including:
    - Plants considered by CDFW to be "rare, threatened or endangered in California." This includes plants tracked by the California Natural Diversity Database (CNDDB) and the California Native Plant Society (CNPS) as California Rare Plant Rank (CRPR) 1 or 2[5];
    - Plants that may warrant consideration on the basis of declining trends, recent taxonomic information, or other factors. This may include plants tracked by the CNDDB and CNPS as CRPR 3 or 4[6].
- Considered locally significant plants, that is, plants that are not rare from a statewide perspective but are rare or uncommon in a local context such as within a county or region (CEQA Guidelines, § 15125, subd. (c)), or as designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include plants that are at the outer limits of their known geographic range or plants occurring on an atypical soil type.

Sensitive natural communities are communities that are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. These communities may or may not contain special status plants or their

[5] See CNDDB's Special Vascular Plants, Bryophytes, and Lichens List for plant taxa with a CRPR of 1 or 2: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109383&inline

[6] CRPR 3 plants (plants about which more information is needed) and CRPR 4 plants (plants of limited distribution) may warrant consideration under CEQA Guidelines section 15380. Impacts to CRPR 3 plants may warrant consideration under CEQA if sufficient information is available to assess potential impacts to such plants. Impacts to CRPR 4 plants may warrant consideration under CEQA if cumulative impacts to such plants are significant enough to affect their overall rarity. Data on CRPR 3 and 4 plants should be submitted to CNDDB. Such data aids in determining and revising the CRPR of plants. See CNDDB's Special Vascular Plants, Bryophytes, and Lichens List for plant taxa with a CRPR of 3 or 4: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109383&inline

habitat. CDFW's *List of California Terrestrial Natural Communities*[7] is based on the best available information, and indicates which natural communities are considered sensitive at the current stage of the California vegetation classification effort. See the Vegetation Classification and Mapping Program (VegCAMP) website for additional information on natural communities and vegetation classification[8].

2. BOTANICAL FIELD SURVEYS

Evaluate the need for botanical field surveys prior to the commencement of any activities that may modify vegetation, such as clearing, mowing, or ground-breaking activities. It is appropriate to conduct a botanical field survey when:

- Natural (or naturalized) vegetation occurs in an area that may be directly or indirectly affected by a project (project area), and it is unknown whether or not special status plants or sensitive natural communities occur in the project area;
- Special status plants or sensitive natural communities have historically been identified in a project area; or
- Special status plants or sensitive natural communities occur in areas with similar physical and biological properties as a project area.

Survey Objectives

Conduct botanical field surveys in a manner which maximizes the likelihood of locating special status plants and sensitive natural communities that may be present. Botanical field surveys should be floristic in nature, meaning that every plant taxon that occurs in the project area is identified to the taxonomic level necessary to determine rarity and listing status. "Focused surveys" that are limited to habitats known to support special status plants or that are restricted to lists of likely potential special status plants are not considered floristic in nature and are not adequate to identify all plants in a project area to the level necessary to determine if they are special status plants.

For each botanical field survey conducted, include a list of all plants and natural communities detected in the project area. More than one field visit is usually necessary to adequately capture the floristic diversity of a project area. An indication of the prevalence (estimated total numbers, percent cover, density, etc.) of the special status plants and sensitive natural communities in the project area is also useful to assess the significance of a particular plant population or natural community.

Survey Preparation

Before botanical field surveys are conducted, the botanical field surveyors should compile relevant botanical information in the general project area to provide a regional

[7] Available at: https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities#natural%20communities%20lists

[8] Available at: https://www.wildlife.ca.gov/Data/VegCAMP

context. Consult the CNDDB[9] and BIOS[10] for known occurrences of special status plants and sensitive natural communities in the project area prior to botanical field surveys. Generally, identify vegetation and habitat types potentially occurring in the project area based on biological and physical properties (e.g. soils) of the project area and surrounding ecoregion[11]. Then, develop a list of special status plants and sensitive natural communities with the potential to occur within the vegetation and habitat types identified. The list of special status plants with the potential to occur in the project area can be created with the help of the CNDDB QuickView Tool[12] which allows the user to generate lists of CNDDB-tracked elements that occur within a particular U.S. Geological Survey 7.5' topographic quad, surrounding quads, and counties within California. Resulting lists should only be used as a tool to facilitate the use of reference sites, with the understanding that special status plants and sensitive natural communities in a project area may not be limited to those on the list. Botanical field surveys and subsequent reporting should be comprehensive and floristic in nature and not restricted to or focused only on a list. Include in the botanical survey report the list of potential special status plants and sensitive natural communities that was created, and the list of references used to compile the background botanical information for the project area.

Survey Extent

Botanical field surveys should be comprehensive over the entire project area, including areas that will be directly or indirectly impacted by the project. Adjoining properties should also be surveyed where direct or indirect project effects could occur, such as those from fuel modification, herbicide application, invasive species, and altered hydrology. Surveys restricted to known locations of special status plants may not identify all special status plants and sensitive natural communities present, and therefore do not provide a sufficient level of information to determine potential impacts.

Field Survey Method

Conduct botanical field surveys using systematic field techniques in all habitats of the project area to ensure thorough coverage. The level of effort required per given area and habitat is dependent upon the vegetation and its overall diversity and structural complexity, which determines the distance at which plants can be identified. Conduct botanical field surveys by traversing the entire project area to ensure thorough coverage, documenting all plant taxa observed. Parallel survey transects may be necessary to ensure thorough survey coverage in some habitats. The level of effort should be sufficient to provide comprehensive reporting. Additional time should be allocated for plant identification in the field.

12 Available at: https://www.wildlife.ca.gov/Data/CNDDB/Maps-and-Data. When creating a list of special status plants with the potential to occur in a project area, special care should be taken to search all quads with similar geology, habitats, and vegetation to those found in the project area.

Timing and Number of Visits

Conduct botanical field surveys in the field at the times of year when plants will be both evident and identifiable. Usually this is during flowering or fruiting. Space botanical field survey visits throughout the growing season to accurately determine what plants exist in the project area. This usually involves multiple visits to the project area (e.g. in early, mid, and late-season) to capture the floristic diversity at a level necessary to determine if special status plants are present[13]. The timing and number of visits necessary to determine if special status plants are present is determined by geographic location, the natural communities present, and the weather patterns of the year(s) in which botanical field surveys are conducted.

Reference Sites

When special status plants are known to occur in the type(s) of habitat present in a project area, observe reference sites (nearby accessible occurrences of the plants) to determine whether those special status plants are identifiable at the times of year the botanical field surveys take place and to obtain a visual image of the special status plants, associated habitat, and associated natural communities.

Use of Existing Surveys

For some project areas, floristic inventories or botanical survey reports may already exist. Additional botanical field surveys may be necessary for one or more of the following reasons:

- Botanical field surveys are not current[14];
- Botanical field surveys were conducted in natural systems that commonly experience year to year fluctuations such as periods of drought or flooding (e.g. vernal pool habitats or riverine systems);
- Botanical field surveys did not cover the entire project area;
- Botanical field surveys did not occur at the appropriate times of year;
- Botanical field surveys were not conducted for a sufficient number of years to detect plants that are not evident and identifiable every year (e.g. geophytes, annuals and some short-lived plants);

---

13 U.S. Fish and Wildlife Service Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants available at: https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/

14 Habitats, such as grasslands or desert plant communities that have annual and short-lived perennial plants as major floristic components may require yearly surveys to accurately document baseline conditions for purposes of impact assessment. In forested areas, however, surveys at intervals of five years may adequately represent current conditions. For forested areas, refer to “Guidelines for Conservation of Sensitive Plant Resources Within the Timber Harvest Review Process and During Timber Harvesting Operations”, available at: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=116396&inline

- Botanical field surveys did not identify all plants in the project area to the taxonomic level necessary to determine rarity and listing status;
- Fire history, land use, or the physical or climatic conditions of the project area have changed since the last botanical field survey was conducted;
- Changes in vegetation or plant distribution have occurred since the last botanical field surveys were conducted, such as those related to habitat alteration, fluctuations in abundance, invasive species, seed bank dynamics, or other factors; or
- Recent taxonomic studies, status reviews or other scientific information has resulted in a revised understanding of the special status plants with potential to occur in the project area.

Negative Surveys

Adverse conditions from yearly weather patterns may prevent botanical field surveyor from determining the presence of, or accurately identifying, some special status plants in the project area. Disease, drought, predation, fire, herbivory or other disturbance may also preclude the presence or identification of special status plants in any given year. Discuss all adverse conditions in the botanical survey report[15].

The failure to locate a known special status plant occurrence during one field season does not constitute evidence that the plant occurrence no longer exists at a location, particularly if adverse conditions are present. For example, botanical field surveys over a number of years may be necessary if the special status plant is an annual or short-lived plant having a persistent, long-lived seed bank and populations of the plant are known to not germinate every year. Visiting the project area in more than one year increases the likelihood of detecting special status plants, particularly if conditions change. To further substantiate negative findings for a known occurrence, a visit to a nearby reference site may help ensure that the timing of botanical field surveys was appropriate.

3. REPORTING AND DATA COLLECTION

Adequate information about special status plants and sensitive natural communities present in a project area will enable reviewing agencies and the public to effectively assess potential impacts to special status plants and sensitive natural communities and will guide the development of avoidance, minimization, and mitigation measures. The information necessary to assess impacts to special status plants and sensitive natural communities is described below. For comprehensive, systematic botanical field surveys where no special status plants or sensitive natural communities were found, reporting

and data collection responsibilities for botanical field surveyor remain as described

[15] U.S. Fish and Wildlife Service Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants available at: https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/

below, excluding specific occurrence information.

Special Status Plant and Sensitive Natural Community Observations

Record the following information for locations of each special status plant and sensitive natural community detected during a botanical field survey of a project area.

- The specific geographic locations where the special status plants and sensitive natural communities were found. Preferably this will be done by use of global positioning system (GPS) and include the datum[16] in which the spatial data was collected and any uncertainty or error associated with the data. If GPS is not available, a detailed map (1:24,000 or larger) showing locations and boundaries of each special status plant population and sensitive natural community in relation to the project area is acceptable. Mark occurrences and boundaries as accurately as possible;
- The site-specific characteristics of occurrences, such as associated species, habitat and microhabitat, structure of vegetation, topographic features, soil type, texture, and soil parent material. If a special status plant is associated with a wetland, provide a description of the direction of flow and integrity of surface or subsurface hydrology and adjacent off-site hydrological influences as appropriate;
- The number of individuals in each special status plant population as counted (if population is small) or estimated (if population is large);
- If applicable, information about the percentage of each special status plant in each life stage such as seedling, vegetative, flowering and fruiting;
- The density of special status plants, identifying areas of relatively high, medium and low density of each special status plant in the project area; and
- Digital images of special status plants and sensitive natural communities in the project area, with diagnostic features.

Special Status Plant and Sensitive Natural Community Documentation

When a special status plant is located, data must be submitted to the CNDDB. Data may be submitted in a variety of formats depending on the amount and type of data that is collected[17]. The most common way to submit data is the Online CNDDB Field Survey Form[18], or equivalent written report, accompanied by geographic locality information (GPS coordinates, GIS shapefiles, KML files, topographic map, etc.). Data submitted in digital form must include the datum[19] in which it was collected.

If a sensitive natural community is found in a project area, document it with a Combined

16 NAD83, NAD27 or WGS84

17 See https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data for information on acceptable data submission formats.

18 Available at: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data

19 NAD83, NAD27 or WGS84

Vegetation Rapid Assessment and Relevé Field Form[20] and submit the form to VegCAMP[21].

Voucher Collection

Voucher specimens provide verifiable documentation of special status plant presence and identification and a scientific record. This information is vital to conservation efforts and valuable for scientific research. Collection of voucher specimens should be conducted in a manner that is consistent with conservation ethics, and in accordance with applicable state and federal permit requirements (e.g. scientific, educational, or management permits pursuant to Fish & G. Code, § 2081, subd. (a)). Voucher collections of special status plants (or possible special status plants) should only be made when such actions would not jeopardize the continued existence of the population. A plant voucher collecting permit[22] is required from CDFW prior to the take or possession of a state-listed plant for voucher collection purposes, and the permittee must comply with all permit conditions.

Voucher specimens should be deposited in herbaria that are members of the Consortium of California Herbaria[23] no later than 120 days after the collections have been made. Digital imagery can be used to supplement plant identification and document habitat. Record all relevant collector names and permit numbers on specimen labels (if applicable).

Botanical Survey Reports

Botanical survey reports provide an important record of botanical field survey results and project area conditions. Botanical survey reports containing the following information should be prepared whenever botanical field surveys take place, and should also be submitted with project environmental documents:

Project and location description

- A description of the proposed project;
- A detailed map of the project area that identifies topographic and landscape features and includes a north arrow and bar scale;
- A vegetation map of the project area using Survey of California Vegetation Classification and Mapping Standards[24] at a thematic and spatial scale that allows the display of all sensitive natural communities;
- A soil map of the project area; and

---

20 Available at: https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities/Submit

21 Combined Vegetation Rapid Assessment and Releve Field Forms can be emailed to VegCAMP staff. Contact information available at: https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities/Other-Info

22 Applications available at: https://www.wildlife.ca.gov/Conservation/Plants/Permits

23 A list of Consortium of California Herbaria participants is available at: http://ucjeps.berkeley.edu/consortium/participants.html

24 Available at: https://www.wildlife.ca.gov/data/vegcamp/publications-and-protocols

- A written description of the biological setting, including all natural communities; geological and hydrological characteristics; and land use or management history.

Detailed description of survey methodology and results

- Names and qualifications of botanical field surveyor(s);
- Dates of botanical field surveys (indicating the botanical field surveyor(s) that surveyed each area on each survey date), and total person-hours spent;
- A discussion of the survey preparation methodology;
- A list of special status plants and sensitive natural communities with potential to occur in the region;
- Description(s) of reference site(s), if visited, and the phenological development of special status plant(s) at those reference sites;
- A description and map of the area surveyed relative to the project area;
- A list of all plant taxa occurring in the project area, with all taxa identified to the taxonomic level necessary to determine whether or not they are a special status plant;
- Detailed data and maps for all special status plants and sensitive natural communities detected. Information specified above under the headings “Special Status Plant and Sensitive Natural Community Observations,” and “Special Status Plant and Sensitive Natural Community Documentation,” should be provided for the locations of each special status plant and sensitive natural community detected. Copies of all California Native Species Field Survey Forms and Combined Vegetation Rapid Assessment and Relevé Field Forms should be sent to the CNDDB and VegCAMP, respectively, and included in the project environmental document as an Appendix[25];
- A discussion of the potential for a false negative botanical field survey;
- A discussion of how climatic conditions may have affected the botanical field survey results;
- A discussion of how the timing of botanical field surveys may affect the comprehensiveness of botanical field surveys;
- Any use of existing botanical field surveys and a discussion of their applicability to the project;
- The deposition locations of voucher specimens, if collected; and
- A list of references used, including persons contacted and herbaria visited.

[25] It is not necessary to submit entire environmental documents to the CNDDB

Assessment of potential project impacts

- A discussion of the significance of special status plant populations in the project area considering nearby populations and total range and distribution;
- A discussion of the significance of sensitive natural communities in the project area considering nearby occurrences and natural community distribution;
- A discussion of project related direct, indirect, and cumulative impacts to special status plants and sensitive natural communities;
- A discussion of the degree and immediacy of all threats to special status plants and sensitive natural communities, including those from invasive species;
- A discussion of the degree of impact, if any, of the project on unoccupied, potential habitat for special status plants; and
- Recommended measures to avoid, minimize, or mitigate impacts to special status plants and sensitive natural communities.

4. BOTANICAL FIELD SURVEYOR QUALIFICATIONS

Botanical field surveyors should possess the following qualifications:

- Knowledge of plant taxonomy and natural community ecology;
- Familiarity with plants of the region, including special status plants;
- Familiarity with natural communities of the region, including sensitive natural communities;
- Experience with the CNDDB, BIOS, and Survey of California Vegetation Classification and Mapping Standards;
- Experience conducting floristic botanical field surveys as described in this document, or experience conducting such botanical field surveys under the direction of an experienced botanical field surveyor;
- Familiarity with federal, state, and local statutes and regulations related to plants and plant collecting; and
- Experience analyzing the impacts of projects on native plant species and sensitive natural communities.

INTRODUCTION

PREFACE

The *L.A. CEQA Thresholds Guide: Your Resource for Preparing CEQA Analyses in Los Angeles (Thresholds Guide)* is a guidance document that draws together practical information useful to City staff, project proponents, and the public involved in the environmental review of projects subject to the California Environmental Quality Act (CEQA). The *Thresholds Guide* is a resource available to provide information to those interested in the CEQA process.

The *Thresholds Guide* provides assistance in evaluating the significance of project impacts on 46 of the most common environmental issues in the City of Los Angeles. This guidance is supplemented by an introduction to each issue area, a recommended analysis method for project impacts, guidance for environmental setting and cumulative impact sections, sample mitigation measures, and references. The *Thresholds Guide* is geared toward readers familiar with the CEQA process. For additional information on the terminology and requirements of CEQA, please refer to the Glossary to the *Thresholds Guide*, The Los Angeles City CEQA Guidelines (City CEQA Guidelines), the State Guidelines for Implementation of the California Environmental Quality Act (State CEQA Guidelines) or the City's Guide to Understanding CEQA in the City of Los Angeles.

The preparation of the *Thresholds Guide* was initiated as part of the City's Development Reform efforts to streamline the City's permit and development processes. It is a tool that compiles information that is useful in the preparation of environmental documents. This information can be used to improve the level of consistency, predictability, and objectivity of the City's environmental documents, while reducing costs and time delays in the environmental review process.

CEQA requires the analysis of discretionary projects to disclose their potential effects on the environment and to allow public participation in the environmental review process. Central to the implementation of CEQA is the identification of "significant" or "potentially significant" impacts that would occur as a result of a proposed project, as this determines the level of review required and the need for mitigation measures to reduce or eliminate project impacts. For projects needing discretionary approval from the City of Los Angeles, the department granting the approval generally acts as the lead agency on behalf of the City and is known as the lead City agency.

The *Thresholds Guide* applies only to those non-exempt projects subject to CEQA that require an Initial Study, negative declaration, mitigated negative declaration, or EIR. It applies both to public and private projects, including residential, commercial, institutional, industrial, and infrastructure projects. Most screening criteria and significance thresholds also apply to Master planned developments, specific plans, zone changes, and other "plan" level proposals.

The *Thresholds Guide* does not impact the existing discretionary authority of decision-makers, although the guidance contained in it could provide more complete information to these decision-makers. The *Thresholds Guide* does not replace or invalidate the City's CEQA Guidelines, as it addresses the content of environmental documents as opposed to procedural requirements. It has no effect on the City's list of projects exempt from the CEQA process (see Article X of the City CEQA Guidelines, which lists project types eligible for categorical exemptions). The *Thresholds Guide* can be used as a complement to existing department procedures for processing CEQA documents, by building on the information in the CEQA Guidelines and providing technical assistance for the environmental analysis and determination of significance. The *Thresholds Guide* does not change the authority of the lead agency, as identified in the State CEQA Guidelines, to determine significance thresholds on a case-by-case basis dependent upon unique environments, evolving regulatory requirements, and the nature of projects encountered by each lead agency.

The guidance in the *Thresholds Guide* does not substitute for the use of independent judgment to determine significance or the evaluation of the evidence in the record, but is intended to provide sufficient flexibility to use the most appropriate criteria for a particular project. CEQA includes additional topics and requirements that are not addressed in the *Thresholds Guide*. The project evaluator and lead agency are still responsible for all CEQA requirements, whether or not they are discussed in the *Thresholds Guide*. The City CEQA Guidelines, the State CEQA Guidelines, and other references describe all of the requirements of the CEQA process and should be consulted if additional assistance is required.

As noted above, the fundamental purpose of CEQA is to publicly disclose and evaluate potential environmental impacts associated with proposed projects. As such, CEQA contains specific public notification and participation requirements. In addition, City policy in the General Plan Framework Element and a similar policy in the Transportation Element is to "assure that (sic) fair treatment of people of all races, cultures, incomes and education levels with respect to the development, implementation and enforcement of environmental laws, regulations, and policies, including affirmative efforts to inform and involve environmental groups, especially environmental justice groups, in early planning stages through notification

and two-way communication.[1]" This assurance may involve efforts to identify and reach affected populations, including low-income communities and communities of color.

CONTENT AND USE

The *Thresholds Guide* presents two sets of criteria to evaluate project impacts: the screening and significance criteria. The screening criteria provide assistance in responding to Initial Study Checklist questions, and can help determine when further study is needed to decide whether a significant impact could potentially occur. Additional study (either in the context of an expanded Initial Study, negative declaration, or EIR) will assist project evaluators in determining whether the project impact falls above or below the significance threshold. The significance threshold identifies the level of impact over which mitigation (or a Statement of Overriding Considerations, if mitigation is not feasible) is required.

By defining screening criteria and significance thresholds, the *Thresholds Guide* provides guidance in determining the appropriate environmental document required for a project within the City of Los Angeles – negative declaration, mitigated negative declaration, or environmental impact report (EIR) – and whether a project's impacts would be presumed significant under normal circumstances, and therefore, require mitigation. The existence of screening criteria and significance thresholds may also encourage project proponents to incorporate impact-reducing measures into project designs, prior to submitting project applications to the City, to reduce potential impacts below the significance level.

The screening criteria and significance thresholds presented in the *Thresholds Guide* are based on a variety of factors, including existing local, state, and federal regulations, administrative practices of other public agencies, and commonly accepted professional standards (common practice). Each threshold was then reviewed with respect to meeting the following goals: objectivity and applicability, defensibility, practicality, nexus between impacts and mitigation, and legal liability. This document, therefore, represents a compilation of existing information and practices and does not introduce new evaluation methods, nor does it diminish the value of independent judgment on the part of the project evaluator. However, the guidance provided in the *Thresholds Guide* can simplify the CEQA process by providing a consistent set of criteria applicable to most discretionary projects in the City. Because evaluation practices continue to evolve due to changing regulations, scientific methods, and court decisions, the project evaluator and lead City agency should always use the best information and evaluation methods available, including those from sources other than the *Thresholds Guide*.

1 *City of Los Angeles, General Plan Framework Element, Policy 3.1.9, page 3-8.*

There are three types of significance thresholds identified in the *Thresholds Guide*: quantitative, qualitative, and case-by-case (also called factors for consideration). Quantitative thresholds provide a measurable criterion with which to compare one or more characteristics of the proposed project, such as "the vehicle-to-capacity ratio increase at a study intersection is greater than 0.020." A qualitative threshold requires comparison to non-numerical criteria, such as "interference with a wildlife movement corridor." For some issue areas, a definitive threshold could not be established, either because the significance of impacts is specific to site conditions or project operations, or because there is no consistent technical guidance available. For these issues, the case-by-case thresholds provide factors for the project evaluator to consider, in light of specific project circumstances, in the determination of significance.

The *Thresholds Guide* does not identify thresholds for all issues found in the State's Initial Study Checklist, but focuses on those that are most commonly of concern throughout the City. In addition, the *Thresholds Guide* provides information on the topic of Shading, which is not listed in the Initial Study Checklist. It also provides expanded information on transportation issues, consistent with the City Department of Transportation's traffic study policies and procedures.

The impact resulting from a particular action depends on the project setting, design, and operational components. Therefore, the use of the *Thresholds Guide* may be appropriate for projects located within City boundaries under "normal" conditions, but there may be circumstances in which another set of criteria better applies to the proposed action or setting, and should be used for the determination of significance. For City-sponsored projects located outside City boundaries, City departments conducting CEQA review must consider the local environmental setting, as well as applicable regulations and policies, and determine if another set of criteria applies or is more appropriate.

Since conditions may vary depending upon the type of project and/or approval that is required, the lead City agency responsible for the implementation of CEQA for a particular project may develop internal departmental direction (e.g., thresholds), not inconsistent with the guidance in the *Thresholds Guide,* to address issues that commonly arise within the jurisdiction of that department. Project applicants should consult with the lead City department regarding any additional or further defined screening criteria or significance thresholds that may apply.

The case study and flowcharts in Exhibits 1-4 illustrate the process of using the screening criteria and significance thresholds, and how their use relates to the Initial Study Checklist and the impact evaluation process. The exhibits all assume that a project is not exempt from CEQA

requirements. The case study (Exhibit 1) assesses operational noise impacts for four project types by posing a series of questions about each "project." This exercise concludes with an Initial Study evaluation and a determination of the type of CEQA document appropriate for that project. The flowcharts (Exhibits 2-4) describe the steps in conceptual terms, focusing on three phases of the CEQA process: 1) the Initial Study Checklist Process (using the screening and significance criteria to determine which boxes to check on the Checklist); 2) the Initial Study Determination (what type of CEQA document to prepare); and 3) the Impact Evaluation and Mitigation Process. The impact from a particular project may fall (a) below the screening criteria, (b) between the screening criteria and the significance threshold, or (c) above the significance threshold.

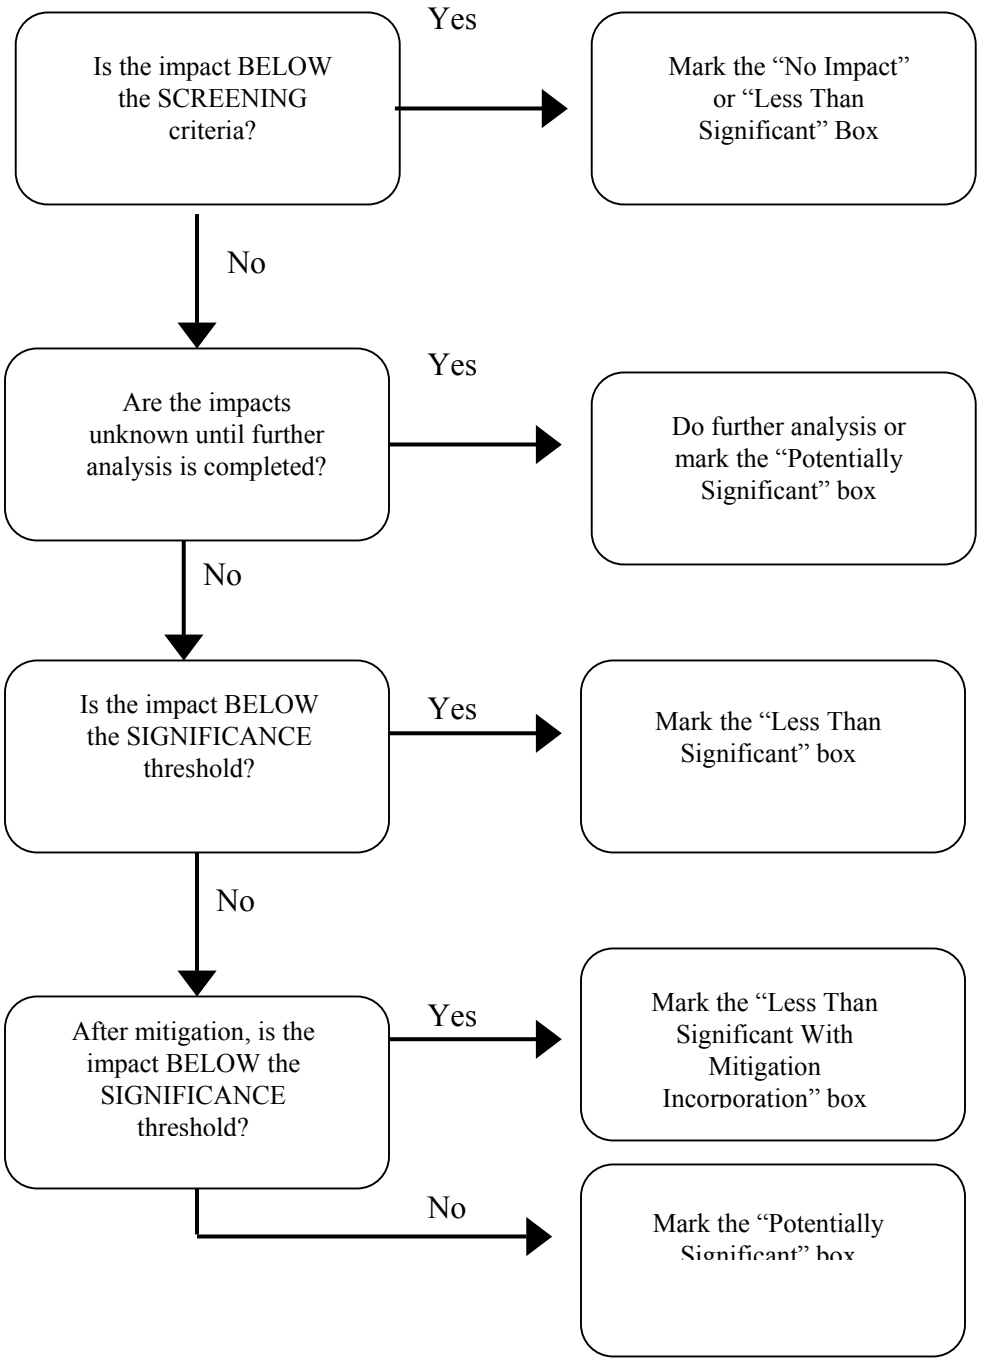
Exhibit 1
CASE STUDY: OPERATIONAL NOISE

Initial Study Checklist Questions

X.a): Would the proposal result in increases in existing noise levels?
X.b): Would the proposal result in exposure of people to severe noise levels?

Initial Study Screening Criteria

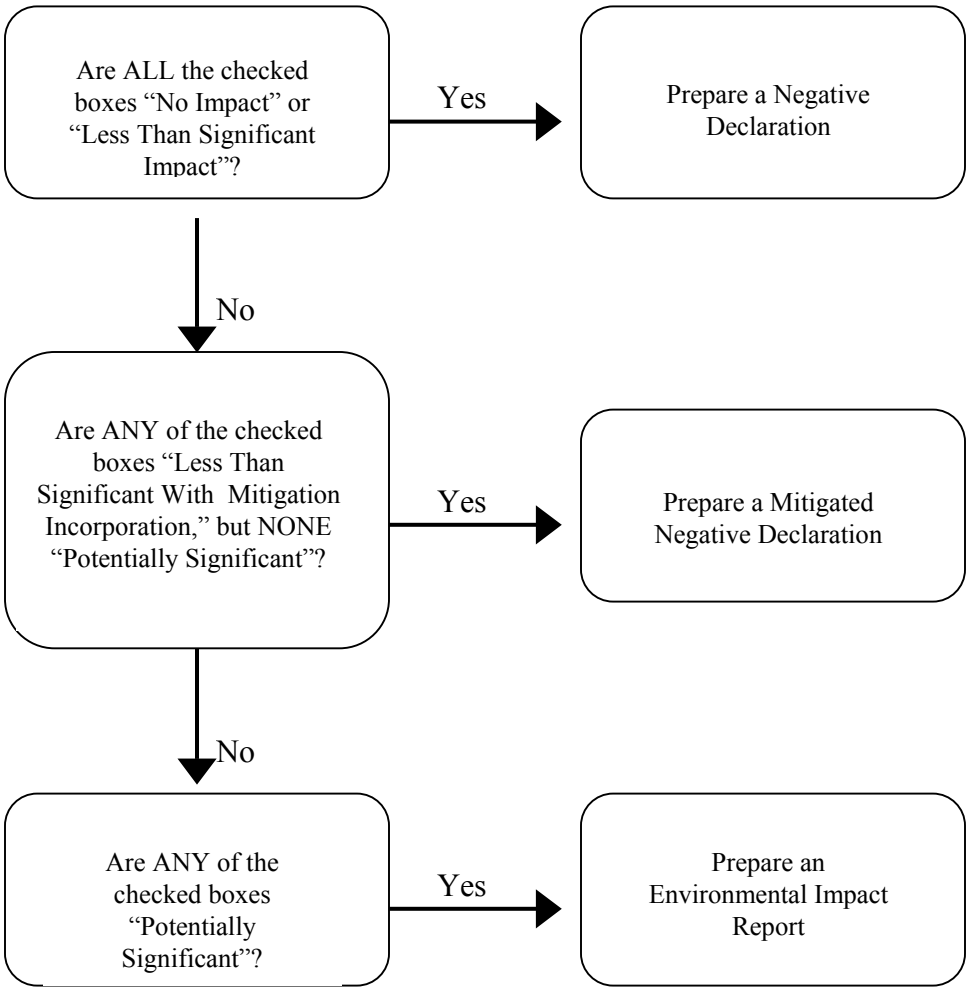
- Would the proposed project introduce a stationary noise source that is likely to be audible beyond the property line of the project site?
- Would the project include 75 or more dwelling units or 100,000 square feet (sf) or greater of nonresidential development, or have the potential to generate 1,000 or more average daily vehicle trips (ADT)?



Significance Threshold

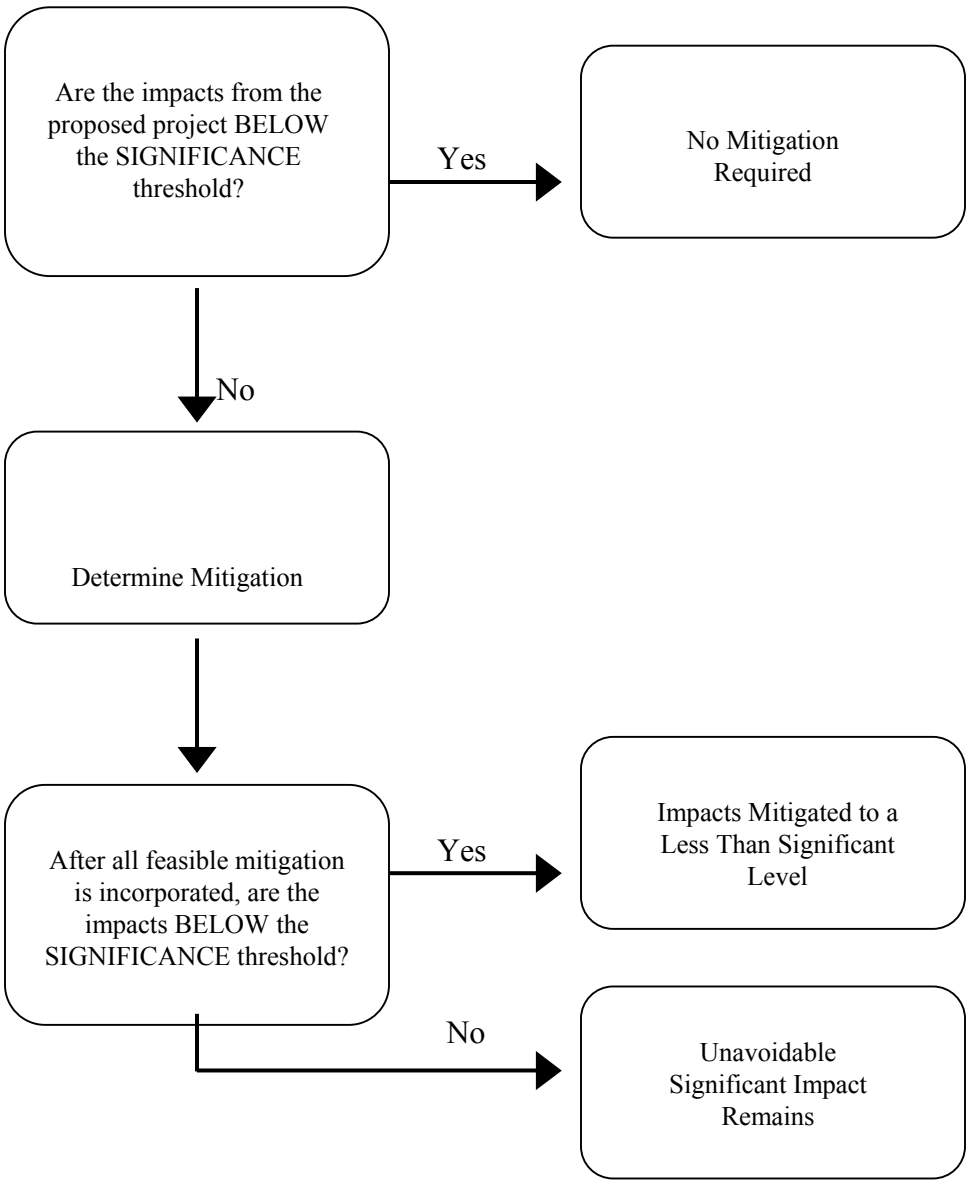
A project would normally have a significant impact on noise levels from project operation if the project causes the ambient noise level measured at the property line of an affected use to increase by 3 decibels (dBA) or more in community noise equivalency level (CNEL) to or within the "normally unacceptable" or "clearly unacceptable" category of the noise exposure chart prepared by the California Department of Health Services (DHS), or any 5 dBA or greater noise increase.

Case	Introduce Stationary Source with Noise Emissions Audible Beyond Property Line?	Include more than 75 du, 100,000 sf nonresidential, or 1,000 ADT?	Increase in Ambient Level?	Increase Remaining After Mitigation	Initial Study Evaluation	Results/ Document Prepared
1	No	No	-	-	No Impact	Neg Dec
2	No	Yes	2 dBA	-	Less Than Significant Impact	Neg Dec
3	Yes	No	5 dBA	2.5 dBA	Potentially Significant Unless Mitigation Incorporated	Mitigated Neg Dec
4	Yes	Yes	7 dBA	5 dBA	Potentially Significant Impact	EIR



Notes: Assumes project is not exempt under CEQA.
The noise exposure chart prepared by the DHS is reproduced in the *Thresholds Guide.*
If the noise level before and/or after mitigation is not known or cannot be determined, additional analysis could be undertaken prior to completing the Initial Study Evaluation or within an EIR.

Exhibit 2
INITIAL STUDY CHECKLIST PROCESS*



* *Assumes the project has had no previous review and is not exempt under CEQA.*

Exhibit 3
INITIAL STUDY DETERMINATION*

* *Assumes the project is not exempt under CEQA.*

Exhibit 4
IMPACT EVALUATION AND MITIGATION PROCESS

Note: If a project would result in one or more significant impacts, the lead agency, prior to project approval, must adopt certain findings as stated in CEQA Section 21081. Additional requirements related to mitigation measures are described in Section 21081.6.

DOCUMENT STRUCTURE

The *Los Angeles CEQA Thresholds Guide* is arranged by issue area, generally in the same order in which the issues appear in the State's Initial Study Checklist. The major environmental categories covered in the document are as follows:

- Air Quality
- Biological Resources
- Cultural Resources
- Geology
- Hazards
- Land Use
- Noise
- Population and Housing
- Public Services
- Public Utilities
- Transportation
- Visual Resources
- Water Resources

For each environmental issue area, the following information is provided:

1. Initial Study Screening Process

Initial Study Checklist Question: This lists the question(s) from the State's Initial Study Checklist addressed within this issue area.

Introduction: The introduction provides a brief description of the issue area, including what types of project activities could be expected to have an impact, how the resource/issue would be affected, and important regulatory agencies and/or regulations.

Screening Criteria: The screening criteria assist in deciding when further study (additional review) is needed to determine whether a project impact could be significant. It assumes that the project is not exempt from CEQA requirements. Criteria are phrased as yes/no questions. For many issue areas, further study is recommended when one or more questions are answered with a "yes." A "no" response to all questions indicates that further study is not required, and there would normally be no significant impact from the proposed project on the subject issue.

Evaluation of Screening Criteria: This section contains any additional information needed to apply the screening criteria and identifies references that may be used in the evaluation.

2. Determination of Significance

Significance Threshold: The significance threshold provides guidance in determining whether or not a project impact would be significant. The threshold assumes that a project

exceeds the screening criteria. The quantitative and qualitative thresholds are phrased in the positive, so that if the project meets one or more of the criteria listed (a "yes" response), it would normally be considered to have a significant impact on the environment. Where a definitive threshold is not available, the *Thresholds Guide* provides case-by-case thresholds which consist of a list of conditions or criteria to be considered for an individual determination of significance.

Environmental Setting: This section identifies the type of information that is appropriate for a project setting or background section.

Project Impacts: This section provides a recommended methodology with which to analyze the proposed project, including the identification and evaluation of direct and indirect impacts, as appropriate, that may occur during construction or operation. It also identifies sources of relevant information and technical resources, and provides the basic steps to follow in the analysis. Impact methodologies are assumed to apply to both project level and plan level analyses unless otherwise specified. Other analysis methods may be appropriate, depending on project circumstances.

Cumulative Impacts: This section presents a method to evaluate cumulative impacts, based on either a related projects list or a planned development approach (the amount of overall growth expected for the project area, according to planning documents or forecasts, by the time of project completion). The methodology describes only the type of analysis that is appropriate and does not address the size or location of related projects to consider in the analysis. In cases where the methodology is the same as that for project impacts, the project impact section is referenced rather than repeating the information.

Sample Mitigation Measures: This section provides a sample list of measures that may be used to reduce project impacts. It does not address specific mitigation measures for certain project types, nor does it recommend or prioritize mitigation measures. Consideration of alternative projects (e.g., smaller scale, different uses) to reduce impacts is assumed to be part of the project alternatives analysis required in an EIR and is not included in the sample mitigation measures listed in the *Thresholds Guide*.

3. Data, Resources, and References

This section provides additional information related to the environmental issue. It may contain references to agencies or others with expertise in the subject area, reference documents, and selected legislation. For references that do not identify an agency or author, the entry refers to the City of Los Angeles. Several sections also provide exhibits and/or supplemental background information that illustrates or further explains concepts addressed in the section.

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE

INITIAL STUDY CHECKLIST QUESTION	THRESHOLDS GUIDE SECTION
I. AESTHETICS: *Would the project:*	
a) Have a substantial adverse effect on a scenic vista?	A.1 Aesthetics A.2 Obstruction of Views
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	A.1 Aesthetics E.3 Landform Alterations
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	A.1 Aesthetics A.3 Shading
d) Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?	(Glare Not Addressed) A.4 Nighttime Illumination

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

INITIAL STUDY CHECKLIST QUESTION	THRESHOLDS GUIDE SECTION
II. AGRICULTURE RESOURCES: *In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and famland. Would the project:*	(Agriculture Not Addressed)
III. AIR QUALITY: *Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:*	
a) Conflict with or obstruct implementation of the applicable air quality plan?	B.1 Construction Emissions B.2 Operational Emissions B.3 Toxic Air Contaminants
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	B.1 Construction Emissions B.2 Operational Emissions B.3 Toxic Air Contaminants

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

INITIAL STUDY CHECKLIST QUESTION	THRESHOLDS GUIDE SECTION
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	B.1 Construction Emissions B.2 Operational Emissions
d) Expose sensitive receptors to substantial pollutant concentrations?	B.1 Construction Emissions B.2 Operational Emissions B.3 Toxic Air Contaminants
e) Create objectionable odors affecting a substantial number of people?	B.2 Operational Emissions
IV. BIOLOGICAL RESOURCES: *Would the project:*	
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by California Department of Fish and Game or U.S. Fish and Wildlife Service?	C. Biological Resources

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

INITIAL STUDY CHECKLIST QUESTION	THRESHOLDS GUIDE SECTION
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	C. Biological Resources
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including but not limited to, marsh, vernal pool, coastal, etc.) through direct removal	C. Biological Resources
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	C. Biological Resources
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	C. Biological Resources
f) Conflict with the provisions of an adopted Habitat Conservation Plan, or other approved local, regional, or state habitat conservation plan?	C. Biological Resources

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

V. CULTURAL RESOURCES: *Would the project:*		
a) Cause a substantial adverse change in the significance of a historical resource as defined in'15064.5?	D.3	Historical Resources
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to '15064.5?	D.2	Archaeological Resources
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	D.1	Paleontological Resources
	E.3	Landform Alterations
d) Disturb any human remains, including those interred outside of formal cemeteries?	D.2	Archaeological Resources

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

VI.	**GEOLOGIC PROBLEMS:** *Would the project:*		
a)	Expose people to potential substantial adverse effects, including the risk of loss, injury, or death involving:		
i)	Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publications 42.	E.1	Geologic Hazards
ii)	Strong seismic ground shaking?	E.1	Geologic Hazards
iii)	Seismic-related ground failure, including liquefaction?	E.1	Geologic Hazards
iv)	Landslides?	E.1	Geologic Hazards
b)	Result in substantial soil erosion or the loss of topsoil?	E.2	Sedimentation and Erosion
c)	Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	E.1	Geologic Hazards

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

d)	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks of life or property?	Not Addressed	
e)	Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	E.3	Landform Alteration
VII. HAZARDS AND HAZARDOUS MATERIALS:	*Would the project:*		
a)	Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	F.1 F.2	Risk of Upset/Emergency Preparedness Human Health Hazards
b)	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	F.1 F.2	Risk of Upset/Emergency Preparedness Human Health Hazards
c)	Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	F.2	Human Health Hazards

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

d)	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and as a result, would it create a significant hazard to the public or the environment?	F.2	Human Health Hazards
e)	For a project located within an airport land use plan or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	F.1 K.2	Risk of Upset/Emergency Preparedness Fire Protection & Emergency Medical Services
f)	For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working within the project area?	F.1 K.2	Risk of Upset/Emergency Preparedness Fire Protection & Emergency Medical Services
g)	Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	F.1 K.2	Risk of Upset/Emergency Preparedness Fire Protection & Emergency Medical Services
h)	Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	K.2	Fire Protection & Emergency Medical Services

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

VIII. HYDROLOGY AND WATER QUALITY: *Would the project:*			
a)	Violate any water quality standards or waste discharge requirements?	G.2	Surface Water Quality
b)	Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	G.2 G.3	Surface Water Quality Groundwater Level
c)	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	G.1 G.2	Surface Water Hydrology Surface Water Quality
d)	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	G.1	Surface Water Hydrology

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

e)	Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	G.1	Surface Water Hydrology
f)	Otherwise substantially degrade water quality?	G.3	Groundwater Level
g)	Place housing within a 100-year flood hazard area as mapped on a federal flood hazard Boundary or flood Insurance Rate Map or other flood hazard delineation map?	G.1 G.2 G.3 G.4	Surface Water Hydrology Surface Water Quality Groundwater Level Groundwater Quality
h)	Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	G.4	Groundwater Quality
i)	Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	G.1 G.3	Surface Water Hydrology Groundwater Level
j)	Inundation by seiche, tsunami, or mudflow?	E.1 G.3	Geologic Hazards Groundwater Level

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

IX.	**LAND USE AND PLANNING:** *Would the project:*		
a)	Physically divide an established community?	H.2	Land Use Compatibility
b)	Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding mitigating an environmental effect?	H.1 H.2	Land Use Consistency Land Use Compatibility
c)	Conflict with any applicable habitat conservation plan or natural community conservation plan?	H.1 H.2	Land Use Consistency Land Use Compatibility
X.	**MINERAL RESOURCES:** *Would the project:*		
a)	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	E.4	Mineral Resources
b)	Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, general plan, or other land use plan?	E.4	Mineral Resources

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

XI. NOISE: *Would the project result in:*		
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	I.1 I.2 I.3 I.4	Construction Noise Operational Noise Railroad Noise Airport Noise
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	I.1 I.2 I.3 I.4	Construction Noise Operational Noise Railroad Noise Airport Noise
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	I.2 I.3 I.4	Operational Noise Railroad Noise Airport Noise
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above the existing without the project?	I.1 I.2 I.3 I.4	Construction Noise Operational Noise Railroad Noise Airport Noise

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

e)	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	I.1 I.2 I.4	Construction Noise Operational Noise Airport Noise
f)	For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	I.1 I.2 I.4	Construction Noise Operational Noise Airport Noise
XII.	**POPULATION AND HOUSING:** *Would the project:*		
a)	Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	J.1	Population and Housing Growth
b)	Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	J.1 J.2	Population and Housing Growth Population and Housing Displacement
c)	Displace substantial numbers of existing people, necessitating the construction of replacement housing elsewhere	J.2	Population and Housing Displacement

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

XIII. PUBLIC SERVICES: *Would the project:*			
a)	Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the above public services:	K.1	Police Protection
i)	Fire protection?	K.2	Fire Protection & Emergency Medical Services
ii)	Police protection	K.1	Police Protection
iii)	Schools?	K.3	Public Schools
iv)	Parks?	K.4	Recreation and Parks
v)	Other public facilities?	K.5	Libraries

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

XIV. RECREATION:			
a)	Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the family would occur or be accelerated?	K.4	Recreation and Parks
b)	Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	K.4	Recreation and Parks
XV. TRANSPORTATION/TRAFFIC: *Would the project:*			
a)	Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections?	L.1 L.2 L.3 L.4 L.8	Intersection Capacity Street Segment Capacity Freeway Capacity Neighborhood Intrusion Impacts In-Street Construction Impacts
b)	Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	L.1 L.2 L.3	Intersection Capacity Street Segment Capacity Freeway Capacity

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

c)	Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	Not Addressed	
d)	Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Not Addressed	
e)	Result in inadequate emergency access?	L.5	Project Access
f)	Result in inadequate parking capacity?	L.7	Parking
g)	Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	L.6	Transit System Capacity
XVI. UTILITIES AND SERVICE SYSTEMS: *Would the project:*			
a)	Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	M.2	Wastewater
b)	Require or result in the construction of new water or wastewater treatment facilities, the construction of which could cause significant environmental effects?	G.1 M.1 M.2	Surface Water Hydrology Water Wastewater

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

c)	Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	G.1 M.2	Surface Water Hydrology Wastewater
d)	Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	M.1	Water
e)	Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	K.2	Wastewater
f)	Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	K.3	Solid Waste
g)	Comply with federal, state, and local statutes and regulations related to solid waste?	M.3	Solid Waste

INITIAL STUDY CHECKLIST QUESTIONS AND RELATED SECTIONS IN L.A. CEQA THRESHOLDS GUIDE, continued

XVII. MANDATORY FINDINGS OF SIGNIFICANCE: *Does the project:*	
a) Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	All sections, particularly: C. Biological Resources D.1 Paleontological Resources D.2 Archaeological Resources D.3 Historical Resources
b) Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	All Sections
c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	Not addressed specifically, each section addresses indirectly

ZI	Zoning Information

GLOSSARY

Alternatives - A range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain the project's objectives but would avoid or substantially lessen any of the significant effects of the project. The comparative merits of the alternatives are evaluated in an EIR or EIS.

Applicant - A legal entity or person who proposes to carry out a project and needs a lease, permit, license, certificate, or other entitlement for use, or who is requesting financial assistance from one or more public agencies to carry out a project.

Approval - The action by a decision-making body, which commits the City to a definite course of action with regard to a project, intended to be carried out by any person.

California Environmental Quality Act (CEQA) - Statute enacted by the California legislature contained in the California Public Resources Code, Section 21000 et seq. The *Thresholds Guide* provides guidance on the determination of significant impacts, one provision of CEQA.

California Law – California Law consists of 29 codes, covering various subject areas, the State Constitution and Statutes. Codes included the following: Business and Professions Code, Civil Code, Code of Civil Procedure, Commercial Code, Corporations Code, Education code, Election Code, Evidence Code, Family Code, Financial Code, Fish and Game Code, Food and Agricultural Code, Government Code, Harbors and Navigation Code, Health and Safety Code, Insurance Code, Labor Code, Military and Veterans Code, Penal Code, Probate Code, Public Contract Code, Public Resources Code, Public Utilities Code, Revenue and Taxation Code, Streets and Highways Code, Unemployment Insurance Code, Vehicle Code, Water Code, and Welfare and Institutions Code.

Categorical Exemption - An exemption from the requirements of CEQA based on a finding by the Secretary For Resources and the Los Angeles City Council that certain types of projects do not have a significant effect on the environment.

CEQA Guidelines - The CEQA Guidelines provide agencies with criteria and procedures for the evaluation of projects and the preparation of environmental documents. The State CEQA Guidelines are contained in Title 14, Division 6 of the California Administrative Code. The Los Angeles City CEQA Guidelines are adopted by ordinance of the City Council.

Code of Federal Regulations (CFR) - is a codification of the general and permanent rules published in the Federal Register by the Executive departments and agencies of the Federal Government. The CFR is divided into 50 titles, which represent broad areas subject to Federal regulation. Each title is divided into chapters, which usually bear the name of the issuing agency. Each chapter is further subdivided into parts covering specific regulatory areas. Large parts may be subdivided into subparts.

Community Plan – A portion of the General Plan that focuses on the setting and

needs of a particular area. It supports the policies of the General Plan. Los Angeles has 35 Community Planning Areas. The 35 Community Plans make up the City's Land Use Element.

Decision-Making Body - A group or individual having project approval authority.

Discretionary Project - An activity defined as a project which requires the exercise of judgment, deliberation, or a decision on the part of the public agency or body in the process of approving or disapproving a particular activity, as distinguished from activities where the public agency or body merely has to determine whether there has been compliance with applicable statutes, ordinances, or regulations.

Entitlement - Used to describe discretionary land use approval granted by the Planning Department. Includes Zone Variances, Zone Changes, Conditional Use Permits, General Plan Amendments, Specific Plan Exceptions, Subdivisions, Parcel Maps, and Site Plan Review.

Environment - Environment, for the purposes of implementing CEQA, is the physical conditions which exist within the area which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.

Environmental and Public Facilities Maps - Show the location of and describe various environmental features and public facilities. The City Planning Department Citywide Division prepared the 42 maps in 1996.

Environmental Assessment Form (EAF) - An environmental form submitted to the Environmental Review Section of the City Planning Department which provides the necessary information to determine the recommended environmental clearance for projects requiring any discretionary action.

Environmental Data Index (EDI) – The EDI is a citywide tabular report describing the geographical distribution of a wide array of environmental characteristics on a census tract basis. Data for 30 environmental elements are included. The City Planning Department prepared the EDI in 1978.

Environmental Documents- Environmental documents, according to CEQA, include Initial Study, Negative Declaration, draft and final EIR, Joint EIR/EIS, Notice of Preparation and General Exemption, Notice of Completion, Notice of Determination, and Notice of Exemption.

Environmental Impact Report (EIR) - An Environmental Impact Report is a concise statement setting forth the environmental effects and considerations pertaining to a project as specified in Section 21100 of CEQA.

Environmental Impact Statement (EIS) - An Environmental Impact Statement may be required pursuant to the National Environmental Policy Act (NEPA) if a federal agency or funding is involved. Like an EIR, an EIS describes the environmental impacts of a proposed project and its alternatives.

Feasible - Feasible means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.

Federal Register – The Federal Register is the official daily publication for Rules, Proposed rules, and Notices of Federal agencies and organizations, as well as Executive Orders and other Presidential Documents.

Framework Element – This strategy for long-term growth sets a citywide context to guide the update of the Community Plans and citywide elements of the General Plan. The Framework Element refines adopted City policy and updates and supersedes Concept Los Angeles, a strategy to preserve residential neighborhoods by focusing growth into centers. Approved by City Council in December 1996.

General Exemption - An exemption from the requirements of CEQA is granted if it can be seen with reasonable certainty that the project in question could not possibly have a significant effect on the environment.

General Plan – A "blueprint" for future development with a long-term outlook. Required by State law to be prepared by each county and city and include seven elements: land use, circulation, housing, conservation, open space, noise, and safety. May also include optional elements. Includes policies, goals, objectives, and programs. Development must not only meet specific zoning requirements, but also the broader policies, goals and objectives set forth in the General Plan. The City's General Plan is organized into the following Elements: Framework; Land Use; Air Quality; Transportation; Housing; Infrastructure Systems; Open Space and Conservation; Noise; Public Facilities and Services; Historic Preservation and Cultural Resources; Safety; and Urban Form and Neighborhood Design.

Initial Study - A comprehensive analysis of those aspects of the environment, which could potentially affect a project or be affected by a project conducted to determine whether a project may have a significant effect on the environment.

Lead Agency - The public agency which has the principal responsibility for carrying out or approving a project. The Lead Agency will prepare the environmental documents for the project either directly or by contract.

Lead City Agency - A Lead City Agency is the City department, bureau, division, section, office, or agency which has the principal responsibility of carrying out a project which is subject to the provisions of CEQA, or has the principal responsibility for processing the application for a lease, permit, license, or other entitlement for use for a project which is subject to the provisions of CEQA. If more than one City Agency meets the Lead City Agency criteria, the Lead City Agency shall be the City Agency that normally acts first on such projects.

