Completed Date: 01/25/2002
Comments: DTSC has submitted an approval to Proposed Belmont New Elem. School No. 9, however past activities at the site(including gasoline service stations, automotive shops and a dry cleaner establishment) have impacted soil and groundwater at the site.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 01/28/2014
Number of Days to Update: 78

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 01/28/2014

Next Scheduled EDR Contact: 01/19/2015
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 01/28/2014
Number of Days to Update: 78

Next Scheduled EDR Contact: 01/19/2015
Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 02/13/2014

Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 10/25/2013

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/10/2014

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/10/2014
Date Data Arrived at EDR: 07/02/2014

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 06/10/2014
Date Data Arrived at EDR: 07/02/2014
Date Made Active in Reports: 09/18/2014

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Federal institutional controls / engineering controls registries

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 06/23/2014
Date Data Arrived at EDR: 07/15/2014
Date Made Active in Reports: 09/18/2014
Number of Days to Update: 65

Source: Environmental Protection Agency
Telephone: 703-603-0695
Last EDR Contact: 09/08/2014
Next Scheduled EDR Contact: 12/22/2014
Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 06/23/2014

Next Scheduled EDR Contact: 11/17/2014
Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Date of Government Version: 08/05/2014

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 05/28/2014

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
21865 East Copley Drive, Diamond Bar, CA 91765

PERMIT TO OPERATE

Permit No.
F32244
A/N 366921

This initial permit must be renewed ANNUALLY unless the equipment is moved, or changes ownership.
If the billing for annual renewal fee (Rule 301.f) is not received by the expiration date, contact the District.

Legal Owner
or Operator:

CENTRAL PLAZA LLC
3450 WILSHIRE BLVD NO 400
LOS ANGELES, CA 90012

ID 122337

Equipment Location: SAME AS ABOVE

Equipment Description:

INTERNAL COMBUSTION ENGINE, CATERPILLAR, DIESEL-FUELED, EMERGENCY ELECTRICAL GENERATION, MODEL 3508 TA, TURBOCHARGED, AFTERCOOLED, 8 CYLINDERS, 1486 BHP.

Conditions:

1. OPERATION OF THIS EQUIPMENT SHALL BE CONDUCTED IN ACCORDANCE WITH ALL DATA AND SPECIFICATIONS SUBMITTED WITH THE APPLICATION UNDER WHICH THIS PERMIT IS ISSUED UNLESS OTHERWISE NOTED BELOW.
2. THIS EQUIPMENT SHALL BE PROPERLY MAINTAINED AND KEPT IN GOOD OPERATING CONDITION AT ALL TIMES.
3. THIS ENGINE SHALL NOT BE USED IN CONJUNCTION WITH ANY UTILITY VOLUNTARY DEMAND REDUCTION PROGRAM.
4. A TIMER SHALL BE MAINTAINED SO AS TO INDICATE THE ENGINE ELAPSED OPERATING TIME.
5. THIS ENGINE SHALL NOT BE OPERATED MORE THAN 92 HOURS IN ANY ONE YEAR.
6. AN ENGINE OPERATING LOG LISTING THE DATE OF OPERATION, THE ELAPSED TIME, IN HOURS, AND THE REASON FOR OPERATION SHALL BE KEPT AND MAINTAINED ON FILE FOR A MINIMUM OF TWO YEARS AND MADE AVAILABLE TO DISTRICT PERSONNEL UPON REQUEST.
7. THE SULFUR CONTENT OF DIESEL FUEL SUPPLIED TO THE ENGINE SHALL NOT EXCEED 0.05% BY WEIGHT.
8. THE FUEL INJECTION TIMING OF THIS ENGINE SHALL BE SET AND MAINTAINED AT 4 DEGREES RETARDED RELATIVE TO STANDARD TIMING.

LOS ANGELES UNIFIED SCHOOL DISTRICT

Facilities Services Division

DATE: July 12, 2017

TO: Andrea Schultz, Head of Operations
CAJA Environmental Services, LLC
15350 Sherman Way, Suite 315
Van Nuys, CA 91406

FROM: Rena Perez, Director
Master Planning & Demographics

SUBJECT: Environmental Impact Report Information Requested for: ***CENTRAL PLAZA PROJECT,*** *located at 3432-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3265-3287 West 7th Street, and 666-678 South Irolo Street, Los Angeles, California 90005-90010 in the Wilshire Community Plan. The site is bounded on the north by Wilshire Boulevard, on the west by Irolo Street, on the south by 7th Street, and on the east by Mariposa Avenue. This mixed-use project will include approximately 641 apartment units, and commercial use.*

Included please find a ***LAUSD Schools Enrollments and Capacities Report*** for the schools that may be impacted by the development project(s) in question. This report contains data on each school's current and projected capacities, enrollments, and school calendars, and is designed to address any questions pertaining to overcrowding and factors related to school capacity.

Please note that *no new school construction is planned* and the data in this report *already take into account* portable classrooms on site, additions being built onto existing schools, student permits and transfers, specific educational programs running at the schools, and any other operational activities or educational programming that affects the capacities and enrollments of LAUSD's schools.

Additional information on LAUSD's Capital Improvement programs can be found on LAUSD's Facilities Services Division main webpage at www.laschools.org.

MASTER PLANNING AND DEMOGRAPHICS RESPONSE TO SPECIFIC QUESTIONS

Questions: 1-2 The project is located in an **Elementary, Middle, and High School** attendance choice/option area. Please see LAUSD Schools Enrollments and Capacities Report details;

Question: 3 Please contact the LAUSD Developer Fee Program Office (DFPO) at (213) 241-0715 for more information regarding fees and student generation rates.

ATTACHMENTS

1. LAUSD SCHOOLS ENROLLMENTS AND CAPACITIES REPORT
2. BOUNDARY DESCRIPTIONS FOR SCHOOLS SERVING PROPOSED PROJECT
   Boundary descriptions for existing schools identified as serving the proposed project

Sincerely,

Rena Perez, Director V. MAFFEI FOR R. PEREZ

[a] Schools & programs that are part of a "school choice area" pull enrollments from the school(s) that have resident areas, as defined by attendance boundaries.

The individual school and calculated total capacities and enrollments for school choice areas are reported to show current and projected seating overage/shortage and overcrowding (shaded green color).

If any of the school choice area schools is multi-track, then the service area is considered overcrowded.

Schools Planned to Relieve Known Overcrowding

NONE

NOTES:

[1] School's ID code.

[2] School's name

[3] The current calendar the school is operating on. Schools operate on a 'multi-track' calendar (listed as 4 TRK), because of overcrowded conditions.

[4] School's current operating capacity, or the maximum number of students the school can serve while operating on its current calendar. Excludes capacity allocated to charter co-locations. Includes capacity for magnet program.

[5] The total number of students living in the school's attendance area and who are eligible to attend the school plus students enrolled at any on-site magnet centers.
-Multi-track calendars are utilized as one method of providing relief to overcrowded schools by increasing enrollment capacities.
-A key goal of the Superintendent and Board of Education is to return all schools to a traditional 2-semester calendar (1 TRK).

[6] The number of students actually attending the school now, including magnet students.

[7] Current seating overage or (shortage): equal to (current capacity) - (resident enrollment).

[8] Current overcrowding status of school. The school is currently overcrowded if any of these conditions exist:
-School is currently on a multi-track calendar.
-There is currently a seating shortage.
-There is currently a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats.

[9] School planning capacity. Formulated from a baseline calculation of the number of eligible classrooms after implementing LAUSD operational goals and shifting to a 2-semester (1 TRK) calendar. Includes capacity allocated to by charter co-locations. Includes capacity for magnet programs.

[10] Projected 5-year total number of students living in the school's attendance area and who are eligible to attend the school. Includes magnet students.

[11] Projected seating overage or (shortage): equal to (projected capacity) - (projected enrollment).

[12] Projected overcrowding status of school. The school will be considered overcrowded in the future if any of these conditions exist:
-School remains on a multi-track calendar.
-There is a seating shortage in the future.
-There is a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats in the future.

* Independent Charter: Capacity and/or enrollment information may not be reported for some independent charters.

‡ Magnet Schools with Resident Kindergarten Enrollment: Resident enrollment is reported for Kindergarten only. Actual enrollment is reported for all grades in school. Projected capacities and enrollments not reported.

REQUEST FOR INFORMATION REGARDING RECREATIONAL AND PARK SERVICES FOR THE CENTRAL PLAZA PROJECT IN THE CITY OF LOS ANGELES

Dear Ms. Schultz:

The following has been prepared in response to your request for Recreation and Parks information relative to the proposed Central Plaza Project. This project proposes the development of 641 residential units and 18,454 square feet of commercial space on a site located at 3432-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3265-3287 West 7th Street, and 666-678 South Irolo Street, in the Wilshire Community Plan Area of the City of Los Angeles.

1. Which parks and recreational facilities would serve the proposed project?

The following Department of Recreation and Parks facilities are classified as neighborhood parks and are located within a two-mile radius of the project site:

- Alvarado Terrace Park, located at 1342 S. Alvarado Terrace.
- Harold A. Henry Park, located at 890 S. Lucerne Avenue.
- Hope and Peace Park, located at 843 Bonnie Brae Street.
- Los Angeles High Memorial Park, located at 4625 W. Olympic Avenue.
- Madison West Park, located at 464 N. Madison Avenue.
- Pico Union Park, located at 1827 S. Hoover Street.
- Robert L. Burns Park, located at 4900 Beverly Boulevard.
- Unidad Park, located at 1644-48 Beverly Boulevard.
- Wilton Place Park, located at 1015 S. Wilton Place.

The following Department of Recreation and Parks facilities are classified as community parks and are located within a five-mile radius of the project site:

- Aliso-Pico Recreation Center, located at 370 S. Clarence Street.
- Alpine Recreation Center, located at 817 Yale Street.
- Baldwin Hills Recreation Center, located at 5401 Highlight Place.
- Bellevue Recreation Center, located at 826 Lucille Avenue.
- Central Recreation Center, located at 1357 E. 22nd Street.

- Claude Pepper Senior Citizens Center, located at 1762 S. La Cienega Boulevard.
- Cypress Recreation Center, located at 2630 Pepper Avenue.
- Denker Recreation Center, located at 1550 W. 35th Place.
- Downey Pool, located at 1775 N. Spring Street.
- Downey Recreation Center, located at 1772 N. Spring Street.
- Echo Park, located at 751 Echo Park Boulevard.
- Echo Park Boys and Girls, located at 303 Patton Street.
- Echo Park Deep Pool, located at 1419 Colton Street.
- Eleanor Green Roberts Aquatic Center, located at 4526 W. Pico Boulevard.
- Elysian Valley Recreation Center, located at 1811 Ripple Street.
- EXPO Center, located at 3980 S. Menlo Avenue.
- Fairfax Senior Citizen Center, located at 7929 Melrose Avenue.
- Gilbert W. Lindsay Community Center, located at 429 E. 42nd Place.
- Hollenbeck Park, located at 415 S. St. Louis Street.
- Hollywood Recreation Center, located at 1122 Cole Avenue.
- Hoover Recreation Center, located at 1010 W. 25th Street.
- Jim Gilliam Recreation Center, located at 4000 S. La Brea Avenue.
- Juntos Park, located at 3135 Drew Street.
- Lafayette Park, located at 2830 W. 6th Street.
- Lake Street Park, located at 227 N. Lake Street.
- Las Palmas Senior Citizen Center, located at 1820 N. Las Palmas Avenue.
- Lemon Grove Recreation Center, located at 4959 Lemon Grove Avenue.
- Lincoln Heights Recreation Center, located at 2303 Workman Avenue.
- Loren Miller Recreation Center, located at 2717 Halldale Avenue.
- Los Angeles Center for Enriched Studies (LACES), located at Airdrome Street between Stearns Drive and Hayworth Avenue.
- MacArthur Park, located at 2230 W. 6th Street.
- Martin Luther King Jr. Park, located at 3934 S. Western Avenue.
- Miguel Contreras Learning Center Pool, located at 322 S. Lucas Avenue.
- Msgr. Ramon D. Garcia Recreation Center, located at 1016 S. Fresno Avenue.
- Normandie Recreation Center, located at 1550 S. Normandie Avenue.
- Pan Pacific Park, located at 7600 Beverly Boulevard.
- Parkview Photo Center, located at 2332 W. 4th Street.
- Pershing Square, located at 525 S. Olive Street.
- Poinsettia Recreation Center, located at 7341 Willoughby Avenue.
- Queen Anne Recreation Center, located at 1240 West Boulevard.
- Rancho Cienega Sports Complex, located at 5001 Rodeo Road.
- Rio de Los Angeles State Park, located at 1900 N. San Fernando Road.
- Robertson Recreation Center, located at 641 Preuss Road.
- Ross Snyder Recreation Center, located at 1501 W. 41st Street.
- Seoul International Park, located at 3250 San Marino Street.
- Shatto Recreation Center, located at 3191 W. 4th Street.
- Silverlake Recreation Center and Dog Park, located at 1850 W. Silverlake Boulevard.
- South Park Recreation Center, located at 345 E. 51st Street.

- South Seas House Park, located at 2301 W. 24th Street.
- State Street Recreation Center, located at 716 N. State Street.
- Toberman Recreation Center, located at 1725 Toberman Street.
- Tommy Lasorda's Field of Dreams, located at 1901 Waterloo Street.
- Trinity Recreation Center, located at 2415 Trinity Street.
- Van Ness Recreation Center, located at 5720 2nd Avenue.
- Vineyard Recreation Center, located at 2942 Vineyard Avenue.
- Vista Hermosa Soccer Field, located at 1301 W. 1st Street.
- Yucca Community Center, located at 6671 W. Yucca Street.

The following Department of Recreation and Parks facilities are classified as regional parks and are located within a ten-mile radius of the project site:

- Armand Hammer Golf Course, located at 601 Club View Drive (at Holmby Park).
- Arroyo Seco Park, located at 5568 Via Marisol.
- Ascot Hills Park, located at 4371 Multnomah Street.
- Barnsdall Park, located at 4800 Hollywood Boulevard.
- Bronson Canyon, located at 3200 Canyon Road.
- Cahuenga Peak Phase I, located at 3698 W. Wonderview Road (in Griffith Park).
- Cahuenga Peak Phase II, located at 3698 W. Wonderview Road (in Griffith Park).
- Campo de Cahuenga, located at 3919 Lankershim Boulevard.
- Charles F. Lummis Home, located at 200 E. Avenue 43.
- Cheviot Hills Park, located at 2551 Motor Avenue.
- Coldwater Canyon Park, located at 12601 Mulholland Drive.
- Elysian Park, located at 929 Academy Road.
- Ernest E. Debs Regional Park, located at 4235 Monterey Road.
- Exposition Park Rose Garden, located at 701 State Drive.
- Griffith Park, located at 4730 Crystal Springs Drive.
- Griffith Park Boys Camp, located at 4730 Crystal Springs Drive (in Griffith Park).
- Harding Golf Course, located at 4730 Crystal Springs Drive (in Griffith Park).
- Heritage Square, located at 3800 Homer Street.
- Hollywoodland Girl's Camp, located at 3200 Canyon Drive (in Griffith Park).
- Holmby Park, located at 601 Club View Drive.
- L.A. Equestrian Center, located at 500 Riverside Drive (in Griffith Park).
- L.A. Live Steamers, located at 5202 Zoo Drive (in Griffith Park).
- Los Feliz Golf Course, located at 3207 Los Feliz Boulevard.
- Penmar Golf Course, located at 1233 Rose Avenue.
- Rancho Park Golf Course, located at 10460 Pico Boulevard.
- Roosevelt Golf Course, located at 2650 N. Vermont Avenue (in Griffith Park).
- Runyon Canyon Park, located at 2000 N. Fuller Avenue.
- South L.A. Wetlands Park, located at 5413 S. Avalon Boulevard.
- Travel Town Museum, located at Griffith Park Drive near Zoo Drive (in Griffith Park).
- Wattles Garden Park, located at 1824 N. Curson Avenue.
- Wilson Golf Course, located at 4730 Crystal Springs Drive (in Griffith Park).

For additional information regarding facilities and features available in these parks visit our website: www.laparks.org.

2. Does the City have any plans to develop new parks or recreational facilities or expand existing parks or recreational facilities within a two-mile radius of the project site?

While the Department is currently in the process of implementing the 50 Parks Initiative, these are typically neighborhood parks which have a service radius of two miles. None of these planned parks will be sited within two miles of the project site.

3. What is the area's existing parkland acres-to-population ratio and what is the desired acres-to-population ratio?

The Wilshire Community Plan Area, within which the project is located, has a parkland acres-to-population ratio of neighborhood and community parks of 0.23 acres per 1,000 residents. The Public Recreation Plan, a portion of the Service Element of the City's General Plan, sets a goal of a parkland acres-to-population ratio of neighborhood and community parks of 4.0 acres per 1,000 residents.

Thank you for the opportunity to provide information relative to the proposed project's impact on recreation and park services. This project is likely to trigger the requirement for an early consultation with the Department prior to the filing. Options for land dedication, recreation credits and fees will be discussed at that time. If you have any questions or comments regarding this information please contact Melinda Gejer, of my staff, at (213) 202-2657 or melinda.gejer@lacity.org.

Sincerely,

MICHAEL A. SHULL

Central Plaza Project
Request for Library Services Information
Los Angeles Public Library Response
October 10, 2018

1. Which libraries would serve the proposed project? Please provide:
    a. Name and address
    b. Size (square feet)
    c. Number of volumes and circulation
    d. Staffing levels
    e. Current service population and future service population
    f. Whether there are planned improvements to add capacity through expansion

    Answer:

    The following Los Angeles Public Library Locations would serve the project area
    - Felipe de Neve Branch Library, page 3
    - Memorial Branch Library, page 4
    - Pio Pico - Koreatown Branch Library, page 5
    - Pico Union Branch Library, page 6
    - Wilshire Branch Library, page 7

    Please see respective pages for each location for answers to questions 1. a.-e.

    There are currently no planned improvements to add capacity through expansion to any facilities in the project area.

2. What are the current desired standards of service (i.e. facility size, number of volumes, etc.) for the service population?

    Answer:

    On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

    Any increase in the residential and/or commuter-adjusted population that is in close proximity to a library has a direct impact on library services with increased demands for library staffing, materials, computers, and information services. Therefore, mitigation measures may be necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid for by the developer.

3. Are there plans to build any new libraries that would serve the project area?

   Answer:

   There are no current plans to construct new libraries in the project area.

1. INTRODUCTION

This report documents the assumptions, methodologies, and findings of a study conducted by Fehr & Peers to evaluate the potential traffic impacts of the proposed 3440 Wilshire Project, located at 3440 Wilshire Boulevard, south of Wilshire Boulevard, west of Mariposa Avenue and east of Irolo Street in the City of Los Angeles. This study was conducted as part of an environmental document being prepared for the proposed Project.

PROJECT DESCRIPTION

The proposed project is on Wilshire Boulevard between Irolo Street and Mariposa Avenue. The adjacent land uses includes a church to the north, apartments to the south, retail, a school, and parking to the east, and office and retail to the west. Figure 1 illustrates the location of the proposed project in relation to the surrounding street system. Regional access to the project site is provided by the Santa Monica Freeway, Interstate 10 (I-10), with access ramps approximately 1.7 miles to the south and the Hollywood Freeway, United States 101 (US-101) with access ramps approximately 1.6 miles to the north. The project is located directly adjacent to the Metro Purple Line Wilshire/Normandie Station.

The project site is currently a parking structure with two office buildings on the site that will remain. The existing office buildings contain approximately 760,456 square feet of office space, including retail, fast food restaurants, and sit down restaurants. The Project will demolish the existing parking structure and build 641 multifamily high rise residential units and 18,454 square feet of retail space. In addition, the project will build two levels of underground parking structure and four levels of above ground parking.

The site currently has five driveways that provide access to the existing uses on the site. Two full access driveways are located on Mariposa Avenue. Two full access driveways are located on 7th Street and one full access driveway is located on Irolo Street. With the project, the southern driveway on Mariposa Avenue will be closed, leaving the site with four driveways to service the property. The residents will primarily use the Mariposa Avenue driveway and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the driveways, similar to the existing site access. The loading areas for the project uses will be located in the parking structure on Level 1 and will be accessible from the Mariposa Avenue driveway. A site plan of the project site is presented in Figure 2A and 2B.

STUDY SCOPE

The scope of work for this study was determined in consultation with the Los Angeles Department of Transportation (LADOT). The base assumptions and technical methodologies were discussed with LADOT as part of the study approach and agreed to in a memorandum of understanding dated August 2018. The MOU is included in Appendix A to this document.

Site Plan - Level B1

TRAFFIC SCENARIOS

The study assumes that the project would be completed by year 2026 and is directed at analyzing the potential project generated traffic impact on local street system under both existing and future year traffic conditions. The following traffic scenarios have been developed and analyzed as part of this study:

- Existing Conditions – The analysis of existing traffic conditions is intended to provide a basis for the remainder of the study. The existing conditions analysis includes a description of the transportation system serving the project site, existing traffic volumes, and an assessment of the operating conditions at the study analysis locations described below.

- Existing plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under existing conditions with the addition of Project-generated traffic. The impacts of the proposed Project on existing traffic operating conditions were then identified.

- Future Base (Year 2026) Conditions – Future traffic projections without the proposed project were developed for the year 2026. The objective of this analysis was to project future traffic growth and operating conditions that could be expected to result from regional growth, related projects, and transportation network changes in the vicinity of the project site by the year 2026.

- Future (Year 2026) plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under future conditions with the addition of Project-generated traffic. The impacts of the proposed Project on future traffic operating conditions were then identified.

STUDY LOCATIONS

Fourteen signalized intersections, one stop-controlled intersections, and two local street segments were selected for analysis in consultation with LADOT.

Signalized Intersections

The following 14 signalized intersections, illustrated in Figure 1, were identified in conjunction with LADOT to be analyzed as part of the scope of work for this Project:

1. Western Avenue & Wilshire Boulevard
2. Western Avenue & 8th Street
3. Normandie Avenue & 3rd Street
4. Normandie Avenue & 6th Street
5. Normandie Avenue & Wilshire Boulevard
6. Irolo Street & 7th Street
7. Irolo Street & 8th Street
8. Normandie Avenue & Olympic Boulevard
9. Mariposa Avenue & 6th Street
10. Mariposa Avenue (West) & Wilshire Boulevard
11. Mariposa Avenue (East) & Wilshire Boulevard

12. Mariposa Avenue & 8th Street
13. Vermont Avenue & Wilshire Boulevard
14. Vermont Avenue & 8th Street

Unsignalized Analysis

The following stop-controlled intersection, illustrated in Figure 1, was identified in conjunction with LADOT to be considered for a signal warrant analysis:

A. Mariposa Avenue & 7th Street

Segment Analysis

The following two segments, illustrated in Figure 1, were identified in conjunction with LADOT to be analyzed as part of the scope of work for this Project:

Segment A. Mariposa Avenue, south of 7th Street
Segment B. Normandie Avenue, south of 7th Street

Freeway Analysis

The *Congestion Management Program for Los Angeles* County (CMP) (Metro, 2010) requires that all CMP mainline freeway monitoring locations where a proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours be analyzed. The proposed Project is not expected to add 150 or more vehicle trips during the AM or PM peak hours on nearby freeways (see Chapter 5). Therefore, no analysis of freeway segments is required for CMP purposes.

In addition, *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* (October 2013, as amended in December 2015), sets forth criteria for when a freeway impact analysis should be conducted. LADOT determined as part of the traffic study memorandum of understanding for this Project that the Project would not meet the criteria requiring a freeway impact analysis (see Appendix A). Accordingly, no further analysis under the City's amended agreement with Caltrans was required.

ORGANIZATION OF REPORT

This report is divided into nine chapters, including this introduction. Chapter 2 describes the existing conditions including an inventory of the streets, highways, and transit service in the study area, a summary of existing traffic volumes, and an assessment of existing operating conditions. The methodologies used to develop traffic forecasts for the Existing, Existing plus Project, Future Base, and Future plus Project scenarios and the forecasts themselves are included in Chapter 3. Chapter 4 presents an assessment of potential intersection traffic impacts of the proposed Project under both existing and future conditions. The results of the neighborhood impact analysis are provided in Chapter 5. The results of the regional transportation system analysis are provided in Chapter 6. Chapter 7 provides an assessment of the proposed Project's access scheme. Chapter 8 summarizes the construction impact analysis. Chapter 9 provides the summary and conclusions.

2. EXISTING CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the study area. The assessment of conditions relevant to this study includes a description of the study area, an inventory of the local street system in the vicinity of the project site, a review of traffic volumes on these facilities, an assessment of the resulting operating conditions, and a summary of the current transit service and bicycle and pedestrian facilities in the study area. A detailed description of these elements is presented in this chapter.

STUDY AREA

The project site is within the Wilshire Community Plan area of the City of Los Angeles. The study area selected for analysis extends to include Western Avenue to the west, Vermont Avenue to the east, 3rd Street to the north, and Olympic Boulevard to the south. All of the streets in the study area are under the jurisdiction of the City of Los Angeles.

EXISTING STREET SYSTEM

Major arterials serving the study area include Western Avenue, Normandie Ave/Irolo St, Mariposa Avenue and Vermont Avenue in the north/south direction and 3rd Street, 6th Street, Wilshire Boulevard, 8th Street and Olympic Boulevard in the east/west direction.

Interstate 10 lies approximately two miles south of the site and US-101 lies approximately 1.5 miles north of the site. Each of these interstates provides regional access to and from the study area.

The characteristics of the major roadways serving the study area are described below. The street descriptions include the designation of the roadway under the *Mobility Plan 2035* (Los Angeles Department of Planning, General Plan Mobility Element) approved by the Los Angeles City Council in September 2016.

FREEWAYS

- **Interstate 10** runs in an east/west direction and extends from the Pacific Ocean eastward through Los Angeles County and beyond. In the vicinity of the study area, the freeway provides four lanes in each direction plus auxiliary lanes. Ramps are provided at Western Avenue, Normandie Avenue and Vermont Avenue.

- **US-101** runs in the southeast-northwest direction, extending from downtown Los Angeles through Hollywood and the San Fernando Valley and beyond. In the vicinity of the study area, the Hollywood freeway provides four lanes in each direction plus auxiliary lanes. Ramps are provided at Western Avenue, Santa Monica Boulevard, Melrose Avenue, and Vermont Avenue.

EAST/WEST STREETS

- **3rd Street** is designated as an Avenue II in the City of Los Angles' *Mobility Plan 2035* and runs north of the project site with two travel lanes in each direction within the project study area. Parking is

permitted along portions of the roadway on both sides of the street. Left-turn pockets are present at major intersections. 3rd Street is part of the Bicycle Enhanced Network, the Moderate Transit Enhanced Network, and the Pedestrian Enhanced Districts in the *Mobility Plan 2035*.

- **6th Street** is designated as an Avenue II that runs north of the project site with two travel lanes in each direction and with no on-street parking during peak hours. During non-peak hours, parking is permitted in the westbound direction leaving one travel lane in that direction and two eastbound travel lanes. Left-turn pockets are present at major intersections.

- **7th Street** is designated as an Avenue II that runs along the southern edge of the project site with one travel lane in each direction. Parking is permitted on both sides of the street and left-turn pockets are present at major intersections. Portions of 7th Street are part of the Neighborhood Enhanced Network and the Pedestrian Enhanced Districts in the *Mobility Plan 2035*.

- **8th Street** is designated as an Avenue II that runs south of the project site with two travel lanes in each direction. Parking is generally permitted on both sides of the street and left-turn pockets are present at major intersections. A portion of 8th Street near the project site is part of the Neighborhood Enhanced Network and the Pedestrian Enhanced Districts.

- **Olympic Boulevard** is designated as a Boulevard II that runs south of the project site with three travel lanes in each direction during peak hours and with two travel lanes in each direction during non-peak hours. Parking is permitted on both sides of the street only during non-peak hours. Left-turn pockets are present at major intersections. Olympic Boulevard is part of the Vehicle Enhanced Network and the Pedestrian Enhanced Districts.

- **Wilshire Boulevard** is designated as an Avenue I that runs north of the project site with two travel lanes in each direction and turn pockets are major intersections. An additional travel lane in each direction provides dedicated right-of-way for bus only lanes during peak hours. Parking is permitted on both sides of the street during non-peak period times. Wilshire Boulevard is part of the Tier 2 Bicycle Lane Network, the Comprehensive Transit Enhanced Network, and the Pedestrian Enhanced Districts.

NORTH/SOUTH STREETS

- **Irolo Street** is designated as an Avenue III that runs west of the project site, south of Wilshire Boulevard with one travel lane in each direction. Parking is permitted on both sides of the street. Irolo Street is part of the Pedestrian Enhanced Districts in the *Mobility Plan 2035*.

- **Mariposa Avenue** is designated as a Local Street that runs east of the project site with one travel lane in each direction and parking permitted throughout the study area.

- **Normandie Avenue** is designated as an Avenue III that runs west of the project site with two southbound travel lanes and one northbound travel lane during the AM peak period and one southbound travel lane and two northbound travel lanes during the PM peak period. Parking is prohibited along the east side of the street during the AM peak period and is prohibited along the west side of the street during the PM peak period. Left-turn pockets are present at major

intersections. In the study area, Normandie Avenue is part of the Pedestrian Enhanced Districts north of Wilshire Boulevard and south of Irolo Street.

- **Vermont Avenue** is designated as an Avenue I that runs east of the project site with two travel lanes in each direction. Parking is permitted on both sides of the street and left-turn pockets are present at major intersections. North of Wilshire Boulevard, Vermont Avenue widens to three travel lanes in each direction during peak hours and parking is only permitted during non-peak hours. In the study area, Vermont Avenue is part of the Comprehensive Transit Enhanced Network and the Pedestrian Enhanced Districts.

- **Western Avenue** is designated as an Avenue II that runs west of the project site with two travel lanes in each direction. South of 6th street, parking is generally only permitted on one side of the street. North of 6th street, parking is permitted on both sides of the street. Left-turn pockets are present at major intersections. Western Avenue is part of the Moderate Plus Transit Enhanced Network and the Pedestrian Enhanced Districts**.**

Lane configurations of the study intersections are provided in Appendix B.

EXISTING PUBLIC TRANSIT SERVICE

The Project site is served by a high level of public transit. Figure 3 shows the various metro bus routes, rapid bus routes, and Metro Rail lines providing service in the study area. The project is located adjacent to the Metro Purple Line Wilshire/Normandie Station. Eight local Metro (Route 16/17, 18, 20, 28, 66, 204, 206, 207), four Metro Rapid (Route 720, 728, 754, 757), two DASH (Wilshire Center/Koreatown and Hollywood/Wilshire), one Foothill Transit (Route 481), and one Commuter Express (Route 534) bus routes provide service within ½ mile of the project site along Wilshire Boulevard. In addition, Wilshire Boulevard has east-west dedicated bus lanes. Table 1 details the transit service near the project site.

EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Figure 4 shows citywide designated bicycle facilities in the project area. As shown in the figure, Wilshire Boulevard has peak hour bus lanes with bicycles permitted. S Oxford Avenue contains a bike lane that extends from W 3rd Street northwards. W 7th Street contains a bike lane from S Catalina Street eastwards. The *Mobility Plan 2035* identifies corridors proposed to receive improved bicycle, pedestrian and vehicle infrastructure improvements. Tier 1 Protected Bicycle Lanes are bicycle facilities that are separated from vehicular traffic. Tier 2 and Tier 3 Bicycle Lanes are facilities on roadways with striped separation. Tier 2 Bicycle Lanes are those which are more likely to be built by 2035. The Neighborhood Enhanced Network is the network of locally-serving streets planned to contain traffic-calming measures that close the gaps between streets containing bicycle facilities. Within the Study Area, W 7th Street east of S New Hampshire Avenue is a planned Tier 1 Protected Bicycle Lane. Wilshire Boulevard contains a planned Tier 2 Bicycle Lane, and Vermont Avenue contains a planned Tier 3 Bicycle Lane. Several streets within the study area are included within the planned Neighborhood Enhanced Network, including W 9th Street/James Wood Boulevard, W 4th Street and S Harvard Boulevard.

The study area generally has a mature network of pedestrian facilities including sidewalks, crosswalks and pedestrian safety features. Approximately 8- to 18-foot sidewalks are provided throughout the study area.

Existing and Planned Bicycle Facilities

EXISTING TRAFFIC VOLUMES AND LEVEL OF SERVICE

This section presents existing base peak hour traffic volumes, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each, indicating volume-to-capacity (V/C) ratios and levels of service (LOS).

EXISTING TRAFFIC VOLUMES

New weekday AM and PM peak hour turning movement counts were collected at the study intersections on Tuesday, April 17, 2018. The existing weekday morning and afternoon peak hour volumes at the study intersections are provided in Appendix B. Count sheets for these intersections are contained in Appendix C.

LEVEL OF SERVICE METHODOLOGY

A variety of standard methodologies are available to analyze LOS. According to *Transportation Impact Study Guidelines* (LADOT, December 2016), this study is required to use the Critical Movement Analysis (CMA) method of intersection capacity calculation (Transportation Research Board, 1980) to analyze signalized intersections in the City of Los Angeles. The V/C ratio is then used to find the corresponding LOS based on the definitions in Table 2A. Under the CMA methodology, a V/C ratio is generated for each study intersection based on factors such as the volume of traffic and the number of lanes providing for such vehicle movement and an LOS grade.

For the driveway analysis, the *Highway Capacity Manual* (HCM) (Transportation Research Board, 2010) methodology was used to analyze the delay. Under HCM methodology, delay is calculated in seconds and given an LOS grade, as shown in Table 2B.

The City of Los Angeles' Automated Traffic Surveillance and Control (ATSAC) system is a computer-based traffic signal control system that monitors traffic conditions and system performance to allow ATSAC-operations to manage signal timing to improve traffic flow conditions. The Adaptive Traffic Control System (ATCS) is an enhancement to ATSAC and provides fully traffic-adaptive signal control based on real-time traffic conditions. All of the study intersections located in the City of Los Angeles are currently operating under the City's ATSAC system and ATCS control. ATSAC and ATCS provide improved operating conditions. Therefore, in accordance with City of Los Angeles procedures, a credit of 0.07 V/C reduction was applied at each intersection where ATSAC is implemented and an additional 0.03 V/C reduction was applied at each intersection where ATCS is implemented.

EXISTING LEVELS OF SERVICE

Existing year traffic volumes presented in Appendix B were analyzed using the intersection capacity analysis methodology described above to determine the existing operating conditions at the study intersections. Table 3 summarizes the results of the analysis of the existing weekday morning and afternoon peak hour V/C ratio and corresponding LOS at each of the analyzed intersections. As indicated, all of the 14 signalized intersections analyzed for impacts operate at LOS D or better during both peak periods. Analysis sheets are provided in Appendix D.

TABLE 2A
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS
CMA METHODOLOGY

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat what restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

3. TRAFFIC PROJECTIONS

PROJECT TRAFFIC

The development of trip generation estimates for the proposed project involves the use of a 3-step process similar to that discussed for the cumulative projects: trip generation, trip distribution, and traffic assignment.

PROJECT TRIP GENERATION

As discussed in Chapter 1, the proposed project consists of 641 multifamily high rise residential units and 18,454 square feet of retail space.

Trip generation rates from *Trip Generation, 10th Edition* (Institute of Transportation Engineers [ITE], 2017) were used to estimate the number of trips associated with the project and are presented in Table 4. The ITE 10th edition introduces and defines the geographic setting for four different settings/locations: Rural, General Urban/Suburban, Dense Multi-Use Urban, and City Core. In many instances, trip generation rates are provided for each land use by geographic setting. The Project is located in an area that meets the dense multi-use urban ITE definitions; therefore, the trip generation rates for dense multi-use urban were used when available. However, for mid-rise and high-rise multifamily housing sites in dense multi-use urban and center city core areas, empirical trip generation data from surveys conducted at properties located within the City of Los Angeles area are available as a secondary data source to the ITE trip rates. The local data reveals higher high-rise residential trip generation rates than the ITE 10th edition rates; therefore, the local data was used for the residential component of this project. A summary of the local data and ITE geographical settings is shown in the MOU in Appendix A.

Furthermore, ITE rates for General Urban/Suburban were used for the retail uses since data is not available for the Dense Multi-Use Urban geographic setting for retail uses. ITE daily rates for General Urban/Suburban were also used for daily trip generation for the residential uses since daily rate data is not available for the Dense Multi-Use Urban geographic setting for these uses.

While the ITE 10th edition data and local data account for geographic settings in urban environments, the data is based on single-use freestanding sites. These defining characteristics limit their applicability to mixed-use or multi-use development projects, such as the proposed project, which is in a high density walkable urban setting with frequent and nearby local and regional transit service. The land use mix, design features, and setting of the proposed project include characteristics that influence travel behavior differently from typical single-use developments. In order to estimate the project's trip generation within the context of the mixed-use setting, a Main Street analysis was conducted, as detailed in Appendix E. The project trip generation accounts for the mix of uses provided in the project, the dense urban setting in which it is located, and the level of transit service provided in the area.

The Main Street methodology as applied in this study starts by estimating the trip generation based on trip generation rates from *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE],2012) and then estimates reductions to account for trip internalization and external non-automobile trips. The Main Street methodology estimates that the proposed project would generate about 32-44% percent fewer trips than the unadjusted ITE data. Informed adjustments were made to the ITE trip generation based on the Main

Street analysis to account for the improved density and diversity of land uses, pedestrian and bicycle connectivity, and transit service in the future.

Internal trip credits can be defined as a reduction that can be applied to the trip generation estimates for individual land uses to account for trips internal to the site. These are trips usually made via walking within the site. Reflective of the travel behavior characteristics of the land uses in the Wilshire corridor as well as the Main Street analysis, a 15% internal credit was incorporated in the trip generation analysis.

Consistent with the City of Los Angeles' *Transportation Impact Study Guidelines* which state that developments above or adjacent to a Metro Rail, Metrolink, or Orange Line station, with convenient pedestrian access to the station may qualify for up to a 25% transit credit, the trip generation estimates incorporate a 25% transit credit.

Per LADOT's *Transportation Impact Study Guidelines,* Attachment I Policy on Pass-By Trips, pass-by credits were applied to portions of the development. A 50% pass-by credit was applied to the retail uses. Pass-by credits account for the patrons making an intermediate stop on the way from an origin to a primary trip destination without a route diversion. These trips would be attracted from traffic passing the site on Wilshire Boulevard and other nearby streets.

As shown in Table 4, the project would generate an estimated net increase of 2,040 daily trips, including 131 trips (19 inbound/112 outbound) during the AM peak hour and 186 trips (125 inbound/61 outbound) during the PM peak hour.

PROJECT TRAFFIC DISTRIBUTION

The geographic distribution of trips generated by the proposed project is dependent on characteristics of the street system serving the project site; the level of accessibility of routes to and from the proposed project site; locations of employment and commercial centers to which residents of the project would be drawn; and residential areas from which the retail employees and other commercial visitors would be drawn. A select zone analysis was conducted for the proposed uses using the City of Los Angeles' Travel Demand Model to inform the general distribution pattern for this study. The distribution of project trips is illustrated in Figure 5.

PROJECT TRAFFIC ASSIGNMENT

The traffic to be generated by the proposed project was assigned to the street network using the distribution pattern described in Figure 5. Appendix B provides the assignment of the proposed Project-generated peak hour traffic volumes at the analyzed intersections during the AM and PM peak hours. The assignment of traffic volumes took into consideration the locations of the proposed project driveways on Mariposa Avenue, Irolo Street, and 7th Street.

PROJECT DRIVEWAYS

As discussed, the site currently has five driveways that provide access to the existing uses on the site. Two full access driveways are located on Mariposa Avenue, Two full access driveways are located on 7th Street and one full access driveway is located on Irolo Street. With the project, the southern driveway on Mariposa Avenue will be closed, leaving the site with four driveways to service the property. The residents will primarily use the Mariposa Avenue driveway and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the driveways, similar to the existing site access.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 10th Edition*, 2017

[b] Internal capture represents the percentage of trips between land uses that occur within the site. Main Street model calibration of base ITE rates reflecting project & site specific characteristics.

[c] The transit credit is based on LADOT's *Traffic Study Policies and Procedures*, December 2016. The guidelines state that up to 25% transit credit may be taken for projects adjacent to a transit station or Rapid Bus stop.

[d] The pass-by credit is based on Attachment I of LADOT's *Traffic Study Policies and Procedures*, December 2016.

[e] Local high-rise residential data collected for LADOT was used to determine the trip generation for the residential land use. The local data did not include information on daily rates, so the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

[f] The local high-rise residential data for the peak hours was collected in locations with access to transit; therefore, a transit credit was not applied during the peak hours. As local data was not available for daily, the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

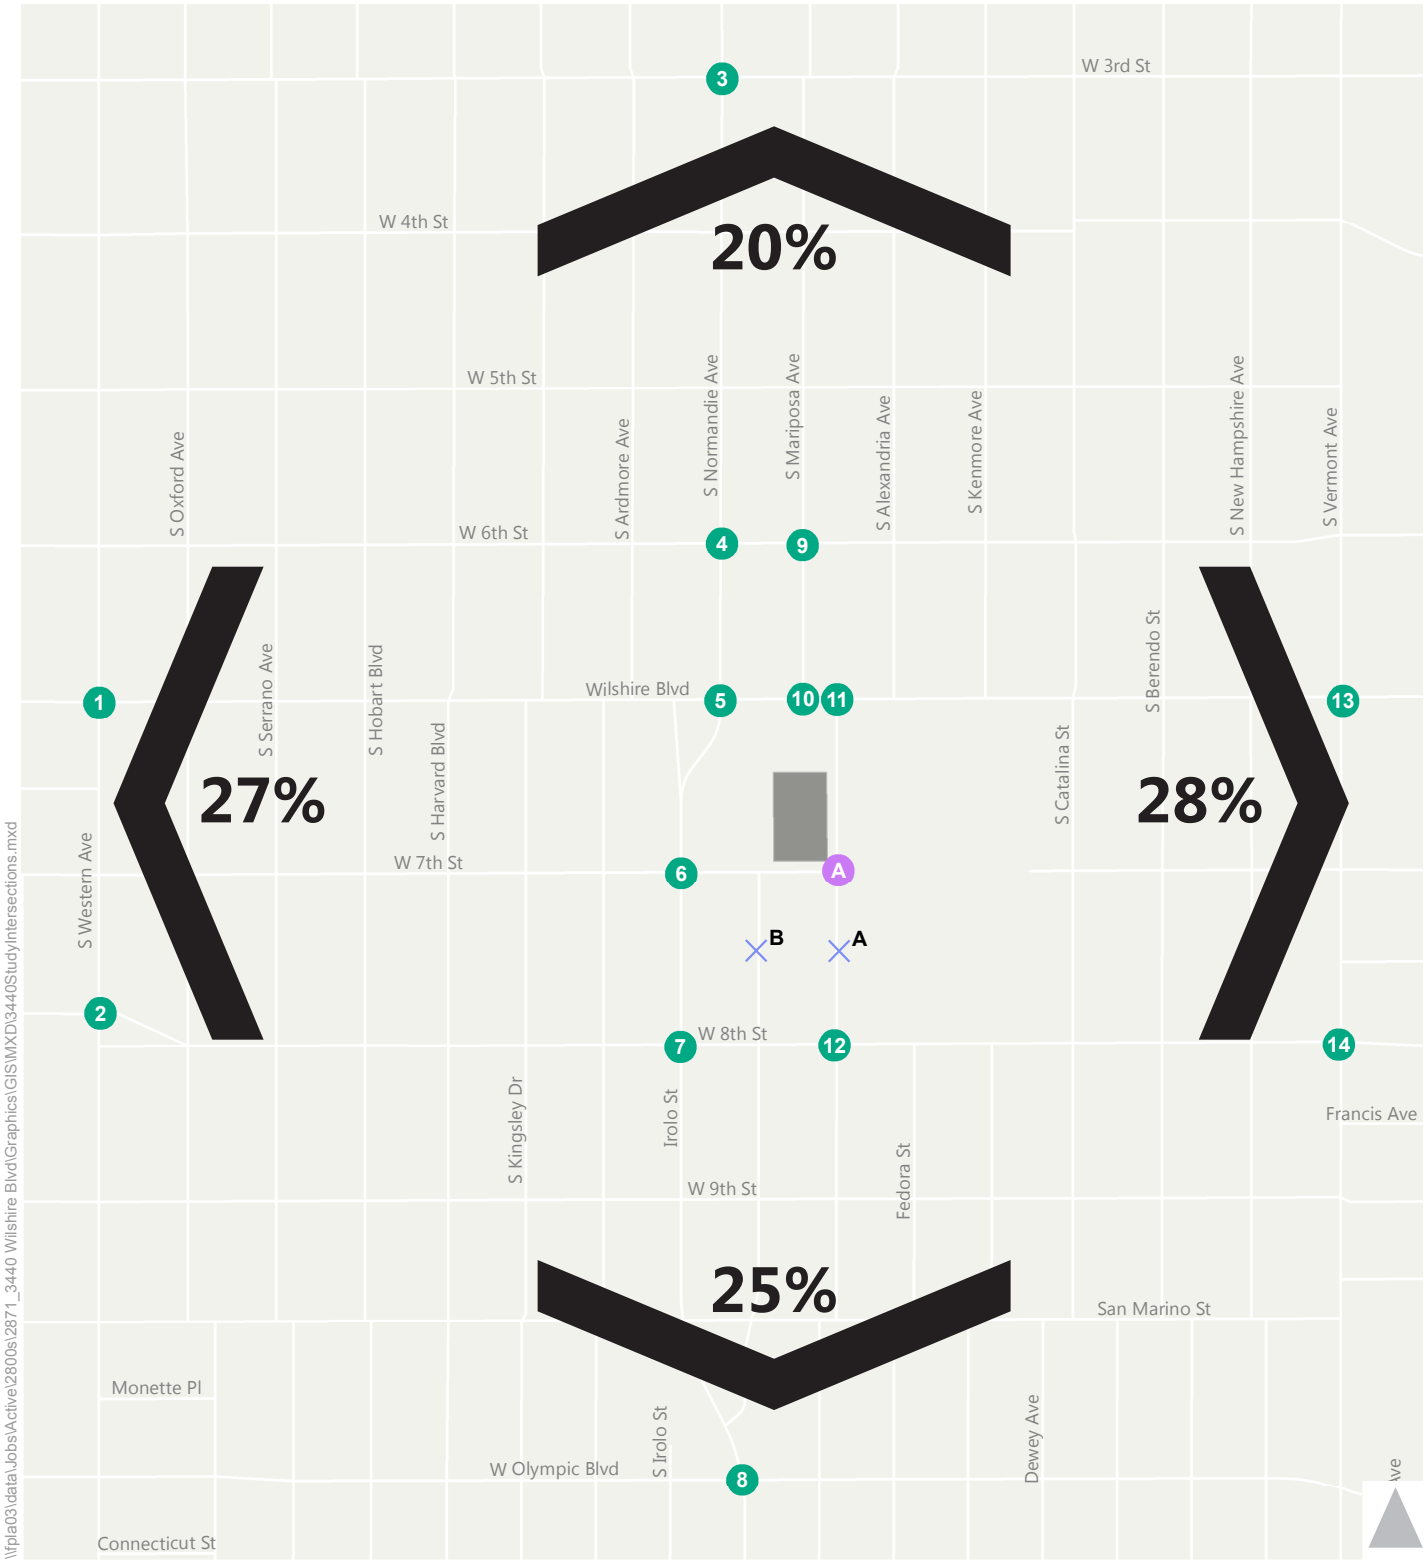

Figure 5

3440 Wilshire Trip Distribution

EXISTING PLUS PROJECT TRAFFIC CONDITIONS

The Project traffic estimated and assigned to the study intersections was added to the existing traffic volumes to estimate existing plus project traffic volumes. Turning movement traffic volumes for the Existing plus Project scenario are provided in Appendix B. Analysis sheets are provided in Appendix D.

FUTURE YEAR 2026 TRAFFIC CONDITIONS

To evaluate the potential impacts of the proposed project on future (Year 2026) conditions, it was necessary to develop estimates of future traffic conditions in the area both without and with Project traffic. First, estimates of traffic growth were developed for the study area to forecast future conditions without the Project. These forecasts included traffic increases as a result of both regional ambient traffic growth and traffic generated by specific developments in the vicinity of the Project (related projects).

These projected traffic volumes, identified herein as the Future Base conditions, represent the future conditions without the proposed Project. The traffic generated by the proposed Project was then estimated and assigned to the surrounding street system. Project traffic was added to the Future Base conditions to form Future (year 2026) plus Project traffic conditions, which were analyzed to determine the incremental traffic impacts attributable to the Project itself.

The assumptions and analysis methodology used to develop each of the future year scenarios discussed above are described in more detail in the following sections.

BACKGROUND OR AMBIENT GROWTH

Based on historic trends and at the direction of LADOT, it was established that an ambient growth factor of 1% per year should be applied to adjust the existing base year traffic volumes to reflect the effects of regional growth and development by year 2026. This adjustment was applied to the existing (year 2018) traffic volume data to reflect the effect of ambient growth by the year 2026.

RELATED PROJECT TRAFFIC GENERATION AND ASSIGNMENT

Future Base traffic forecasts include the effects of known specific projects, called related projects, expected to be implemented in the vicinity of the proposed project site prior to the buildout date of the proposed Project. The list of related projects was prepared based on data from LADOT and verified by City Planning. A total of 134 cumulative projects were identified in the study area; these projects are listed in Table 5 and illustrated in Figure 6.

- Purple Line Extension
- Project Site

Figure 6

Related Projects

Trip Generation

For related projects provided by LADOT, the trip generation was used as provided. For related projects provided by City Planning or other sources, trip generation was used from a combination of previous study findings and publicly available environmental documentation. Where trip generation estimates for the related projects were not available, they were calculated using trip generation rates contained in *Trip Generation, 9th*. Table 5 presents the resulting trip generation estimates for these related projects. These projections are conservative in that they do not in every case account for either the existing uses to be removed or the possible use of non-motorized travel modes (transit, walking, etc.).

Trip Distribution

The geographic distribution of the traffic generated by the related projects is dependent on several factors. These factors include the type and density of the proposed land uses, the geographic distribution of population from which employees and potential patrons of proposed commercial developments may be drawn, the locations of employment and commercial centers to which residents of residential projects may be drawn, and the location of the projects in relation to the surrounding street system. Additionally, if the traffic study or environmental document for a related project was available, the trip distribution from that study was used.

Traffic Assignment

Using the estimated trip generation and trip distribution patterns described above, traffic generated by the related projects was assigned to the street network.

TRANSPORTATION INFRASTRUCTURE PROJECTS

The Metro Purple Line subway is currently undergoing an extension from the Wilshire/Western station to Westwood/UCLA. Construction for the first section of the project began in 2015 and is anticipated to be completed in 2023. The second section of the project, began in 2018 and is anticipated to be completed in 2025. The full project includes additional stations at Westwood/UCLA and Westwood/Veterans Affairs Hospital.

There are no other infrastructure changes in the study area planned for implementation by year 2026 per confirmation by City staff. Therefore, network changes were not included in the analysis.

FUTURE YEAR 2026 BASE TRAFFIC VOLUMES

Future year 2026 base weekday AM and PM peak hour traffic volumes and lane geometries for the analyzed intersections are provided in Appendix B. The Future Base traffic conditions represent an estimate of future conditions without the proposed Project inclusive of the ambient background growth and related projects traffic.

FUTURE PLUS PROJECT TRAFFIC PROJECTIONS

The proposed Project traffic volumes were added to the year 2026 Future Base traffic projections, resulting in Future (year 2026) plus Project AM and PM peak hour traffic volumes. As provided in Appendix B, the Future (year 2026) plus Project scenario presents future traffic conditions with the completion of the proposed Project.

4. INTERSECTION TRAFFIC IMPACT ANALYSIS

The traffic impact analysis evaluates the projected LOS at each study intersection under the Existing plus Project and Future (year 2026) plus Project conditions to estimate the incremental increase in the V/C ratios caused by the proposed Project. This provides the information needed to assess the potential impact of the project using significance criteria established by LADOT.

CRITERIA FOR DETERMINATION OF SIGNIFICANT TRAFFIC IMPACT

The City of Los Angeles has established threshold criteria to determine significant traffic impact of a proposed project in its jurisdiction. Under the LADOT guidelines, an intersection would be significantly impacted with an increase in V/C ratio equal to or greater than 0.04 for intersections operating at LOS C, equal to or greater than 0.02 for intersections operating at LOS D, and equal to or greater than 0.01 for intersections operating at LOS E or F after the addition of project traffic. Intersections operating at LOS A or B after the addition of the project traffic are not considered significantly impacted regardless of the increase in V/C ratio. The following summarizes the impact criteria:

LOS	Final V/C Ratio	Project-Related Increase in V/C
C	> 0.700 - 0.800	equal to or greater than 0.040
D	> 0.800 - 0.900	equal to or greater than 0.020
E or F	> 0.900	equal to or greater than 0.010

EXISTING PLUS PROJECT IMPACT ANALYSIS

EXISTING PLUS PROJECT TRAFFIC LEVEL OF SERVICE

The existing plus project traffic volumes presented in Appendix B were analyzed to determine the projected V/C ratios and LOS for each of the analyzed intersections under this scenario. Table 6 summarizes the Existing plus Project LOS. Analysis sheets are provided in Appendix D. As indicated in Table 6, all 14 signalized intersections are projected to operate at LOS D or better during both peak hours.

EXISTING PLUS PROJECT INTERSECTION IMPACTS

As shown in Table 6, after applying the aforementioned City of Los Angeles significant impact criteria, it is determined that the proposed Project would not result in significant impacts under Existing plus Project conditions at any of the study intersections.

FUTURE PLUS PROJECT IMPACT ANALYSIS

FUTURE BASE TRAFFIC CONDITIONS

The year 2026 Future Base peak hour traffic volumes were analyzed to determine the projected V/C ratio and LOS for each of the analyzed intersections. Table 7 summarizes the future LOS. Seven of the 14 signalized intersections analyzed for impacts are projected to operate at LOS D or better during the morning and afternoon peak hours under Future Base conditions. The following seven intersections are projected to operate at LOS E or worse during one or both of the peak hours under Future Base conditions:

1. Western Avenue & Wilshire Boulevard (LOS E during AM and PM)
2. Western Avenue & 8th Street (LOS E during AM and LOS F during PM)
5. Normandie Avenue & Wilshire Boulevard (LOS F during AM and PM)
7. Irolo Street & 8th Street (LOS F during AM and PM)
8. Normandie Avenue & Olympic Boulevard (LOS E during AM and LOS F during PM)
13. Vermont Avenue & Wilshire Boulevard (LOS F during AM and PM)
14. Vermont Avenue & 8th Street (LOS E during AM and LOS F during PM)

FUTURE PLUS PROJECT TRAFFIC CONDITIONS

The resulting Future (year 2026) plus Project peak hour traffic volumes, provided in Appendix B, were analyzed to determine the projected future operating conditions with the addition of the proposed Project traffic. The results of the Future (year 2026) plus Project analysis are also presented in Table 7, with analysis sheets provided in Appendix D. Seven of the 14 signalized intersections analyzed for impacts are projected to operate at LOS D or better during the morning and afternoon peak hours under Future (year 2026) plus Project conditions. The following seven intersections are projected to operate at LOS E or worse during one or both of the peak hours under Future (year 2026) plus Project conditions:

1. Western Avenue & Wilshire Boulevard (LOS E during AM and PM)
2. Western Avenue & 8th Street (LOS E during AM and LOS F during PM)
5. Normandie Avenue & Wilshire Boulevard (LOS F during AM and PM)
7. Irolo Street & 8th Street (LOS F during AM and PM)
8. Normandie Avenue & Olympic Boulevard (LOS E during AM and LOS F during PM)
13. Vermont Avenue & Wilshire Boulevard (LOS F during AM and PM)
14. Vermont Avenue & 8th Street (LOS E during AM and LOS F during PM)

FUTURE (YEAR 2026) PLUS PROJECT INTERSECTION IMPACTS

As shown in Table 7, using the criteria for determination of significant impacts, it is determined that the proposed Project would not result in significant impacts under Future (year 2026) plus Project conditions. No mitigation measures are therefore required.

UNSIGNALIZED INTERSECTION SIGNAL WARRANT ANALYSIS

One intersection near the project site is currently unsignalized, Mariposa Avenue & 7th Street. The City of Los Angeles traffic analysis methodology and significance criteria are for signalized intersections only. The City does not provide impact thresholds for unsignalized intersections. Rather, the LADOT *Transportation Impact Study Guidelines* states that "unsignalized intersections should be evaluated solely to determine the need for the installation of a traffic signal or other traffic control device."

Traffic volumes and lane configurations, as presented in Appendix B, were used to prepare the signal warrant analysis at the Mariposa Avenue & 7th Street unsignalized intersection under existing, existing plus project, future base, and future plus project conditions. As shown in Table 8, the intersection met the signal warrant thresholds during the PM peak hour under all analysis scenarios, except existing conditions. During the AM peak hour, the intersection met the signal warrant for future plus project conditions. Analysis sheets are provided in Appendix F.

TABLE 8
3440 WILSHIRE PROJECT
PEAK HOUR SIGNAL WARRANT ANALYSIS

No.	INTERSECTIONS	PEAK HOUR	EXISTING SIGNAL WARRANT MET	EXISTING PLUS PROJECT SIGNAL WARRANT MET	FUTURE BASE SIGNAL WARRANT MET	FUTURE PLUS PROJECT SIGNAL WARRANT MET
A	Mariposa Ave & 7th St	AM	No	No	No	Yes
		PM	No	Yes	Yes	Yes

5. NEIGHBORHOOD TRAFFIC IMPACT ANALYSIS

This chapter presents the results of an analysis conducted regarding the potential for Project impacts on local residential streets in neighborhoods near the Project. The analysis was conducted on two residential street segments to the south of 7th Street and the project site on Normandie Avenue and Mariposa Avenue. These streets were selected in conjunction with the City of Los Angeles, as they were determined to have a greater likelihood of neighborhood cut-through traffic from the Project. The significance of potential impacts was assessed using criteria established by the City of Los Angeles.

24-hour machine counts were conducted on the two analyzed street segments in April 2018. Future daily traffic volumes were projected in a manner similar to the peak hour analysis of the study intersections, including both ambient growth at 1% per year as well as anticipated traffic from cumulative projects that could be constructed by 2026. The net new Project trips were assigned to the street network based on the Project trip distribution pattern presented in Chapter 3 and were added to the future base projection to obtain future plus project projections.

NEIGHBORHOOD STREET IMPACTS

Under the City of Los Angeles guidelines, a project impact on a local residential street would be considered significant if the new commercial trips generated by the project result in increases in average daily traffic (ADT) volumes as follows:

Projected ADT with Project (Final ADT)	Project-Related Increase in ADT
0 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

Daily traffic volumes for the existing and projected future conditions are summarized in Tables 9 to 10. As shown, the proposed Project would not result in a significant impact at any of the study neighborhood street segments.

TABLE 9
3440 WILSHIRE PROJECT
NEIGHBORHOOD STREET IMPACT ANALYSIS - EXISTING PLUS PROJECT ANALYSIS

Street Segment	Weekday Two-Way Daily	With Project Impact Analysis				
	Existing Base	Commercial Project Only	Existing plus Project	Project % Increase	Impact Criteria [a]	Significant Impact?
Mariposa Ave south of 7th Street	5,531	77	5,608	1.4%	8%	NO
Normandie Ave south of 7th Street	4,164	[b]	4,164	[b]	8%	No

Notes:

[a] Uses City of Los Angeles impact criteria for residential street segments.

[b] Negligible number of project trips are projected to use this segment.

NEIGHBORHOOD STREET IMPACT ANALYSIS - CUMULATIVE PLUS PROJECT ANALYSIS

Street Segment	Weekday Two-Way Daily Volume		With Project Impact Analysis				
	Existing Base	Cumulative Base	Commercial Project Only	Cumulative plus Project	Project % Increase	Impact Criteria [a]	Significant Impact?
Mariposa Ave south of 7th Street	5,531	6,271	77	6,348	1.2%	8%	NO
Normandie Ave south of 7th Street	4,164	4,509	[b]	4,509	[b]	8%	NO

Notes:

[a] Uses City of Los Angeles impact criteria for residential street segments.

[b] Negligible number of project trips are projected to use this segment.

6. REGIONAL TRANSPORTATION SYSTEM IMPACT ANALYSIS

This section presents an analysis of potential impacts on the regional transportation system. This analysis was conducted in accordance with the procedures outlined in *Congestion Management Program for Los Angeles County* (Metro, 2010). The CMP requires that, when an environmental impact report is prepared for a project, traffic and transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use those facilities.

In addition, *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* (October 2013, as amended in December 2015) sets forth criteria for when a freeway impact analysis should be conducted. LADOT determined as part of the traffic study memorandum of understanding for the Project (see Appendix A) that the Project would not meet these criteria for requiring a freeway impact analysis.

REGIONAL TRAFFIC IMPACT ANALYSIS

The CMP guidelines require that the first issue to be addressed is the determination of the geographic scope of the study area. The criteria for determining the study area for CMP arterial monitoring intersections and for freeway monitoring locations are:

- All CMP arterial monitoring intersections where the proposed project will add 50 or more trips during either the AM or PM peak hours of adjacent street traffic.

- All CMP mainline freeway monitoring locations where the proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours.

SIGNIFICANT TRAFFIC IMPACT CRITERIA

The CMP traffic impact analysis guidelines establish that a significant project impact occurs when a certain threshold is exceeded. If the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$), a significant impact would occur. If the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$).

ARTERIAL MONITORING STATIONS

The CMP arterial monitoring station closest to the proposed project site is at Western Avenue & Wilshire Boulevard located west of the proposed project site. Based on the project trip distribution and trip generation, the project is expected to add approximately 11 trips in the AM peak hour and 17 trips in the PM peak hour through the CMP arterial monitoring station. The proposed project is not estimated to exceed the arterial analysis criteria of 50 vehicle trips at the above-mentioned location; therefore, no further CMP arterial analysis is required.