Ministerial Project - Activities undertaken by public agencies pursuant to a statute, ordinance, or regulation that sets forth the conditions upon which the undertaking must or must not be granted. A ministerial decision involves only the use of fixed standards or objective measurements without professional judgment.

Mitigated Negative Declaration (MND) - When significant impacts may occur as a result of the implementation of a project, but mitigation and/or project modification reduce impacts to a less than significant level, then a Mitigated Negative Declaration

is issued with discussion and conditions attached.

Mitigation - Mitigation includes avoiding the impact altogether by not taking a certain action or parts of an action; minimizing impacts by limiting the degree or magnitude of the action and its implementation; rectifying the impact by repairing, rehabilitating, or restoring the impacted environment; reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or compensating for the impact by replacing or providing substitute resources or environments.

National Environmental Policy Act (NEPA) - The National Environmental Policy Act is the federal law requiring an environmental assessment for federal actions that involve impacts on the environment. NEPA is set forth in 42 U.S.C.A. 4321 et seq.

Negative Declaration (ND) - A statement by the Lead Agency briefly setting forth the reasons why the project, although not otherwise exempt, will not have a significant effect on the environment and therefore does not require the preparation of an EIR.

Notice of Completion (NOC) - A brief notice filed with the State Clearinghouse in the Governor's Office of Planning and Research by a Lead Agency as soon as it has completed a draft EIR and is prepared to send out copies for review.

Notice of Determination (NOD) - A public notice filed with the City and County Clerk by the Lead City Agency after a project subject to the provisions of CEQA and involving a Negative Declaration, Mitigated Negative Declaration or an EIR has been approved.

Notice of Exemption (NOE) - A public notice which may be filed with the City and County Clerk by a Lead City Agency after the decision-making body has approved a project and has determined that it is a ministerial, categorically exempt, or emergency project, or is otherwise exempted pursuant to the provisions of Section 21080 (b) of the California Public Resources Code.

Notice of Preparation (NOP) - A brief notice sent by a Lead City Agency to notify Responsible Agencies and interested parties that the Lead City Agency plans to prepare an EIR for a proposed project.

Office of Planning and Research (OPR) - Assists in the understanding and implementation of CEQA by (1) preparing and updating the State CEQA Guidelines; (2) evaluating Categorical Exemptions; (3) distributing documents to state agencies through the State Clearinghouse; (4) coordinating between other public agencies; and (5) preparing and distributing publications related to the understanding and use of CEQA.

Participating City Agency - A City department, bureau, division, section, office, officer, or agency, which is required by Charter or action of the City Council to review a particular class of projects and make comments or recommendations to the Lead City Agency.

Responsible Agency - A public agency, such as a city or county, which proposes to carry out or has approval power over a project, but is not the Lead Agency for the project.

Significant Effect - A substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the proposed activity including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. This *Thresholds Guide* is intended to assist in the determination of significant effects.

Specific Plan – describes the allowable land uses, identifies open space, and details infrastructure availability and financing for a portion of a community. Specific plans implement, but are not technically a part of the General Plan. Los Angeles has various specific plans throughout the City, such as West Los Angeles, Warner Center, etc.

State Clearinghouse - In the Governor's Office of Planning and Research. Responsible for distributing environmental documents to state agencies, departments, boards, and commissions for review and comment. Coordinates the responses to ensure accurate and consistent responses from the state.

Statement of Overriding Considerations - A statement with findings identifying public objectives that, in the opinion of the decision-making body, warrant approval of a project notwithstanding its significant adverse impact(s) on the environment.

Statutory Exemption - Exemption from the requirements of CEQA based on the determination by the California Legislature that a specific type of project should be exempt from CEQA.

Zoning – The purpose of zoning regulations is to implement the policies of the General Plan. Zoning lists the kinds of uses allowed on a parcel and sets standards such as minimum lot size, maximum building height, and minimum front yard depth. Zoning must comply with the general plan, is adopted by ordinance, and carries the weight of local law. The City's Zoning is found in Chapter 1 of the Los Angeles Municipal Code (LAMC).

Exhibit 5

VERBAL MOTION

I HEREBY MOVE that Council ADOPT the following recommendation of the City Planning Commission (Item No. 37, CF 03-1459 & 03-1459-S1) relative to amending the Los Angeles Municipal Code (LAMC) to add certain native trees to the class of "protected tree" formerly solely oak tree), SUBJECT TO THE APPROVAL OF THE MAYOR:

1. FIND that this action is exempt from California Environmental Quality Act, pursuant to Article II, Section 2(m) of the City's Guidelines.

2. ADOPT the January 18, 2006 Findings of the City Planning Commission as the Findings of the Council.

3. PRESENT and ADOPT the accompanying ORDINANCE, approved by the Interim Director of Planning (on behalf of the City Planning Commission) amending the LAMC to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions. CPC 2004-2290 CA

   Fiscal Impact Statement: None submitted by the Planning Department. Neither the City Administrative Officer nor the Chief Legislative Analyst has completed a financial analysis of this report.

(Planning and Land Use Management Committee waived consideration of the above matter)

MOTION

I **MOVE** that the matter of EXEMPTION, COMMUNICATION FROM THE CITY PLANNING COMMISSION and ORDINANCE FIRST CONSIDERATION relative to amending the Los Angeles Municipal Code (LAMC) to add certain native trees to the class of "protected tree" (formerly solely oak tree), Item 37 (CF 03-1459 and CF 03-1459-S1) on today's Council Agenda, Tuesday, February 28, 2006, be AMENDED to ADOPT the following ADDITIONAL RECOMMENDATIONS:

1. DIRECT the Bureau of Street Services to report on a quarterly basis on the number of violations of the City's Protected Trees Ordinance, as codified in the Los Angeles Municipal Code (LAMC), and the nature of those violations occurring at but not limited to, small lot, multi-family, and large developments, the number of violations occurring per Council District, permits issued for removal, and the number of trees illegally removed.

2. DIRECT the Bureau of Street Services and the City Administrative Officer (CAO), to report on a quarterly basis on the resources needed to properly enforce the City's Protected Trees Ordinance.

EXECUTIVE SUMMARY

The 1988 amendment to the Fish and Wildlife Conservation Act mandates the U.S. Fish and Wildlife Service (USFWS) to "identify species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act (ESA) of 1973." *Birds of Conservation Concern 2008* (*BCC 2008*) is the most recent effort to carry out this mandate. The overall goal of this report is to accurately identify the migratory and non-migratory bird species (beyond those already designated as federally threatened or endangered) that represent our highest conservation priorities. The geographic scope of this endeavor is the United States in its entirety, including island "territories" in the Pacific and Caribbean. *BCC 2008* encompasses three distinct geographic scales—North American Bird Conservation Initiative (NABCI) Bird Conservation Regions (BCRs), USFWS Regions, and National—and is primarily derived from assessment scores from three major bird conservation plans: the Partners in Flight North American Landbird Conservation Plan, the United States Shorebird Conservation Plan, and the North American Waterbird Conservation Plan.

Bird species considered for inclusion on lists in this report include nongame birds, gamebirds without hunting seasons, subsistence-hunted nongame birds in Alaska; and Endangered Species Act candidate, proposed endangered or threatened, and recently delisted species. Assessment scores from all three bird conservation plans are based on several factors, including population trends, threats, distribution, abundance, and relative density. These assessment scores serve as the foundation on which we built the *BCC 2008* lists. Although the different bird conservation plans use somewhat different methods for determining the highest priority species, the scores from each represent true conservation priorities for each of the three species groups (landbirds, shorebirds, and waterbirds). We therefore view the conservation priorities within each plan as approximately equivalent. After creating BCR lists, we developed specific criteria for including species on USFWS Region and National lists. The various BCR lists contain 10 to 53 species, USFWS Region lists contain 27 to 78 species, and the National list contains 147 species. On average, priority species make up about 10 to 15 percent of the native bird species in any given geographic unit.

While all of the bird species included in *BCC 2008* are priorities for conservation action, this list makes no finding with regard to whether they warrant consideration for ESA listing. Our goal is to prevent or remove the need for additional ESA bird listings by implementing proactive management and conservation actions. We recommend that these lists be consulted in accordance with Executive Order 13186, "Responsibilities of Federal Agencies to Protect Migratory Birds." This report should also be used to develop research, monitoring, and management initiatives. *BCC 2008* is intended to stimulate coordinated and collaborative proactive conservation actions among Federal, State, Tribal, and private partners. We hope that, by focusing attention on these highest-priority species, this report will promote greater study and protection of the habitats and ecological communities upon which these species depend, thereby contributing to healthy avian populations and communities.

ACKNOWLEDGMENTS

This document was the result of close collaboration between staff in all regions of the U.S. Fish and Wildlife Service's Migratory Bird Program. The primary collaborators were Mila Plavsic, Jeff Shenot, and Marie Strassburger (Region 9); the initiative coordinators, Brad Andres (U.S. Shorebird Conservation Plan; USSCP), Jennifer Wheeler (North American Waterbird Conservation Plan; NAWCP) and Terry Rich (Partners in Flight; PIF); and the Regional Coordinators: Tara Zimmerman, Mike Green, Nanette Seto, Sue Thomas, and Maura Naughton (Region 1), Bill Howe and Dave Krueper (Region 2), Steve Lewis, Tom Will, and Bob Russell (Region 3), Dean Demarest, Chuck Hunter, Jaime Collazo, and Stefani Melvin (Region 4), Randy Dettmers (Region 5), Stephanie Jones, Suzanne Fellows, and Kevin Kritz (Region 6), Kent Wohl, Steve Matsuoka, and Richard Lanctot (Region 7). All were involved in developing selection criteria, compiling and finalizing BCR and USFWS Region lists, and reviewing and commenting on several drafts of this report.

The basis of this list is the work that many people have done to reach true avian priorities, and we have based this document on their work. We are particularly grateful for all of the work the initiatives (USSCP, NAWCP, and PIF) have done completing prioritization scores and methods. We thank Arvind Panjabi (Rocky Mountain Bird Observatory) for making available the PIF database and for responding to our many questions.

This edition of the *BCC 2008* is dedicated to John L. Trapp, who retired from USFWS in 2007 after 33 years of outstanding contributions to bird conservation. John had an extensive ornithological knowledge and passion for birds, and he oversaw almost all of the previous editions of the Birds of Conservation Concern.

INTRODUCTION

The purpose of this document is to identify migratory and non-migratory birds of the United States and its territories that are of conservation concern so as to stimulate coordinated and proactive conservation actions among Federal, State, Tribal, and private partners. The conservation concerns may be the result of population declines, naturally or human-caused small ranges or population sizes, threats to habitat, or other factors. The primary statutory authority for *Birds of Conservation Concern 2008* (*BCC 2008*) is the Fish and Wildlife Conservation Act of 1980 (FWCA), as amended; other authorities include the Endangered Species Act (ESA) of 1973, the Fish and Wildlife Act of 1956, and 16 U.S.C. § 701. The 1988 amendment (Public Law 100-653, Title VIII) to the FWCA requires the Secretary of the Interior, through the United States Fish and Wildlife Service (USFWS), to "identify species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act of 1973." *BCC 2008* is the most recent effort by the USFWS to carry out this proactive conservation mandate and update *Birds of Conservation Concern 2002* (USFWS 2002). The overall goal of this report is to accurately identify those species (beyond those already federally listed as threatened or endangered) in greatest need of conservation action at three different geographic scales.

A primary goal of the USFWS is to conserve avian diversity in North America (USFWS 1990, 2004). This goal includes reducing or removing threats that may necessitate that a species be considered for listing under the ESA. The Birds of Conservation Concern are largely a subset of a larger list known as the Birds of Management Concern (BMC). The BMC is a subset of all species protected by the Migratory Bird Treaty Act (MBTA, see 50 CFR 10.13), and includes those which pose special management challenges due to a variety of factors (e.g., too few, too many, conflicts with human interests, or societal demands) (USFWS 2004). The BMC includes both game birds below their desired condition and nongame birds. As indicated in its strategic plan (USFWS 2004), the Migratory Bird Program places priority emphasis on these birds in its activities.

The philosophy underlying this report is that proactive bird conservation is necessary at a time when human impacts are at an all-time high. We strongly believe that a well-designed program that addresses resource-management issues up front will prevent or remove the need to consider listing species as threatened or endangered, and will promote and conserve long-term avian diversity in the United States. In addition, proactive conservation clearly is more cost-effective than the extensive recovery efforts required once a species is federally listed under the ESA. Our intent is for *BCC 2008* to stimulate coordinated efforts to develop and implement comprehensive and integrated approaches for the study, management, and protection of "non-ESA listed" bird species deemed to be in the most need of additional conservation actions. It should also be noted that, while the inclusion of native species not listed under the MBTA is beyond the scope of the FWCA, the USFWS has an incentive to encourage proactive management of these species by State agencies and other partners to prevent the need for listing them as endangered or threatened.

Bird species assemblages, guilds, or communities have recently been promoted as indicators of ecological integrity in a variety of habitats (Bradford et al. 1998, O'Connell et al. 2000, Canterbury et al. 2000, Venier and Pearce 2007), and at-risk bird species are good measures of ecosystem threats (Beissinger et al. 1996). Setting priorities in conservation is crucial because resources are limited. Many systems for setting wildlife-conservation priorities have been proposed. Some have focused heavily on identifying and quantifying threats to endangered or rare species (Master 1991, Wilcove et al. 1998). Others have focused on highlighting species that deserve attention due to threats to their populations, widespread or long-term declines, or low potential for population recovery (Millsap et al. 1990). The Canadian Wildlife Service developed a priority ranking system that focuses on conservation concerns and agency responsibilities to assist in setting conservation priorities for landbird species (Dunn 1997, Dunn et al. 1999). The mandate of the 1988 FWCA amendment requires a more proactive approach.

BCC 2008 uses current conservation assessment scores from three bird conservation plans: Partners in Flight North American Landbird Conservation Plan (PIF; Rich et al. 2004), the United States Shorebird Conservation Plan (USSCP; Brown et al. 2001, USSCP 2004), and the North American Waterbird Conservation Plan (NAWCP, Kushlan et al. 2002). Waterfowl game species covered by the North American Waterfowl Management Plan (Canadian Wildlife Service, U.S. Fish and Wildlife Service, Secretario de Medio Ambiente y Recursos Naturales, 2004) are specifically excluded from the BCC list in accordance with the FWCA of 1980. Species in need of additional conservation attention are identified at three distinct geographic scales: North American Bird Conservation Initiative (NABCI) Bird Conservation Regions (BCRs; U.S. NABCI Committee 2000a, 2000b, 2000c), USFWS Regions, and National.

Assessment scores are based on several parameters including population trend, threats, distribution, abundance, and the importance of an area to a species. Partners in Flight, a coalition of Federal and State government agencies, non-governmental organizations, and private interests, developed species assessment scores out of concern for the sharp declines in many North American landbirds (Rich et al. 2004). The PIF approach (Carter et al. 2000, Rich et al. 2004) has been peer-reviewed by an independent body of avian biologists (Beissinger et al. 2000). Similar coalitions have prepared and reviewed conservation assessment scores for shorebirds at the National scale (Brown et al. 2000, USSCP 2004), and in step-down regional shorebird conservation plans (see http://www.fws.gov/shorebirdplan) and for waterbirds at the continental scale (Kushlan et al. 2002) and in step-down regional waterbird conservation plans (see http://www.waterbirdconservation.org). Additionally, we found it necessary to develop conservation assessment scores for species not yet evaluated by any of the bird conservation plans, such as Pacific Island birds. Taken together, these assessment scores can be used to develop a comprehensive set of integrated bird conservation priorities; this represents a unique conservation effort unmatched in any other major group of organisms in North America.

BACKGROUND

Why Did We Create Lists at Different Geographic Scales?

Listing birds of conservation concern at three geographic scales maximizes the utility of the lists for a variety of partner agencies and organizations. The different geographic scales, from smallest to largest, are as follows:

Bird Conservation Regions (BCRs). We have adopted BCRs as the smallest of our geographic scales. BCRs have been endorsed by the North American Bird Conservation Initiative (NABCI, U.S. NABCI Committee 2000a, 2000b, 2000c) as the basic units within which all-bird conservation efforts will be planned and evaluated (Fig. 1). The NABCI is an endeavor to increase the effectiveness of bird conservation at the continental level and currently includes the United States, Canada, and Mexico. Its goal is to deliver "the full spectrum of bird conservation through regionally based, biologically driven, landscape-oriented partnerships" (U.S. NABCI Committee 2000a). A published map of BCRs and accompanying written descriptions of each are available (U.S. NABCI Committee 2000b, 2000c). The BCR lists will be most useful to Federal land-managing agencies and their partners in their efforts to abide by the bird conservation principles embodied in the MBTA and Executive Order 13186, "Responsibilities of Federal agencies to protect migratory birds" (Clinton 2001). The NABCI has recognized 35 BCRs that cover the contiguous 48 States, Alaska, and Hawaii, numbered 1 to 5, 9 to 37, and 67 (Hawaii) (U.S. NABCI Committee 2000a, 2000b, 2000c, http://www.nabci-us.org/bcrs.html). For purposes of this report, we created two additional BCRs to encompass island "territories" of the United States,[1] "Other U.S. Pacific Islands" (i.e., excluding Hawaii) and "U.S. Caribbean Islands." In the *BCC 2002* report, these two BCRs were referred to as BCR 68 for the Pacific Ocean and BCR 69 for the Caribbean, but those designations were changed for *BCC 2008* because NAWCP uses those numbers to refer to marine areas ("pelagic" BCRs). Although *BCC*

[1] Island "territories" and other affiliations of the United States considered in this document include (a) *American Samoa*—an unincorporated and unorganized territory; (b) *Baker Island*—an unincorporated territory administered by the USFWS as a National Wildlife Refuge (NWR); (c) *Commonwealth of the Northern Marianas Islands*—aligned through a covenant of "political union"; (d) *Guam*—an unincorporated organized territory; (e) *Howland Island*—an unincorporated territory administered by the USFWS as a NWR; (f) *Jarvis Island*—an unincorporated territory administered by the USFWS as a NWR; (g) *Johnston Atoll*—an unincorporated and unorganized territory under joint operational control of the Department of Defense and USFWS (and administered as a NWR); (h) *Kingman Reef*—an unincorporated territory administered by the USFWS as a NWR; (i) *Midway Atoll*—an unincorporated territory administered by the USFWS as a NWR; (j) *Navassa Island*—administered by the USFWS as a NWR; *(k) Palmyra Atoll*—an incorporated territory that is partially privately owned and partially administered by USFWS as an NWR; (l) *Commonwealth of Puerto Rico*—a commonwealth; (m) *U.S. Virgin Islands*—an unincorporated organized territory; and (n) *Wake Island*—an unincorporated territory administered by the Department of the Interior (Central Intelligence Agency 2001).

2008 does not adopt the pelagic BCR system, it recognizes that some BCC species occur in the U.S. primarily or only at sea. These species are listed under the adjacent terrestrial BCR. Thus, there are 37 BCR lists of priority species.

USFWS Regions. BCC lists are presented in this document for 8 USFWS Regions.[2] The USFWS Region lists will be useful to USFWS administrators and biologists, other Federal and State agencies within a Region, and their partners and cooperators.

National. The National list encompasses the United States in its entirety, including island "territories" in the Caribbean and the Pacific. The National list should be viewed as a barometer of the status of U.S. bird populations, providing an "early warning" of birds that may decline to levels requiring ESA protection unless additional conservation measures are taken. The National list will be most useful as an outreach tool for educating the public about the precarious status of bird species in the U.S. It will also be useful for National bird conservation planning. The National list should not be used to foster bird conservation at smaller geographic scales; that is the purpose of the BCR and USFWS Region lists.

Although there are other lists of this nature, such as the National Audubon Society/American Bird Conservancy 2007 WatchList (Butcher et al. 2007), *BCC 2008* is the only list that meets USFWS mandates for the conservation of migratory nongame birds. Conservation organizations create lists of concern that reflect their unique missions, and it is important to keep this in mind when comparing lists. With regard to birds, the USFWS focuses on its trust responsibilities as defined by the Code of Federal Regulations, which excludes, for example, gallinaceous birds (resident game birds) unless they are listed as threatened or endangered under the Endangered Species Act (ESA). Similarly, the *Birds of Conservation Concern*, as mandated by Congressional legislation, excludes birds regulated as hunted species and birds listed under the ESA. Nongovernmental organizations like American Bird Conservancy (ABC) or National Audubon are not limited by these legal distinctions, and as a result they can provide lists that are more inclusive. The USFWS *Birds of Conservation Concern*, the ABC/Audubon Watch List, and a number of other lists share a common base: they are all reliant on the conservation assessments of the major bird partner initiatives and the surveys upon which those initiative assessments are grounded. National Audubon, American Bird Conservancy, and the USFWS are all partners, among others, in participating in the assessments of those initiatives.

[2] The Pacific Region (Region 1) includes Idaho, Oregon, Washington, Hawaii, and the Pacific Islands. The Southwest Region (Region 2) includes Arizona, New Mexico, Oklahoma, and Texas. The Great Lakes-Big Rivers Region (Region 3) includes Illinois, Indiana, Iowa, Michigan, Missouri, Minnesota, Ohio, and Wisconsin. The Southeast Region (Region 4) includes Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, Puerto Rico/Virgin Islands, South Carolina, and Tennessee. The Northeast Region (Region 5) includes Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, and West Virginia. The Mountain-Prairie Region (Region 6) includes Colorado, Kansas, Montana, North Dakota, Nebraska, South Dakota, Utah, and Wyoming.
The Alaska Region (Region 7) consists of the state of Alaska. The California and Nevada Region (Region 8) consists of the states of California and Nevada.

What Bird Species Did We Consider?

The various species groups considered for inclusion in *BCC 2008* are described in Table 1 and include nongame birds; gamebirds without hunting seasons; subsistence-hunted nongame birds in Alaska; and Endangered Species Act candidate, proposed endangered or threatened, and recently delisted species. The major groups of species not considered in this assessment are (1) migratory gamebirds for which hunting regulations are established (i.e., cooperatively managed by Federal-State flyway councils); (2) species that are peripheral to the U.S. (i.e., population fragments within U.S. jurisdiction are too small to be managed capably); (3) species, subspecies, and populations of federally-endangered or -threatened birds (i.e., those subject to the provisions of the ESA); (4) resident gamebirds (i.e., managed by State wildlife agencies), unless listed as a federal ESA candidate; and (5) non-native species.

Because the assessments of the three bird conservation initiatives that we use here are all species-based, assessment scores were available only for full species. However, where appropriate, subspecies and populations are included in this assessment based on geographic range, federal candidate status, or available local data. Such subspecies and populations are noted on lists at all three geographic scales.

In the spirit of all-bird conservation, we include native species not specifically covered by the MBTA when they are deemed to be conservation priorities, as long as they are not part of one the groups excluded from consideration (see above). To avoid confusion, we clearly differentiate between those species that are and are not protected by the MBTA. A list of species protected by the MBTA is found in Title 50, Part 10, of the *Code of Federal Regulations*.

What Sources of Information Did We Use?

The methods used to assess and prioritize species differ between PIF, the USSCP, and the NAWCP. These differences relate to geographic scope, factor thresholds, and treatment of uncertainty. Although the methods for determining the highest-priority species are somewhat different among the different initiatives, scoring reflects state-of-the-art conservation assessments for each of the three species groups (landbirds, shorebirds, and waterbirds); we therefore view the conservation priorities within the three conservation plans as approximately equivalent.

PIF Assessment Scores. We used assessment scores from the PIF Species Assessment Database (version 2005, with unpublished 2007 updates) housed at the Rocky Mountain Bird Observatory, which we believe were the best available data at the time this report was prepared. In this database a panel of bird species experts has assigned each landbird species in North America scores ranging from 1 (lowest priority or degree of concern) to 5 (highest priority or degree of concern) for each of six factors, assessing aspects of future vulnerability at the range-wide scale: Population Size (PS), Breeding Distribution (BD), Non-breeding Distribution (ND), Threats in the Breeding Season (TB), Threats in the Non-breeding season (TN), and Population Trend (PT) (Panjabi et al. 2005). These factors are then used to calculate a Continental Combined Score

(CCS): PS + max(BD, ND) + max(TB, TN) + PT. The threats scores and the distribution scores are highly correlated so PIF used this score rather than a simple total. Thus, CCS ranges from 4 for a widespread and increasing species which is expected to face even more favorable conditions in the future, to 20 for a species of the very highest future conservation concern. The CCS was used to develop the landbird portion of the National BCC list.

Partners in Flight also assesses species at the BCR level. That assessment includes two additional criteria, Relative Density (RD) and Percent of Population, which reflect the importance of a particular BCR to each species. The global scores for TB, TN, and PT are also adjusted using BCR-specific data. These BCR scores informed the selection of landbirds for the *BCC 2008* BCR lists.

All of these factors are defined and discussed in detail in Panjabi et al. (2005). Both PIF breeding and wintering (non-breeding) scores, where available, were used in assessing species for inclusion in the *BCC 2008* report. In consultation with experts, the USFWS prepared scores for landbirds of Hawaii and Pacific island "territories" using the PIF process.

USSCP Assessment Scores. For shorebird species, we started with the updated assessment scores from the USSCP (USSCP 2004), which were built on original plan assessments (Brown et al. 2000, Brown et al. 2001). We incorporated new information on shorebird population trends and sizes published by Morrison et al. (2006) and Bart et al. (2007). Information on population sizes were ranked according to the PIF criteria. We also included updates in breeding and nonbreeding threats provided by regional shorebird working groups. The USSCP assessment process uses most of the same factor scores (with slightly different criteria) as PIF, but priorities were derived using a categorical (rather than a summation) approach (Brown et al. 2001). A prioritization protocol for shorebirds (in Brown et al. 2001) describes prioritization categories and their relationship to factor scores.

NAWCP Assessment Scores. Like USSCP, the NAWCP assessment process also uses most of the same factor scores (with slightly different criteria) as PIF and derives priorities using a categorical approach (Kushlan et al. 2002). For all three scales used in the BCC, we referred to the continental-scale assessment results documented in the NAWCP plan (Kushlan et al. 2002) and subsequent analyses (i.e., for non-colonial waterbirds, documented at http://www.waterbirdconservation.org), which we considered to be the best available data for waterbirds and seabirds. For *BCC 2008* BCR lists, we also referred to assessments in regional waterbird conservation plans or documents that most closely resemble regional waterbird conservation plans, where available (see www.waterbirdconservation.org.) These regional-scale status assessments are, in general, based on the continental-scale assessment, though regional planning groups made adjustments based on BCR-scale needs and values.

What Selection Criteria Did We Use For *Birds of Conservation Concern 2008* Lists?

The following are the criteria used to select species for consideration and inclusion on BCR, USFWS Region, and National lists. At each scale, USFWS expertise and discretion refined the

pool of species under consideration from the three bird conservation initiatives—as well as those selected for priority lists—to comply with the FWCA amendment of 1988. The same criteria were used for all subspecies and populations considered separately for inclusion.

There may be additions to the lists over the next several years. Newly designated Federal candidate species, species proposed for listing, and species removed from the list of endangered and threatened species will automatically be considered to be on the appropriate BCC list(s), effective the day of their designation or delisting as published in the *Federal Register*.

General criteria (rule-sets) for placing species on any BCC list

1. Begin with list from appropriate bird conservation initiative.

2. Follow criteria below for appropriate bird groups (see Panjabi et al. 2005 for explanation of terms).

3. Add non-breeding species if the species occurs at significant Relative Density scores and/or has moderate or high threat levels (based on expert opinion or data) in non-breeding season, if not already included due to breeding population (indicate with "nb").

4. Consider subspecies and populations where appropriate and where information on their status is available (e.g., Dickinson 2003).

5. Remove sport-hunted species (including their non-hunted populations) and federally-listed threatened or endangered populations (retaining non-listed populations with notation).

6. Add any recently ESA de-listed, candidate, or proposed species not already included.

7. In very limited circumstances, add or remove species (and document rationale) when Service expertise, supplemental information, or local data indicates a much greater or lesser degree of concern than that reflected by bird conservation initiative scoring.

Criteria for placing species on BCR lists

***LANDBIRD* criteria for *BCR* lists (see Panjabi 2005 for explanation of terms)**:

1. Include species meeting the PIF criteria for Species of Regional Importance – Continental Concern (U.S. and Canada), EXCEPT

   a) if Regional Combined Score <15 and Action Code = "Planning and Responsibility"

   b) in BCRs shared with Canada and Mexico, those with Relative Density ≥1 in the *U.S.* portion of the BCR (consult state population data).

c) for species shared with Latin America and the Caribbean (LAC), remove species with core ranges outside the U.S. and its territories if <1% of population or range-wide distribution is in the U.S. and threats in LAC are low. However, if conservation action for a species is warranted in the U.S. due to high threats in LAC, then it could be included in the appropriate U.S. BCR lists.

2. Include species meeting the PIF criteria for Species of Regional Importance – Regional Concern IF:

   a) Regional Combined Score ≥15 and Action Code = "Critical Recovery" or "Immediate Management"

   b) Regional Combined Score ≥ 17 and Action Code = "Management Attention"

3. Rank species in Hawaii and Pacific island territories using latest PIF criteria and above criteria as appropriate.

***SHOREBIRD* criteria for *BCR* lists:**

1. Include all species, subspecies, and populations meeting criteria for National BCC List if >1% of taxon occurs anytime during annual cycle in the BCR (i.e., Relative Density ≥1 in the BCR). The criteria for National BCC List are:

   a) population is undergoing a strong decline (Population Trend = 5), regardless of population size; OR
   b) population is declining or stable (Population Trend = 4 or 3) and populations are small, distributions are limited and threats are high (Population Size + Breeding Distribution + Non-breeding Distribution + Threats to Breeding + Threats to Non-breeding ≥ 18).

***WATERBIRD* criteria for *BCR* lists:**

1. Initially identify species of greatest concern from each BCR using the regional waterbird conservation plans or similar documentation (e.g., Joint Venture implementation plans). Depending on BCR-scale approaches, include species regionally assessed as High or Highest/Highly Imperiled, as Tier I (if the PIF approach was used), or priority species for BCR-scale partnership.

2. Remove species from BCR lists if U.S. populations are considered unmanageable (e.g., Relative Density <1).

3. Identify and retain only those species of greatest conservation concern, as some regional-plan species lists were designed to maximize support for a wide range of conservation activities by partners or identify species around which partnerships could operate.

Criteria for placing species on USFWS Regional lists

1. Include species from the BCC BCR lists if the species has the equivalent of a RD >1 or a manageable population in 50% or more of the BCRs in which it occurs within a USFWS region.

Criteria for placing species on BCC National list

***LANDBIRD* criteria for *National* list:**

1. Include all PIF "Continental Watchlist" (which includes the U.S. and Canada) species and U.S. island territories' species that meet PIF Continental Watchlist criteria EXCEPT,

   a) species without manageable populations in the U.S. or its territories; however, if conservation action is warranted in the U.S. due to high threats elsewhere, then such species could be included;

   b) species that are not listed on any BCC BCR list.

***SHOREBIRD* criteria for *National* list:**

1. Include species (or subspecies/population designations where supported by USSCP Conservation Assessment [2000] or more recent work) that meet any ONE of the following criteria:

   a) population is undergoing a strong decline (Population Trend = 5), regardless of population size; OR
   b) population is declining or unknown (Population Trend = 4 or 3) and populations are small, distributions are limited and threats are high (Population Size + Breeding Distribution + Non-breeding Distribution + Threats to Breeding + Threats to Non-breeding ≥ 18).

Scores have been revised and reflect the best science to date and are under review (Andres unpubl.).

WATERBIRD criteria for *National* list:

1. Include species ranked "Highly Imperiled" in the NAWCP continental-scale assessment unless not occurring on any BCR list.

2. Consider all species ranked "High" in the NAWCP continental-scale assessment (unless not

occurring on any BCR list) and include those with global population size (PS) factor score of 5, 4, 3 or 2. Populations at PS = 2 are included if they are at the lower end of the range in this category (i.e., 69,200) and experiencing steep declines.

THE *BIRDS OF CONSERVATION CONCERN 2008* LISTS

To maximize the usefulness of this report to multiple partners, the *BCC 2008* lists are presented in 46 separate tables, comprising 37 BCR lists (Tables 2 to 38), 8 USFWS Region lists (Tables 39 to 47) and 1 National list (Table 48). Summaries of the status of each species at each of the three distinct geographic scales are provided in Appendix B, and a list of scientific names of all species mentioned is found in Appendix C. The BCR lists range from 10 to 53 species, USFWS Region lists range from 27 to 78 species, and the National list consists of 147 species. The number of priority species represents roughly 10 to 15 percent of all bird species of any given geographic unit.

BCR Lists

The number of species on individual BCR lists (Tables 2 to 38) ranges from 10 to 53, averaging about 27. Lists are generally larger for BCRs in the southern United States, reflecting greater species diversity at lower latitudes and the importance of these regions for wintering migrants. Island birds are at increased risk of becoming endangered. Thus, the "Other U.S. Pacific Islands" BCR and "U.S. Caribbean Islands" BCR have relatively high proportions of their native species represented as birds of conservation concern. Roughly ten percent of the bird species native to Hawaii (BCR 67) are identified as birds of conservation concern, but that region also has a disproportionately large number of bird species listed as either endangered or threatened under the ESA; combining birds of conservation concern with endangered or threatened species, about 25 percent of the native Hawaiian avifauna is at risk.

USFWS Region Lists

The number of species on individual USFWS Region lists (Tables 39 to 47) ranges from 27 to 78, averaging about 50. Following the trend seen in BCRs, USFWS Region lists of priority species are larger in the southern United States, although this is partially attributed by the disparities in area covered by each of the Regions. The birds on the USFWS Region lists generally represent about 10 percent of the species native to the respective Regions.

National List

The National list (Table 48) is comprised of 147 species, and includes disproportionately larger numbers of species from the orders Procellariformes (albatrosses, petrels, shearwaters, and storm-petrels), Charadriiformes (shorebirds, gulls, terns, and auks), and Piciformes (woodpeckers). Within the Charadriiformes, the families Charadriidae (plovers), Haematopodidae (oystercatchers), Scolopacidae (sandpipers), and Alcidae (murres, murrelets,

and auklets) are represented on the list by greater numbers of species than expected. Among the Passeriformes—a large and diverse order of perching birds—the families Parulidae (wood-warblers) and Emberizidae (sparrows) and the subfamily Drepanidinae (Hawaiian honeycreepers) dominate the list in terms of both actual and relative numbers.

DISCUSSION

BCC 2008 is the latest update in a continuing effort to assess and prioritize bird species for conservation purposes (USFWS 1982, 1987, 1995, 2002; and U.S. Department of the Interior 1990). It is difficult to make meaningful comparisons among the lists because of differences in the way each succeeding report was prepared. In chronological order, these previous lists contained 28, 30, 77, 124, and 131 species of conservation concern at a National scale in 1982, 1987, 1990, 1995, and 2002 respectively; by comparison, *BCC 2008* includes 147 species at the National scale.

Do these figures reflect an actual decline in the conservation status of the Nation's birdlife, or do they merely reflect improvements in our ability to accurately identify and characterize species in real need of conservation attention? The truth probably lies somewhere in between. The preparation of prioritized species lists should be viewed as an evolving process, improving as our knowledge base increases, with each list reflecting the best available information at the time of its publication. The three bird conservation initiatives update their own assessments and scoring as new data or analyses become available. The data from these initiatives—which form the basis of *BCC 2008*—incorporate a great deal of input from many bird experts and have wide acceptance among members of avian conservation and scientific communities. We are confident that the methods used in *BCC 2008* are the best available for identifying avian conservation priorities as directed by the FWCA amendment of 1988.

Of the 131 species on the *BCC 2002* National list, 103 were retained on the current 2008 list and 28 were deleted due to a lack of convincing evidence that continued elevated concern is warranted. Forty-four species were added to the National list, resulting in a net gain of sixteen species for a current total of 147 species.

Of the 211 species on the Audubon WatchList (Butcher et al. 2007) that are not also a) endangered or threatened or b) hunted, 106 are on the *BCC 2008* National list and an additional 8 are on USFWS Region or BCR lists.

The selection criteria that we used identified 10 to 15 percent of all species at each geographic scale to be in need of additional conservation attention. Nongame migratory birds protected by the MBTA, the primary focus of this effort, make up an overwhelming proportion of the species on the *BCC 2008* lists. However, the proportional representation of non-MBTA species increases progressively at larger scales, reflecting the vulnerability of the island-endemic species that form the bulk of this group. The proportional representation of ESA candidate species also increases progressively at larger scales. ESA-delisted and ESA-proposed species make up a progressively smaller proportion of the species at larger scales.

BCC 2008 can be used as a barometer of the condition of our country's avifauna. Although there are general patterns that can be inferred from this report, there is no single reason why any species was placed on any one of these lists; some are relatively common but are undergoing sharp declines in population numbers, others are rare but may actually be increasing in numbers in certain locations, and others may be both rare and declining. However, habitat loss due to alteration or destruction continues to be the major reason for the declines of many species (Askins et al. 1990, USFWS 1995, Samson et al. 1998, Askins 2000). Birds included in the *BCC 2008* lists are deemed priorities for conservation actions, and the lists will be consulted for actions taken on Federal lands in accordance with Executive Order 13186, "Responsibilities of Federal agencies to protect migratory birds" (Clinton 2001). BCC species will also receive priority attention in the USFWS when allocating research, monitoring, and management funding. Our hope is that *BCC 2008* will stimulate coordinated, collaborative proactive conservation actions among Federal, State, and private partners.

APPENDIX A

Figure 1 Map of the Bird Conservation Regions (BCRs) of the United States [3]

3 The figure does not show BCR 67 (Hawaii) or two other Bird Conservation Regions from the report that included islands in the Pacific and Caribbean which are either U.S. Territories or other affiliates.

Table 1 Eligibility of Various Species Groups for *BCC 2008* Consideration.

Applicable Federal Authority	Eligible	Not Eligible
Migratory Bird Treaty Act	"Nongame" and "other" species (as variously defined by bilateral migratory bird conventions with Canada, Mexico, Japan, and Russia)	Species peripheral to the U.S. (e.g., population fragments too small to be managed capably)
	"Gamebirds" (as defined by 50 CFR 20.11) for which hunting seasons have not recently been established (e.g., most shorebirds)	"Gamebirds" (as defined by 50 CFR 20.11) for which sport hunting seasons are established
	All subsistence-hunted species in Alaska (except "gamebirds" with established sport hunting seasons)	
Endangered Species Act	Candidates, including "resident gamebirds" (see below), or proposed Endangered or Threatened	Species, subspecies, and populations designated as Endangered or Threatened (as listed at 50 CFR 17.11)
	Non-listed subspecies and populations of otherwise Endangered or Threatened species (e.g., *occidentalis* ssp. of Spotted Owl)	
	Recently delisted MBTA species (e.g., Peregrine Falcon)	
	Other MBTA species delisted in the future	
None	Endemic Hawaiian honeycreepers of the subfamily Drepanididae (e.g., Hawai`i `Amakihi)	"Resident gamebirds" (generally hunted and managed by State wildlife agencies), unless listed as ESA Candidate (see above)
	Other island endemics (e.g., Fiji Shrikebill)	Non-native species

Table 2 BCR 1 (Aleutian/Bering Sea Islands) *BCC 2008* list[4]

Laysan Albatross (nb)
Black-footed Albatross (nb)
Red-faced Cormorant
Pelagic Cormorant
Black Oystercatcher
Rock Sandpiper (*ptilocnemis* ssp.)

APPENDIX C

Index of Scientific Names of Species Appearing in the BCC 2008 Lists (Tables 2-48), Arranged Alphabetically by Common Name

Common Name	Scientific Name
Akekee	*Loxops caeruleirostris*
Akikiki	*Oreomysis bairdi*
Alauahio, Maui	*Paroreomyza maculata*
Albatross, Black-footed	*Phoebastria nigripes*
Albatross, Laysan	*Phoebastria immutabilis*
Amakihi, Hawaii	*Hemignathus virens*
Amakihi, Kauai	*Hemignathus kauaiensis*
Amakihi, Oahu	*Hemignathus flavus*
Ani, Smooth-billed	*Crotophaga ani*
Anianiau	*Hemignathus pan*/us
Apapane	*Mimatione sanguinea*
Auklet, Cassin's	*Ptychororamphus aleuticus*
Auklet, Whiskered	*Aethia pygmaea*
Beardless-Tyrannulet, Northern	*Camptostoma imberbe*
Becard, Rose-throated	*Pachyramphus aglaiae*
Bittern, American	*Botaurus lentiginosus*
Bittern, Least	*Ixobrychus exilis*
Blackbird, Rusty	*Euphagus carolinus*
Blackbird, Tricolored	*Agelaius tricolor*
Black-Hawk, Common	*Buteogallus anthracinus*
Bobolink	*Dolichonyx oryzivorus*
Booby, Brown	*Sula leucogaster*
Booby, Masked	*Sula dactylatra*
Booby, Red-footed	*Sula sula*
Bunting, Lark	*Calamospiza melanocorys*
Bunting, McKay's	*Plectrophenax hyperboreus*
Bunting, Painted	*Passerina ciris*
Bunting, Varied	*Passerina versicolor*
Chickadee, Black-capped	*Poecile atricapillus*
Chuck-will's-widow	*Caprimulgus carolinensis*
Coot, Caribbean	*Fulica caribaea*
Cormorant, Great	*Phalacrocorax carbo*
Cormorant, Red-faced	*Phalacrocorax urile*
Cormorant, Pelagic	*Phalacrocorax pelagicus pelagicus*
Crake, Spotless	*Porzana tabuensis*
Crake, Yellow-breasted	*Porzana flaviventer*
Crossbill, Red	*Loxia curvirostra*
Cuckoo, Black-billed	*Coccyzus erythropthalmus*
Cuckoo, Mangrove	*Coccyzus minor*
Cuckoo, Yellow-billed	*Coccyzus americanus*
Curlew, Bristle-thighed	*Numenius tahitiensis*
Curlew, Long-billed	*Numenius americanus*
Dickcissel	*Spiza americana*
Dowitcher, Short-billed	*Limnodromus griseus*
Duck, Masked	*Nomonyx dominicus*

Duck, Ruddy	*Oxyura jamaicensis jamaicensis*
Dunlin	*Calidris alpina arcticola*
Eagle, Bald	*Haliaeetus leucocephalus*
Eagle, Golden	*Aquila chrysaetos*
Egret, Reddish	*Egretta rufescens*
Egret, Snowy	*Egretta thula*
Elepaio	*Chasiempis sandwichensis*
Falcon, Peregrine	*Falco peregrinus*
Falcon, Prairie	*Falco mexicanus*
Fantail, Rufous	*Rhipidura rufifrons mariae*
Fantail, Rufous	*Rhipidura rufifrons saipanensis*
Finch, Cassin's	*Carpodacus cassinii*
Finch, Purple	*Carpodacus purpureus*
Flamingo, American	*Phoenicopterus ruber*
Flicker, Gilded	*Colaptes chrysoides*
Flicker, Northern	*Colaptes auratus*
Flycatcher, Acadian	*Empidonax virescens*
Flycatcher, Buff-breasted	*Empidonax fulvifrons*
Flycatcher, Olive-sided	*Contopus cooperi*
Flycatcher, Scissor-tailed	*Tyrannus forficatus*
Flycatcher, Willow	*Empidonax traillii*
Frigatebird, Magnificent	*Fregata magnificens*
Godwit, Bar-tailed	*Limosa lapponica baueri*
Godwit, Hudsonian	*Limosa haemastica*
Godwit, Marbled	*Limosa fedoa*
Goldfinch, Lawrence's	*Carduelis lawrencei*
Goshawk, Northern	*Accipiter gentilis laingi*
Grebe, Eared	*Podiceps nigricollis*
Grebe, Horned	*Podiceps auritus*
Grebe, Pied-billed	*Podilymbus podiceps*
Grebe, Western	*Aechmophorus occidentalis*

Introduction

Project Overview

Chino Hills State Park features significant open space that supports healthy wildlife and plant communities within the Mediterranean California Ecoregion, one of the most biologically diverse areas in the world. A new Discovery Center and day-use facilities located at the western end of Chino Hills State Park will provide opportunities for visitors to better understand the park's significance and value.

The new 2,065 square foot Discovery Center (approximately 1,500 square feet of exhibit space), a multi-purpose room (approximately 1,652 square feet), and associated elements will provide improved park access, restroom facilities, parking, visitor orientation, safety information, and further communicate the significance of the park. The area will include interior and exterior exhibits, an outdoor amphitheater, viewing platforms, and a "Discovery Trail" landscaped with native plants. The main exhibit hall will provide visitors with interpretive media and activities, while the multi-purpose room will support rotating exhibits, and community events.

The Chino Hills State Park Visitor Center Project came into fruition as a result of 2000 Bond Act funding and a $950,000 donation from the Wildlands Conservancy. The current budget allocation for construction of this project is $2,189,000 from DPR bond funds. An additional $500,000 is budgeted for interior exhibits, while $225,000 is allocated for exterior improvements: outdoor exhibits ($90,000), interpretive landscaping ($115,000), and parking lot landscaping ($20,000).

Near trailheads and scenic views of riparian habitat, the Discovery Center will provide visitors with opportunities to enhance their park experience, participate in community-based programs and events, support educational programs for school groups, and a place to embark on an adventure at Chino Hills State Park.[1] Interpretation is often considered the best ally in the protection of such a precious place. Educational and interpretive programs will play a key role in

[1] Trail use by equestrians, mountain bikes, and hikers will be permitted within the area, but off-trail use poses a threat to native plants and animals.

enhancing the protection of this irreplaceable open space area so close to a large urban population.

The Discovery Center is a desirable location to explore the concepts of the park's biodiversity, regional biocorridors, and human impacts on and relationship with the Chino Hills environment. Drawing upon resource specialists, Hills for Everyone, and park staff, this plan proposes media, themes, and methods for interpreting the extraordinary biodiversity and resources within Chino Hills State Park.

Chino Hills State Park Discovery Center Mission Statement

The Chino Hills State Park Discovery Center is dedicated to the preservation and interpretation of the biological diversity and natural and cultural resources of Chino Hills State Park. The facility provides unique learning opportunities, inspires positive environmental actions, and builds lasting connections between humans and this precious urban wildland.

Project Goals

The Chino Hills State Park Discovery Center will be a premier educational and interpretive destination for children, teachers, and the local community. Overall goals for the Chino Hills Discovery Center include the following. The interpretive facility will:

- Protect the park's natural and cultural resources and the biological diversity of Chino Hills State Park through education and interpretation.
- Enhance visitors' experience with exhibits, displays, and park information.
- Enrich the experience of school groups by providing curriculum related activities, exhibits, and educational opportunities.
- Provide learning experiences that appeal to visitors with different levels of knowledge and interest.
- Offer a multi-use area to encourage community based learning and activities.
- Upon visiting the Chino Hills Discovery Center and exploring its exhibits, visitors will want to explore the rest of the park.

Overview of Chino Hills State Park

Declaration of Purpose

The purpose of Chino Hills State Park is to preserve the natural, cultural, and scenic resources of the rolling hills, wooded canyons, and riparian forests that are representative of the early California landscape, and make them available for public enjoyment and education.

California State Parks will endeavor to preserve and restore native habitats in the park for their intrinsic natural values, to promote biological diversity, and to support the integrity of regional ecosystems. California State Parks will endeavor to protect the cultural and scenic resources, promote an understanding of the park's unique features, and provide recreation opportunities in a manner consistent with the protection of natural and cultural values.[2]

Spirit of Place

Chino Hills State Park gives those who visit it a sense of being transported back in time to an earlier and more undeveloped California. Upon entering the park, the transition from the human-made environment to the natural environment is abrupt; housing tracts quickly give way to open hills, and once inside, the sights and sounds of modern intrusions are minimal and one feels many miles away from cities and freeways. The park interior is enveloped by its ridgelines, and one perceives the land as being secluded, protected, and still. Without city noises and visual obtrusions, visitors become aware of the park's subtle movements, natural smells, and variations in microclimate, vegetation, and topography. Many endearing values of the park are intangible. The qualities of open space, natural sounds, and fresh air cannot be quantified like physical resources can, but they allow visitors to be aware of and reconnected with the natural world.

The forces of nature that have shaped the land are evident by the steeply cut valleys, landslides, and rolling hills of the park. These places mark the passage of time through their variation of seasonal colors. The park's landscape changes over the course of a year from one that is dry and dusty to one that is moist and lush. These variations can also be discovered while moving from the exposed ridgetops to the dense shade under riparian tree canopies.

[2] California Department of Parks and Recreation, *Chino Hills State Park General Plan* (San Diego: CDPR Southern Service Center, 1999), 48.

The park is one of few in the Los Angeles Basin that offers opportunities for tranquility, solitude, and relief from the hectic urban life that surrounds it. It gives visitors a place to explore and recreate at their leisure. As the pace of life in this area quickens and the size of the population adjacent to the park grows, these values will become increasingly precious to many park visitors.

One comes away from Chino Hills State Park feeling refreshed. But the effect of one's experience at the park is most apparent when one returns to the urban environment. The park leaves visitors with a feeling of compassion for the disappearing values of California's past landscapes and a sincere appreciation for the remaining open space that is available for today's enjoyment.[3]

Location

Chino Hills State Park is an open space area located within three, highly urban counties (Orange, Riverside, and San Bernardino). It is a significant biocorridor linking wildlife habitats of the Puente-Chino Hills and Santa Ana Mountains. This area is one of the few Los Angeles Basin parks offering opportunities for tranquility, solitude, and relief from the hectic urban life that surrounds it.

Its 14,102 acres encompass stands of forest, scrub, and grassland habitats. The park is part of an important 31 mile long regional wildlife movement corridor of natural open space where animals move back and forth between the Santa Ana Mountains and the west end of the Whittier Hills. The Cleveland National Forest in the Santa Ana Mountains is just south of the Coal Canyon area of the park on the opposite side of Highway 91.

Chino Hills State Park is a vitally important refuge for many species of plants and animals as a link between natural areas. It is biologically connected to Santa Ana Mountains and the Cleveland National Forest via the Coal Canyon biocorridor, the only remaining viable link between them. Other parks in the vicinity include Carbon Canyon Regional Park to the west, Prado Regional Park to the east, Featherly Regional Park to the south, and Yorba Regional Park to the southwest.[4]

Park History

Over the centuries, many people have made use of the open spaces and plentiful water, plant and animal resources of the Chino Hills. Prior to European contact, the Gabrielino (Tongva) Indians, who lived along the Santa Ana River basin, set up temporary camps for gathering acorns, elderberries, and other seeds.

After the Spanish founded Mission San Gabriel in 1771, the Chino Hills were used extensively for grazing by mission cattle. During the Mexican Republic era, the hills were used as spillover grazing from such surrounding Mexican ranchos as Santa Ana del Chino and La Sierra Yorba. After Mexico ceded California to the United States in 1848, the land was still used primarily for grazing.

Private land acquisition began in the 1870s and continued into the 1890s. In 1948, the 1,720-acre Rolling M Ranch was established and the land leased to nearby landowners for cattle grazing. Some late nineteenth and early twentieth century oil exploration and mining activity also took place in the park. A ranch house, barn, and several windmills and watering troughs serve as reminders of the cattle ranching days.

In 1977, the California legislature passed a resolution directing California State Parks to conduct a study about acquiring Chino Hills land for park purposes. A local citizens group, Hills for Everyone, worked closely with California State Parks and the legislature to create the park with an initial acquisition of 2,237 acres. In 1984, the State Park and Recreation Commission officially declared the area a unit of the State Park System. Since that date, numerous land acquisitions from various private landowners have expanded the park to its present acreage. [5]

Geography

Ranging from 430 feet to 1,781 feet in elevation, the park straddles the north end of the Santa Ana Mountains and the southeast portion of the Puente-Chino Hills, which together form the northern end of the Peninsular Ranges in Southern California. This formation interrupts the generally flat Los Angeles Basin with a variety of rolling hills, mountains and canyons on its south and east sides. The hills are a result of uplift and folding along the Whittier and Chino faults.

[5] California State Parks, *Park History*, http://www.parks.ca.gov/default.asp?page_id=21967.

The Puente-Chino Hills are made up of sedimentary rocks of the Puente Formation, deposited from five to fifteen million years ago. Associated with this formation are petroleum resources that have been explored and exploited in the Los Angeles region since the late 1800s. Fine clay soils are found in these formations, as well as a few areas of alluvial deposits that wash down from the hills and mountains during winter rains. [6]

Plant Communities

Diversity is perhaps the most important feature of the vegetation found within Chino Hills State Park. In fact, Chino Hills has several different kinds of vegetation in each of its major habitats.

In the park's creek zones, cattail stands provide habitat for a variety of wildlife, among them red-winged blackbirds. Along seasonal and year-round creeks, the willow and sycamore woodlands have understories of wild rose, stinging nettle and mule fat. These riparian areas provide cover and food for numerous animals and nesting birds. Many of these nesting birds are migratory species that come to the streamside habitats from Central and South America each spring to raise their young. Southern California black walnut trees join coast live oaks to form woodlands above the creeks, often on north facing slopes. These walnut woodlands are another important and rare plant community preserved in the park. Only a few thousand acres of this California habitat still exist, with about 1500 acres in preserves. Several hundred acres are protected at Chino Hills State Park.

The Tecate cypress is another special type of plant community found only in a few places in the United States. Several Tecate cypresses are found in Coal Canyon, adjacent to the larger ecological reserve managed by the California Department of Fish and Game.

Scrub and chaparral communities along the hills and slopes above the canyon floors include coastal sage scrub, dominated by California buckwheat and California sagebrush and mixed chaparral dominated by laurel sumac and toyon. Many California wildlife species depend on these scrub and chaparral communities for survival. Because these communities are disappearing as urban development continues, they form an increasingly important part of the biological resources protected in the park.

[6] California State Parks, *Geography*, http://www.parks.ca.gov/default.asp?page_id=21971.

Most of the grassland in the park is non-native annual European grasses that were introduced here during the early ranching years. However, grassland species native to California, such as purple needle grass and giant rye can be found among the annuals. An active grassland restoration program in the park is restoring native grassland to its more natural and dominant state. [7]

Wildlife

Because of its great variety of habitats and microclimates, Chino Hills State Park is an ideal location for observing many wildlife species native to Southern California. Red-tailed hawks and turkey vultures soar above. Coyotes, deer, bobcats and other mammals are often seen in the woodlands, scrub, and grasslands. Visitors with good ears and sharp eyes will enjoy the many songbird species seen and heard foraging and raising young in the trees and shrubs.

More than 200 species of birds and mammals, numerous reptiles and amphibians, and thousands of types of insects and other invertebrates live in the park. Some of these animals, including least Bell's vireo, the California gnatcatcher and the coastal cactus wren, are considered rare, threatened or endangered. The local diversity of native plants and animals found here in the Southern California region is greater than in any other area of comparable size in the United States. [8]

Building the Chino Hills Bio-Link

For humans relaxing or recreating in the park, Chino Hills is an island of tranquility in a sea of urbanization. For the plants and animals in the park, it is a link to other natural areas. By providing a major biological link between islands of open space, Chino Hills State Park effectively makes habitats larger and helps to ensure species diversity.

The many different watersheds of Chino Hills State Park combine to make up a biological corridor that allows wide-ranging species such as bobcats, mountain lions and a variety of rare species to avoid becoming trapped in isolated patches of habitat. When small patches of wilderness are cut off from other open space areas, many of the species present at the time of isolation will inevitably disappear. [9]

Biological corridors help to maintain healthy populations of plants and animals by allowing for genetic exchange, species migration, maintaining a balanced food chain, and repopulating after a catastrophe such as the 2008 fire that burned "More than 95% of the park's 14,100 acres..."[10]

Recreational Resources

The proximity of its natural open space to urban populations and extensive trail network make Chino Hills State Park a popular and valuable recreational resource. Visitors enjoy both active and passive forms of recreation that focus primarily on trail use. People frequently visit the park from adjacent communities to walk, jog, bike, or ride horses. The park is also a popular spot for family and equestrian campers, as well as picnickers.[11]

[10]David Kelly, "A state park left a shambles," *Los Angeles Times*, November 29, 2008, sec. B.
[11] California Department of Parks and Recreation, *Chino Hills State Park General Plan* (San Diego: CDPR Southern Service Center, 1999), 36.

Current Status of Interpretation

Existing Interpretive Planning Documents

Derived from the original general plan and resource inventory completed during the 1980s, a revised *Chino Hills State Park General Plan* was completed in 1999. This document outlines interpretive themes, resources, interpretive collections, and proposed facilities (including plans for a visitor center) within the park. Suggesting a new emphasis on habitat connections, native plant and animal diversity and fragility in the area, the general plan provides the framework for the interpretive programs, media, and facilities within the park.[12] No formal interpretive planning documents have been previously completed for the park.

Interpretive Collections

The Department acquires and maintains collections for several reasons. First, to preserve elements of the natural and cultural environment original to the park; second, to document the people, events, and cultural and natural features that are central to the park's purpose; and third, to support the interpretation of themes that are important to the park.

The following Goal and Scope of Collections Statement, identified in the park's 1999 General Plan, states the management objectives and provides guidelines for the type of park collections at Chino Hills State Park.[13]

Goal: Provide for the collection of natural and cultural artifacts original to Chino Hills State Park which supports the Declaration of Purpose and Department mission.

Scope of Collections Statement:
Natural and cultural material and object collections at Chino Hills State Park will have a specific connection to the natural and cultural history of the park, or provide support for interpretive themes and programs. Archaeological and paleontological materials, natural history specimens of park flora and fauna, and objects like historic furnishings, equipment, or personal items associated with the park are all potential collection items at Chino Hills State Park. Historic object collections will include those of the ranching period up to the year 1950.

[12] California Department of Parks and Recreation, *Chino Hills State Park General Plan* (Sacramento: CDPR, 1999), 44.
[13] Ibid, 66-67.

- *Acquisition of ranching era artifacts and props will have a local historical association to the Rolling M Ranch, or other ranching activities within or near Chino Hills State Park.*

- *Natural history specimens of rare species will not be collected. Only lawfully salvaged specimens will be maintained in collections.*

- *The Department will establish safe and secure spaces for storage and display of park collections, and systems for inventory and management. Policies as outlined in the Department Operations Manual (DOM) Chapter 20 will be followed.*

The Chino Hills State Park interpretive collections were inventoried on March 25, 2008 by Christina Swiden (Museum Curator III, Northern Service Center) with the assistance of Larrynn Carver (Inland Empire District Archaeologist) and Dennis Stephen (Chino Hills State Park Ranger) at the Rolling M Ranch. Thirteen objects with cultural significance were cataloged and photographed and included Native American and historic ranching artifacts. Natural objects such as animal bones, antlers, bird's nest, geological specimens, and the Chino Hills State Park plant catalogue were not inventoried as museum objects.[14]

Interpretive and photographic collections not owned by the park may be acquired from the Hills for Everyone archives, Chino Hills State Park Interpretive Association, Olinda Oil Museum, The Puente Hills Landfill and Native Habitat Preservation Authority, Hillside Open Space Education Coalition, The Pomona Valley Audubon, Sea and Sage Audubon Society, The Angeles Chapter of the Sierra Club, the California Native Plant Society, Department of Fish and Game, United States Fish and Wildlife Service, the Brea Museum and Heritage Center, The Fairchild Aerial Photography Collection at Whittier College, CalPhotos at UC Berkeley, State Park staff, Johnny Bennet, Bruce Farnsworth, Daniel S. Cooper, and other local photographers.

Visitor Orientation

The Chino Hills State Park brochure was revised in 2007 and is available at various locations within the park or online on the California State Park website.[15] These park brochures are offered at the entrances of Bane Canyon, Rolling M Campground, and Chino Hills Discovery Center.

---

[14] California Department of Parks and Recreation, *Rolling M Ranch, Chino Hills State Park Museum Collection Inventory*, (Sacramento: Northern Service Center, Christina Swiden, 2008).
[15] California State Parks, *Chino Hills State Park brochure*, http://www.parks.ca.gov/pages/648/files/ChinoHillsPDF.pdf.

Outside the park, the Olinda Oil Museum makes Chino Hills State Park brochures available to the visiting public. Other external forms of information and orientation include "Franko's Map of the Santa Ana Mountains & Chino Hills State Park," which displays the trails within the park and interprets significant features in the area.[16]

Interpretive Facilities and Media

The majority of interpretive facilities are located at or near Rolling M Ranch and Coal Canyon. No orientation or major interpretive components exist at the far-western end of the park. The Discovery Center will create much-needed interpretive facilities that are non-existent at the western end of the park.

The only other major interpretive area is located at the Rolling M Ranch within the far eastern section of the park. With little emphasis on the importance of the area's natural heritage, the interpretation and education at the Rolling M Ranch mostly focuses on cultural history. This area includes a campfire amphitheater and interpretive panels about various topics such as ranching, sensitive birds, and wildfire issues. There is an interpretive station along the Santa Ana River Trail at Coal Canyon. There is some interpretive signage within Coal Canyon and near the confluence of Bane and Aliso drainages.

Signs focused on the interpretation of Native Americans are located along the Hills for Everyone Trail. This is a one mile long route that begins west of the Rolling M Ranch off of Telegraph Canyon Trail.

Audio-visual programs related to environmental conservation and biodiversity within Chino Hills State Park were created by Hills for Everyone and the Puente Hills Landfill Native Habitat Preservation Authority. These forms of media were produced in partial cooperation with California State Park staff and should be further evaluated for their relevance to this project.

Park Programs and Events

Chino Hills State Park was closed in 2009 due to the economic crisis affecting the state of California. Recently re-opened, budget constraints are limiting staff availability to provide services at the site. With improved funding, it is anticipated that park programs will again be available, including campfire and educational talks, school tours, nature hikes, bird

[16] Franko Maps Ltd, *Franko's Map of the Santa Ana Mountains & Chino Hills State Park*, http://www.frankosmaps.com/Santa_Ana_Mountains.htm.

walks, and flower walks. The Junior Ranger program, offered to children seven to twelve years of age, is also expected to resume.

Two key special events that have traditionally been held at the park – and that are expected to continue – are Living History Day (the last Saturday in April) and Wilderness Day (in the fall).

Other events include overnight camp out fundraisers that are hosted by the Chino Hills State Park Interpretive Association. These special events feature interpretive programs on topics such as bird calls, coyotes, and meteors.[17]

Special events also include park restoration, trail clean-up days, and Earth Day. These types of events incorporate safety talks and interpretive programs to increase visitor awareness and understanding of park resources.

Some of the park programs and events are expected to continue to be held on the eastern side of the park (Rolling M Ranch). Others will be held on the western side of the park, upon completion of the new Discovery Center.

The California State Parks website can be checked for upcoming programs and events at Chino Hills State Park: http://www.parks.ca.gov/default.asp?page_id=648

[17] Chino Hills State Park Interpretive Association, *Past Events*, http://www.chinohillsstatepark.org/Take_A_Tour/photo_gallery/meet-the-meteors.htm.

Special Concerns

Potential Audience

The park is situated within the counties of Orange, Riverside, and San Bernardino, and borders on Los Angeles County. Bordered on the northeast by the City of Chino Hills, on the south by the City of Yorba Linda, on the southeast by the City of Corona, on the west by the City of Brea, and is close to the communities of Chino, Olinda Village, and Sleepy Hollow. Chino Hills State Park is a popular destination for horseback riders, mountain bikers, joggers, wildlife enthusiasts, researchers, families, and organized groups. With fifteen million people living within a one-hour drive of the park, an extremely diverse population could potentially visit the park. Over the last five years, an average of 113,307 people visited the park on an annual basis.[18]

The Discovery Center portion of Chino Hills State Park is within the City of Brea and approximately 35,400 residents live in close proximity to this park entrance.[19] The primary audience currently visiting the park consists of twenty to forty year old males who are interested in trail recreation, wildlife viewing, and camping.[20] With access to three major trails, the Discovery Center is expected to attract mountain bikers, joggers, wildlife viewers.

The Discovery Center will also appeal to school groups from Anaheim, Brea, Chino, Chino Hills, Corona, Placentia, Yorba Linda, and beyond with curriculum-based programs and educational opportunities. In Brea alone there are six elementary schools, one junior high school, and two high schools.[21] The park's close proximity to the urban core creates many possibilities for visitation. Some schools, such as Olinda Elementary, are less than a mile from the Discovery Center. The proximity to new educational opportunities may inspire frequent visitation from school groups.

Community outreach, creative marketing, and accessible curriculum-relevant programming must be a top priority to meet the needs of school groups. A recent survey of nearly three hundred teachers from the local area showed that ninety-seven percent of teachers had never taken their

[18] California State Parks, *State Park System Statistical Reports 2003-2007*, http://www.parks.ca.gov/?page_id=23308.
[19] According to the 2000 United States Census, Brea is a city of approximately 35,400 people with a median income of $59,759. Approximately 77% of the population is white, 20% Hispanic, and 9% Asian.
[20] California Department of Parks and Recreation, *Chino Hills State Park General Plan* (San Diego: CDPR Southern Service Center, 1999), 1 and Expanded from memorandum 4-30-04 (Karen Barry to Joanne Redoble)
[21] Brea Olinda School District, "Schools," http://www.bousd.k12.ca.us/schools/default.asp.

class to Chino Hills State Park and seventy-four percent said that lack of information had prevented them from visiting the park. The survey also revealed that many teachers are faced with lack of funding for transportation and limited ability to go on field trips. Taking these obstacles into consideration, the interpretive programs and media at the Discovery Center aim to ease limitations to access and exceed educational expectations in order to further develop a dedicated park constituency and an educational community tied to Chino Hills State Park and its resources.[22]

Staffing and Park Support

To be a successful interpretive institution, the Chino Hills State Park Discovery Center will need sufficient staff to meet the needs of visitors seven days a week. The Discovery Center will require the attention of maintenance and interpretive staff to meet visitor expectations of facility cleanliness and comfort. They will also answer telephone calls, arrange group visits and special events, and support regular interpretive and educational programs at the Discovery Center.

The facility will be supported by a State Park Ranger, an Interpreter, District Archaeologist, Environmental Scientists, maintenance workers, seasonal support, and volunteers. While volunteers will be essential to supporting the facility, it should be noted that volunteer management and training will require a significant amount of support and staff time.[23]

Current park partners include the Chino Hills State Park Interpretive Association, a State Park cooperating association that supports interpretation and education in the park. Other potential support for future park program development includes Hills for Everyone, Metropolitan Water District, Aera Energy LLC, Olinda Oil Museum, and other local community groups.

[22] California State Parks conducted a K-12 teacher survey in May 2008 which included responses primarily from the Placentia-Yorba Unified School District and the Brea Olinda Unified School District.

[23] Refer to the following for more information regarding volunteer development and management: California State Parks, *The Gift of Time: Effective Volunteer Program Management for Local Parks and Recreation Agencies*, http://www.parks.ca.gov/pages/795/files/the%20gift%20of%20time.pdf.

Overall Interpretive Direction

California State Parks' Interpretation Mission Statement

Interpretation is a special form of communication that helps people understand, appreciate, and emotionally connect with the rich natural and cultural heritage preserved in parks. It is the mission of interpretation in California State Parks to convey messages that initially will help visitors value their experience, and that ultimately will foster a conservation ethic and promote a dedicated park constituency. [24]

Interpretive Goals

Interpretation is based on the premise that knowledge deepens the park experience and provides lasting benefits not only to individuals but also to society in general. The goal of interpretation at Chino Hills State Park is to expand the visitor's awareness, understanding, and appreciation of the park's resources and explore how they are part of Southern California's natural and cultural heritage. [25]

The following new goals outline the expectations for communication and delivery of meaningful interpretive experiences at the Chino Hills State Park Discovery Center.

- Convey the significance of Chino Hills State Park as a regional biological corridor and a hotspot for biological diversity, essential to the survival of diverse natural communities.
- Create an appreciation among visitors for Chino Hills State Park as an urban wildland, connected to and influenced by the cities and populations surrounding the park.
- Provide interpretive programs that are compatible with the other interpretive methods and media offered within the park.
- Inform visitors that staying on the trails and following park regulations protects both the visitor and the park's irreplaceable resources.
- Inspire visitors to take an active role in protecting their natural and cultural heritage.

Interpretive Objectives

Interpretive objectives refer to specific statements of expected accomplishment or desired future condition within the context of achieving a broader goal. The following objectives have been developed

[24] California State Parks Interpretation and Education Division, *Interpretation and Education Mission Statements*, http://www.parks.ca.gov/?page_id=23434.
[25] California Department of Parks and Recreation, *Chino Hills State Park General Plan*, 66.

to determine what people will learn, feel, and do as a result of their experience at the Chino Hills State Park Discovery Center.

Learning Objectives

- Visitors will be able to identify plants and animals as they explore the park.
- Visitors will understand that the preservation of native plants is essential to biodiversity.
- Visitors will understand that plants and animals play a distinct role within their community.
- Visitors will understand what a food chain is and its role in the ecosystem.
- Visitors will understand that the walnut woodland community found within Chino Hills State Park is rare.
- Visitors will understand the concept of biodiversity and the variety of plant and animal life within Chino Hills State Park.
- Visitors will understand that plants and animals need regional wildland connectivity to survive and stay in balance.
- Visitors will understand the challenges that an animal faces living on the urban edge and navigating through the biocorridor.
- Visitors will understand the relationship between the urban and wildland environments.
- Visitors will understand that their actions at home impact natural processes.
- Visitors will understand that humans depend on and use diverse natural resources in a variety of ways.
- Visitors will understand the actions that led to the preservation of the park and its resources including the civic involvement of Hills for Everyone and California State Parks.
- Visitors will understand the importance of environmental stewardship to Southern California.
- Visitors will understand the variety of plant communities within Chino Hills State Park.

Emotional Objectives

- Visitors will be visually introduced to the park's spirit of place.
- Visitors will want to explore the park and its biodiversity.
- Visitors will want to explore the Discovery Center and the rest of the park.
- Visitors will see the environment through the eyes of the animals that live within the Chino Hills area.
- Visitors will feel that they are connected to the natural world.
- Visitors will feel more connected to the plants and animals at Chino Hills State Park.

- Visitors will feel that they have a role in protecting biodiversity.
- Visitors will appreciate the biodiversity at Chino Hills State Park.

Behavioral Objectives

- Visitors will easily find park facilities, features, and information.
- Visitors will explore the park in safety.
- Visitors will explore the variety of plant communities within Chino Hills State Park.
- Visitors will explore the amphitheater and the relationships between plants, animals, and people.
- Visitors will explore the combined forces that shape biodiversity at Chino Hills State Park.
- Visitors will use a microscope to study insect and seed specimen and will compare biological differences.
- Visitors will engage in activities related to environmental stewardship that extend beyond Chino Hills State Park.
- Visitors will study specimens associated with the park's plants, animals, and habitats.

Interpretive Themes

Interpretive themes define a point of view given to the park's natural, cultural, aesthetic, and recreational resources. Themes link tangible resources to intangible, universal concepts that engage and inspire visitors. Tangible resources related to Chino Hills State Park include plants, animals, wildlands, and the bordering urban development. Universal concepts relevant to the messages communicated at the Discovery Center include survival, adaptation, irreplaceable loss, refuge, and interconnectivity. The following themes will direct the messages and media delivered at the Discovery Center.

Unifying Interpretive Theme

Media, exhibits, and programs conducted at the Discovery Center will be related to the following unifying theme:

> **Chino Hills State Park is an irreplaceable urban wildland of regional and global biological significance.**

The unifying theme communicates the main idea interpreted at the Chino Hills State Park Discovery Center. The park is unique because of its preservation of wildlands within a highly urban core of Southern California and the biologically diverse plant and animal populations that depend on these wildland areas within and connected to Chino Hills State Park to survive. Visitors will explore how human actions are impacting the natural areas within the region and why the protection of wildlands is vital today and for the future. Interpretive topics will explore concepts of biodiversity, regional connectivity, and human interrelationships with the Chino Hills environment. Additional themes and key messages are listed below:

Primary Theme I: The biodiversity connected to Chino Hills State Park makes it an exceptional place.

Supporting Theme IA: The connection of Chino Hills State Park to other wildland areas is crucial to the survival of plants and animals throughout the region.

Supporting Theme IB: Diverse rare, threatened, and endangered native plants and animals find refuge in the fragile natural environment of Chino Hills State Park.

Primary Theme II: Living on the edge of wildlands brings challenges and responsibilities for preserving the delicate balance between the habitats of wild animals and the needs of human residents.

Primary Theme I:
The biodiversity connected to Chino Hills State Park makes it an exceptional place.

MESSAGES

What is biodiversity? [26]

1.1 Biodiversity simply means the variety of plants and animals and other living things in a particular area or region.

Generally, the higher the degree of biodiversity, the healthier an ecosystem tends to be.[27]

1.2 Chino Hills State Park, an important open space area within the Los Angeles Basin, provides refuge for an unusually large number of plant and animal species for an open space area of its size.

More than 200 species of birds and mammals, numerous reptiles and amphibians, and thousands of types of invertebrates can be found in the park.

1.3 "Maintaining a wide diversity of species in each ecosystem is necessary to preserve the web of life that sustains all living things." Chino Hills is a unique variety of interconnected plants and animals.[28]

Biodiversity is not only important to the natural world, it is important to all people. The world's plants and animals provide them with food and medicine, clean air and water, and places to escape city life.

Global and Regional Significance

1.4 California contains the greatest number of endangered plants and the greatest number of endangered birds of any region in the continental U.S.[29]

---

[26] California Biodiversity Council, *California Biodiversity Council: An Applied Definition of Biodiversity*, http://biodiversity.ca.gov/Biodiversity/biodiv_definition.html and Michael G. Barbour and Jack Major, *Terrestrial Vegetation of California* (Davis: California Native Plant Society, 1988), 111.

[27] The Field Museum, "Underground Adventure-Soil Biodiversity," http://www.fieldmuseum.org/UndergroundAdventure/teachers/soil_biodiversity.shtml.

[28] Ibid.

[29] U.S. Fish and Wildlife, http://endangered.fws.gov.

Los Angeles, Santa Barbara, San Diego, and San Bernardino counties are four of ten counties in the continental United States with the largest number of threatened or endangered plant and animal species.[30]

1.5 The Mediterranean California Ecoregion, which covers much of western California and northwestern Baja California, is recognized worldwide as a significant area of biodiversity. This area contains a greater number of biological resources than any other area of comparable size in the United States.[31]

1.6 The Mediterranean climate type only occurs in four locations outside of the region surrounding the Mediterranean Sea. Sometimes it is considered relatively "rare" when compared to other world climate types. Only a very narrow area of the earth's surface actually supports plants and animals found in Mediterranean climates.

Among the recognized hotspots of biodiversity on Earth, all five main regions with a Mediterranean climate are included: The California Floristic Province; Central Chile; The Mediterranean Basin; The Cape Floristic Region and Southwest Australia.[32]

Mediterranean ecosystems are among the most threatened on Earth. More than 41 percent of their land has been converted to farmland and urban uses. Worldwide, only 5 percent of their natural area is protected.

Most people understand the plight of tropical rainforests, where habitat loss exceeds habitat protection by 2 to 1. In other words, for every acre of rainforest saved, two have been lost to conversion or development. In Mediterranean habitats, the disparity is much greater. For every acre of Mediterranean habitat saved, eight acres have been permanently lost.[33]

[33] Nature Conservancy, *California Saving Mediterranean Habitats Worldwide*, http://www.nature.org/wherewework/northamerica/states/california/projectprofiles/shawquestions.html.

Building Blocks of Biodiversity

1.7 "Soil is a living thing. A single gram can contain as many as 15, 000 different species, 6 million creatures in total. Talk about diversity! While most of us may never actually see these life forms with our own eyes, they are there — and they are immensely important to us."[34]

Chino Hills State Park is located in Soil Region VII-Southern California. The Soil Conservation Service has mapped thirty-nine soil units representing twenty soil series. These soils vary widely in depth, fertility, permeability, and other important characteristics, which support diverse animal life.[35]

The soil, as the major medium for plant growth, is the basic resource for all land use and development. The healthier the soil, the more life that ecosystem can support, resulting in a greater degree of biodiversity.[36]

1.8 The Chino Hills are part of the divide between the Los Angeles and Santa Ana Hydrologic Basins. Chino Hills State Park contains some complete watersheds such as Aliso Canyon, Telegraph Canyon, and Water Canyon. Most of the park drains toward the Santa Ana River or Carbon Creek. The high divide in the park between San Juan Hill and Gilman Peak creates microclimate differences due to rain shadow effect.

Supporting Theme IA:
The connection of Chino Hills State Park to other wildland areas is crucial to the survival of plants and animals throughout the region.

MESSAGES
The Biocorridor

1.9 Habitat fragmentation is the tearing of the fabric of natural landscapes into smaller and smaller pieces. The alteration of habitats by human activities has been called the greatest threat to biodiversity on earth.[37]

---

[34] GreenTreks Network, Inc, *Biodiversity: Healthy Soil*, http://www.greentreks.org/documentaries/biodiversity/healthysoil.asp.
[35] California State Parks, *Chino Hills State Park General Plan* (Sacramento: State Park and Recreation Commission, 1999), 18.
[36] The Field Museum, "Underground Adventure-Soil Biodiversity," http://www.fieldmuseum.org/UndergroundAdventure/teachers/soil_biodiversity.shtml.
[37] Melanie Marie Schlotterbeck, *GIS Mapping of Biological Studies in the Puente-Chino Hills Wildlife Corridor Including Species Diversity and Relative Abundance* (Masters Thesis: CSU, Fullerton, 2001), 8.

Roads, trails, developments, and power lines are all ways a landscape is fragmented. Fragmentation begins with a gap, the initial loss of native habitat, which overtime gets bigger and bigger. [38] The Puente-Chino Hills, including the park, have become increasingly isolated by the conversion of the surrounding landscape to urban uses.

1.10 Biocorridors, like hallways between rooms, are extensions of habitat that connect one core habitat area to another. Small isolated areas of habitat simply cannot support as many species as larger areas. In order for the biodiversity of the park to be maintained at or near current levels it must remain connected to other protected wildlands in the region.

Biological corridors help to maintain healthy populations of plants and animals by allowing for genetic exchange, species migration, maintaining a balanced food chain, and repopulating after a catastrophe such as a fire. When small patches of wilderness are cut off from other open areas, many of the species present at the time of isolation will inevitably disappear or become extinct.

1.11 The habitat linkages important to the biological survival within the park include Coal Canyon, Sonome Canyon, and the natural slopes and drainages that connect the park to the Prado Basin to the east.

Coal Canyon links the park to the Cleveland National Forest and the Santa Ana Mountains. This is the most important biocorridor in the park because of its linkage to these much larger wildland areas.

Sonome Canyon links Chino Hills State Park to Tonner Canyon and other wildlands to the northwest, which lies in Los Angeles County.

Natural slopes and drainages east of the park connect it to important core habitat in the Prado Basin east of State Route 71. Both the Santa Ana River and the Prado Basin enhance the biocorridor.[39]

---

[38] Melanie Marie Schlotterbeck, *GIS Mapping of Biological Studies in the Puente-Chino Hills Wildlife Corridor Including Species Diversity and Relative Abundance* (Masters Thesis: CSU, Fullerton, 2001), 8-9.
[39] California State Parks, *Chino Hills State Park General Plan* (Sacramento: State Park and Recreation Commission, 1999), 17.

Food Chains and Ecosystems

1.12 Wide-ranging species mostly include predators at the top of the food chain that are essential for the maintenance of healthy ecosystems. Biocorridors allow wide-ranging species such as bobcats, mountain lions, and a variety of rare species from becoming trapped in isolated patches of habitat.

Mountain lions are predators at the top of the food chain and keep the ecosystem in balance. Bobcats eat smaller fare: rabbits, squirrels, reptiles, birds. Bobcats are near the top of the food chain, but mountain lions sometimes eat them. Both require plenty of space to find enough prey. A healthy ecosystem supports healthy predators.

1.13 The greatest threat to wildlife everywhere is habitat loss and fragmentation. Mountain lions and bobcats need a large, contiguous range for adequate prey and successful reproduction. The maintenance of wild areas that are connected by wildlife corridors is essential. A continuous range is the only way to preserve viable populations.

1.14 The movement of medium and large terrestrial carnivores occurs within the park and through the park vicinity (see Barrett and Beir, 1993 and Crooks and Haas, 1999).

Supporting Theme IB:
Diverse rare, threatened, and endangered native plants and animals find refuge in the fragile natural environment of Chino Hills State Park.

MESSAGES
Sensitive Species

1.15 Over 30 species of mammals, birds, reptiles, and amphibians have been documented in the park that are considered Endangered, Threatened or California Species of Special Concern.

1.16 When there are too few animals of a species left, the species can no longer successfully reproduce itself, no more individuals are born, and the species becomes extinct.

In our state, the California grizzly bear, the official state animal, and the gray wolf have become extinct, and the California condor teeters on the edge of extinction.

At least twenty-one animal species and thirty-four plant species have become extinct in recent decades in California.[40]

Native Plant Communities

1.17 More than 5,000 plants in California are native. This is more than are found in the northeastern United States and Canada combined, an area 10 times larger than California. At least one-third of these 5,000 plants are found nowhere else in the world.[41]

California's native plants evolved here over a very long period, and are the plants which the first Californians knew and depended on for their livelihood.[42] Plants have adapted to the extreme difference in rainfall and temperature between winter and summer seasons. Sclerophyll plants range in formations from forests, to woodland, and scrub. Fires occur frequently in Mediterranean climate zones.

1.18 These plants have co-evolved with animals, fungi and microbes, to form a complex network of relationships. They are the foundation of our native ecosystems, or natural communities.[43] Plants and animals are uniquely adapted to their environments and can be adversely influenced by changes to their environment.

1.19 Native plants often support 10 to 50 times as many species of native wildlife as non-native plants.[44] Plants are a cornerstone of biological diversity. Native plants do the best job of providing food and shelter for native wild animals. Native plants are used in the development of new foods, medicines and industrial products. Commercial strawberries were developed using our coast strawberry, *Fragaria chiloensis*, and pacific yew, *Taxus brevifolia*, yielded Taxol, an anti-cancer drug. Native plants are also an essential element in the natural beauty for which California is famous.

1.20 Defined by the type of plants that live within them, it is important to recognize that plant communities are not always clearly defined entities with strictly delineated boundaries, and that a given species may well inhabit two or more different such communities. Plant communities or associations are typically dependent on or affected

[40] U.S. Fish and Wildlife, http://endangered.fws.gov.
[41] California Biodiversity Council, *California Biodiversity Council: An Educator's Guide to Biodiversity*, http://biodiversity.ca.gov/Biodiversity/what_is.html.

[43] Ibid.
[44] California Native Plant Society, "Vegetation," http://www.cnps.org/cnps/vegetation/.

by such factors as geographical location, soil types, precipitation rates, angle and direction of slopes, elevations, microclimates and successional considerations, and thus it is not uncommon to find a particular plant or grouping of plants growing outside what would be thought of as its customary habitat if some of the above factors are advantageous to that growth.[45]

1.21 The region is rich in flora and fauna, due in part, to the vegetation communities, which support such a diversity of life.[46]

Walnut Woodlands[47]

1.22 The acorn woodpecker, Nuttall's woodpecker, California ground squirrel, western bluebird, great horned owl, band-tailed pigeon, plain titmouse, red-shouldered hawk, Pacific slender salamander, and western skink are typical animals.

1.23 Southern California black walnut trees join coast live oak to form woodlands above the creeks, often on the north facing slope. While black walnut used to be very common, only a few thousand acres of protected walnut woodland now exists. Several hundred acres exist in the park.

1.24 Walnuts were used for black die by Native Americans.

1.25 Woodlands have understories of California redberry, purple nightshade, native bunchgrass, lupines and poppies that blend into the grasslands.

Valley Grasslands[48]

1.26 Most grassland in the park is composed of non-native European annual grass and weed species introduced by early ranching.

1.27 Valley grassland once covered the major valleys of Southern California, and consisted mainly of native bunchgrasses. However, these perennial grasses were not well adapted to disturbances

[48] Kathy Jacobs, *From the Desert to the Sea: Major Habitats of Southern California*, http://www.lalc.k12.ca.us/uclasp/local_habitats/habitats/chaparral.html.

created by grazing herd mammals and humans, and have been largely replaced by imported Mediterranean weeds from Europe. In addition, in Southern California, much of the former expanse of this habitat has been built on, and the habitat so completely altered that it is now classified as non-native grassland.

1.28 Grassland species native to California such as purple needlegrass and giant rye can still be found among the European annuals at the park.

Chaparral[49]

1.29 Chaparral is the dominant habitat found in the mountains of Southern California.

1.30 The plants must be able to tolerate long periods without rain, dry soil, baking sun.

1.31 Chaparral plants often have two root systems; shallow roots for catching water when it falls as rain, and tap roots for support.

1.32 Some chaparral plants are *allelopathic*, producing toxins which inhibit plant growth near them.

1.33 Chaparral plants include chamise, laurel sumac, and coffee berry.

Coastal Sage Scrub[50]

1.34 Coastal sage scrub is found below 3000 feet on dry slopes, usually near the coast (although it can extend into inland valleys). This habitat is cooler than chaparral, but ironically often drier. Rainfall is often heavier at higher elevations, and coastal sage scrub often has rainfall less than 10 inches, which is about the same as in some desert regions. Coastal sage scrub is limited to areas that do not freeze.

1.35 Many of the plants are drought-deciduous and strongly odoriferous. Some of the community's plants and animals are also found in desert habitats.

---

[49] Kathy Jacobs, *From the Desert to the Sea: Major Habitats of Southern California*, http://www.lalc.k12.ca.us/uclasp/local_habitats/habitats/chaparral.html.

[50] Kathy Jacobs, *From the Desert to the Sea: Major Habitats of Southern California*, http://www.lalc.k12.ca.us/uclasp/local_habitats/habitats/chaparral.html.

1.36 California sagebrush; California encelia; white, purple, and black sages; California buckwheat; Coyote bush; coast goldenbush; and golden yarrow are typical plants.

1.37 Some chaparral plants are found scattered within patches of coastal sage scrub. They include lemonadeberry, toyon and laurel sumac. Prickly-pear cactus is also found abundantly here, especially after grazing by cattle.

1.38 Two birds considered threatened or sensitive, the coastal California gnatcatcher and the coastal cactus wren, are found here. The cactus mouse, pocket mice, deer mice, coyotes, agile kangaroo rats, and mountain lions are also here.

1.39 This habitat is much reduced due to development.

Riparian Woodlands[51]

1.40 Riparian woodland is made up of plants which grow near streams and lakes.

1.41 These plants require more water than scrub-adapted plants, and often have large leaves.

1.42 In Chino Hills State Park the dominant trees are western sycamore, black willow, red willow, and arroyo willow. Cottonwoods are also found along the Santa Ana River. The riparian understory consists of mule fat, wild rose, poison oak, and stinging nettle.

1.43 Due to stream channelization and development, much riparian habitat is disappearing in Southern California, and as it vanishes, so do the animals relying on it.

1.44 Before it was listed as Endangered, the least Bell's vireo, a small songbird that breeds in riparian forests, was reduced to less than 300 pairs in Southern California. Habitat destruction, cattle grazing, and brood parasitism by the brown-headed cowbird were the main reason for its decline.

1.45 Cattail stands provide cover for a variety of wildlife, including red-winged black birds.

---

[51] Kathy Jacobs, *From the Desert to the Sea: Major Habitats of Southern California*, http://www.lalc.k12.ca.us/uclasp/local_habitats/habitats/chaparral.html.

Primary Theme II:
Living on the edge of wildlands brings challenges and responsibilities for preserving the delicate balance between the habitats of wild animals and the needs of human residents.

MESSAGES
Native American land use

2.1 Native Americans commonly used plants to make baskets, dye, and other items. Native Californians also managed land for preferred species.

Agriculture and Ranching

2.2 Agriculture and other human activities disturbed native species and brought invasive species to the area including an abundance of non-native European annual grasses and weeds.

Urbanization and Edge Effects

2.3 The discovery of oil led to the first major influx of human activity in the hills, which continues to this day. Oil operations attracted commercial business needed to sustain and support the work force. In the quest for oil, settlers created many new towns across the hills including Brea, Yorba Linda, La Habra, and Whittier.[52]

2.4 The Inland Empire experienced the largest growth within California and continues to follow this trend. The Inland Empire (Riverside and San Bernardino Counties) added over 666,000 persons between 1990 and 2000. The increase is comparable to the entire population of Kern County.[53]

2.5 Urbanization leads to the loss of habitat making it difficult for animals to find food, shelter, and space that they need to survive.

As land in Southern California becomes more developed and wildlands dwindle, the importance of Chino Hills State Park to the preservation of biodiversity will greatly increase.

2.6 Edge effects occur where development, including roads, takes place adjacent to wildlands.

[52] Melanie Marie Schlotterbeck, *GIS Mapping of Biological Studies in the Puente-Chino Hills Wildlife Corridor Including Species Diversity and Relative Abundance* (Masters Thesis: CSU, Fullerton, 2001), 5.
[53] Southern California Association of Governments, Census Data, http://www.scag.ca.gov/census/.

Edge effects threaten the ecological integrity, recreational experience, aesthetic quality, public investment, and safety operations of preserved areas.

Because of adverse effects to wildlands from surrounding areas, the following impacts may occur:
-Introduction of exotic vegetation inadvertently carried in from bikes, people, animals or spread from backyards or other areas adjacent to the wildland.
-Fires can become more frequent and severe (as witnessed in November 2008 when 95% of the park burned).
-Pets can act as predators of and competitors with native wildlife, as well as vectors for disease.
-Use and creation of designated trails can degrade the natural environment.
-Introduction of exotic animals which can compete with or prey on native animals.
-Influence on Earth Systems, such as solar radiation, soil richness and erosion, wind damage, hydrologic cycle, and water pollution can affect the natural and built environment.
-Loss of foraging habitat.

Park use today

2.7 Concerned individuals and organizations such as Hills for Everyone, The Wildlands Conservancy and California State Parks helped to preserve Chino Hills State Park.

Individuals and groups have made a positive impact on the environment. When realizing the value of wildlands and the biodiversity of the Puente-Chino Hills, concerned individuals and groups such as Hills for Everyone took action to preserve Chino Hills and make it a California State Park. With determination and dedication, concerned individuals continue to support the conservation of open land and biodiversity.

2.8 Urban parks also protect watersheds. Natural habitat can filter pollutants out of water, helping to ensure that water is safe to drink.[54]

[54] The Nature Conservancy, "Do Urban Parks Matter?," http://support.nature.org/site/PageServer?pagename=asktheconservationist_200809

2.9 Many urban parks exist primarily for the recreation and enjoyment of urban residents. This is very important to many people's quality of life.[55]

2.10 Visitors can also become steward of wildlands and promote biodiversity by planting native gardens, removing invasive species, reducing loss of wildlands by limiting new development (living in environmentally friendly, older communities), recycling, staying on park trails, keeping your pets inside or on a leash, and not feeding wildlife.

[55] Ibid.

Interpretive Periods[56]

The primary interpretive period for the cultural history of Chino Hills State Park spans from the 1920s to the 1980s and represents the most active period of ranching in the area. A secondary interpretive period relates to Native American habitation of the area, though much archaeological data is lacking.[57] The Discovery Center will primarily interpret the urbanization of the twenty-first century that continues to build along the park boundaries.

Most of the current cultural features within the park are associated with ranching, the most dominant historical land use. Other resources are associated with mineral and oil extraction, transportation and other public utilities, and varied agricultural and horticultural uses. The following periods are identified as significant in the 1999 General Plan:

Native American period (1,000BP-1771)

Chino Hills State Park is located in the inland portion of the traditional Gabrielino territory in close proximity to the Juaneño, Luiseño, Serrano, and Cahuilla tribes. The Gabrielino (Tongva) were occupying lands in and around the park at the time the Spaniards arrived in Southern California.

The most recent dates for sites in the Prado Basin and Chino Hills are not well defined, but fall around 1,000 years before present (BP). Mission baptismal records indicate the former presence of aboriginal villages near Chino Hills State Park; however, archeological data about these sites is lacking. One site within Chino Hills State Park yielded dates between 1070 and 2380 years BP.

Spanish/Mexican Period (1771-1848)

Although exploration occurred both north and south of the park, there is no documented evidence indicating the park was formally surveyed during the eighteenth or early-nineteenth century, nor legally acquired prior to the 1830s. Mission San Gabriel was established just twenty miles northwest of the park, so stock grazing may have occurred on park land as early as the 1770s.

Early American Period (1848-1920)

In contrast to the surrounding region, there is no evidence of permanent activity other than grazing in the present-day park prior to the U.S. Surveyor General's public domain surveys. These surveys began in 1853 and were not completed until 1894. The deputy surveyor's field notes do

[56] California Department of Parks and Recreation, *Chino Hills State Park General Plan*, 31-32.
[57] California Department of Parks and Recreation, *Chino Hills State Park General Plan*, 33.

not indicate any structures, fences, or wagon roads in the park, although much of the land was obtained and used for grazing during this period.

Legal acquisition of public domain land within Chino Hills State Park by private individuals did not begin until the early 1870s. Many of those filing were associated with the small ranching community of Rincon just east of the park boundary along the Prado Basin. Local ranchers such as Fenton Slaughter, who had purchased Raymundo Yorba's home and property in 1868, established successful sheep and cattle ranching operations that extended into the eastern limits of Chino Hills State Park. Activity and ownership increased during the Great Land Boom of the mid-l880s. Those who purchased Chino Hills land for ranching use included the founder of the town of Chino, Richard Gird. By 1895 much of the future park property was under absentee ownership, such as that of the San Francisco based Chino Land and Water Company.

Although most of the Chino Hills land was in ownership by 1900, the first published USGS quadrangle map of 1902 indicates only three miscellaneous structures and a wagon road running within current park boundaries. These structures were likely associated with various ranching and mineral extraction activities. Although no large deposits were located or exploited within the park, several oil wells and mines have been documented from this period.

Twentieth Century Development Period (1920s-1980)
During the inter-war years of the 1920s to the 1940s, the ranching industry reached its most active period at Chino Hills. In 1921, local dairy rancher Frank Pellissier purchased most of the Chino Land and Water Company holdings for his dairy herds, including the area of the future Rolling M Ranch. The first aerial photographs of the region in the late l930s indicate numerous cleared areas that had obviously received regular grazing activity along almost all the watershed canyons of the park, including near the Santa Ana River and Carbon Canyon.

The 1940s saw the increased development of the Rolling M Ranch complex. Aerial photographs show several structures and cleared areas on the site by 1940. In 1948, the Mollin Investment Company acquired 1,720 acres, subsequently naming the area Rolling M Ranch. The company enlarged and improved the corral system and rehabilitated and enlarged the main house. Mollin owned the property until the establishment of the State Park in the 1980s.

California State Parks' Education Mission Statement

The most powerful forms of education are meaningful, involve the student, promote critical thinking, and appeal to different learning styles. Our mission is to provide educational experiences both in California State Parks and in the classroom, assisting educators with curriculum needs and offering activities that enable students to investigate, research, and participate in interactive learning. [58]

California Educational Content Standards

In 2005, a survey was conducted of thirty-four third to fifth grade elementary school teachers in the areas surrounding Chino Hills State Park. This study found that cultural history, water cycles, plant germination, life cycles, geology, food chains, and responsibility and awareness are the most curriculum relevant topics.[59]

In 2008, this survey was revised and expanded, with more than three hundred K-12 teachers responding. They confirmed the previously identified curriculum content was relevant to a wider student population (beyond third to fifth grade). Life cycles, environmental stewardship/conservation, food chains, and cultural history were identified as the top four curriculum relevant subjects. Interpretive facilities and educational programs at Chino Hills State Park should consider these findings in order to meet the educational needs of the local community.

The Discovery Center will emphasize the connections between humans and the natural environment helping to integrate natural and cultural history curriculum. The identified interpretive topics of biological diversity, urban interface, and environmental stewardship will best relate to the curriculum relevant topics of life cycles, the food chain, plant and animal structures, responsibility and awareness, and other identified curriculum content standards. The following list identifies specific California Department of Education Content Standards[60] for Grades K through 12 with notes identifying the potential application through educational programs and interpretive facilities at the Chino Hills State Park:

Kindergarten

Science Content Standards: Life Sciences

Different types of plants and animals inhabit the earth. As a basis for understanding this concept:

---

[58] California State Parks Interpretation and Education Division, *Interpretation and Education Mission Statements*, http://www.parks.ca.gov/?page_id=23434.
[59] E-mail from Kelly Elliott to Kathy Weatherman, May 23, 2005.
[60] California State Board of Education, "Content Standards," http://www.cde.ca.gov/be/st/ss/.

Students know how to observe and describe similarities and differences in the appearance and behavior of plants and animals (e.g., seed-bearing plants, birds, fish, insects).

Application
The basis for understanding the concept of biodiversity is discussing the variety, features, and traits of plants and animals within Chino Hills State Park.

Kindergarten
Science Content Standards: Earth Science
Earth is composed of land, air, and water. As a basis for understanding this concept:

Students know how to identify resources from Earth that are used in everyday life and understand that many resources can be conserved.

Application
The Discovery Center will explore how humans use their natural environment.

Grade One
Science Content Standards: Life Sciences
Plants and animals meet their needs in different ways. As a basis for understanding this concept:

Students know different plants and animals inhabit different kinds of environments and have external features that help them thrive in different kinds of places.

Students know both plants and animals need water, animals need food, and plants need light.

Students know animals eat plants or other animals for food and may also use plants or even other animals for shelter and nesting.

Students know roots are associated with the intake of water and soil nutrients and green leaves are associated with making food from sunlight.

Application
Students will explore the factors that impact plants and animals, why animals need certain habitats, and how all native animals and plants within Chino Hills State Park need each other to survive.

Grade Two
Science Content Standards: Life Sciences
Plants and animals have predictable life cycles. As a basis for understanding this concept:

Students know the sequential stages of life cycles are different for different animals, such as butterflies, frogs, and mice.

Students know many characteristics of an organism are inherited from the parents. Some characteristics are caused or influenced by the environment.

Students know there is variation among individuals of one kind within a population.

Students know light, gravity, touch, or environmental stress can affect the germination, growth, and development of plants.

Students know flowers and fruits are associated with reproduction in plants.

Application
Students will explore how plants and animals reproduce and thrive within Chino Hills State Park. Students will study the factors that can negatively impact biodiversity.

Grade Two
Science Content Standards: Earth Sciences
Earth is made of materials that have distinct properties and provide resources for human activities. As a basis for understanding this concept:

Students know that soil is made partly from weathered rock and partly from organic materials and that soils differ in their color, texture, capacity to retain water, and ability to support the growth of many kinds of plants.

Students know rock, water, plants, and soil provide many resources, including food, fuel, and building materials, that humans use.

Application
This standard can be aligned with the factors that influence biodiversity and explain the history of the oil industry at Olinda (a former oil town just outside the western park boundaries). This may also include a discussion of how soil influences plant growth and the location of where plants grow.

Grade Three
History-Social Science Content Standards
Trace the ways in which people have used the resources of the local region and modified the physical environment (e.g., a dam constructed upstream changed a river or coastline).

Application
Interpretive topics related to this standard include the impacts of increasing urbanization and the variety of human uses associated with the Chino Hills environment. This includes Native California uses; mining, farming which led to the introduction of non-native species; and erosion.

Grade Three
Science Content Standards: Life Sciences
Students know when the environment changes, some plants and animals survive and reproduce; others die or move to new locations.

Students know that some kinds of organisms that once lived on Earth have completely disappeared and that some of those resembled others that are alive today.

Application
Interpretive topics related to this standard include plant and animal adaptations, the changes within the Chino Hills environment, urban edge effects, animals that have already become extinct within Southern California, the impacts of fire, and the concept of biodiversity.

Grade Four
Science Content Standards: Life Sciences
All organisms need energy and matter to live and grow. As a basis for understanding this concept:

Students know plants are the primary source of matter and energy entering most food chains.

Students know producers and consumers (herbivores, carnivores, omnivores, and decomposers) are related in food chains and food webs and may compete with each other for resources in an ecosystem.

Students know decomposers, including many fungi, insects, and microorganisms, recycle matter from dead plants and animals.

Application
Topics related to this standard include the importance of native plants to the ecosystems within Chino Hills State Park and Southern California.

Living organisms depend on one another and on their environment for survival. As a basis for understanding this concept:

Students know ecosystems can be characterized by their living (biotic) and nonliving (abiotic) components.

Students know that in any particular environment, some kinds of plants and animals survive well, some survive less well, and some cannot survive at all.

Students know many plants depend on animals for pollination and seed dispersal, and animals depend on plants for food and shelter.

Students know that most microorganisms do not cause disease and that many are beneficial.

Application
Topics related to this standard include biodiversity, ecosystems, adaptation to the urban environment, and food chains and exploring what happens when a food chain/web is broken.

Grade Five
Science Content Standards: Earth Sciences
Water on Earth moves between the oceans and land through the processes of evaporation and condensation. As a basis for understanding this concept:

Students know water vapor in the air moves from one place to another and can form fog or clouds, which are tiny droplets of water or ice, and can fall to Earth as rain, hail, sleet or snow.

Students know that the amount of fresh water located in rivers, lakes, underground sources, and glaciers is limited and that its availability can be extended by recycling and decreasing the use of water.

Students know the origin of water used by their local communities.

Energy from the sun heats Earth unevenly, causing air movements that result in changing weather patterns. As a basis for understanding this concept:

Students know uneven heating of the Earth causes air movements (convection currents).

Students know the influence the ocean has on the weather and the role the water cycle plays in weather patterns.

Application
Topics related to these standards include the water cycle, weather and climate. The movement of water (the water cycle) influences the weather and climate of the Chino Hills environment, which in turn determines the plants and animals living in the area.

Grade Six
Science Content Standards: Ecology/Life Sciences
Organisms in ecosystems exchange energy and nutrients among themselves and with the environment. As a basis for understanding this concept:

Students know energy entering ecosystems as sunlight is transferred by producers into chemical energy through photosynthesis and then from organism to organism through food webs.

Students know matter is transferred over time from one organism to others in the food web and between organisms and the physical environment.
Students know populations of organisms can be categorized by the functions they serve in an ecosystem.

Students know different kinds of organisms may play similar ecological roles in similar biomes.

Students know the number and types of organisms an ecosystem can support depends on the resources available and on abiotic factors, such as quantities of light and water, a range of temperatures, and soil composition.

Application
The Discovery Center will explore ecosystems, food chains, niches, and succession.

Grade Seven
Science Content Standards: Focus on Life Sciences
Biological evolution accounts for the diversity of species developed through gradual processes over many generations. As a basis for understanding this concept:

Students know both genetic variation and environmental factors are causes of evolution and diversity of organisms.

Students know that extinction of a species occurs when the environment changes and the adaptive characteristics of a species are insufficient for its survival.

Application
Species diversity in Chino Hills State Park includes rare, threatened and endangered species and species which are now extinct or extirpated from the region.

Grade Eight
Science Content Standards: Focus on Physical Sciences
Principles of chemistry underlie the functioning of biological systems. As a basis for understanding this concept:

Students know that carbon, because of its ability to combine in many ways with itself and other elements, has a central role in the chemistry of living organisms.

Students know that living organisms are made of molecules consisting largely of carbon, hydrogen, nitrogen, oxygen, phosphorus, and sulfur.

Application
These standards can be used to explain processes necessary to the functioning of an ecosystem, such as photosynthesis, evaporation, transpiration and decomposition.

Grades Nine Through Twelve
Science Content Standards: Biology/Life Sciences
Ecology
Stability in an ecosystem is a balance between competing effects. As a basis for understanding this concept:

Students know **biodiversity** is the sum total of different kinds of organisms and is affected by alterations of habitats.

Students know how to analyze changes in an ecosystem resulting from changes in climate, human activity, introduction of nonnative species, or changes in population size.

Students know a vital part of an ecosystem is the stability of its producers and decomposers.

Students know at each link in a food web some energy is stored in newly made structures but much energy is dissipated into the environment as heat. This dissipation may be represented in an energy pyramid.

Students know how to distinguish between the accommodation of an individual organism to its environment and the gradual adaptation of a lineage of organisms through genetic change.

Application
These standards can be directly applied to the concept of biological diversity explored within the Discovery Center.

Interpretive Recommendations

Proposed Interpretive Programs

The Discovery Center will offer opportunities for interpretive talks, walks, and educational programs. Possible areas within the vicinity to conduct these activities include the multi-purpose room, the amphitheater area, the Discovery Trail, or along adjacent trails. Topics may include biological diversity, food chains, animal adaptations, human land use, invasive species, life cycles, or other messages of relevance to the park.

The Discovery Center's multi-use facility will also be a desirable place to host community events and educational workshops. This space will allow the local community, visitors, and others to further explore the significant cultural and natural resources of Chino Hills State Park. The amphitheater offers potential for interpretive programming. Recommended messages include food chains, food webs, and how healthy ecosystems support biodiversity.

All interpretive programming should relate to the messages being delivered at the Discovery Center or outlined in the Chino Hills State Park General Plan. Programs should be relevant, accurate, provocative, programmatically accessible, organized, retained, and thematic. See California State Parks' *Basic Interpretive Learning System* or www.parks.ca.gov/interptools for more information on conducting interpretation at Chino Hills State Park.

Interpretive opportunities within the Discovery Center and outside its doors will stimulate the discovery, appreciation, and protection of the irreplaceable urban wildland of Chino Hills State Park. Thematic, interactive exhibits will focus on the human connections to biological diversity, the regional importance of Chino Hills State Park as a biological corridor, and the impact of human actions on the natural world. It will also introduce the cultural history of the area including Native American involvement in the area and historic ranching.[61]

Exhibits and programs will be primarily geared toward local schools and nearby communities. Discovery Center exhibits and curriculum-aligned interpretive learning carts will inspire an appreciation for the biological diversity of the Chino Hills region and promote environmental stewardship.

[61] California Department of Parks and Recreation, *Chino Hills State Park General Plan* (San Diego: CDPR Southern Service Center, 1999), 44.

The center will also provide interpretive media and park information for all visitors to make the most of their visit to Chino Hills State Park.

The park's unifying theme will be relevant to all interpretive messages and media developed within the Discovery Center and related interpretive facilities including the amphitheater and trails. This unifying theme, as previously outlined in this document, is:

> **Chino Hills State Park is an irreplaceable urban wildland of regional and global biological significance.**

Proposed Visitor Flow, Interpretive Areas, and Exhibit Concepts

Appendix A provides detailed information on the proposed visitor flow, interpretive areas, and exhibit concepts. There are four exterior exhibit areas (Area E-1 through E-4) and eight interior exhibit areas (Area I-1 through I-8) as follows:

Area E-1: Welcome to Chino Hills State Park!
Area E-2: Discovery Trail
Area E-3: Walnut Woodland Amphitheater
Area E-4: Discovery Cart
Area I-1: Welcome to Chino Hills State Park
Area I-2: Discover Biodiversity
Area I-3: Building Blocks of Biodiversity
Area I-4: A Closer Look at Biodiversity
Area I-5: Biocorridors: Linkages to Survival
Area I-6: Living on the Edge
Area I-7: Biodiversity Benefits Us All
Area I-8: Become a Park Protector!

The proposed visitor flow within the Discovery Center begins after passing through the main entrance and sales area where visitors will be greeted at the reception counter (I-1). Straight ahead, an exhibit title wall (I-2) will create a visual invitation to explore the exhibit hall. To the right (I-3) a tactile map of the entire Park will be the central feature of this area. The primary thematic focus here will be on the factors that influence biodiversity at the Park. In the distance, a large floor-to-ceiling window wall offers views of the Chino Hills. The adjoining space beyond features a central counter that serves as an interactive exhibit allowing visitors to have a closer look at biodiversity (I-4). Adjacent exhibits explore the concept of biocorridors (I-5) and the important role they play in species survival. The concept of living on the urban edge takes advantage of the building's interior architecture, creating a series of discovery encounters

such as motion-activated lights, evening sounds, and a vignette portraying a typical urban backyard (I-6). Additional stories for interpretation in the Discovery Center include the benefits of biodiversity (I-7) and an exit message that encourages all visitors to become park protectors (I-8). Visitors will exit the exhibit space through an exterior corridor that leads to a platform with views of the Chino Hills in the distance and of the Walnut Woodland Amphitheater below.

Proposed Phasing and Preliminary Budget

Based on the total funds allocated to the interpretive portion of the project ($705,000), the following is suggested as the Proposed Phasing and Preliminary Budgets:

Phase I: Interpretive Exhibits - $514,000
- Interior Exhibits (Discovery Center @ $420K; Discovery Cart @ $35k)
- Outdoor Exhibits (Exterior Interpretive Panels @ $59K)

Phase II: Interpretive Landscaping and Misc. Outdoor Exhibits - $139,000

Phase III: Discovery Center Mural - $52,000

Appendices

Appendix A: Exhibit Concepts (19 sheets, each 11" X 17")

Appendix B: Proposed Interpretive Objects List

Appendix C: Multimedia and Audio Treatment Plans

Appendix D: Interpretive Text Outlines

Appendix B: Proposed Interpretive Objects List

The following list is based on proposed interpretive objects identified in Appendix A: Exhibit Concepts. Quantity, materials, and other fabrication/purchase details still to be determined. This list does not include exhibit components such as the tactile map or other interactives, exhibit supports, audio visual equipment, or items such as park brochures.

Area I-4

- Plant and animal specimens (fabricated) for the diorama
- Magnifiers (sliding carriage, turning, and tethered/hand-held)
- Wentz Scope with rotating specimen wheels
- Natural history specimens/slides*
- Replica skulls, bones and/or bird bills
- Stools

Area I-5

- Wildlife camera (actual or fabricated)

Area I-6

- Motion sensor light
- Trashcan & lid with trash (actual or fabricated)
- Urban Threats sculpture –pesticide containers, plastic can rings, etc. (actual or fabricated)

Area I-7

- Guest book (or create cover similar to flipbooks with removable pages)

Area E-4

- Specific objects still to be determined

*NOTE: The Park will provide some natural history specimens that can be prepared for display by others (e.g., slides). These may include:

- Seeds, pods, leaves, flowers
- Feathers, animal scat/owl pellets, insects/spiders
- Soil samples

Appendix C: Multimedia and Audio Treatment Plans

Multimedia Programs

Building Blocks of Biodiversity (Area I-3)

Description

This push-button interactive will give visitors an impression of the park's biological significance with a "sprinkling" of the reasons why the building blocks come together at Chino Hills. By exploring the conditions necessary to support biodiversity, visitors will have a renewed appreciation for the rich plant and animal life that Chino Hills State Park sustains. Six (6) buttons will trigger the 5 building blocks (each 30-60 seconds in length) plus one that puts all the blocks together (1-2 minutes in length). Messages will be delivered primarily via captions with related nature sounds.

Emotional Impact

a. Provide examples of the biodiversity "building blocks" in a manner that allows visitors to discover the varied and unique qualities (motion, sound, form, etc.) to be found at Chino Hills SP.
b. Explain that the biodiversity "building blocks" are connected.
c. Explore how the various combinations of the "building blocks" shape biodiversity at Chino Hills SP.
d. Express the program's primary theme: Chino Hills State Park is a special place because it has all of the conditions to create a high level of biological diversity.

Specific Method

a. Putting it all together: Visitors will be invited to discover why Chino Hills has such high biological diversity compared to most places. Image begins with a map of the world with Mediterranean climate areas (see 'Climate' graphic on exhibit concept layout) with zoom to North America, then California, and finally to Chino Hills State Park. Image focuses on the Puente/Chino Hills/Coal Canyon area as story unfolds about the creation of the Chino Hills (geomorphology). The variety of soils, along with climate and water factors, is used to describe the variety of habitats found at CHSP. The presence of the rain shadow effect dramatically conveys the movement of water over wildlands. Examples of plant and animal species (e.g. insects, reptiles, mammals, birds) remind visitors of the life that these wildlands sustain, zooming into the eyes of one of the animals, then panning back out at the "floating" map of CHSP (see 'Attract Loop' below).

b. Geomorphology: close-up views of maps, photography (including aerials such as DWR 2005 set of 50-copy at DPR/Natural Resources Division), etc. to help visitors read the contours of Chino Hills (canyons, slopes and ridgelines). Possibly include aerial footage from Saving Open Space DVD.
c. Soil: close-up views (original footage and/or photo stills) to capture the textures and colors of the park's various soil types.
d. Climate: a journey through the park (via original footage and/or photo stills with related nature sounds) highlighting the wet and dry seasons, wind, and other climactic factors.
e. Water: watersheds, seasonal wetlands/creeks, and rain shadow effect captured with original footage and/or photo stills and related nature sounds.
f. Wildlands: from open grasslands to tree-clustered woodlands, Chino's wildlands provide habitat for diverse plants and animals as depicted via original footage and/or photo stills with related nature sounds. The topic of "zone interface" may also be highlighted here.