FREEWAY ANALYSIS

Regional access to the project site is provided by the US-101 Freeway located approximately 1.6 miles north of the project site and the I-10 Freeway located approximately 1.7 miles to the south of the project site, respectively. The CMP freeway monitoring stations closest to the project site includes the US-101 Freeway at Normandie Avenue and the I-10 Freeway at Budlong Avenue.

The CMP freeway monitoring station closest to the project site on the US-101 freeway is located at Normandie Avenue. Based on the Project distribution patterns, approximately 7.5% of project traffic is expected to travel through the US-101 freeway monitoring station at Normandie Avenue. According to the trip generation estimates shown in Table 4, the project is projected to result in an increase of 10 trips in the morning and 14 trips in the evening peak hour US-101 at Normandie Avenue.

The CMP freeway monitoring stations closest to the project site on the I-10 freeway are at Budlong Avenue. Approximately 7.5% of project traffic is expected to travel east on the I-10 freeway through Budlong Avenue and approximately 7.5% is expected to travel west on the I-10 freeway towards the City of Santa Monica. The project is projected to result in an increase of 10 trips in the morning and 14 trips in the evening peak hour on eastbound and westbound I-10 freeway.

Since fewer than 150 trips would be added during the AM or PM peak hours in either direction at any of the freeway segments in the vicinity of the study area, no further analysis of the freeway segments is required for CMP purposes.

REGIONAL TRANSIT IMPACT ANALYSIS

Potential increases in transit person trips generated by the proposed project were estimated. Appendix C-8 of the 2010 CMP provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the projected number of vehicle trips. This methodology assumes an average vehicle ridership (AVR) factor of 1.4 in order to estimate the number of person trips to and from the project and then provides guidance regarding the percentage of person trips assigned to public transit depending on the type of use (commercial/other versus residential) and the proximity to transit services. Appendix C-8 of the 2010 CMP recommends summarizing the fixed-route local bus services within ¼ mile of the project site and express bus routes and rail service within two miles of the project site.

Excluding the transit credit in the trip generation table shown in Table 4, the proposed Project would have an estimated increase in vehicle trip generation of approximately 201 net vehicle trips during the AM peak hour and 310 during the PM peak hour before the transit credit. Applying the AVR factor of 1.4 to the estimated vehicle trips would result in an estimated increase of approximately 281 and 434 person trips during the AM and PM peak hours, respectively.

As discussed in Chapter 3, a 25% transit credit was applied to the Project trip generation estimates to account for trips made to and from the project site using modes other than automobiles. The Project is located within a ¼-mile walking distance of the Metro Purple Line at the Wilshire/Western Station as well as the transit service documented in Table 1. Consistent with this approach, the Project would generate an estimated increase of 70 transit trips during the AM peak hour and 108 transit trips during the PM peak hour. Given the frequency of the high quality transit service in close proximity to the project site, including the Metro Purple Line subway and multiple Metro Rapid and local bus routes, the incremental transit riders resulting from the Project are not anticipated to result in a significant impact on the transit lines serving the area.

7. SITE ACCESS

The proposed project would have four driveways:

- A full-access driveway on Mariposa Avenue.
- Two full-access driveways on 7th Street.
- A full-access driveway on Irolo Street.

The loading areas for the project uses will be located in the parking structure on Level 1 and will be accessible from the Mariposa Avenue driveway.

LEVEL OF SERVICE ANALYSIS FOR PROJECT DRIVEWAYS

A level of service analysis was conducted at to evaluate the ability of the project access plan to accommodate the anticipated traffic levels at the driveway access points. The residents will primarily use the Mariposa Avenue driveway and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the driveways, similar to the existing site access. The driveway LOS analysis focuses on the two driveways which will be used by residents.

The driveway locations below will be unsignalized and stop-controlled and were analyzed using the 2-way Stop methodology from the HCM. The HCM methodology determines the average vehicle delay for the stop-controlled approach to find the corresponding LOS based on the definitions presented in Table 2B. Driveway analysis LOS worksheets are included in Appendix D. Table 11 shows the results of the LOS analysis at the unsignalized driveways.

TABLE 11 – DRIVEWAY SERVICE AND IMPACT ANALYSIS

Driveway Location	Peak Hour	Existing plus Project (2018)		Future plus Project (2026)	
		Delay (seconds)	LOS	Delay (seconds)	LOS
7th Street Eastern Driveway	AM PM	13.9 18.4	B C	14.6 20.2	B C
Mariposa Avenue Driveway	AM PM	21.9 23.2	C C	24.6 26.0	C D

As shown, the driveways are projected to operate at acceptable LOS (LOS D or better) under Existing plus Project (2018) and Future plus Project (2026) conditions.

8. CONSTRUCTION PERIOD IMPACT ANALYSIS

CONSTRUCTION IMPACT CRITERIA

LADOT generally considers construction-related traffic to cause adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. LADOT requires implementation of worksite traffic control plans to ensure that any construction-related effects are minimized to the greatest extent possible.

The LA CEQA Thresholds Guide provides four categories to be considered in regards to in-street construction impacts: temporary traffic impacts, temporary loss of access, temporary loss of bus stops or rerouting of bus lines, and temporary loss of on-street parking (LA CEQA Threshold Guide, pages L.8-2 through L.8-4). The factors to be considered in each of these categories as established in the LA CEQA Threshold Guide are as follows:

- Temporary Traffic Impacts:
  - The length of time of temporary street closures or closures of two or more traffic lanes;
  - The classification of the street (major arterial, state highway) affected;
  - The existing traffic levels and LOS on the affected street segments and intersections;
  - Whether the affected street directly leads to a freeway on- or off-ramp or other state highway;
  - Potential safety issues involved with street or lane closures;
  - The presence of emergency services (fire, hospital, etc.) located nearby that regularly use the affected street.
- Temporary Loss of Access:
  - The length of time of any loss of vehicular or pedestrian access to a parcel fronting the construction area;
  - The availability of alternative vehicular or pedestrian access within ¼ mile of the lost access;
  - The type of land uses affected, and related safety, convenience, and/or economic issues.
- Temporary Loss of Bus Stops or Rerouting of Bus Lines:
  - The length of time that an existing bus stop would be unavailable or that existing service would be interrupted;
  - The availability of a nearby location (within ¼ mile) to which the bus stop or route can be temporarily relocated;
  - The existence of other bus stops or routes with similar routes/ destinations within a ¼mile radius of the affected stops or routes;
  - Whether the interruption would occur on a weekday, weekend or holiday, and whether the existing bus route typically provides service that/those day(s).
- Temporary Loss of On-Street Parking:
  - The current utilization of existing on-street parking;
  - The availability of alternative parking locations or public transit options (e.g. bus, train) within ¼ mile of the project site;
  - The length of time that existing parking spaces would be unavailable.

The LAMC provides that construction activities are limited to the hours from 7:00 AM to 9:00 PM on weekdays and from 8:00 AM to 6:00 PM on Saturdays and holidays. No construction is permitted on Sundays.

CONSTRUCTION IMPACT ASSESSMENT

Construction of the project is anticipated to begin in January 2022 and end in January 2026 for a total construction duration of approximately 48 months to complete. The construction of the two project towers, Tower 1 and Tower 2, will be completed sequentially. Demolition and grading phases for both towers will occur at the same time and the construction and architectural coatings phases of Tower 1 and Tower 2 will occur sequentially. The construction is anticipated to involve four key phases:

(1) demolition and site preparation – 2 months;

(2) grading – 3 months;

(3) construction – 19 months for Tower 1 and 19 months for Tower 2;

(4) architectural coatings – 5 months for Tower 1 and 5 months for Tower 2.

The assessment of the Project against the construction impact factors established in the *LA CEQA Thresholds Guide* is presented in Table 12 and discussed below.

TEMPORARY TRAFFIC IMPACTS

Full-time closures to the sidewalk and parking lane are anticipated for the project along Mariposa Avenue and 7th Street. Mariposa Avenue is classified as a local street and 7th Street is classified as an Avenue II. In addition, there are no emergency services located within the immediate vicinity of the affected streets. The closures during construction would be for the parking lane; therefore, the temporary construction impacts on the roadway network would be considered less than significant.

The sidewalks along Mariposa Avenue and 7th Street fronting the project construction will be closed for the duration of the project. Sidewalk and lane closures are not anticipated along Wilshire Boulevard. The sidewalk on the east side of Mariposa Avenue and south side of 7th Street will be open and pedestrians are anticipated to use this as a detour throughout construction. As such, the temporary impacts to pedestrians during construction would be less than significant.

The intersection of Mariposa Avenue (South) & Wilshire Boulevard operates at LOS A during both peak hours under existing conditions, and would operate at LOS A during the both peak hours under cumulative conditions. The intersection of Irolo Street & 7th Street operates at LOS A during both peak hours under existing conditions, and would operate at LOS B in the AM peak hour and LOS D during the PM peak hour under cumulative conditions.

Worksite traffic control plans would be prepared for any temporary vehicle lane, bicycle lane, or sidewalk closures in accordance with applicable City and MUTCD guidelines.

TEMPORARY LOSS OF ACCESS

The existing office building located directly north of the construction site will remain open throughout construction. In addition, the parking garage will remain open during construction as well providing parking for both the office building tenants and the construction workers. Pedestrian and vehicular access to properties located to the east and west of the project site will be open and unobstructed for the duration of construction. Since the Project construction would not block any vehicle or pedestrian access to other parcels fronting the construction area, impacts would be less than significant.

TEMPORARY LOSS OF BUS STOPS OR REROUTING OF BUS LINES

Bus stops are not located along Mariposa Avenue or 7th Street where the parking lane closures would occur. A bus only lane is located on the south side of Wilshire Boulevard adjacent to the project site and a bus stop is present directly east of Irolo Street, but construction will not affect bus operations as there are no sidewalk or lane closures anticipated on Wilshire Boulevard along the Project frontage. Therefore, the project construction would not require relocation of bus stops and the construction impacts on transit operations would be less than significant.

TEMPORARY LOSS OF ON-STREET PARKING

Construction would require temporary removal of well utilized on-street parking spaces along the project frontages of Mariposa Avenue, from Wilshire Boulevard to 7th Street, and 7th Street, from Irolo Street to Mariposa Avenue, to accommodate the construction area footprint and/or temporary truck staging. This would require the temporary removal of 12 two-hour metered parking spaces along Mariposa Avenue and 16 two-hour metered parking spaces along 7th Street for 24 months. Per the provisions in the California Public Resources Code Section 21099, which implements SB 743, parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. As such, temporary parking impacts would be less than significant.

TABLE 12
3440 WILSHIRE PROJECT
CONSTRUCTION IMPACT SIGNIFICANCE FACTORS

Significance Factor [a]	**Assessment**	**Conclusion**
Per the *LA CEQA Thresholds Guide* , the determination of significance shall be made on a case-by-case basis, considering the following factors:		
Temporary Traffic Impacts:		
• The length of time of temporary street closures or closures of two or more traffic lanes; • The classification of the street (major arterial, state highway) affected; • The existing traffic levels and level of service (LOS) on the affected street segments and intersections; • Whether the affected street directly leads to a freeway on- or off-ramp or other state highway; • Potential safety issues involved with street or lane closures; • The presence of emergency services (fire, hospital, etc.) located nearby that regularly use the affected street.	• Temporary street closures or closures of two or more traffic lanes are not anticipated. • The streets affected by any temporary lane or sidewalk closures (Mariposa Avenue and 7th Street) local street and Avenue II, respectively. • The Mariposa/Wilshire and Irolo/7th intersections currently operates at LOS A during both peak periods. Mariposa/Wilshire operates at LOS A during both peak periods under cumulative. Irolo/7th operates at LOS B (AM) and LOS D (PM) under cumulative. • None of the affected streets directly lead to a freeway on- or off-ramp or other state highways. • Worksite traffic control plans would be prepared for any temporary lane closures in accordance with applicable City and MUTCD guidelines. • There are no emergency services located within the immediate vicinity of the affected streets.	• Less than significant.
Temporary Loss of Access:		
• The length of time of any loss of vehicular or pedestrian access to a parcel fronting the construction area; • The availability of alternative vehicular or pedestrian access within ¼ mile of the lost access; • The type of land uses affected, and related safety, convenience, and/or economic issues.	• Blockage of existing vehicle or pedestrian access to parcels fronting the construction area is not anticipated. Access to the office building and parking structure will remain throughout construction.	• Less than significant.
Temporary Loss of Bus Stops or Rerouting of Bus Lines:		
• The length of time that an existing bus stop would be unavailable or that existing service would be interrupted; • The availability of a nearby location (within ¼ mile) to which the bus stop or route can be temporarily relocated; • The existence of other bus stops or routes with similar routes/ destinations within a ¼mile radius of the affected stops or routes; • Whether the interruption would occur on a weekday, weekend or holiday, and whether the existing bus route typically provides service that/those day(s).	• There are no bus stops along the Mariposa Avenue and 7th Street. There is one bus lane on the south side of Wilshire Boulevard, with a bus stop located along the project frontage but as lane closures are not anticipated along Wilshire Boulevard, project construction would not require blockage of the bus lane.	• Less than significant.
Temporary Loss of On-Street Parking:		
• The current utilization of existing on-street parking; • The availability of alternative parking locations or public transit options (e.g. bus, train) within ¼ mile of the project site; • The length of time that existing parking spaces would be unavailable.	• The Project could require temporary removal of on-street parking spaces along the Project frontages on Mariposa Avenue and 7th Street to accommodate temporary truck staging or travel lanes. This requires the temporary removal of 28 well utilizted, two-hour, metered parking spaces for 24 months. • Public transit options are available within 1/4 mile of the Project site, including: Metro Purple Line Wilshire/Normandie Station and rapid and local bus routes on 6th Street, 8th Street, 9th Street, and Wilshire.	• Less than significant in accordance with SB 743/Public Resources Code Section 21099.
Note: SB 743 as implemented in California Public Resources Code Section 21099 provides that parking impacts of a residential, mixed- use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. This guidance supersedes the significance guidance in the *LA CEQA Threshold Guide* .		

CONSTRUCTION TRAFFIC

CONSTRUCTION TRUCKS

Haul Trucks

Hauling activity is expected to occur during Phase 1, 2, and 3. Up to 30 haul trucks per day are anticipated on peak haul days in Phase 1 and up to 55 haul trucks per day are anticipated on peak haul days in Phase 2. One haul truck is anticipated in Phase 3.

Hauling hours are anticipated to be 7:00 AM to 5:00 PM. The haul route for the project will most likely be either eastbound on Wilshire Boulevard to the I-101 Freeway, or south on Irolo Street to the I-10 Freeway, to the Manning Pit Landfill in Irwindale. Trucks are expected to be staged off-site and dispatched to the project site as needed.

Equipment and Delivery Trucks

In addition to haul trucks, the site is also expected to generate equipment and delivery trucks during each phase of construction. One example would be concrete delivery, which would be required for the parking garage and the buildings on-site. Other materials could include plumbing supplies, electrical fixtures, and items used in furnishing the buildings. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in variously sized vehicles including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would have to be delivered to the site. This equipment could include cranes, bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles.

Minimal delivery/equipment trucks are expected to be needed under Phase 1 and Phase 2. Phase 3 is expected to generate up to 20 equipment/delivery trucks per day on peak activity days. Phase 4 is expected to generate up to 40 equipment/delivery trucks per day on peak activity days.

CONSTRUCTION EMPLOYEES

The number of construction workers would vary throughout the construction period with the building construction phase generating the highest number of trips. Phase 1 is expected to involve a total of 15 workers on site on a daily basis and Phase 2 will involve up to approximately 20 workers on a peak day. Phase 3 is expected to involve a total of 200 workers on site on a daily basis and Phase 4 will involve up to approximately 5 workers on a peak day.

CONSTRUCTION WORKER PARKING

During the demolition/excavation phase and the first portion of the building construction while the parking garage is under construction, it is anticipated that construction employees would be parked in the 3550 Wilshire parking lot directly next to the project site as well as in nearby buildings along Wilshire Boulevard owned by the project applicant. Once the subterranean parking structure component of the Project is complete, construction workers would also be parked in the additional spaces in the garage.

CONSTRUCTION PERIOD TRIP GENERATION

Based on the aforementioned information, a construction period trip generation analysis was conducted for each phase of construction to estimate daily, morning and evening peak hour passenger car equivalent (PCE) trips. Construction workers often travel to and from a worksite outside of the typical peak commute hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers will arrive during the peak morning commute hour and 40% will depart during the peak evening commute hour For the purposes of the trip generation analysis, the hauling hours were assumed to occur from 7:00 AM to 5:00 PM, a 10-hour period, which would create the highest number of haul trips in the peak hours. The delivery/equipment trucks are anticipated to arrive and depart between 7:00 AM and 5:00 PM, a 10-hour period. A PCE factor of 2.5 was assumed for haul trucks assuming the use of double-belly trailer trucks and a PCE factor of 2.0 was used for delivery trucks.

Table 13 shows a summary of construction period trip generation under each phase of construction. As shown, on a peak construction activity day, a total of up to 196 daily PCE trips are estimated to occur under Phase 1, of which 24 PCE trips would occur during each of the morning and evening peak hours. Phase 2 is estimated to generate a total of 331 daily PCE trips on a day with peak construction activity, of which 38 PCE trips are estimated to occur during each of the morning and evening peak hours. Phase 3 is estimated to generate a total of 485 daily PCE trips on a day with peak construction activity, of which 88 PCE trips are estimated to occur during each of the morning and evening peak hours. Phase 4 is estimated to generate a total of 170 daily PCE trips on a day with peak construction activity, of which 18 PCE trips are estimated to occur during each of the morning and evening peak hours.

At any given time, the peak construction activity is estimated to generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied (2,040 daily trips, 131 AM peak hour trips, and 186 PM peak hour trips, as shown in Table 4).

Although significant construction impacts are not anticipated, the influx of this material and equipment could create less than significant impacts on the adjacent roadway network based on the following considerations:

- There may be intermittent periods when large numbers of material deliveries are required, such as when concrete trucks will be needed for the parking garage and the buildings.
- Some of the materials and equipment could require the use of large trucks (18-wheelers), which could create additional congestion on the adjacent roadways.
- Delivery vehicles may need to park temporarily on adjacent roadways such as Sunset Place and Hoover Street as they deliver their items. Based on past experience, it is not uncommon for these types of deliveries to result in temporary lane closures.

TABLE 13
3440 WILSHIRE PROJECT
CONSTRUCTION PERIOD TRIP GENERATION

Peak Daily Activity Under Each Phase

	Demolition & Site Preparation	Grading	Construction	Architectural Coating

Phase 34Total	***170***	***10***	***8***	***18***	***8***	***10***	***18***

PCE - Passenger car equivalent

Notes:

[1] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[2] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

[3] - Daily haul, delivery/equipment, and trash truck trips were assumed to occur evenly throughout an 8-hour construction day in off-peak hours. Therefore, the daily truck trips were divided by 8 hours to calculate morning and evening peak hour truck trips.

CONSTRUCTION MITIGATION MEASURES

As shown in Table 12, impacts related to construction traffic were found to be less than significant. In addition, the peak construction activity will generate fewer daily and peak hour trips than are projected for the project once it is completed and occupied. While mitigation measures are not required to mitigate significant impacts, to be conservative a Construction Traffic Management Plan and Construction Worker Parking Plan should be implemented.

A Construction Traffic Management Plan will be developed by the contractor and approved by the City of Los Angeles to alleviate construction period impacts, which may include but is not limited to the following measures:

- Provide off-site truck staging in a legal area furnished by the construction truck contractor. Anticipated truck access to the project site will be off Mariposa Avenue and 7th Street.
- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.
- As one parking lane and/or sidewalk closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, should be implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- Establish requirements for loading/unloading and storage of materials on the project site, where parking spaces would be encumbered, length of time traffic travel lanes can be encumbered, sidewalk closings or pedestrian diversions to ensure the safety of the pedestrian and access to local businesses and residences.
- Ensure that access will remain unobstructed for land uses in proximity to the project site during project construction.
- Coordinate with the City and emergency service providers to ensure adequate access is maintained to the project site and neighboring businesses and residences.

A Construction Worker Parking Plan will also be developed by the contractor and approved by the City of Los Angeles to ensure that the parking location requirements for construction workers will be strictly enforced. These could include but are not limited to the following measures:

- During construction activities when construction worker parking cannot be accommodated on the project site, the plan shall identify alternate parking location(s) for construction workers and the method of transportation to and from the project site (if beyond walking distance) for approval by the City 30 days prior to commencement of construction.
- Provide all construction contractors with written information on where their workers and their subcontractors are permitted to park, and provide clear consequences to violators for failure to follow these regulations. This information will clearly state that no parking is permitted on residential streets.

9. SUMMARY AND CONCLUSIONS

This study was undertaken to analyze the potential traffic impacts of the proposed development on the current site of 3440 Wilshire Boulevard. The following summarizes the results of this analysis:

- The proposed Project involves the construction of 641 multifamily high-rise units and 18,454 square feet of retail space.
- The proposed Project is located on Wilshire Boulevard between Irolo Street and Mariposa Avenue. Inbound and outbound vehicular access will be provided by four separate driveways, one on Mariposa Avenue, two on 7th Street, and one on Irolo Street. The loading areas for the project uses will be located in the parking structure on Level 1 and will be accessible from the Mariposa Avenue driveway.
- The Project would generate an estimated net increase of 2,040 daily vehicle trips, including 131 trips during the AM peak hour and 186 trips during the PM peak hour.
- The LOS analysis for the Existing plus Project and Future plus Project determined that the Project would not result in significant impacts at study area intersections.
- Significant CMP arterial, CMP freeway or transit impacts would not be created by the Project; therefore, no mitigation measures would be required.
- Impacts related to construction traffic were found to be less than significant. In addition, the peak construction activity will generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied. While mitigation measures are not required to mitigate significant impacts, to be conservative, a Construction Traffic Management Plan and Construction Worker Parking Plan should be implemented.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 10th Edition* , 2017

[b] Internal capture represents the percentage of trips between land uses that occur within the site. Main Street model calibration of base ITE rates reflecting project & site specific characteristics.

[c] The transit credit is based on LADOT's *Traffic Study Policies and Procedures* , December 2016. The guidelines state that up to 25% transit credit may be taken for projects adjacent to a transit station or Rapid Bus stop.

[d] The pass-by credit is based on Attachment I of LADOT's *Traffic Study Policies and Procedures* , December 2016.

[e] Local high-rise residential data collected for LADOT was used to determine the trip generation for the residential land use. The local data did not include information on daily rates, so the general urban/suburban daily equation was used, making it appropriate to apply a transit credit.

FEHR PEERS

DRAFT MEMORANDUM

Date: July 17, 2018

To: Eddie Guerrero and Wes Pringle, LADOT

From: Tom Gaul and Amanda Heinke, Fehr & Peers

Subject: Trip Generation for Multifamily Residential Uses – ITE 10th Edition

---

In November 2017, the Institute of Traffic Engineers (ITE) released the 10th edition ITE Trip Generation Manual, which provided updated trip generation rates for numerous land uses. In light of the new 10th edition rates, a comparison of the 10th edition trip generation rates to the 9th edition rates as well as to the local trip generation data was conducted for multifamily residential uses. The purpose of this memorandum is twofold: (1) to present a brief summary of the changes in the ITE 10th edition multifamily residential trip rates and (2) provide a recommendation for multifamily residential trip generation rates in the City of Los Angeles for dense mixed-use urban areas and city core areas.

Key ITE Multifamily Residential Trip Rate Changes

Both the ITE 9th and ITE 10th edition manuals include three categories for multifamily housing: low-rise, mid-rise, and high-rise multifamily housing. The definitions of the low-rise, mid-rise, and high-rise categories remain the same as described in the 9th edition: low-rise is one or two stories, mid-rise is three to 10 stories, high-rise is greater than 10 stories. The ITE 9th edition manual also included generic apartment rates (land use code 220) and generic condominium rates (land use code 230) that were not related to height. The ITE 10th edition manual no longer provides this option, only providing rates for low-rise, mid-rise, and high-rise.

In addition, the ITE 10th edition introduces geographic setting for four different settings/locations: Rural, Urban/Suburban, Dense Multi-Use Urban, and City Core. The ITE 10th edition manual definitions for each of the geographic setting terms are shown in Attachment A.

Table 1 provides a comparison between the 9th edition and 10th edition rates for residential land uses by each geographical setting.

Locally Available Trip Data

For mid-rise and high-rise multifamily housing sites in dense multi-use urban and center city core areas, trip generations rates from properties within the City of Los Angeles area are available as a secondary data source to the ITE trip rates. Table 2 provides data obtained from local trip generation surveys conducted as part of the *Measuring the Miles/Infill and Complete Streets* project for LADOT[1], further categorized into properties that were mid-rise and high-rise as well as general urban/suburban, dense multi-use urban, or city center core areas to mirror the category distinctions in the ITE 10th edition trip generation manual. Table 2 provides the average trip generation for mid-rise and high-rise residential properties in the City of Los Angeles.

The local data reveals that mid-rise and high-rise multifamily average trip rates for the AM and PM peak hours in dense multi-use urban areas are lower than the ITE 9th edition rates, but higher than the ITE 10th edition peak hour rates. As the local data reveals a higher trip generation rates than the ITE 10th edition rates, the local data should be used for the purposes of estimating trip generation for mid-rise and high-rise projects in dense multi-use urban areas in the City of Los Angeles.

However, local data was not available for low-rise multifamily or for daily trip rates for mid-rise and high-rise multifamily sites. In the absence of local data, the 10th edition general urban/suburban trip rates may be used. Transit credits may be considered according to LADOT transportation guidelines.

Summary of Recommendations

- For multifamily uses located in general urban/suburban areas, the ITE 10th edition residential trip rates for all multifamily housing types are statistically valid and are representative of recent travel patterns. These rates are acceptable to use as an estimate for residential vehicle trip generation.
- For multifamily mid-rise and multifamily high-rise uses located in dense multi-use urban areas, the local mid-rise and high-rise data should be applied to properties that meet the ITE definitions of location in dense multi-use urban areas since the local data reveals higher trip generation than the 10th edition ITE rates for the same uses. The following summarizes these rates:

[1] Memorandum from Tom Gaul & Cary Bearn, Fehr & Peers, to Claire Bowin & David Somers, Los Angeles Department of City Planning, "Infill and Complete Streets Study, Tasks 2.1B & 2.1C Local Trip Generation Studies", April 20, 2017.

Local Trip Generation Rates for
Multifamily Mid-Rise and High-Rise Residential Land Uses in Dense Multi-Use Urban Areas

Land Use	AM Peak Hour (trips per DU)	PM Peak Hour (trips per DU)
Multifamily Mid-Rise	0.31	0.30
Multifamily High-Rise	0.23	0.30

- For multifamily mid-rise uses located in city center core areas, the ITE 10th edition trip rates should be used in the absence of sufficient local data points. For the multifamily high-rise uses in city center core areas, as both the ITE data and the local data are low in sample size, the local trip data for the dense multi-use areas should be used.
- For low-rise multifamily housing in dense multi-use urban and center city core areas, the low-rise trip rates for the general urban/suburban geographic setting should be used due to the lack of readily available local daily data. Transit credits may be considered for daily trip generation if using these rates under this scenario.

[b] Source presents trip generation information in rates only.

Attachment A

The following presents the definitions of the setting/location for City Center Core, Dense Multi-Use Urban, General Urban/Suburban, and Rural areas for use in the ITE Trip Generation Manual, 10th edition.

Center City Core – the downtown area for a major metropolitan region at the focal point of a regional light- or heavey-rail transit system. This area type is typified by multi-storied buildings, a wide range of land uses an extensive pedestrian sidewalk network, and shared and priced parking both on-street and in structured garages or surface lots. The area typically has more jobs than residents and therefore is typically an employment destination. The area also includes the immediate vicinity of the commercial core.

Dense Multi-Use Urban – a fully developed area (or nearly so), with diverse and interacting complementary land uses, good pedestrian connectivity, and convenient and frequent transit. This area type can be a well-developed urban area outside a major metropolitan downtown or moderate size urban area downtown. The land use mix typically includes office, retail, residential, and often entertainment, hotel, and other commercial uses. The residential uses are typically multifamily or single-family on lots no larger than one-fourth acre. The commercial uses often have little or no setback from the sidewalk. Because the motor vehicle still represents the primary mode of travel to and from the area, there typically is on-street parking and often off-street public parking. The complementary land uses provide the opportunity for short trips within the Dense multi-Use Urban area, made convenient by walking, biking, or transit. The area is served by significant transit (either rail or bus) that enables a high level of transit usage to and from the area of development.

General Urban/Suburban – an area associated with almost homogeneous ehicle-centered access. Nearly all person trips that enter or exist a development site are by personal passenger or commercial vehicle. The area can be fully developed (or nearly so) at low-medium density with a mix of residential and commercial uses. The commercial land uses are typically concentrated at intersections or spread along commercial corridors, often surrounded by low-density, almost entirely residential development. Most commercial buildings are located behind the parking area or surrounded by parking. The mixing of land uses is only in terms of their proximity, not in terms of function. A retail land use may focus on service a regional clientele whereas a service land use may target motorists or pass-by vehicle trips for its customers. Even if the land uses are complementary, a lack of pedestrian, bicycling, and transit facilities or services limit non-vehicle travel.

Rural – agricultural or undeveloped except for scattered parcels and at very low densities.

MOU ATTACHMENT A
FREEWAY SCREENING FOR 3440 WILSHIRE PROJECT IN ACCORDANCE WITH SCREENING CRITERIA DESCRIBED IN SECTION 3 OF THE "AGREEMENT BETWEEN CITY OF LOS ANGELES AND CALTRANS DISTRICT 7 ON FREEWAY IMPACT ANALYSIS PROCEDURES" (DECEMBER 2015)

INTRODUCTION

Section 3.1 of the "Agreement Between City of Los Angeles and Caltrans District 7 On Freeway Impact Analysis Procedures" originally dated October 2013 specifies the freeway mainline and ramp screening criteria for development projects in the City of Los Angeles. Section 3.1 was amended in December of 2015 with the following threshold criteria:

> "City will require Project applicants to work with Caltrans and prepare a Freeway Impact Analysis, utilizing Caltrans' "Guide for the Preparation of Traffic Impact Studies" ("TIS Guide"), for land use proposals that meet any of the following criteria:
>
> - The project's peak hour trips would result in a 1-percent or more increase to the freeway mainline capacity of a freeway segment operating at level-of-service (LOS) E or F (based on an assumed capacity of 2,000 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 2-percent or more increase to the freeway mainline capacity of a freeway segment operating at LOS D (based on an assumed capacity of 2,000 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 1-percent or more increase to the capacity of a freeway off-ramp operating at LOS E or F (based on an assumed ramp capacity of 850 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 2-percent or more increase to the capacity of a freeway off-ramp operating at LOS D (based on an assumed ramp capacity of 850 vehicles per hour per lane)."

The purpose of this analysis is to apply the screening criteria to determine whether a Freeway Impact Analysis would be required for the 3440 Wilshire project. The methodologies used to conduct the screening analysis for the project, and the results of the screening, are described below.