Attract Loop & Surrounding Text

a. An attract loop will depict a "floating" 3-D animation of Chino Hills SP (use tactile model as reference) with a statement defining biodiversity and its significance at Chino Hills SP. Ambient sounds of diverse animal species may also be used here.
b. The upright graphic panel (location of interactive monitor) should provide a brief message to encourage visitors to press the buttons below to find out more about the building blocks of biodiversity. Additional text could explain that Chino Hills State Park is a special place because it has all of the conditions to create a high level of biological diversity.
c. Text on the reader rail (location of interactive buttons) should provide instructions and an attractor statement such as "Select a button below to explore the factors that shape biodiversity".

Biocorridors: Linkages to Survival (Area I-5)

"Animal Signs – Looking for Clues: Tracks, Scat, Collars, and Cameras!"

Description

This push-button interactive will give visitors an in-depth look at how and why scientists study animal presence and movement. Four (4) buttons will trigger specific examples: tracks, scat, collars, and cameras (each approximately 2 minutes in length). Narration may be provided by park staff (biologist and interpreter). Scientists who have conducted animal studies in the area will be invited to explain techniques they have used and data they have gathered – such as

the low presence of certain animals in areas frequented by domestic dogs.

Emotional Impact

a. Demonstrate the variety of methods and techniques used to locate evidence of animal presence and movement.
b. Provide track and scat examples in a fun and engaging way such that visitors will want to explore the park to look for animal signs.
c. Explain the use of animal collars, tracking stations, and cameras (video and still) as a study method that requires trained professionals and strategic planning.
d. Express the program's primary theme: scientific studies are important to determine species survival within the area's biocorridors.

Specific Method

a. Tracks: Locate tracks along the park trails, zooming in to focus on details. Look for a variety of animals such as reptile, mammal (small and large), and bird species. Will require original footage and/or high resolution photography.
b. Scat: Locate scat along the park trails, zooming in to focus on details. Look for a variety of animals such as reptile (snake and lizard), mammal (small and large), and bird species. Will require original footage and/or high resolution photography.
c. Collars: Interview scientists such as Paul Beier (mountain lions) and/or Lisa Lyren (bobcats and coyotes) to explain the use of radio collars to monitor animal movement. Photo stills may also be available, particularly of animals using an undercrossing. Animal and human safety, and the concept of "island biogeography" – patches of land that are disconnected – might also be addressed.
d. Cameras: Interview scientists such as Paul Beier (mountain lions) and/or Lisa Lyren (bobcats) to explain the use of cameras (still and/or video) to monitor animal movement. Video tape from previous studies, if permission can be obtained, might be used here. Photo stills may also be available, particularly of animals using an undercrossing (try not to duplicate ones being used with 'Collars' above). Tracking stations may also be discussed here.

Attract Loop & Surrounding Text

a. An attract loop will provide enticing visual cues to draw visitors in to playing the various programs. Ambient sounds of diverse animal species may also be used here.
b. Text on upright graphic panel (location of interactive monitor) should provide a brief introduction to the four animal sign "clues"

and encourage visitors to press the buttons below to find out more. Additional text could explain that the various animal signs are proof that animals are using biocorridors and that places such as Chino Hills State Park are doing a good job of protecting open space.

c. Text on the reader rail (location of interactive buttons) should provide instructions and an attractor statement such as "Select a button below to find out more clues to animal signs".

Living on the Edge (Area I-6): "We all need a safe place to live"

Description

This multimedia program will run as a continuous loop and will require no activation. A series of images and accompanying brief text will convey positive steps that visitors can take both at home and in the park to promote a healthy environment. Amount of steps to correlate with adjacent flip panel exhibits (approximately 10). Steps/text will be approximately 30 seconds each; entire program will be no longer than 5 minutes in length.

Emotional Impact

a. Demonstrate positive actions that visitors can take to promote a healthy environment at home and in the park.
b. Explain the positive consequences each action has to protecting wildlife and wildlands.
c. Provide specific examples that are introduced in the adjacent panels and flip panel interactive exhibits. Accompanying text may be repeated here for emphasis and/or as a way to test information learned.
d. Express the program's primary theme: people can help keep wildlife and wildlands a safe place to live.

Specific Method

a. Predation: keeping pets away from wildlands (dogs on trails & impacts to bobcats)
b. Let them Be: enjoying nature and keeping it wild by letting it be
c. Lights Out: having security lights on timers rather than motion activated; using lights only when needed; using low illumination
d. No to Noise: keeping music volume low, especially at night; minimizing auto-related sounds (gunning engine, screeching breaks, alarms)
e. Water Wise: using native/drought-tolerant plants and minimizing non-native grass/turf lawns
f. Natural Products: eliminating (or minimizing) use of herbicides and pesticides; when needed, use those made from natural compounds

g. Fire Safety: keeping vegetation away from homes
h. Goodbye Exotics: keeping up with weed abatement and replacing with native plants
i. Wildlife Attractors: using native plants that attract pollinators, birds
j. Living Lightly: walking, bicycling, and carpooling

No Attract Loop/Surrounding Text (continuous loop program with text)

Audio Program

Living on the Edge (Area I-6): "Evening in an Urban Edge Backyard"
Description

As visitors enter the low-lit space they hear various nighttime sounds associated with nocturnal animals of the natural environment. As they enter further, a motion-activated light is triggered and different sounds associated with the urban environment can be heard. The light dims a bit, providing illumination of the interpretive messages/panels. After a few minutes the lights return to create the low-lit space and the natural environment's nocturnal sounds return.

Emotional Impact

a. Feel the surprise of urban lights and noise as nocturnal animals might experience them.
b. Recognize actions that help prevent wild species from entering backyards (keep lids on trash cans, pets and pet food inside, etc.)
c. Appreciate the nighttime sounds of nature.
d. Express the program's primary theme: people can help keep wildlife and wildlands a safe place to live.

Specific Method

a. Nighttime sounds prior to motion sensor triggered light: frogs, crickets, owls, coyotes, the soft scampering of animals, etc.
b. Nighttime sounds after motion sensor triggered light: barking dogs, trash can lid falling to the ground, quick sound of panicked animals (e.g. raccoon) quickly leaving the area and rustling through dried leaves, car alarms, gunning engines, etc.

Accessibility related notes/questions:

- All AV programs will be close-caption.
- Use raised tactile elements and/or braille to make the push-buttons more accessible to the visually impaired.
- Consider the use of raised tactile elements on the reader rails to further assist people with visual impairments, such as the use of tracks in Area I-5: Animal Signs.

Appendix D: Interpretive Text Outlines

INTERIOR EXHIBITS

Area I-2: Discover Biodiversity

Exhibit Title Panel

Discover Biodiversity

The biological richness of Chino Hills

Area I-3: Building Blocks of Biodiversity

Introductory Panel

Discover why Chino Hills has very high biological diversity compared to most places!

- □ Describe the basic concept of biodiversity
- □ Explain that Chino Hills has a high biodiversity compared to most places (it has many habitats in one area)
- □ Invite visitors to discover the rich biodiversity at Chino Hills

Building Blocks Panel

Building Blocks of Biodiversity

What contributes to the biodiversity at Chino Hills?

Climate

Our Mediterranean climate is the reason so many living things love to call California home.

- □ Describe Mediterranean Climate & CA floristic province
- □ Give examples of how these factors influence CH biodiversity

Water

The availability of water is a major factor influencing the survival of plants and animals.

- □ Describe the basic concepts of water cycles and watersheds
- □ Give examples depicting how the seasonality of water influences biodiversity in the Chino Hills area

Wildlands

A variety of habitats support a great diversity of plants and animals.

- □ Describe the basic concepts of wildlands and habitats
- □ Explain how wildlands provide places for biodiversity to thrive
- □ Give examples of flora and fauna associated with diverse habitats found within Chino Hills (and/or CHSP)

Geomorphology
The diversity of landforms supports a greater variety of plant communities.
- □ Describe the basic concept of geomorphology
- □ Give examples of the land-shaping processes that can be found in the Chino Hills (and/or CHSP)

Soil
A tablespoon of soil contains hundreds of microorganisms invisible to the naked eye.
- □ Explain how soil is different than dirt
- □ Give examples of the types of soil found in Chino Hills and the associated plants that grow in a given soil type/area (habitat)

Reading Rail
Adaptability
The plants and animals of this southern California region (or CHSP) have adapted to live in a Mediterranean climate.
- □ Describe the basic concept of adaptability
- □ Give examples that show how flora and fauna found in the Chino Hills area (or CHSP) have adapted – generalists & specialists

Topographical Map Labels
- □ Identify key landmarks within and surrounding Chino Hills SP
- □ Provide directional information (compass or just an arrow with 'N')
- □ Other?

Area I-4: A Closer Look at Biodiversity

Diorama Title Panel – side 1 (Grassland Soils)
Nature's Rototiller
Even this common pest serves a purpose.
- □ Describe the benefits of a pocket gopher to grassland soils

Diorama Title Panel – side 2 (Woodland Soils)
Nature's Soil Makers
Woodlands are a community of decomposers.
- □ Describe the benefits of decomposers to woodland soils

Closer Look Panel
A Closer Look at Biodiversity
Color – Pattern – Size – Shape

[NOTE: Flip books will have approximately 8 pages, 1 for each specimen]
Flip book #1: Seed dispersal (with magnifiers on sliding carriages)

Where do these seeds grow?

- Identify a variety of seeds/seed pods, the plants they come from and location (habitat) where the plant grows
- Give examples of seeds/seed pods that demonstrate a variety of dispersal mechanisms (coordinate examples with exterior exhibits)

Flip book #2: Animals (with magnifiers)
What kind of animal is this?

- Identify a variety of animals/animal parts, the animals they come from and the location (habitat) where the animal lives
- Give examples such as feathers, animal scat (e.g., owl pellets), insects, and spiders

Flip book #3: Soil (with multiple magnifiers on tethers)
Where does the soil exist?

- Identify the key soil types that exist in the park/Chino Hills, their distinctive characteristics/composition (parent material), and where they are located (habitat)
- Give soil examples that demonstrate the varieties located in the park (coordinate examples with exterior exhibits)

Wentz Scope
[Text will primarily be captions based on final specimens selected]

Area I-5: Biocorridors: Linkages to Survival

Habitat Fragmentation Panel

Habitat Fragmentation
Habitat fragmentation creates a landscape of isolated patches of wildlife habitat.

- Describe the basic concept of habitat fragmentation
- Explain how habitat fragmentation threatens species
- Give examples of habitat fragmentation in the Chino Hills area

Tracking Panel

Telltale Clues
How do we know where animals go and what they do?

- Explain that nibbled plant leaves, holes in the ground, and matted down vegetation are clues to animal activity

Tracks

- Describe how tracks are indicators of where animals are found and patterns of travel

Scat

- Describe how scat indicates what an animal is eating

Cameras

- Describe how cameras help scientists monitor animal movement

Biocorridors Panel

Biocorridors: Linkages to Survival

What are Biocorridors?

- Describe the basic concept of biocorridors
- Explain that Chino Hills/CHSP is an important biocorridor

Crossing Design

- Describe the basic concept of wildlife crossings
- Discuss the different types of wildlife crossings
- Use Coal Canyon as an example to explain how undercrossings work and why one size doesn't fit all

How much space do they need?

- Define territory vs. range
- Give examples of the 5 animals that are displayed in the interactive to explain how much space they need

Why do they move?

[Note: This may be developed into an interactive exhibit

- Explain why certain animals need such large territories
- Describe predator-prey relationship in context of animal movement

Interactives

[Text will primarily be captions and directions – if required – based on final interactive design]

Before/After Fragmentation

What is left of our wildlands?

Range of movement map/map inset [Buttons: See where they go – push buttons activate lighting for paths of travel by various species on the large map and on the smaller map inset]

Area I-6: Living on the Edge

Introductory Panel

Living on the edge

- Describe the basic concept of urban edge effects
- Explain the importance of living responsibly in these sensitive areas

From Habitat to Homes

- Describe the change from native habitats to human habitation over time in the Chino Hills including Native American villages
- Provide an overview of the area's land use/ranching history including Rolling M Ranch
- Explain the period/s of population growth in this inland region including new communities surrounding the Chino Hills

Urban Backyard Panel/s

- Vignette will include 'Keep a lid on it' and 'Don't feed them trash' signs (no other interpretive text here)

Peace and Quiet Panel

We all need peace and quiet

Shhhhh!

Light and Noise

- Describe the basic concept of the impacts of light and noise on nocturnal animals

Animal "Voice" Bubbles

- Provide examples from the "perspective" of nocturnal animals of the impacts of light and noise

Urban Threats Panel

- Ask visitors what they can do to keep wild lands safe [use sculptural 'threat' elements as a counterpoint to the positive steps/actions depicted in the AV program and/or in the Positive Steps Panel]

Safe Place Panel

We all need a safe place to live

Positive Steps

[NOTE: The nearby audiovisual program will focus on positive steps to protect wildlands/wildlife; this panel may not be needed]

Animal "Voice" Bubbles

- Provide example/s from the "perspective" of nocturnal animals related to needing a safe place to live

Area I-7: Biodiversity Benefits Us All

Introductory Panel (All Living Things Feel Stress)

Pushed into a corner

Urban development has cornered wildlife into increasingly smaller spaces.

- Explain the importance of wildlands such as CHSP to the preservation of biodiversity

Balanced Needs

Living on the edge of wildlands is a delicate balance between preserving wildlife habitat and providing for the needs of humans.

- Describe the challenges to preserving wildlife habitats
- Explain why (or ask visitors why) we should protect habitats

Food & Medicine Panel

Food & Medicine

Native plants and animals can provide materials to feed humans and treat many of their illnesses.

- Describe the uses of local plants and animals by California Indians
- Compare cultivated foods with native plant species
- Identify medical contributions provided by native plants & animals

Clean Air & Water Panel

Clean Air & Water

Pollutants are filtered out of the air and water by a variety of plants and animals.

- Describe species that are indicators of environmental health
- Explain how plants and animals detoxify and decompose wastes found in water
- Explain how plants filter out contaminants in the air

Health & Wellness Panel

Health & Wellness

Wildlands provide spaces for healthy outdoor experiences.

- Identify the variety of outdoor experiences available at CHSP
- Explain the relationship between health and the outdoors
- Describe the intangible, intrinsic values provided by a wildlands experience

Interactives

[Text will primarily be captions and directions – if required – based on final interactive design]

Food & Medicine
Polar Motion Wetlands
Guest Book

Area I-8: Become a Park Protector!

Introductory Panel
How Will You Protect Biodiversity?

Reader Rail Panel
It's easy to become a Park Protector

- Explain that Chino Hills is one of 25 biodiversity hotspots in the world
- Invite visitors to start becoming Park Protectors
- Identify behaviors & activities that protect biodiversity when entering a wild land – locally and globally; include something specific for children

Brochure possibilities: Joining the Chino Hills SP Volunteer Association, Hills for Everyone, and/or California State Park Foundation; Living on the Edge/Urban Edge; Exotic Species; Trail Etiquette/Leave No Trace; CHSP Trails Map.

EXTERIOR EXHIBITS

Area E-1: Welcome to Chino Hills State Park!

Park Map Panel
Welcome to Chino Hills State Park!

- Provide a brief introductory message that invites visitors to explore the park (perhaps highlight recreational opportunities and park resources)
- Describe basic safety related to visiting the park and hiking the trails
- List the significant regulatory information that park visitors need to know

Brea Canyon Entrance "Inset" Panel
[Text will primarily be captions/labels of park features]

Area E-2: Discovery Trail

Discovery Trail Panel

- Describe the basic concept of biodiversity
- Introduce the plant communities found in the park
- Describe the revegetation process in the Discovery Trail area

Plant Communities Panels (one each: Oak Woodland, Grasslands, Coastal Sage Scrub, Chaparral, and Riparian Woodland)

- Describe the characteristics of this habitat (such as the types of animals that thrive here)
- Explain where it can be found in the park (identify specific trails or other features)

Plant Identification Panels (5 per habitat; 2-3 shapes)

- Describe the types of plants that thrive in this habitat and that are represented along the Discovery Trail

Planting Table
[Text will primarily be captions/labels of graphics used in final design]

Soils Display Panels (6 total)

- Describe the characteristics of each soil type that is displayed(such as the associated plants that grow in a given soil type/habitat)
- Explain where it can be found in the park (identify specific trails or other features)

Area E-3: Walnut Woodland Amphitheater

Walnut Woodland Panel

- Describe the significance of walnut woodlands
- Explain the basic concept of a food chain
- Identify the role of each plant and animal within a food chain that can be found in a walnut woodland habitat

Area E-4: Discovery Cart

Adaptations & Life Cycles Panel (Positive Steps)

- Provide a brief introductory message that invites visitors to explore how life cycles and adaptations promote biodiversity

Discovery Drawers/Displays
[Text will primarily be captions/labels based on the cart's final design]

Exhibit 8

California Department of Fish and Wildlife
California Natural Diversity Database (CNDDB)

SPECIAL VASCULAR PLANTS, BRYOPHYTES, AND LICHENS LIST

AUGUST 2018

Recommended Citation:

California Department of Fish and Wildlife, Natural Diversity Database. August 2018. Special Vascular Plants, Bryophytes, and Lichens List. Quarterly publication. 127 pp.

Table of Contents

Special Plants i
NatureServe Element Ranking For Plants ii
California Rare Plant Ranks iv
Special Lichens vi
Rare Plant Seed Banking vii
Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities viii
Special Vascular Plants, Bryophytes, and Lichens List ix

Special Plants

"Special Plants" is a broad term used to refer to all the plant taxa inventoried by the Department of Fish and Wildlife's California Natural Diversity Database (CNDDB), regardless of their legal or protection status. Special Plants include vascular plants as well as high priority bryophytes (mosses, liverworts, and hornworts) and lichens. Special Plant taxa are species, subspecies, or varieties that fall into one or more of the following categories:

- Officially listed by California or the Federal Government as Endangered, Threatened, or Rare;

- A candidate for state or federal listing as Endangered, Threatened, or Rare;

- Taxa listed in the California Native Plant Society's *Inventory of Rare and Endangered Plants of California*;

- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Quality Act (CEQA) Guidelines; these taxa may indicate "None" under listing status, but note that all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA;

- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;

- A Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service Sensitive Species;

- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California; and

- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g. wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.).

The Special Vascular Plants, Bryophytes, and Lichens List (located at the end of this document) contains taxa that are actively inventoried, tracked, and mapped by the CNDDB (California Rare Plant Rank 1 and 2 plants) as well as taxa which we track but for which we currently only have quad and county level geographic information available to our users (California Rare Plant Rank 3 and 4 plants). For the latter taxa, we maintain site and other information in manual files along with Internet access to the quad and county level information via our CNDDB QuickView Tool.

NatureServe Element Ranking For Plants

Last updated July 2013

All Heritage Programs, such as the California Natural Diversity Database (CNDDB) use the same ranking methodology, originally developed by The Nature Conservancy and now maintained and recently revised by NatureServe. It includes a **Global rank** (G rank), describing the rank for a given taxon over its entire distribution and a **State rank** (S rank), describing the rank for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the subspecies. The next page of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank. Procedurally, state programs such as the CNDDB develop the State ranks and the Global ranks collaboratively among states/provinces containing the species. NatureServe then checks for consistency and logical errors at the national level.

An element rank is assigned using standard criteria and rank definitions. This standardization makes the ranks comparable across organism and political boundaries. NatureServe has developed a "rank calculator" to help increase repeatability and transparency of the ranking process. The three main categories that are taken into consideration when assigning an element rank are rarity, threats, and trends. Within these three categories, various factors are considered including:

- Range extent, area of occupancy, population size, number of occurrences and number of good occurrences (ranked A or B). Environmental specificity can also be used if other information is lacking.
- Overall threat impact as well as intrinsic vulnerability (if threats are unknown).
- Long-term and short-term trends.

Detailed information on the newest element ranking methodology can be found here: http://natureserve.org/publications/library.jsp

With the above considerations in mind, refer below for the numerical definitions for G1-5 and S1-5. An element's ranking status may be adjusted up or down depending upon the considerations above.

Element Ranking

Global Ranking

The *global rank* (G-rank) is a reflection of the overall status of an element throughout its global range. Both Global and State ranks represent a letter+number score that reflects a combination of Rarity, Threat and Trend factors, with weighting being heavier on Rarity.

Species or natural community level:

G1 = Critically Imperiled— At very high risk of extinction due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
G2 = Imperiled— At high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
G3 = Vulnerable— At moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
G4 = Apparently Secure— Uncommon but not rare; some cause for long-term concern due to declines or other factors.
G5 = Secure— Common; widespread and abundant.

Subspecies/variety level:

Subspecies/varieties receive a T-rank attached to the G-rank. With the subspecies/varieties, the G-rank reflects the condition of the entire species, whereas the T-rank reflects the global situation of just the subspecies or variety. For example: *Chorizanthe robusta* var. *hartwegii* is ranked G2T1. The G-rank refers to the whole species range i.e., *Chorizanthe robusta.* The T-rank refers only to the global condition of var. *hartwegii*.

State Ranking

The *state rank* (S-rank) is assigned much the same way as the global rank, but state ranks refer to the imperilment status only within California's state boundaries.

S1 = Critically Imperiled— Critically imperiled in the state because of extreme rarity (often 5 or fewer populations) or because of factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
S2 = Imperiled— Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the state.
S3 = Vulnerable— Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.
S4 = Apparently Secure— Uncommon but not rare in the state; some cause for long-term concern due to declines or other factors.
S5 = Secure— Common, widespread, and abundant in the state.

Notes:

1. Other considerations used when ranking a species or natural community include the pattern of distribution of the element on the landscape, fragmentation of the population/stands, and historical extent as compared to its modern range. It is important to take a bird's eye or aerial view when ranking sensitive elements rather than simply counting element occurrences.
2. Uncertainty about the rank of an element is expressed in two major ways: by giving a range rank (e.g. S2S3 means the rank is somewhere between S2 and S3) or by adding a ? to the rank (e.g. S2? means the rank is more certain than S2S3 but less certain than S2).
3. Other symbols include: GH (all sites are historical), SH (all CA sites are historical), GX (all sites are extirpated, element is extinct in the wild), SX (all CA sites are extirpated), G#Q (the element is very rare but there are taxonomic questions associated with it; the calculated G rank is qualified by adding a Q after the G#).

California Rare Plant Ranks[1]

1A. Presumed extirpated in California and either rare or extinct elsewhere
1B. Rare or Endangered in California and elsewhere
2A. Presumed extirpated in California, but more common elsewhere
2B. Rare or Endangered in California, but more common elsewhere
3. Plants for which we need more information - Review list
4. Plants of limited distribution - Watch list

1A: Plants Presumed Extirpated in California and either rare or extinct elsewhere

The plants of Rank 1A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes those plant taxa that are both presumed extinct, as well as those plants which are presumed extirpated in California and rare elsewhere. A plant is extinct if it no longer occurs anywhere. A plant that is extirpated from California has been eliminated from California, but may still occur elsewhere in its range.

1B: Plants Rare, Threatened, or Endangered in California and Elsewhere (Includes Rare Plant Ranks 1B.1, 1B.2, 1B.3)

The plants of Rank 1B are rare throughout their range with the majority of them endemic to California. Most of the plants that are ranked 1B have declined significantly over the last century. California Rare Plant Rank 1B plants constitute the majority of plant taxa tracked by the CNDDB, with more than 1,000 plants assigned to this category of rarity.

2A: Plants Presumed Extirpated in California, but more common elsewhere

The plants of Rank 2A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes only those plant taxa that are presumed extirpated in California, but that are more common elsewhere in their range. Note: Plants of both Rank 1A and 2A are presumed extirpated in California; the only difference is the status of the plants outside of the state.

2B: Plants Rare, Threatened, or Endangered in California, but More Common Elsewhere (Includes Rare Plant Ranks 2B.1, 2B.2, 2B.3)

The plants of Rank 2B are rare, threatened or endangered in California, but more common elsewhere. Plants common in other states or countries are not eligible for consideration under the provisions of the Federal Endangered Species Act; however they are eligible for consideration under the California Endangered Species Act. This rank is meant to highlight the importance of protecting the geographic range and genetic diversity of more widespread species by protecting those species whose ranges just extend into California. Note: Plants of both Rank 1B and 2B are rare, threatened or endangered in California; the only difference is the status of the plants outside of the state.

3: Plants About Which We Need More Information - A Review list

---

1 In March, 2010, DFG changed the name of “CNPS List” or “CNPS Ranks” to “California Rare Plant Rank” (or CRPR). This was done to reduce confusion over the fact that CNPS and DFG jointly manage the Rare Plant Status Review groups (300+ botanical experts from government, academia, NGOs and the private sector) and that the rank assignments are the product of a collaborative effort and not solely a CNPS assignment.

In July 2013, CNPS revised the Rare Plant Ranks in order to better define and categorize rarity in California’s flora. In essence, Rank 2 was split into Rank 2A and Rank 2B to be complementary to the already existing 1A and 1B ranks. This split in Rank 2 plants resulted in five Rank 2 plants moving to Rank 2A (Presumed extirpated in California, but more common elsewhere) and the remaining Rank 2 plants being re-classified as Rank 2B (Rare, Threatened or Endangered in California, but more common elsewhere).

(Includes Rare Plant Ranks 3, 3.1, 3.2, 3.3)

The plants that comprise Rank 3 are united by one common theme--we lack the necessary information to assign them to one of the other lists or to reject them. Nearly all of the plants remaining on Rank 3 are taxonomically problematic.

4: Plants of Limited Distribution - A Watch list
(Includes Rare Plant Ranks 4.1, 4.2, 4.3)

The plants in this category are of limited distribution or infrequent throughout a broader area in California, and their vulnerability or susceptibility to threat appears low at this time. While we cannot call these plants “rare” from a statewide perspective, they are uncommon enough that their status should be monitored regularly. Should the degree of endangerment or rarity of a Rank 4 plant change, we will transfer it to a more appropriate rank or delete it from consideration.

Threat Ranks:
The California Rare Plant Ranks (CRPR) use a decimal-style threat rank. The threat rank is an extension added onto the CRPR and designates the level of threats by a 1 to 3 ranking with 1 being the most threatened and 3 being the least threatened. So most CRPRs read as 1B.1, 1B.2, 1B.3, etc. Note that some Rank 3 plants do not have a threat code extension due to difficulty in ascertaining threats for these species. Rank 1A and 2A plants also do not have threat code extensions since there are no known extant populations of the plants in California.

Threat Code extensions and their meanings:
.1 - Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 – Moderately threatened in California (20-80% of occurrences threatened / moderate degree and immediacy of threat)
.3 – Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Special Lichens

Lichens are not plants, but a symbiotic relationship between a fungus and either green algae or cyanobacteria (aka bluegreen algae).

Many lichen taxa are under-studied and under-surveyed. For this reason, a detailed and cautious approach is taken when a lichen taxa is nominated as a potential species of conservation concern. In particular, special attention is paid to survey efforts and rate of occurrence discovery when deciding whether a lichen is of conservation concern.

There are a few lichens in California for which we have adequate information to place them on our Special Vascular Plants, Bryophytes, and Lichens list. They appear after the bryophytes at the beginning of the list. Lichen statuses are developed in coordination with the California Lichen Society (CALS) and relevant experts. Please visit the California Lichen Society webpage for additional information about sponsoring a lichen of conservation concern (http://californialichens.org/).

Rare Plant Seed Banking

As of July 2014, the CNDDB is including within our database information on whether a particular CNDDB-tracked taxon has been seed banked at an official seed banking institution. The institutions that we currently have information from are: Rancho Santa Ana Botanic Garden, Santa Barbara Botanic Garden, UC Berkeley Botanical Garden, US Department of Agriculture, Berry Seed Bank, Kew Royal Botanic Gardens, and the San Diego Zoo Conservation and Research for Endangered Species (CRES) Native Gene Seed Bank.

The Special Vascular Plants, Bryophytes, and Lichens List now contains a column for whether the taxon has been seed banked (Yes or No). For those with a subscription to the CNDDB, additional information about which institution/organization houses the seed bank, as well as seed bank querying capabilities, are available through RareFind.

CNDDB is providing this seed bank information as a courtesy to our clients for use in their conservation activities. Seed banking is a long-term conservation strategy that can complement the *in situ* protection and conservation of rare plant populations. If a species is seed banked, it does not mean that the species is any less rare or of any less conservation concern. As with all information in CNDDB, this seed bank information should be used with caution. It is essential that anyone who makes a seed collection be aware of seed collection and documentation guidelines. Please see Rancho Santa Ana Botanic Garden's webpage for some additional information on seed collections (https://www.rsabg.org/conservation/seed-conservation).

Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities

In order to facilitate a consistent and systematic approach to botanical field surveys and assessments of special status plants and sensitive natural communities, protocols for surveying and evaluating impacts to these resources have been developed. These protocols were put together by California Department of Fish and Wildlife staff and may be found in the Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities document.

Special Vascular Plants, Bryophytes, and Lichens List

Last updated August 9, 2018

The remainder of this document contains the CNDDB's Special Vascular Plants, Bryophytes, and Lichens List current as of the date on the title page of this document. While the CNDDB and CNPS strive to remain consistent in the taxa we track and the ranks assigned to those taxa, there can be discrepancies usually due to lag time between when a plant species undergoes review in CNPS and when it gets added to the CNDDB. However, all species tracked by CNPS are also tracked by the CNDDB.

For additional information on how CNDDB determines what species to track on our Special Vascular Plants, Bryophytes, and Lichens List, please see the document "How Revisions Are Made to the Special Plants, Bryophytes, and Lichens List" on the CNDDB webpage.

Special Plants

"Special Plants" is a broad term used to refer to all the plant taxa inventoried by the Department of Fish and Wildlife's California Natural Diversity Database (CNDDB), regardless of their legal or protection status. Special Plants include vascular plants as well as high priority bryophytes (mosses, liverworts, and hornworts) and lichens. Special Plant taxa are species, subspecies, or varieties that fall into one or more of the following categories:

- Officially listed by California or the Federal Government as Endangered, Threatened, or Rare;
- A candidate for state or federal listing as Endangered, Threatened, or Rare;
- Taxa listed in the California Native Plant Society's *Inventory of Rare and Endangered Plants of California*;
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Equality Act (CEQA) Guidelines; these taxa may indicate "None" under listing status, but note that all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA;
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- A Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service Sensitive Species/Species of Conservation Concern;
- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California; and

- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g. wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.).

The Special Vascular Plants, Bryophytes, and Lichens List (located at the end of this document) contains taxa that are actively inventoried, tracked, and mapped by the CNDDB (California Rare Plant Rank 1 and 2 plants) as well as taxa which we track but for which we currently only have quad and county level geographic information available to our users (California Rare Plant Rank 3 and 4 plants). For the latter taxa, we maintain site and other information in manual files along with Internet access to the quad and county level information via our CNDDB QuickView Tool.

NatureServe Element Ranking for Plants

All Heritage Programs, including the California Natural Diversity Database (CNDDB) use the same ranking methodology, originally developed by The Nature Conservancy and now maintained and periodically revised by NatureServe. It includes a **Global rank** (G rank), describing the rank for a given taxon over its entire distribution and a **State rank** (S rank), describing the rank for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the subspecies or variety. The next section of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank. Procedurally, state programs such as the CNDDB develop the State ranks and the Global ranks collaboratively among states/provinces containing the species. NatureServe then checks for consistency and logical errors at the national level.

An element rank is assigned using standard criteria and rank definitions. This standardization makes the ranks comparable across organism and political boundaries. NatureServe has developed a "rank calculator" to help increase repeatability and transparency of the ranking process. The three main categories that are taken into consideration when assigning an element rank are rarity, threats, and trends. Within these three categories, various factors are considered including:

- Range extent, area of occupancy, population size, number of occurrences, and number of good occurrences (ranked A or B). Environmental specificity can also be used if other information is lacking.
- Overall threat impact as well as intrinsic vulnerability (if threats are unknown).
- Long-term and short-term trends.

Detailed information on the newest element ranking methodology can be found on the NatureServe Publications webpage.

With the above considerations in mind, refer below for the definitions for G1-G5 and S1-S5. An element's ranking status may be adjusted up or down depending upon the considerations above.

Element Ranking

Global Ranking

The Global rank (G rank) is a reflection of the overall status of an element throughout its global range. Both Global and State ranks represent a letter + number score that reflects a combination of Rarity, Threat and Trend factors, with weighting being heavier on Rarity.

Species or natural community level:

- GX - Presumed extinct
- GH - Possibly extinct; known only from historical occurrences but there is still some hope of rediscovery.
- G1 - Critically imperiled; at very high risk of extinction or elimination due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.
- G2 - Imperiled; at high risk of extinction or elimination due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- G3 - Vulnerable; at moderate risk of extinction or elimination due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- G4 - Apparently secure; at fairly low risk of extinction or elimination due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- G5 - Secure; at very low risk of extinction or elimination due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats.

Subspecies/variety level:

Subspecies/varieties receive a T rank attached to the G rank. With the subspecies/varieties, the G rank reflects the condition of the entire species, whereas the T rank reflects the global situation of just the subspecies or variety. For example: *Chorizanthe robusta* var. *hartwegii* is ranked G2T1. The G rank refers to the whole species range i.e., *Chorizanthe robusta*. The T rank refers only to the global condition of var. *hartwegii*.

State Ranking

The State rank (S rank) is assigned much the same way as the Global rank, but State ranks refer to the imperilment status only within California's state boundaries.

- SX - Presumed extirpated
- SH - Possibly extirpated; known only from historical occurrences but there is still some hope of rediscovery.
- S1 - Critically imperiled; at very high risk of extirpation in the jurisdiction due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2 - Imperiled; at high risk of extirpation in the jurisdiction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- S3 - Vulnerable; at moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- S4 - Apparently secure; at a fairly low risk of extirpation in the jurisdiction due to an extensive range and/or many populations or occurrences, but with possible

cause for some concern as a result of local recent declines, threats, or other factors.

- S5 - Secure; at very low or no risk of extirpation in the jurisdiction due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

Additional Notes on NatureServe Ranks

Other considerations used when raking a species or natural community include the pattern of distribution of the element on the landscape, fragmentation of the population/stands, and historical extent as compared to its modern range. It is important to take an overall view when ranking sensitive elements rather than simply counting element occurrences.

Uncertainty in the exact status of an element can be expressed as range ranks (e.g., G3G4 to express uncertainty as to whether an element is a G3 or G4) and modifiers can be added to some of the ranks to denote questionable taxonomy (e.g., G3Q) or inexact numeric ranks (e.g., S3? to indicate the element is most likely an S3 but there is a significant chance the element could be an S2 or S4). In rare instances where an element is only extant in cultivation or captivity, a “C” modifier can be added to denote that the element is extinct in the wild across its native range but present in cultivation or captivity (e.g., G1C).

California Rare Plant Ranks[1]

1A Presumed extirpated in California and either rare or extinct elsewhere

1B Rare or Endangered in California and elsewhere

2A Presumed extirpated in California, but more common elsewhere

2B Rare or Endangered in California, but more common elsewhere

3 Plants for which we need more information – Review list

4 Plants of limited distribution – Watch list

1A: Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere

The plants of Rank 1A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes those plant taxa that are both presumed extinct, as well as those plants which are presumed extirpated in California and rare elsewhere. A plant is extinct if it no longer occurs anywhere. A plant that is extirpated from California has been eliminated from California, but may still occur elsewhere in its range.

[1] In March 2010, CDFW changed the name of "CNPS List" or "CNPS Ranks" to "California Rare Plant Rank" (or CRPR). This was done to reduce confusion over the fact that CNPS and CDFW jointly manage the Rare Plant Status Review groups (300+ botanical experts from government, academia, NGOs, and the private sector) and that the rank assignments are the product of a collaborative effort and not solely a CNPS assignment.

1B: Plants Rare, Threatened, or Endangered in California and Elsewhere (Includes Rare Plant Ranks 1B.1, 1B.2, 1B.3)

The plants of Rank 1B are rare throughout their range with the majority of them endemic to California. Most of the plants that are ranked 1B have declined significantly over the last century. California Rare Plant Rank 1B plants constitute the majority of plant taxa tracked by the CNDDB, with more than 1,000 plants assigned to this category of rarity.

2A: Plants Presumed Extirpated in California, but More Common Elsewhere

The plants of Rank 2A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes only those plant taxa that are presumed extirpated in California, but that are more common elsewhere in their range. Note: Plants of both Rank 1A and 2A are presumed extirpated in California; the only difference is the status of the plants outside of the state.

2B: Plants Rare, Threatened, or Endangered in California, but More Common Elsewhere (Includes Rare Plant Ranks 2B.1, 2B.2, 2B.3)

The plants of Rank 2B are rare, threatened, or endangered in California, but more common elsewhere. Plants common in other states or countries are not eligible for consideration under the provisions of the Federal Endangered Species Act; however they are eligible for consideration under the California Endangered Species Act. This rank is meant to highlight the importance of protecting the geographic range and genetic diversity of more widespread species by protecting those species whose ranges just extend into California. Note: Plants of both rank 1B and 2B are rare, threatened, or

endangered in California; the only difference is the status of the plants outside of the state.

3: Plants about which we need more information – A Review List (Includes Rare Plant Ranks 3, 3.1, 3.2, 3.3)

The plants that comprise Rank 3 are united by one common theme – we lack the necessary information to assign them to one of the other lists or reject them. Nearly all of the plants remaining on Rank 3 are taxonomically problematic.

4: Plants of Limited Distribution – A Watch List (Includes Rare Plant Ranks 4.1, 4.2, 4.3)

The plants in this category are of limited distribution or infrequent throughout a broader area in California, and their vulnerability or susceptibility to threat appears low at this time. While we cannot call these plants "rare" from a statewide perspective, they are uncommon enough that their status should be monitored regularly. Should the degree of endangerment or rarity of a Rank 4 plant change, we will transfer it to a more appropriate rank or delete it from consideration.

Threat Ranks

The California Rare Plant Ranks (CRPR) use a decimal-style threat rank. The threat rank is an extension added onto the CRPR and designates the level of threats by a 1 to 3 ranking with 1 being the most threatened and 3 being the least threatened. Most CRPRs read as 1B.1, 1B.2, 1B.3, etc. Note that some Rank 3 plants do not have a threat code extension due to difficulty in ascertaining threats for these species. Rank 1A and 2A

plants also do not have threat code extensions since there are no known extant populations of the plants in California.

Threat Code Extensions:

.1 – Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2 – Moderately threatened in California (20-80% of occurrences threatened / moderate degree and immediacy of threat)

.3 – Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Special Lichens

Lichens are not plants, but a symbiotic relationship between a fungus and either green algae or cyanobacteria (also known as bluegreen algae).

Many lichen taxa are under-studied and under-surveyed. For this reason, a detailed and cautious approach is taken when a lichen taxa is nominated as a potential species of conservation concern. In particular, special attention is paid to survey efforts and rate of occurrence discovery when deciding whether a lichen is of conservation concern.

There are a few lichens in California for which we have adequate information to place them on our Special Vascular Plants, Bryophytes, and Lichens list. They appear after the bryophytes at the beginning of the list. Lichen statuses are developed in coordination with the California Lichen Society (CALS) and relevant experts. Please visit the California Lichen Society webpage for additional information about sponsoring a lichen of conservation concern.

Other Status

The status of species on the Special Plants List according to other conservation organizations is provided below.

- **Bureau of Land Management (BLM) Sensitive:** Bureau of Land Management Manual §6840 states that "BLM sensitive species are: (1) species listed or proposed for listing under the Endangered Species Act (ESA), and (2) species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA, which are designated as Bureau sensitive by the State Director(s). All Federal candidate species, proposed species, and delisted species in the 5 years following delisting will be conserved as Bureau sensitive species." See the BLM webpage for California Threatened & Endangered Species for more information.
- **United States Forest Service (USFS) Sensitive:** The USDA Forest Service defines sensitive species as plant and animal species identified by a regional forester that are not listed or proposed for listing under the federal Endangered Species Act for which population viability is a concern, as evidenced by significant current or predicted downward trends in population numbers or density, or significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution. Regional Foresters shall identify sensitive species occurring within the region. More information on California species can be found on the Pacific Southwest Region (Region 5) Plants and Animals site.

Rare Plant Seed Banking

As of July 2014, the CNDDB is including within our database information regarding whether a CNDDB-tracked taxon has been seed banked at an official seed banking institution. The institutions that we currently have information from are: California Botanic Garden (formerly named Rancho Santa Ana Botanic Garden), Santa Barbara Botanic Garden, UC Botanical Garden at Berkeley, US Department of Agriculture, Berry Seed Bank, Kew Royal Botanic Gardens, the San Diego Zoo Conservation and Research for Endangered Species (CRES) Native Gene Seed Bank, and the University of California at Santa Cruz.

The Special Vascular Plants, Bryophytes, and Lichens List now contains a column for whether the taxon has been seed banked (Yes or No). For those with a subscription to the CNDDB, additional information about which institution/organization houses the seed bank, as well as seed bank querying capabilities, are available through RareFind.

CNDDB is providing this seed bank information as a courtesy to our clients for use in their conservation activities. Seed banking is a long-term conservation strategy that can complement the *in situ* protection and conservation of rare plant populations. If a species is seed banked, it does not mean that the species is any less rare or of any less conservation concern. As with all information in CNDDB, the seed bank information should be used with caution. It is essential that anyone who makes a seed collection be aware of seed collection and documentation guidelines. Please see the California Botanic Garden webpage for additional information on seed collections

Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities

In order to facilitate a consistent and systematic approach to botanical field surveys and assessments of special status plants and sensitive natural communities, protocols for surveying and evaluating impacts to these resources have been developed. These protocols were put together by California Department of Fish and Wildlife staff and may be found in the Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities document.

Special Vascular Plants, Bryophytes, and Lichens List

The remainder of this document contains the CNDDB's Special Vascular Plants, Bryophytes, and Lichens List current as of the date on the title page of this document. While the CNDDB and CNPS strive to remain consistent in the taxa we track and the ranks assigned to those taxa, there can be discrepancies usually due to lag time between when a plant species undergoes review in CNPS and when it is added to the CNDDB. However, all species tracked by CNPS are also tracked by the CNDDB.

For additional information on how CNDDB determines what species to track on our Special Vascular Plants, Bryophytes, and Lichens List, please see the documents "How Revisions are Made to the Special Plants, Bryophytes, and Lichens List" and "Rare Plant Data in California: The Cooperative Relationship between the California Natural Diversity Database and the California Native Plant Society" on the CNDDB webpage.

Bryophytes

Scientific Name	Common Name	Element Code	Federal Listing Status	State Listing Status	Heritage Rank	Rare Plant	Other Status	Seed Banked	Records in CNDDB?
Anomobryum julaceum	slender silver moss	NBMUS80010	None	None	G5?/S2	4.2		No	Yes
Bruchia bolanderi	Bolander's bruchia	NBMUS13010	None	None	G3G4/S3	4.2	USFS:S	No	Yes
Bryum chryseum	brassy bryum	NBMUS1A430	None	None	G5/S3	4.3		No	No
Buxbaumia viridis	buxbaumia moss	NBMUS1B040	None	None	G3G4/S2	2B.2	BLM:S USFS:S	No	Yes
Campylopodiella stenocarpa	flagella-like atractylocarpus	NBMUS84010	None	None	G5/S1?	2B.2		No	Yes
Climacium dendroides	tree climacium moss	NBMUS1T020	None	None	G5/S1	2B.1		No	Yes

EXHIBITS (AT END OF TEXT):

Exhibit Sources And Explanatory Notes

Exhibit A: Mineral Resources

Exhibit B: SEAs And Other Resources

INTRODUCTION

The state (1970 and 1971) requires that conservation and open space elements be included in city and county general plans. The latter is to address conservation, protection, development, utilization and reclamation of natural resources. The former is to address the remaining natural and other open space resources. The emphasis of state law is on "natural" resources. Guidelines prepared by the Governor's Office of Planning and Research make clear that subject areas to be addressed by these and other general plan elements often overlap. Jurisdictions are allowed to organize their general plans in accordance with their unique needs and conditions. Los Angeles has opted to place the conservation aspects of open space within its Conservation Element.

In the interim since the adoption of the city's first conservation and open space plans (1973) much has changed. The environmental movement of the 1970s and 80s and concerns about public health, quality of life, environmental protection and other issues spawned laws, court actions and requirements which changed jurisdictional authority and mandated implementation programs to protect natural resources. Consequently, many of the areas to be addressed by the elements are now more fully addressed by other legal requirements and other mandated plans.

This Conservation Element surveys laws, requirements and procedures which have been established for protection of natural resources. It primarily is an informational document which is designed to help readers understand the context, history and opportunities for protection and improvement of the city's natural resources.

The alphabetical topical organization of the element is to assist people in finding information about subjects that relate to their areas of interest. Each topical section includes references to related sections and plans. Given the scope of the topics covered, the element is intended as a general reference, not a comprehensive encyclopedia of information about all related laws and programs.

CHAPTER I: BACKGROUND

PLANNING AREA

The element relates to the entire city of Los Angeles.

DEMOGRAPHICS

The 1990 federal census estimated that the city's population was 3,485,399 individuals.

CALIFORNIA GENERAL PLAN REQUIREMENTS

Mandated elements and zoning. In 1970-71 the State of California required cities and counties to adopt general plan conservation and open space elements by 1973 (Government Code Section 65302). The Los Angeles conservation and open space plans were adopted in 1973. They were deemed by the state to be in compliance with its laws.

The requirements for the conservation and open space elements are among the most detailed and complex of any of the seven mandated elements. The other mandated elements are land use, circulation, housing, noise and safety.

General plan consistency and relationship to other elements. State law recognizes that state requirements regarding the content of one element may overlap the requirements for another. Therefore, it allows the required information to be contained in one element and to be incorporated by reference in another. State law also allows local jurisdictions to organize their general plans in a manner that is appropriate to the jurisdiction and needs, providing that all general plan requirements are met.

All elements and parts of a general plan are required to be integrated, internally consistent and compatible (Government Code Section 65300.5). The Conservation is consistent with all adopted elements of the city's general plan.

Scope of element. State law intends that conservation elements address "conservation, development, and utilization of natural resources including water and hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources." State general plan legislation was amended (1995) to require that preparation of the water portion of the general plan address water and land reclamation, water (including ocean) pollution,

regulation and use of land in stream beds, erosion, watershed protection, flood control and rock, sand and gravel resources.

Open space, as defined by the California Government Code (Section 65560), is "any parcel or area of land or water that essentially is unimproved and devoted to an open-space use," including:

(1) preservation of natural resources, e.g., preservation of flora and fauna (animal habitats), bird flyways, ecologic and other scientific study areas, watershed;

(2) managed production of resources, e.g., recharge of ground water basins or containing mineral deposits that are in short supply;

(3) outdoor recreation, e.g., beaches, waterways, utility easements, trails, scenic highway corridors; and/or

(4) public health and safety, e.g., flood, seismic, geologic or fire hazard zones, air quality enhancement.

Identification, preservation, protection and management of the natural resources is a primary thrust of the state open space and conservation element requirements. As is allowed by state law, Los Angeles has organized its general plan to meet its own particular circumstances and needs. It has opted to incorporate natural open space, agricultural and other open space features of the state's open space requirements into this Conservation Element. The Conservation Element references other city plans that address mandated subjects, including water supply and demand, which is addressed by city water plans and the general plan Infrastructure Systems Element. The Conservation Element primarily addresses preservation, conservation, protection and enhancement of the city's natural resources.

Requirements and related issues addressed by other elements. Conservation and open space subjects that are required or suggested by state law and the Governor's Office of Planning and Research Guidelines, and which are not addressed or only in part by this element, are included in other general plan elements, such as:

-- air quality (Air Quality Element);

-- bicycle paths (Transportation and Open Space elements);

-- equestrian and hiking trails (Public Facilities and Services Element and Open Space Element);

-- electrical energy resources and systems (Infrastructure Systems Element);

-- fire, flood, geologic and seismic hazard (Safety Element);

-- landfills (Infrastructure Systems Element);

-- parks (Public Facilities and Services Element and Open Space Element);

-- rivers and streams (open space aspects by Open Space Element; drainage systems by Infrastructure Systems Elements; flood hazard also by Safety Element);

-- scenic highways (Transportation and Open Space elements);

-- water resources (Infrastructure Systems Element).

Implementation. This element is implemented by the various city regulations and programs described herein, consistent with the implementation requirements of state general plan law (Government Code Section 65400). In addition, some of the above listed elements and individual community plans, which comprise the Land Use Element, address conservation related land use and systems issues.

TECHNICAL REFERENCES. During the preparation of this element the primary sources for technical information were enforcement and resources management agencies. Exhibits were prepared from the planning department's geographic information system (GIS).

FORMAT. Chapter II surveys resources that are to be conserved. It is organized alphabetically according to topic. The table of contents provides subheadings to assist the reader with subject searches. The text includes general historic, legislative and program information, along with cross references to related plans and information sources and a summary of continuing issues that need to be addressed by city government.

The objectives, policies and programs are those that are within the jurisdiction of the City of Los Angeles. Programs related to matters outside the authority of the city are not listed. The element contains a single goal which applies to all topics.

The "General Plan Guidelines" issued by the Governor's Office of Planning and Research (1998) advises that a general plan should contain goals, objectives, policies, programs and implementation monitoring. Goals are described as a general setting of direction, objectives as

intermediate steps in attaining the goal, policies as specific guides to decision making and programs as specific means of achieving the policies. Each policy is to have at least one corresponding implementation measure. The element complies with these guidelines.

CHAPTER II: RESOURCE CONSERVATION AND MANAGEMENT

Topics are addressed alphabetically. The emphasis, in keeping with state law, is on conservation and preservation of natural resources. Facilities and systems, including standards relating thereto, will be addressed by the Public Facilities and Services, Infrastructure Systems or other elements of the general plan.

Goal, objectives, policies and programs (an asterisk * indicates the program lead agency, if any). One goal applies to all sections.

Goal 1: a city that preserves, protects and enhances its existing natural and related resources.

SECTION 1: AGRICULTURAL LANDS

A few parcels of land in the city is deemed significant farmland by the state geologist (Exhibit B), e.g., a significant commercial crop or animal producing site. the largest of these is the Open Space Zone portion of Pierce College (Woodland Hills). Its agricultural use is related to the state community college's educational curriculum.

Until World War II the city was an important center for agriculture in California. Los Angeles was established by Spain in 1781 as an agricultural way station to provide supplies for Spanish military forces. By the time California achieved statehood (1850), the Los Angeles economy was primarily cattle ranches, vineyards, wineries and grain fields. Following statehood, immigrants, mostly from the midwestern and eastern United States, began establishing fruit and vegetable farms. A series of droughts (1864-76) killed thousands of cattle and caused ranchers to subdivide and sell their large holdings for conversion to orchards, vineyards, wineries and vegetable farms. By 1876 the city's economy had shifted from a ranch to a farm economy and sheep raising had been introduced. With the opening of the Los Angeles aqueduct (1913) agricultural uses expanded, particularly in the San Fernando Valley where irrigation turned desert lands into rich farmlands. By World War II Los Angeles was the home of the largest dairy and egg farms in the nation and one of the principal sources for lima beans. New vineyards and wineries, citrus groves and fruit orchards continued to be established.

City planners were so confident that agriculture would remain a permanent part of the city's economy that they planned (1944) new Valley urban centers surrounded by agricultural lands. The plan was radically changed when the county tax assessor reassessed the Valley farmlands to "higher" uses, envisioning the need for housing to

accommodate the rapidly growing population. By the time the city's new zoning ordinance was adopted to implement the plan (1947), farmers already were selling their holdings and moving their businesses outside the city. Zone changes and subdivisions rapidly transformed farmlands into residential tracts to provide homes for workers in the burgeoning aeronautics and other industries that were established during and following World War II.

Between the 1940s and 1960s the Los Angeles economy shifted from an agricultural to an industrial and commercial economy. Today only the Pierce College parcel remains. The college master plan, approved in 2000, designates the parcel for agricultural and related uses.

Conclusion. The largest significant agricultural site in the city is within Pierce College. Reuse of the site is under consideration by the state, which owns the property.

Continuing issue: potential conversion of the Pierce College agricultural resource site to other uses.

Agricultural lands objective, policy and program:

Objective: retain in agricultural use, as appropriate, the last state-designated significant agricultural parcel within the city, the Pierce College parcel.

Policy: continue to work with the college and neighbors to encourage the retention of the parcel in agricultural use for educational and related purposes, which are compatible with neighboring uses.

Program: periodic Canoga Park-Winnetka-Woodland Hills Community Plan review and revision.

Responsibility: *Department of City Planning.

For related information see: Animal Keeping, Nurseries, Crop Gardens Section.

SECTION 2: ANIMAL KEEPING, NURSERIES, CROP GARDENS

Some lands, mostly in the San Fernando Valley, are zoned for agricultural or animal keeping uses and are improved with small garden plots and/or animal oriented uses (e.g., equine boarding, petting zoos, private animal keeping). These uses and the equine trail systems help preserve the historic rural character of sections of the city. Commercial nurseries still exist throughout Los Angeles. Through planning and infrastructure decisions, Los Angeles has encouraged

establishment and retention of rural uses. For example, small parcels of public land have been formally or informally opened for neighborhood gardens tended by local residents; special overlay districts and equine oriented parks and trails have been established to encourage equine uses; and power system rights-of-way and other public lands have been leased for nurseries.

Continuing issue: loss of the last remaining animal keeping, nursery and crop gardening uses.

Animal keeping, nurseries, crop gardens objective, policy and program:

Objective: retain, to the extent feasible, the last remaining agricultural features of the city as part of the city's heritage and economy.

Policy: continue to encourage the retention of parcels in agricultural and low density land use and zoning categories that will encourage their retention in agricultural and related uses.

Program: community plan review and revision.

Responsibility: *Department of City Planning.

For related information see:

N Agricultural Lands Section and

N Equine Areas Section.

SECTION 3: ARCHAEOLOGICAL AND PALEONTOLOGICAL

Archaeological. Pre-historic and historic archaeological sites exist throughout the city. Hunter-gatherer Indians inhabited the Los Angeles region long before Europeans arrived. Remnants of their various cultures continue to be unearthed and documented. The oldest find is the partial skeleton of La Brea Woman, among the oldest human bones ever found in California. She is believed to have been buried approximately 9,000 years ago. Her grave became engulfed in tar and was discovered in 1914, during an excavation for tar ("brea") in what is now called La Brea Tar Pits in the Wilshire community.

Site protection. Various federal, state and local regulations have been promulgated to protect archaeological sites and resources. Although the state general plan law calls for mapping of the sites, all mapping of pre-historic sites is confidential, pursuant to California Government

Code Section 6254.10. This is to protect sites from disturbance, scavenging and vandalism.

The federal Archaeological Resources Protection Act of 1979 (Public Law 96-95) protects archaeological resources and sites on federal and Indian lands, including requirements for issuance of permits by federal land managers to excavate or remove archaeological resources. The Native American Graves and Repatriation Act (1990) and the Native American Heritage Act (1984 and 1992) provide guidelines for protection of Native American remains and artifacts.

The California Environmental Quality Act (CEQA) provides guidelines for identification and protection of archaeological sites and artifacts as a part of local development permit processing. CEQA guidelines define an archaeological resource as "significant," i.e., to be protected if: (1) it is associated with an event or person of recognized significance to California or American history or of recognized scientific importance in pre-history, including culturally significant Native American sites; (2) it can provide information that is of demonstrable public interest and is useful in addressing scientifically consequential and reasonable archaeological research questions; (3) it has a special or particular quality, such as the oldest, best, largest or last surviving example of its kind; (4) it is at least one hundred years old and possesses substantial stratigraphic integrity; or (5) it involves important research questions that historical research has shown can be answered only with archaeological methods.