FREEWAY MAINLINE SEGMENT SCREENING

The 3440 Wilshire project is located at 3440 Wilshire Boulevard, Los Angeles, CA 90010 with regional access provided by the Interstate 10 (I-10) freeway and US Route 101 (US-101). Five sections of freeways were selected for a freeway screening analysis:

- I-10 Freeway west of Normandie Avenue – 4 lanes in each direction
- I-10 Freeway east of Normandie Avenue – 4 lanes in each direction
- US-101 north of Western Avenue – 4 lanes in each directions
- US-101 south of Silverlake Boulevard (north of Rampart Boulevard) – 4 lanes in each directions
- US-101 south of Rampart Boulevard – 4 lanes in each directions

Project trips on the freeway facilities are shown in Table A1 and the mainline screening analysis is shown in Table A2. As shown in Table A2, the freeway capacity is 8,000 vph for 4 lanes. The most rigorous trigger criteria for LOS E/F operations was used for the screening analysis. For LOS E or F operations, the threshold test is whether the project would use 1% of the available capacity (80 vph for 4 lanes). Because no more

than 19 project trips are expected to occur in any analyzed peak hour on any particular segment, the mainline screening threshold is not met and therefore a Freeway Impact Analysis is not required.

FREEWAY RAMP SCREENING

Project trips on the freeway off-ramp facilities are shown in Table A1 and the freeway off-ramp screening analysis is shown in Table A3. Six freeway off-ramps were selected for a freeway screening analysis. The most rigorous trigger criteria for LOS E/F operations was used for the screening analysis. For LOS E or F operations, the threshold test is whether the project would use 1% of the capacity (based on an assumed ramp capacity of 850 vehicles per hour per lane), or approximately 9 vph for 1-lane and 17 vph for 2-lanes. Because no more than 4 project trips are expected to occur in any analyzed peak hour on 1-lane ramps and no more than 9 project trips are expected to occur in any analyzed peak hour on 2-lane ramps, the freeway off-ramp screening thresholds are not met and therefore a Freeway Impact Analysis is not required.

# of Lanes [a]	4	4	4	4
Capacity	8,000	8,000	8,000	8,000
Worst-case LOS	**E/F**	**E/F**	**E/F**	**E/F**
Trigger % [b]	1%	1%	1%	1%
Trigger	80	80	80	80
Project Trips	2	12	13	6
Exceed Trigger?	no	no	no	no

Notes:

a. # of lanes does not include auxiliary or HOV lanes.

b. The worst-case assumption of LOS was used with the most stringent trigger thresholds: LOS E/F Threshold: 1% of capacity if LOS E or F, 2% of capacity if LOS D, using 2,000 vphpl capacity

TABLE A3
3440 WILSHIRE PROJECT

PROJECT TRIP GENERATION

	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
Project Trip Generation	19	112	125	61

RAMP SCREENING

Off-Ramp	Peak Hour	Worst-Case Off-Ramp LOS [a]	Ramp Terminus # of Lanes	Ramp Terminus Trigger	Project Trips	Exceed Trigger?
I-10 EB Normandie Ave Off	AM	E/F	2	17	1	no
	PM	E/F		17	9	no
I-10 WB Normandie Ave Off	AM	E/F	2	17	1	no
	PM	E/F		17	9	no
US-101 SB Western Ave Off	AM	E/F	2	17	1	no
	PM	E/F		17	9	no
US-101 SB Melrose Ave Off	AM	E/F	1	9	1	no
	PM	E/F		9	4	no
US-101 NB Silverlake Blvd Off	AM	E/F	2	17	1	no
	PM	E/F		17	9	no
US-101 NB Rampart Blvd Off	AM	E/F	1	9	1	no
	PM	E/F		9	4	no

Notes:

a. The worst-case assumption of LOS was used with the most stringent trigger thresholds: LOS E/F Threshold: 1% of capacity if ramp at LOS E or F, 2% if ramp at LOS D, using HCM intersection methodology at ramp terminus

APPENDIX E:
MAIN STREET ANALYSIS

Appendix E – 3440 Wilshire MainStreet Analysis

Trip Generation Methodology

Current accepted methodologies, such as the Institute of Transportation Engineers (ITE) Trip Generation methodology, are primarily based on data collected at suburban, single-use, freestanding sites. These defining characteristics limit their applicability to mixed-use or multi-use development projects, such as the proposed project, which is in a high density walkable urban setting with frequent and nearby local and regional transit service. The land use mix, design features, and setting of the proposed project include characteristics that influence travel behavior differently from typical single-use suburban developments. Thus, traditional data and methodologies, such as ITE, would not accurately estimate the project vehicle trip generation. In response to the limitations in the ITE methodology, and to provide a straightforward and empirically validated method of estimating vehicle trip generation at mixed-use developments, the US Environmental Protection Agency (EPA) sponsored a national study of the trip generation characteristics of multi-use sites. Travel survey data was gathered from 239 mixed-use developments in six major metropolitan regions, and correlated with the characteristics of the sites and their surroundings. The findings indicate that the amount of external traffic generated is affected by a wide variety of factors, each pertaining to one or more of the following characteristics:

- **The relative numbers of residents and jobs on the site** – the better the site jobs/ housing balance, the greater the proportion of commute trips that remain internal.
- **The amount of retail and service use on the site relative to the number of residences** – the greater the degree to which retail and service opportunities match the needs generated by site residents, the greater the internalization of household-generated shopping, personal services and entertainment travel.
- **The amount of retail and service use relative to the number of employees** – the better the balance of employee-oriented retail and service opportunities, the greater the internal capture of lunchtime and after-work dining, shopping and errands by site employees.
- **The overall size of the development** – the larger the scale of the development in terms of acreage and total amounts of residential and commercial use, the greater the likelihood that travel destinations can be satisfied within the site as a whole.
- **The density of development** – the greater the concentration of dwellings and commercial space per acre, the greater the likelihood that the interacting land uses will be near enough together to encourage walking or short-distance internal driving.
- **The internal connectivity for walking or driving among different activities** – measured in terms of the ratio of intersections to total land area within the site directly influences trip internalization and the number of trips made by walking instead of driving.
- **The availability of transit** – the greater the number of jobs within a reasonable travel time via transit, the greater the share of travel likely to occur by transit, and the lower the traffic generation.
- **The number of convenient trip destinations within the immediate area** – the number of retail and other jobs in neighborhoods immediately surrounding the multi-use site increases the amount of walking to/from the site and reduces vehicular traffic generation. These characteristics were

related statistically to the trip behavior observed at the study development sites using Hierarchical Linear Modeling (HLM) techniques. This quantified relationships between characteristics of the mixed-use developments and the likelihood that trips generated by those mixed-use developments will stay internal and/or use modes of transportation other than the private vehicle.

These statistical relationships produced equations, known as the EPA MXD model, that allows predicting external vehicle trip reduction as a function of the mixed-use development characteristics. Applying the external vehicle trip reduction percentage to "raw trips", as predicted by ITE, produces an estimate for the number of vehicle trips traveling in or out of the site.

Validation of MXD/MainStreet Model

Since the conclusion of the EPA sponsored study, Fehr & Peers has been actively enhancing the MXD model to improve sensitivity to various site characteristics, improve peak hour performance, and continue to validate the model against mixed-use sites where data is available. A set of 28 independent mixed-use sites across the country that were not included in the initial EPA model development have been tested to validate the model. These sites represent locations where it is expected that traditional data and methodologies, such as ITE, would not accurately estimate the project vehicle trip generation. Table 1 presents the performance of the MXD model against ITE and ITE internalization procedures.

Based on all statistical measurements, the MXD model performs better than the ITE recommended procedures for these types of sites. The MXD model has been approved for use by the EPA[1]. It has also been peer-reviewed in the ASCE Journal of Urban Planning and Development[2], peer-reviewed in a 2012 TRB paper evaluating various smart growth trip generation methodologies[3], recommended by SANDAG for use on mixed-use smart growth developments[4], and has been used successfully in multiple certified EIRs in California. Fehr & Peers has incorporated the MXD model into its MainStreet model. Appendix A presents certified EIRs that have used the Main Street model or its predecessors.

TABLE 1
3440 WILSHIRE PROJECT
VALIDATION STATISTICS COMPARISON

Validation Statistic	ITE Raw	ITE with Internalization	Main Street Model
Daily			
Average Model Error[1]	30%	17%	4%
% RSME[2]	42%	28%	17%
R-Squared[3]	0.72	0.87	0.95
AM Peak Hour			
Average Model Error[1]	57%	53%	3%
% RSME[2]	58%	76%	34%
R-Squared[3]	56%	56%	91%
PM Peak Hour			
Average Model Error[1]	56%	41%	22%
% RSME[2]	96%	81%	59%
R-Squared[3]	-56%	-11%	41%

Notes:

1. Average model error measures the difference between the estimated trip generation and the counted trip generation of 28 survey sites.

2. RMSE stands for percent root mean squared error is a demand assessment of performance of transportation models in that it does not apply average that would allow over-estimates and under-estimates to cancel one another out and it penalizes proportionally more for large errors. A % RMSE of less than 40% is generally considered acceptable in transportation modeling.

3. R-squared is a statistical measure that indicates, in this case, the degree to which each method explains the variation in trip generation among the 28 survey sites. A R-Squared value closer to 1.0 indicates that the method fully explains the variation in trip generation amongst the survey sites and would be suitable to be used for that set of site types.

MainStreet Analysis

Table 2 summarizes the input values and data sources for the MainStreet model for the project and surrounding neighborhood. The MainStreet model uses both internal project land uses and local and regional demographic data. Table 3 summarize the estimated trip generation for project neighborhood using the MXD/MainStreet methodology.

As shown in Tables 2, the MainStreet methodology accounts for the following:

- Internal Capture trips – are defined as trips made internal to the project area. The MainStreet methodology reduces the ITE-based automobile trip generation by about 8 percent for the daily and 12 and 13 percent for the AM and PM peak hours to account for internal trips within the neighborhood. Considering the expected shortage of parking, traffic congestion, available transit service, and walkability of the project area, most internal trips are expected to be non-auto trips. Adjusting for non-auto trips between compatible land uses within the site, the final internal capture for non-auto trips is expected to be between 8 and 13 percent.

- External Walk, Bike, and Transit trips - are defined as external trips made using non-automobile modes. The Main Street methodology reduces the ITE-based automobile trip generation by about 24 to 32 percent to account for external walk, bike, or transit trips.

Overall, the Project is estimated to generate up to 44 percent fewer trips than estimated by the unadjusted ITE methodology. In consultation with LADOT, 15% was used as the internalization capture for daily, AM, and PM peak hours and 25% transit for a total credit of 40% on project trips.

Comparisons with Mode Share Data

US Census data were used to check the reasonability of the MainStreet model results presented above. Table 4 shows journey to work mode share data for the census tracts in the project area based on the 2012 American Community Survey (ACS) data. The data shows that nearly half of the area residents' journey to work is by non-automobile modes. Table 7 also compares the project area mode share with journey to work data for residents throughout all of the City of Los Angeles, all of the County of Los Angeles, and the entire Southern California Association of Governments (SCAG) region. City of Los Angeles, County of Los Angeles, and SCAG residents have higher automobile mode shares because of more suburban development patterns.

The current project area residents' automobile mode share is about 18 percent lower than City of Los Angeles, 25 percent lower than County of Los Angeles, and about 26 percent lower than SCAG mode share.

TABLE 4 – AMERICAN COMMUNITY SURVEY (ACS) (2012) – DAILY JOURNEY TO WORK MODE SHARE

FORM GEN. 160A (Rev. 1/82)

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

3440 Wilshire Blvd
DOT Case No. CEN 16-44755

Date: October 25, 2018

To: Heather Bleemers, City Planner
Department of City Planning

From: Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **TRANSPORTATION ANALYSIS FOR THE PROPOSED MIXED-USE PROJECT LOCATED AT 3440 WILSHIRE BOULEVARD**

The Department of Transportation (DOT) has reviewed the transportation impact study, dated September 2018, prepared by Fehr & Peers, for the proposed mixed-use development located at 3440 Wilshire Boulevard. In order to evaluate the effects of the project's traffic on the available transportation infrastructure, the significance of the project's traffic impacts is measured in terms of change to the volume-to-capacity (V/C) ratio between the "future no project" and the "future with project" scenarios. This change in the V/C ratio is compared to DOT's established threshold standards to assess the project-related traffic impacts. The transportation impact analysis included the detailed analysis of 14 signalized intersections, one un-signalized intersection, and two street segments. Based on DOT's current traffic impact criteria[1], none of these signalized intersections would be significantly impacted by project-related traffic prior to mitigation. The results of the transportation impact analysis, which accounted for other known development projects in evaluating potential cumulative impacts, adequately evaluated the project's traffic impacts on the surrounding community and is summarized in **Attachment 1**.

DISCUSSION AND FINDINGS

A. Project Description

The project site is currently occupied by a parking structure with two office buildings. The two existing office buildings will remain and include approximately 760,456 square feet of office space, retail, fast food restaurant, and sit down restaurant. The proposed mixed-use development at 3440 Wilshire Boulevard will replace just the existing parking structure with 641 high rise residential units, 18,454 square feet of retail space, two levels of underground parking structure, and four levels of above ground parking.

The project currently has five driveways that provide access to the existing uses. The new project will close one of the driveways, leaving the site with four driveways to serve the property. Residents will primarily use the Mariposa Avenue and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the

[1] Per the DOT Transportation Impact Analysis Policies and Procedures, a significant impact is identified as an increase in the Critical Movement Analysis (CMA) value, due to project related traffic, of 0.01 or more when the final ("with project") Level of Service (LOS) is LOS E or F; an increase of 0.020 or more when the final LOS is LOS D; or an increase of 0.040 or more when the final LOS is LOS C.

driveways. Loading areas for the project will be accessible from the Mariposa Avenue driveway. The project is expected to be completed by 2026.

B. Trip Generation

The project is estimated to generate a net increase of 2,040 daily trips, 131 trips in the a.m. peak hour, and 186 trips in the p.m. peak hour. The trip generation estimates are based on formulas published by the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition, 2017. A copy of the trip generation table can be found in **Attachment 2**.

C. Freeway Analysis

The traffic study included a freeway impact analysis that was prepared in accordance with the State-mandated Congestion Management Program (CMP) administered by the Los Angeles County Metropolitan Transportation Authority (MTA). According to this analysis, the project would not result in significant traffic impacts on any of the evaluated freeway mainline segments. To comply with the Freeway Impact Analysis Agreement executed between Caltrans and DOT in October 2013, the study also included a screening analysis to determine if additional evaluation of freeway mainline and ramp segments was necessary beyond the CMP requirements. The project did not meet or exceed any of the four thresholds defined in the latest agreement, updated in December 2015. Exceeding one of the four screening criteria would require the applicant to work directly with Caltrans to prepare more detailed freeway analyses. No additional freeway analysis was required.

PROJECT REQUIREMENTS

A. Construction Impacts

DOT recommends that a construction work site traffic control plan be submitted to DOT's Citywide Temporary Traffic Control Section or Permit Plan Review Section for review and approval prior to the start of any construction work. Refer to http://ladot.lacity.org/what-we-do/plan-review to determine which section to coordinate review of the work site traffic control plan. The plan should show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. DOT also recommends that all construction related traffic be restricted to off-peak hours to the extent feasible.

B. Highway Dedication And Street Widening Requirements

On January 20, 2016, the City Council adopted the Mobility Plan 2035 which is the new Mobility Element of the General Plan. A key feature of the updated plan is to revise street standards in an effort to provide a more enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Per the new Mobility Element, **WILSHIRE BOULEVARD** is designated as an Avenue I, which would require a 35-foot half-width roadway within a 50-foot half-width right-of-way. **WEST 7TH STREET** is designated as an Avenue II, which would require a 28-foot half-width roadway within a 43-foot half-width right-of-way. **SOUTH NORMANDIE AVENUE/ IROLO STREET** is designated as an Avenue III, which would require a 23-

foot half-width roadway within a 36-foot half-width right-of-way. **MARIPOSA AVENUE** is designated as a Local Street, which would require an 18-foot half-width roadway within a 30-foot half-width right-of-way. The applicant should check with BOE's Land Development Group to determine if there are any other applicable highway dedication, street widening and/or sidewalk requirements for this project.

C. Parking Requirements

The project currently has five driveways that provide access to the existing uses. The new project will close one of the driveways, leaving the site with four driveways. Residents will primarily use the Mariposa Avenue and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the driveways. Loading areas for the project will be accessible from the Mariposa Avenue driveway.

The number of parking spaces that will be provided by the project was not disclosed in the study. The applicant should check with the Department of Building and Safety on the number of Code-required parking sp aces needed for the project.

D. Driveway Access and Circulation

The proposed site plan illustrated in **Attachment 3** is acceptable to DOT; however, review of the study does not constitute approval of the driveway dimensions and internal circulation schemes. Those require separate review and approval and should be coordinated with DOT's Citywide Planning Coordination Section (201 N. Figueroa Street, 5th Floor, Room 550, at 213-482-7024). In order to minimize potential building design changes, the applicant should contact DOT for driveway width and internal circulation requirements so that such traffic flow considerations are designed and incorporated early into the building and parking layout plans. All new driveways should be Case 2 driveways and any security gates should be a minimum 20 feet from the property line. All truck loading and unloading should take place on site with no vehicles backing into the project via any of the project driveways.

E. Development Review Fees

An ordinance adding Section 19.15 to the Los Angeles Municipal Code relative to application fees paid to DOT for permit issuance activities was adopted by the Los Angeles City Council in 2009. This ordinance identifies specific fees for traffic study review, condition clearance, and permit issuance. The applicant shall comply with any applicable fees per this ordinance.

If you have any questions, please contact Johnathan Yu of my staff at (213) 972-4993.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 10th Edition*, 2017

[b] Internal capture represents the percentage of trips between land uses that occur within the site. Main Street model calibration of base ITE rates reflecting project & site specific characteristics.

[c] The transit credit is based on LADOT's *Traffic Study Policies and Procedures*, December 2016. The guidelines state that up to 25% transit credit may be taken for projects adjacent to a transit station or Rapid Bus stop.

[d] The pass-by credit is based on Attachment I of LADOT's *Traffic Study Policies and Procedures*, December 2016.

[e] Local high-rise residential data collected for LADOT was used to determine the trip generation for the residential land use. The local data did not include information on daily rates, so the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

[f] The local high-rise residential data for the peak hours was collected in locations with access to transit; therefore, a transit credit was not applied during the peak hours. As local data was not available for daily, the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

FEHR PEERS

DRAFT

TECHNICAL ADDENDUM TO
3440 WILSHIRE PROJECT TRANSPORTATION IMPACT ANALYSIS

Date: August 27, 2019

To: Wes Pringle, Los Angeles Department of Transportation

From: Tom Gaul and Ryan Liu, Fehr & Peers

Subject: ***Traffic Analysis of Revised 3440 Wilshire Project***

Ref: LA16-2871

This document is a technical addendum to the original transportation impact analysis conducted by Fehr & Peers for the 3440 Wilshire Project[1] and included in the Mitigated Negative Declaration (MND) for the Project. This addendum summarizes an update to the transportation impact analysis as a result of changes made to the proposed Project.

PROJECT DESCRIPTION

The original Project involved the construction of 641 multifamily high-rise residential units and 18,454 square feet of retail space. The original Project would demolish an existing parking structure which serves an existing 760,456 square feet of office space that is to remain. The site currently has five driveways that provide access to the existing uses on the site. Two full access driveways are located on Mariposa Avenue. Two full access driveways are located on 7th Street and one full access driveway is located on Irolo Street. With the original Project, the southern driveway on Mariposa Avenue would be closed, leaving the site with four driveways to service the property. The residents would primarily use the Mariposa Avenue driveway and eastern 7th Street driveway, but all other land uses on the site would have access to use each of the driveways, similar to the existing site access. The loading areas for the original project uses would be located in the parking structure on Level 1 and will be accessible from the Mariposa Avenue driveway.

The revised Project description provides 640 multifamily high-rise residential units, 5,538 square feet of retail space, 4,600 square feet of high-turnover (sit-down) restaurant space, and 2,000 square feet of fast casual restaurant space. The revised Project's access and driveway plan will remain the same as that of the original Project.

Figure 1 shows the revised site plan with the aforementioned changes to project components.

[1] Fehr & Peers, *3440 Wilshire Boulevard Project Transportation Analysis*, September 2018.

METHODOLOGY AND TRIP GENERATION

Analysis Methodology

This study evaluates the potential for peak-hour project-generated traffic impacts at the same 15 study intersections and two street segments in the vicinity of the project site (shown in Figure 2) that were evaluated in the 2018 Transportation Impact Analysis with the original Project. Peak hour traffic impacts were evaluated during typical weekday morning and afternoon peak hours. Four traffic scenarios were developed in order to conduct the plus project impact analyses:

1. Existing Conditions are the traffic conditions presented in the 2018 Transportation Impact Analysis report.

2. Existing plus revised Project conditions are the traffic conditions expected with the addition of the revised proposed project layered on top of the Existing baseline traffic volumes. The incremental increase in traffic compared to existing conditions provides the basis for the identification of potential impacts of the proposed project.

3. Future (Year 2026) Base Conditions reflect background traffic growth and related projects project for Year 2026, which are the same traffic conditions presented in the 2018 Transportation Impact Analysis report.

4. Future (Year 2026) plus Project conditions are the traffic conditions expected with the addition of the proposed revised project layered on top of the cumulative baseline traffic volumes in Year 2026. The incremental increase in traffic compared to cumulative base conditions provides the basis for the identification of potential impacts of the proposed project.

Level of Service Methodology

For a detailed explanation of level of service methodology, refer to page 13 of the 2018 Transportation Impact Analysis. Fourteen of the 15 study intersections are signalized. According to LADOT's *Traffic Study Policies and Procedures*, this study is required to use the Critical Movement Analysis (CMA) method of intersection capacity calculation to analyze signalized intersections.

The remaining unsignalized intersections was not evaluated for significant impacts. Consistent with current LADOT guidelines, a signal warrant analysis was conducted at this intersection to determine if a traffic signal is warranted at this location.

Existing Conditions

Table 1 shows the existing conditions for the 14 signalized intersections developed in the 2018 Transportation Impact Analysis. The traffic volumes for Existing Conditions are provided in Attachment A.

Revised Project Trip Generation

The revised Project description has resulted in a change to the Project trip generation compared to what was developed for the project in the 2018 Transportation Impact Analysis. The revised Project involves a decrease in retail use from 18,454 sf to 5,538 sf; decrease in number of residential units from 641 to 640 dwelling units; addition of high turnover (sit-down) restaurant use of 4,600 sf; and the addition of 2,000 sf of fast casual restaurant space. Table 2 provides a summary of the original Project trip generation estimates and Table 3 provides a summary of the revised Project trip generation estimates. The Project was estimated to generate approximately 2,040 net daily vehicle trips external to the Project site, including 131 AM peak hour trips and 186 PM peak hour trips. With the revised Project description, the Project is estimated to generate approximately 2,348 net daily vehicle trips external to the Project site, including 153 AM peak hour trips and 202 PM peak hour trips. This constitutes an increase of about 308 daily, 22 AM peak hour, and 16 PM peak hour trips from the trip generation estimate for the original Project.

The revised Project-only traffic was added to existing volumes to calculate Existing plus Project traffic volumes. Existing plus Project traffic volumes were used to calculate intersection volume-to-capacity ratios and level of service. The results of the analysis of Existing plus Project weekday morning and afternoon peak hour conditions at the 14 signalized study intersections for the revised Project description are summarized in Table 4. Detailed LOS calculations are provided in Attachment B.

The revised Project-only traffic was also added to Future (Year 2026) to calculate Future (Year 2026) plus Project traffic volumes. These traffic volumes are provided in Attachment A. These volumes were used to calculate intersection volume-to-capacity ratios and level of service. The results of the analysis of Future (Year 2026) weekday morning and afternoon peak hour conditions at the 14 signalized study intersections are summarized in Table 5. Detailed LOS calculations are provided in Attachment B.

INTERSECTION LEVEL OF SERVICE AND IMPACT ANALYSIS

Criteria for Determination of Significant Traffic Impacts at Intersections

The criteria for determination of significant traffic impacts are described below. Significance criteria established by City of Los Angeles were used to assess the potential for significant Project impacts at the intersections in each city. The City of Los Angeles has recently modified its metrics and significance criteria for the measurement of project impacts on the transportation system. The criteria used in this analysis are the criteria used by the City at the time the original Transportation Impact Assessment and the Mitigated Negative Declaration were prepared.

The City of Los Angeles has established threshold criteria to determine significant traffic impact of a proposed project in its jurisdiction. Under the LADOT guidelines, an intersection would be significantly impacted with an increase in V/C ratio equal to or greater than 0.04 for intersections operating at LOS C, equal to or greater than 0.02 for intersections operating at LOS D, and equal to or greater than 0.01 for intersections operating at LOS E or F after the addition of project traffic. Intersections operating at LOS A or B after the addition of the project traffic are not

considered significantly impacted regardless of the increase in V/C ratio. The following summarizes the impact criteria:

LOS	Final V/C Ratio	Project-Related Increase in V/C
C	> 0.700 - 0.800	equal to or greater than 0.040
D	> 0.800 - 0.900	equal to or greater than 0.020
E or F	> 0.900	equal to or greater than 0.010

Existing plus Project Intersection Traffic Impact Analysis

The Existing plus Project peak hour level of service results were compared to Existing level of service results to identify significant traffic impacts at study locations generated by the revised Project.

Under the original Existing plus Project scenario, in the 2018 Transportation Impact Analysis, none of the 14 signalized study intersections were determined to be significantly impacted. As shown in Table 4, under the revised Existing plus Project scenario analyzed in this addendum, none of the study intersections were determined to be significantly impacted by the proposed Project during the AM and PM peak hours. No new significantly impacted intersections were identified.

Future (Year 2026) plus Project Intersection Traffic Impact Analysis

The Future (Year 2026) plus Project peak hour level of service results were compared to Future (Year 2026) Base level of service results to identify significant traffic impacts at study locations generated by the revised Project.

In the 2018 Traffic Study, none of the 14 signalized study intersections were determined to be significantly impacted under the Future (Year 2026) scenario. As shown in Table 5, with the revised Project description, no new intersections were identified to be impacted by the proposed Project during the AM and PM peak hours.

Because both the 2018 Transportation Impact Analysis and the revised Project Impact Analysis did not identify any significant impacts at signalized study intersections, mitigation measures are not necessary.

UNSIGNALIZED INTERSECTION SIGNAL WARRANT ANALYSIS

The signal warrant analysis was revised for the one unsignalized intersection analyzed in the original traffic study:

A. Mariposa Avenue & 7th Street

Revised traffic volumes for Existing plus Project and Future (Year 2026) plus Project scenarios were used to prepare signal warrant analysis at the unsignalized intersection.

As shown in Table 6, the intersection of Mariposa Avenue & 7th Street meets the signal warrant thresholds under the PM peak hour in the Existing plus Project scenario and both peak hours in the Future plus Project scenario. These results are unchanged from the original 2018 Transportation Impact Analysis.

Analysis sheets are provided in Attachment C.

NEIGHBORHOOD STREET SEGMENT IMPACT ANALYSIS

Under the City of Los Angeles guidelines, a project impact on a local residential street would be considered significant if the projected increase in average daily traffic (ADT) volumes is as follows:

Projected ADT with Project (Final ADT)	Project-Related Increase in ADT
0 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

Daily traffic volumes for the Existing and Future (Year 2026) with the revised Project are summarized in Tables 7 and 8, respectively. As shown, the revised Project would not result in a significant impact at any of the study neighborhood street segments.

REGIONAL TRANSPORTATION SYSTEM IMPACT ANALYSIS

The CMP traffic impact analysis guidelines establish that a significant project impact occurs when a certain threshold is exceeded. If the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C ≥ 0.02), causing LOS F (V/C > 1.00), a significant impact would occur. If the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C ≥ 0.02).

Arterial Monitoring Stations

The CMP arterial monitoring station closest to the Project Site is at Wilshire Boulevard & Western Avenue located west of the proposed Project site. The revised Project is expected to add approximately 15 trips in the AM peak hour and 20 trips in the PM peak hour at Wilshire Boulevard & Western Avenue.

The revised Project is not estimated the exceed the arterial analysis criteria of 50 vehicle trips at the above-mentioned location; therefore, no further CMP arterial analysis is required.

Freeways

Based on the revised project trip generation estimates shown in Table 3 and using the same trip distribution estimates presented in 2018 Transportation Impact Analysis, the revised Project is projected to result in an increase of 11 trips in the morning and 15 trips in the evening peak hour

on the I-10 freeway at Budlong Avenue. The revised Project is also projected to result in an increase of 11 trips in the morning peak hour and 15 trips in the evening peak hour on the US-101 freeway at Normandie Avenue. Since fewer than 150 trips would be added during the AM or PM peak hours in either direction at any of the freeway segments in the vicinity of the study area, no further analysis of the freeway segments is required for CMP purposes.

Regional Transit Impact Analysis

The revised project would have an estimated increase in vehicle trip generation of approximately 166 net vehicle trips during the AM peak hour and 222 during the PM peak hour before the transit credit. Applying the AVR factor of 1.4 to the estimated vehicle trips would result in an estimated increase of approximately 232 and 311 person trips during the AM and PM peak hours, respectively. The CMP provides that, of the total net person trips of a project, 15% of total person trips generated would be assigned as transit riders for projects, due to proximity to the Metro Purple Line Wilshire/Normandie. Following this approach, the revised Project would generate an estimated increase of 35 transit trips during the AM peak hour and 47 transit trips during the PM peak hour, and no significant impacts to the transit system would be anticipated. Given the frequency and density of existing and proposed transit service in close proximity to the Project Site, the incremental transit riders resulting from the revised Project are not anticipated to result in a significant impact on the transit lines serving the area.

SITE ACCESS

The site access driveway analysis presented in the 2018 Transportation Impact Analysis was revised to reflect the changes to the Project. Tables 9 shows revised LOS and delay for the following two driveways analyzed in the 2018 study that will be used by residents:

- 7th Street Eastern Driveway
- Mariposa Avenue Driveway

Both driveways are projected to operate at acceptable LOS (LOS D or better) under Existing plus Project and Future plus Project conditions, same as the 2018 Transportation Impact Analysis. Attachment B shows detailed LOS and delay analysis for both driveways.

SUMMARY

The purpose of this addendum is to present the results of a traffic analysis conducted for the revised 3440 Wilshire Project featuring 640 multifamily high-rise housing units, 5,538 sf of retail space, 4,600 sf of high turnover (sit-down) restaurant space, and 2,000 sf of fast casual restaurant space, and to compare these results with the traffic analysis for the original Project to determine whether the revised Project would generate more or fewer impacts than the original Project. The following presents a summary of the findings of this memorandum:

- The revised Project would generate an estimated net increase of 2,348 daily trips, including 153 trips during the AM peak hour and 202 trips during the PM peak hour.