If it is determined that a development project may disrupt or damage such a site, the project is required to provide mitigation measures to protect the site or enable study and documentation of the site, including funding of the study by the applicant. The city's environmental guidelines require the applicant to secure services of a bona fide archaeologist to monitor excavations or other subsurface activities associated with a development project in which all or a portion is deemed to be of archaeological significance. Discovery of archaeological materials may temporarily halt the project until the site has been assessed, potential impacts evaluated and, if deemed appropriate, the resources protected, documented and/or removed.

Under CEQA, discovery of human remains requires evaluation by the county coroner of the nature of the remains and cause of death. If the remains are determined to be of Native American origin, the Native American Heritage Commission is asked to determine the descendants who are to be notified or, if unidentifiable, to establish procedures for burial.

The state-designated repository in the Los Angeles area for archaeological data is the South Central Coastal Information Center. Reports concerning archaeological investigations are to be filed with the center. Other academic institutions, research facilities and museums in the area also have archaeological resource information and expertise.

Paleontological. Los Angeles is rich in paleontological sites. Fossils have been found mostly in sedimentary rock that has been uplifted, eroded or otherwise exposed. Most of the sites are in local mountains. However, the best known and most abundant fossil resource are La Brea Tar Pits, which are owned and operated by the County of Los Angeles. They are within and surround the 23-acre Hancock Park, which includes an art museum and the Page Museum (tar pit related displays and activities). The tar pits have provided an abundance of animal and plant fossils. Most are from the Pleistocene epoch (Ice Age) and date as far back as 40,000 years. Finds include mammoths, saber-tooth cats, insects and birds.

Site protection. Pursuant to CEQA, if a land development project is within a potentially significant paleontological area, the developer is required to contact a bona fide paleontologist to arrange for assessment of the potential impact and mitigation of potential disruption of or damage to the site. If significant paleontological resources are uncovered during project execution, authorities are to be notified and the designated paleontologist may order excavations stopped, within reasonable time limits, to enable assessment, removal or protection of the resources. For Los Angeles city and county, the Los Angeles County Museum of Natural History, including the George C. Page Museum, provides advice concerning paleontological resources.

Conclusion. The city has a primary responsibility in protecting significant archaeological and paleontological resources.

Continuing issues: loss of or damage to archaeological and paleontological sites due to development, unauthorized removal and vandalism.

Archaeological and paleontological objective, policy and program:

Objective: protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.

Policy: continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are

identified during land development, demolition or property modification activities.

Program: permit processing, monitoring, enforcement and periodic revision of regulations and procedures.

Responsibility: departments of *Building and Safety, *City Planning and Cultural Affairs and/or the *lead agency responsible for project implementation.

For related information see: Cultural and Historical Section.

SECTION 4: CONSERVATION

Conservation is the managed or controlled use of natural, cultural and historical resources. In Los Angeles it includes a diversity of programs, including acquiring, preserving and protecting large tracts of open space for habitat conservation, species protection, watershed maintenance and other purposes; acquiring, preserving and protecting cultural and historical resources; reducing the demand for nonrenewable mineral and petroleum resources, water and other natural resources; recycling water, wood products, metals, glass and other materials. Conservation is addressed by various sections of this element in relation to particular subject matter.

SECTION 5: CULTURAL AND HISTORICAL

The city's form, institutions and culture have been shaped by a diversity of events, individuals and groups and the city's environmental setting. Modern cultural history of Los Angeles dates to the establishment of the pueblo (town) in 1781 by a Spanish expedition which originated in Sonora of Lower California (now Mexico). With the establishment of the Republic of Mexico (1821) Los Angeles came under Mexican rule. From 1847 to 1850 it was occupied by United States military forces. In 1850 California became a state of the United States and Los Angeles became a U.S. city. A combination of the gold rush and the opening of California spurred immigration, mostly by settlers from the midwest and eastern United States. Population growth continued almost unabated until the 1970s. Settlers, merchants and imported workers brought new cultural traditions or reinforced old traditions. Today over 100 languages and dialects are spoken in the local schools, over 42% of the population is of Hispanic origin, over 12% of African American origin, slightly under 10% of Asian and Pacific Islander origin and one percent is Native American.

To identify, protect and preserve historic sites and structures for the enrichment of future generations various city, state and federal

procedures have been promulgated. The most significant for Los Angeles are described in the following. The general plan Historic Preservation and Cultural Resources Element will address historic and cultural protection issues in greater detail.

Conservation and protection. Five types of historic protection designations apply in the city: (1) Historic-Cultural Monument designation by the city's Cultural Heritage Commission and approved by the City Council; (2) placement on the California Register of Historical Resources or (3) the National Register of Historic Places (1980 National Historic Preservation Act); (4) designation by the Community Redevelopment Agency (CRA) as being of cultural or historical significance within a designated redevelopment area; and (5) classification by the City Council (recommended by the planning commission) as an Historic Preservation Overlay Zone. Designations help protect structures and support rehabilitation fund requests.

The California Environmental Quality Act (CEQA) also protects significant cultural and historic resources. CEQA was revised in 1998 to redefine "historic resource" to include resources that are presumed to be significant, unless the preponderance of evidence is to the contrary. A property no longer must be designated officially as a landmark or of historic importance to be considered under CEQA review. The lead agency for permit processing may deem properties not formally listed and not included in historic surveys as "historically significant," if they meet criteria for listing in the California Register.

Under the city's CEQA guidelines, an environmental assessment must be prepared for any proposed demolition, destruction or significant modification of an Historic-Cultural Monument or resource listed on the national or state registers, or on the CRA list, or cited as a proposed historical resource by a community plan or historic preservation overlay zone survey, or which are over 50 years old and are substantially intact examples of an architectural style important in Los Angeles or are associated with an architect or other person of importance in Los Angeles history. Under the 1998 amendment, buildings less than 50 years old may also be considered.

Historic-Cultural Monuments. In 1962, at the request of the Los Angeles Chapter of the American Institute of Architects, the city drafted and approved an ordinance designed to protect and/or identify architectural, historical and cultural buildings, structures and sites of importance in the city's history and/or cultural heritage. In the intervening 30 years the Cultural Heritage Commission (CHC) has designated almost 700 sites as Historic-Cultural Monuments.

The list of the designated sites is maintained by the CHC. It includes historic buildings, corridors (tree lined streets) and geographic areas. In some instances plaques have been erected on sites of historic events or former structures that were of cultural or historic significance. Sites are mapped on the city's zoning maps to guide permit processing. The building department will not issue permits for modification of a designated monument unless authorized to do so by the CHC, which may impose conditions of permit approval.

Additional protections apply to structures or sites that are listed on the state or national registers. The National Park Service administers the National Register of Historic Places and the California Office of Historic Preservation administers the state register. Criteria applied to determine qualification for the registers includes context (importance to an historic theme, place, time), integrity (location, design, setting, workmanship, materials) and, if a recent resource, exceptional importance.

The Community Redevelopment Agency maintains a list of buildings and structures of historical significance for purposes of project planning and evaluating neighborhood improvement proposals.

Historic Preservation Overlay Zones (HPOZ). The HPOZ provision of the zone code, Los Angeles Municipal Code (LAMC) Section 12.20.3, was adopted in 1979; amended 2001. It contains procedures for designation and protection of areas that have structures, natural features or sites of historic, architectural, cultural or aesthetic significance. Fourteen areas of the city are classified as HPOZs and twelve other areas are under study. HPOZ areas contain significant examples of architectural styles characteristic of different periods in the city's history. They may be a few blocks or a few square miles in area.

Property owners are encouraged to make property improvements that will enhance the historic character of the HPOZ area. Neighbors often join together to secure period street lights and other features that will contribute to historic and cultural emphasis. Alleys may be converted to park-like uses or street signs or circulation modified to support the HPOZ area goals. Street fairs and other activities generate community involvement and general public awareness of the unique area and help raise funds for neighborhood and property improvement.

A consultant to the planning department prepared (1997) a general survey of all pre-1950s structures within five community plan areas of the city. It provides a primary data resource for establishing future HPOZ areas and for guiding public and private efforts to preserve individual structures. The consultant also prepared a computerized survey, including digital photos, of historic structures within the

Highland Park HPOZ. Using the same techniques, staff are preparing similar surveys for other HPOZ areas. The data is used to assist city personnel and citizen design review boards in evaluating proposed projects and building modifications and to help them assess trends and devise preservation strategies.

Conclusion. The city has primary responsibility for identifying and protecting its cultural and historical heritage.

Continuing issues: loss of significant, important or contributory cultural and historical sites and structures to neglect, site redevelopment or damage.

Cultural and historical objective, policy and programs:

Objective: protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.

Policy: continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition or property modification activities.

Program 1: development permit processing, monitoring, enforcement and periodic revision of regulations and procedures.

Responsibility: departments of *Building and Safety, *City Planning, *Cultural Affairs and *Community Redevelopment Agency and/or the *lead agency responsible for project implementation.

Program 2: prepare the Historic Preservation and Cultural Resources Element of the general plan.

Responsibility: departments of *City Planning and Cultural Affairs.

Program 3: continue to survey buildings and structures of any age in neighborhoods throughout the city in order to develop a record that can be used in the present and future for evaluating their historic and cultural value as individual structures and within the context of surrounding structures.

Responsibility: departments of Building and Safety, *City Planning, and *Cultural Affairs and the *Community Redevelopment Agency.

Program 4: continue to establish Historical Preservation Overlay Zones throughout the city.

Responsibility: departments of Building and Safety, *City Planning and Cultural Affairs and the Community Redevelopment Agency.

SECTION 6: ENDANGERED SPECIES

Without protection of habitats suitable for species propagation, entire species of native plants and animals gradually will decline or become extinct. A couple of hundred plants and animals that live in Los Angeles habitats are listed on the federal and/or state endangered, threatened or species of special concern lists. Within the Santa Monica Mountains National Recreation Area alone 26 plants and animals are classified as rare, threatened or endangered and 58 more have been placed on the list of species of special concern by the National Park Service. Within the city more than 180 plant and animal species are listed by the Environmental Affairs Department for the city as a whole.

Definitions:

Endangered species. In danger of extinction throughout all or a significant portion of their range.

Sensitive species. All the plant and animal species classified as endangered, threatened, rare or of special concern.

Threatened species. Likely to become an endangered species in the foreseeable future.

Species of special concern. Rare, very restricted distribution, declining or at a critical life cycle stage when residing in California.

Species protection. Under the federal Endangered Species Act of 1973 (Public Law 93-205, 16 United States Code 1531 et seq.) the Secretary of the Interior or Secretary of Commerce determines which species are to be listed on the endangered or threatened species registers. Any species on these lists is protected. The current registries are available from the U.S. Fish and Wildlife Service which also maintains lists of sensitive species and species of special concern. Some of the animal species are further protected through international treaties, such as the migratory bird treaties that have been signed between the United States and Canada, Mexico and Japan and the Migratory Bird Treaty Act, which is administered by the U.S. Fish and Wildlife Service. The latter protects all common wild birds except house sparrows, starlings, feral pigeons and resident game birds. Under this act it is unlawful to kill, capture, collect, possess, import or export any migratory bird or items associated with them, such as feathers, parts, nests and eggs, except by permit for scientific purposes, falconry, Native American ceremonial purposes or taxidermy.

Under the California Endangered Species Act (Fish and Game Code, Division 3, Chapter 1.5) the California Fish and Game Commission establishes endangered and threatened species lists and lists of species classified as "of special concern."

The California Native Plant Protection Act (NPPA) prohibits the taking, import or sale of rare, threatened or endangered plant species, except as exempted by the act. Even where exceptions apply, where the Department of Fish and Game (DFG) has notified a property owner of the presence of such a plant, the property owner must notify the DFG before destroying the plant. This provides an opportunity for the state to salvage the plant.

With the passage of the National Environmental Policy Act (NEPA) in 1969, protection of significant features of the natural environment was mandated. NEPA applies only to projects in which federal funds are involved or where a major federal permit is required. The California Environmental Quality Act (CEQA) of 1970 established environmental protection procedures for processing land development projects within

the state. It provides the primary local means of identifying and protecting species listed in any of the sensitive species categories; protecting local species diversity and numbers; and evaluating potential impacts on and protecting habitats, wildlife dispersal and migration corridors.

If a protected species is identified as potentially impacted by a proposed development project, the developer is required by CEQA to provide protection of the species. Protection may involve project design to avoid disturbing, damaging or destroying the habitat; acquisition of all or part of the site by an environmental conservation or governmental agency for purposes of resource management; agreement to contribute to the protection of a habitat at another site; or some other mitigation measure. The DFG and/or U.S. Fish and Wildlife Service, often with the assistance of local environmental conservation organizations, works with the developer and city to devise a mitigation plan.

Protection/propagation enhancement programs. A few examples of sensitive species protection and propagation enhancement programs that exist within the city are described below.

Belding's Savannah Sparrow. The endangered sparrow lives in the Ballona wetlands. The Playa Vista development project mitigation measures include restoration of the wetlands. Restoration will include increasing the flow of water which will enhance the survival and growth of pickleweed upon which the sparrow depends for foraging, breeding and perching.

California condor and other endangered captive species. Zoos, including the Los Angeles Zoo, have joined with other organizations in efforts to research and carry out programs for propagation of endangered species, some of which no longer exist in the wild. For example, the Los Angeles and San Diego zoos have joined with the Peregrine Fund and U.S. Fish and Wildlife Service in a condor breeding program. The program includes mating of birds in captivity, hatching eggs, raising young condors, releasing captive birds into local mountain ranges, monitoring their survival, and evaluating carcasses of dead condors to assess how to better protect them in the wild.

California Least Tern. The endangered terns nest at two sites within the city, on the Venice Beach and within the Los Angeles Harbor. Both sites are restricted to public access during nesting season. It is estimated that the breeding pairs at the Venice beach site have increased from 165 pairs to 375 pairs since 1988.

California native oaks. The only plant group specifically protected by city ordinance is native oaks. The ordinance prohibits destruction of the Valley oak (Quercus lobata) and California live oak (Quercus agrifolia) and any tree of the oak genus indigenous to California which measures eight inches or more in diameter four and one-half feet above the ground (Ordinance No. 153,478). It excludes scrub oaks (Quercus dumosa aka Quercus herberidifolia) and nursery grown oaks. The Department of Public Works enforces the ordinance. The Department of City Planning may authorize removal or relocation relative to subdivision permits. Public works, as the primary enforcement agency, has the authority to authorize relocation or removal under certain circumstances, such as public endangerment.

El Segundo Blue butterfly. The largest known population of the endangered butterfly is located in a portion of El Segundo Dunes, which lie west of the Los Angeles International Airport. The butterfly was threatened with extinction due to urban encroachment, including homes and introduction of non-native plants that threatened to eliminate the buckwheat and other native vegetation on which the butterfly thrives. Two preserves were created on airport and Chevron refinery lands in the 1980s. The sites are restricted from general public access. They have been cleared of much of the introduced vegetation and replanted, resulting in a regeneration of the native plants. The airport department estimates that the butterfly population on its property has increased from 500 to between 40,000 and 50,000 El Segundo Blues since 1985. The figure fluctuates annually depending upon the weather and growth of the plants on which the blues depend.

Conclusion. The city has a primary role in protecting endangered and other at risk plant and animal species.

Continuing issues:

N Loss of native species unique to the Los Angeles environs.

N Loss of sensitive species.

N Loss of habitats that contribute to the healthy propagation of unique native and migratory species.

Endangered species objective, policies and programs (see also Habitats Section):

Objective: protect and promote the restoration, to the greatest extent practical, of sensitive plant and animal species and their habitats.

Policy 1: continue to require evaluation, avoidance, and minimization of potential significant impacts, as well as mitigation of unavoidable significant impacts on sensitive animal and plant species and their habitats and habitat corridors relative to land development activities.

Program: Permit processing, monitoring, enforcement and periodic revision of regulations and procedures.

Responsibility: departments of *Building and Safety and *City Planning, Environmental Affairs and the *lead agency responsible for city project implementation.

Policy 2: continue to administer city-owned and managed properties so as to protect and/or enhance the survival of sensitive plant and animal species to the greatest practical extent.

Program 1: environmentally sensitive property management.

Responsibility: *agencies responsible for property management, especially the departments of Airports, Harbor, Public Works and Recreation and Parks, and Water and Power.

Program 2: local, state and international endangered species protection, propagation and survival enhancement programs.

Responsibility: *Los Angeles Zoo and *agencies that participate specific programs (e.g., departments of Airports and Harbor).

Policy 3: continue to support legislation that encourages and facilitates protection of endangered, threatened, sensitive and rare species and their habitats and habitat corridors.

Program: City legislative program.

Responsibility: *Mayor and *City Council (and City Legislative Analyst).

For related information see: Habitats Section.

SECTION 7: EQUINE AREAS

One of the unique features of highly urbanized Los Angeles is its equine areas, which are located mostly on the fringes of the San Fernando Valley and Santa Monica Mountains, where there is access to mountain trail systems. Horsepower was the primary means of locomotion until the early part of the 20th century when automotive and rail

transportation rapidly transformed Los Angeles from a rural to an urban economy. Ranches and farmlands disappeared. Equine routes were paved or abandoned. Equines for work uses gave way to equines for show, film, recreational, therapeutic and educational purposes. Throughout the century the number and size of equine keeping areas continued to shrink until they were threatened with extinction, largely due to encroachment from development, especially development of non-animal keeping residential projects.

Zoning/K supplemental use district. To protect the equine uses and to encourage establishment of new uses, equines (horses, donkeys, mules) were specifically permitted by right on lots zoned for agricultural uses and on certain large lot (17,500 square feet or more) residential uses. However, zoning and county health code regulations contributed to a continuing loss of equine uses. The laws were intended to protect non-equine residential uses from animal impacts, e.g., odor, dust, health and safety concerns.

To reduce the impact of health code regulations on existing equine uses, the 'K' Equinekeeping District enabling provisions (LAMC Section 13.05) were enacted (1964). The intent of the K District supplemental use designation is to better protect existing equine areas and to encourage establishment of new equinekeeping areas. The provisions have been amended many times to strengthen equine protection and make it easier to establish K Districts. Less restrictive land use regulations apply to lots in K Districts than to those in non-K areas. A new district can be as small as five acres and may include several contiguous ownerships. For current K Districts see Exhibit B.

Today equine uses have recognized rights vis-a-vis residential uses and improved dust control and odor technology enables them to be more compatible with residential uses. Prior to the 1970s, health and other regulations required that equine uses be moved 75 feet from dwellings, even if they were established prior to the dwelling. If the equine use could not be moved, it was terminated. Forced termination threatened the viability of some K Districts and eliminated many other equine uses.

In the 1970s zoning laws were changed to protect legally established equine uses from encroachment. Equine uses in K Districts may remain and the use may be modified if a dwelling is located between 75 and 35 feet of the equine use. In non-K Districts a legal equine was permitted to remain but became nonconforming. Nonconformity limits modification of the equine use.
In 1986 discretionary permits were required for dwellings proposed for location closer than the health department's 35-foot limit to a legal equine use. A zoning administrator must consider the hardship to both

the dwelling and the equine use properties; whether either can be relocated. If the zoning administrator permits the dwelling to be built closer than 35 feet to the equine use, the equine use must move or be terminated.

Trails. There are over 90 miles of equine trails within the city. Riding trails, especially around the north rim of the San Fernando Valley and in and around the Santa Monica Mountains reinforces the existing equine uses and makes their expansion more viable. Careful planning and maintenance of equine trails is important for the protection of the watershed and natural environments.

New subdivisions within a K District typically are required by decision makers to provide equestrian trails, as are subdivisions that are proposed adjacent to equinekeeping uses and the Rim of the Valley Trail Corridor. However, this requirement is discretionary. Sometimes the development's homeowners' association is required to maintain the trails or volunteer groups arrange to maintain trails. Sometimes the Department of Recreation and Parks accepts responsibility for trail upkeep, provided the land developer pays an initial maintenance fee. Usually the fee is insufficient to pay for long term maintenance and repair of the trails, thereby placing a financial burden on the city.

"Guide to Existing and Potential Equestrian Trails" (adopted 1977, revised 1991) guides trail and equine area development and protection in the northwest San Fernando Valley. Equine trails will be more fully addressed by the Open Space Element of the general plan. In addition, some of the community plans identify equine areas and trails and contain equine policies.

Equine oriented parks. Some city parks have equine oriented trail features, such as rest areas with hitching posts and watering troughs. Griffith Park has 54 miles of riding trails, a pony ring and an 80 acre Equestrian Center. The Center has been the site of important local, national and international events, including the 1984 Olympic Games and 1995 World Cup Dressage. It has a 4,300 seat covered arena, several uncovered arenas, training facilities, 520 boarding stalls and related facilities. Stetson Ranch Park in Sylmar is an equine oriented park with two equestrian rings. Hansen Dam in Lake View Terrace is crisscrossed by riding trails and has a 40 acre equestrian center with 17 arenas and several hundred boarding stalls. Orcus Park near Hansen Dam was converted to an equestrian park in 1999 and renamed Gabrielino Equestrian Park. It has staging areas and parking for recreational vehicles with overnight use by groups allowed by reservation. All of these city parks are linked by trails to the Angeles National Forest and Rim of the Valley Corridor trail systems. The Hansen Dam and

Griffith Park equestrian centers are managed by private operators, through leases with the Department of Recreation and Parks.

Equine population. The number of licensed equines has remained fairly stable during recent years. The annual license fee goes into the Equestrian Facilities Trust Fund for acquisition, construction and maintenance of equine trails and facilities on City properties. It is estimated that less than a third of all equines stabled in the city are licensed. In 1996-97 the Department of Animal Regulation issued 1,622 equine permits; 1,505 in 1997-98; and 1,695 in 1998-99. Most of the equines are boarded privately. Some are stabled in one of 52 private boarding stables, most of which are in the San Fernando Valley. In addition, equines stabled in the immediate environs utilize the city's equine trails and facilities. The largest concentration (approximately 1,500 equines) is located north of Griffith Park in Burbank and Glendale.

Conclusion. The city has a primary role in encouraging and enabling the retention and expansion of equine uses.

Continuing issues:

N Loss of equine sites due to change in use and encroachment.

N Lack of city standards for equine trail dedication, development, maintenance, safety and protection of the environment.

N Lack of city funds to maintain existing trails that are within the city's responsibility.

N Funding to accelerate the implementation of the Rim of the Valley Corridor and other trail and facility systems before opportunities are lost to acquire land for connecting trails and systems.

N Safe interface of trails with city streets.

Equine areas objective, policies and programs:

Objective: retain equine oriented uses as a part of the city's heritage and for recreational, educational and economic purposes.

Policy 1: continue to encourage the establishment of new equine uses and K districts and to protect existing significant areas from encroachment.

Program 1: designation of equine oriented policies, areas, trails and related information in community plans.

Responsibility: departments of *Building and Safety and *City Planning.

Program 2: as a part of community plan and/or other city plan preparation, identify equinekeeping areas that would be suitable for new K Districts and recommend that the City Council or planning commission initiate said districts.

Responsibility: departments of Animal Regulation, *City Planning, and Recreation and Parks.

Program 3: periodic review and revision of the equine provisions of the Los Angeles Municipal Code.

Responsibility: departments of *Animal Regulation, *City Planning, and *Recreation and Parks.

Policy 2: establish standards and procedures for a comprehensive equine trail system, similar to the bikeways system, including provisions for protection of watershed and natural environments.

Program: with the assistance of a citizen-technical advisory committee, develop requirements, guidelines, standards and procedures for equine trail dedications and maintenance and prepare a trail system plan.

Responsibility: departments of Animal Regulation, *City Planning, Public Works, *Recreation and Parks, and Transportation.

Policy 3: continue to expand and maintain trail linkages which will reinforce the viability of equine uses.

Program 1: street dedication, improvement and maintenance.

Responsibility: departments of *City Planning, *Public Works, Recreation and Parks and *Transportation.

Program 2: city park and cooperative trail development and linkage programs.

Responsibility: departments of City Planning, Environmental Affairs, and *Recreation and Parks.

Policy 4: continue to increase funding for equine trails and facilities acquisition, construction, maintenance and equine related city activities.

Program: exploration and development, with the assistance of private equine interests, of potential funding sources for equine related facilities and activities.

Responsibility: departments of *Animal Regulation, Office of Administration and Resource Services, *Recreation and Parks, other agencies as appropriate.

For related information about trails see:

N Community plans of the Los Angeles City General Plan, Los Angeles Department of City Planning (especially for communities in the north San Fernando Valley).

N "Guide to Existing and Potential Equestrian Trails," Los Angeles Department of City Planning, revised February 1991.

N "Major Equestrian and Hiking Trails Plan, an Element of the Master Plan of the City of Los Angeles," Department of City Planning and Department of Recreation and Parks, 1968.

N "Open Space Element," Los Angeles City General Plan (under preparation).

SECTION 8: EROSION

Wind, water and human activity cause erosion of land surfaces. Erosion can result in the loss of valuable ground surface materials, depositing them into basins and the ocean, and can result in the reduction in air quality due to wind carried dust. Erosion, especially water erosion, can damage the watershed and contribute to hillside instability and flooding. Following brush fires, the threat of erosion is great due to loss of ground cover.

Inland erosion. Since 1952, when Los Angeles became the first city in the nation to regulate hillside grading, the city has promulgated regulations that enable evaluation of slope stability and imposition of mitigation measures. The building code (LAMC Sections 91.700 et seq.) and Specific Plan for the Management of Flood Hazards (Ordinance 172,081) regulate grading, excavations, landfill and other construction activities that might cause or be impacted by slope or ground instability, erosion or flooding. Other development permits, such as subdivision permits, for projects on hillsides or in unstable areas

typically contain conditions for mitigation of potential slope instability and erosion, including slope reinforcement, planting, irrigation and drainage requirements. To hold the soil and protect watersheds from erosion following major brush fires, federal or state agencies sometimes seed denuded areas with wild plant seeds which rapidly germinate. However, such seeding may introduce plants which damage the local ecological balance and may increase brush density. Some botanists recommend no seeding and, instead, reliance on the natural regeneration of existing plants, some of which are assisted in their germination by fire conditions.

Beach erosion. Beaches within the boundaries of the city include Will Rogers and Dockweiler state beaches and Venice beach. City beaches are leased to Los Angeles county. The county maintains them and their related facilities and provides life guards and other services. Beaches are part of the ocean related ecological system. In addition, they provide a buffer which protects coastal areas and infrastructure (e.g., adjacent neighborhoods and streets) and they are a prime recreational and visual attraction for tourists and local residents. The loss of beaches could have a direct impact on the ecosystem, safety and the economy.

Los Angeles is affected by seasonal storms, generally between October and April. The storms can dump several inches of rain in a few hours. A 100-year capital storm can drop as much as 24 inches within 24-hours. Storms wash the land and carry debris, sediments, waste and other matter to the ocean. Over the millennia changes in river courses and geologic structures have resulted from earthquakes, erosion and other natural phenomenon. These natural actions have changed the shape and character of the coastline. They continue to operate but, in some cases, human activity has interceded to contain, redirect or redefine the coastline and natural events in ways that have impacted the beaches.

Apart from the flood control system, probably the most significant human intervention was the development of the Los Angeles-Long Beach harbors in the San Pedro Bay. In 1891 the U.S. Congress selected the bay as the site for a deep water port to serve southern California. The U.S. Army Corps of Engineers completed the port in 1914. Construction and expansion of the port and creation of the adjoining port at Long Beach required dredging of existing sediments, creation of new land forms and beaches and installation of structures within the bay. These activities caused significant changes in the ecology of the bay and adjacent coast. The initial channeling of the Los Angeles River (1921) was to divert water away from the harbor to protect it from flood damage. Channeling local rivers and streams and capturing sediments

before they reached the ocean reduced replenishment of ocean sediments and modified natural erosion and sedimentation patterns.

Harbor dredging and other development created and eroded beaches by changing tidal patterns or adding sand that created new beaches or replenished existing beaches. For example, in 1928 more than one million cubic yards of sand was dredged from the harbor and used to create what became Cabrillo Beach in San Pedro.

In the 1930s, the engineering bureau's hydraulic research laboratory evaluated sand migration in order to identify causes of erosion which were damaging roads and public systems. The study concluded that the primary cause of beach erosion was breakwaters and other army corps projects that had modified wave action along the coast. Flood control and drainage projects blocked the natural discharge of sediments into the ocean, virtually eliminating the natural replenishment of beach sands. Dredging removed sediments from the migration stream. Mitigation of beach erosion eventually was recognized by the federal government as being beyond the expertise, resources and authority of local jurisdictions.

Beach erosion management. An Act For the Improvement and Protection of the Beaches Along the Shores of the United States was enacted by Congress in 1936. It provided funding for federal construction of facilities to prevent coastal erosion in areas where federal interests were involved. The 1946 the Shore Protection Cost Sharing Act (Public Law 79-727) provided for up to one-third federal cost sharing for construction of shore protection projects on publicly-owned lands. But more was needed. By 1956 beach erosion was so endemic to large bodies of water within the United States that Congress placed the army corps in charge of beach erosion management in an effort to establish more comprehensive oversight. In 1962 the River and Harbor and Flood Control Act (PL 87-874) provided for the federal government to pay up to 70% of the beach erosion and shore protection construction costs.

The 1986 Water Resources Development Act (WARDA; PL 99-662) recognized hurricane and storm damage reduction and recreation as the primary purposes of beach erosion control projects. A 1996 amendment to WARDA added environmental restoration. WARDA is reenacted every two years. It delegates beach erosion management, in part, to the U.S. Army Corps of Engineers. WARDA provides federal cost sharing up to 65% and provides federal participation in periodic renourishment projects for up to 50 years, when protective dunes or sacrificial sand is employed to protect against storm and wave damage.

With reduction of beach renourishment funding in the mid-1990s, the beach erosion management program was severely curtailed. Migration of

sand and lack of sand replenishment has resulted in the virtual disappearance of some beaches in California. To address the issue, the American Coastal Coalition was formed to lobby for fund reinstatement and acceleration of beach renourishment programs. The coalition is comprised of representatives of coastal jurisdictions, including the Los Angeles County Beaches and Harbors Department, and interested groups throughout the nation. The county has initiated efforts to involve local jurisdictions in coalition activities which will help protect and renourish local beaches.

Conclusion. Although the city does not have primary jurisdiction over beach management, it has primary responsibility over dredging and construction in the harbor and land use actions on shore that can affect sedimentation patterns and result in erosion or replenishment of beaches. In addition, the city can lobby for state and federal legislation and programs that will protect beaches.

Continuing issues:

N Erosion of hillsides resulting in loss of natural watershed and features, flooding and endangerment to structures and people.

N Loss of beach sands resulting in loss of beaches; undermining or loss of natural features and endangerment to structures and people.

Erosion objective, policies and programs (for landslide and flood, see the Safety Element):

Objective: protect the coastline and watershed from erosion and inappropriate sedimentation that may or has resulted from human actions.

Policy 1: support legislation and efforts to secure and retain federal funding for Pacific coast beach protection and renourishment programs.

Program: include beach protection and renourishment in the city's federal and state legislative (lobbying) programs.

Responsibility: *Mayor and *City Council (and City Legislative Analyst).

Policy 2: continue to prevent or reduce erosion that will damage the watershed or beaches or will result in harmful sedimentation that might damage beaches or natural areas.

Program 1: permit processing and enforcement, especially mitigation of potential beach and soil erosion and protection of hillside and coastal terrain.

Responsibility: departments of *Building and Safety, City Planning and/or *any city agencies that have responsibility for planning, construction or maintenance of projects that could affect beach sediments and erosion.

Program 2: community plan land use provisions, especially protection of hillsides, watershed, beaches and the coastline.

Responsibility: *Department of City Planning.

Program 3: information dissemination about erosion abatement and landscaping.

Responsibility: departments of *Building and Safety, *City Planning, *Public Works, and *Water and Power.

Program 4: researching and continuing to improve Municipal Code regulations regarding soil stability and erosion abatement.

Responsibility: *Department of Building and Safety.

For related information see:

N Ocean Section (contamination and cleanup);

N "Infrastructure Systems Element" (wastewater discharge into the ocean), Los Angeles City General Plan (under preparation); and

N "Safety Element" (flood hazard, erosion), Los Angeles City General Plan, Los Angeles Department of City Planning, 1996.

SECTION 9: FISHERIES

A fishery is a water body containing a population or populations of fish, including shellfish. The only fisheries in the city are ocean fisheries. All lakes within the city are reservoirs. Most natural water courses are contained within flood control channels, which do not contain significant fish populations. Completion of the Donald C. Tillman Reclamation Plant in the Sepulveda Dam basin resulted in continuous discharge of treated water down the river, creating the first year-round Los Angeles River flow since the 1930s. Regeneration of the river environment due to the flow can support fish along the natural bottom stretches of the river, which now are rich in plant

life. The river fish tend to be introduced fish, like carp. Naturally occurring fish may be washed into the river from streams during storms.

Sport and commercial fishing takes place in freshwater and ocean environments. Pleasure fishing occurs at large local lakes that have been stocked by the California Department of Fish and Game (DFG). The program was initiated locally between 1993 and 1995. The lakes are stocked with catfish from May through November and with rainbow trout from November through April. In 1999, the DFG gave the city's Department of Recreation and Parks authority to contract with private suppliers, approved by the DFG, to stock city lakes with Channel Cat Fish.

Sport or recreational ocean fishing occurs from piers, beaches and boats. Commercial fishing boats ply the off-shore waters. Weather and other factors can affect the fishing industry and fisheries. In 1997-98 El Niño conditions warmed local waters, driving large communities of anchovies, squid and rock fish to cooler waters and attracting increased populations of sea bass, yellow tail and barracuda from Mexican waters. Until the early 1970s tuna canning was a major industry in California and in San Pedro. By 1985 the industry had shifted to American Samoa and Puerto Rico, partially due to international competition, labor costs and costs associated with the upgrading of aging plants to meet waste discharge cleanup regulations. During the same period in California the sea urchin industry expanded from 77,000 pounds (1972) to 51 million pounds (1981), largely for processing and export to Japan. In 1975 Mexico excluded U.S. fishing boats from its territorial waters and restricted access to white bass, yellowtail and other fish off the Baja coast, thereby significantly curtailing the local fishing industry. Contaminants also can affect fisheries. Chemical contaminants can make fish and shellfish hazardous to eat and can cause mutations to and death of entire populations. For information about contaminant impacts on the Santa Monica and San Pedro bays see the Ocean Section.

Fisheries protection. Too much harvesting can damage ocean animal populations. Market forces periodically shift due to changing culinary demands associated with shifts in food fads, local ethnic populations and international markets, sometimes resulting in damaging over harvesting of particular populations or species.

Under regulations promulgated by the state legislature, state Fish and Game Commission and the U.S. Fishery Management Council, the California Department of Fish and Game (DFG) sets catch limits and other regulations designed to protect marine populations from over harvesting. The DFG is responsible for state fisheries management. To protect the local fisheries, DFG restricts commercial fishing in 62% of

Santa Monica Bay, from Rocky Point (Palos Verdes Peninsula) to Malibu Point. It prohibits use of gill nets, trammel nets, purse seines and trawling in near shore areas and sets minimum size limits for some species, including the California halibut. The state legislature in 1998 directed the DFG, under the authority of the Marine Life Management Act, to develop comprehensive management plans to conserve and sustain designated classifications of threatened fish.

Fisheries are impacted by contaminants. Pollution discharge management is discussed in the Ocean Section.

Conclusion. Fisheries management is outside city authority. However the city has stewardship responsibility relative to discharges into the Santa Monica and San Pedro bays.

Continuing issues:

N Reduction and loss of remaining fisheries due to human activities and contaminants.

N Restoring native fisheries that have been lost or significantly reduced by over harvesting, contamination or loss of habitat.

N Contaminants that make local fish and shell fish a health hazard to humans and other animals if eaten.

Fisheries objectives, policies and programs:

Objective 1: protect and restore ocean fisheries (habitats).

Policies and programs: see the Ocean Section.

Objective 2: protect fisheries and enhance, restore or create fisheries for native fish populations and for sport fishing or harvesting in city managed waters.

Policy 1: continue to implement and to cooperate with lake fish stocking or enhancement programs.

Program 1: Coordination of the California Department of Fish and Game park lake fish stocking program.

Responsibility: *Department of Recreation and Parks.

Program 2: stocking or management of fisheries at Lake Crowley and other city-owned or managed lakes and fisheries outside the city boundaries.

Responsibility: *Department of Water and Power.

Policy 2: continue to consider and implement measures that will mitigate potential damage to and will encourage maintenance or restoration of fisheries.

Program: development permit processing and city property management and development.

Responsibility: departments of *Building and Safety and *City Planning, *lead agencies responsible for city development project implementation and *agencies that own or manage properties.

N Ocean Section (contamination, restoration and NPDES permit); and

N "Infrastructure Systems Element" (wastewater discharge into water bodies), City of the Los Angeles General Plan (under preparation).

SECTION 10: FOREST

The only remaining substantial conifer and big tree forests within the immediate Los Angeles city area are located outside the city's boundaries within the Angeles National Forest (aka Angeles Forest) and on the north slope of the Santa Susana Mountains (mostly within the Santa Clarita Woodlands Park). The park, noted for its Big Cone Spruce, is managed by the Santa Monica Mountains Conservancy. Plans are underway to develop an access-habitat corridor connecting the park to O'Melveny Park within the City of Los Angeles.

Angeles Forest contains natural flora ranging from desert to alpine growth, including 2,000 year old limber pines. Approximately 3,500 acres of Angeles Forest lands are located within the northern portions of the Sunland and Tujunga communities of the city. The forest reserve was established in response to a petition from the citizens of Los Angeles under the 1891 Forest Reserve Act. On December 20, 1892 President Benjamin Harrison announced the creation of the "San Gabriel Timberland Reserve" and placed it under the authority of the U.S. Department of Interior. The reserve was renamed the San Gabriel National Forest (1907) and then the Angeles National Forest (1908). It was the first national forest established in California and the eighth in the nation. The reserve was set aside to protect the watershed for development of farmlands in the Los Angeles and San Gabriel valley

basins. Today Angeles Forest comprises one-fourth of the land area of Los Angeles County, provides 35% of the Los Angeles basin's total ground water supply and continues to play a significant role in reducing flood hazards in the region, controlling erosion and providing large habitats for propagation and protection of native plants and wildlife.

Angeles Forest is comprised of two large sections that are separated by Soledad Canyon. It extends from the Tehachapi Mountains (near Kern County) to the San Bernardino National Forest (San Bernardino County). It is bounded by the Mojave Desert (north) and by Los Angeles, Pasadena and other cities and unincorporated areas (south). Its land area rises from the desert to one of the highest peaks in southern California, 10,064-foot high Mount Baldy. It contains over 690,000 acres of land, including most of the San Gabriel Mountains. Over 650,000 acres are managed by the U.S. Forest Service. Some 40,000 acres are privately owned parcels which the forest service is attempting to acquire. The city for decades has cooperated with the forest service in zoning private lands within and adjacent to the forest in very low density zoning, protecting equine and hiking trail linkages to the forest system and by supporting the forest service's efforts to acquire private lands within the forest boundaries and periphery of the forest.

While watershed protection is the primary purpose of the reserve, from before its inception it has been a major recreation resource for the region. Hikers and equestrians blazed trails through the forest beginning in the 1880s. The introduction of roads in the 1920s opened it to greater public access, leading to construction of camping facilities and private resorts. After World War II it became an increasingly important recreation area for Los Angeles.

It is one of the few national forests that is located close to the cities it serves. It provides recreational opportunities for over 12 million people in the region and ranks second to beaches in outdoor recreation popularity within the region. In addition to hiking, equine and off-road vehicle trails, within the forest boundaries are wilderness areas, fishing and other water recreation, the Mount Wilson observatory complex, campsites, youth camps, skiing facilities, experimental forestry sites, dams and other flood control facilities, reservoirs, protected historical and archaeological sites, fire service facilities, and other recreational, research, maintenance and educational sites and facilities. More than 16 threatened and endangered species are protected by habitats of the Angeles Forest.

Conclusion. The city does not have jurisdiction over the national forest. However it works cooperatively with the forest service in

integrating land use and trail systems, providing fire fighting assistance and other cooperative relationships.

Continuing issues:

N Acquisition of private lands within and adjacent to Angeles Forest for watershed, habitat protection, recreation and other forest compatible purposes.

N Coordination of public and private sectors to develop trail and habitat linkages that connect with the Angeles Forest systems.

Forest objective, policy and programs:

Objective: retain the forests as primary watershed, open space and recreational resources for the region.

Policy: continue to support the preservation and protection of Angeles Forest and Santa Clarita Woodlands.

Program 1: community plans, zoning and other land use policies and controls designed to prevent inappropriate development and uses adjacent to Angeles Forest.

Responsibility: *Department of City Planning.

Program 2: development of park lands adjoining, in proximity to or which link with the Angeles Forest and Santa Clarita woodlands with uses that are compatible with forest habitat protection, trail and corridor systems and forest facilities.

Responsibility: *Department of Recreation and Parks.

For related information see:

N "Infrastructure Systems Element" (groundwater, watershed), Los Angeles City General Plan (under preparation);

N "Open Space Element" (urban forest), Los Angeles City General Plan (under preparation); and

N "Safety Element" (fire protection agreements), Los Angeles City General Plan, Los Angeles Department of City Planning, 1996.

SECTION 11: GEOLOGIC HAZARD

The general plan Safety Element addresses seismic, geologic, flood, fire and other natural hazards, including identified risk areas within fault zones, potential liquefaction and landslide areas and flood plains. The general plan Infrastructure Systems Element will address associated facilities and systems.

SECTION 12: HABITATS

Los Angeles has a rich biodiversity, principally within mountain and coastal habitats. Many of the natural areas are threatened by urbanization which encroaches upon, reduces and fragments them and severs connecting habitat corridors that are essential for the survival of some species.

Definitions:

Habitat. Areas that support the survival of wild animals and native plants. These include native plant environments, (e.g., coastal sage scrub, oak woodlands, dunes and stream fed woodlands) and trees throughout the city that serve as stopovers and nesting places for migratory birds.

Biodiversity. The variety of living things, both plant and animal, in the environment.

Ecology. The relationship between living things and their environment. A balanced environment enables maintenance of healthy habitats which perpetuate biodiversity.

Habitat types within Los Angeles.

Inland habitats. Inland habitats are natural or artificially created refuges or water bodies. They provide habitats for resident species or stopovers for migratory birds. These include undeveloped areas, especially in the mountains, flood plains and other protected, restricted or private undeveloped lands; created lakes, reservoirs and dam sites and associated park and open space lands; and parks, golf courses, cemeteries and other lands with extensive natural or introduced vegetation.

Until the 1970s, acquisition generally was for development purposes, such as for expansion of the infrastructure (reservoirs, power transmission-rights-of-way, schools), for recreational or aesthetic purposes (parks and scenic parkways) or for protection of watersheds (national forests). In the 1970s local open space acquisition began to emphasize protection of biodiversity.

The emphasis began to shift due to national public interest in protection of the environment. This concern made possible one of the most significant measures for protection of habitats and establishment of public parks in U.S. history, the National Parks and Recreation Act of 1978, which was engineered by Congressman Philip Burton of San Francisco. It provided funds for hundreds of parks, trail linkages, wilderness areas, historic and cultural sites and facilities, seashores, scenic and wild rivers and other sites throughout the United States and its territories, including $150 million for the establishment of the Santa Monica Mountains National Recreation Area (SMMNRA).

Until the mid-1990s public land acquisition and dedications often were opportunistic, resulting in some parcels being isolated from public access and lacking in wildlife corridors to interconnect habitats, further species propagation or link recreational uses. A scarcity of funding, increasing demands for conveniently accessible recreational opportunities and continuing encroachment into open space areas resulted in a shift in emphasis from opportunistic acquisition to securing lands that provide the greatest amount of habitat preservation and human values.

Today a variety of entities and organizations in the region are working together to link the existing parcels of public and quasi-public forest and park land in order to provide permanent wildlife habitats and habitat corridors, protect native plants and scenic areas, provide trails and other open space-compatible recreation, enhance the public's access to views and use of open space, provide research and educational opportunities, and protect historical, paleontological and archaeological sites. The largest collection of publicly owned natural habitats in the city are the parks and publicly owned open spaces in the San Gabriel, Santa Monica, Verdugo and Santa Susana Mountains.

Significant Ecological Areas (SEAs). SEAs are significant habitats identified by Los Angeles County as important for the preservation and maintenance of biodiversity. They were identified and formally documented by the Regional Planning Commission (1976) to elaborate the "significant ecological area" provisions contained in the 1972 interim county general plan (finalized 1980). Each SEA was selected on the basis of existing known habitats of sensitive or endangered species as well as sites containing a diversity of native plant and animal resources. Within the City of Los Angeles all or part of some of the sites (Exhibit B) are privately owned, some of which have been developed with structures or other uses. Publicly owned portions of SEAs generally have been classified in the Open Space Zone and often are part of public park sites. SEA designations provide an informational basis for analysis of private projects relative to CEQA

review and guide public and private efforts to develop strategies for protecting and acquiring existing habitats. For example, in October 1999 the Department of Water and Power agreed to maintain the Chatsworth reservoir as a natural reserve. Designation of the site as a SEA assisted efforts to protect it from sale and possible development. The county is in the process of revising its general plan and the SEA designations.

Wildlife corridors. Wildlife corridors are land segments that connect two or more large habitat areas and provide a habitat for movement of animals between those areas. They encourage protection and health of animal populations by enabling access to food and broader animal interchange for healthy species propagation. Loss of corridors especially impacts large carnivores that need extensive territory for survival. As freeways and other barriers block corridors and as habitats shrink, large animals are forced from the city or are unable to survive.

The most extensive local effort to establish corridor linkages is the Rim of the Valley Trail Corridor. The corridor plan is based on the masters thesis of California State University at Northridge student Marge Feinberg (1974). Her plan was adopted into state law (Public Resources Code Section 33204.3) in 1990. The act authorizes the Santa Monica Mountains Conservancy, a state agency, to work with counties and cities within the greater Los Angeles area to acquire land and coordinate efforts to create a continuous necklace of public parks, habitat corridors and trails which will link the entire mountain system around the San Fernando and La Crescenta Valleys. One of the prime features of the plan is creation of permanent habitat corridors to protect endangered and threatened native plant and animal species.

Another important corridor project is the carnivore study (begun 1996), which is sponsored by the National Park Service in coordination with UCLA, the University of Massachusetts and other entities. It is monitoring large carnivores (including cougars, bobcats and coyotes) within a 30 square mile portion of the central Santa Monica Mountains National Recreation Area (SMMNRA) to estimate their chances of long-term survival in an urbanized environment. The study is providing field data on which to base protection and management actions and is assisting in identifying and evaluating additional properties needed for habitat and corridor preservation and restoration. It has identified several corridors, including corridors between the Santa Susana Mountains and the Simi Hills and between the Simi Hills and the Santa Monica Mountains. Other corridors include connections between the Santa Monica Mountains and the Verdugo and San Gabriel Mountains.

The study has found that, although SMMNRA is a largely undeveloped area, wildlife corridors and habitats have been encroached upon and fragmented by urbanization. Some corridors have been eliminated, forcing animals to cross roads or use culverts and roadway underpasses to access their territories. The study is monitoring the use of such introduced passageways. Other studies have arrived at the same conclusion. In recognition of the impact new transportation systems can have on wildlife corridors, the U.S. Congress (1998) authorized funding under the Transportation Equity Act for the 21st Century (TEA-21) for wildlife corridor protection relative to proposed federally funded transportation projects, including mitigation of potential vehicle and animal conflicts, e.g., construction of animal tunnels.

Ocean habitat. See Ocean Section.

Coastal wetlands. Wetlands are transitional lands between water and land systems where the water table is usually at or near the surface or the land is covered by shallow water, e.g., marshes and bogs. Wetlands in the city are associated with springs, streams, rivers (e.g., Tujunga Wash) and lakes, as well as the ocean. Among the largest and most threatened wetlands are the coastal wetlands. Wetlands filter and cleanse water of pollutants and provide wildlife habitats. During the 20th century an estimated 95% of the wetlands along the Los Angeles coast disappeared, largely due to water being diverted by flood control and drainage systems, development of wetlands, encroachment, water contamination and other impacts associated with urbanization.

Only remnants of coastal wetlands have survived in the city. The largest is in the Westchester-Playa del Rey community. It is the Ballona wetlands, an identified SEA. Approximately 374 acres of the wetlands are within the Playa Vista development project. Much of the wetlands, Ballona Creek Channel and associated dune and habitat areas are proposed by the project for habitat enhancement, including wetlands restoration, creation of a freshwater marsh and establishment of a riparian corridor.

Within the Venice community is the Venice Canal System, which is an SEA, a city historic monument and an important part of the wetlands system. The Venice Local Coastal Program, Venice Community Plan and Venice Coastal Zone Specific Plan contain policies and regulations to guide public and private canal enhancement and protection.

The Ballona Lagoon is part of the system. It connects the canals to the Pacific Ocean. Over the century since the canals were built as a part of a unique subdivision (1905), accumulated sediments have impacted water circulation and pollutants and human activity have damaged the ecology of the canal system. In 1988, concerned citizens formed the

Ballona Lagoon Marine Preserve (BLMP) to protect and restore the lagoon. BLMP's efforts led to the lagoon restoration and enhancement project (1997), which is nearing completion. To gain greater control of the lagoon, the city swapped city-owned lands for private land on the west bank and, along with the California Coastal Conservancy, acquired additional land control through easements. Upon completion of the project the city's Bureau of Street Services will assume responsibility for maintenance of the lagoon. Plans for additional enhancements and public access improvements are under consideration.

In 1993 the Bureau of Engineering completed the Venice Canals rehabilitation project. Begun in 1991, it included dredging of the canals to improve water circulation, construction of new canal banks, reconstruction of several bridges, replanting canal banks with indigenous and compatible vegetation and improvement of public access, including construction of bikeways and pedestrian paths. Upon completion of the project the Bureau of Street Services assumed responsibility for canal maintenance.

Habitat protection legislation.

California Environmental Quality Act (CEQA). CEQA requires evaluation of potential impacts of proposed projects on biodiversity, habitats, wildlife dispersal and migration corridors. Potential negative impacts are to be avoided, minimized or mitigated to a level of insignificance. Off-site mitigation may be employed to reduce on-site mitigation burdens on a project.

The Bolsa Chica Restoration Project in neighboring Orange County is an example of the application of off-site mitigation for a Los Angeles based project. Bolsa Chica is a combined federal-state management project headed by the California Coastal Conservancy. The project includes the purchase of approximately 880 acres of oil fields and restoration of almost 600 acres of wetlands to establish a habitat preserve. Although a variety of agencies and private parties are contributing funds to the project, the bulk of the funding for land purchase and restoration is from the ports of Los Angeles and Long Beach. They have contributed millions of dollars, as part of their CEQA mitigation requirements, to compensate for natural resources lost within the harbor due to harbor expansion.

Development of the city's Geographic Information System (GIS) will greatly assist in CEQA evaluation and the mapping of environmental data. In a cooperative effort, the planning department and other public agencies are recording data from a variety of information sources for every parcel of land in the city. Environmental and other geographically based data will be accessible by system users, including

the general public, via the Internet. GIS already is providing invaluable information to agencies for land use planning, development projects and CEQA analysis. The exhibits that are a part of this element were generated from the city's GIS data base.

Natural Community Conservation Act (NCCA). Following complaints by developers and property owners that protection of identified species unduly delayed projects and constituted a taking of their land, the state enacted the Natural Community Conservation Act of 1991 (Fish and Game Code Chapter 10, Division 3, Sections 2800 et seq.). The NCCA is administered by the Department of Fish and Game (DFG). Its goal is to identify and secure habitat areas for protection of biodiversity. Habitat areas are identified by the DFG and plans are prepared for habitat protection. The pilot program for southern California is the coastal sage scrub habitat area, including the Palos Verdes Peninsula, the only site near Los Angeles city. The coastal sage scrub is the home of the California gnatcatcher and approximately 100 other potentially threatened or endangered species.

When a development project is proposed, a determination is made concerning the potential impacts of the project on biodiversity and the best means of avoiding or mitigating them. The NCCA allows local, state or federal agencies to enter into agreements with public and private entities to implement a "natural community conservation plan" (NCCP), e.g., habitat and species protection within a specified geographic area. Participation in an NCCP does not exempt a development project from CEQA. Mitigation measures pursuant to CEQA may, as an alternative, include participation in an NCCP in order to reduce the burden for on-site mitigation. As far as can be ascertained, no projects within the City of Los Angeles are utilizing the NCCA.

Conclusion. The city has an important role in preserving, protecting, enhancing, creating and monitoring habitats to ensure the maintenance of the rich local biodiversity. Its primary means are acquisition, management of publicly owned sites, permit processing, data collection, regulatory authority and cooperative efforts with other entities.

Continuing issues:

N Loss or degradation of the last remaining SEAs.

N Loss or severing of habitats, habitat corridors and migratory bird stopover sites that are essential for the healthy propagation and maintenance of native and migratory species.

Habitats/ecological areas objective, policies, programs (see also Endangered Species, Fisheries, Ocean and Wetlands sections):

Objective: preserve, protect, restore and enhance natural plant and wildlife diversity, habitats, corridors and linkages so as to enable the healthy propagation and survival of native species, especially those species that are endangered, sensitive, threatened or species of special concern.

Policy 1: continue to identify significant habitat areas, corridors and buffers and to take measures to protect, enhance and/or restore them.

Program 1: development permit environmental review and other applicable processes that identify and/or require evaluation, avoidance, minimization and mitigation of potential significant impacts on natural habitats, corridors and linkages.

Responsibility: departments of *Building and Safety and *City Planning, *lead agencies responsible for city development project implementation and *agencies that own or manage properties.

Program 2: community plan land use classification of significant habitats in categories that will encourage their retention.

Responsibility: *Department of City Planning.

Policy 2: continue to protect, restore and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within city owned or managed sites.

Program: City property management.

Responsibility: *city agencies that own or manage lands and/or are responsible for project implementation.

Policy 3: continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive and rare species.

Program: property acquisition and providing support or assistance to other public and private entities in acquiring habitat areas and corridors and for habitat recovery efforts for species protection and recreational uses.

Responsibility: *Mayor, *City Council (and City Legislative Analyst), *Department of Recreation and Parks.

Policy 4: continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.

Program: City legislative program.

Responsibility: *Mayor and *City Council (and City Legislative Analyst).

For related information see:

N Endangered Species Section;

N Fisheries Section;

N Habitats/Scenic Lands Outside the City Section;

N Ocean Section; and

N "Open Space Element," Los Angeles City General Plan (under preparation).

SECTION 13: HABITATS AND SCENIC AREAS OUTSIDE THE CITY

The city, by virtue of its facility and utility sites outside city boundaries, has a habitat stewardship role beyond its borders. Its land holdings and its facility and land agreements include park, recreation, airport, dam, power transmission rights-of-way, power plant, aqueduct and other facilities, systems and sites. Most of the lands and facilities are under the ownership or management of the Department of Water and Power (DWP). The remainder are owned or managed by the airports department, or other city agencies.

The city's environmental stewardship has occasionally been challenged. Challenges recently have resulted in commitments to protect, restore and/or enhance four significant habitat and scenic areas: the Grand Canyon-Colorado River Plateau, Owens Valley, Owens Lake and Mono Lake. The four cases and related commitments are summarized below.

Grand Canyon-Colorado River Plateau. One of the nation's most important open space resource areas is the Colorado River Plateau, which includes the Grand Canyon and Glen Canyon. In recent decades there has been national concern about increased visibility pollution which sometimes obliterates views of vistas and nearby landmarks. Over a century ago the haze was due largely to wind swept dust and lightning caused forest fires. Recent studies identified a variety of sources, including sulfur dioxide emitted from coal fired generating stations. Sulfur dioxide combines with moisture to form tiny, visible sulfate particles that discolor the air, contributing to the haze. Polluted air is sucked into Grand Canyon by cold air, which drains from the high plateaus and

settles in the canyon, impairing the spectacular views tourists travel thousands of miles to see.

The Navajo Generating Station, owned by the Salt River Project consortium, which includes the DWP, was identified as one source of the haze. It is located near Page, Arizona, south and east of the Glen Canyon National Park and at the northeast edge of Grand Canyon National Park, 80 miles from the main Grand Canyon visitor center. This coal fired facility was constructed in 1975, before sulfur dioxide scrubbers became available.

A series of studies were conducted (1987-89) to identify the sources of Grand Canyon haze. Chemical tracers used in a National Park Service study, partially funded by the consortium, identified some of the haze as originating from the Navajo plant. Based on the study, the Environmental Defense Fund sued the EPA for failing to enforce the visibility provision of the Clean Air Act. An EPA study concluded that in the winter, between November and March, haze reduced visibility at the Grand Canyon from 150 miles to under 10 miles and that the Navajo plant was a significant source. A verification study by the National Academy of Sciences found that the winter haze was caused primarily by automotive vehicle exhausts, that the Navajo plant "contributed significantly" and that ore smelters, pollution from near and distant urban areas (including Mexico) and other sources also contributed. Based on the study, the EPA (1989) contended that the Navajo plant contributed 40% of the introduced haze. It issued an order requiring the consortium to install scrubbers.

The consortium agreed (1991) to reduce visibility impacts by installing scrubbers designed to remove 90% of the sulfur dioxide emissions. These were in service by August 1999. The historic agreement marked the first time the EPA had enforced the Clean Air Act provisions requiring protection of visibility at national parks and wilderness areas. For the first time it acted solely to protect visibility and aesthetic values, not health quality. The scrubbers may improve visibility at the Grand Canyon by 7% on an average winter day. They are not expected to improve visibility during summer months when air pollution from the Los Angeles basin is the principal source of Colorado Plateau haze.

Another potential source of sulfur dioxide pollution affecting the Colorado Plateau region is the Mohave Generating Station in Laughlin, Nevada. The station is operated by the Southern California Edison Company and is partially owned by the DWP. It was constructed in 1971 and has partial emission controls. As a result of negotiations, which were concluded in 1999 to settle pending litigation, an agreement was reached requiring the station to install additional emission controls

by 2005, or to cease operation in its present form, e.g., coal fired facility.

Owens Lake and Owens Valley. City of Los Angeles and federal ownership of almost all the lands in the Owens Valley, including mountain slopes on both sides of the valley, has kept the area free from commercial development, providing an almost unbroken view from Highway 395 of the magnificent Sierra Nevada and White Mountains. Public ownership also has enabled public access for hiking, hunting, fishing and winter sports. But the city's diversion of the Owens River waters before they reach Owens Lake and tapping of underground valley water have contributed to impaired air quality and other impacts on the valley.

Owens Lake. The air quality issue associated with the drying of the lake, primarily due to water diversion, resulted in dust mitigation measures. These, in turn, resulted in side benefits to habitat and wildlife enhancement. The majority of Owens Lake (95%) is owned by the State of California and is under the authority of the State Lands Commission.

The lake is a remnant of a large prehistoric freshwater lake which at one time extended some 60 miles up and down Owens Valley, reaching a depth of 320 feet. By the time settlers entered the valley in the mid-19th century, Owens Lake had shrunk to a fraction of that size, to a shallow, salty desert sink. Dissolved minerals and salts, which had flowed into the lake for millennia, had become so concentrated by evaporation that only algae, brine shrimp, brine flies and other primitive life could survive.

By 1905, diversion of Owens River water by local farmers and an extended drought shrank the lake even more. Shrinkage was accelerated by the Los Angeles River Aqueduct. Completed in 1913, the aqueduct diverted most of the remaining river water before it reached the lake.

By the late 1920s, the lake had become a dry lake, one of the largest dry lakes in California. Its rapid shrinking had left shallow brine pools within the dry lake bed and springs and seeps around its edges. These wetlands supported remnants of the primitive marine ecosystem, some of which remain to this day.

Due to the accelerated drying of the lake caused by the aqueduct diversion, an alkaline crust of dissolved and crystallized minerals and salts was created over much of the lake bed. Winds and shifting sands lacerated the crust, resulting in dust becoming airborne during windy periods.

Passage of the federal Clean Air Act (1963), and its subsequent amendments, and formation (1979) of the Great Basin Unified Air Pollution Control District (APCD) lead to efforts to implement federal clean air standards. In 1983, legislation (California Health and Safety Code Section 42316) was enacted which allowed Los Angeles to continue exercising its water rights in the Owens Valley, providing it complied with state and federal air quality standards by mitigating documented air quality impacts resulting from the city's water withdrawals from the valley.

In 1990 an amendment to the federal Clean Air Act identified the area as a "non-attainment" area in meeting clean air standards for particulate matter. It required attainment by 2001, with a five-year extension option. The 1997 State Implementation Plan (SIP) for achieving attainment required Los Angeles to use specified measures to mitigate the dust relative to Owens Lake. Because the measures had not been fully tested in the Owens Lake environment and conditions of the lake crust varied from site to site and with changes in the climate, Los Angeles challenged the plan. It was concerned about being required to expend money and effort implementing measures that might not work. To assess the situation, Mayor Richard Riordan and other Los Angeles officials toured the valley and met with APCD officials in August 1997. Riordan was the first Los Angeles mayor to officially visit Owens Valley since the first aqueduct was completed.

In response to the city's challenge, the California Air Resources Board directed it and the APCD to work out a compromise. The negotiations resulted (1998) in a memorandum of agreement (MOA). Provisions of the MOA were incorporated into the revised SIP (1998) and approved by the federal Environmental Protection Agency (1999) for attainment of air quality standards by a new date, 2006.

The MOA addresses dust abatement and allows phased and flexible implementation. It requires that ten square miles of the 110-square mile lake bed be treated by the end of 2001, an additional 3.5 square miles in the year 2002 and three more in 2003. At least two square miles per year are to be treated each year, or until the APCD deems that the federal standards have been met. The plan will be reviewed in 2003 to determine if the pace should be quickened to achieve the air quality standards by 2006. The DWP may use a variety of strategies, including shallow flooding, planting of vegetation, covering areas with gravel.

The lake will not be refilled. Instead, sections will be treated with water or vegetation, or covered with gravel to control dust. Initially, ten square miles will be flooded with a few inches of water, permanently covering or saturating sections of the lake bed crust, a

measure that, as a side benefit to air quality improvement, will contribute to habitat restoration and enhancement. In June and July of each year, additional water will be provided to specified locations for maintenance of food and water sources suitable for sustaining nesting and fledgling shorebirds. Native and other designated plant species will be encouraged in designated areas. Incompatible species, e.g., salt cedar, will be removed. Berm and access roads will be provided with snowy plover crossings to allow free movement of adult and chick plovers. To protect human health, a mosquito abatement program will be implemented.

The DWP estimates that the initial shallow flooding phase will cost $100 million to implement. The total project will result in an estimated loss of 40,000 acre feet of aqueduct water per year (equal to service to 80,000 households), which will be replaced through water purchases and other means.

Owens Valley. Vegetation protection evolved out of the Owens Valley groundwater pumping issue. The protections relate to those sections of the valley that are owned by the City of Los Angeles, roughly between Lone Pine and Bishop, not including Owens Lake.

The city's plan for a second aqueduct and enactment of the California Environmental Quality Act of 1970 (CEQA) prompted a suit (1972) by Inyo County to restrict the city's groundwater pumping in Owens Valley. Inyo alleged that the city's plan to increase flows for the second aqueduct by pumping additional ground water violated CEQA. After a decade of suits, counter suits and negotiations, the city and Inyo agreed to jointly prepare an environmental impact report (EIR) that would address existing and potential impacts associated with the pumping. Completed in 1991, the EIR identified two separate time periods (1970-90 and 1990 onward) of mitigation measures for implementation by the DWP. The measures related to impacts associated with prior pumping (1970-90) and to potential impacts associated with planned future pumping.

Challenges to the EIR, its process and authority resulted in the court inviting testimony from interested parties. Subsequently, Los Angeles and Inyo entered into a memorandum of understanding (MOU) which affirmed the EIR and included additional mitigation measures. Based on the MOU, the court ruled (1997) that the EIR met legal requirements.

The EIR contains mitigation measures, goals for vegetation protection and procedures for preparation of annual plans to address future potential vegetation impacts. Mitigation measures include transfer of town water systems to local control and annual payment by the city to Inyo County of funds for local programs and services, including park

acquisition and maintenance, salt cedar plant nuisance abatement and for county water department environmental programs.

Mono Lake. In 1940 the DWP extended its aqueduct system to Mono Basin, diverting snow melt waters from Lee Vining, Walker, Parker and Rush creeks, the main sources that feed Mono Lake. The 65 square mile salty, alkaline lake lies 6,000 feet above sea level in the high desert of the eastern Sierra, below the Tioga Pass entry to Yosemite National Park. More than 250,000 people a year from all over the world arrive by road, foot or on skis to enjoy the eerie volcanic beauty and magnificent views. The lake is believed to be a million year old remnant of an inland sea. Minerals carried by waters that flow through volcanic and geologic formations maintain the high saline content of the lake, which provides a unique ecosystem that supports millions of rare brine shrimp and other organisms. The organisms provide food for migratory birds and are harvested commercially. Two large volcanic islands (Paoha and Negit) provide migratory stop-over and nesting sites for thousands of ocean feeding birds, including phalaropes, which arrive in midsummer on their way from the arctic to nesting grounds in Baja, California. An estimated 90% (50,000 birds) of the California and 20% of the world sea gull population nest on the islands.

Diversion by the DWP of as much as 95,000 acre feet of water annually, along with Owens Valley resources, provides Los Angeles with its least expensive and purest sources of water. But diversion has severely impacted the Mono Basin, causing the lake to drop as much as 40 feet since 1941. The drop exposed 21 square miles of lake bed. This resulted in a doubling of the water's salinity (three times saltier than the ocean) and left a residue of dry salt and mineral crystals, similar to that of Owens Lake, that was stirred into dust clouds by high winds.

In the late 1970s, continued low snowfall in the eastern Sierra, combined with the DWP's diversion of stream water caused the level of the lake to drop significantly, exposing land bridges to Negit Island. Coyotes traversed the exposed land, destroying a colony of nesting gulls (1978). The Audubon Society and the Mono Lake Committee petitioned the court to prohibit the diversion of creek waters, contending it was causing irreversible ecological damage.

Heavy snowfall during the winters of 1983 and 1984 led to another court action. The abundant snow melt following the heavy snowfalls caused the two DWP dams to overflow, sending water and trout down the dry stream beds that fed the lake. When the DWP resumed its stream diversion, California Trout, Inc., a sport fishing organization, and the Mono Lake Committee filed suit requesting enforcement of a state fisheries law that prohibits killing of fisheries to supply water to an aqueduct.

After a decade of litigation and negotiation, the state Water Resources Control Board (1994) issued Decision No. 1631, which establishes a schedule of stream flows; fixes the amount of water the DWP can divert from the basin, based on the elevation of the lake; and requires preparation of a stream and waterfowl habitat restoration plan. Following a settlement agreement between Los Angeles and interested parties concerning the monitoring program, the board (1998) approved the stream and waterfowl habitat plan.

The plan permits the DWP to export 16,000 acre feet of water a year from the basin. This figure will increase to 30,000 acre feet per year when Mono Lake reaches an elevation of 6,391 feet. The lake had risen to 6,385 feet by 2000, sufficiently covering the land bridges between Negit Island to ward off coyotes. It is anticipated that it will take approximately 20 years for the 6,391 level to be achieved.

To assist Los Angeles in replacing aqueduct water due to the reduced diversion, the state legislature (1994) approved a bill allocating $36 million for water projects in Los Angeles, primarily for the East Valley Reclamation Project in the San Fernando Valley. The East Valley Project will provide an estimated one-third of the amount of Mono Lake water lost as a result of the settlement. The DWP will supply remaining water needs by purchase and from other sources.

Conclusion. The city is responsible, in whole or in part, for management of facilities and properties it owns or operates outside its borders. Its stewardship includes consideration of potential impacts on and management of natural areas and scenic resources.

Continuing issues:

N Meeting the city's water, power and other needs while at the same time striving to be a good steward of natural resources and to minimize impacts on the environment.

N Compliance with environmental protection legal agreements involving City owned or operated facilities which are located beyond the city's borders.

Habitats and scenic areas outside the city objective, policies and programs:

Objective: protect important natural habitats and scenic sites outside the city which are owned by the city or are impacted by city facilities.

Policy 1: continue striving to meet the city's water, power and other needs while at the same time striving to be a good steward of natural resources and minimizing impacts on the environment.

Program: City facility and property management programs.

Responsibility: departments of *Airports, *Public Works and *Water and Power.

Policy 2: continue striving to meet legal mandates to avoid, mitigate or abate potential significant environmental impacts associated with city facilities that are located outside the city's borders.

Program: operating agency facility and property management programs.

Responsibility: departments of *Airports, *Public Works, *Recreation and Parks, and *Water and Power.

N "Infrastructure Systems Element" (including water and power facilities and systems), Los Angeles City General Plan (under preparation) and

N "Public Facilities and Services Element" (parks and other city facilities), Los Angeles City General Plan (under preparation).

SECTION 14: HAZARDOUS MATERIALS

The general plan Safety Element addresses hazardous materials. However, after the element was drafted, several important changes took place that warrant mentioning. These involve the state Unified Program and landfill, brownfields and NPDES programs.

Unified Program. In an effort to streamline hazardous materials management the state adopted the Unified Hazardous Waste and Materials Management Regulatory Program (aka Unified Program). The program (California Health and Safety Code, Division 20 and Code of Regulations, Titles 19, 22, 24 and 27) consolidates and makes six existing state hazardous waste and materials management programs consistent with each other and mandates their coordination. The Los Angeles City Fire Department applied for and was designated the Certified Unified Program Agency (CUPA) for the city (1997), making it the single point contact for Unified Program activities. As the city's CUPA, the Fire Department accepts applications from regulated facilities, issues permits, performs inspections, coordinates with

other regulatory agencies, enforces regulations within its jurisdiction and provides information regarding hazardous materials regulations and management. The Fire Department, as described in the Safety Element, already was performing many of the tasks assigned by state legislation.

In 1995 the non-regulatory Hazardous and Toxic Materials Office was transferred from the Department of Public Works to the Environmental Affairs Department (EAD). The office works primarily with businesses and city agencies, disseminating information, providing technical assistance and coordinating city efforts to promote proper hazardous materials management and prevention of hazardous materials pollution.

Landfill regulation. Pursuant to state law (Public Resources Code Division 30 and Code of Regulations Titles 14 and 27) cities and counties are authorized to enforce solid waste management regulations at all landfill, transfer station and composting facilities. In 1993, the city established (Ordinance No. 168,508) a local enforcement agency (LEA) within EAD. The LEA monitors approximately 100 solid waste facilities, including open and closed disposal sites and potential former disposal sites that have been identified by the California State Integrated Waste Management Board (IWMB). The disposal sites are located throughout the city. Most were established prior to government landfill siting regulations. Some may have been established in the 19th century. Landfill sites deemed to have existing or potential health or safety problems are inspected by the LEA. Redevelopment of a site requires LEA approval prior to issuance of a building permit. The LEA evaluates proposed plans and the site. It can require soils reports and may impose conditions to abate any potential health or safety problems. Sites deemed not to have been a landfill or to have no health or safety problems are recommended by the LEA to the IWMB for removal from the site inspection list.

Brownfields. The U.S. Environmental Protection Agency (EPA) defines brownfields as abandoned, inactive or underutilized industrial and commercial properties where expansion or redevelopment is complicated by real or perceived environmental contamination. The EPA provides funds for site assessment and revitalization of sites that are contaminated with hazardous materials.

The city's brownfields program is a collaborative approach to redevelopment of individual or groups of old industrial parcels. Soil contamination often is a major deterrent to redevelopment because owners lack the funds to cleanup the contaminants which are impeding property sale or improvement. Most of the sites are located within communities which grew up around industries, some of which were established before World War I. The goal of the city program is to assist property owners in resolving contamination related problems

(e.g., legal, financial, bureaucratic) so that contaminated properties cleaned up and redeveloped, thereby providing a catalyst for community revitalization.

Primary agencies involved in the city's brownfields program are the Community Redevelopment Agency (CRA), the EAD, Community Development Department, the Mayor's Office of Economic Development and City Council offices of districts in which the projects are located. Other agencies join to provide technical expertise, help secure funding, coordinate infrastructure improvements and assist in site redevelopment.

One of the city's first brownfields demonstration projects was the Goodyear Tract, a 208-acre, multi-ownership industrial area located in South Central Los Angeles near the Alameda rail corridor. For over a decade the area was the focus of debate regarding the appropriate mechanism to achieve neighborhood-compatible reuse. The mechanism selected was designation of the area, including the Goodyear Tract, as a redevelopment project area, under the administration of the CRA. The Goodyear Tract portion will be redeveloped primarily with industrial uses.

Another project is the former Crown Coach site, a 20-acre vacant contaminated parcel that is owned by the State of California and is located less than three miles from the Los Angeles civic center. Under agreement with the state, Los Angeles conducted a site assessment. It subsequently completed soil cleanup and has issued a request for proposal for site development which will maximize community and economic benefit of the site. The developer will collaborate with the state to accomplish groundwater cleanup.

The innovative collaborative approach and success of the Goodyear Tract and other brownfields projects helped the city win selection as one of 16 communities around the nation to be designated (1998) by the federal government as Brownfields Showcase Communities. The designation made the city eligible for special funding and technical assistance from federal agencies which have joined to address brownfields issues in Los Angeles. The city's program provides direct technical and other assistance to over 30 sites throughout the city (2000).

NPDES. The Bureau of Sanitation has regulatory authority over discharge of hazardous and non-hazardous materials into sewer and stormwater systems. In 1998 responsibility for coordination of the city's compliance with the National Pollutant Discharge Elimination System (NPDES) municipal stormwater permit was transferred from the engineering to the sanitation bureau.

Conclusion. The city has a primary regulatory, informational and catalytic role in hazardous materials management, cleanup and brownfields site revitalization.

Continuing issues:

- Reduce the amount of release of toxic waste into air, land and water.

- Existing contaminated sites that pose a threat to public or environmental health, or discourage site redevelopment.

- Improper use, storage, transport or disposal of hazardous materials.

- Accidental release of hazardous materials.

Hazardous materials goals, objectives, policies and programs: see the Safety Element. The new information identified in this element is covered by the objectives and policies of the Safety Element.

For related information see:

- "Infrastructure Systems Element" (wastewater, solid waste and water resources management), Los Angeles City General Plan (under preparation);

- Ocean Section (NPDES permit); and

- "Safety Element" (hazardous materials), Los Angeles City General Plan, Los Angeles Department of City Planning, 1996.

SECTION 15: LAND FORM AND SCENIC VISTAS

The city encompasses 467 square miles of land area, including approximately 214 square miles of hills and mountains. The San Gabriel and Santa Susana Mountains bound the city on the north, the Santa Monica Mountains extend across the middle of the city, and the Palos Verdes Hills and Pacific Ocean are on the south and west. The topography rises from sea level to 5,074 feet (Sister Elsie station in the San Gabriel Mountain foothills in Tujunga). The Santa Monica Mountains are the most visible feature from many areas of the city. They are 60 miles long and stretch from Elysian and Griffith parks in Los Angeles to Point Mugu State Park in Ventura County. The Los Angeles River and its associated tributaries and flood plains also are prominent topographic features.

Land form protection. Several sections of the Los Angeles Municipal Code (LAMC) are specifically intended to encourage retention of

existing land forms. These include the residential planned development supplemental district (LAMC Section 13.04), which encourages clustering of development in order to reduce grading and preserve existing natural terrain; the slope-density regulations (LAMC Section 17.50-E), which restrict density on the basis of the calculated average of the ungraded slopes at selected contours within a parcel that is proposed for divisions of land; the hillside overlay zone (LAMC 12.21-A.17) within which restricted densities and other requirements for neighborhood and environmental compatibility apply; and the Specific Plan For The Management of Flood Hazards (Ordinance 172,081), which contains hazard protection requirements. In addition, some community plans contain land form protection provisions. Under the California Environmental Quality Act, project design adjustments may be required to mitigate potential significant impacts on landform and unique site features. The California Coastal Act requires minimization of natural landform alteration by new development projects within the coastal zone, including minimization of activities that would contribute to erosion and geologic instability. Flood plain management is addressed by the general plan Safety Element.

Scenic features protection. Scenic views or vistas are the panoramic public view access to natural features, including views of the ocean, striking or unusual natural terrain, or unique urban or historic features. Public access to these views is from park lands, private and publicly owned sites and public rights-of-way.

The Transportation Element contains provisions regulating scenic highways which are not regulated by specific plans. The element contains a map of the designated scenic highways and guidelines for protection of natural scenic features and for aesthetic enhancement of the highways. Scenic protection provisions also are contained in the community plans. The LAMC contains provisions which potentially protect views. These include height limits and building setback requirements. Some scenic highways, including the Mulholland Drive Scenic Parkway, are regulated by specific plan ordinances that contain design provisions intended to protect natural ridge tops, neighborhood visual ambience, public views and other features.

The California Environmental Quality Act mandates identification and protection of scenic resources. Identified resources include trees, historic buildings, rock outcroppings and similar features that are located within a designated state scenic highway. Under CEQA and the LAMC, decision makers have been able to require retention and protection of scenic features.

Conclusion. Through acquisition, park development and land use planning and development requirements the city has a major role in protecting

land forms and scenic features and in making scenic features accessible to the public.

Continuing issues:

N Loss of natural features of the terrain, especially in mountain and hillside areas.

N Loss of scenic features.

N Loss of visual or physical accessibility to view corridors, scenic features and areas.

Land form and scenic vistas objective, policy and programs:

Objective: protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.

Policy: continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.

Program 1: permit processing, enforcement and periodic revision, especially environmental review, grading, large lot zoning, clustering of structures, building height limits and other project design and construction methods for protecting natural terrain and features and protecting public view access.

Responsibility: departments of *Building and Safety, *City Planning and *Public Works and other agencies involved in city development permit review and/or processing.

Program 2: planning and construction of roads, utilities and other public projects, especially projects that are within or impact natural terrain and/or scenic areas.

Responsibility: *Bureau of Engineering and/or the *agency that owns or manages the land and/or is responsible for project implementation.

For related information see:

N "Transportation Element" (scenic highway provisions), Los Angeles City General Plan, Los Angeles Department of City Planning, 1999.

SECTION 16: OCEAN

The Pacific Ocean bounds portions of the city to the west (Santa Monica Bay) and South (San Pedro Bay). The San Pedro Bay contains the Long Beach and Los Angeles harbors. The bays are rich in plant and animal life. They and their associated beaches are among the most important recreational and tourist resources in the region. Commercial and recreational fishing also occur in the bays, especially in the Santa Monica Bay. Damage to the ecology of the bays has a direct effect on the environment and the economy of the city and region. Many factors affect the local marine ecology including natural storm runoff, waste discharge and construction of harbor, flood control and other structures.

Ocean protection. The state has jurisdiction over waters, tidelands and off-shore lands to a point three miles from shore. The federal government has jurisdiction over lands and waters that lie beyond the three-mile limit. The city has land management jurisdiction on shore and is responsible for managing discharges into the ocean from land based sources and systems.

Clean Water Act/NPDES permits. The primary legislation affecting water quality, including the quality of ocean waters, is the federal Clean Water Act. It was amended in 1972 to establish regulations and requirements for implementation by state and local governments "to restore and maintain the chemical, physical, and biological integrity of the nation's water" (Pollution Control Act, Section 101). The amendments made it unlawful to discharge waterborne pollutants into any navigable waters of the United States from any point source, except as allowed by a National Pollutant Discharge Elimination System (NPDES) permit. A "point source" is any identifiable source of discharge, such as a sewage discharge or a leaking pipe or storage container. "Navigable waters" relative to the city means the Pacific Ocean and the Los Angeles River. A "non-point" source is water runoff that contains pollutants from a source that is not readily identifiable, e.g., pollutants that accumulate on streets.

The U.S. Environmental Protection Agency (EPA) issues interpretive guidelines for implementation of the Clean Water Act. The regulatory mechanism for compliance with the guidelines are the NPDES permits which must be filed by local jurisdictions. The state Water Resources

Control Board administers the Clean Water Act in California. It delegates authority to regional water quality control boards. The Los Angeles Regional Water Quality Control Board (RWQCB) administers the Los Angeles county NPDES permits.

The Clean Water Act was amended (1987) to require reduction in the discharge of pollutants into the stormwater system. However, the EPA, recognizing the difficulty in assessing non-point source pollution and the need for further study, postponed compliance by Los Angeles county with stormwater runoff requirements.

Point pollution sources. The major city controlled point source was identified as wastewater and sludge (waste solids) discharge. The primary source of sludge dumping in the Santa Monica Bay was the city's Hyperion Wastewater Treatment Plant.

The Hyperion plant serves an area of 514 square miles, including 83 square miles of contractual area outside of the city's boundaries. It is the largest wastewater treatment facility in the city. The plant processes sludge from the Hyperion, Donald C. Tillman and Los Angeles-Glendale wastewater treatment plants. The sludge is used to create methane gas or is reduced to powder, both of which are used to create electrical energy. It also is used for fertilizer for non-food crops, landfill cover and other purposes. The ash produced during sludge reprocessing is reused in copper smelting in Arizona. An outfall pipe discharges treated wastewater five miles off shore.

In compliance with a federal ninth circuit court consent decree, Hyperion stopped dumping sludge into the bay in 1987. By that time, sludge from the plant had spread over an estimated two square mile area of the ocean floor from several decades of dumping. Five years after the dumping ceased, marine life was regenerating and pollution of beaches had declined to almost no posting of health hazard warnings. Full operation of the Hyperion energy recovery system sludge processing facilities began in 1989. Interim effluent limits were instituted to coincide with phased improvements at the plant. Full secondary treatment was achieved by December 31, 1998, enabling the city to meet the federal Clean Water Act standards. The plant can provide secondary treatment for 450 million gallons of wastewater per day and its new equipment has reduced the plant's air polluting emissions by 80 percent. Facilities are being constructed to expand plant capacity to meet the city's projected wastewater treatment needs to the year 2010.

The first Los Angeles County municipal NPDES permit was approved by the RWQCB in 1990. It was a five-year permit requiring specific compliance with point source pollution measures. The Hyperion, Donald C. Tillman and Los Angeles-Glendale wastewater treatment plants were major point

sources that underwent facility upgrades to achieve compliance with the permit.

Non-point pollution sources. With effective monitoring and control of point sources, storm related, non-point source pollution became the major source of bay pollution. Bacterial, trash and other water borne pollution is the greatest during the first heavy storms of the rainy season. Debris and sediments from air pollution and other sources that accumulate during the dry season on roofs, vegetation and other surfaces are flushed by storms into the drainage systems and then into the bays. Overflow or damage to wastewater systems is most likely to occur during heavy storms.

The Clean Water Act was clarified (1990) concerning non-point sources and general stormwater runoff. Requirements are being implemented by the second County of Los Angeles municipal NPDES municipal stormwater permit (1996). The goal of the second permit is to reduce pollutants in storm water and urban runoff in order to achieve compliance with federal standards and improve the water quality of the bays. The county is the principal permittee, the 86 cities within the county are co-permittees. Identified potential pollution sources, ranging from restaurants to harbors, must use "best management practices" (BMPs) to the maximum extent practicable to reduce or eliminate water borne pollutants.

The permit BMPs are any programs or technology used to reduce or eliminate water borne pollutants associated with stormwater runoff. City of Los Angeles BMPs include installation of systems to capture, divert and/or clean the water; installation of drainage systems to divert rain water from gutters to other beneficial uses (e.g., irrigation); and increased stormwater diversion (e.g., expansion of water spreading grounds). Municipal code amendments (adopted 1999), modification of city procedures and new guidelines were prepared by the Bureau of Sanitation, the city's lead agency for NPDES compliance, in coordination with other city agencies.

In January 1999, the EPA directed the RWQCB to establish more stringent standards for eliminating contaminants (trash, chemicals, metals) that are carried by stormwater into local creeks, rivers and drainage systems and are discharged into the ocean. The RWQCB was instructed by the EPA to establish standards for targeted water bodies, including the Los Angeles River, Ballona Creek and Santa Monica Bay.

The current phase of water cleanup includes assessment of "total maximum daily loads" (TMDL) of particular contaminants for specific water bodies. A TMDL is the maximum amount of a pollutant that a water body can tolerate and still maintain the designated beneficial uses.

Beneficial uses include drinking water sources, fishing, habitat maintenance, recreation. The first TMDL program selected by the RWQCB that affects the city is trash pollution of the bays.

Chemical pollution. For over a century, oil, raw sewage and chemical waste have been discharged into the ocean from land sources and ocean vessels. Sometimes contamination has been so bad that it has resulted in injury to wildlife and quarantine of beaches. Chemical contamination of coastal waters and sediments can have long term detrimental effects on plant and animal life. Harmful chemical compounds are carried through the food chain from silt feeding creatures to fish, then to birds and land animals, including humans, that eat fish. Contamination has caused genetic mutations and reduced the numbers plants and animals in some areas, especially near sewer outfalls and chemical concentrations. Some contaminants, like DDT, if ingested can cause cancer, respiratory problems and other illnesses in humans and may contaminate ocean sediments for decades.

The Clean Water Act prohibits dumping of chemicals into water bodies. The Bureau of Sanitation monitors the city's drainage systems, investigates illegal dumping and cites identified offenders. However, existing toxic deposits still threaten human health and the ecological systems of the bays. It will take years for some sediment communities to recover. Some bottom feeding fish continue to carry contaminants at concentration levels that are considered hazardous for human consumption.

The main source of chemical contaminants is from chemicals deposited on the Palos Verdes Shelf between 1949 and 1971 when chemical companies dumped DDT and other toxic chemical waste into the sewer system. The 110 tons of DDT, the world's largest known deposit, is spread over a 17 square mile area of the Palos Verdes Shelf. The dumping was discovered after seals and other marine life began to be affected by chemical poisoning. Commercial fishing of the white croaker has been banned since 1990 from the near shore waters of the shelf, including the Los Angeles harbor, due to high levels of hazardous chemicals in its tissues.

Systematic cleanup of the shelf began in 1998 when the Los Angeles County Sanitation Districts and 155 municipalities agreed to a court settlement. They will pay $45.7 million to a "superfund" operated by the EPA for the cleanup. During the summer of 2000, the EPA began covering 180 acres of the shelf near the White's Point sewer outfall with sand and silt. The controversial experimental program is intended to abate the contamination impacts of the chemical pollutants. The EPA will increase enforcement of the no-fishing zone around the shelf and will expand public information and warnings to consumers, urging them

not to eat white croakers caught off the Palos Verdes Peninsula. Federal and state lawsuits have been filed to recover damage, abatement and restoration costs from companies that allegedly dumped the wastes.

Trash pollution. Trash is a major part of stormwater pollution. In anticipation of major storms, the county erects trash fences or nets at flood control channel outlets to capture debris before it can disperse into the ocean. Some 13 tons of trash was captured at the Ballona Creek outlet during a single heavy early season storm in the fall of 1997. The most common debris is plastic, probably due to the effectiveness of recycling of glass and metal, the common use of plastics and limited plastic recycling programs. The NPDES permit requires improvement of street cleaning to keep debris from ending up in storm drains and improvement of public information programs in the schools and elsewhere to encourage appropriate trash disposal and recycling. The city's NPDES public information program informs people about the damage debris can cause to marine life and encourages use of trash containers. Abatement measures will be expanded under the TMDL related program.

California Environmental Quality Act (CEQA). CEQA requires that potential runoff associated with proposed development projects be evaluated. Stormwater questions are included in the CEQA initial studies checklist in order to assure evaluation of potential impacts, consistent with the 1996 NPDES permit. If potentially significant impacts are identified, imposition of mitigation measures is required to reduce the volume of water that will flow into drainage and flood control systems and bodies of water, to assure maintenance of water quality and to protect against or mitigate potential negative changes in the surface water flow. City CEQA procedures also require evaluation for diversion and capture of water runoff, as required by the NPDES permit.

Santa Monica Bay cleanup. The bay stretches from Point Dume (west of Malibu) to Point Fermin (San Pedro). The federal Water Quality Act designated the bay an "estuary of national significance" (1987). The Santa Monica Bay Restoration Project (SMBRP), a partnership of governmental officials, environmentalists, scientists and representatives of the industrial sector, was established by the state and federal government to prepare a plan for protection and management of the bay. The plan was approved in 1995. Propositions 12 and 13, approved by California voters in March 2000, include funding for plan implementation.

The SMBRP report "Taking the Pulse of the Bay - State of the Bay 1998," assessed the effectiveness of cleanup actions and issues. It estimated that, since the early 1970s, pollution from heavy metals decreased by 67 to 99 percent and pollution from suspended solids decreased by 83

percent (from 250,000 to 43,000 metric tons), in spite of a 25 percent increase in the population of the metropolitan area. Between 1988 and 1997 the annual number of beach closures due to wastewater spills decreased from 46 to 6 events. Even the unusually heavy January and February 1998 storms resulted in spills that closed the beaches for only 27 days. The SMBRP report concluded that overall improvement of the bay was due primarily to cessation of sludge dumping from the city's Hyperion wastewater treatment plant, improved city and county wastewater treatment and efficiency and cessation of chemical dumping.

During the 20-year period there has been a regeneration of plant and animal life along the entire Los Angeles coast. Of particular significance is the regeneration of kelp beds. Kelp attaches to rocky ocean bottoms off Malibu and the Palos Verdes Peninsula. The beds are considered the rain forest of the southern California marine environment. They support over 800 species of fish and invertebrates, some of which live only in kelp communities. The beds were reduced significantly from 1940 to 1974, primarily due to wastewater discharge, sea urchin grazing and oceanographic conditions. With cleaner water and sediments and the replanting of kelp, the beds regenerated and enlarged. Kelp growth leveled off in 1990, possibly due to ocean warming and increased sea urchin grazing. The increase in fish and invertebrate populations associated with the beds contributed to increases in the marine animal populations of the bay, including sea lions, which numbered 150 animals in the mid-1980s and now are estimated to number over 700 animals.

No major changes occurred in the intertidal communities, i.e., the beaches and rocky areas that are exposed by low tides. Invertebrate colonies remained stable, except for black abalone which virtually disappeared from the bay and California coast, probably due to over harvesting and disease. In 1997 the state legislature enacted a 10-year ban on abalone fishing south of San Francisco Bay.

In short, the general health of the Santa Monica Bay improved over the past 20 years but continuing cleanup of contaminated sediments and discharges into the bay is needed. The goal of NPDES and related programs is to reduce contaminants at their source or to capture or divert contaminants before they reach the bay.

San Pedro Bay cleanup. The same type of measures that improved the Santa Monica Bay contributed to cleanup of the San Pedro Bay. The Terminal Island wastewater treatment plant and county outfall system were upgraded (1980s). The Los Angeles and Long Beach harbor authorities enforce dumping and contain spills from sites and facilities over which they have authority. The U.S. Coast Guard is

responsible for management of tanker spills, other spills and ocean vessel discharge incidents within the harbors.

Conclusion. Although the city does not have primary authority over ocean waters, it has a major responsibility in protecting the ocean from water borne contamination from land-based sources.

Continuing issues:

N Contamination of the Santa Monica and San Pedro bays.

N Restoration of the bays.

Ocean objective, policies and programs.

Objective: protect and enhance the diversity and sustainability of the natural ecologies of the Santa Monica and San Pedro bays, including the bay fishery populations.

Policy 1: continue to reduce pollutant discharge into the bays from both natural and human sources.

Program 1: National Pollution Discharge Elimination System (NPDES) permit implementation.

Coordinating agency: *Bureau of Sanitation, with the assistance of all other city agencies.

Program 2: compliance with laws prohibiting discharge of contaminants into the bays and their tributaries.

Responsibility: *Bureau of Sanitation.

Program 3: research and experimentation with methods to upgrade and improve the efficiency of wastewater processing facilities in maintaining high water quality standards.

Responsibility: *Bureau of Sanitation.

Program 4: management of the Los Angeles Harbor in an ecologically sensitive manner.

Responsibility: *Harbor Department.

Policy 2: continue to support legislation and to seek funding and legislation intended for bay and coastal protection, enhancement and habitat restoration.

Program: City legislative program.

Responsibility: *Mayor and *City Council (and City Legislative Analyst).

Policy 3: continue to support and/or participate in programs to clean bay sediments and/or mitigate potentially harmful effects of contaminants in the sediments and waters of the bays.

Program: Palos Verdes shelf cleanup and other programs.

Responsibility: *As appropriate to or designated by the program.

- Safety Element (harbor spillage management, hazardous materials, flooding, drainage) of the General Plan, Los Angeles Department of City Planning, 1996.

SECTION 17: OPEN SPACE/PARKS

It is important to conserve natural open space lands and enhance urban open spaces. "Open space" is a broad term that can include virtually anything from a sidewalk or lawn to the mountains and ocean. It is defined by the California general plan law (Government Code Section 65560) as "any parcel or area of land or water that essentially is unimproved and devoted to an open-space use," whether for preservation and protection of natural resources or for human activity. Virtually every section of this element includes some aspect of open space protection, conservation or enhancement. The general plan Open Space Element will discuss the open space aspects of the city, including park sites and urbanized spaces, e.g., streets. The Public Facilities

Element will address the human use aspects of city park sites. The Conservation Element primarily addresses conservation aspects of the natural open spaces that are addressed by the various subjects contained in this element.

SECTION 18: RESOURCE MANAGEMENT: MINERAL RESOURCES (SAND AND GRAVEL)

Natural mineral deposits are nonrenewable resources that cannot be replaced once they are depleted. The primary mineral resources within the city are rock, gravel and sand deposits. Sand and gravel deposits follow the Los Angeles River flood plain, coastal plain and other water bodies and courses. Significant potential deposit sites have been identified by the state geologist. They lie along the flood plain from the San Fernando Valley through the downtown (Exhibit A). Much of the area identified has been developed with structures and is inaccessible for mining extraction.

Mining of sand and gravel began in Los Angeles around 1900 when concrete became popular as a building material. Extraction began in the Arroyo Seco and the Big Tujunga Wash. From 1920 to the present, the demand for sand and gravel has been spurred by construction associated with growth in California and the southwestern United States. The only currently available deposit site in the city is the Tujunga alluvial fan, which is rich in accumulations of high quality sand and gravel washed from the adjacent mountains.

No on- or off-shore mining of beach or ocean sand is permitted by the State of California within the coastal zone or adjoining ocean of the southern California area. This is to protect the beaches and coastline within the region.

Resource protection/extraction regulation. Authority over mining is divided between state and local jurisdictions. The California Lands Commission has permitting authority over mining relative to off-shore lands and inland lands associated with navigable bodies of water. The California Coastal Commission has permitting authority relative to on- and off-shore lands within the coastal zone (extending inland 1,000 yards from the mean high tide line of the Pacific Ocean). The federal Surface Mining Control and Reclamation Act of 1977 is less comprehensive and less restrictive than the state act. Therefore, the California act is the primary regulator of surface mining within the state. However, mine operators must comply with federal, state and local regulations.

California Surface Mining and Reclamation Act of 1975 (SMARA). SMARA (Public Resources Code Section 2710 et seq.; subsequently amended) is the primary regulator of on-shore surface mining in the state. It

delegates specific regulatory authority to local jurisdictions. The act requires the state geologist (Division of Mines and Geology) to identify all mineral deposits within the state and to classify them as: (1) containing little or no mineral deposits, (2) significant deposits or (3) deposits identified but further evaluation needed. Local jurisdictions are required to enact specific plan procedures to guide mineral conservation and extraction at particular sites and to incorporate mineral resource management policies into their general plans. A particular concern of the state legislators in enacting SMARA was premature loss of minerals and protection of sites threatened by development practices which might preclude future mineral extraction.

In 1979 the state Board of Mining and Geology adopted guidelines for the management of mineral resources and preparation of local plans. The guidelines require local general plans to reference the state-identified mineral deposits and sites that are identified by the state geologist for conservation and/or future mineral extraction. Subsequently the board identified urbanized areas where irreversible land uses precluded mineral extraction. Much of Los Angeles was deemed urbanized and, therefore, exempt from SMARA.

The state geologist classified Mineral Resources Zone-2 (MRZ-2) sites within the city (Exhibit A). MRZ-2 sites contain potentially significant sand and gravel deposits which are to be conserved. Any proposed development plan must consider access to the deposits for purposes of extraction. Much of the area within the MRZ-2 sites in Los Angeles was developed with structures prior to the MRZ-2 classification and, therefore, are unavailable for extraction.

California Environmental Quality Act (CEQA). CEQA requires that impacts on non-renewable mineral resources be evaluated relative to proposed development projects. Where significant mineral deposits are known or are believed to exist, evaluation must be made concerning whether the proposed project will preclude extraction activity and whether the project will cause permanent loss of the mineral resource. If a potential negative impact is identified, measures must be considered for mitigation of the impact.

City regulation/management. To comply with SMARA, Los Angeles adopted (1975) the 'G' Surface Mining supplemental use provisions (LAMC Section 13.03). Subsequent amendments have brought the city's provisions into consistency with new state requirements. The 'G' provisions are land use, not mineral conservation regulations. They regulate the establishment of sand and gravel districts, extraction operations, mitigation of potential noise, dust, traffic and other potential impacts, as well as post-extraction site restoration. Other conditions may be imposed by the city if deemed appropriate.

General plan references. SMARA requires that the general plan identify the MRZ-2 sites and contain resource management provisions. In addition to this element (Exhibit A), MRZ-2 sites are identified in two community plan elements of the city's general plan, the Sun Valley and the Sunland-Tujunga-Lake View Terrace-Shadow Hills-East La Tuna Canyon community plans. All three elements contain resource management provisions.

Conservation. It is the city's policy that construction materials, such as concrete and rock, be recycled to reduce the amount of solid waste that goes into local landfills, thereby extending the life of the landfills. Recycling has a secondary benefit of reducing the demand for sand and gravel and produces recycled materials, which can be substituted for the natural materials.

Conclusion. The city is responsible for implementing the California Surface Mining and Reclamation Act requirements, as they apply to Los Angeles. It does so primarily through land use controls and permit issuance and monitoring.

Continuing issues:

N Loss of remaining, accessible sand and gravel deposits.

N Potential future temporary or permanent loss of important ecological sites, especially in the Tujunga Wash, due to mining.

N Environmental and neighborhood compatible extraction and site reclamation.

Resource management - mineral resources (sand and gravel) objective, policies and programs:

Objective: conserve sand and gravel resources and enable appropriate, environmentally sensitive extraction of sand and gravel deposits.

Policy 1: continue to implement the provisions of the California Surface Mining and Reclamation Act (Public Resources Code Section 2710 et seq.) so as to establish extraction operations at appropriate sites; to minimize operation impacts on adjacent uses, ecologically important areas (e.g., the Tujunga Wash) and ground water; to protect the public health and safety; and to require appropriate restoration, reclamation and reuse of closed sites.

Program 1: administration and periodic updating of the 'G' Surface Mining District overlay zone provisions (LAMC 13.03).

Responsibility: departments of Building and Safety and *City Planning.

Program 2: community plan identification of state designated Mineral Resources Zone-2 sites and including of related resource management provisions.

Responsibility: *Department of City Planning.

Policy 2: continue to encourage the reuse of sand and gravel products, such as concrete, and of alternative materials use in order to reduce the demand for extraction of natural sand and gravel.

Program: recycling of construction materials.

Responsibility: *Bureau of Sanitation and city agencies that conduct or oversee construction projects.

For related information see:

N Sun Valley and Sunland-Tujunga-Lake View Terrace-Shadow Hills-East La Tuna Canyon community plan elements of the Los Angeles City General Plan, Los Angeles Department of City Planning.

SECTION 19: RESOURCE MANAGEMENT (FOSSIL FUELS): OIL

In 1769 a Spanish expedition led by Captain Gaspar de Portolá explored the area now known as Los Angeles. The men discovered "pitch" bubbling from the earth. The pitch was oil tar which still bubbles to the surface in the vicinity of the Los Angeles County Museum of Art and La Brea Tar Pits. Native Indians used the tar as glue and a waterproofing agency. Early settlers and ranchers mined it for a variety of purposes, including for road surfacing. Oil (petroleum) extraction began in 1892 after E.L. Doheny discovered oil near what is now Glendale Boulevard and Second Street. Petroleum extraction and refining continue to be important industries in Los Angeles. Deposits (Exhibit A) underlie portions of downtown and west Los Angeles, the harbor area and the Santa Monica and San Pedro bays. Twenty producing oil fields lie wholly or partially within the city. The Wilmington field is one of the largest in the state. Its 1,332 wells produce 54,612 barrels of oil per day (1996).

Since the early days of oil rigs and open gushers, technology has made drilling, extraction and refining operations safer, more compatible

with surrounding communities and more efficient. Slant drilling and extraction from multiple lines can be accomplished from a single relatively unobtrusive site. For decades the sites have been camouflaged within buildings or behind walls that are designed to make them look like houses, office buildings or other neighborhood compatible structures. State and local regulations protect surrounding neighborhoods from potential odors, noise, hazardous spills, explosions and fires.

Resource protection/extraction regulation.

Federal. The federal government owns submerged lands extending seaward beyond the three-mile state land limit. In 1981 the U.S. Congress began issuing moratoria on expenditure of funds for processing leases within designated offshore tracts (3-mile quadrants). This effectively prohibited issuance of new oil drilling leases by the U.S. Department of Interior within the tracts. In 1984, the moratorium was expanded to include the Santa Monica Bay. All of the southern California shoreline was added in 1985. The ban currently applies to all unleased tracts off the entire west coast, the east coast and parts of Florida and Bristol Bay in Alaska. It is renewed annually by Congress. Various bills were under discussion (1999) to modify the Outer Continental Shelf Lands Act, including modifying or lifting the moratorium.

President George Bush issued an executive order prohibiting the Department of Interior from offering unleased tracts for lease in the same general areas as the expenditure ban. The order expires in 2002. Any President may change a presidential order.

State. The state has regulatory authority over inland lands and owns tidelands and submerged lands extending seaward three miles from the shoreline. Oil and gas deposits within the three-mile limit and on-shore are under the authority of the California Department of Conservation's Division of Oil and Gas. The division regulates extraction of oil and gas, extraction operations and management of oil, gas and geothermal reserves. Drilling permits and off-shore leases are issued by the California Lands Commission.

Consolidated Coastal Sanctuary Act. To protect the coastal ecology, the state legislature (1994) enacted the Consolidated California Coastal Sanctuary Act (Public Resources Code 6240 et seq.). The act consolidated previous coastal protection regulations that had temporarily prohibited issuance of oil drilling leases along individual sections of the California coast. It prohibits offshore drilling within California coastal waters and lands, which were not already leased for drilling. The ban has applied to the Santa Monica Bay since the 1950s. Exceptions allow the commission to issue leases related to national

emergencies and to any company that has a federal lease on adjoining lands, if drilling within the leased three-mile federal quadrant could result in draining an oil reserve that extends into state owned lands.

Coastal Act. The California Coastal Act initiative was approved by state voters (1976) to protect the coastal environment and ensure equitable public access to the beaches and ocean. It invests the California Coastal Commission with the authority of overseeing the coastal zone. The zone is depicted on maps on file with the commission and the city. It extends seaward to the city's outer limit jurisdiction and inland 1,000 yards from the mean high tide line, or further where significant habitats, recreational areas or estuaries exist. The commission establishes policies, standards and procedures for coastal development. It reviews and issues permits for proposed development, including drilling and extraction, within the zone. It can impose conditions on projects or deny permits for projects that are not consistent with the city's local coastal plans (community plans) or that would harm or would interfere with public enjoyment of the coastal environment.

California Environmental Quality Act (CEQA). CEQA requires consideration of potential impacts (e.g., oil spills) of proposed land development projects on the environment. For a project to proceed, potentially negative impacts must be avoided or mitigated to a level of insignificance.

City. For several decades the city has supported the ban on off-shore oil drilling. Its position is due to concern about potential oil spills that could damage the beaches and ecology of the bays.

The city has regulatory authority over on-shore land use within its borders, including issuance of drilling permits, protection of underground water supplies (wells and aquifers), safety considerations relative to hazardous materials management and construction of facilities, consistent with state and federal law. The issue of safety relative to hazardous materials management is addressed in the general plan Safety Element.

The 'O' Oil Drilling supplemental use district provisions of the Municipal Code (Section 13.01) were initially enacted in 1953. They delineate the boundaries within which surface operations for drilling, deepening or operation of an oil well or related facilities are permitted, subject to conditions and requirements set forth in the code and by a Department of City Planning zoning administrator, the Fire Department and city's petroleum administrator of the Office of Administrative and Research Services. The conditions protect surrounding neighborhoods and the environment from potential impacts,

e.g., noise, hazard, spills and visual blight. In addition, the Department of Water and Power monitors drilling operations to assure protection of water wells and aquifers. Property owners, including the city, receive oil production royalties from lands (e.g., city streets) that lie within oil drilling districts (Exhibit A).

Conservation. Petroleum is a non-renewable resource. Many fields in the city already are depleted and extraction from them has been discontinued. Measures related to energy conservation and reducing the city's reliance on oil are addressed by the general plan Infrastructure Systems Element. The city also is experimenting with electric battery vehicles, operates a food container (petroleum product) recycling program and is exploring other ways to reduce reliance on oil and oil products and, thereby, to slow the depletion of petroleum resources.

Other considerations.

Air quality. Oil extracted from the Los Angeles area is heavy in sulfur and other materials that contribute to air pollution. Therefore, Los Angeles oil generally is exported because it is unsuitable for automotive and other local uses, due to potential air quality impacts. Air quality impacts, including petroleum refining operations, are regulated under state and federal law.

Safety issues are addressed by the general plan Safety Element.

Conclusion. The city has primary authority over the issuance and monitoring of land use permits for drilling and drill site restoration. It has an important role to play in lobbying for state and federal concerning permitting and activities that are outside the regulatory authority of the city.

Continuing issues:

N Protection of the Santa Monica and San Pedro bays and inland neighborhoods from potential spills and other hazards potentially associated with oil drilling, production and transport.

N Safe use, storage, transmission and transport.

N Drilling, extraction and site restoration that is compatible with surrounding neighborhoods.

N Depletion of nonrenewable petroleum reserves.

N Reliance on imported oil for electrical energy generation, vehicles and other use which makes the city vulnerable to changes in the international petroleum markets.

N Subsidence.

Resource management (fossil fuels) - petroleum (oil and gas) objective, policies and programs: For storage, accidental release and containment of hazardous materials see the Safety Element and the Hazardous Materials Section of this chapter.

Objective: conserve petroleum resources and enable appropriate, environmentally sensitive extraction of petroleum deposits located within the city's jurisdiction so as to protect the petroleum resources for the use of future generations and to reduce the city's dependency on imported petroleum and petroleum products.

Policy 1: continue to encourage energy conservation and petroleum product reuse.

Program 1: public information and energy conservation incentives programs.

Responsibility: *Department of Water and Power and city agencies that own and/or operate energy generated equipment.

Program 2: petroleum products recycling.

Responsibility: *Bureau of Sanitation and city agencies that use petroleum fueled and lubricated vehicles and equipment.

Program 3: alternative fuel and energy sources research and use.

Responsibility: *Department of Water and Power in cooperation with other agencies that produce alternate energy (e.g., Bureau of Sanitation) and/or operate facilities that have the capability of being converted to alternative energy use.

Policy 2: continue to support state and federal bans on drilling in the Santa Monica Bay and on new drilling along the California coast in order to protect the San Pedro and Santa Monica bays from potential spills associated with drilling, extraction and transport operations.

Program: City legislative program.

Responsibility: *Mayor and *City Council (and City Legislative Analyst).

Policy 3: continue to protect neighborhoods from potential accidents and subsidence associated with drilling, extraction and transport operations, consistent with California Department of Conservation, Division of Oil and Gas requirements.

Program: administer and periodically update the city's 'O' Oil Drilling District provisions.

Responsibility: Office of Administrative and Research Services and departments of *City Planning, Building and Safety, Fire and Water and Power.

N Resource Management Section: Gas; and

N "Safety Element" (hazardous materials and safety), Los Angeles City General Plan, Los Angeles Department of City Planning, 1996.

SECTION 20: RESOURCE MANAGEMENT (FOSSIL FUELS): GAS

The Southern California Gas Company supplies gas for the city. The city does not distribute or regulate natural gas, apart from petroleum extraction activities and gas generated at its landfills, sewage treatment plants and similar facilities. The same regulatory provisions that apply to oil generally apply to gas drilling and extraction, with the city's authority limited to land use and safety. The Department of Water and Power (DWP) purchases gas for electrical generation, but does not sell gas to its customers. Through its electrical energy conservation program it encourages efficient use of natural gas which is one of its fuel resources for production of electricity. Energy efficiency results not only in reducing use demand to protect nonrenewable natural gas resources but reduces energy costs and contributes to improvement of air quality. The issue of safety relative to hazardous materials management is addressed by the Hazardous Materials Section and the general plan Safety Element.

Secondary local sources of gas. In addition to the potential and known sources associated with oil deposits, a minor local source of methane gas is landfills, including city operated landfills. Landfill gas is generated during the fill decomposition process. Due to the hot, dry local climate, it takes an estimated 40 years for decomposition to be completed sufficiently for landfill sites to be converted to public uses. In the interim, the city recovers the gas and either burns it off at the site or converts it to electrical energy for sale to electrical utilities. Methane gas also is produced during the city's sewage treatment process. It is used to generate electrical energy for the treatment plants.

Primary distributor/supplies. The Southern California Gas Company (SCGC) is the largest distributor of natural gas in the nation. It supplies gas to 4.7 million customers, including 4.5 million residential customers within the approximately 32,000 square mile area of southern and central California. The SCGC provides over 937.7 billion cubic feet (Bcf) of natural gas to its southern California customers. At the present rate of usage, average temperature and anticipated growth of population and business, the SCGC projects an increase in demand to 1,033.8 Bcf by the year 2010. An estimated 237 million cubic feet (Mcf) per year will be for Los Angeles city customers, compared to 155 Mcf feet in 1990. The highest demand occurs in colder winter months, usually peaking for residential users in January. Economic and political situations, such as the 1970s oil embargo, also can affect supply and demand.

Most of the SCGC gas comes from on- and off-shore production in California, the San Juan Basin in northwestern New Mexico and southwestern Colorado, the Rocky Mountain region of southwestern Wyoming and from western Canada (primarily the Province of Alberta). The Permian Basin of southeastern New Mexico and west Texas and the Anadarko Basin in western Oklahoma and the Texas panhandle provide alternative sources. The gas is distributed through a network of underground pipelines.

Conservation. Conservation is encouraged by all levels of government. The California Code of Regulations Title 24 requires energy conservation measures in new development projects. The California Environmental Quality Act requires that impacts on nonrenewable energy resources be considered and that potential significant negative impacts be mitigated to a level of insignificance. Mitigation measures typically require development projects to include gas conservation measures to the satisfaction of the SCGC.

Air quality requirements continue to affect the demand for natural gas. New federal automotive gasoline fuel specifications (1995) resulted in

an increase in refinery production. State and federal requirements for reduction in air pollutants have spurred the development of alternative low emission fuels for automotive vehicles including development of vehicles fueled by natural gas and powered by electrical systems. The first natural gas vehicles were introduced into southern California in 1992. As natural gas vehicles become more reliable, versatile, cost-efficient, readily available and less expensive to buy and maintain, demand for natural gas fuel is anticipated to increase significantly.

To encourage efficient use of gas, SCGC provides free information and consultation to its customers. It provides analyses of homes and facilities concerning how to reduce energy costs through efficient use of electrical and natural gas systems, including selection and financing of energy efficient equipment, building materials and project design. To low income households SCGC offers to install basic weatherization measures at no cost.

Industry deregulation. Deregulation of the gas industry has resulted in an increase in gas providers who compete with the SCGC. It is anticipated that deregulation of the California electric industry will result in increased demand for gas used in generation of electrical energy and will impact gas recovery approaches. For example, enhanced oil recovery (injection of steam into oil-bearing geologic areas to enhance extraction by lowering oil viscosity), which has been a declining technology, is anticipated to continue declining due to restructuring, resulting in alternate, less costly, fuel sources for the southern California market.