- The LOS analysis for the Existing plus Project scenario determined that the revised Project would not result in any significant impacts at any signalized intersections, same as when compared to the original Project analyzed in the 2018 Transportation Impact Analysis.
- Under the Future (Year 2026) plus Project scenario, it is determined that the revised Project would not result in any significant impacts at any signalized intersections, same as when compared to the original Project analyzed in the 2018 Transportation Impact Analysis.
- It was determined that the revised Project would not trigger a significant traffic impact at any of the analyzed neighborhood street segments.
- A traffic signal is warranted during either or both the AM and PM peak hours during the Existing plus Project and Future plus Project scenarios for the unsignalized intersection of Mariposa Avenue & 7th Street. This is the same result as for the original Project analyzed in the 2018 Transportation Impact Analysis. Further signal warrants, engineering study, and coordination with LADOT would be required before installing a proposed traffic signal at this location.
- Significant CMP arterial, CMP freeway or transit impacts would not be created by the revised Project; therefore, no mitigation measures would be required.
- It was determined that the two driveways to be used primarily by residents as studied in the 2018 Transportation Impact Analysis would operate at an acceptable LOS D or better under Existing plus Project and Future plus Project scenario.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 10th Edition*, 2017

[b] Internal capture represents the percentage of trips between land uses that occur within the site. Main Street model calibration of base ITE rates reflecting project & site specific characteristics.

[c] The transit credit is based on LADOT's *Traffic Study Policies and Procedures*, December 2016. The guidelines state that up to 25% transit credit may be taken for projects adjacent to a transit station or Rapid Bus stop.

[d] The pass-by credit is based on Attachment I of LADOT's *Traffic Study Policies and Procedures*, December 2016.

[e] Local high-rise residential data collected for LADOT was used to determine the trip generation for the residential land use. The local data did not include information on daily rates, so the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

[f] The local high-rise residential data for the peak hours was collected in locations with access to transit; therefore, a transit credit was not applied during the peak hours. As local data was not available for daily, the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

Attachment C - Revised Project Signal Warrant Analysis

TRAFFIC SIGNAL WARRANTS
PEAK HOUR VEHICULAR VOLUME (MUTCD Warrant 3, Caltrans Warrant 11)

Major Street:	Mariposa
Minor Street:	7th St
Scenario:	Existing 2018 AM
Urban/Rural:	u (U=urban, R=rural [a])

PEAK HOUR VOLUME (MUTCD Warrant 3, Caltrans Warrant 11)

Number of Lanes on Each Approach

Major Street:	1
Minor Street:	1

Vehicles Per Hour (Peak Hour)

Major Street (Approach 1):	223	Major Street Left Turn (see note [b]):	36
Major Street (Approach 2):	290	Minor Street (Higher Volume App.):	250
Major Street Total (Both Approaches):	513	Minor Street Total:	286
Minimum Volume on Major Street to Satisfy Warrant (see note [d]):	450	Minimum Volume on Minor Street to Satisfy Warrant (see note [d]):	410

PEAK HOUR VOLUME WARRANT SATISFIED? **NO**

Notes:

a. May be used when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000.

b. Heavier left-turn movement from the major street may be included with minor street volume if a separate signal phase is proposed for left-turn movements.

c. From: USDOT, FHWA, "Manual on Uniform Traffic Control Devices," 2001, Figure 4C-1.

d. From: USDOT, FHWA, "Manual on Uniform Traffic Control Devices," 2001, Figure 4C-3.

Adopted from: U.S. Department of Transportation, Federal Highway Administration, "Manual on Uniform Traffic Control Devices, Millennium Edition," 2001; and Caltrans, "Traffic Manual," 2002.

TRAFFIC SIGNAL WARRANTS
PEAK HOUR VEHICULAR VOLUME (MUTCD Warrant 3, Caltrans Warrant 11)

Major Street:	Mariposa
Minor Street:	7th St
Scenario:	Existing 2018 PM
Urban/Rural:	u (U=urban, R=rural [a])

PEAK HOUR VOLUME (MUTCD Warrant 3, Caltrans Warrant 11)

Number of Lanes on Each Approach

Major Street:	1
Minor Street:	1

Vehicles Per Hour (Peak Hour)

Major Street (Approach 1):	354	Major Street Left Turn (see note [b]):	50
Major Street (Approach 2):	185	Minor Street (Higher Volume App.):	276
Major Street Total (Both Approaches):	539	Minor Street Total:	326
Minimum Volume on Major Street to Satisfy Warrant (see note [d]):	450	Minimum Volume on Minor Street to Satisfy Warrant (see note [d]):	390

PEAK HOUR VOLUME WARRANT SATISFIED? **NO**

Notes:

a. May be used when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000.

b. Heavier left-turn movement from the major street may be included with minor street volume if a separate signal phase is proposed for left-turn movements.

FORM GEN. 160A (Rev. 1/82)

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

3440 Wilshire Boulevard
DOT Case No. CEN19-48798

Date: October 22, 2019

To: Heather Bleemers, Senior City Planner
Department of City Planning

From: Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **ADDENDUM TO THE TRANSPORTATION IMPACT ANALYSIS FOR THE PROPOSED MIXED-USE PROJECT AT 3440 WILSHIRE BOULEVARD**

On October 25, 2018, the Department of Transportation (DOT) issued a transportation assessment report to the Department of City Planning for the proposed Mixed-Use project (**Attachment D**) based on the September 2018 transportation impact analysis prepared by Fehr & Peers. However, since the report was released, the project has been revised and an August 27, 2019 addendum to the transportation analysis was prepared by Fehr & Peers.

The original project at 3440 Wilshire Boulevard proposed 641 multifamily high-rise residential units and 18,454 square feet located. The revised project proposes 640 multifamily high-rise residential units, 5,538 square feet of retail space, 4,600 square feet of high-turnover sit down restaurant, and 2,000 square feet of fast casual restaurant. The revised project level of service table can be found in **Attachment A**. The revised project trip generation table can be found in **Attachment B**. The revised project site plan can be found in **Attachment C**. The original project's level of service table, trip generation table, and site plan can all be found in **Attachment D**. The revised project's access and driveway plan will remain the same as the original project. A table of project land use changes is as follows:

Land Use	Original Project	Revised Project
Multifamily High-Rise Residential Units	641 units	640 units
Retail Space	18,454 square feet (sf)	5,538 sf
High-Turnover Sit Down Restaurant	-	4,600 sf
Fast Casual Restaurant	-	2,000 sf

The previous traffic analysis determined that none of the fourteen analyzed intersections would be significantly impacted by project related traffic. The revised is also not expected to result in significant impacts to any of the fourteen intersections. DOT concurs with the addendum that the project's expected impact would be less than significant and no changes to the transportation analysis are required. All of the project requirements that are identified in DOT's October 25, 2018 letter (**Attachment D**) shall remain in effect.

If you have any questions, please contact Pete Eyre of my staff at (213) 972-4913.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 10th Edition*, 2017

[b] Internal capture represents the percentage of trips between land uses that occur within the site. Main Street model calibration of base ITE rates reflecting project & site specific characteristics.

[c] The transit credit is based on LADOT's *Traffic Study Policies and Procedures*, December 2016. The guidelines state that up to 25% transit credit may be taken for projects adjacent to a transit station or Rapid Bus stop.

[d] The pass-by credit is based on Attachment I of LADOT's *Traffic Study Policies and Procedures*, December 2016.

[e] Local high-rise residential data collected for LADOT was used to determine the trip generation for the residential land use. The local data did not include information on daily rates, so the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

[f] The local high-rise residential data for the peak hours was collected in locations with access to transit; therefore, a transit credit was not applied during the peak hours. As local data was not available for daily, the general urban/suburban daily rate was used, making it appropriate to apply a transit credit.

Revised Site Plan

FORM GEN. 160A (Rev. 1/82)

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

3440 Wilshire Blvd
DOT Case No. CEN 16-44755

Date: October 25, 2018

To: Heather Bleemers, City Planner
Department of City Planning

From: Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **TRANSPORTATION ANALYSIS FOR THE PROPOSED MIXED-USE PROJECT LOCATED AT 3440 WILSHIRE BOULEVARD**

The Department of Transportation (DOT) has reviewed the transportation impact study, dated September 2018, prepared by Fehr & Peers, for the proposed mixed-use development located at 3440 Wilshire Boulevard. In order to evaluate the effects of the project's traffic on the available transportation infrastructure, the significance of the project's traffic impacts is measured in terms of change to the volume-to-capacity (V/C) ratio between the "future no project" and the "future with project" scenarios. This change in the V/C ratio is compared to DOT's established threshold standards to assess the project-related traffic impacts. The transportation impact analysis included the detailed analysis of 14 signalized intersections, one un-signalized intersection, and two street segments. Based on DOT's current traffic impact criteria[1], none of these signalized intersections would be significantly impacted by project-related traffic prior to mitigation. The results of the transportation impact analysis, which accounted for other known development projects in evaluating potential cumulative impacts, adequately evaluated the project's traffic impacts on the surrounding community and is summarized in **Attachment 1**.

DISCUSSION AND FINDINGS

A. Project Description

The project site is currently occupied by a parking structure with two office buildings. The two existing office buildings will remain and include approximately 760,456 square feet of office space, retail, fast food restaurant, and sit down restaurant. The proposed mixed-use development at 3440 Wilshire Boulevard will replace just the existing parking structure with 641 high rise residential units, 18,454 square feet of retail space, two levels of underground parking structure, and four levels of above ground parking.

The project currently has five driveways that provide access to the existing uses. The new project will close one of the driveways, leaving the site with four driveways to serve the property. Residents will primarily use the Mariposa Avenue and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the

[1] Per the DOT Transportation Impact Analysis Policies and Procedures, a significant impact is identified as an increase in the Critical Movement Analysis (CMA) value, due to project related traffic, of 0.01 or more when the final ("with project") Level of Service (LOS) is LOS E or F; an increase of 0.020 or more when the final LOS is LOS D; or an increase of 0.040 or more when the final LOS is LOS C.

driveways. Loading areas for the project will be accessible from the Mariposa Avenue driveway. The project is expected to be completed by 2026.

B. Trip Generation

The project is estimated to generate a net increase of 2,040 daily trips, 131 trips in the a.m. peak hour, and 186 trips in the p.m. peak hour. The trip generation estimates are based on formulas published by the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition, 2017. A copy of the trip generation table can be found in **Attachment 2**.

C. Freeway Analysis

The traffic study included a freeway impact analysis that was prepared in accordance with the State-mandated Congestion Management Program (CMP) administered by the Los Angeles County Metropolitan Transportation Authority (MTA). According to this analysis, the project would not result in significant traffic impacts on any of the evaluated freeway mainline segments. To comply with the Freeway Impact Analysis Agreement executed between Caltrans and DOT in October 2013, the study also included a screening analysis to determine if additional evaluation of freeway mainline and ramp segments was necessary beyond the CMP requirements. The project did not meet or exceed any of the four thresholds defined in the latest agreement, updated in December 2015. Exceeding one of the four screening criteria would require the applicant to work directly with Caltrans to prepare more detailed freeway analyses. No additional freeway analysis was required.

PROJECT REQUIREMENTS

A. Construction Impacts

DOT recommends that a construction work site traffic control plan be submitted to DOT's Citywide Temporary Traffic Control Section or Permit Plan Review Section for review and approval prior to the start of any construction work. Refer to http://ladot.lacity.org/what-we-do/plan-review to determine which section to coordinate review of the work site traffic control plan. The plan should show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. DOT also recommends that all construction related traffic be restricted to off-peak hours to the extent feasible.

B. Highway Dedication And Street Widening Requirements

On January 20, 2016, the City Council adopted the Mobility Plan 2035 which is the new Mobility Element of the General Plan. A key feature of the updated plan is to revise street standards in an effort to provide a more enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Per the new Mobility Element, **WILSHIRE BOULEVARD** is designated as an Avenue I, which would require a 35-foot half-width roadway within a 50-foot half-width right-of-way. **WEST 7TH STREET** is designated as an Avenue II, which would require a 28-foot half-width roadway within a 43-foot half-width right-of-way. **SOUTH NORMANDIE AVENUE/ IROLO STREET** is designated as an Avenue III, which would require a 23-

foot half-width roadway within a 36-foot half-width right-of-way. **MARIPOSA AVENUE** is designated as a Local Street, which would require an 18-foot half-width roadway within a 30-foot half-width right-of-way. The applicant should check with BOE's Land Development Group to determine if there are any other applicable highway dedication, street widening and/or sidewalk requirements for this project.

C. Parking Requirements

The project currently has five driveways that provide access to the existing uses. The new project will close one of the driveways, leaving the site with four driveways. Residents will primarily use the Mariposa Avenue and eastern 7th Street driveway, but all other land uses on the site will have access to use each of the driveways. Loading areas for the project will be accessible from the Mariposa Avenue driveway.

The number of parking spaces that will be provided by the project was not disclosed in the study. The applicant should check with the Department of Building and Safety on the number of Code-required parking sp aces needed for the project.

D. Driveway Access and Circulation

The proposed site plan illustrated in **Attachment 3** is acceptable to DOT; however, review of the study does not constitute approval of the driveway dimensions and internal circulation schemes. Those require separate review and approval and should be coordinated with DOT's Citywide Planning Coordination Section (201 N. Figueroa Street, 5th Floor, Room 550, at 213-482-7024). In order to minimize potential building design changes, the applicant should contact DOT for driveway width and internal circulation requirements so that such traffic flow considerations are designed and incorporated early into the building and parking layout plans. All new driveways should be Case 2 driveways and any security gates should be a minimum 20 feet from the property line. All truck loading and unloading should take place on site with no vehicles backing into the project via any of the project driveways.

E. Development Review Fees

An ordinance adding Section 19.15 to the Los Angeles Municipal Code relative to application fees paid to DOT for permit issuance activities was adopted by the Los Angeles City Council in 2009. This ordinance identifies specific fees for traffic study review, condition clearance, and permit issuance. The applicant shall comply with any applicable fees per this ordinance.

If you have any questions, please contact Johnathan Yu of my staff at (213) 972-4993.

CENTRAL PLAZA PROJECT-REQUEST FOR WASTEWATER SERVICE INFORMATION

This is in response to your June 29, 2017 letter requesting a review of your proposed mixed-use project located at 3432-3470 W Wilshire Blvd, 659-699 S Mariposa Ave, 3265-3287 W 7th St, and 666-678 S Irolo St, Los Angeles, CA 90005/90010. The project will consist of residential units, retail space, restaurant space, as well as a swimming pool. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Proposed			
Residential-Studio	75/ DU	461 DU	34,575
Residential: 2-BDRM	150/ DU	180 DU	27,000
Retail	25 GPD/1000 FT^2	13,500 SQ.FT	338

Pool	7.48 GAL/ FT^3	4,800 CU.FT	35,904
Water Feature	7.48 GAL/ FT^3	1,331 CU.FT	9,956
Total			**128,155**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes an existing 18-inch line on Normandie Ave. The sewage from the existing 18-inch line feeds into a 48-inch line on Normandie Ave before discharging into a 57-inch sewer line on James M Wood Blvd. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in the 18-inch line and the 54-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
18	Wilshire Blvd R/W	*	4.32 MGD
48	Normandie Ave.	26	29.86 MGD
54	James M Wood Blvd.	*	67.79 MGD
57	James M Wood Blvd.	24	36.70 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

If you have any questions, please call Christopher DeMonbrun at (323) 342-1567 or email at chris.demonbrun@lacity.org.

STORMWATER REQUIREMENTS

LA Sanitation, Watershed Protection Program (WPP) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

In accordance with the Municipal Separate Storm Sewer (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (Order No. R4-2012-0175, NPDES No. CAS004001) and the City of Los Angeles Stormwater and Urban Runoff Pollution Control requirements (Chapter VI, Article 4.4, of the Los Angeles Municipal Code), the Project shall comply with all mandatory provisions to the Stormwater Pollution Control Measures for Development Planning (LID Ordinance) and as it may be subsequently amended or modified. Prior to issuance of grading or building permits, the Applicant shall submit a LID Plan to the City of Los Angeles, Bureau of Sanitation, Watershed Protection Division (WPD), for review and approval. The LID Plan shall be prepared consistent with the requirements of the Development Best Management Practices Handbook.

Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lacitysan.org. It is advised that input

regarding LID requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the LID requirements. Green Street standard plans can be found at: www.eng2.lacity.org/techdocs/stdplans/

CONSTRUCTION REQUIREMENTS

All construction sites are required to implement a minimum set of BMPs for erosion control, sediment control, non-stormwater management, and waste management. In addition, construction sites with active grading permits are required to prepare and implement a Wet Weather Erosion Control Plan during the rainy season between October 1 and April 15. Additionally, construction sites that disturb more than one-acre of land are subject to the NPDES Construction General Permit issued by the State of California, and are required to prepare, submit, and implement the Storm Water Pollution Prevention Plan (SWPPP).

If there are questions regarding the stormwater requirements, please call WPP's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

GROUNDWATER DEWATERING REUSE OPTIONS

The Los Angeles Department of Water and Power (LADWP) is charged with the task of supplying water and power to the residents and businesses in the City of Los Angeles. One of the sources of water includes groundwater. The majority of groundwater in the City of Los Angeles is adjudicated, and the rights of which are owned and managed by various parties. Extraction of groundwater within the City from any depth by law requires metering and regular reporting to the appropriate Court-appointed Watermaster. LADWP facilitates this reporting process, and may assess and collect associated fees for the usage of the City's water rights. The party performing the dewatering should inform the property owners about the reporting requirement and associated usage fees.

On April 22, 2016 the City of Los Angeles Council passed Ordinance 184248 amending the City of Los Angeles Building Code, requiring developers to consider beneficial reuse of groundwater as a conservation measure and alternative to the common practice of discharging groundwater to the storm drain (SEC. 99.04.305.4). It reads as follows: "Where groundwater is being extracted and discharged, a system for onsite reuse of the groundwater, shall be developed and constructed. Alternatively, the groundwater may be discharged to the sewer."

Groundwater may be beneficially used as landscape irrigation, cooling tower make-up, and construction (dust control, concrete mixing, soil compaction, etc.). Different applications may require various levels of treatment ranging from chemical additives to filtration systems. When onsite reuse is not available the groundwater may be discharged to the sewer system. This allows the water to be potentially reused as

recycled water once it has been treated at a water reclamation plant. If groundwater is discharged into the storm drain it offers no potential for reuse. The onsite beneficial reuse of groundwater can reduce or eliminate costs associated with sewer and storm drain permitting and monitoring. Opting for onsite reuse or discharge to the sewer system are the preferred methods for disposing of groundwater.

To help offset costs of water conservation and reuse systems, LADWP offers the Technical Assistance Program (TAP), which provides engineering and technical assistance for qualified projects. Financial incentives are also available. Currently, LADWP provides an incentive of $1.75 for every 1,000 gallons of water saved during the first two years of a five-year conservation project. Conservation projects that last 10 years are eligible to receive the incentive during the first four years. Other water conservation assistance programs may be available from Metropolitan Water District of Southern California. To learn more about available water conservation assistance programs, please contact LADWP Rebate Programs 1-888-376-3314 and LADWP TAP 1-800-544-4498, selection "3".

For more information related to beneficial reuse of groundwater, please contact Greg Reed, Manager of Water Rights and Groundwater Management, at (213)367-2117 or greg.reed@ladwp.com.

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact LA Sanitation Solid Resources Recycling hotline 213-922-8300.

Sincerely,

Ali Poosti, Division Manager
Wastewater Engineering Services Division
LA Sanitation

Ms. Andrea Schultz, Head of Operations
CAJA Environmental Services, LLC
15350 Sherman Way, Suite 315
Van Nuys, CA 91406

Dear Ms. Schultz,

Subject: Los Angeles Department of Water and Power
Water and Electricity Connection Services Request
Central Plaza Project

The Los Angeles Department of Water and Power (LADWP) is in receipt of your letter dated June 29, 2017 requesting LADWP's ability to provide water and electric services for the Central Plaza Project (Thomas Brothers Maps, Page 633, J3).

The Project is the Central Plaza Project (Project). The Project site is bounded on the north by Wilshire Boulevard, on the west by Irolo Street, on the south by 7th Street, and on the east by Mariposa Avenue. The address of the Project site is 3432-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3265-3287 West 7th Street, and 666-678 South Irolo Street, Los Angeles, California 90005/90010 in the Wilshire Community Plan.

Current development at the Project site include four commercial office buildings with ground floor retail uses that front West Wilshire Boulevard and South Irolo Street, a three-story parking structure, and a five-story parking structure. The proposed Project will involve the demolition of the existing three-story parking structure, adding ground floor retail to the existing commercial office buildings, constructing three commercial kiosks along Wilshire Boulevard and Irolo Street, and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean. The 23-story mixed-use building will include approximately 280 apartment units, rooftop amenities, and commercial space. The 28-story mixed-use building will include approximately 361 apartment units, rooftop amenities, and commercial space. Both buildings will share a podium with amenity space and four stories of above-grade and two stories of below-grade parking. In total, this Project will result in 18,454 square feet of commercial floor area (13,500 square feet of retail area and 4,954 square feet of restaurant area) and 1,910 vehicle parking spaces.

We are providing information for consideration and incorporation into the planning, design, and development efforts for the proposed Project. Regarding water needs for the proposed Project, this letter does not constitute a response to a Water Supply Assessment (WSA) pursuant to California State Water Code Sections 10910-10915 for development projects to determine the availability of long-term water supply. Depending on the Project scope, a WSA by the water supply agency may need to be requested by the CEQA Lead Agency and completed prior to issuing a draft Negative Declaration or draft Environmental Impact Report (EIR).

If a Lead Agency determines that the proposed Project parameters (e.g., development details such as type, square footage, anticipated water demand, population increase, etc.) are such that they are subject to state law requiring a WSA, a separate request must be made in writing and sent to:

Mr. Richard Harasick
Senior Assistant General Manager – Water System
Los Angeles Department of Water and Power
111 North Hope Street, Room 1455
Los Angeles, CA 90012

If you have any further questions regarding the water supply assessment process, please contact Mr. Delon Kwan, at (213) 367-2166 or by e-mail at Delon.Kwan@ladwp.com.

Below you will find some information about water needs.

Water Needs

As the Project proceeds further in the design phase, we recommend the Project applicant or designated Project Management Engineer contact Mr. Hugo Torres at (213) 367-2130 or by e-mail at Hugo.Torres@ladwp.com to make arrangements for water supply service needs.

The following responses are provided regarding impacts to water service.

1. Please describe sizes and capacities of existing water mains that would serve the Project Site.

   The Project site is served by a 30-inch CI pipe in Wilshire Blvd, a 16-inch CI pipe in Irolo St, and an 8-inch CI pipe in Maripose Ave. Please see the attached Water Service Map 134-195

2. Are there any existing water service problems/deficiencies in the Project area?

   There are no problems/deficiencies in the Project area.

3. Would LADWP be able to accommodate the Project's demand for water service with the existing infrastructure in the Project area? If not, what new infrastructure or upgrades to infrastructure would be needed?

LADWP should be able to provide the domestic needs of the project from the existing water system. LADWP cannot determine the impact on the existing water system until the fire demands of the project are known. Once a determination of the fire demands has been made, LADWP will assess the need for additional facilities, if needed.

4. How does the City anticipate and plan for future water service needs?

   The LADWP works closely with the City of Los Angeles, Department of City Planning to develop and update our Urban Water Management Plan (UWMP) every five years. The UWMP is the planning document for future water demands for the City. The UWMP identifies short-term and long-term water resources management measures to meet growing water demands during normal, single-dry, and multiple-dry years over a 20-year horizon. The City's water demand projection in the UWMP was developed based on the Regional Transportation Plan (RTP) demographic projection by the Southern California Association of Governments (SCAG).

   See the following link to the 2015 UWMP:

   http://www.ladwp.com/docs/QOELLADWP005416

   In general, projects that conform to the demographic projection from RTP by SCAG and are currently located in the City's service area are considered to have been included in LADWP's water supply planning efforts in the UWMP; therefore, projected water supplies would meet projected demands.

   The proposed Project may be required to comply with the California Water Code Sections 10910-10915, in accordance with adopted legislation (SB 901, SB 610, and SB 221) for a Water Supply Assessment (WSA). The CEQA lead agency, not LADWP, determines whether or not the proposed project parameters are subject to state law requiring a WSA, and a separate request must be made by the lead agency in writing and sent to LADWP.

5. In order to assess the proposed Project's future consumption of water, please provide your recommended rates. Land Use: ___ gallons / unit / day.

   For estimating a project's indoor water demand, we use applicable sewer generation factors (sgf). Please refer to the attached table displaying the current SGFs.

   For outdoor (landscape) water demand, we use California Code of Regulations Title 23. Division 2. Chapter 2.7. Model Water Efficient Landscape Ordinance. Please refer to the following link:

   http://www.water.ca.gov/wateruseefficiency/landscapeordinance/

If the proposed project scope includes cooling tower(s), consult a mechanical engineer to estimate the cooling water demand.

Applicants are encouraged to commit to water conservation measures that are beyond the current codes and ordinances, to lower the net additional water demand for the proposed project.

6. Please provide any recommendations that might reduce any potential water supply impacts that would be associated with the Project.

In addition to compliance with city ordinances and permit requirements related to water conservation, including Ordinance No. 184248, effective June 6th 2016, applicants are also encouraged to implement voluntary conservation measures beyond those required by ordinance. Specific conservation nmeasures may depend on project uses. Some measures may also include using more efficient faucets, shower heads, and appliances as well as implementing Best Management Practices that may include onsite capture and reuse of stormwater to displace potable water consumption.

For more information, please see the conservation pages on LADWP's website:

https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-water/a-w-conservation?_adf.ctrl-state=6gx7kgl3j_4&_afrLoop=215674915771936

Power Needs

It should be noted that the Project Applicant may be financially responsible for some of infrastructure improvements (e.g., installation of electric power facilities or service connections) necessary to serve the proposed Project.

As the Project proceeds further, please contact one of our Engineering Offices, as listed on Pages 1-4 of the Electric Service Requirements (available on-line at www.ladwp.com) for dealing with power services and infrastructure needs.

1. Please describe the sizes and voltages of existing electrical distribution lines and facilities that would serve the Project site and the surrounding. Please include a map illustrating your description.

- **Many underground 4.8-kV circuits are adjacent to the Project site along Mariposa Avenue, Wilshire Boulevard, Irolo Avenue, and 7th Street.**
- **Underground 34,5-kV circuits are adjacent to the Project site along Mariposa Avenue, Wilshire Boulevard, and Irolo Avenue.**
- **Based on LADWP's preliminary estimated electric demand of the Project, it will be supplied from LADWP's 34.5-kV system, and may require the consolidation of existing and new loads within the Project site.**

- **LADWP may require space for a minimum of two pads for electrical equipment within the property with the required clearances and LADWP should have accessibility to the equipment.**
- **LADWP does not release/provide electrical distribution maps.**

2. Are there any existing electricity service problems/deficiencies in the Project area?

   No, however, the cumulative effects of this and other projects in the area will require the Department to construct additional distribution facilities in the future. The Project would require on-site transformation facility.

3. Would the LADWP be able to accommodate the proposed Project's demand for electricity service with the existing infrastructure in the Project area? If not, what new infrastructure would be needed to meet the proposed Project's demand for electricity?

   This cannot be answered without the review of the Project developer's electrical drawings and load schedules. However, the cumulative effects of this and other projects in the area will require the LADWP to construct additional distribution facilities in the future. This Project will require on-site transformation and may require underground line extension on public streets.

4. Would the LADWP be able to accommodate the proposed Project's demand for electricity with existing electricity supplies?

   Electrical Service is available and will be provided in accordance with the LADWP's Rules Governing Water and Electric Service (available on-line at https://www.ladwp.com under Commercial/Customer Service/Electric Services/Codes & Specifications). The estimated power requirement for this proposed Project is part of the total load growth forecast for the City of Los Angeles and has been taken into account in the planned growth of the City's power system.

   LADWP's load growth forecast incorporates construction activity and is built into the commercial floor space model; the McGraw Hill Construction report identifies all large projects. In planning sufficient future resources, LADWP's Power Integrated Resource Plan incorporates the estimated power requirement for the proposed Project through the load forecast input and has planned sufficient resources to supply the electricity needs.

5. In order to assess the proposed Project's future consumption of electricity, please provide us with your recommended rates. Land Use: multi-family residential = Kilowatt-hour / unit / year.

   LADWP does not provide consumption rates.

Please see enclosed document titled, "LADWP Water and Energy Conservation Measures," for information regarding mandatory and voluntary measures to reduce water and energy consumption.

Water Conservation

LADWP is always looking for means to assist its customers to use water resources more efficiently and welcomes the opportunity to work with new developments to identify water conservation opportunities. Some water conservation measures are enclosed. The LADWP website contains a current list of the available rebates and incentive programs, including the performance based Custom Water Conservation Technical Assistance Program (WCTAP, https://www.ladwp.com/ladwp/faces/wcnav_externalId/a-w-cstm-wtr-prjct-tap?_adf.ctrl-state=h8fsat92s_4&_afrLoop=3392823718109) for commercial, industrial, institutional and multi-family residential customers up to $250,000 for the installation of pre-approved equipment which demonstrates water savings. Mr. Mark Gentili is the Water Conservation Program Manager and can be reached at (213) 367-8556 or by e-mail at Mark.Gentili@ladwp.com. See the following link for LADWP water conservation rebate information on our website: https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-water/a-w-conservation

Energy Efficiency

LADWP suggests consideration and incorporation of energy- efficient design measures (enclosed) for building new commercial and/or remodeling existing facilities. Implementation of applicable measures would exceed Title 24 energy efficiency requirements. LADWP continues to offer a number of energy efficiency programs to reduce peak electrical demand and energy costs. For further information please contact Ms. Lucia Alvelais, Utility Services Manager, at (213) 367-4939 or by e-mail at Lucia.Alvelais@ladwp.com. See the following link for LADWP energy efficiency rebate information on our website: https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-power/a-p-energyefficiencyandrebates

Solar Energy

Solar power is a renewable, nonpolluting energy source that can help reduce our dependence on fossil fuels. Mr. Jason Rondou is the Solar Energy Program Manager and can be reached at (213) 367-3601 or by e-mail at Jason.Rondou@ladwp.com.

For more information about the Solar Incentive Program, please visit the LADWP website: www.ladwp.com/solar or www.ladwp.com/fit regarding the Feed-In Tariff Program.

For more information on other rebates and programs, please visit the LADWP website:https://www.ladwp.com/ladwp/faces/ladwp/commercial/c-savemoney/c-sm-rebatesandprograms

Electric Vehicle Transportation

LADWP is encouraging the installation of convenient electric vehicle (EV) charging stations for the home, workplace, and public charging to support the adoption of EVs in the City of Los Angeles. Mr. Marvin D. Moon is the Power Engineering Manager in charge of this program and can be reached at (213) 367-1716 or via email at Marvin.Moon@ladwp.com.

For more information on LADWP EV discount rates and charging incentives for residential and business customers, please visit the website: www.ladwp.com/ev. If you would like a Customer Service Representative to answer your questions or review your account and help you decide on the best option, please call us at 1-866-484-0433 or email us at PluginLA@ladwp.com.

Please include LADWP in your mailing list and address it to the attention of Mr. Charles C. Holloway in Room 1044 for review of the environmental document for the proposed Project.

Mr. Charles C. Holloway
Manager of Environmental Planning and Assessment
Los Angeles Department of Water and Power
111 North Hope Street, Room 1044
Los Angeles, CA 90012

If there are any additional questions on this utility services request, please contact Mr. Aiden Leong of the Environmental Assessment Group at (213) 367-0706.

Sincerely,

Charles C. Holloway
Manager of Environmental Planning and Assessment

FOOTNOTES TO SGFs TABLE

(a) SFC rates for these facilities have historically been published in SFC ordinances.