Conclusion. The city has little regulatory authority over gas production and distribution, except relative to land use (e.g., drilling), safety issues (e.g., storage facilities) and gas that is produced at wastewater processing facilities and city landfill sites. It works cooperatively with the SCGC to provide information to the public regarding energy conservation and safety.

Continuing issues:

N Depletion of nonrenewable natural gas resources.

N Safe use, storage, transmission and transport of gas.

Resource management (fossil fuels) - petroleum (oil and gas) objectives, policies and programs: see prior section (oil).

For related information see:

- "Infrastructure Systems Element" (electrical and other city managed energy resources and conservation), Los Angeles City General Plan (under preparation);

- Hazardous Materials Section;

- Resource Management Section: Oil; and

- "Safety Element" (hazardous materials), City of the Los Angeles General Plan, Los Angeles Department of City Planning, 1996.

Caveat Exhibit B: the exhibit identifies Open Space Zone (OS) sites that are of sufficient size, scale or linear extension to qualify as features of city wide significance. Along with parks they are provided for purposes of showing the relationship of the sites to Significant Ecological Areas and other conservation resource areas. The OS Zone only applies to publicly owned open space.

Exhibit sources and explanatory notes:

1. Note: only significantly large parcels or geographic areas that are classified on the Los Angeles City Comprehensive Zoning Ordinance as 'OS' Open Space Zone, 'O' Oil Drilling District, 'G' Surface Mining District or 'K' Equinekeeping District are shown on these exhibits.

2. Source: "Farmland Mapping and Monitoring Program," California Department of Conservation, 1998.

   Note: the site identified is a portion of Pierce College. "Unique Farmland" is denoted by the state as "Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the two update cycles prior to the mapping date."

   Other lands identified by the Department of Conservation but not depicted on this exhibit are "Urban and Built Up Land," i.e., land which is occupied by structures of at least one unit to 1.5 acres or approximately six structures to a 10-acre parcel and is no longer primarily in farming use.

Draft Supplemental Environmental Impact Report/Environmental Impact Statement and Section 4(f) Evaluation

Prepared by the
State of California Department of Transportation

The environmental review, consultation, and any other action required in accordance with applicable Federal laws for this project is being, or has been, carried out by Caltrans under its assumption of responsibility pursuant to 23 USC 327.

Caltrans will issue a single document that consists of the Final Environmental Impact Statement and Record of Decision pursuant to Pub. L. 112-141, 126 Stat. 405, Section 1319(b) unless it is determined that statutory criteria or practicability considerations preclude issuance of such a combined document.

3.17 Plant Species

3.17.1 Regulatory Setting

The U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) have regulatory responsibility for the protection of special-status plant species. "Special-status" species are selected for protection because they are rare and/or subject to population and habitat declines. Special status is a general term for species that are provided varying levels of regulatory protection. The highest level of protection is given to threatened and endangered species; these are species that are formally listed or proposed for listing as endangered or threatened under the Federal Endangered Species Act (FESA) and/or the California Endangered Species Act (CESA). Please see the Threatened and Endangered Species section 3.19 in this document for detailed information about these species.

This section of the document discusses all the other special-status plant species, including CDFW species of special concern, USFWS candidate species, and California Native Plant Society (CNPS) rare and endangered plants.

The regulatory requirements for FESA can be found at 16 United States Code (USC), Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. The regulatory requirements for CESA can be found at California Fish and Game Code, Section 2050, et seq. Department projects are also subject to the Native Plant Protection Act, found at Fish and Game Code, Section 1900-1913, and the California Environmental Quality Act (CEQA), CA Public Resources Code, Sections 2100–21177.

3.17.2 Affected Environment

This section is based on the *Natural Environment Study* (NES; December 2015), the *Supplemental Natural Environment Study* (Supplemental NES; April 2016), and the *Biological Assessment* (BA; April 2016) prepared for the Proposed Project.

A literature review and a records search were conducted to identify the existence or potential occurrence of special-status plant species located within or in the vicinity of the Biological Study Area (BSA). The most recent records of the California Natural Diversity Data Base (CNDDB) (Commercial Version) and the California Rare Plant Rank (CRPR; formerly the CNPS Electronic Inventory of Rare and Endangered Vascular Plants of California) (2011, 2013, and 2014) were reviewed for the quadrangles containing and surrounding the BSA (i.e., the *Orange, Yorba Linda,*

Black Star Canyon, and *Prado Dam, California,* United States Geological Survey [USGS] 7.5-minute quadrangles). These databases contain records of reported occurrences of federal- or State-listed endangered, threatened, proposed endangered or threatened species; California Species of Special Concern (SSC); or otherwise special-status species or habitat that may occur within or in the immediate vicinity of the BSA. In addition, a list of species occurring in the County of Orange was obtained from the USFWS Information, Planning, and Conservation (IPaC) System online database on May 19 and June 15, 2011, September 9, 2013, and December 1, 2014. Official species lists were obtained from the USFWS on January 22, 2014, February 2, 2015, February 11, 2016, and September 16, 2016.

Reconnaissance-level surveys and plant community mapping were conducted on May 10, 2011, March 17, 2015, and March 19, 2015. A full season of focused botanical surveys within the BSA were conducted on May 10 and June 28, 2011. A late season botanical survey was conducted on August 22, 2013, and early season focused botanical surveys were conducted on May 15, 16, 20, and 27, 2014, which completed a full season plant survey. In addition, botanical surveys of the recently added slope area south of SR-91 were conducted on March 17 and 19, 2015.

The results of the literature review indicated that a total of 39 special-status plant species have the potential to occur within or in the vicinity of the BSA. Seven are Federal- and/or State-listed as threatened or endangered species and are discussed in Section 3.19, Threatened and Endangered Species.

Of the remaining 32 special-status plant species identified through the literature review as potentially occurring in the BSA, it was determined that the BSA does not contain suitable habitat for the following 16 species:

- Coulter's saltbush (*Atriplex coulteri*)
- South Coast saltscale (*Atriplex pacifica*)
- Davidson's saltscale (*Atriplex serenana* var. *davidsonii*)
- Malibu baccharis (*Baccharis malibuensis*)
- Lucky morning-glory (*Calystegia felix*)
- Smooth tarplant (*Centromadia pungens* ssp. *laevis*)
- Long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*)
- White-bracted spineflower (*Chorizanthe xanti* var. *leucotheca*)
- Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)
- Heart-leaved pitcher sage (*Lepechinia cardiophylla*)

- Jokerst's monardella (*Monardella australis* ssp. *jokerstii*)
- Hall's monardella (*Monardella macrantha* ssp. *hallii*)
- Mud nama (*Nama stenocarpum*)
- California beardtongue (*Penstemon californicus*)
- Santiago Peak phacelia (*Phacelia keckii*)
- Salt Spring checkerbloom (*Sidalcea neomexicana*)

None of these 16 special-status plant species were observed or otherwise detected in the BSA at the time of the surveys. Therefore, these species are considered absent from the BSA and are not discussed further in this section.

Suitable habitat for the remaining 16 special-status plant species occurs or potentially occurs in the BSA. These special-status plant species are:

- Chaparral sand-verbena (*Abronia villosa* var. *aurita*)
- Intermediate mariposa lily (*Calochortus weedii* var. *intermedius*)
- Lewis' evening-primrose (*Camissoniopsis lewisii*)
- Southern tarplant (*Centromadia parryi* ssp. *australis*)
- Many-stemmed dudleya (*Dudleya multicaulis*)
- Tecate cypress (*Hesperocyparis forbesii*)
- Vernal barley (*Hordeum intercedens*)
- Southern California black walnut (*Juglans californica*)
- Intermediate mondardella (*Monardella hypoleuca* ssp. *intermedia*)
- Felt-leaved monardella (*Monardella macrantha* ssp. *hallii*)
- Chaparral nolina (*Nolina cismontane*)
- Allen's pentachaeta (*Pentachaeta aurea* ssp. *allenii*)
- White rabbit-tobacco (*Pseudognaphalium leucocephalum*)
- Coulter's matilija poppy (*Romneya coulteri*)
- Chaparral ragwort (*Senecio aphanactis*)
- San Bernardino aster (*Symphyotrichum defoliatum*)

However, with the exception of California black walnut and Coulter's matilija poppy, none of these species was found in the BSA during botanical surveys conducted in 2011, 2013, and 2014, which were performed during the appropriate blooming period for these species when they would have been observed. Therefore, those 14 species are also considered absent from the BSA. California black walnut and Coulter's matilija poppy are the only special status species present in the BSA and are discussed further below.

3.17.2.1 California Black Walnut

Southern California black walnut (California walnut or California black walnut) is not federally and/or State-listed and has no official status. However, California walnut merits consideration under CEQA because of the relatively limited distribution of California walnut woodland, and it is a CNPS CRPR 4 species (plants of limited distribution). California walnut is only found in Southern California. Recent construction has removed this habitat in many areas, and its future is uncertain. California walnut prefers very loose, moist soil on steep hillsides with northern and eastern exposures at elevations below 900 feet (ft), although it is not confined to these areas. California walnut occurs within many other plant communities and is often a component of grassland, coastal sage scrub (CSS), chaparral, riparian woodland, oak woodland, and mixed canyon woodland.

California walnut trees were observed in the BSA during botanical surveys conducted in 2011, 2013, and 2014. Figure 3.15.1, provided earlier, shows the locations where California walnut trees were observed.

- Approximately 3 individual California black walnut trees were observed in the median of the SR-241/SR-91 junction, specifically the median in the north end of SR-241 (Sheet 6 of Figure 3.15.1). All of these individuals were saplings less than 5 ft tall, with trunk diameters less than 5 inches.
- Approximately 10 individual trees were observed north of SR-91, adjacent to the SR-91 westbound off-ramp at Gypsum Canyon Road (Sheet 6 of Figure 3.15.1).
- Approximately 10 to 20 scattered mature individual trees were observed on the north side of a sound wall northwest of the SR-91 /Gypsum Canyon Road interchange adjacent to the Canyon RV Park, which is located within the boundaries of Featherly Regional Park(Sheets 5 and 6 of Figure 3.15.1).

3.17.2.2 Coulter's Matilija Poppy

Coulter's Matilija poppy is not federally and/or State listed and has no official status. However, Coulter's Matilija poppy merits consideration because of its relatively limited distribution in California. Coulter's Matilija poppy is a perennial shrub that grows to up to 8 ft tall. It has large paper mâché-like flowers that are white with a yellow center. It occurs in CSS and chaparral habitats up to 4,000 ft in elevation. This species is a California Special Plant and a CNPS 4 species (plants of limited distribution).

Suitable habitat exists for this species in the BSA and it was observed in the BSA during the August 2013 and May 2014 botanical surveys. Figure 3.15.1 (Sheets 7 and 8) shows the locations where Coulter's Matilija poppies were observed in the BSA. During the focused surveys in 2013, approximately 100 individuals were observed south of SR-91, east of SR-241. Two additional individuals were observed approximately 0.25 mile farther east. In spring 2014, poppies were found at these 2013 locations, with 45 additional individuals found in the vicinity. In 2013 and 2014, a total of 147 plants were identified in the BSA.

3.17.3 Environmental Consequences

3.17.3.1 Temporary Impacts

Build Alternative (Two-Lane Express Lanes Connector) (Preferred Alternative)

California Black Walnut

The California black walnut trees at the Gypsum Canyon off-ramp and those at the adjacent Canyon RV Park would not be directly impacted by the Proposed Project because they are outside the proposed temporary impact area and some are protected by an existing sound wall. There may be temporary indirect impacts to the Gypsum Canyon off-ramp trees due to potential fuel spills from construction equipment and activities of equipment or personnel outside designated construction areas and Environmentally Sensitive Areas (ESAs) in the vicinity of the trees. The Canyon RV Park walnut trees are outside of the proposed temporary impact area and are protected by an existing sound wall.

Measure PS-1, provided later in this section, which requires barriers to be installed around the protected zone of any California black walnut tree, would avoid and/or minimize temporary impacts to California black walnut trees.

Coulter's Matilija Poppy

There may be direct temporary impacts to Coulter's Matilija poppy. Potential temporary indirect impacts to this plant include potential fuel spills from construction equipment and activities of equipment or personnel outside designated construction areas and ESAs. This plant may be partially and/or fully removed during soil disturbance. To the extent feasible, this plant would be protected in place, once the full extent of the soil disturbance is known. Coulter's Matilija poppy is not protected by any federal, State, or local regulations, and project impacts to this CNPS CRPR 4 species are relatively limited. Therefore, no compensatory mitigation is required. Measure PS-3, provided later in this section, which requires barriers to be installed

around the protected zone of any Coulter's Matilija poppies, would avoid and/or minimize temporary impacts to Coulter's Matilija poppy.

No Build Alternative

The No Build Alternative does not include any improvements to SR 241 or SR-91 in the Project Area. Therefore, no temporary impacts to special-status plant species would occur as a result of the No Build Alternative.

3.17.3.2 Permanent Impacts

Build Alternative (Two-Lane Express Lanes Connector) (Preferred Alternative)

California Black Walnut

California black walnut trees are not protected by any federal, State, or local regulations. As shown in Figure 3.15.2 (Sheets 5 and 6 of Figure 3.15.2), the Proposed Project may result in permanent direct impacts to three California black walnut saplings, a CNPS CRPR 4 species, in the median of the SR-241/SR-91 interchange (at the north end of SR-241). Permanent impacts may include complete removal, heavy encroachment, or extensive branch removal that may have substantial detrimental impacts to the long-term viability of the trees due to the placement of the overhead connector. These three saplings would be protected in place, to the extent feasible. While these three saplings may be permanently impacted by the Proposed Project, the complete removal of these three saplings is not expected to substantially affect the long-term viability of this species because it is a CNPS CRPR 4 species. They are young trees, and they occur outside a native woodland habitat.

The California black walnut trees at the Gypsum Canyon off-ramp and the adjacent Canyon RV Park are not expected to be directly impacted by the Proposed Project. Permanent indirect impacts due to increased storm water runoff, traffic, litter, or through enhancing the germination and proliferation of nonnative invasive plant species is highly unlikely due to the location of these walnut trees adjacent to the Gypsum Canyon off-ramp. The Gypsum Canyon off-ramp and Canyon RV Park walnut trees are outside the Project Area, and some of the trees are protected by an existing sound wall.

Furthermore, the California black walnut trees that may be permanently impacted by the Proposed Project consist of a few individual saplings located within a median. These three saplings are not in a natural walnut woodland setting. Therefore, potential removal of these few individuals by the Proposed Project does not require any

compensatory mitigation. Measure PS-1, provided later in this section, which requires barriers to be installed around the protected zone of any California black walnut tree, and Measure PS-2, which requires the relocation of the California black walnut saplings located in the median of the SR-241/SR-91 interchange (if feasible), would avoid and/or minimize permanent impacts to California black walnut.

Coulter's Matilija Poppy

The Coulter's Matilija poppies within the slope area south of SR-91 would be removed to accommodate drainage improvements and an access road. Figure 3.15.2 illustrates where the Proposed Project would impact Coulter's Matilija poppies. While some or all of these individuals may be permanently impacted by the Proposed Project, even the complete removal of these populations is not expected to substantially affect the long-term viability of this species as it is a CNPS CRPR 4 species that is growing in marginal quality habitat adjacent to SR-91.

Coulter's Matilija poppy is not protected by any federal, State, or local regulations, and project impacts to this CNPS CRPR 4 species are relatively limited. Therefore, no compensatory mitigation is required. Measure PS-3, which requires barriers to be installed around the protected zone of any Coulter's Matilija poppies, would minimize permanent impacts to Coulter's Matilija poppy.

No Build Alternative

The No Build Alternative does not include any improvements to the SR-241 or SR-91 in the Project Area. Therefore, no permanent impacts to special-status plant species would occur as a result of the No Build Alternative.

3.17.4 Avoidance, Minimization, and/or Mitigation Measures

The following measure would avoid and/or minimize impacts to California black walnut trees:

Measure PS-1 **California Black Walnut Environmentally Sensitive Areas.** Prior to clearing or construction, highly visible barriers (such as orange construction fencing) will be installed around the protected zone of any southern California black walnut tree and designated as an Environmentally Sensitive Area (ESA) to be preserved for those trees not within the footprint of project structures or areas of ground disturbance. The protected zone will extend 5 feet (ft) outside of the drip line or 15 ft from the trunk of the tree, whichever is greater. No grading or fill

activity of any type will be permitted within the ESA. In addition, no construction activities, materials, or equipment will be allowed within the ESAs. All construction equipment will be operated in a manner so as to prevent accidental damage to nearby California black walnut trees. No structure of any kind, or incidental storage of equipment or supplies, will be allowed within the ESA. Silt fence barriers will be installed at the ESA boundary to prevent accidental deposition of fill material in areas where trees are immediately adjacent to planned grading activities.

Measure PS-2 **California Black Walnut Sapling Relocations.** The California black walnut saplings in the median of the SR-241/ SR-91 interchange will be assessed at the time of construction and relocated within Caltrans right-of-way, if feasible.

The following measure would avoid and/or minimize impacts to Coulter's Matilija poppies:

Measure PS-3 **Coulter's Matilija Poppies Environmentally Sensitive Areas.** Prior to clearing or construction, highly visible barriers (such as orange construction fencing) will be installed around the protected zone of any Coulter's Matilija poppies and designated as an ESA to be preserved to the extent feasible. The protected zone will extend 5 ft outside of the vegetation edge. No grading or fill activity of any type will be permitted within the ESA. In addition, no construction activities, materials, or equipment will be allowed within the ESAs. All construction equipment will be operated in a manner so as to prevent accidental damage to nearby Coulter's Matilija poppies. No structure of any kind, or incidental storage of equipment or supplies, will be allowed within the ESA. Silt fence barriers will be installed at the ESA boundary to prevent accidental deposition of fill material in areas where Coulter's Matilija poppies are adjacent to planned grading activities.

Introductory

SPECIES: Juglans californica

AUTHORSHIP AND CITATION:
Esser, Lora. 1993. Juglans californica. In: Fire Effects Information System, [Online]. U.S. Department of Agriculture, Forest Service, Rocky Mountain Research Station, Fire Sciences Laboratory (Producer). Available: https://www.fs.fed.us/database/feis/plants/tree/jugcal/all.html [2020, November 21].

ABBREVIATION:
JUGCAL

SYNONYMS:
Juglans californica S. Watson var. californica

NRCS PLANT CODE:
JUCA

COMMON NAMES:
southern California walnut
California walnut
California black walnut
southern California black walnut

TAXONOMY:
The scientific name of southern California walnut is Juglans californica S. Watson [19,25,37]. Southern California walnut hybridizes readily

with black walnut (J. nigra) and English walnut (J. regia).

LIFE FORM:
Tree

FEDERAL LEGAL STATUS:
None [37]

OTHER STATUS:
Southern California walnut woodland is severely threatened by urbanization. The Nature Conservancy, in cooperation with the state of California, is giving high priority to aquiring vegetative/habitat data on the woodland. They list it as one of California's rare and imperiled natural communities [1,5].

DISTRIBUTION AND OCCURRENCE

SPECIES: Juglans californica

GENERAL DISTRIBUTION:
Southern California walnut is endemic to California [10]. The current distribution of southern California walnut-dominated forests and woodlands is limited to the Santa Clarita River drainage in the vicinity of Sulphur Mountain, small stands in the Simi Hills and Santa Susana Mountains, the north slope of the Santa Monica Mountains, and the San Jose, Puente, and Chino hills. The best remaining stands are in the San Jose Hills [8]. Outside of this range, southern California walnut occurs in Santa Barbara, western San Bernardino, and northern San Diego counties [25]. It is conspicuously absent from the coastal foothills of the Santa Ana Mountains, San Diego County [33].

Southern california walnut is cultivated in Hawaii [38].

ECOSYSTEMS:
FRES28 Western hardwoods
FRES34 Chaparral - mountain shrub

STATES:
CA HI

BLM PHYSIOGRAPHIC REGIONS:
3 Southern Pacific Border
7 Lower Basin and Range

KUCHLER PLANT ASSOCIATIONS:
K030 California oakwoods

K033 Chaparral
K035 Coastal sagebrush

SAF COVER TYPES:
246 California black oak
248 Knobcone pine
249 Canyon live oak
250 Blue oak - gray pine
255 California coast live oak

SRM (RANGELAND) COVER TYPES:
NO-ENTRY

HABITAT TYPES AND PLANT COMMUNITIES:
Southern California walnut woodland may be monospecific or mixed. Coast live oak (Quercus agrifolia) frequently codominants in the walnut woodland [13]. Between Santa Barbara and Orange counties, southern California walnut is locally dominant or codominant in the coast live oak phase of oak woodland [1,8]. Narrow, isolated stands of southern California walnut sometimes occur in chaparral [29]. Occasionally, southern California walnut is found in coastal sage scrub [9].

Classifications naming southern California walnut as a dominant or indicator species are as follows:

Community ecology and distribution of California hardwood forests and woodlands [1]
Californian evergreen forest and woodland [5]
Oak woodland [8]
Vegetation types of the San Gabriel Mountains [9]
Demographic structure of southern California walnut (Juglans californica; Juglandaceae) woodlands in southern California [13]
An introduction to the plant communities of the Santa Ana and San Jacinto Mountains [33].

Associated species not previously mentioned include arroyo willow (Salix lasiolepis), California sycamore (Platanus racemosa), white alder (Alnus rhombifolia), California bay (Umbellularia californica), laurel sumac (Malosma laurina), sugar sumac (Rhus ovata), toyon (Heteromeles arbutifolia), Mexican elder (Sambucus mexicana), redberry (Rhamnus crocea), coffeeberry (R. californica), hollyleaf cherry (Prunus ilicifolia), birchleaf mountain-mahogany (Cercocarpus betuloides), California scrub oak (Quercus dumosa), poison-oak (Toxicodendron diversilobum), spiny ceanothus (Ceanothus spinosus), bigpod ceanothus (C. megacarpus), California sagebrush (Artemisia californica), California buckwheat (Eriogonum fasciculatum), black sage (Salvia mellifera), fuschia-flower gooseberry (Ribes speciosum), brome (Bromus spp.), wild oat (Avena fatua), sweetscented bedstraw (Galium triflorum), rape mustard (Brassica rapa), wildrye (Elymus spp.), and Mexican whorled milkweed (Asclepias fascicularis) [9,13,14,18,24,28].

MANAGEMENT CONSIDERATIONS

SPECIES: Juglans californica

IMPORTANCE TO LIVESTOCK AND WILDLIFE:
Southern California walnut forests and woodlands provide favorable habitat for a number of vertebrates and invertebrates. A 2-year survey in a southern California walnut woodland in the San Jose Hills found 29 species of diurnal birds [25]. Many rodents, including California ground squirrels and western gray squirrels, eat the nuts [11,25]. The nuts are rarely eaten by deer [25].

PALATABILITY:
NO-ENTRY

NUTRITIONAL VALUE:
NO-ENTRY

COVER VALUE:
Larger southern California walnut trees provide excellent cover for deer, nesting birds, and rodents [25]. Raptors such as owls use the upper reaches of trees as roosts and nesting places. California ground squirrels dig burrows at the bases of old trees [25].

VALUE FOR REHABILITATION OF DISTURBED SITES:
Southern California walnut has been successfully planted for erosion control on road slopes with deep soil at elevations below 3,500 feet (1,066 m). Best growth is achieved in partial shade [11]. In Los Angeles County, southern California walnut was planted in brush wattles during construction of a road fill. Trees reached heights of 12 feet (3.7 m) in 10 years [11].

OTHER USES AND VALUES:
Humans eat the nuts of southern California walnut, but the nuts are not grown commercially [25]. Chumash Indians ate the walnuts and used the nutshells for dice. They used the bark for making baskets [31]. Southern California walnut is suitable for ornamental landscaping and is widely planted in urban forestry projects [11,13].

OTHER MANAGEMENT CONSIDERATIONS:
Southern California walnut communities are in decline [5,10]. Threats include urban and rural development, overgrazing, and increased recreational use of walnut woodlands [14,25]. In Aliso Creek, Chino Hills State Park, cattle grazing initiated dry conditions, which were worsened by a 5-year drought. The resulting very dry environment hindered survival of walnut seedlings [14]. Grazing has been the principal economic activity in California walnut forests and woodlands for 200 years. The species composition of the southern California walnut woodland understory in the Puente and San Jose hills is

attributed to overgrazing by cattle [25].

Pathogens: Southern California walnut is highly susceptible to crown (Phytophthora spp.) rots. Walnuts planted in soil infested with P. citricola and flooded for 48 hours biweekly showed reduced growth and high rates of mortality [17].

In the San Jose Hills, southern California walnut develop heart rot between 20 to 30 years of age. Portions of the trunk and older limbs subsequently become infested with termites and wood-boring beetles. Older multistemmed trees often have some stems that are healthy, some with heart rot, and others that are dead [25].

BOTANICAL AND ECOLOGICAL CHARACTERISTICS

SPECIES: Juglans californica

GENERAL BOTANICAL CHARACTERISTICS:
Southern California walnut is a native, deciduous tree that grows from 20 to 49 feet (6-15 m) tall [15,21]. It varies considerably in morphology according to the age of the tree and site characteristics. Trees in savanna woodland tend to have multiple trunks which grow outward from a ring at the base, giving younger trees the appearance of "V"-shaped shrubs. Trees in more dense stands tend to be single-stemmed and taller [13,25]. The strongly scented trunk is blackish brown and becomes deeply furrowed with age [15]. The root system is extensive, often with a deep taproot [11]. The leaves are 1.5 to 3 inches (3.5-7.5 cm) long [15]. Southern California walnut trees live to be about 100 years old [11].

Southern California walnut is monoecious [15,21]. Slender staminate catkins develop on the wood of the previous year. Pistillate flowers are borne singly or in clusters in short terminal spikes on the current year's growth [4]. The globose fruit is contained in an indehiscent husk or shell that does not open at maturity [4,15].

RAUNKIAER LIFE FORM:
Phanerophyte

REGENERATION PROCESSES:
Sexual reproduction: Southern California walnut produces seed at 5 to 8 years of age [4]. Variations in precipitation from year to year can affect fruit production and seedling establishment. In drought years little or no fruit is produced [13]. Seeds do not have a dormancy period and usually germinate within 4 weeks of dispersal [4,13]. In the spring in the San Jose Hills, densities of 4,742 seedlings per acre (2,000/ha) have been reported [25]. The western gray squirrel may be an important dispersal agent for walnut seed [25].

Vegetative reproduction: Southern California walnut sprouts from the root crown and trunk following cutting or burning [25,29].

SITE CHARACTERISTICS:
Southern California walnut occurs in a mediterranean climate, characterized by mild, wet winters and hot, dry summers [12]. Trees generally occur on mesic sites such as north slopes, creekbeds, canyon bottoms, and alluvial terraces [5,19,25]. Trees grow best in deep, alluvial soils with high water-holding capacity. Soils are high in clay content [10,25]. At California State Polytechnic University, soils beneath walnut forests are 3.3 feet (1 m) deep [25].

Elevation: Although southern California walnut has been successfully planted at elevations up to 3,500 feet (1,066 m), it usually occurs from 500 to 2,500 feet (150-760 m) elevation [1,25].

SUCCESSIONAL STATUS:
NO-ENTRY

SEASONAL DEVELOPMENT:
Southern California walnut leaves appear in January and February, with all trees in full leaf by March [25]. Trees on warmer or drier sites develop leaves several weeks earlier than those in cooler, more mesic locations. Flowering begins about the same time as leaf production, with fruits developing to full size during spring. By late summer fruits have matured. Fruit abscission begins in October and November, but some fruits remain on the tree throughout winter [25].

FIRE ECOLOGY

SPECIES: Juglans californica

FIRE ECOLOGY OR ADAPTATIONS:
Southern California walnut has large woody platforms at the soil surface. The platforms shield the meristematic tissue beneath them from fire. After fire, sprouts surround the platforms, resulting in multiple trunks [25]. According to Quinn [25], the basal platforms are an adaptation to fire similar to the lignotuber.

Most southern California walnut woodlands are subject to periodic fires. Fire is an annual possibility in most locations, where dead annual grasses are present beneath and between the trees during the summer fire season [25].

FIRE REGIMES:
Find fire regime information for the plant communities in which this species may occur by entering the species name in the FEIS home page under "Find Fire Regimes".

POSTFIRE REGENERATION STRATEGY:
Tree with adventitious-bud root crown/soboliferous species root sucker

FIRE EFFECTS

SPECIES: Juglans californica

IMMEDIATE FIRE EFFECT ON PLANT:
Southern California walnut trees are top-killed by most fires [25].

PLANT RESPONSE TO FIRE:
Southern California walnut recovers well from fire. It sprouts vigorously from the trunk and root crown when top-killed by fire, but does not produce seedlings, an indication that most seeds are killed by fire [11]. In Los Angeles County, 10-year-old southern California walnuts were severely burned. Sprouts from the root crowns reached 5 feet (1.5 m) during postfire year 1 [11]. Southern California walnut was sprouting from the root crown 3 years and 8 months after a fire in Big Sycamore Canyon, Ventura County, in the fall of 1973 [29].

Several hundred trees were burned in July 1989 at California State Polytechnic University. One year after fire there was no evidence of dead trees, even though most of the branches and stems had been top-killed. Almost all of the trees sprouted from the root crown within 6 weeks of the fire [25].

FIRE MANAGEMENT CONSIDERATIONS:
In plant communities near urban areas, the overstory of oak and walnut is a special resource that managers usually protect from fire. However, the understory of these forests can be burned during cool weather to eliminate accumulated ground fuels and produce a shaded fuelbreak [28].

Quinn [25] suggested that prescribed fires of low intensity, at intervals of several years, be tested for their effects on southern California walnut communities.

DEMOGRAPHIC STRUCTURE OF CALIFORNIA BLACK WALNUT (*JUGLANS CALIFORNICA*; JUGLANDACEAE) WOODLANDS IN SOUTHERN CALIFORNIA

JON E. KEELEY
Department of Biology, Occidental College,
Los Angeles, CA 90041

ABSTRACT

Three woodlands dominated by California black walnut were studied. At one site, *Quercus agrifolia* was a co-dominant whereas at the other two sites *Juglans californica* dominated >90% of the relative areal coverage. *Heteromeles arbutifolia* was a significant component of all three woodlands. At two of the sites most of the walnuts were single-stemmed and some of them exceeded 15 m in height. Another site was a more open savanna type woodland and many trees had multiple stems; 40% had 4 or more stems per plant and one had 16 stems. The age structure of the three *Juglans* populations is presented. At all sites there were stems at least 70 years of age. All populations had substantial seedling recruitment and densities ranged from 275 to 1975 seedlings (defined as stems ≤ 5 years of age and not attached to a mature tree) per hectare. It is hypothesized that irregularities in annual seedling establishment and seedling mortality play an important role in structuring these populations.

California black walnut (*Juglans californica*, nomenclature according to Munz 1974) is a low growing hardwood tree endemic to southern California. Woodlands dominated by this walnut occur in the southern Santa Inez and Santa Susana Mountains of Ventura Co. and the eastern-most portion of the Santa Monica Mountains and foothills of eastern Los Angeles Co. Most of these woodlands occur below 500 m although well-developed walnut woodlands may extend up to 1000 m (e.g., the north side of Oat Mt. in the Santa Susana Mts.). Outside of this range, *J. californica* occurs more often as scattered individuals amongst other hardwoods which form the Southern Oak Woodland Community. *Juglans californica* extends eastward to the western flanks of the San Bernardino Mts. and south to northern San Diego Co. (Beauchamp 1986). The northern limit of distribution appears to be central Santa Barbara Co.; reports of the species in San Luis Obispo Co. are considered to be either ascribable to *J. hindsii* (Jeps.) Jeps. (Hoover 1970) or plantings (Griffin and Critchfield 1972). The tree has been used in southern California as a rootstock for commercial walnut crops, and it has been widely planted in urban forestry projects, e.g., in the western Santa Monica Mountains (Radtke 1978).

Despite widespread current interest in California hardwoods, *Ju-*

MADROÑO, Vol. 37, No. 4, pp. 237–248, 1990

glans californica woodlands have not received much attention. Apart from a few papers on the systematic affinities (Jepson 1908, 1917; Thomsen 1963) the only studies are two unpublished master's theses (Swanson 1967; Leskinen 1972). Throughout its range this species tends to be best developed on N-facing slopes with deep, well developed soils with high water-holding capacity derived from Tertiary marine shales. On many sites it is closely associated with two other tree species, *Quercus agrifolia* and *Heteromeles arbutifolia* (the latter is often associated with adjacent chaparral communities where, due to frequent fires, it is a shrub). Swanson (1967) reported that *Juglans* seedling reproduction was absent in the Los Angeles Co. population he studied and suggested this was due to low precipitation.

Due to urban sprawl much of the California black walnut woodland has been destroyed or is threatened, and it is considered to be one of California's rare and imperiled natural communities (Jones & Stokes Associates 1987). An understanding of the age structure of such woodlands is an important first step towards evaluating the reproductive status and, thus, the future health of the remaining remant woodland stands. The focus of this study was to assess the age structure of three *Juglans californica* stands.

Study Sites and Methods

Study sites. Three sites of one to several hectares of walnut woodland were located as follows. 1, N-facing slope of Sulphur Mt. (350 m elev.) W of Hwy 150, 10 km N of Santa Paula, Ventura Co.; 2, N-facing slope of Mt. Washington (250 m), 3 km NE of Elysisan Park, city of Los Angeles, Los Angeles Co.; 3, E-facing slope (225 m) in Montecito Park, 5 km SW of South Pasadena, city of Los Angeles, Los Angeles Co.

Methods. At each site, 18 10 × 10 m plots were randomly located and the basal diameter of stems of all tree and large shrub species within the plots was recorded. Stems connected to the same root-crown were indicated and the height and diameter of the canopy of each individual was recorded. Heights of trees beyond the reach of a 4 m pole were determined by calculation from the geometric relationship between angle to the top of the tree (measured with an inclinometer) and distance to the tree along the same contour. At each site nine to 10 *Juglans* trees were cored at 25 cm above the ground with an increment borer and the basal diameter, areal diameter and height were recorded. Also, 18 seedlings and saplings, too small to be cored, were cut and a section of the stem near the base was removed. The increment cores and stem sections were returned to the lab for ring counts.

The quadrat data were analyzed for community indices of density and coverage for all woody species. Basal coverage and areal cov-

TABLE 1. RELATIVE AREAL COVERAGE, BASAL AREA COVERAGE, AND DENSITY FOR *JUGLANS CALIFORNICA* DOMINATED WOODLAND ON THE NORTH-FACING SLOPE OF SULPHUR MT., VENTURA COUNTY, CALIFORNIA.

Species	Relative areal coverage (%)	Basal area coverage (m^2/ha)	Density (no./ha)	
			Stems	Individuals
Juglans californica				
Alive	49	11.4	3925	3500
Dead	<1	<0.1	50	50
Quercus agrifolia	39	38.2	1390	1240
Heteromeles arbutifolia	12	1.6	1450	1140
Sambucus mexicana	<1	<0.1	90	80
Rhamnus crocea	<1	<0.1	30	30

erage were calculated by assuming the trunks and canopies approximated a circle. Densities of stems (ramets) as well as individuals (genets) were calculated. The *Juglans* cores and stem sections were sanded and the number of rings determined. On older stems the coloration of the heartwood made ring counts impossible without first bleaching with a 5% solution of sodium hypochlorite. It was assumed that rings were laid down annually, a reasonable assumption for a temperate climate deciduous tree, and true for other trees in southern California (Schulman 1947). A regression analysis of age and basal diameter was done using a linear regression and polynomial regression program available on BMDP (Brown 1977). The equation giving the best fit was used to predict the ages of all *Juglans* stems recorded in the quadrats.

RESULTS

There were marked differences in the community characteristics of the three walnut woodlands. At the Sulphur Mt. Site (Table 1) *Quercus agrifolia* (coast live oak) was a co-dominant whereas at the other two sites (Tables 2 and 3) *Juglans californica* was the only dominant. At Sulphur Mt. areal coverage was estimated to be greater for walnut but due to the massive trunks of several of the live oaks, basal area coverage was substantially greater for that species. At this site the *J. californica* were nearly all single stemmed and thus the number of individual genets was similar to the number of stems (ramets) (Table 1). Although *Juglans* was the only dominant at the other two sites (Tables 2 and 3) there were marked differences between these two stands. At the Mt. Washington Site *J. californica* basal area coverage was double that recorded at Montecito Park whereas the latter site had more than double the number of stems as the Mt. Washington Site. In other words the Mt. Washington Site

TABLE 2. RELATIVE AREAL COVERAGE, BASAL AREA COVERAGE, AND DENSITY FOR *JUGLANS CALIFORNICA* DOMINATED WOODLAND ON THE NORTH-FACING SLOPE OF MT. WASHINGTON, LOS ANGELES COUNTY, CALIFORNIA.

Species	Relative areal coverage (%)	Basal area coverage (m^2/ha)	Density (no./ha)	
			Stems	Individuals
Juglans californica				
Alive	90	38.4	1360	1130
Dead	<1	0.1	50	50
Heteromeles arbutifolia	8	3.4	410	150
Prunus ilicifolia	2	0.6	220	200

was a woodland of large, mostly single-stemmed, trees whereas the Montecito Park Site was a more open woodland with many smaller, multiple-stemmed trees and a greater number of dead *Juglans* trunks. At all sites *Heteromeles arbutifolia* was a significant component of these woodlands. *Sambucus mexicana, Rhamnus ilicifolia, Prunus ilicifolia,* and *Toxicodendron diversilobum* were present at all three sites, although they were not always recorded from the plots. Swanson (1967) reported putative hybrids between *J. californica* × *J. regia* from an area on Sulphur Mt.; however, I did not observe any at the Sulphur Mt. Site.

The distribution of stem diameters of the three co-dominants at Sulphur Mt. showed marked differences. For *J. californica* (Fig. 1) there was more continuous distribution of size classes (up to 85 mm) compared to that for *Q. agrifolia* (Fig. 1). This coast live oak population had 90% of the stems in the smallest size class and very few greater than 25 mm. The maximum stem diameter was 1000 mm for *Q. agrifolia* which was nearly three times greater than the largest *J. californica* and six times greater than the largest *H. arbutifolia* (Fig. 1).

The tallest *J. californica* trees were 11 m although only 10% of the population was greater than 5 m. *Quercus agrifolia* reached 18 m and 10% were taller than 10 m. Several of the *Heteromeles arbutifolia* were 10 m in height.

At the Sulphur Mt. Site, 27 *Juglans* stems were aged and the oldest was 98 years. Age was significantly correlated with all of the parameters measured: basal diameter (Fig. 2), areal diameter (Fig. 2) and height (Fig. 2). The relationship between age and areal canopy diameter was best described by a linear equation whereas the relationship between age and basal diameter or age and height best fit a higher order polynomial equation. The regression equation relating age and basal diameter was used to estimate the ages of the

TABLE 3. RELATIVE AREAL COVERAGE, BASAL AREA COVERAGE, AND DENSITY FOR *JUGLANS CALIFORNICA* DOMINATED WOODLAND ON AN EAST-FACING SLOPE IN MONTECITO HEIGHTS, LOS ANGELES COUNTY, CALIFORNIA.

Species	Relative areal coverage (%)	Basal area coverage (m^2/ha)	Density (no./ha)	
			Stems	Individuals
Juglans californica				
Alive	95	19.6	2790	1710
Dead	3	4.2	478	100
Heteromeles arbutifolia	1	0.1	78	20
Prunus ilicifolia	1	<0.1	20	10

Juglans stems recorded from the quadrats and these are shown in Fig. 3. The oldest trees encountered in the sampling were estimated to be about 73 years of age. Fifty percent of the population, or 1975/ha, were estimated to be seedlings (defined as stems ≤ 5 years of age and not attached to a matured tree). This seedling pool had an areal canopy diameter of ≤ 0.5 m and 20% of this cohort exceeded 1.0 m in height. There were gaps in some age classes but most were represented and the decrease in density with age best fit a negative third order polynomial relationship ($p < 0.001$, $r = 0.95$).

At the Mt. Washington Site stem diameters of *Juglans* were significantly larger than those observed at Sulphur Mt. with the largest being 900 mm. Heights of these trees were also greater; one tree was 15.5 m and 10% of the population exceeded 8 m. The same pattern of larger trees at this site was observed for *H. arbutifolia*. One stem had a basal diameter of 575 mm and a height of 11 m. The only other woody species recorded was *Prunus ilicifolia* although many of the specimens appeared to be hybrids with *P. lyonii* (a Channel Island endemic) which grew at the site and may have escaped from cultivation or been planted by aerial spraying (Radtke 1978). At this site the largest *Juglans* stem cored was rotted in the middle so the exact age was unknown. From the intact cores, a linear model was the best fit between age and basal diameter. Using this equation the largest *Juglans* stem encountered in the quadrat sampling was estimated to be 132 years of age (Fig. 3). Only 25% of the stems (275/ha) were 1–5 year old seedlings and the decrease in density of older age classes approximated a second order polynomial curve ($p < 0.01$, $r = 0.94$).

At the Montecito Park Site the largest *Juglans* stem had a diameter of 675 mm and was 10 m tall. The largest *Heteromeles* stem had a basal diameter of only 71 mm. The oldest *Juglans* stem aged was 81 years of age and a linear model was the best fit for the age/

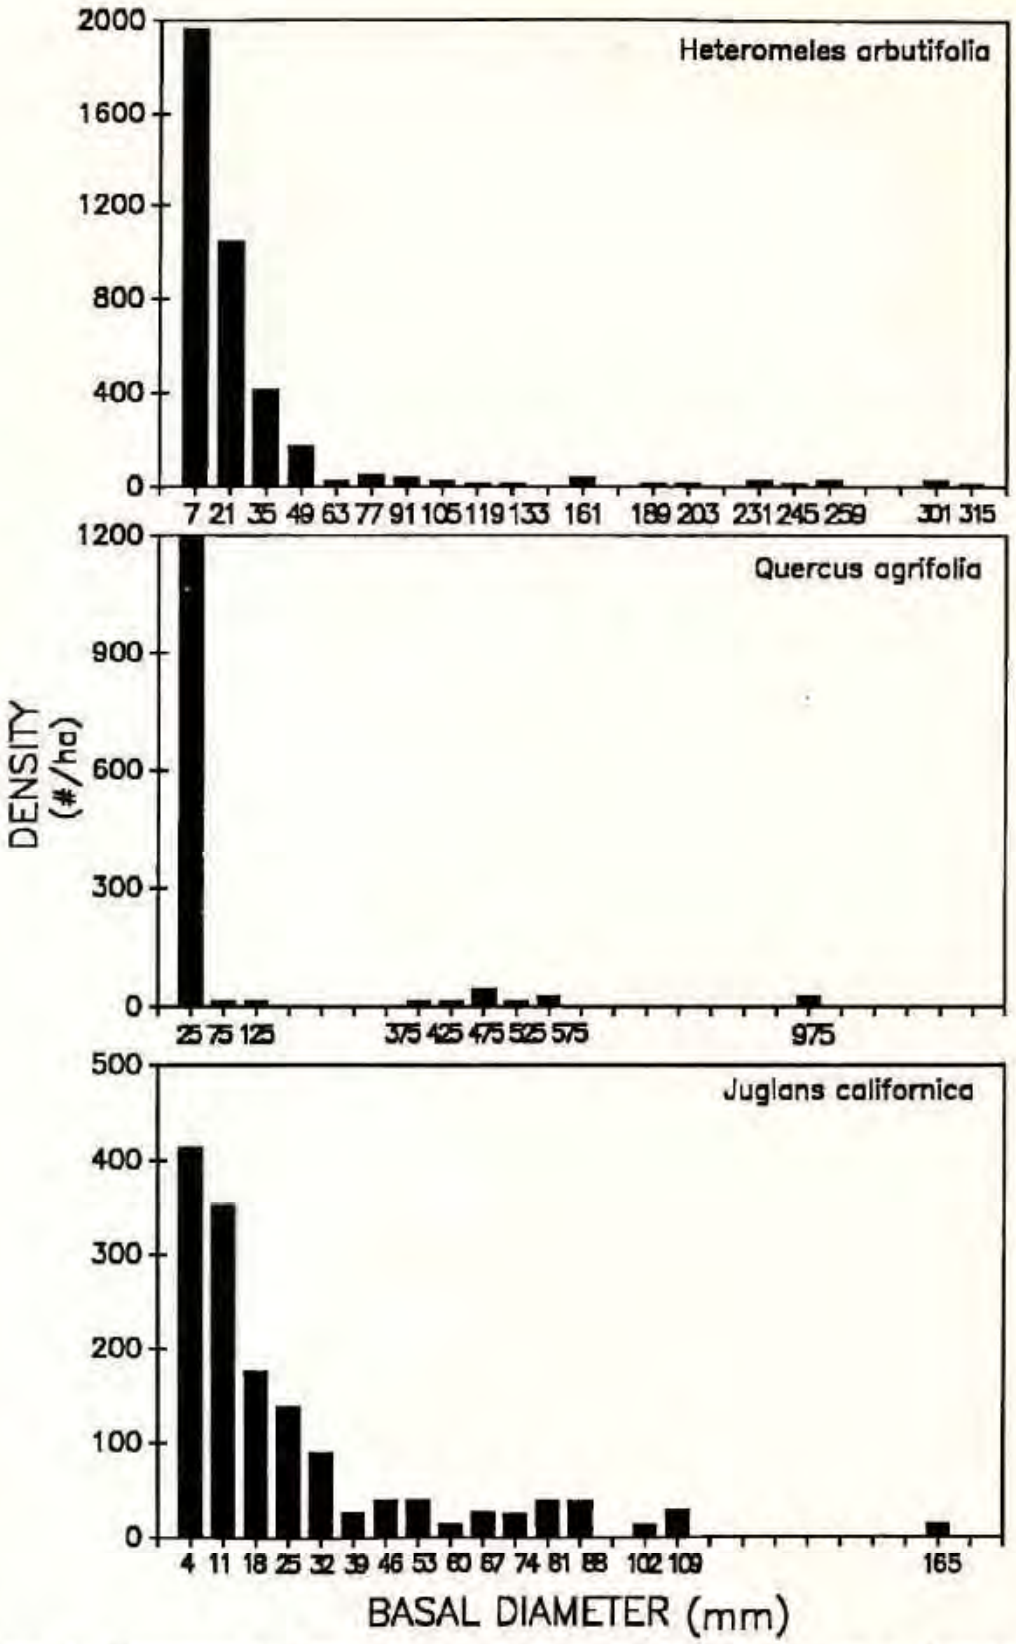

FIG. 1. Frequency distribution of stem diameters for *Juglans californica, Quercus agrifolia,* and *Heteromeles arbutifolia* at the Sulphur Mt. Site.

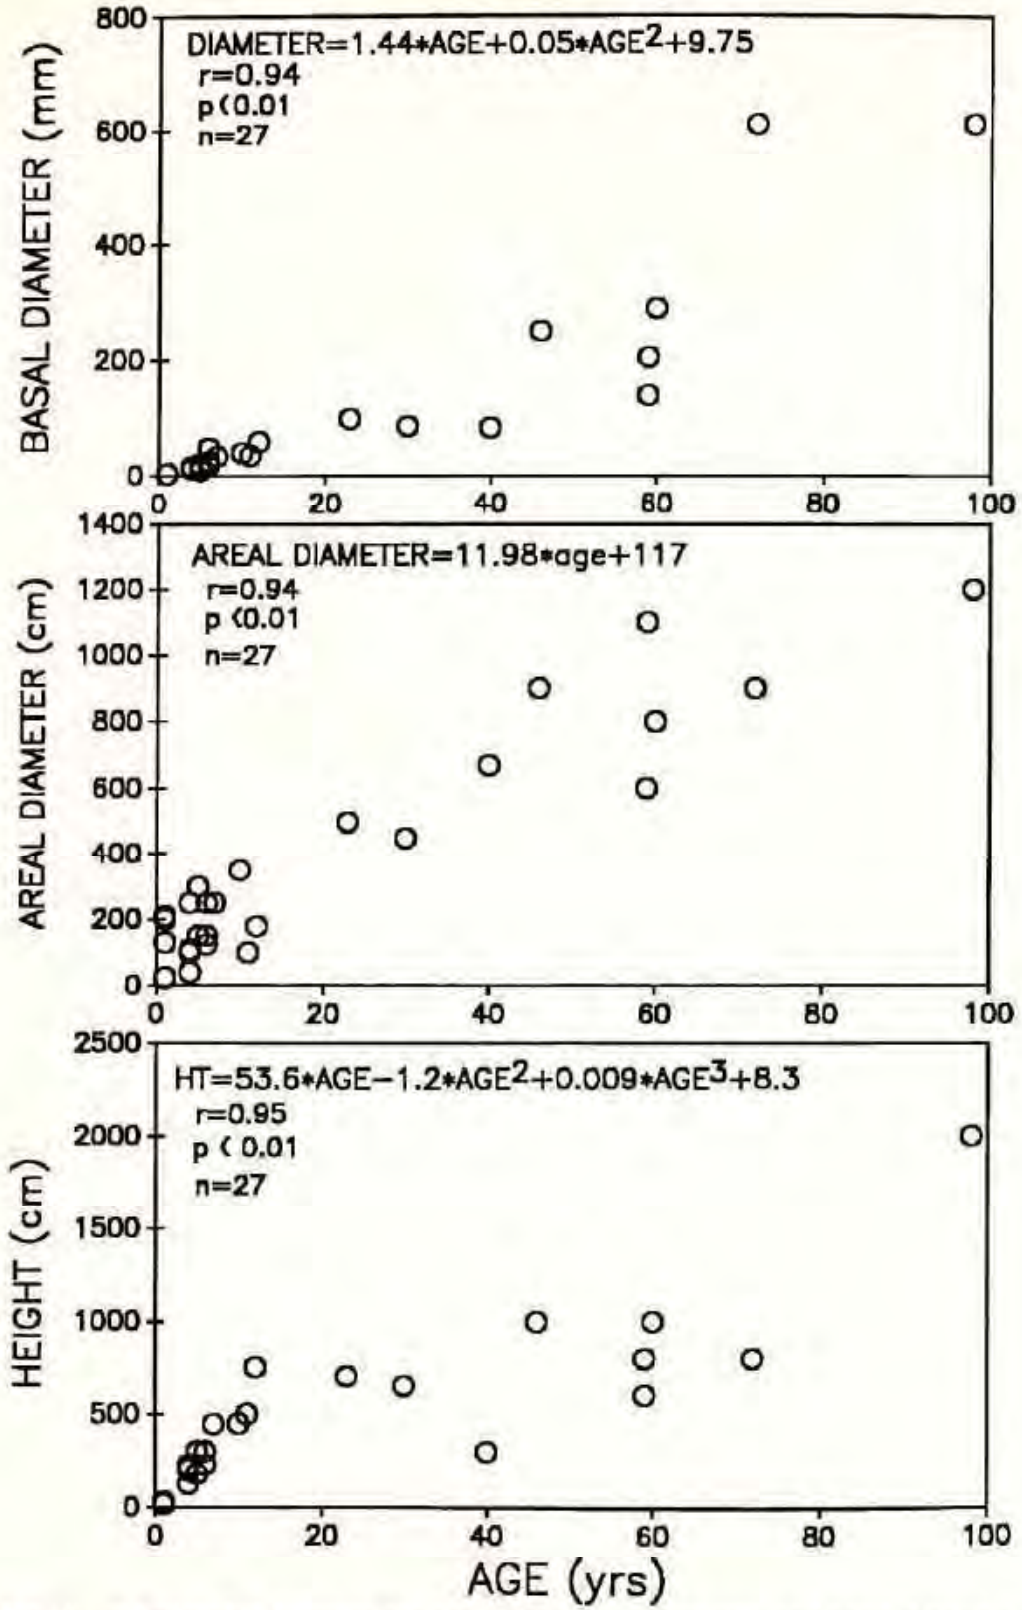

FIG. 2. Relationship between age and height, areal diameter, and basal diameter, for *Juglans californica* at the Sulphur Mt. Site.

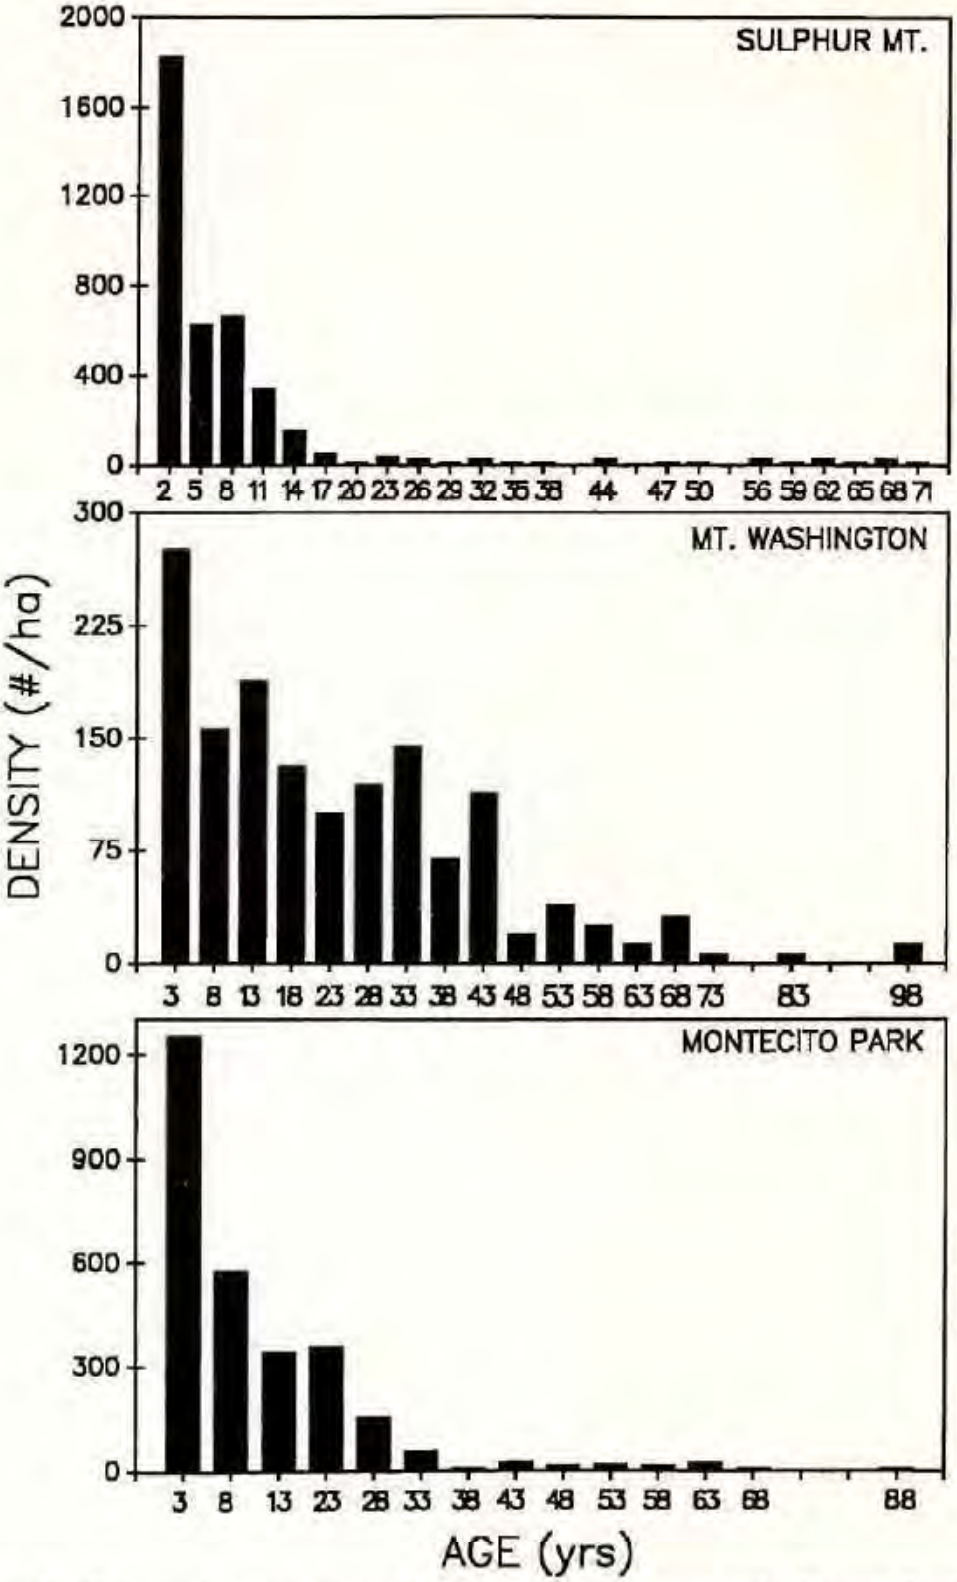

FIG. 3. Estimated age structure of *Juglans californica* stems at the three study sites (live = solid bar, dead = open bar). Age of stems recorded in the random quadrat sampling was predicted from the equations: Sulphur Mt. Site: Age = 0.313·Diameter

diameter relationship. This equation predicted the oldest tree sampled in the quadrats was 77 years (Fig. 3) and that 45% of the population of *Juglans* stems (1250/ha) were ≤ 5 years of age. There was a very rapid drop in density of older age classes which approximated a third order polynomial curve ($p < 0.001$, $r = 0.97$). As can be seen in Table 3, there were many more stems than individual genets at this site. Seedlings and saplings were seldom multiple-stemmed, rather these were generally the larger trees. Of these, 40% had four or more stems and one tree had 16 stems. The age-structure of individual genets, as reflected in a histogram of the oldest stem on each genet (not shown), was compared with the histogram for all stems (Fig. 3). The shape of these histograms was remarkably similar and the number of individual genets ≤5 years (i.e., seedlings) was 51% of the population or 860/ha.

Discussion

Black walnut woodlands in southern California may be dominated by *Juglans californica* alone or walnuts associated with sclerophyllous evergreen trees. The most common ones reported in this study, *Quercus agrifolia* and *Heteromeles arbutifolia,* have also been reported from other studies (Swanson 1967; Leskinen 1972; Campbell 1980). Axelrod (1977) contends that this *Juglans* dominated woodland is quite ancient, dating back to at least the Miocene when it was associated with an even greater array of evergreen broadleaf trees.

A number of the evergreen trees and shrubs currently associated with *Juglans* woodlands, e.g., *Heteromeles arbutifolia, Prunus ilicifolia,* and *Rhamnus ilicifolia,* are common elements in the widespread chaparral community which is often juxtaposed with walnut woodlands. These evergreens persist in the fire-prone chaparral due to their proclivity to resprout after fire. The reproductive biology of these evergreens, however, is poorly adapted to this community in that the seeds have no imposed dormancy and thus germinate readily after dispersal. These seedlings do not survive in most chaparral stands; consequently, seedling reproduction by these species is seldom observed in chaparral. Reports of reproduction are usually restricted to extremely old chaparral (Keeley and Keeley 1988) or woodlands, as observed in this study. These taxa persist in walnut woodlands, as well as other broadleaf woodlands (Campbell 1980), as "gap-phase" species, which is consistent with the fact that these

---

$- 0.00029 \cdot \text{Diameter}^2 + 0.08$ ($p < 0.001$, $r = 0.96$, $n = 27$); Mt. Washington Site: $\text{Age} = 0.141 \cdot \text{Diameter} + 4.77$ ($p < 0.001$, $r = 0.91$, $n = 25$); Montecito Park Site: $\text{Age} = 0.126 \cdot \text{Diameter} + 3.59$ ($p < 0.001$, $r = 0.93$, $n = 23$).

species produce bright, red, bird-dispersed berries unlike most other chaparral taxa. These evergreen taxa have been part of oak woodlands and the mixed evergreen forest since at least Miocene (Axelrod 1977) and today are still considered to be "characteristic components" of four different woodland communities in California (Barbour and Major 1977).

The three sites studied here describe woodlands of quite different structure. The Montecito Park Site was the most open savanna-like woodland of the three sites. Total dominance of all woody species (as measured by basal area coverage) was less than half that observed at the other two sites. Records of prior disturbance in this area are non-existent. Observations of the surrounding hills, which are dominated by *Brassica nigra* and other non-native annuals with remnants of a few resprouting chaparral shrubs, suggests this area has burned frequently in the past; a characteristic of much of the Los Angeles Basin (Freudenberger et al. 1987). The savanna-like aspect of the Montecito Park Site may be due to such disturbance. The multiple-stem character of most of the walnut trees at that site would be consistent with that hypothesis since this species resprouts readily after burning. In addition, the significant number of sizeable dead *Juglans* at this site (Table 3) compared to very few at the older Mt. Washington Site (Table 2) also supports the idea that fires have been a part of the Montecito Site's history.

The Mt. Washington Site is an example of a more closed-canopy type woodland with a much greater dominance of *Juglans*. The structure of this woodland suggests it has been free from disturbance for an extended period of time. Most of the walnuts are single-stemmed and there are many large specimen trees, both *J. californica* and *H. arbutifolia*, of extraordinary size. There was no obvious evidence of fire at this site in recent decades as was true of the Sulphur Mt. Site, which likewise had mostly single-stemmed walnut trees.

Seedling regeneration of *Juglans* was evident at all three sites. The density of seedlings at Sulphur Mt. was similar to that observed by Swanson (1967) for a site near our Sulphur Mt. site. Neither of the Los Angeles Co. sites described here lacked seedling reproduction as Swanson (1967) reported for his Brea Canyon site in eastern Los Angeles Co. He hypothesized that this lack of *Juglans* seedling establishment was due to the lower precipitation in the southern part of its range. His hypothesis seems unlikely in light of the continuous seedling establishment apparent over the past several decades in the two Los Angeles Co. sites described here (Fig. 3). Intensive cattle grazing present at Swanson's (1967) Brea Canyon Site may account for lack of seedling recruitment there; grazing in recent decades has not been a factor at any of the sites described here. The large seedling population observed at the Montecito Park Site suggests that, if protected from fire, eventually this savanna-like woodland may develop into a denser woodland.

Interpretation of the age structures reported here requires careful analysis. If we assume that all three populations have constant rates of annual recruitment, and mortality is constant with age, we could conclude that these populations are relatively stable. That is, barring disturbance, recruitment and survival of seedlings and saplings is sufficient to maintain these populations in the future. If these assumptions were true one could account for gaps in certain age classes by a low intensity disturbance such as a ground fire which selectively eliminated seedlings during those years but failed to kill older age classes. Such a hypothesis seems unlikely since, due to the low canopies and lack of self-pruning in these walnuts, fires generally are much more intense and consume the entire canopy of the forest.

In general, a model of constant recruitment and constant mortality is probably a poor one for interpreting age structure of walnut populations. The shape of age-structures (Fig. 3) could be explained by an increase in fruit production as the trees in the forest age. This is an unlikely explanation since abundant fruit production is observed on trees after about 20 years (pers. obs.) plus the Mt. Washington stand with the largest and oldest trees did not have greater seedling production than the other two younger stands.

I suggest reproduction and mortality are not constants in these walnut populations and that they vary in a stochastic rather than a deterministic manner. Although no quantitative data exist on *Juglans californica* reproduction, one can readily observe years of little or no fruit production, commonly in drought years, in contrast to mast years of very heavy walnut production during wetter years. Since the seeds of this species have no imposed dormancy and germinate readily after dispersal (Keeley 1987), it follows that seedling establishment would not be constant from year to year. Due to the potentially lethal effect of occasional severe droughts, it seems likely that mortality is also not constant for all age cohorts. Thus, I hypothesize that gaps in certain age classes in some of the age structures presented here are due to annual variations in recruitment and mortality, resulting from annual differences in climate, especially precipitation.

Acknowledgments

I thank Cheryl Swift for assistance in making figures, J. Griffin, V. L. Holland, and D. Keil for helpful comments on the ms and R. Quinn whose symposium talk stimulated completion of this project.

Natural Communities

Natural Communities have been part of the Natural Heritage conservation triad, along with plants and animals, since the inception in 1979 of California's natural heritage program, the California Natural Diversity Data Base (CNDDB). Natural Community elements were at first classified according to "Preliminary Descriptions of the Terrestrial Natural Communities of California" (Holland 1986). Since the mid-1990s, however, CDFW and our partners, including the California Native Plant Society (CNPS), have been working on classifying vegetation types using the state standards embodied in the Survey of California Vegetation, which comply with the National Vegetation Classification Standard (NVCS). We now use the terms "Natural Communities" and "vegetation types" interchangeably.

NVCS is a hierarchical classification, with the most granular level being the Association. Associations are grouped into Alliances, Alliances into Groups, and upward, as follows:

- Formation Class
    - Formation Subclass
        - Formation
            - Division
                - Macrogroup
                    - Group
                        - Alliance
                            - Association

The classification for California was first published as the Manual of California Vegetation in 1995, updated in the second edition of the Manual (Sawyer et al. 2009), and is now most easily accessed in the Manual of California Vegetation Online. However, because we are continually updating the classification based on new projects, much information is also in project-specific classification and mapping reports.

Semi-natural Alliances and Special Stands

The classification also includes **Semi-natural Alliances** and **Special Stands**. Semi-natural Alliances are strongly dominated by non-native plants that have become naturalized in the state. **Special Stands** are specific patches of vegetation in the landscape that are unique from other patches, which may appear structurally

that are unique from other patches, which may appear structurally distinctive as well as rare. These are usually defined by the presence of locally-dominant but globally or regionally rare plant taxa, including plants on the California Native Plant Society's Inventory of Rare and Endangered Plants of California or the Department's Special Plants List. The rare species typically defines the type (e.g., Callitropsis abramsiana), and stands usually establish in less redundancy (e.g., less than 10 stands) across the landscape than other vegetation types. Certain rare plants establish with a unique set of species within certain climatic and edaphic conditions, and they typically co-dominate with a rare assemblage of species. In the case of certain more widespread taxa, the stands in California may be so isolated from other stands in the species range that we don't know whether they represent an alliance, association or an outlier stand. **Provisional Alliances** and **Provisional Semi-natural Alliances** are types for which we have fewer than 10 stands sampled, but which we expect will prove to be more widespread.

Sensitive Natural Communities

Natural Communities are evaluated using NatureServe's Heritage Methodology, the same system used to assign global and state rarity ranks for plant and animal species in the CNDDB. VegCAMP has been ranking California Natural Communities by their rarity and threat since the inception of the program. However, since 2012 the ranking methodology has become more transparent and defensible through the advent of a rank calculator. VegCAMP and the California Native Plant Society's Vegetation Program now use this calculator to rank Natural Communities; rankings are reviewed by both programs.

The basic ranking concepts of rarity and threats used in the "Heritage Methodology" since the 1970's remain the same, using the best and most recent scientific information available. However, as a result of better definitions based on classification and mapping of California's Natural Communities, we can apply standardized quantitative rarity and threat parameters and compute weighted scores for rarity and threats. For rarity, the

ranking involves the knowledge of range and distribution of a given type of vegetation, and the proportion of occurrences that are of good ecological integrity. Threats and trends are likewise considered in categories such as residential and commercial development, agriculture, energy production and mining, and invasive and other problematic species and genes (among others). Threat scope (typically assessed within a 20-year timeframe for vegetation) and severity are used to calculate an overall threat score, which is added to the overall rarity score for a single rank of 1 through 5. Evaluation is done at both the Global (full natural range within and outside of California) and State (within California) levels resulting in a single G (global) and S (state) rank ranging from 1 (very rare and threatened) to 5 (demonstrably secure). For more details on the components of ranking see the “factor reference sheet” on the conservation rank calculator mentioned above.

Natural Communities with ranks of S1-S3 are considered Sensitive Natural Communities to be addressed in the environmental review processes of CEQA and its equivalents. A question mark (?) denotes an inexact numeric rank because we know we have insufficient samples over the full expected range of the type, but existing information points to this rank; it is the equivalent of the NatureServe rank calculator's "range of rankings" option.

We have not provided the G and S rank for all associations in the current version of the list. However, associations currently designated as being of S3 or rarer are indicated with a Y in the Sensitive column. For alliances with State ranks of S1-S3, all associations within them are also considered Sensitive. Note that Alliances that are not considered sensitive may contain associations that are marked with a Y in the Sensitive column. Membership rules for associations can be found in project-level reports as referenced in the MCV Online Alliance descriptions. If you have questions about these please contact VegCAMP staff.

Ranking is an ongoing process and we expect to provide association level ranks for all of the S3 or rarer entities in the future. Please note that Semi-natural Alliances are not ranked, as these are defined by non-native species.

As of 2018, about half of California has been mapped and classified according to the state and national standard. Accordingly, not all Sensitive Natural Communities have been described, and the ranks of some current communities may change as we refine their known distributions. However, rankings are based on the best available information.

Our mapping standards call for a minimum mapping unit (MMU) of not greater than 10 acres for upland communities, but usually 1 or 2 acres, with wetlands and other special types such as sensitive natural communities being mapped at a MMU of ¼ acre. These MMUs are used for regional-scale projects and are based on the available imagery or other data and the budget or speed at which the mapping must be done. For project-level review maps, the MMUs will likely be smaller; higher resolution imagery and the ability of ecologists to visit all or most of the stands on the ground can allow a higher resolution map. MMUs may also vary by lifeform, with even very small MMUs for sensitive herbaceous communities, for example, Selaginella bigelovii stands on a rock outcrop. They may also be smaller for types of concern such as invading Arundo donax stands that will need treatment, depending on the purpose of the map. MMUs will depend on the needs or requirements of the lead and trustee agencies and the needs for impact assessment and mitigation planning. A consideration related to this is the separation distances between trees and shrubs, which can help determine, for a particular landscape, what is a stand of shrub or tree vegetation vs. emergent shrubs or trees over a stand in a different life form.

As noted above, some associations are considered sensitive even though the alliance in which they nest are not. Thus, an alliance-level regional map may not portray stands of association-level sensitive natural communities. For project-level maps for environmental review, all sensitive natural communities should be mapped, even if at the association level.

Natural Communities Lists

The documents below provide the Vegetation Classification and

Mapping Program's current list of vegetation Alliances, Associations, and Special Stands, and their Global and State rarity ranks. We have not ranked all associations with specific G and S ranks, except those defined from specific projects where they are well-understood geographically and so are more accurately ranked than placed within the broader "Sensitive" category. Natural Communities with ranks of 1-3 are considered sensitive and marked with a Y in the rightmost column. A "?" indicates our best estimate of the rank when we know we have insufficient samples over the full expected range of the type, but existing information points to this rank. Semi-Natural Stands are included but not ranked. Pending additions are at the bottom of the list. For previous lists, contact any VegCAMP staff.

Addressing Sensitive Natural Communities in Environmental Review

- Identify all Natural Communities within the project footprint using the best means possible, for example, keying them out in the Manual of California, Second Edition (Sawyer et al. 2009) or in classification or mapping reports from the region, available on VegCAMP's Reports and Maps page.
- Refer to the current standard list of Natural Communities to determine if any of these types are ranked Sensitive (S1-S3 rank); if so, see CEQA Guidelines checklist at IVb.
- Other considerations when assessing potential impacts to Sensitive Natural Communities from a project include:
    1. Compliance with state and federal wetland and

1. Compliance with state and federal wetland and riparian policies and codes, as certain Natural Communities are restricted to wetlands or riparian settings.
2. Compliance with the Native Plant Protection Act and the state and federal Endangered Species Acts, as some Natural Communities either support rare species or are defined by the dominance or presence of such species.
3. Compliance with CEQA Guidelines Section 15065(a), which mandates completion of an EIR if a project would threaten to eliminate a plant community.
4. Compliance with local regional plans, regulations, or ordinances that call for consideration of impacts to Natural Communities.
5. Vegetation types that are not on the state's sensitive list but that may be considered rare or unique to the region under CEQA Guidelines Section 15125(c).

- If a Natural Community in the project area has not previously been described, it may be a rare type. In this case, please contact VegCAMP (Rachelle Boul) about documenting the Natural Community.
- If there are Sensitive Natural Communities on your project site and you need guidance regarding their significance, assessment of quality or value, and potential impacts, contact the appropriate regional staff person through the local CDFW Regional Office. These staff have local knowledge and context.
- The Department's document Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (PDF) provides information on reporting.

Semi-Natural Stands and Addressing Grasslands and Flower Fields

Semi-natural alliances have their own membership rules, that is, the minimum percent relative or absolute cover of the non-native to define a stand, which can be ecosystem-dependent. However, California's grasslands and flower fields vegetation types are among the most difficult to analyze and study. The greatest challenge comes from the variation in species composition and abundance from early to late season and between years. Researchers and consultants have tended to underestimate the significance of native herbaceous plants because they are frequently at their highest cover either very early or very late in the season and may have very low cover during the spring and summer, when non-native grasses dominate and when field work is often performed. Additionally, in some years, a given area may be characterized by an abundance of non-native forbs and grasses, while in other years native herbs may dominate. This inter-seasonal and inter-annual variance of cover between the diagnostic species and the less diagnostic species leads us to conclude that rules for an herbaceous vegetation type's identification should be more broadly inclusive for nativity, with relative cover as low as 10% natives determining a native stand.

Use of the Manual of California Vegetation requires looking closely to determine if native indicator species are evenly distributed and interspersed with non-native plants while visiting the sites throughout the growing season. Although this often makes for more difficult field identification, detection of native plants ensures a proper assessment of the stand's conservation and biodiversity value.

There are indeed many grasslands or herbaceous stands populated almost entirely by non-natives; some have been heavily disturbed in the past and others invaded by exotics that can preclude natives almost completely, such as medusa-head (Elymus caput-medusae) and perennial pepperweed (Lepidium latifolium). Vegetation scientists at NatureServe, the California Native Plant Society, and CDFW determine non-native stands based on a rule of at least 90% cover of non-native species without evenly distributed or diverse native forbs and grasses at any time in the growing season. Conversely, a stand is considered native if 10% or more relative cover consists of native taxa that are evenly distributed in

the stand and present at any time during growing season. For example, the Sonoma County Vegetation Key (PDF) includes this rule for the Deschampsia caespitosa alliance: Deschampsia cespitosa, Danthonia californica, and/or Eryngium armatum dominate or co-dominate individually or in combination (if Holcus lanatus has the highest cover, but these three species have at least 10% combined cover, key to Deschampsia).

Unclassified Areas of the State

For parts of the state that have not been classified according to state standards (the inverse of this map (PDF)), it may be appropriate to use the vegetation types as described in "Preliminary Descriptions of the Terrestrial Natural Communities of California" (Holland 1986 (Excel)). This is particularly true for sensitive natural community types. In some unclassified areas, common types may already be described at the Alliance level. Check the membership rules in the Manual of California Vegetation Online and use these types whenever possible. Refer to Holland types only when a current type does not exist.

Legacy Sensitive Natural Communities in CNDDB

At the time funding for the Natural Communities part of the CNDDB program was halted in the mid-1990s, approximately 2,500 occurrences of 96 sensitive natural community types had been entered in CNDDB, all based on Holland's classification. No new occurrences have been added since then, and our focus is now on completing an updated statewide classification, element ranking, and map. Once the entire state is classified and mapped, we will be able to review the existing occurrences in CNDDB and update them individually by existence, type, and global and state rarity ranking. We think it imprudent to remove these Holland-based elements from the CNDDB before assessing them and reclassifying them in terms of the currently accepted state and national standards for

vegetation classification. Their existence should be addressed in the environmental review processes of CEQA and its equivalents, along with occurrences of plants and animals tracked by the CNDDB. To convert between Holland and current types see http://vegetation.cnps.org/classifications

Jurisdictional Determinations

Vegetation maps produced under the state standards do not imply regulatory jurisdictional determinations under Section 404 of the Federal Clean Water Act, Section 10 of the Rivers and Harbors Act, Section 1600 of the California Fish and Game Code (Lake and Streambed Alteration Program), Sustainable Ground Water Act (see https://gis.water.ca.gov/app/NCDatasetViewer/) or the lack thereof. Such determinations usually require a site visit to assess the current conditions on the ground and to map boundaries at a finer scale than the state vegetation map standard. Similarly, terms such as “riparian” and “wetland” in the vegetation keys and type descriptions may inform but do not imply or assert regulatory jurisdiction or the lack thereof.

Los Angeles City Council
City Hall, Room 395
Los Angeles, CA 90012

ATTN: Barbara Greaves, Legislative Analyst
Planning and Land Use Management Committee

CITY PLAN CASE NO. 2004-2290 CA

Transmitted herewith is an ordinance (Appendix A), which amends the Los Angeles Municipal Code to add certain native trees to the class of "protected tree" (formerly solely oak tree), reduces the size protected, eliminates the minimum lot size, expands the universe of people who can perform tree reports, and clarifies and enhances the enforcement provisions.

On January 12, following a public hearing, the City Planning Commission adopted the Planning Department staff report and findings, and **approved the proposed ordinance (Appendix A) with recommendations**. The recommendations included that the City Attorney ensure that the penalty for illegal removal of protected trees run with the land, that building permits are withheld as part of the enforcement procedure, that the enforcement language be clarified if possible, and that a maintenance fee for trees planted as a mitigation be included in the Public Works section of the Municipal Code. The Commission also requested staff to develop guidelines to assist applicants in understanding the requirements and procedures.

This action was taken by the following vote:

Moved:	Usher
Seconded:	Freer
Ayes:	Cardoso, Hughes, Kay, Kezios, Roschen, Woo
Absent:	Iriando

Vote: 6-0

G. Williams

Gabriele Williams, Commission Executive Assistant II
City Planning Commission

Attachments: Findings, Appendix A (Ordinance)

cc: Keith Pritsker, Deputy City Attorney

FINDINGS

That the City Council:

Adopt the staff report of November 10, 2005, as its report on the subject;

Adopt the findings in the staff report dated November 10, 2005.

The City Planning Department recommends that the City Council, in accordance with Charter Section 558, find that the attached, proposed ordinance (Appendix A) is:

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species. RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

Los Angeles City Planning Department
RECOMMENDATION REPORT

CITY PLANNING COMMISSION	CASE NO:	CPC-2004-2290-CA
	CEQA:	ENV-2004-2201-CE
	LOCATION:	Citywide
DATE: January 12, 2006	COUNCIL DISTRICTS:	All
TIME: after 8:30a.m. *	PLAN AREAS:	All
PLACE: Room 1010 City Hall 200 North Spring St., Los Angeles, CA 90012	RELATED FILES:	n/a

PUBLIC HEARING REQUIRED—CONTINUED FROM MEETING OF NOVEMBER 10, 2005

REQUEST: Continued consideration of staff report and proposed amendments to the Zoning Code first heard November 10, 2005, regarding amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Los Angeles Municipal Code.

SUMMARY: The proposed amendments to the Zoning Code will bring the provisions of the Code regarding Oak Trees in conformance with revisions to Section 46 (Oak Tree Regulations) and 96.303.5 of the Municipal Code.

RECOMMENDATION:

1. Adopt the staff report as its report on the subject.
2. Adopt the attached findings.
3. Approve the proposed amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, and 17.52 I (Appendix A) and recommend their adoption by the City Council.

CONTACT INFORMATION: Michael O'Brien, City Planning Associate, 213-482-7077

Appendix A—Staff report and proposed Amendments to Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I, and 46.00 through 46.06, and 96.303.5 of the Municipal Code from November 10, 2005.

ADVICE TO PUBLIC: *The exact time this report will be considered during the meeting is uncertain since there may be several other items on the agenda. Written communications may be mailed to the Commission Secretariat, 200 North Main Street, Room 532, Los Angeles, CA 90012 (Phone No.213/978-1300). While all written communications are given to the Commission for consideration, the initial packets are sent the week prior to the Commission's meeting date. If you challenge these agenda items in court, you may be limited to raising only those issues you or someone else raised at the public hearing, or in written correspondence on these matters delivered to this agency at or prior to the public hearing. As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability, and upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or other services may be provided upon request. To ensure availability of services, please make your request no later than three working days (72 hours) prior to the meeting by calling the Commission Secretariat at 213/978-1300.

SUMMARY

On November 10, 2005, the Commission considered a staff report and proposed ordinance amending Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code. These Sections need to be revised to be consistent with the revisions proposed for Sections 46.00 through 46.06 and 96.303.5 of the Los Angeles Municipal Code under the Authority of the Board of Public Works and the Department of Building and Safety. These latter sections contain the City's oak tree regulations (proposed to be changed to the "protected tree regulations") and are not under the purview of the Department of City Planning nor the City Planning Commission.

Considerable testimony was given at the Commission meeting. The commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

This report addresses the issues raised at the November 10 meeting and recommends adoption of the attached ordinance, Appendix A.

FINDINGS

1. In accordance with Charter Section 556, the proposed ordinance (Appendix A) is in substantial conformance with the purposes, intent, and provisions of the General Plan. It implements Policy 3 of Section 6: Endangered Species of the Conservation Element of the General Plan by revising regulations concerning endangered species; and Policy 4 of Section 10: Habitats of the Conservation Element of the General Plan by creating legislation that encourages and facilitates protection of local native plant and animal habitats. It also implements the California Environmental Quality Act by designating *Juglans californica* var. *californica* as a protected species, consistent with the recommendations of the California Native Plant Society (6th Inventory of Endangered Species, RED Code 4-4-4) that this "locally significant" species be "evaluated for consideration during the preparation of environmental documents relating to CEQA"; and

2. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) will have no adverse effect upon the General Plan, specific plans, or any other plans being created by the Department of City Planning because the proposed ordinance is consistent with the General Plan and carries out the General Plan goals, policies and objectives discussed above. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code; and

3. In accordance with Charter Section 558 (b)(2), the proposed ordinance (Appendix A) is in conformity with the public necessity, convenience, general welfare and good zoning practice. These amendments to the Zoning Code are for the purpose of eliminating conflicts and ensuring consistency in the Municipal Code. By inclusion of the Certified Arborist in the list of "Tree Expert," the revisions will help streamline permit processing by affording applicants a greater choice of experts to prepare tree reports; and

4. The proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City's

CEQA Guidelines (ordinances which do not of themselves have an impact on the physical environment). The proposed amendments to the Zoning Code apply only to future development projects. All projects are still subject to zoning, environmental, and land use laws that regulate development throughout the City at the time the applications are filed. Each individual project will have its own environmental review.

STAFF REPORT

REQUEST

On November 10, 2005, the Commission considered the staff report and proposed ordinance to add protections to certain trees (in addition to oak trees) and to revise the existing protections to oak trees. The ordinance amends Sections 12.21 A 12, 17.02, 17.05 H 7, 17.05 R, 17.06 B 13, 17.06 C, 17.51 D, 17.52 I of the Zoning Code, all of which make reference to oak trees. The Commission directed staff to report back on the following topics: species to be protected, size of trees to be protected, any hardships accruing to developers, the status of trees on adjoining properties, the oversight of the regulations, the enforcement of the regulations, the urgency of adopting the proposed regulations, options for "replacement" of trees, and whether a citation for non-permitted removal of protected trees continues with a change of ownership.

DISCUSSION

Species to be protected. The task force during its deliberations in 2003 considered all local species of native trees for possible protection. The task force settled on the addition of only three trees to the list of protected trees, because these three trees, the Southern California Black Walnut (Juglans californica var. californica), the Western Sycamore (Platanus racemosa), and the California Bay (Umbellularia californica), formed a suite of trees diagnostic of the Southern California environment. Only in Southern California do these three trees grow together. Other trees considered have a greater natural range and are not typical solely of Southern California. In addition, the Southern California Black Walnut is already protected under the Mt. Washington Specific Plan, and it is listed as a species of concern whose existence on a project should be considered under the California Environmental Quality Act.

Size. The committee recognized that protecting only trees 8" or more in diameter have the result of protecting only large trees, and would be purely aesthetic in nature. In order to ensure continuing existence of these trees in the area, smaller sizes need to be protected. Four inches was arrived at by considering the case of the Southern California Black Walnut, which typically grows as a multi-trunk tree after fires. Establishing a diameter size of four inches would protect walnuts; a larger size would miss almost all walnuts that survived after fires.

Hardships accruing to developers. Developers are already familiar with the current requirements to survey trees eight inches or more in diameter. The proposed amendment would merely mandate a slightly longer report. For a typical single family residence, which usually would have only one protected tree on the property, a consultant's report would cost less than $200.00, which is only a fraction of building fees and typical project costs.

Status of trees on adjoining properties. Since adjoining properties are not typically surveyed for development purposes, trees on adjoining properties would not be required to be identified as a part of the development application package for any property. Development on a property may require a neighboring tree to be pruned, ground to be cut or filled, etc. In such a case, the property owner has the general legal right to prune both above ground and below ground parts of a tree that extend over and under his property, to cut and fill ground, etc., provided that these actions do not cause the tree to die. Section 46 defines "removed" or "removal" as "any act which will cause a protected tree to

die." If a property owner wished to undertake such extensive pruning, grading, etc., that would cause a protected tree to die, then that property owner would need a permit to undertake such an action. The property owner might also be liable to the adjacent property owner for destruction of a tree on the neighboring property.

Oversight of the regulations and enforcement of the regulations. The Street Tree Division of the Board of Public Works is responsible for oversight of the regulations. Enforcement comes in several ways. One, applicants for building permits are required to list protected trees on their site plans. Two, as part of any required environmental review, a plot plan of the site showing all trees must be submitted, and a mitigation for removal of any protected trees is required, in accordance with Code requirements. Three, citizen complaints to the Street Tree Division may cause the Street Tree Division itself to survey the trees on an affected parcel. Building permits will be withheld until the applicant evidences compliance with the protected tree regulations—usually, a sign-off from the Street Tree Division.

Enforcement is ultimately under the purview of both the Board of Public Works and the Department of Building and Safety. The Board can request the Department to withhold building permits on a property for violation of the protected tree regulations, or revoke a permit issued for which construction has not commenced, after a public hearing on the matter. This penalty can be for up to ten years, depending on the severity of violation of the protected tree regulations.

Urgency of adopting the proposed regulations. The proposed regulations are not urgently required to prevent an imminent threat to any particular tree or group of trees. However, the regulations should be adopted as soon as possible, in order to dovetail with the Mayor's "million trees" initiative.

Options for "replacement" of trees. The remover of trees can replace the trees on the site from which the trees were removed, provided that there is enough space on the site for them to be planted. If there is not enough space, the remover can purchase replacement trees and donate them to the Street Tree Division, which will plant them in available, appropriate, places. Alternatively, as a policy matter, the Street Tree Division will accept a monetary donation that approximates the value of the trees removed.

Whether a citation for non-permitted removal of protected trees continues with a change of ownership. Section 46.06 states that "the authority of the Bureau to act [to request that Building and Safety withhold or revoke building permits] shall not apply to a purchaser... who in good faith and for valuable consideration has acquired title subsequent to the illegal removal or relocation of any protected trees and prior to the recordation of the notice of intent [of the Bureau to act.]"

CONCLUSION

The proposed ordinance (included in Appendix A) provides technical corrections to the "Oak Tree" (now "Protected Tree") provisions of the Zoning Code, to bring them into consistency with the amended provisions of Section 46 of the Municipal Code.

ENVIRONMENTAL IMPACT

The attached proposed ordinance (Appendix A) is exempt from the requirements of the California Environmental Quality Act (CEQA) pursuant to Article II, Section 2, Subsection (m) of the City of Los

Angeles CEQA Guidelines (ordinances which have no negative impact on the physical environment). Individual projects will continue to undergo specific environmental review at the time of their proposal.

California is a marvelous place, with a greater range of landforms, a greater variety of habitats, and more kinds of plants and animals than anywhere else in continental North America. There are more endemic plants and animals here than in any area of equivalent size in the United States. When whites first arrived in California, it was a scene of unparalleled, almost unimaginable, natural richness. Unfortunately, this richness coupled with the region's delightful Mediterranean climate soon attracted an unprecedented number of people that encroached upon the landscape to such a degree that California is the state with the greatest number of endangered species.

Nevertheless, California also has the greatest amount of open space in the lower 48 states, and an increasingly devoted proportion of citizens attempting to protect it. These people have won great victories, but many Californians still fail to appreciate the intricate and beautiful natural order of things, and/or that human activities are capable of spoiling it all.

Long-time residents of southern California have watched as the cow, the plow, and the bulldozer have altered the landscape. We have watched as urban sprawl, like some huge ameba, has gobbled up the native terrain; beaches, wetlands, coastal bluffs, valleys, canyons, and hill-tops. Not only have buildings covered the land, but we have watched developers convert native communities to athletic fields, golf courses, and parklands landscaped with non-native vegetation; all in the name of "open space."

Humans are merely one of the living organisms in the system, but unlike other organisms, they are capable of thinking and analyzing. Those that choose not to think about California's natural treasures have already altered the face of California forever. This symposium is dedicated to all those thoughtful people who are willing to devote time and energy to promote the concept of preservation and/or restoration of native landscapes. It is also dedicated to the change in attitude that is essential if future generations are to enjoy and appreciate California's natural beauty and diversity.

THE STATUS OF WALNUT FORESTS AND WOODLANDS (*Juglans californica*) IN SOUTHERN CALIFORNIA

Dr.Ronald D. Quinn
Department of Biological Sciences
California State Polytechnic University
Pomona, CA 91768

INTRODUCTION

Juglandaceae, a plant family of the Northern Hemisphere, contains 8 living genera and approximately 60 species (Manchester and Dilcher, 1982). The genus Juglans is represented by 21 species, 18 in the Western Hemisphere, 16 in North America, 5 in the United States, and 2 in the state of California (Manning, 1978). Natural stands of the species occurring in northern California, Juglans hindsii Jeps., are located in a few places in the lower Sacramento River drainage. This paper deals only with Juglans californica Wats., the walnut tree of southern California.

California walnut forests and woodlands are found only in southern California, with a very limited distribution within that range. All walnut stands are within or near urban areas, and the rapid expansion of metropolitan southern California is further reducing the limited extent of this species. This paper is intended to draw attention to this little-known tree, review the extremely limited literature on the species, and promote its conservation.

DISTRIBUTION

The most extensive stands of Juglans californica are found in the foothills around inland valleys of Ventura, Los Angeles, and northern Orange counties at elevations below 900 meters (Griffin and Critchfield, 1972; Swanson, 1967). The current distribution of walnut-dominated woodlands and forests is limited to the Santa Clarita River drainage in the vicinity of Sulphur Mountain, small stands in the Simi Hills and Santa Susana Mountains, the north slope of the Santa Monica Mountains, the San Jose Hills, Puente Hills, and Chino Hills (Griffin and Critchfield, 1972; Swanson, 1967). Outside of this range in Santa Barbara County, western San Bernardino County, and south to San Diego County, walnuts occur mixed with other species of trees, especially oaks. The best-developed stands are found on steep hillsides with northern exposures, almost exclusively on soils derived from Miocene-Pliocene marine shales (Keeley, in review; Leskinen, 1972). This parent material weathers to deep soils high in clay content, with a high water holding capacity (Pomerening, 1990). On the campus of California State Polytechnic University the soils beneath walnut forests are a meter deep (Pomerening 1990). Presumably it is the combination of north slope aspect and soils with unusually high ability to retain moisture which allows this tree to remain physiologically active through the rainless summer.

DESCRIPTION

The walnuts of California were first mentioned by Richard Brindsley Hinds, a botanist with the British exploring ship Sulphur, which entered the lower Sacramento River in 1837 (Jepson, 1910). The California walnut (Figure 1) was named by Sereno Watson in 1875. He described it as growing around San Francisco Bay and southward to Santa Barbara, but gave no type locality (Watson, 1875). Early in this century Willis Linn Jepson (1908) recognized a number of morphological differences between the northern and southern forms of Juglans, and concluded from the original description and the specimens Watson had before him that the type locality of those trees must have been southern California. Consequently he distinguished the northern form as the variety hindsii. Later Jepson (1917) pointed out that there was a wide gap between the distributions of the southern and northern forms of walnuts. This and other evidence led him to separate the two populations as distinct species, J. californica (southern) and J. hindsii (northern). Because the tree of southern California retained the species name "californica", it is referred to herein as the California walnut.

The California walnut varies considerably in morphology, according to the age of the tree and site characteristics. In Los Angeles and Orange Counties trees tend to have multiple trunks which grow outward from a ring at the base, giving younger plants the appearance of "V"-shaped shrubs. In an Orange County sample of 50 trees, the mean number of trunks per tree was 4.4, with a range of 1-17 (Swanson, 1967). On drier sites and locations with thinner soils even older individuals may retain the proportions and stature of a shrub, never growing taller than 4-5 meters. When trees on more mesic sites grow larger, the several trunks and projecting branches tend to arch away from the center with the outermost branches touching the ground, giving the tree as a whole a hemispherical shape (Figure 2). The interior of these large rounded trees can be free of low branches and understory vegetation, thereby providing excellent cover at its center for deer, nesting birds, and other vertebrates.

Near canyon bottoms and in the northern portion of its natural distribution, J. californica tends to have fewer trunks, growing to a height of 15 meters and assuming the proportions of an upright tree. In some cases large limbs emerge from a single trunk, curving first upward and then toward the ground.

COMPOSITION OF CALIFORNIA WALNUT WOODLAND

California walnuts can occur singly, in mixtures with other species of trees, and in nearly pure stands. The plant community of which they are a part has been classified as "southern oak woodland" by Munz and Keck (1959), while Griffin (1977) placed it in the "coast live oak phase" of a southern oak woodland. This nomenclature implies that evergreen oaks (Quercus spp.) dominate these communities, although Griffin (1977) recognized that the California walnut can be locally dominant. In fact, in stands on many north facing slopes in the Puente and San Jose Hills of Los Angeles County, it is the only tree

Figure 1. Pinnately compound leaves of California walnut, *Juglans californica*. (Photograph by Allan A. Schoenherr)

present, and attains vegetative cover of 100 percent. In such places it would be accurate and useful to call this plant community a California walnut forest. The California Natural Diversity Data Base uses this name, placing it within the category of broadleaved upland forests.

A vegetation map made 50 years ago of the San Jose Hills of Los Angeles County, located at the edges of the present cities of Pomona, Covina, Walnut, and La Verne, shows an unbroken walnut forest extending for a distance of 5 km (Weislander, 1934). As shown on that map the boundaries of this forest had a highly convoluted and irregular shape. In the complex topography of these hills they were found on north and northeast facing slopes, while other slopes were dominated by annual grasses. This general pattern remains today, although it has been interrupted in many places by subsequent urbanization.

There is considerable variation in the structure and species composition of California walnut woodlands. Near the southern end of its range, in the Puente Hills of Orange County, Swanson (1967) found that trees occurred in a density of 84 per ha, produced a 40% canopy cover, and grew with a small number of coast live oaks (Quercus agrifolia) (Table 1). Near the northern end of the range, on Sulphur Mountain in Ventura County, Swanson (1967) measured a tree density almost four times higher (306/ha), and canopy cover more than twice as great (90%). There he reported that California walnuts grow with Juglans hybrids (J. californica x J. regia), tree-sized Sambucus mexicana, and a few coast live oaks. Despite these differences in openness and associated species of trees, the importance value of California walnuts was nearly identical in both tree communities (Table 1).

A comparison of understory plants at the Ventura county and Orange county sites studied by Swanson (1967) shows that the introduced Old World grass Avena fatua is most frequent at both places (Table 2). This species and all others listed for the Orange county site are indicators of disturbance, and most of them originated in Eurasia. I attribute the species composition of this understory plant community to cattle grazing, which has been the principal economic activity in the California walnut forests and woodlands of both the Puente and San Jose Hills for the past two centuries. With the exception of the ubiquitous A. fatua and Galium triflorum, the Ventura county site shows no evidence of the botanical changes associated with prolonged disturbance, and it is distinct in this respect from the southern site.

PHENOLOGY

Juglans californica is a winter-deciduous tree. In Los Angeles County I have observed that leaves appear in January or February, with all trees in full leaf by March. Trees on warmer or drier sites develop leaves several weeks earlier than those in cooler, more mesic locations. Leaflets begin to lose their green color in October, and leaf abscission is completed in November or December. Thus the trees are leafless for a period of 2-3 months. Flowering begins about the same time as leaf production, with fruits developing to full size during the spring. By late summer the fruits have fully matured. Fruit abscission

Asclepias fascicularis	5	Ribes speciosum	15
		Osmorhiza brachypoda	5

begins slightly before or at the same time as leaf abscission, but some fruits remain on the tree through the winter.

Mature walnut fruits are actively sought and eaten by both California ground squirrels (Spermophilus beecheyi Richardson) and western gray squirrels (Sciurus griseus Ord.). They are also edible to humans, with a sweet meat that tastes very like the commercially grown English walnut (Juglans regia). The nuts have never been grown commercially, however, because the shell is very thick and the meat is difficult to remove from numerous small chambers within the shell. Even so, the California walnut has found some economic use in agriculture. Its roots are more resistant to New World diseases and more suited to California soils than the roots of the English walnut tree, so commercial walnut trees have been produced by grafting scions of English walnut to root-stock of California walnut (Swanson, 1967). Native walnut has also been planted in urban forestry projects in the western Santa Monica Mountains and elsewhere (Radtke, 1978).

In some years, California walnut seedlings appear in great numbers in the spring. Seedling densities of 2000 per hectare have been measured in Ventura County (Swanson, 1967). Germination rates of 20-50 percent are achieved in cultivation, using standard nursery procedures (R. Walsh, personal communication). In nature, young California walnuts on favorable sites grow quite rapidly. In the San Jose Hills, trees older than 20 to 30 years tend to develop heart rot, with the interior portions of the trunk and older limbs becoming infested with termites, wood-boring beetles, and fungi. As they grow larger, portions of trees so affected may die or break during winter storms, particularly if they carry heavy burdens of mistletoe on their limbs. Older, multi-trunked trees often have some trunks that are healthy, some with heart rot, and others that are dead. I have observed that when a trunk dies, breaks, or is cut, sprouting will often occur at its base. Thus older trees frequently have collections of trunks of various sizes, ages, and states of vigor.

Because of heart rot it is difficult or impossible to determine the age of most mature trees through counts of annual rings. By use of an increment borer near the base of approximately 30 trees, Swanson (1967) was able successfully to age 10 individuals. Regression analysis of these 10 trees showed a close relationship between trunk diameter and ring number (Figure 3, $r = 0.849$). The oldest tree so measured was 68 years old, with a basal diameter of 35.6 cm (Figure 3). In Swanson's samples the most frequent size classes of trunk diameters at breast height (DBH) were 7.7 - 15.2 cm, and 15.3 - 22.9 cm (Table 3), but trees with basal diameters as large as 140 cm (Ventura County) and 87 cm (Los Angeles County) have been reported (Jepson, 1910). Presumably these unusually large trees were also unusually old. Since trees increase in diameter more slowly as they age, an individual with twice the girth of a 68 year old tree might be several times the age of the smaller tree. Unfortunately we may never know, since most or all of these record-sized individuals are gone.

FIRE ECOLOGY

California walnut woodlands are

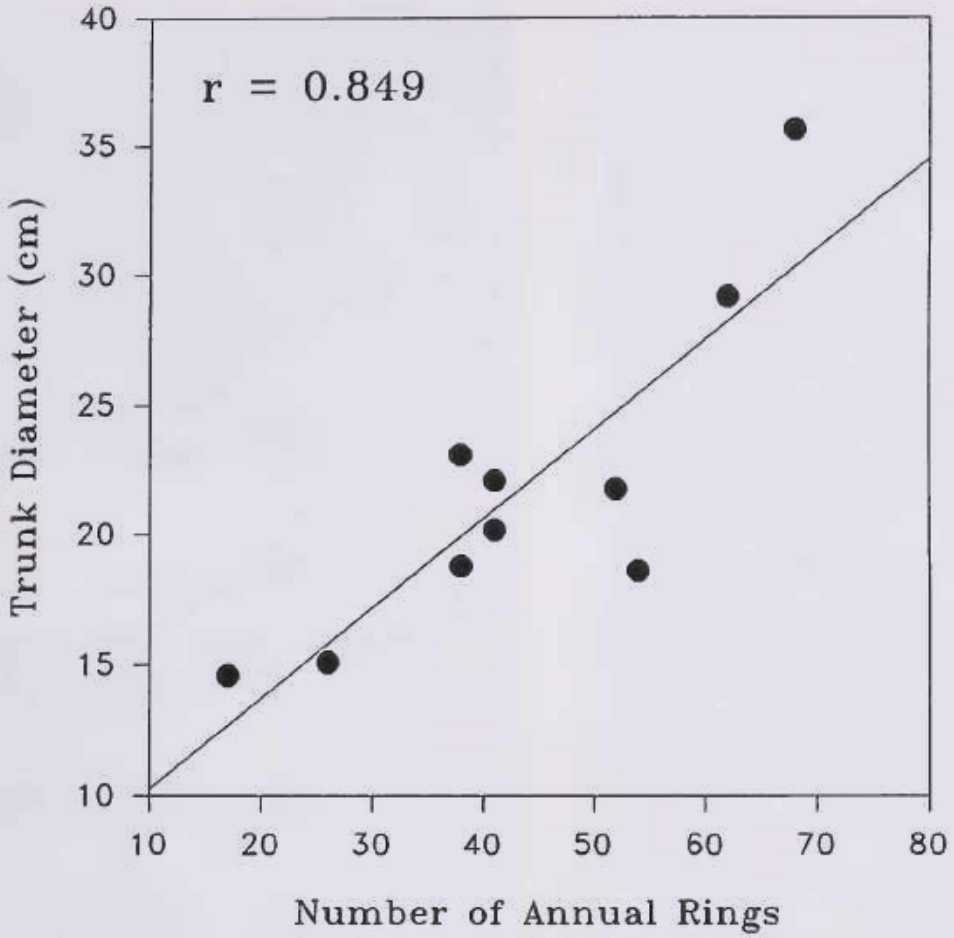

Figure 3. Annual growth rings vs trunk diameter of 10 Juglans californica trees.

TABLE 3. Size classes of trunks of 50 Juglans californica trees in Brea Canyon, OrangeCounty. Data from Swanson, 1967.

DBH (cm)	Percent Total (N = 211)
0 - 7.6	10
7.7 - 15.2	29
15.3 - 22.9	29
23.0 - 30.5	24
> 30.5	8

subject to periodic fires. Because most populations of trees are surrounded by annual grasslands, which extend as an understory beneath the trees, fires of low intensity are possible each summer after the grasses die. The dry grasses provide a highly flammable pathway for summer fires to follow between and beneath the trees. The bark of the trees is thin, and even moderate amounts of heat will kill above ground portions of the plant. The ends of the outer branches often touch the ground, so that approaching fires can spread into the tree canopy easily. Burned trees almost invariably resprout from the base, eventually producing a ring of new trunks growing outward from the fire-killed trunks. Several hundred walnut trees in and around the Voorhis Ecological Reserve of California State Polytechnic University, Pomona were burned in a wildfire in July, 1989. One year after this fire there is no evidence that any of these trees were killed, even though most branches and stems died. Almost all individuals sprouted from the base within 6 weeks of the burn.

Repeated fires are sufficient to explain why most trees have multiple trunks. It may be that the trees of Ventura County have been subjected to fires less frequently. As a whole they have fewer trunks per tree than those of Orange County (Swanson, 1967). Older California walnuts have large woody platforms at the surface of the ground, from which living trunks arise. Some of these platforms are quite large, more than a meter across, presumably increasing in size each time a fire kills living trunks and new ones sprout ever farther from the original center. Thus a ring of trunks may surround a basal platform that is many times older than any living trunk. Since the platform is largely buried beneath the soil it shields meristematic tissue from the heat of passing fires, and post-fire sprouts arise from its lower portions. I interpret the basal platform as an adaptation to fire, and as evidence of the long existence of California walnuts in the fire environment of southern California. It is similar in form and analogous in function to the lignotuber at the base of many species of chaparral shrubs.

ANIMAL COMMUNITY

Walnut forests and woodlands provide favorable habitat for a number of vertebrates and invertebrates. The rich foliage, present for 9-10 months of the year in a landscape with relatively few trees overall, combined with the many hollow trunks and limb holes produced by heart rot, provides sustenance for many wood- and foliage-feeding invertebrates. The annual leaf fall generates considerable litter, providing another habitat for invertebrates. These animals, in turn, can attract insectivorous vertebrates to the woodland. A two year survey in a walnut woodland in the San Jose hills found 29 species of diurnal birds (C. Shannon, unpublished data). The presence of more than half of these bird species is attributable to the walnut trees. Older walnuts provide numerous nesting cavities for birds and rodents, and the upper reaches of the tallest trees are used as roosts and nesting places for raptors and owls. The hollow bases of old trees are preferred burrow sites for California ground squirrels, and probably for various species of reptiles and

invertebrates as well. The walnut fruits are avidly sought by both California ground squirrels and western gray squirrels. Since some of the walnuts persist on the trees into winter, they are a continuing source of food for the tree squirrels. In areas where both walnut woodlands and collections of introduced trees are present, western gray squirrels forage preferentially in the walnuts. It is very likely that the gray squirrels are an important dispersal agent for walnut seeds. This would be analogous to the eastern woodlands of North America, where there is evidence that the fox squirrel, a species which is ecologically similar to the gray squirrel, has coevolved with J. nigra, the black walnut (Stapanian and Smith, 1978).

MANAGEMENT OF WALNUT FORESTS AND WOODLANDS

The distribution of the California walnut described by Jepson (1908, 1917) was limited to a relatively few foothill areas of southern California. The largest trees reported in Los Angeles County were located along Walnut Creek in the eastern San Gabriel Valley (Jepson, 1910). Even before this watercourse was channelized, these trees had apparently vanished (Weislander, 1934). The best remaining stands of these trees south of Ventura County are found in the Puente and San Jose Hills, and these are being rapidly fragmented and destroyed by the rapid urbanization of hillsides in eastern Los Angeles and northern Orange Counties.

One of the most extensive walnut woodlands in the Puente Hills is located in Tonner Canyon. At this writing there are proposals to remove thousands of walnut trees in the upper part of Tonner Canyon in the Puente Hills of Los Angeles County to construct a golf course, and a second proposal would bulldoze many more in the lower part of the canyon in Orange County for a subdivision. A third proposal suggests the construction of expressways along the full lengths of Tonner and Soquel Canyons (Chang, 1990). Soquel Canyon is also in the Puente Hills, and contains walnut woodlands. In the San Jose Hills the best developed walnut forest in the vicinity of Cal Poly University was destroyed by expansion of a landfill. This rapidly vanishing plant community has received little attention from either the scientific or environmental community. The first and, to my knowledge, only comprehensive study of California walnut woodlands is an unpublished master's thesis completed more than 20 years ago (Swanson, 1967).

Interest in the hardwood tree communities of California has been increasing since the 1970's. This interest, however, is focused almost exclusively on oaks. A detailed vegetation classification system for southern california made no mention of Juglans, not even in the species index (Payson, et al, 1980). That same year a symposium on California oaks dealt with other tree species associated with oaks, but not walnuts (Plumb et al, 1980). An introductory paper at a recent symposium on California hardwoods stated that most research continues to focus on oaks, with little attention given to other widespread hardwood species (Conard and Griffin, 1987). A single sentence in the symposium proceedings mentioned the increasing disturbance and rarity of

California walnut woodlands due to human activity (Barbour, 1987). The most recent volume on the hardwoods of California, which includes extensive statistical data on most minor hardwood species, does not discuss Juglans at all, although the genus is listed in the species index (Bolsinger, 1988). In 1987 the Integrated Hardwood Range Management Program was formed, a statewide organization with the goal of creating a program of research, education, and management of California hardwoods (Scott, 1987). It is described as a vehicle for promoting oak conservation. The conference on California hardwoods scheduled for late 1990, like all those that have preceded it, will be concerned almost exclusively with oaks (Standiford, personal communication).

There are 2 problems to be addressed concerning management of California walnut woodlands; 1. the outright disappearance of the community in the face of rapid urbanization, and 2. reversal of ecological changes within the community due to overgrazing, increased fire frequency, and introduced species of understory plants. The first problem is the most important and urgent; if it is not dealt with, the second problem is moot. There are several de facto reserves for California walnut woodlands in the San Jose and Puente Hills. Examples of such reserves are Bonelli Regional County Park, California State Polytechnic University, Mt. San Antonio College, canyon areas of Forest Lawn, and the Firestone Boy Scout Reservation. These places do not have the protection and preservation of walnut woodlands as an explicit management goal, but in the course of their other activities they do accord incidental (or accidental) protection to the trees. There are two exceptions to this pattern. The first is Mt. San Antonio College, which has established the first and only California walnut reserve on campus agricultural lands. The second is Chino Hills State Park, between Orange and San Bernardino Counties. Walnut trees are not as abundant there as elsewhere, but the park does have the goal of protecting and restoring native plant communities, including walnut woodlands.

It is important to recognize that California walnuts are rapidly approaching the status of a custodial species, which I define as a species with remnant natural populations found only within reserves of limited size, where protection of the population is an explicit management goal. Free ranging herds of American bison (Bison bison) in natural parks are an example of a custodial species. The Engelmann oak (Quercus engelmannii) is another example of a southern California tree that is approaching the status of a custodial species. A major reason for the establishment of the Nature Conservancy's reserve on the Santa Rosa Plateau of Riverside County was the conservation of this species of tree and other rare plant populations. The fact that California walnuts can be grown readily outside their natural range (Swanson, 1967), or regrown on disturbed sites (Leskinen, 1972), does not lessen the importance of protecting natural populations any more than the ease of propagating coast redwoods in urban parks and gardens makes it less important to conserve natural populations on the north coast of California. The genetic composition of natural tree populations is the product of

thousands of generations of natural selection. Such a population is attuned to the site at which it occurs in countless and subtle ways that we are unequipped to understand fully. Moreover, by virtue of their size and longevity, walnut trees provide the framework for an ecosystem containing innumerable species of microorganisms, animals, and other plants. At present we lack the resources to document the presence and understand the importance of all these many life forms, and it is tragically certain that if the trees disappear so too will a host of companion species.

It is encouraging to note that the conservation and propagation of California walnuts is beginning to receive attention. Nurseries in Los Angeles, Orange, and Riverside Counties that specialize in native plants now purchase hundred- pound quantities of California walnut seeds gathered from the wild (R. Walsh, personal communication). Each 100 pounds contains roughly 10,000 seeds. If even a small percentage of these are successfully germinated, potted, and planted, then thousands of walnut seedlings are growing somewhere each spring. Chino Hills State Park plans to use this species in revegetation programs.

Most of the plants in the understory of California walnut forests and woodlands in Los Angeles and Orange Counties are alien species favored by overgrazing, frequent fire, and other disturbances. The ubiquitous Avena fatua (wild oats) and other introduced species dominate the understory of walnut woodlands, almost to the exclusion of the native species they have displaced. It would be desirable within reserves to extirpate alien species from the understory of California walnuts and to replace them with those native species most likely to have been present prior to arrival of Europeans. The extirpation phase could be quite difficult, and might be practical only on small plots, but when successful, reintroductions of stable associations of native understory species would be possible.

As discussed above, fire plays a role in the ecological structure and function of walnut woodlands, as it does in most californian plant communities. The prehuman (or pre-European) fire frequency is unknown. Fire today is frequent; it is an annual possibility in most locations, where dead annual grasses are present beneath and between the trees during the summer fire season. Fire in the past may have been less frequent, since the original grasses were mostly perennial rather than annual, and would have produced a less flammable summer ground cover. As California walnuts become a custodial species, and therefore subject to a managed fire regime, I suggest that prescribed fires of low intensity, at intervals of several years, be tested for their effects on the walnut community, particularly in places where an understory of native plants has been reestablished.

This paper has reviewed the limited amount of information available about the California walnut. It is my hope that it will help to emphasize the increasingly precarious status of remaining natural populations, and encourage positive action to conserve this element of the natural heritage of southern California. The juggernaut of urban growth is at the doorstep of most of the remaining walnut woodlands. We have

precious few native species of trees, and native stands of this one cannot be allowed to vanish.

ACKNOWLEDGEMENTS

I thank Allan Schoenheer, Curtis Clark, and Barbara Ellis-Quinn for reviewing earlier drafts of this paper. Field work has been supported in part by a LandLab grant from the Cal Poly Kellogg Unit Foundation, Inc.