(b) Bureau of Sanitation will determine the flow based on the information given by applicants for facilities with industrial discharge. The flow will be redetermined by Sanitation inspectors annually based on water bills. If the actual flow exceeds the previous year's determined flow, the applicants will be charged for the difference.
If this type of facility is exempt from an industrial discharge permit, only the domestic SFC will be assessed.

(c) The SFC for a bar shall be the sum of SFC's for all areas based on the SGF for each area (ex. fixed seat area, public table area, dancing area).

(d) The determination of SGF for juice bars and coffee houses previously depended on the extent of the actual food preparation in house, not by the types of food provided. Food is assumed to be prepared offsite and as such, the three prior subcategories have been consolidated.

1) SGF for no pastry baking and no food preparation is 720 gpd/1000 gr.sq.ft.
2) SGF for pastry baking only and no food preparation is 720 gpd/1000 gr.sq.ft.
3) SGF for complete food preparation is 25 gpd/seat, the same as a fast food restaurant.

Juice bars and coffee houses do not serve any alcoholic drinks.

(e) Building construction includes trailers, field offices, etc.

(f) Cocktail lounge usually does not serve prepared food.

(g) Cold storage facilities are categorized as follow:

1) No Sales - the cold storage facility is used only for temporary storage, no selling is involved. For example, cold storage facilities at the harbor temporarily store seafood until it is distributed.
2) Cold storage w/ retail sales - the primary function of this facility is to support the wholesale/retail operation of a store, such as supermarket freezers, refrigerators, etc.

(h) Counseling centers include marriage counseling centers, alcohol/drug rehabilitation /dependency centers, nutrition centers, diet centers, etc.

(i) Part-time basis schools or dance studios should be charged as retail area - 50 gpd /1000 gr.sq.ft. Full-time basis schools should be charged by the number of students.

(j) Domestic waste is estimated at 50 gpd/1,000 square feet in addition to total process flow.

(k) Bureau of Sanitation will determine if an industrial permit is needed for health spas. The first year flow is based on 650 gpd/1000 gr.sq.ft., and the Sanitation inspectors will redetermine the flow annually based on water bill from the previous year. The applicants are responsible for paying the difference of SFC.

Health club/spa includes lobby area, workout floors, aerobic rooms, swimming pools, Jacuzzi, sauna, locker rooms, showers, and restrooms. If a health club/spa has a gymnasium type of facility, this portion should be charged separately at the gymnasium SFC rate.

Gymnasiums include basketball court, volleyball court, and any other large open space with low occupancy density.

(l) Lobby of retail includes lounges, holding rooms, or waiting area, etc.

(m) Full service post offices include U.S. Postal Service, UPS, Federal Express, DHL, and etc.

(n) The SGF for a college dormitory based on student capacity also includes the SGF for the dormitory cafeterias.

(o) A bedroom is defined as an enclosed subdivision with 50 sq.ft. or more floor area in a residential building commonly used for sleeping purpose, and is partitioned off to form a habitable room.

(p) The SGF for schools based on the student capacity, covers the following facilities:

1) classrooms and lecture halls
2) professors' offices
3) administration offices
4) laboratories for classes or research
5) libraries
6) bookstores
7) student/professor lounges
8) school cafeterias
9) warehouses and storage areas
10) auditoriums
11) gymnasiums
12) restrooms

It does not include water used by schools for swimming pools. When a school files an application for addition of any of the foregoing facilities, the student population will be reassessed and the total gpd for the new facility will be based on the number of students increased since the last SFC was paid or when the City implemented the SFC for the first time. The SFC for any school facility (ex. stadium, dormitory, etc.) not listed above, will be based on the designated SGF for that category.

(q) The SFC for a TV or motion picture studio shall be the sum of SFC's for different facilities in the studio, based on the SGF for each facility. A studio may include one or more of the following facilities: audience viewing room, filming room, film processing, storage area, etc.

(r) No independent tanning salons with shower were encountered during 1996 survey.

(s) Alternative basis of charge for City's consideration. The prior square footage basis is also presented should the City decide to continue charging on that basis.

LADWP WATER & ENERGY CONSERVATION MEASURES

IMPACT ON THE WATER SYSTEM

If the estimated water requirements for the proposed project can be served by existing water mains in the adjacent street(s), water service will be provided routinely in accordance with the Los Angeles Department of Water and Power's (LADWP) Rules and Regulations (available on-line at www.ladwp.com under Commercial/Customer Service/Water Services under the title, Rules Governing Water & Electric Service. If the estimated water requirements are greater than the available capacity of the existing distribution facilities, special arrangements must be made with the LADWP to enlarge the supply line(s). Supply main enlargement will cause short-term impacts on the environment due to construction activities.

In terms of the City's overall water supply condition, the water requirement for any project that is consistent with the City's General Plan has been taken into account in the planned growth in water demand. Together with local groundwater sources, the City operates the Los Angeles-Owens River Aqueduct and purchases water from the Metropolitan Water District of Southern California. These three sources, along with recycled water, will supply the City's water needs for many years to come.

Statewide drought conditions in the mid-1970s and late 1980s dramatically illustrated the need for water conservation in periods of water shortage. However, water should be conserved in Southern California even in years of normal climate because efficient use of water allows increased water storage for use in dry years as well as making water available for beneficial environmental uses. In addition, electrical energy is required to treat and deliver all water supplies to the City and the rest of Southern California. Conserving water contributes to statewide energy conservation efforts. Practicing water conservation also results in decreased customer operating costs.

WATER CONSERVATION

LADWP assists residential, commercial, and industrial customers in their efforts to conserve water. Below is a list of some of the water conservation requirements in Los Angeles for new construction and when fixtures are replaced in existing buildings. Also included are further voluntary recommendations to save water.

1. High efficiency water closets, high efficiency urinals, water-saving showerheads, and low flow faucets must be installed in new constructions and may be retrofitted in existing buildings. The flow rates of new plumbing fixtures must comply with the most stringent of the following: Los Angeles City Ordinance No. 180822 (http://clkrep.lacity.org/onlinedocs/2009/09-0510_ord_180822.pdf), the 2014 Los Angeles Plumbing Code and the 2013 California Green Building Standards Code (CALGreen), the 2014 Los Angeles Green Building Code.

2. New installations of air conditioning systems that utilize evaporative cooling (i.e. employ cooling towers) shall operate at a minimum of 5.5 cycles of concentration. Single pass cooling systems are prohibited in most cases.

3. Energy Star rated dishwashers must be installed for new construction and when replacing existing units in most cases. Water conserving clothes washers are available from many manufacturers and should be selected. Water saved by these appliances also saves energy in that the water used by these appliances is typically heated.

4. The design of the hot water plumbing system should be such that it minimizes the delivery time for hot water. This may be accomplished through the use of a demand type or a timed and temperature control type hot water recirculation system, point-of-use water heaters, and/or a parallel piping system which all help reduce the pipe length between the fixture and the point of supply of the hot water.

5. Landscape areas utilize a significant volume of the water delivered by LADWP and represent a great potential for water conservation. The State adopted landscape regulations for landscape areas over 2,500 square feet that apply for new constructions and when existing landscapes are renovated. These regulations are addressed by Los Angeles City Ordinance No. 170978 and the City of Los Angeles Irrigation Guidelines (http://cityplanning.lacity.org/Forms_Procedures/2405.pdf) and require submittal of a landscape document package prepared and signed by a licensed professional architect, engineer or contractor to the Department of Building and Safety for review. Please contact the Los Angeles City Planning Department for further information.

6. The landscape irrigation system should be designed, installed, and tested to provide uniform irrigation coverage for each zone. Sprinkler head patterns must be adjusted to minimize over spray onto walkways and streets. Each zone (sprinkler valve) should water plants having similar watering needs (do not mix shrubs, flowers and turf in the same watering zone).

7. Automatic irrigation timers should be set to irrigate landscapes during early morning or late evening hours to reduce water losses from evaporation. Adjust irrigation run times for all zones seasonally, reducing watering times and frequency in the cooler months (fall, winter, spring). Adjust sprinkler timer run times to avoid water runoff, especially when irrigating sloped property.

8. The City of Los Angeles has enacted legislation to address the water supply shortages caused by the recent statewide drought. Los Angeles City Ordinance No. 181288 (http://clkrep.lacity.org/onlinedocs/2009/09-0369-s9_ord_181288.pdf) also known as the Emergency Water Conservation Plan imposes phased water rationing during drought conditions and imposes penalties

for users that do not comply. When water rationing is in effect, landscape irrigation is prohibited between the hours of 9:00 AM and 4:00 PM. Specific watering days and maximum irrigation rates are also defined in this ordinance. When water rationing is in effect, it can be extremely difficult to establish certain types of new landscapes. The landscape architect must take this into consideration in selecting the plant type and the landscape design.

9. Selection of drought-tolerant, low water consuming plant varieties should be used to reduce irrigation water consumption. For a list of plant varieties with their irrigation requirements, refer to the State Guide for Landscape Irrigation which can be found at, (http://www.water.ca.gov/pubs/planning/guide_to_estimating_irrigation_water_needs_of_landscape_plantings_in_ca/wucols.pdf), or consult a landscape architect.

10. Graywater and other alternate water source systems are now addressed in the California Plumbing Code for residential and non-residential buildings. Graywater is semi clean wastewater generated and collected on-site by the building's plumbing system from showers, bathtubs, bathroom sinks and clothes washers but does not include wastewater from toilets, dishwashers or kitchen sinks. The collected graywater is then reused on-site for various beneficial uses. The Plumbing Code addresses the proper collection, handling, treatment and use of Alternate Water Sources.

    The use of graywater reduces the demand for potable water. Please see the attached link for information regarding the installation graywater systems in Los Angeles for residential properties: http://www.ladwp.com under Residential/Go Green.

11. The City continues to expand its purple pipe distribution system of recycled water. The availability of recycled water should be investigated as a source to irrigate large landscaped areas and for toilet and urinal flushing.

LADWP is always looking for means to assist its customers to use water resources more efficiently and welcomes the opportunity to work with new developments to identify water conservation opportunities. Some water conservation measures are enclosed. The LADWP website contains a current list of the available rebates and incentive programs, including the performance based Custom Water Conservation Technical Assistance Program (TAP). Mr. Mark Gentili is the Water Conservation Program Manager and can be reached at (213) 367-8556 or by e-mail at Mark.Gentili@ladwp.com. See the following link for LADWP water conservation rebate information on our website:
https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-water/a-w-conservation

COMMERCIAL ENERGY EFFICIENCY MEASURES

During the design process, the applicant should consult with the Los Angeles Department of Water and Power, Conservation and Sustainability Programs Section,

regarding possible energy efficiency measures. The Conservation and Sustainability Programs Section encourages customers to consider design alternatives and information to maximize the efficiency of the building envelope, heating, ventilation, and air conditioning, building lighting, water heating, and building mechanical systems. The applicant shall incorporate measures to meet or, if possible, exceed minimum energy efficiency standards for: (1) Title 24, Part 6 of the California Code of Regulations (Title 24); (2) California Green Building Standards Code (CALGreen); (3) Los Angeles Green Building Code. In addition to energy efficiency technical assistance, the LADWP may offer financial incentives for energy designs that exceed minimum energy efficiency standards.

1. Built-in appliances, refrigerators, and space-conditioning equipment should exceed the minimum efficiency levels mandated in the Title 24.

2. Install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces which provides the following:

    - A variable air-volume system which results in minimum energy consumption and avoids hot water energy consumption for terminal reheat;

    - A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods;

    - Sequentially staged operation of air-conditioning equipment in accordance with building demands; and

    - The isolation of air conditioning to any selected floor or floors.

3. Consider the applicability of the use of thermal energy storage to handle cooling loads.

4. Cascade ventilation air from high-priority areas before being exhausted, thereby decreasing the volume of ventilation air required. For example, air could be cascaded from occupied space to corridors and then to mechanical spaces before being exhausted.

5. Recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from the buildings, via ceiling plenums, to reduce cooling loads in warm weather.

6. Install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems.

7. Ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. Where applicable, design building

entrances with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.

8. Building commissioning should be completed prior to issuance of the certificate of occupancy to verify that the building systems components meet the project requirements.

9. Finish exterior walls with light-colored materials and high-emissivity characteristics to reduce cooling loads. Finish interior walls with light-colored materials to reflect more light and, thus, increase lighting efficiency.

10. Use a white reflective material for roofing meeting California standards for reflectivity and emissivity to reject heat. The Los Angeles Municipal Code now mandates cool roof materials for all new and complete replacement roofs installed in the City of Los Angeles.

11. Install thermal insulation in walls and ceilings, which exceeds requirements established by Title 24.

12. Design window systems to reduce thermal gain and loss, thus, reducing cooling loads during warm weather and heating loads during cool weather.

13. Install heat-rejecting window treatments, such as films, blinds, draperies, or others on appropriate exposures.

14. Install LED lamps or fixtures, which give the highest light output per watt of electricity consumed, for all street and parking lot lighting to reduce electricity consumption. Install an astronomical time switch control to meet your projects design needs.

15. Install automatic daylighting controls and dimmable electronic ballasts, to light fixtures near windows and skylights, to maximize the use of natural daylight available and reduce artificial lighting load.

16. Install occupant-controlled thermostats to permit individual adjustment of heating, and cooling to avoid unnecessary energy consumption.

17. Install a lighting control system to automatically control interior and exterior lights in public areas and will also energize emergency egress lights when an emergency occurs.

18. Control mechanical systems (HVAC and lighting) in the building with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space.

19. Incorporate windowless walls or passive solar inset of windows into the project for appropriate exposures.

20. Design project to focus pedestrian activity within sheltered outdoor areas.

21. Install individual occupant sensors indoors, where appropriate, to automatically turn lights off when an area is vacated.

22. Install the manufacturers recommended lamp and ballast combination for all fluorescent light fixtures to provide the most efficient light output. Use reflectors to direct maximum levels of light to work surfaces.

For additional information concerning these conservation measures, please contact Ms. Lucia Alvelais, Utility Services Manager, at (213) 367-4939. Also, please visit the Los Angeles Department of Building and Safety's website for information on CALGreen and the Los Angeles Green Building Code (http://ladbs.org/LADBSWeb/green-bldg.jsf). Additional water and energy code compliance tips as well as various useful Green Building links are available on the LADWP website at the following location: http://www.ladwp.com under Commercial/Go Green.

SUBJECT: Water Supply Assessment – Central Plaza Project

SUMMARY

The Water Supply Assessment (WSA) is for the Central Plaza Project located within the Wilshire Community Plan area of the City of Los Angeles (City). LADWP staff determined the total net additional water demand for the Central Plaza Project is 77 acre-feet per year (AFY) and has concluded this additional water demand can be accommodated. The Central Plaza Project's base water demand was further reduced by 48 AFY through implementation of the conservation ordinance and code requirements and an additional 2 AFY through the project implementing additional voluntary conservation measures. WSA will meet the requirements of California Water Code Sections 10910-10915. The governing body of each public water system is required to make a determination on WSAs for major projects.

City Council approval is not required.

RECOMMENDATION

It is recommended that the Board of Water and Power Commissioners (Board) adopt the attached Resolution authorizing the WSA for the Central Plaza Project.

ALTERNATIVES CONSIDERED

LADWP is required by state law, as set forth in California Water Code Sections 10910-10915, to prepare this WSA for the Central Plaza Project. There are no other alternatives.

FINANCIAL INFORMATION

The Central Plaza, LLC (Applicant) paid $17,000 to cover LADWP's expenses for preparation of this WSA.

BACKGROUND

WSAs are prepared in conformance with California law and the City ordinances to ensure proposed projects that utilize water resources are consistent with the City's conservation goals and long-term water supply availability, as detailed in LADWP's 2015 Urban Water Management Plan (UWMP). LADWP's 2015 UWMP is the water supply planning document for the City and is prepared by LADWP.

Each WSA performed by LADWP is carefully evaluated within the context of LADWP's most recent UWMP and current conditions, such as restrictions on State Water Project (SWP) pumping from the Sacramento-San Joaquin River Delta (Delta) imposed by a Federal Court. The Metropolitan Water District of Southern California (MWD), from whom the City purchases its SWP and Colorado River water supplies, has also been actively developing plans and making efforts to provide additional water supply reliability for the entire Southern California region. LADWP coordinates closely with MWD to ensure implementation of MWD's water resource development plans.

Part of MWD's planning effort is the update and implementation of its Integrated Water Resources Plan (IRP) and its UWMP, which are designed to address potential reductions in water supply due to the effects of variable hydrologic conditions and regulatory restrictions on exports from the Delta. The 2015 IRP update resulted in the development of the following six main findings and conclusions: action is needed to minimize unacceptable level of shortage allocation frequency in the future, maintain Colorado River supplies, stabilize SWP supplies, develop/protect local supplies and water conservation, maximize effectiveness of storage and transfers, and continue with adaptive management approach.

LADWP's 2015 UWMP contains a water shortage contingency plan for multi-year dry hydrological periods. This water shortage contingency plan was implemented on June 1, 2009, when the Board adopted Shortage Year Rates and the City Council implemented the landscape irrigation and prohibited use restrictions contained in the City's Water Conservation Ordinance. The City's Water Rate Ordinance, adopted June 1995 was last amended by the Board, effective April 15, 2016. The new water rate structure increases the number of tiers from two to four for single-family residential

customers. The goal is to incentivize conservation while recovering the higher costs of providing water to high volume users. In keeping with cost of service principles, the incremental pricing for the tiers is based on the cost of water supply and, for the third and fourth tiers, added pumping and storage costs.

Various conservation measures are also required through the following regulations: the City's Green Building Codes Revision/Use of Greywater Systems/Water Conservation Measures Ordinance No. 184248, the City's Water Efficiency Requirements Ordinance No. 180822, 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing Code, and 2014 Los Angeles Green Building Code. All codes became effective January 1, 2014, except Ordinance No. 184248, effective June 2016, and Ordinance No. 180822, effective December 2009.

Projected Water Use and Conservation

On March 22, 2017, the Los Angeles Department of City Planning (Planning Department), lead agency for the Central Plaza Project, requested LADWP perform a WSA. Based on information obtained from Planning Department, the Central Plaza Project will redevelop part of an approximately 7.36-acre site of commercial land uses within the Wilshire Community Plan area of the City for residential and commercial land uses. The Central Plaza Project is generally bounded by 7th Street to the south, Mariposa Avenue to the east, Irolo Street to the west, and Wilshire Boulevard to the north.

The Central Plaza Project's site currently consists of four commercial office buildings that contain approximately 760,456 square feet (sq ft) of floor area with ground floor retail uses, a 266,571 sq ft, three-story parking structure, and a 206,180 sq ft, five-story parking structure. As part of the project, the existing three-story parking structure and landscaping will be demolished to support the development of the Central Plaza Project. The existing water demand to be removed is approximately 1 AFY.

The Central Plaza Project will add ground floor retail to the existing office buildings, develop three retail kiosks along West Wilshire Boulevard and South Irolo Street, and construct a 23-story mixed-use building (Tower 1) and a 28-story mixed-use building (Tower 2) on top of a podium that will be four stories above grade and two stories subterranean. Tower 1 will include approximately 280 apartment units, rooftop amenities, and commercial space; while Tower 2 will include approximately 361 apartment units, rooftop amenities, and commercial space. The Central Plaza Project will add a total of 641 residential units, 2,692 sq ft of lobby and leasing space, 13,500 sq ft of retail space, 4,954 sq ft of restaurant uses, 9,935 sq ft of indoor lounge, 10,930 sq ft of rooftop amenity deck space, a pool, and a water feature. The Central Plaza Project will also include approximately 483,684 sq ft of parking (309,558 sq ft covered), 21,860 sq ft of landscaping and cooling towers.

LADWP staff recommended implementation of additional voluntary water conservation measures to maximize the potential water-use efficiency for the Central Plaza Project. Recommended voluntary conservation measures are in addition to those required by the City's current codes and ordinances. Based on LADWP staff recommendations, Applicant has voluntarily committed to implement the following additional measures that are beyond those required by law:

- High Efficiency Toilets with a flush volume of 1.06 gallons per flush, or less, for residential units only
- Showerheads with a flow rate of 1.75 gallons per minute, or less, for residential units only
- Drip/Subsurface Irrigation (Micro-Irrigation)
- Proper Hydro-zoning/Zoned Irrigation (groups plants with similar water requirements)
- Drought Tolerant Plants – 70 percent of total landscaping

A written commitment of the Central Plaza Project's planned voluntary water conservation measures was submitted by Applicant and is attached with WSA in Appendix B.

With the addition of these voluntary water conservation measures, which yield additional savings of approximately 2 AFY, the total net additional water demand is approximately 77 AFY.

Applicant has also committed to comply with the City of Los Angeles Low Impact Development Ordinance (City Ordinance Nos. 181899 and 183833) and to implement Best Management Practices that have stormwater recharge or reuse benefits for the Central Plaza Project as applicable:

- Catch Basin Insert – a device that can be inserted into an existing catch basin design to provide some level of runoff contaminant removal.
- Catch Basin Screens
- Cistern – captures stormwater runoff as it comes down through the roof gutter system, if infiltration is not feasible

The Central Plaza Project is determined by Planning Department to be consistent with the demographic projections for the City from both the 2012 and 2016 Regional Transportation Plans (RTP) by the Southern California Association of Governments (SCAG). The City's water demand projection in 2015 UWMP was developed based on the 2012 RTP demographic projection using the 2010 U.S. Census for the City. LADWP used a modified-unit-use approach to develop its service area-wide water demand projections. This methodology does not rely on individual development demands to determine area-wide growth. 2015 UWMP concluded there are adequate water supplies to meet projected water demand through 2040. Therefore, projected water supply available during normal, single-dry, and multiple-dry water years as

included in the 25-year projection of 2015 UWMP is sufficient to meet the projected water demand associated with the Central Plaza Project, in addition to the existing and planned future demand on LADWP.

ENVIRONMENTAL DETERMINATION

Determine item is exempt pursuant to the California Environmental Quality Act (CEQA) Guidelines 15268 (b) (4). In accordance with Section 15268 (b)(4) of the CEQA Guidelines, Ministerial projects such as Approval of individual utility service connections and disconnections are exempt from the requirements of CEQA.

CITY ATTORNEY

The Office of the City Attorney reviewed and approved the Resolution as to form and legality.

ATTACHMENTS

- Resolution
- Water Supply Assessment

RESOLUTION NO. _____

WHEREAS, Los Angeles Department of Water and Power (LADWP) constitutes a "public water system" pursuant to California Water Code Section 10912, subdivision (c); and

WHEREAS, the Central Plaza Project qualifies as a "project" under California Water Code Section 10912, subdivision (a) (7); and

WHEREAS, the Central Plaza Project is located in the service area of LADWP's water supply system, and LADWP would serve the area of the Central Plaza Project development; and

WHEREAS, on March 22, 2017, the City of Los Angeles (City) Department of City Planning (Planning Department) requested the LADWP conduct a Water Supply Assessment (WSA) for the Central Plaza Project pursuant to California Water Code Sections 10910-10915; and

WHEREAS, the Central Plaza Project would redevelop an approximately 7.36-acre site of commercial land uses within the Wilshire Community Plan area of the City for residential and commercial land uses; and

WHEREAS, LADWP's Water Resources Division has prepared a WSA for the Central Plaza Project in compliance with California Water Code Sections 10910-10915; and

WHEREAS, the Central Plaza Project is determined by Planning Department to be consistent with the demographic projections for the City from both the 2012 and 2016 Regional Transportation Plans by the Southern California Association of Governments; and

WHEREAS, LADWP staff performed the water demand analysis and determined the net increase in total water demand for the Central Plaza Project is 77 acre-feet per year; and

WHEREAS, Central Plaza, LLC (Applicant) has agreed to implement additional conservation measures, as described in WSA, that are in addition to those required by law; and

WHEREAS, LADWP anticipates that its projected water supply available during normal, single-dry, and multiple-dry water years as included in the 25-year projection contained in its adopted 2015 Urban Water Management Plan can accommodate the projected water demand associated with the Central Plaza Project, in addition to the existing and planned future demands on LADWP; and

WHEREAS, the Board of Water and Power Commissioners (Board) adopted a Water Rate Ordinance for water service effective April 15, 2016. The Board believes that the price signals contained in the Water Rate Ordinance encourages conservation and will help to contribute to reductions in City-wide demands to meet demand projections; and

WHEREAS, in accordance with Water Code Section 10910 (g) (1) the Board has the responsibility for approval and certification of WSA's prepared by LADWP; and

WHEREAS, the Board has independently reviewed and considered the WSA and documentation making up the administrative record; and

WHEREAS, a publicly noticed Board hearing was held with respect to this item on July 18, 2017, and the Board considered evidence presented by LADWP's Water Resources Section staff, the staff recommendation to approve the WSA, and other comments from interested parties at the public hearing.

NOW, THEREFORE, BE IT RESOLVED that the Board finds that LADWP can provide sufficient domestic water supplies to the Central Plaza Project area and approves the WSA prepared for the Central Plaza Project, now on file with the Secretary of the Board, and directs that WSA and a certified copy of Resolution be transmitted to Planning Department.

BE IT FURTHER RESOLVED that the Board finds that LADWP's total projected water supplies available during normal, single-dry, and multiple-dry water years during a 20-year projection will meet the projected water demands associated with the Central Plaza Project in addition to existing and planned future uses including agricultural and industrial uses.

BE IT FURTHER RESOLVED that the Board has considered the WSA prior to making a decision to approve the WSA, and finds that the WSA is adequate and was prepared in accordance with Water Code Section 10910 (c) (2), and meets the requirements of Water Code Section 10910 (d), (e), (f), and (g).

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of a Resolution adopted by the Board of Water and Power Commissioners of the City of Los Angeles at its meeting held

G. Water Supply Assessment Checklist

Introduction

Proposed major projects subject to certain requirements in the California Water Code Sections 10910-10915 require that a city or county identify any public water system that may supply water to the Central Plaza Project and request the public water system provide a Water Supply Assessment (WSA). The WSA is a determination by the water supplier that the demands associated with the Central Plaza Project were included in its most recently adopted 2015 UWMP showing that there is an adequate 20-year water supply.

The City of Los Angeles (City) Department of City Planning (Planning Department), serving as the lead agency as prescribed by the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.), for the Central Plaza Project, has identified LADWP as the public water system that will supply water. In response to Planning Department's request for a WSA, LADWP has performed the assessment contained herein.

LADWP has supplied the City with a safe and reliable water supply for over a century. Over time, the City's water supplies have evolved from primarily local groundwater to predominantly imported supplies. Today, the City relies on over 85 percent of its water from imported sources. As such, LADWP has taken an active role in regional and statewide water management. The sustainability of Los Angeles' local water supplies are dependent on the City's ability to maximize water conservation, increase recycled water use, expand stormwater capture, and accomplish other local water resource goals.

WSA is prepared to meet the applicable requirements of state law as set forth in California State Water Code Sections 10910-10915. Significant references and data for WSA are from the City's 25-year water resource plan, entitled *Los Angeles Department of Water and Power Urban Water Management Plan 2015*, adopted by the Board of Water and Power Commissioners (Board) on June 7, 2016. LADWP's 2015 UWMP is incorporated by reference and is available for review through LADWP's Web site, www.ladwp.com/uwmp.

Findings

The Central Plaza Project is estimated to increase the total net water demand within the site by 77 acre-feet (AF) annually based on review of information submitted by Planning Department. Central Plaza, LLC (Applicant) has committed to implement additional water use efficiency measures that are beyond those required by current law.

LADWP's WSA finds adequate water supplies will be available to meet the total additional water demand of 77 AF annually for the Central Plaza Project. LADWP anticipates the projected water demand from the Central Plaza Project can be met

during normal, single-dry, and multiple-dry water years, in addition to the existing and planned future demands on LADWP.

WSA approval addresses the City's long-term water supply and demand forecasts to accommodate the Central Plaza Project, and is not an approval for water service connection. A separate request shall be made to LADWP requesting an evaluation of water service connection for the Central Plaza Project.

The basis for approving WSAs for developments is LADWP's most recently adopted UWMP. LADWP's water demand forecast, as contained in LADWP's 2015 UWMP, uses long-term demographic projections for population, housing, and employment. The California Urban Water Management Planning Act requires water suppliers to develop a UWMP every five years to identify short-term and long-term water resources management measures to meet growing water demands during normal, single-dry, and multiple-dry years. If the projected water demand associated with the Central Plaza Project was not accounted for in the most recently adopted LADWP 2015 UWMP, WSA must include a discussion with regard to whether LADWP's total projected water supplies available during normal, single-dry, and multiple-dry water years during a 20-year projection will meet the projected water demand associated with the Central Plaza Project, in addition to LADWP's existing and planned future uses.

The City's water demand projection in LADWP's 2015 UWMP was developed based on the 2012 Regional Transportation Plan (RTP) demographic projection by the Southern California Association of Governments (SCAG) using the 2010 United States (U.S.) Census for the City. LADWP's 2015 UWMP concluded there are adequate water supplies to meet projected water demands through 2040. Therefore, the City's water supply projections in LADWP's 2015 UWMP are sufficient to meet the City's water demand projections based on the 2012 RTP.

Planning Department has determined that the Central Plaza Project conforms with the use and intensity of development permitted by the City's General Plan, and that it is consistent with the demographic projection for the City from both the 2012 and 2016 RTPs. Therefore, anticipated water demand for the Central Plaza Project falls within LADWP's 2015 UWMP's projected water supplies for normal, single-dry, and multiple-dry years through the year 2040 and is within the LADWP 2015 UWMP's 25-year water demand growth projection. This WSA can be approved based on the fact that the Central Plaza Project's water demand falls within the LADWP 2015 UWMP's projected increase in citywide water demands, while anticipating multi-dry year water supply conditions occurring at the same time.

Additionally, LADWP's 2015 UWMP contains a water shortage contingency plan for multi-year dry hydrological periods. This water shortage contingency plan was implemented on June 1, 2009, when the Board adopted Shortage Year Rates, and the City Council implemented the landscape irrigation and prohibited use restrictions contained in the City's Water Conservation Ordinance (Ordinance).

The City's Water Rate Ordinance, adopted in June 1995, was last amended by the Board, effective April 15, 2016. The revised rate ordinance restructured the rates to help further promote conservation. For example, single family rates switched to a four-tier system that sends a strong price signal to deter against wasteful water use. The Board finds that the price signals contained in the Water Rate Ordinance encourage conservation and support further reduction in City-wide demand. Past and current implementation of water rate price signals and higher ordinance phases have resulted in reducing the total customer water usage, on average, by approximately 19.7 percent over the time period from June 2009 to May 2017.

The Central Plaza Project Description

The following project information was obtained from Planning Department's WSA Request Letter and the scope confirmation e-mail (Appendix A):

Project Name:	Central Plaza Project
Lead Agency:	Planning Department
Planning Community:	Wilshire Community Plan

The Central Plaza Project will redevelop an approximately 7.36-acre site of commercial land uses within the Wilshire Community Plan area of the City for residential and commercial land uses. The Central Plaza Project is generally bounded by 7th Street to the south, Mariposa Avenue to the east, Irolo Street to the west, and Wilshire Boulevard to the north.

The Central Plaza Project's site currently consists of four commercial office buildings that contain approximately 760,456 square feet (sq ft) of floor area with ground floor retail uses, a 266,571 sq ft, three-story parking structure, and a 206,180 sq ft, five-story parking structure. As part of the project, the existing three-story parking structure and landscaping will be demolished to support the development of the Central Plaza Project. The existing water demand to be removed is approximately 1 AFY.

The Central Plaza Project will add ground floor retail to the existing office buildings, develop three retail kiosks along West Wilshire Boulevard and South Irolo Street, and construct a 23-story mixed-use building (Tower 1) and a 28-story mixed-use building (Tower 2) on top of a podium that will be four stories above grade and two stories subterranean. Tower 1 will include approximately 280 apartment units, rooftop amenities, and commercial space; while Tower 2 will include approximately 361 apartment units, rooftop amenities, and commercial space. The project will add a total of 641 residential units, 2,692 sq ft of lobby and leasing space, 13,500 sq ft of retail space, 4,954 sq ft of restaurant uses, 9,935 sq ft of indoor lounge, 10,930 sq ft of rooftop amenity deck space, a pool, and a water feature. The project will also include approximately 483,684 sq ft of parking (309,558 sq ft covered), 21,860 sq ft of landscaping and cooling towers.

LADWP staff performed the water demand analysis and determined the net increase in water demand for the Central Plaza Project is 77 AFY.

A subsequent revised WSA may be required if one or more of the following occurs: (1) changes in the Central Plaza Project result in a substantial increase in water demand for the Central Plaza Project; (2) changes in the circumstances or conditions substantially affecting the ability of LADWP to provide a sufficient supply of water for the Central Plaza Project; or (3) significant new information becomes available which was not known and could not have been known at the time when WSA was prepared. If deemed necessary, Applicant may request a revised WSA through lead agency.

The Central Plaza Project Water Demand Estimate

Projected total net water demand increase for the Central Plaza Project is estimated to be 77 AF annually which includes annual water conservation. Savings due to water conservation ordinances are approximately 48 AFY, and savings due to additional voluntary conservation measures are approximately 2 AFY.

In evaluating the Central Plaza Project's water demand, the Sewer Generation Factors (SGF), published by City of Los Angeles Department of Public Works Bureau of Sanitation (LASAN) in 2012, are applied to the Central Plaza Project scope for calculating indoor water use. SGFs are factors of how much wastewater is generated (gallons per day) per unit (per sq ft, per dwelling unit, per seat, etc.). LASAN publishes a list of SGFs for approximately 175 different building use types in the City, and updates factors to make adjustments necessary due to water conservation efforts and increased efficiencies in new appliances and plumbing fixtures. Outdoor landscape water demand is estimated per California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. Historical billing records are used to establish existing baseline water demand on the property. LADWP also encouraged the Central Plaza Project to implement additional water conservation measures above and beyond the current water conservation ordinance requirements.

The net increase in water demand, which is the projected additional water demand of the Central Plaza Project, is calculated by subtracting the existing baseline water demand and water saving amount from the total proposed water demand.

Table I shows a breakdown of the existing and proposed new types of uses for the Central Plaza Project, and the corresponding estimated volume of water usage with the implementation of the conservation measures for the Central Plaza Project.

Types of use were derived from WSA request letter and the scope confirmation e-mail in Appendix A.

Table II estimates the total volume of water conservation based on conservation measures the Applicant has committed to for the Central Plaza Project (Appendix B).

Water Demand Forecast

LADWP's 2015 UWMP projects yearly water demand to reach 675,700 AF by fiscal-year-ending (FYE) 2040 with passive water conservation, or an increase of 31.6 percent from FYE 2015 actual water demand. Water demand projections in five-year increments through FYE 2040 are available in LADWP's 2015 UWMP for each of the major customer classes: single-family, multifamily, commercial/governmental, and industrial. Demographic data from the Southern California Association of Government's 2012 RTP, as well as billing data for each major customer class, weather, conservation, price of water, personal income, family size, economy, and drought conservation effect were factors used in forecasting future water demand growth.

LADWP's 2015 UWMP used a modified-unit-use approach to develop its service area-wide water demand projections. This methodology does not rely on individual development demands to determine area-wide growth, because such an inventory in LADWP service area in the next 25 years is only a subset of the total development potential. Therefore, the growth or decline in population, housing units, and employment for the entire service area was considered in developing long-term water projections for the City through FYE 2040. The historical water demand for a unit of customer class, such as gallons-per-day per single family, is modified to account for future changes, including water conservation, and applied to the 2012 RTP demographic projections by SCAG. This modified-unit-use-approach has proven to be a reliable forecast historically, when compared with actual consumption, excluding the effects of conservation.

LADWP's 2015 UWMP is updated every five years as required by California law. This process entails, among other requirements, an update of water supply and water demand projections for water agencies.

Collaboration between LADWP and MWD is critical in ensuring that the City's anticipated water demands are incorporated into the development of MWD's long-term Integrated Water Resources Plan (IRP). MWD's IRP directs a continuous regional effort to develop regional water resources involving all of MWD's member agencies including the City. Successful implementation of MWD's IRP has resulted in reliable supplemental water supplies for the City from MWD.

State law further regulates distribution of water in extreme dry weather conditions. Section 350-354 of the California Water Code states that when a governing body of a distributor of a public water supply declares a water shortage emergency within its service area, water will be allocated to meet needs for domestic use, sanitation, fire protection, and other priorities. This will be done equitably and without discrimination between customers using water for the same purpose(s).

LADWP – 2015 UWMP

The California Urban Water Management Planning Act (first effective on January 1, 1984) requires every urban water supplier prepare and adopt a UWMP every five years. The main goals of UWMPs are to forecast future water demands and water supplies under average and dry year conditions, identify future water supply projects such as recycled water, provide a summary of water conservation Best Management Practices (BMP), and provide a single and multi-dry year management strategy.[1]

LADWP's 2015 UWMP, available for reference through www.ladwp.com/uwmp, serves two purposes: (1) achieve full compliance with requirements of California's Urban Water Management Planning Act; and (2) serve as a master plan for water supply and resources management consistent with the City's goals and policy objectives.[2]

A number of important changes have occurred since LADWP prepared its 2010 UWMP. The year 2012 marked the start of the current multi-year drought in California. In January 2014, Governor Jerry Brown proclaimed a drought state of emergency. In July 2014, the State Water Resources Control Board (SWRCB) implemented its Emergency Water Conservation Regulation (Emergency Regulation), as directed by Governor Brown, to take actions to reduce water use by 20 percent Statewide, which was later increased to 25 percent statewide, with adjustments to account for different climates, expected growth, investment made to create drought-resilient water supplies by different cities through October 2016. In October 2014, Mayor Eric Garcetti issued Executive Directive No. 5 (ED5) Emergency Drought Response which set goals to reduce per capita water use, reduce purchases of imported potable water by 50 percent, and create an integrated water strategy to increase local supplies and improve water security considering climate change and seismic vulnerability. Lastly, in April 2015, the Mayor's Sustainable City pLAn (pLAn) was released establishing targets for the City over the next 20 years to strengthen and promote sustainability. The pLAn included a number of water resources goals, including reduce average per capita potable water use by 20 percent from Fiscal Year (FY) 2013/14 by 2017, reduce average per capita potable water use by 22.5 percent from FY 2013/14 by 2025, reduce imported water purchases from MWD by 50 percent from 2013/14 by 2025, reduce per capita potable water use by 25 percent from 2013/14 by 2035, and expand all local sources of water so that they account for at least 50 percent of the total supply by 2035. The pLAn included a multi-faceted approach to developing a locally sustainable water supply to reduce reliance on imported water, reducing per capita water use through conservation, and increasing local water supply availability.

A number of new requirements have been added to the Urban Water Management Planning Act since completion of LADWP's 2010 UWMP, including: an extension of the submittal deadline from December 31, 2015 to July 1, 2016, a narrative description of water demand measures implemented over the past five years and future measures

[1] *City of Los Angeles Department of Water and Power 2015 Urban Water Management Plan*, at ES-2.
[2] *Id.* at ES-2.

planned to meet 20 percent demand reduction targets by 2020, implementation of a standard methodology for calculating system water loss, a mandatory electronic filing of UWMPs, a voluntary reporting of passive conservation savings, energy intensity, and climate change, and a requirement to analyze and define water features that are artificially supplied with water.

LADWP's 2015 UWMP projects a seven percent lower water demand trend than what was projected in the previous LADWP 2010 UWMP. It outlines plans, as described below, to provide a highly reliable water supply by FYE 2040, by implementing cost-effective conservation, recycled water, and stormwater capture programs, ultimately meeting the targets established in ED5 and pLAn, including reducing imported water purchases from MWD.

Near-Term Conservation Strategies

Enforcing prohibited uses of water. Prohibited uses of water are intended to eliminate waste and increase awareness of the need to conserve water. In effect at all times, prohibited uses have been in place since the early 1990s. Under enforcement, failure to comply would be subject to penalties, which can range from a written warning for a first violation to monetary fines and water service shutoff for continued non-compliance.

Expanding the prohibited uses of water. In August 2009, and again in August 2010, the City updated the Emergency Water Conservation Plan Ordinance (No. 181288) by clarifying prohibited uses of water, modifying certain water conservation requirements, and developing new phases of conservation depending on the severity of water shortages. In June 2015, the City amended Ordinance No. 181288 with the new Ordinance No. 183608. Ordinance No. 183608 clarified prohibited uses and added an additional phase to allow for outdoor watering two days a week. In April 2016, the City once again amended Ordinance No. 183608 with the Ordinance No. 184250, which defined and added fines for unreasonable uses of water. The Ordinance is expected to improve the City's ability to comply with current regulations and respond to the ongoing drought conditions. Prohibited uses in effect at all times (Phase I) include[3]:

- Water leaks allowed to go unattended
- Outdoor irrigation between the hours of 9 a.m. to 4 p.m.
- Outdoor irrigation that results in excess water flow leaving the property
- Outdoor irrigation during and 48 hours after rain events
- Outdoor irrigation with spray head sprinklers and bubblers for more than ten minutes per watering day per station
- Outdoor irrigation with standard rotors and multi-stream rotary heads for more than 15 minutes per cycle and up to two cycles per watering day per station
- Large landscape irrigation systems without automatic shutoff rain sensors

[3] *Id.* at 3-11.

- Washing paved surfaces (sidewalks, walkways, driveways, or parking areas) unless using a LADWP-approved water conserving spray cleaning device
- Water for decorative fountains, ponds, or lakes unless the water is part of a recirculating system
- Installation of single-pass cooling systems in buildings requesting new water service
- Installation of non-recirculating systems in new commercial laundry facilities
- Installation of non-recirculating systems in new conveyor car washes
- Car washing with a hose, unless an automatic shut-off device is attached
- Water served to customers in eating establishments, unless requested
- Daily towel and linen service option must be offered to hotel and motel guests

Phase II of the Water Conservation Ordinance was enacted in August 2010 and is currently in effect. In addition to the restrictions in Phase I, Phase II also limits landscape irrigation irrigation to three days per week, Monday, Wednesday, and Friday for odd-numbered street addresses and Tuesday, Thursday, and Sunday for even-numbered street addresses. Watering times for non-conserving nozzles (spray head sprinklers and bubblers) are limited to eight minutes per watering day per station.

On January 17, 2014, with California facing water shortfalls in the driest year in recorded state history, Governor Brown proclaimed a Drought State of Emergency. Local urban water suppliers and municipalities were called upon to implement their local water shortage contingency plans. Responding to the executive order, in 2015, SWRCB imposed mandatory cutbacks ranging from four percent to 36 percent. LADWP was required to reduce its water use by 16 percent compared to the 2013 levels. LADWP met the state mandated reduction goal and saved 16.1 percent between June 2015 and May 2016. In 2016, following a relatively wet winter in Northern California, SWRCB replaced the regulations by a localized “stress test” approach, which LADWP successfully met.

On April 7, 2017, Governor Jerry Brown issued Executive Order B-40-17 formally ending the drought emergency. The Governor lifted the drought emergency in all California counties except Fresno, Kings, Tulare and Tuolumne where emergency drinking water projects will continue to help address diminished groundwater supplies. The order also rescinds two drought-related emergency proclamations and four drought-related executive orders. Cities and water districts throughout the state are required to continue reporting their water use each month, according to the order, which also bans wasteful practices, such as hosing off sidewalks and running sprinklers when it rains.

As the Governor ended the drought emergency, five state agencies unveiled a long-range plan to rein in water use, called “Making Water Conservation a California Way of Life.” This plan builds on the successes and lessons learned from California’s five-year drought and establishes a framework for long-term efficient water use that reflects the state’s diverse climate, landscape, and demographic conditions.

Achieving the plan's goals will help all of California better prepare for longer and more severe droughts caused by climate change. Among other things, the plan will require all urban agencies to meet new targets, based on their local climates, land-use characteristics and other factors. The urban agencies would set the targets themselves, based on parameters set by the state.

On October 14, 2014, Mayor Garcetti issued his Executive Directive No. 5 (ED5) to set accelerated short-term conservation targets to address the drought and set long-term water reliability goals. Shortly after, the Mayor published the City's Sustainability pLAn (pLAn) on April 8, 2015. The pLAn builds upon the goals in ED5 to establish the following water resources related goals to achieve long-term water reliability for the City: per capita water use reduction goals of 20 percent by 2017, 22.5 percent by 2025, and 25 percent by 2035; a reduction in LADWP purchases of imported potable water by 50 percent by 2025; and expanding local water supplies to account for 50 percent of total supplies by 2035. LADWP's 2015 UWMP incorporates the pLAn goals in its local water supply plans to reduce reliance on purchased water in the future. These plans include increased stormwater capture, groundwater clean-up, recycled water, and conservation.

Most significant among them is an increased goal for conservation. On January 1, 2017, the City was able to meet the short-term target of 20 percent reduction through drought response measures that dropped per capita water use to 104 gallons per day. While this extraordinary achievement will have lasting effects on the City's water use efficiency, LADWP will need to work together with residents and businesses to achieve additional permanent conservation savings needed to maintain these drought savings and further reduce per capita water use by 25 percent by 2035. Achieving the pLAn and LADWP 2015 UWMP per capita water use reduction goals will help reduce the City's reliance on imported water while providing drought-resilient supplies that are not subject to increasingly frequent hotter weather conditions.

Among the actions required by ED5 that have been implemented are the following:

- Increase rebates for rain barrels, including interconnection piping and control systems, to $100 per barrel.
- Increase LADWP's California Friendly Landscape Incentive rebate funding to $1.75 per sq ft.

In addition to mandatory action items including those listed above, ED5 also calls for residents to:

- Voluntarily reduce their outdoor watering from three to two days.
- Replace turf lawns with native and climate-appropriate landscaping during the optimal Fall/Winter planting season, utilizing LADWP rebates for turf removal.
- Replace any remaining high water use plumbing fixtures and appliances with low-flow fixtures and appliances using consumer rebates provided by LADWP.
- Ensure swimming pools have covers to reduce water evaporation.

ED5 goals were later enhanced/modified by the Mayor's pLAn in April 2015. Strategies under pLAn sought to execute key conservation steps outlined in ED5 as well as expand the scope and financing for conservation programs and incentives.

Extending outreach efforts. Over the last several years, LADWP has expanded conservation outreach and education. Some activities to promote conservation include: increased communication with ratepayers through Twitter, Facebook, newspapers, radio, television, bus benches/shelters, and movie theaters, among other types of media; outreach to Homeowner Associations and Neighborhood Councils; distribution of hotel towel door hangers and restaurant table tent cards; and ramping up marketing of expanded water conservation incentive and rebate programs.

On April 9, 2015, the new "Save the Drop" Water Conservation Outreach Campaign was launched. This campaign is a partnership between LADWP and the Mayor's Office. Outreach materials include new public service announcements, radio spots, event handouts, and signage on the sides of LASAN trucks. The campaign has partnered with celebrities such as Steve Carrell, Jaime Camil, and Moby for public service announcements airing on TV, cinema, and radio.

Encouraging regional conservation measures. LADWP has worked with MWD to encourage all water agencies in the region to promote water conservation and adopt water conservation ordinances which include prohibited uses and enforcement.

Long-Term Local Supply Strategies

In April 2015, the Mayor released the City's first ever Sustainable City pLAn that focuses on sustainability, with special focus on the environment, the economy, and equity. The pLAn enhances ED5 goals, and incorporates water savings goals of reduction in per capita potable water by 20 percent by 2017, by 22.5 percent by 2025, and by 25 percent by 2035. The pLAn goals also include a reduction in imported water purchases from MWD by 50 percent from 2013/14 levels by 2025 and expansion of all local sources of water so that they account for at least 50 percent of the total supply by 2035. The pLAn includes specific strategies and desired outcomes for conservation, recycled water, and stormwater capture. Some of the strategies to meet these goals include investments in state-of-the art technology, rebates and incentives promoting water-efficient appliances, tiered water pricing, Technical Assistance Program for business and industry, and large landscape irrigation and efficiency programs.

1.0 Increase Water Conservation Through Reduction of Outdoor Water Use and New Technology

Goal

Increase water conservation savings to achieve ED5 and pLAn water conservation goals by cutting back on outdoor water use, expanding rebates and incentives,

improving water efficiency at public facilities, and enhancing savings through review of new developments**.** LADWP plans to achieve additional water conservation savings of 108,100 AFY during average years and 143,500 AFY during single/multi-dry years by year 2040[4].

Action Plan

Conservation Rebates and Incentives**.** LADWP is continuing to expand rebates and incentives for homeowners and business owners to encourage them to purchase water-saving technology. Rebate and incentive programs include the following: Commercial Rebate Program, Residential Rebate Program, Direct Install Partnership Program, and Technical Assistance Program. In addition, as part of the City's ongoing effort to encourage customers to adopt active water conservation measures (i.e., measures that can help customers conserve water on a daily basis without thinking about it) in their homes and businesses, LADWP continues to distribute water-saving bathroom and kitchen faucet aerators and shower heads free-of-charge. In an effort to reduce outdoor water use, LADWP launched the California Friendly Landscape Incentive Program in 2009. Between November 1, 2014, and July 9, 2015, this Program provided rebates for turf removal to residential customers of $3.75 per sq ft for the first 1,500 sq ft and $2.00 per sq ft with no cap thereafter, and to commercial customers of up to $3.75 per sq ft. MWD is no longer offering turf removal incentives to new applicants, effective July 9, 2015, because available funding has been fully allocated.

LADWP has relaunched the California Friendly Landscape Incentive Program to continue a utility-sponsored rebate program for its customers. Effective July 15, 2015, residential customers are eligible to receive a rebate of $1.75 per sq ft for 1,500 sq ft maximum, while commercial customers are eligible for a rebate of $1.00 per sq ft for the first 10,000 sq ft and $0.50 per sq ft thereafter up to 43,560 sq ft maximum.

Some highlights from the list of LADWP's numerous water conservation accomplishments are:

- LADWP's Water Conservation Program has achieved a total cumulative hardware water savings of over 125,000 AFY, mainly through installation of conservation devices subsidized by rebates and incentives, since the inception of the program in FYE 1991 to FYE 2016.
- Water conservation achievements have resulted in Los Angeles using just as much as it did 45 years ago despite a population increase of over one million people.
- California Friendly Landscape Incentive Program – In total (Residential and Commercial Turf removal), LADWP has removed over 48 million sq ft of turf, saving over 1.9 billion gallons of water per year.
- LADWP's 100-percent volumetric tiered rate structure has been providing financial incentives to all customers for efficient water use since 1993.

[4] *Id.* at 11-11 to 11-13.

- Water Meter Replacement Program started in 2006 and is ongoing. The current program goal is to replace 25,000 meters per year out of approximately 700,000 existing small meters, which equates to a 28-year replacement. Over the next five years, LADWP plans to ramp up to a replacement cycle of 20 years. This program provides customers with greater accuracy in metering water use and a higher degree of accountability for water that is delivered by the City's distribution system.
- Technical Assistance Programs (TAP) for business and industry have been created to provide incentives for retrofitting water-intensive industrial equipment with high efficiency devices. A large effort is currently being expended using TAP to increase water-efficiency of commercial cooling towers and expand the program for small business participation.

Action by Public Agencies. LADWP assists City Departments and other public agencies in leveraging incentive funds to retrofit their facilities with water-efficient hardware. Significant accomplishments include the following highlights:

- In an effort to reduce water waste and identify areas of potential water conservation, LADWP provided on-site water audit training for the City's Department of General Services (GSD) plumbers, Department of Recreation and Parks (RAP) landscapers and Port of Los Angeles (POLA) staff, and conducted nearly 500 facility audits.
- In January 2009, a Memorandum of Understanding (MOU) was signed between LADWP and GSD to install 875 water-efficient urinals and 325 high-efficiency toilets in City facilities.
- Ten high-use City facilities have been retrofitted with water-efficient toilets, urinals, and faucets saving approximately 23 AFY. Locations include City Hall, City Hall East, Pershing Square, and LADWP headquarters.
- Utilizing a $3 million per year grant from LADWP, RAP has retrofitted 23 parks with California Friendly landscape and water-efficient irrigation. Through this MOU, RAP completed the Los Feliz Golf Course project in July 2014. Golf course improvements include a fully automated recycled water system, and six acres of grass have been replaced with California Friendly landscaping. Annually 5.5 million gallons of water will be saved due to the changes.

***Enhancing Conservation through New Developments*.** LADWP continues to work with the City's Green Building Team to pursue desired changes in local codes and standards to promote water efficiency in new construction projects and major building renovations. One of the significant accomplishments was the approval of the Water-Efficiency Requirements Ordinance No. 180822 by the City Council, which modifies City Municipal Code to establish new requirements for water conservation in construction of new buildings, and the installation of new plumbing fixtures in existing buildings to minimize the effects of any water shortages on the customers of the City, effective December 1, 2009. Additional conservation measures are also required through the following regulations which were effective January 1, 2014: 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing

Code, and 2014 Los Angeles Green Building Code. On April 8, 2015, the California Energy Commission adopted new efficiency standards for toilets, faucets and other appliances effective January 1, 2016. Also, on July 15, 2015, in response to Governor Brown's Executive Order B-29-15, the California Water Commission approved the revised Model Water Efficient Landscape Ordinance, which reduces the maximum amount of water allowed from the 2009 version of the ordinance. The California Department of Water Resources (DWR) estimates that a new home will use 20 percent less landscape water than allowed by the 2009 ordinance, and commercial landscape will cut water use by 35 percent. Also, Ordinance No. 184248, *Green Building Codes Revision, Use of Greywater Systems, Water Conservation Measures*, became effective June 6, 2016, and mandates a number of new fixture requirements and methods of construction for plumbing and irrigation systems. California Plumbing Code, Los Angeles City Plumbing Code and amending ordinances apply to all newly constructed buildings, additions and alterations whenever new fixtures are installed in existing buildings. CALGreen, the LA Green Building Code and the amending ordinances also apply to new construction projects, but are limited to additions and alterations to existing buildings that either increase the building's conditioned volume or have a valuation of $200,000 or more. For this development, all requirements above resulted in savings of approximately 48 AFY.

In addition, the City adopted Ordinance No. 181899, also known as the "Low Impact Development" Ordinance, and Ordinance No. 183833, entitled "Stormwater and Urban Runoff Pollution Control." The purpose of these Ordinances includes rainwater harvesting and stormwater runoff management, water conservation, and recycled water reuse and gray water use. Ordinance No. 181899 was effective as of November 14, 2011, and Ordinance No. 183833 was effective October 3, 2015.

***Future Programs*[5].** In December 2014, LADWP started its Home Water Use Report Pilot Study, which provides 72,000 single family customers bi-monthly home water use reports on their water usage, statistics on how they compare to similar households with average and efficient water use, and customized water saving tips and rebate recommendations. The pilot study group also has access to online on historical water use, estimated breakdown of how the customer is using their water, and additional information on how to save water in their homes. Upon completion of the pilot study by the end of 2017, LADWP will analyze results to determine the savings potential and cost-effectiveness of the program, which will assist LADWP in planning a long-term program that targets the entire single family customer sector.

Also, LADWP is currently working on pilot projects to test installation of Advanced Metering Infrastructure, which is the use of radio-based technology that would provide for two-way communication between water meters and LADWP's system. The Advanced Metering Infrastructure would provide real-time water meter data to both the end user and LADWP, which would allow LADWP to find leaks at an earlier stage and reduce non-revenue water losses. It would also allow customers to determine their water use more often than a traditional bi-monthly or monthly bill, and motivate them to

[5] *Id.* at 3-33.

proactively increase conservation sooner rather than after they receive their bill. Customers can also receive instant alerts if their usage is abnormally high.

***LADWP Water Conservation Potential Study*[6].** In fall of 2014, LADWP initiated the Water Conservation Potential Study, the largest and most comprehensive conservation study in the U.S. The study will provide a better understanding of how historical water conservation investment efforts have impacted existing water use efficiency and device saturation levels and help LADWP prioritize future water conservation investments in the City by identifying remaining water conservation opportunities to increase City's water use efficiency into the future. Phase 1 of the study estimated conservation potential, and data from extensive and comprehensive residential surveys were used to determine the current saturation of conserving devices and practices. For example, preliminary study results show that 80 percent of single family homes in LADWP have high efficiency toilets, indicating that toilet rebate programs are reaching a saturation threshold. For non-residential sectors, a combination of previous studies conducted by both LADWP and MWD were used, as well as expert judgement from water conservation professionals with substantial experience in commercial and industrial water use and efficiency. Phase 2, currently ongoing, will incorporate results from a comprehensive water survey of 100 City-owned facilities. City-owned facility water surveys are still being fully analyzed and will be incorporated into a revised conservation potential that will be presented in the final report.

Initial results of LADWP Water Conservation Potential Study show that the additional, naturally occurring water conservation potential, post FYE 2015, will reach approximately 71,000 AFY by FYE 2040. Naturally occurring savings represent conservation from natural replacement, new development adhering to building/plumbing codes, and ordinances for landscape water use. With increased LADWP funding for conservation programs, possibly requiring a level double of current program levels, conservation potential may increase to a cost-effective maximum potential of approximately 120,000 AFY by FYE 2040, inclusive of the 71,000 AFY of naturally occurring conservation. The maximum achievable conservation level for FYE 2040, inclusive of and beyond cost-effective maximum potential, is projected to be 218,000 AFY.

2.0 Water Recycling

LADWP's 2015 UWMP identifies the goal of delivering 75,400 AFY by 2040 to off-set imported water.[7] This will increase recycled water use in the City more than six-fold as a percentage of supply, from the current two percent to 13 percent by 2040. Some of the examples of the steps the City is taking in order to achieve this goal are listed below. Other projects not listed below will also contribute to recycled water use in City's service area.

[6] *Id.* at 3-34.
[7] *Id.* at 4-27.

Recycled Water Master Planning (RWMP). In 2012, LADWP completed a three-year RWMP. RWMP documents guide near-term recycled water planning through 2035, as well as long-term recycled water planning for up to 50 years beyond the 2035 horizon. RWMP documents include an evaluation of recycling alternatives that integrate two strategies to increase recycling: Groundwater Replenishment (GWR), and non-potable reuse (NPR). The GWR Project will replenish San Fernando Basin (SFB) with up to 30,000 AFY of recycled water. NPR projects will increase NPR recycled water use to 45,400 AFY by 2040 by increasing deliveries to irrigation and industrial customers throughout the City.

pLAn. The Mayor's Sustainable City pLAn established goals to increase recycled water use by expanding recycled water by an additional 6 million gallons per day by 2017 at Terminal Island Water Reclamation Plant, converting 85 percent of public golf courses to recycled water, developing a strategy to convert the City's lakes to recycled water and implement a pilot project, and expanding recycled water production, treatment, and distribution to incorporate indirect potable reuse and direct potable reuse.[8]

GWR Project. The Final Environmental Impact Report for the GWR Project was certified by the Los Angeles Board of Water and Power Commissioners on December 6, 2016. A pilot study to optimize the recycled water purification process by evaluating various technologies and their combinations is underway. This project would replenish SFB with up to 30,000 AFY of purified recycled water from the Donald C. Tillman Water Reclamation Plant (DCTWRP). Achieving this replenishment goal would entail operating DCTWRP at the plant's full existing capacity to treat up to 80 million gallons per day of wastewater.

The Machado Lake Pipeline Project (MLPP). MLPP is a part of a joint agency project between Los Angeles Sanitation, Los Angeles Bureau of Engineering, and LADWP to serve the Los Angeles Harbor area customers up to an additional 6 million gallons per day of advanced treated recycled water from an expanded Terminal Island Treatment Plant. The MLPP will construct 8,800 linear feet (LF) of 24-inch ductile iron pipeline that connects two segments of existing pipeline infrastructure within the Los Angeles Harbor Area and creates a loop between the charged southern system and the uncharged northern system. The project is split into two construction phases. Construction on Phase I will begin early 2017 and construction on Phase II will begin late 2017. Phase I includes installation of 3,300 LF of 24-inch pipeline along Figueroa Street between Harry Bridges Boulevard and Anaheim Street. Phase II includes installation of 5,500 LF of 24-inch pipeline along Quay Avenue from East Street to Anaheim Street and on Anaheim Street to Alameda Street.

Elysian Park Water Recycling Project. The Elysian Park Water Recycling Project will not only irrigate the Elysian Fields Park and parts of the Elysian Park neighborhood, but also provide reliability to the recycled water system overall. Project proposes the installation of a nearly two miles of pipeline, two pump stations, and a one or two million gallon storage tank. Its construction will ensure dependable service to meet

[8] *Id.* at 4-26.

Los Angeles' growing demand for recycled water in the Metro area. Project will include demolition of the existing 500,000 gallon tank at Elysian Park and install separate new potable water pipelines for restrooms and drinking fountains in the park. Recycled water will be supplied from the Los Angeles-Glendale Water Reclamation Plant. Anticipated project completion is 2021.

***Downtown Water Recycling Project*.** The Los Angeles-Glendale Water Reclamation Plant will supply recycled water for the Downtown Water Recycling Project. Project proposes installation of up to 82,500 LF of 16-inch purple pipe into and through Downtown Los Angeles. The project will supply up to 2,170 AFY of recycled water for non-potable demands – irrigation and industrial uses. Potential anchor customers include University of Southern California and Matchmaster. Anticipated project completion is 2022.

Recycled Water Outreach. The City developed RWMP documents with input from stakeholders through ongoing outreach activities beginning in 2009, including interaction with the Recycled Water Advisory Group (RWAG) and key stakeholders. Presentations were given to elected official, Kindergarten-12 grade students, and Neighborhood Councils and community groups. RWAG, made up of approximately 70 stakeholders representing neighborhood councils, environmental groups, business organizations, civic groups, and other interests has recently been integrated into the One Water L.A. Stakeholder Group. They provide the City with input and feedback on many water related issues including the water recycling program. The One Water L.A. Stakeholder Group continues to participate in workshops, facility tours, and update sessions, and provide insightful feedback to the City as projects are implemented.

3.0 Enhancing Stormwater Capture

Stormwater runoff from urban areas is an underutilized resource. Within the City, the majority of stormwater runoff is directed to storm drains and ultimately channeled into the ocean. Unused stormwater reaching the ocean carries with it many pollutants that are harmful to marine life. In addition, local groundwater aquifers that should be replenished by stormwater are receiving less recharge than in the past due to increased urbanization. Urbanization has increased the City's hardscape, which has resulted in less infiltration of stormwater and a decline in groundwater elevations. The estimated current stormwater capture in the City is approximately 64,000 AFY. LADWP's 2015 UWMP projects to double the amount of stormwater capture under a conservative scenario. Centralized stormwater capture projects will increase stormwater capture by approximately 35,000 AFY by year 2035.[9] Centralized stormwater capture projects are large-scale operated projects that are designed specifically to infiltrate large amounts of runoff into underlying groundwater aquifers. Distributed stormwater capture projects, such as dry-wells and cisterns, will also provide 33,000 AFY of additional stormwater capture and infiltration/reuse in the SFB, for a total of 68,000 AFY including centralized

[9] *Id.* at 7-10.

capture by year 2035.[10] Distributed stormwater/runoff capture refers to capturing localized dry and wet weather runoff.

The Stormwater Capture Master Plan defines stormwater capture targets over the next 20 years in five-year increments to year 2035, and identifies future centralized stormwater capture projects and program types for distribution stormwater capture such as on-site infiltration, on-site direct use, green streets, sub-regional infiltration, and sub-regional direct use. LADWP began its initial research for the Stormwater Capture Master Plan in the fall of 2013 and completed a final plan in late 2015**.** Stormwater Capture Master Plan goals were integrated into LADWP's 2015 UWMP.

Specific strategies under the Mayor's pLAn to increase stormwater capture include identifying funding mechanisms to implement the Enhanced Watershed Management Plans necessary for MS4 permit compliance, expanding use of permeable pavement sites and green streets (e.g., bioswales, infiltration cut-outs, permeable pavement, and street trees), and expanding the Rain Barrel Program.

LADWP's 2015 UWMP projects that there will be a minimum of 15,000 AFY of increased groundwater pumping in SFB due to water supply augmentation through centralized stormwater infiltration by year 2040. Anticipating that stored groundwater will rebound in response to enhanced groundwater replenishment, LADWP will work with the Upper Los Angeles River Area Watermaster to continue observing actual water levels and re-evaluate basin safe yield to allow additional increases in groundwater production over time as SFB elevations rebound.[11]

In addition, development has encroached onto waterway floodplains requiring the channelization of these waterways that once recharged the groundwater aquifers with large volumes of stormwater runoff. When the floodplains were undergoing rapid development, LADWP and the Los Angeles County Flood Control District reserved several parcels of land for use as spreading facilities. These facilities are adjacent to some of the largest tributaries of the Los Angeles River, and the Pacoima and Tujunga Washes.

During average and below average years, these spreading facilities are very effective at capturing a large portion of the stormwater flowing down the tributaries. However, they are incapable of capturing a significant portion of the flows during wet and extremely wet years. Weather patterns in Los Angeles are highly variable, with many periods of dry years and wet years. Some climate studies predict that these patterns may become more extreme in the future.

LADWP is currently partnering with other government and non-governmental agencies in various stormwater enhancement studies and projects that include the following:

[10] *Id*. at 7-10.
[11] *Id*. at 7-29.

Completed Centralized Projects

Implemented centralized projects have increased the amount of stormwater captured by an average of 10,600 AFY since 2013. Below is a sample of recently implemented centralized projects:

- **Sheldon-Arleta Gas Management System**
  Completed in 2009. Scope included the installation of a methane gas abatement system mitigating methane migration during groundwater recharge operations at Tujunga Spreading Grounds. Project increases regional annual average stormwater recharge by 4,000 AFY.

- **Big Tujunga Seismic Retrofit Project**
  Completed in 2012. Scope included the retrofit of the Big Tujunga Dam to meet state seismic and spillway requirements and increase the reservoir's storage capacity. Project increases regional annual average stormwater capture by 4,500 AFY.

- **Hansen Spreading Grounds Upgrade**
  Completed in 2013. Scope included combining and deepening the spreading basins as well as upgrading the intake structure to increase recharge capacity. Project increases regional annual average stormwater recharge by 2,100 AFY.

Completed Distributed Projects

LADWP's already implemented distributed projects that have increased the amount of stormwater captured by an average of 333 AFY. Following is a sample of recently implemented distributed projects:

- **Sun Valley Park Stormwater Infiltration Project**
  Completed in 2010. Scope included installing a stormwater pretreatment system, infiltration gallery, and retention system for infiltration. Project increases regional annual average stormwater capture by 30 AFY.

- **Elmer Avenue Neighborhood Green Street/Elmer Paseo Green Alley Stormwater Infiltration Projects**
  Completed in 2011 - Scope for Elmer Avenue Green Street included installing stormwater underground retention infiltration system under the street, and vegetated swales and rain gardens in the parkway and private property. Completed in 2013 - Scope for Elmer Paseo Green Alley included installing underground retention infiltration system and vegetated swales to increase stormwater capture. Combined projects increase regional annual average stormwater capture by 41 AFY.

- **Garvanza Park Stormwater Capture Use and Infiltration Project**
  Completed in 2012. Scope included installing a stormwater pretreatment system, infiltration gallery, and retention system for use at the Garvanza Park. Project increases regional annual average stormwater capture by 51 AFY.

- **North Hollywood Alley Retrofit BMP Demonstration Project**
  Completed in 2013. Scope included retrofitting four alleys with pervious surfaces to facilitate stormwater infiltration. Project increases regional annual average stormwater capture by 29 AFY.

- **Glenoaks-Sunland Stormwater Infiltration Project**
  Completed in 2013. This project included construction of dry wells and parkway infiltration swales along a portion of the sidewalks of Glenoaks Boulevard which currently have no storm drains. Project increases regional annual average stormwater capture by 28 AFY.

- **Woodman Avenue Median Stormwater Infiltration Project**
  Completed in 2014. Scope included replacing an existing concrete median with vegetated swales and an underground retention system for infiltration. Project increases regional annual average stormwater capture by 55 AFY.

- **Avalon Alley South**
  Completed in September 2015. This project implements low impact development (LID) stormwater capture and infiltration BMP's in the alley to capture, infiltrate, and retain stormwater runoff from a 4.3 acre area and provides stormwater capture of 1 million gallons per year (3.1 AFY). The BMPs include permeable pavers, dry wells, cisterns, and rain gardens. The Project improves water quality, attenuates peak storm flows, and increases stormwater capture and water supply and is a joint partnership between the City of Los Angeles Sanitation, the Trust for Public Land, and the Council for Watershed Health in South Los Angeles.

- **Sun Valley Economic Development Administration Public Improvement Project**
  Completed in 2016. Scope included the installation of 46 dry wells within the public right of way in an area with limited storm drainage. Project increases regional annual average stormwater capture by 93 AFY.

- **Broadway Greenway**
  Completed in 2016. The Project is a pilot phase of a larger project being explored by the Water Replenishment District (WRD) involving strategic implementation of neighborhood BMP retrofits through the region. Four levels of BMPs are being developed. This includes stormwater capture infrastructure on: residential parcel-based scale, neighborhood-scale, green street commercial, and a sub-regional scale infiltration gallery. The sub-regional BMP will capture up to a 2 inch rain event from at 58 acre tributary area. The Project is expected to recharge

groundwater aquifers by 40 AFY. The project was implemented by the City's Bureau of Engineering.

- **Hollywood/Los Angeles Beautification Stormwater Capture Project**
  This is a demonstration project to encourage stormwater capture. The City of Los Angeles Department of Public Works, Bureau of Street Services and LASAN will provide in-kind design services, while the Sun Valley Beautiful Committee, Council District 6, and the Los Angeles Unified School District (LAUSD) are project sponsors and partners. Project increases regional annual average stormwater capture by 6 AFY.

Current/Future Centralized Projects

Within the next five years, the following centralized projects are expected to be implemented that will provide an estimated 25,279 AF of increased stormwater capture annually. Following is a short description of these future projects:

- Big Tujunga Dam Sediment Removal Project
- Branford Spreading Basin Upgrade
- Bull Creek Stormwater Capture Project
- Canterbury Power Line Easement Stormwater Capture Project
- East Valley Baseball Stromwater Capture Project
- Fernangeles Park Stormwater Capture Project
- Lopez Spreading Grounds Upgrade
- Pacoima Dam Sediment Removal Project
- Pacoima Spreading Grounds Upgrade
- Penmar Water Quality Improvement Project
- Riviera County Club Stormwater Capture Project
- Rory M. Shaw Wetlands Park Project (Strathern Pit)
- Tujunga Spreading Grounds Upgrade (in construction)
- Valley Generating Station Stormwater Capture Project
- Whitnall Highway Power Line Easement Stormwater Capture Project

Current/Future Distributed Projects

Within the next five years, the following distributed projects are expected to be implemented that will provide an estimated 1,659 AFY of increased stormwater capture. Below is a short description of these future projects:

- Agnes Avenue – Vanowen to Kittridge Stormwater Capture Project
- Arundo Donax Removal Project (in construction)
- Branford Street – Laurel Canyon to Pacoima Wash Stormwater Capture Project
- Burbank Boulevard Stormwater Capture Project
- Glenoaks and Filmore Stormwater Capture Project
- Glenoaks-Nettleton Stormwater Infiltration Project

- Great Street – Hollywood Avenue – La Brea to Gower Project
- Great Street – Lankershim Boulevard (Chandler to Victory) Project
- Great Street – Reseda Boulevard – Plummer to Parthenia Project
- Great Street – Van Nuys Boulevard (Laurel Canyon to San Fernando) Project
- Great Street – Western Avenue – Melrose to 3rd Project
- Laurel Canyon Boulevard Green Street Stormwater Infiltration Project (in construction)
- LAUSD Conserving for Our Kids Program (in construction)
- Maclay Middle School – LAUSD Project
- Northridge Middle School Project
- Tyrone Yard – New LADWP Valley Center Project
- Valley Center Stormwater Capture Project
- Van Nuys Boulevard Median Stormwater Capture Project
- Van Nuys Boulevard Median Stormwater Capture Project
- Victory-Encino Stormwater Infiltration Project
- Victory-Goodland Median Stormwater Capture Project
- Water LA Phase 2
- Whitnall Gardens Project

4.0 Accelerating Clean-Up of SFB

LADWP groundwater production wells in SFB have been impacted by contamination caused by improper storage, handling and disposal of hazardous chemicals used in the aircraft manufacturing industry, as well as commercial activities associated with automobile and equipment repair, dry cleaners, paint shops, chrome plating, textile manufacturing and fuel storage and dispensing dating back to the 1940s.

Since the 1980 discovery of volatile organic compound (VOC) contamination of groundwater in SFB, LADWP has been working with state and federal agencies to contain and remediate man-made contaminants in SFB. Chlorinated solvents such as trichloroethylene (TCE), perchloroethylene (PCE) and carbon tetrachloride account for the majority of this groundwater contamination.

In 2009, LADWP began an $11.5 million, six-year study and development of a comprehensive remediation and cleanup strategy for all groundwater basin contamination in SFB. This study was completed in February 2015.[12]

Development of State-of-the-Art Groundwater Basin Remediation Facilities

- Based on the available groundwater quality information, a groundwater basin remediation program consisting of centralized as well as localized/well head remediation facilities will be needed for public and environmental benefits as well as to prevent further loss of groundwater.

[12] *Id*. at 6-9.

- Design and construction of the groundwater basin remediation facilities is estimated to cost approximately $600 million, and operation and maintenance is estimated to cost an additional $50 million per year.

Groundwater and Treatment System Monitoring

- In order to fully characterize SFB groundwater quality as required by SWRCB Board's Division of Drinking Water guidelines and policies, LADWP has drilled 25 new monitoring wells in SFB to fill in data gaps and utilized a network of over 70 existing monitoring and production wells.

- Cost to install the monitoring wells is approximately $22 million.

With completion of SFB groundwater characterization, LADWP is proceeding with the necessary environmental reviews, design, permitting, construction, and start-up of the groundwater basin remediation program to effectively clean and remove contaminants from SFB. The groundwater basin remediation program is anticipated to be operational by FYE 2022.

LADWP's groundwater remediation facilities now operating within SFB include:

- ***NHOU*.** Under the direction of USEPA, LADWP operates and maintains NHOU pursuant to a Cooperative Agreement between the two agencies. Since the 1980 discovery of VOC contamination in SFB, LADWP worked closely with the state and federal regulators to implement facilities that will contain and remediate the contaminant plume. NHOU began operations in the late-1980s utilizing an aeration tower for VOC removal followed by vapor-phase Granular Activated Carbon (GAC) to control air emissions. However, changing conditions in the aquifer and discovery of new contaminants including Hexavalent Chromium and 1,4 dioxane, found in concentrations greater than state health standards, have impacted a number of NHOU production wells and continues to threaten other wells. In response to the continued movement of the contaminated groundwater and the presence of new contaminants in the NHOU, EPA conducted a Focus Feasibility Study (FFS) to evaluate alternatives for improving the groundwater cleanup plan. Following completion of the FFS in 2009, EPA signed the 2009 Record of Decision (ROD) selecting the Second Interim Remedy for the NHOU. The availability of new information regarding the nature and the extent of the contamination plume within the NHOU has allowed EPA to refine its understanding of the extent of the groundwater contamination. As a result, EPA has recently proposed to expand the second remedy to increase extraction rate from 2000 gpm to 6500 gpm, add more extraction wells, and design a more efficient treatment system that will treat for emerging contaminants and ensure more reliable and effective remedy.

- ***Liquid-Phase GAC Pilot Treatment Plant at Tujunga Wellfield*.** The Liquid-Phase GAC Pilot Treatment Plant removes VOC from two of the twelve production wells in the Tujunga Wellfield, and treats the extracted groundwater for potable use. The pilot facility treats approximately 8,000 gallons-per-minute of groundwater, removes contaminants, and discharges the treated effluent into LADWP's water distribution system for beneficial use pursuant to California Water Code. This pilot facility is a joint project with MWD to demonstrate the effectiveness of utilizing certain liquid phase GAC media for removal of VOC from the groundwater.

- ***Pollock Wells Treatment Plant.*** The plant provides four liquid-phase GAC vessels to remove VOC contamination from two groundwater wellheads. LADWP has identified hexavalent chromium as an emerging contaminant that may impair the operation of the Pollock Wells Treatment Plant. In response, LADWP has initiated studies and the development of additional remediation systems to remove the hexavalent chromium and other emerging contaminants that are not addressed by the GAC treatment system.

The overall purpose of the San Fernando Groundwater Basin Remediation Project is to restore and protect the full use of the San Fernando Groundwater Basin as a source of water consistent with LADWP's long-term water rights and historic groundwater use.

Water Supplies

The Los Angeles Aqueducts (LAA), local groundwater, purchased water from MWD, and recycled water are the primary sources of water supplies for the City. Table III shows LADWP water supplies from 2007 to 2016 from these sources. The total required water supply to meet water demand shows an overall declining trend over this time period due to reductions in total demand. However, sufficient water supplies were available in each of the years to meet the total demand. In 2009, the total water demand decreased due to conservation efforts by mandatory conservation imposed in the City following drier hydrologic conditions coinciding with an economic recession. In 2013, drought conditions returned and have triggered State and City mandatory conservation measures.

TABLE III
LADWP Water Supply

Calendar Year	Los Angeles Aqueducts	Local Groundwater	MWD	Recycled Water	Transfer, Spread, Spills, and Storage	Total
2007	127,392	88,041	439,353	3,595	-57	658,438
2008	148,407	64,604	427,422	7,048	1,664	645,817
2009	137,261	66,998	351,959	7,570	554	563,234
2010	251,126	68,346	205,240	6,900	-938	532,550
2011	357,752	49,915	119,481	7,708	-153	535,009
2012	166,858	59,109	326,122	5,965	1,182	556,872
2013	64,690	66,272	438,534	9,253	-2,404	581,153
2014	62,088	94,280	391,320	11,307	2,080	556,915
2015	26,828	81,618	378,439	9,844	432	496,297
2016	87,892	73,304	317,767	8,730	-984	488,677

Note: Units are in AF

Los Angeles Aqueducts

Snowmelt runoff from the Eastern Sierra Nevada Mountains is collected and conveyed to the City via LAA. LAA supplies come primarily from snowmelt and secondarily from groundwater pumping, and can fluctuate yearly due to the varying hydrologic conditions. In recent years, LAA supplies have been less than the historical average because of environmental restoration obligations in Mono and Inyo Counties.

The City holds water rights in the Eastern Sierra Nevada where LAA supplies originate. These supplies originate from both streams and from groundwater. In 1905, the City approved a bond measure for purchase of land and water rights in the Owens River Valley. By 1913, the first LAA began its deliveries of water to the City primarily from surface water diversions from the Owens River and its tributaries. Historically, these supplies were augmented from time to time by groundwater extractions from beneath the lands that the City had purchased in the Owens Valley.

In 1940, the first LAA was extended north to deliver Mono Basin water to the City pursuant to water rights permits and licenses granted by the SWRCB. In 1970, the second LAA was completed increasing total delivery capacity of the LAA system to approximately 561,000 AF per year. The second LAA was to be filled by completing the Mono Basin diversions originally authorized in 1940, by a more effective use of water for agricultural purposes on City-owned lands in the Owens Valley and Mono Basin and by increased groundwater pumping from the City's lands in the Owens Valley.

In 1972, Inyo County filed a CEQA lawsuit challenging the City's groundwater pumping program for the Owens Valley. The lawsuit was finally ended in 1997, with the County of Inyo and the City entering into a long-term water agreement for the management of groundwater in the Owens Valley. That water agreement, entered as a judgment of the Superior Court in the County of Inyo (County of Inyo vs. City of Los Angeles, Superior

Court No. 12908) outlines the management of the City's Owens Valley groundwater resources. As a result of this water agreement and subsequent MOU, LADWP has dedicated 37,000 AF of water annually for enhancement and mitigation projects throughout Owens Valley which includes the re-watering of 62 miles of the Lower Owens River. LADWP also provides approximately 80,000 AF of water annually for other uses in the Owens Valley such as irrigation, town water supplies, stockwater, wildlife and recreational purposes.

Further, in December 1989, the Superior Court entered an injunction, ordering LADWP to allow sufficient flow to pass through the Mono Basin diversion facilities to maintain water level in Mono Lake at 6,377 feet from sea level and also to restore streams and protection of fishery in these streams. As a result, the City did not export any water from Mono Basin until 1994, when SWRCB issued Decision 1631. In September 1994, by virtue of the public trust doctrine, the SWRCB issued Decision 1631, an amendment to the license for LADWP exports from Mono Basin which placed conditions on LADWP's water gathering activities from Mono Basin. Under Decision 1631, LADWP's allowable amount of export for a given runoff year (RY), April - March is dependent on the Mono Lake elevation. For RY 2016-2017, LADWP plans to export approximately 4,500 AF of water from Mono Basin, the same amount as for RY 2015-2016, due to Mono Lake's elevation being projected to remain below 6,380 feet, but above 6,377 on April 1,2017. LADWP has implemented an extensive restoration and monitoring programs in Mono Basin to increase the level of Mono Lake and to improve stream conditions, fisheries and waterfowl habitats in Walker, Parker, Rush and Lee Vining Creeks. With reduced diversions from the Mono Basin and favorable hydrologic conditions, Mono Lake's elevation has risen overtime. Once the elevation of Mono Basin reaches 6,391-feet above mean sea level, a moderate increase in water exports from the Mono Basin will be permitted pursuant to the Decision 1631.

In July 1998, LADWP and the Great Basin Unified Air Pollution Control District (GBUAPCD) entered into a Memorandum of Agreement to mitigate dust emissions from Owens Lake. Diversion of water from Owens River, first by farmers in the Owens Valley and then by the City beginning in 1913, resulted in the exposed lakebed becoming a major source of windblown dust. LADWP has spent $1.6 billion and used substantial quantities of water since it started diverting water from LAA to mitigate dust emissions at Owens Lake. As of December 31, 2008, LADWP mitigated dust emissions from 29.8 square-miles of Owens Lake in accordance with GBUAPCD's 2003 revised State Implementation Plan. As of April 1, 2010, LADWP mitigated an additional 9.2 square - miles in accordance with GBUAPCD's 2008 State Implementation Plan. Upon completion of Phase 8 in October 2012, LADWP has mitigated dust emissions from a total of approximately 42 square-miles of Owens Lake. Phase 7a was completed by the regulatory compliance deadline of December 31, 2015, and upon its completion, LADWP has mitigated dust emissions on 45 square-miles. Phase 7a is a water neutral project.

On November 14, 2014, an historic agreement between LADWP and GBUAPCD was reached which for the first time established an upper limit of 53.4 square miles that LADWP could potentially be ordered to mitigate dust emissions from Owens Lake playa

by the GBUAPCD. As part of this historic agreement, LADWP has agreed to mitigate dust emissions for an additional 3.62 square miles of Owens Lake playa. The Phase 9/10 Project is to be completed by December 31, 2017, and is anticipated to result in further water conservation at Owens Lake through increasing use of water efficient and waterless dust mitigation measures. Upon completion of Phase 9/10 Project, LADWP will mitigate approximately 48.6 square miles of dust missions in Owens Lake playa. Hence, GBUAPCD's potential future dust mitigation orders to LADWP cannot exceed an additional 4.8 square miles. The agreement allows LADWP to use water efficient and waterless dust mitigation measures, while maintaining existing wildlife habitat on the lakebed. As a result, LADWP expects to save significant amounts of water in coming years with implementation of the Owens Lake Master Project and other water conservation projects.

Average deliveries from LAA system have been approximately 111,293 AF of water annually from FY 2011/12 to 2015/16. During this period, the record low snowpack for LAA watershed in the Eastern Sierra Nevada Mountains was recorded on April 1, 2015. Supply conditions have changed drastically since 2015. Snowpack in the Eastern Sierra was at 203 percent of an average year on April 1, 2017. On March 20, 2017, Mayor Garcetti had proclaimed a state of local emergency for LAA as a response to the snowpack levels in the Eastern Sierra. The proclamation was issued to assist LADWP in taking immediate steps to protect infrastructure and manage runoff in the Owens Valley including, but not limited to, protection of facilities and diversion of conveyance flows.

The average annual long-term LAA delivery between 2015 and 2040, using the 50-year average hydrology from FY 1961/62 to 2010/11, is expected to be approximately 278,000 AFY and gradually decline to 267,000 AFY due to projected climate change impacts. However, with the anticipated completion of the Owens Lake Master Project by 2024, the projected LAA delivery may increase to 286,000 AFY due to water conserved at Owens Lake which would off-set most of the anticipated long-term losses.[13]

Groundwater

The SFB and Sylmar Basin are subject to the judgment in the City of San Fernando vs. the City of Los Angeles, et al. Groundwater pumping by LADWP and other parties is tracked and reported to the court-appointed Upper Los Angeles River Area (ULARA) Watermaster. The Central Basin is also subject to court judgments. Pumping is reported to the Water Replenishment District of California (WRD), the administrative member of the Central Basin Water Rights Panel.

SFB is the largest of four basins within ULARA. The basin consists of 112,000-acres of land and comprises 91.2 percent of ULARA valley fill. The City has accumulated 537,622 AF of stored groundwater in SFB as of October 1, 2014. This is water the City can withdraw from the basin during normal and dry years or in an emergency, in

[13] *Id.* at 5-15.

addition to the City's approximately 87,000 AF annual entitlement in the basin. With SFB remediation facilities in operation by FYE 2022, groundwater storage credit will be used to maximize pumping in the future above City's annual entitlement in SFB. The majority of the City's groundwater is extracted from SFB. Sylmar Basin is located in the northern part of ULARA, consists of 5,600 acres, and comprises 4.6 percent of ULARA valley fill. City's current annual entitlement per latest Sylmar Safe Yield is 3,570 AF. Sylmar Basin production will increase to 4,170 AFY from FYE 2016 to FYE 2039 to utilize groundwater the City has accumulated into storage and then return to the entitlement of 3,570 AFY in FYE 2040.[14]

A Court decision on pumping rights in ULARA was implemented in a judgment on January 26, 1979. Enclosed with the assessment are copies of those pages from the judgment showing the entitlements (see Appendix D). Further information about ULARA is in the ULARA Watermaster Report. ULARA Watermaster Report and some background information on the judgment are available for review at the office of the ULARA Watermaster or on-line at www.ularawatermaster.com.

City additionally has adjudicated rights to extract groundwater from the Central Basin. Annual entitlement to Central Basin is 17,236 AF. City has accumulated groundwater into storage in Central Basin, and pumping can be temporarily increased until stored water credits have been expended.[15] See Appendix D for copies of relevant portions of the third amended judgment. Judgment is available for review on the WRD Web site at http://wrdwater.org/.

For the period of July 2014 to June 2015, City extracted 80,097 AF and 6,948 AF from the San Fernando and Central Basins, respectively. City plans to continue production from its groundwater basins in the coming years to offset reductions in imported supplies. However, extraction from the basins may be limited by water quality, sustainable pumping practices, and groundwater elevation.

Groundwater produced by City from the San Fernando, Sylmar, and Central Basins for the last available five years are shown on Table IV, as well as groundwater pumping projections for average, single-dry, and multi-year dry weather conditions in five-year increments. Table IV excludes 15,000 AFY of anticipated pumping in SFB from stormwater recharge as well as 30,000 AFY of additional groundwater recharge with highly treated water from DCTWRP planned for 2024 and beyond.

*projected production: LADWP 2015 UWMP Exhibit 6I

MWD

MWD is the largest water wholesaler for domestic and municipal uses in Southern California. As one of 26 member agencies, LADWP purchases supplemental water from MWD in addition to the supplies from local groundwater and LAA. MWD imports a portion of its water supplies from Northern California through the State Water Project's (SWP) California Aqueduct and from the Colorado River through MWD's own Colorado River Aqueduct (CRA). LADWP will continue to rely on MWD to meet its current and future water needs.

In ongoing efforts to evaluate MWD's own import reliability, an assessment was done to address changes in demand and supply conditions, and to provide additional resource reserves to mitigate against uncertainties in demand projections and risks in implementing supply programs. All these efforts went into MWD's 2015 UWMP.

All 26 member agencies have preferential rights to purchase water from MWD. Pursuant to Section 135 of MWD Act, "Each member public agency shall have a preferential right to purchase from the district for distribution by such agency, or any public utility therein empowered by such agency for the purpose, for domestic and municipal uses within the agency a portion of the water served by the district which shall, from time to time, bear the same ratio to all of the water supply of the district as the total accumulation of amounts paid by such agency to the district on tax assessments and otherwise, excepting purchase of water, toward the capital cost and operating expense of the district's works shall bear to the total payments received by the district on account of tax assessments and otherwise, excepting purchase of water, toward such capital cost and operating expense." This is known as preferential rights.

As of June 30, 2016, LADWP has a preferential right to purchase 19.94 percent of MWD's total water supply.

LADWP has worked with MWD in developing a plan for allocating water supplies during periods of shortage. On February 12, 2008, MWD Board adopted its Water Supply Allocation Plan (WSAP). LADWP supported the adoption of this plan to acquire its dry weather condition supplies from MWD.

In response to 2009 regulatory restrictions on water supplies from Northern California, MWD Board announced on April 14, 2009, that supply deliveries to the member agencies would be reduced by 10 percent. Reduced supply allocation was to be effective from July 1, 2009 through June 30, 2010, but in April 2010, MWD Board approved an extension of the reduced supply allocation through June 30, 2011, primarily to restore storage balances in MWD's groundwater and surface storage facilities.

On March 31, 2011, California Governor Brown declared an end to the statewide drought emergency that had been proclaimed earlier on February 27, 2009, by then Governor of California Arnold Schwarzenegger. MWD's Board subsequently voted on April 12, 2011, to end implementation of the 2010/11 water supply allocation. In the same decision, MWD Board also voted against implementing a water supply allocation for 2011/12. These actions restored full imported water deliveries to member agencies without risk of allocation penalties effective April 2011.

On January 17, 2014, Governor Brown proclaimed a drought State of Emergency. At the end of March 2015, state hydrologists measured a record low five percent of normal snow pack in the Sierra Nevada Mountains. As a result, on April 1, 2015, Governor Brown issued Executive Order B-29-15 to achieve a statewide 25 percent reduction compared to 2013 usage levels in urban water use through February 28, 2016. On May 18, 2016, due to improved hydrologic conditions, SWRCB adopted a revised emergency water conservation regulation, effective June 2016 through February 2017, requiring locally developed conservation standards based upon each agency's specific circumstances.

The record dry and hot conditions of 2014 significantly impacted the water resources of both the State of California and MWD. DWR limited supplies from SWP to only five percent of the contractors' SWP Table A amounts in 2014. This allocation was the lowest ever in the history of SWP. MWD was able to meet demands in 2014 by relying heavily on storage reserves to make up for the historically low allocation on SWP. MWD's dry-year storage reserves ended 2014 at approximately 1.2 million AF.

On April 14, 2015, to support Governor Brown's Executive Order B-29-15, and to reduce withdrawals from MWD's dry-year storage reserves, MWD implemented WSAP at a Level 3 Regional Shortage Level, effective July 1, 2015, though June 30, 2016. MWD's dry-year storage reserves ended 2015 at approximately 0.87 million AF.

On May 10, 2016, citing the improved water supply conditions and reduced water use due to conservation, MWD voted to end the current WSAP allocation and rescind WSAP Regional Shortage Level 3 and declared a Condition 2 Water Supply Alert for allocation year 2016/17. MWD, however, called for member agencies to continue with conservation efforts to safeguard against future dry years. On April 9, 2017, citing the improved water supply conditions, the actions taken by the Governor and the projected storage reserves, MWD voted to declare a Condition 1 Water Supply Watch.

Purchases from MWD have averaged 64 percent of the City's water supply over a five-year period from FY 2011/12 to 2015/16. The sustainable pLAn calls for a reduction in purchased imported water by 50 percent by 2025 from the FY 2013/14 level, which was approximately 441,870 AF. To meet targets established by the pLAn, LADWP plans to reduce water demand through increased conservation as well as increase local supply development. Local supply development includes enhancing the ability for groundwater pumping through increased stormwater capture projects and groundwater replenishment with highly treated recycled water as well as remediation of contaminated groundwater supplies in SFB. LADWP also plans to increase recycled water use for non-potable purposes. With these initiatives and under average hydrologic conditions, LADWP's 2015 UWMP projects MWD purchases to be approximately 65,930 AFY in 2025.

Recent Issues Related to the State Water Project

Federal Endangered Species Act (ESA) Litigation filed by several environmental interest groups in the United States District Court for the Eastern District of California alleged that existing biological opinions and incidental take statements inadequately analyzed impacts on listed species under the Federal ESA. On May 25, 2007, Federal District Judge Wanger issued a decision on summary judgment finding the United States Fish and Wildlife Service's (USFWS) biological opinion for Delta smelt was invalid. On December 14, 2007, Judge Wanger issued his Interim Remedial Order requiring that SWP and Central Valley Project operate according to certain specified criteria until a new biological opinion for the Delta smelt is issued. USFWS released the new biological opinion on December 15, 2008. Based on the Water Allocation Analysis released by DWR on December 19, 2008, which analyzed the biological opinion's effects on SWP operations, export restrictions under median hydrologic conditions reduce deliveries to MWD by approximately 500,000 AF.

MWD and other impacted agencies and stakeholders filed separate lawsuits in federal district court challenging the biological opinion, which the federal court consolidated under the caption "Delta Smelt Consolidated Cases." On December 14, 2010, Judge Wanger issued a decision on summary judgment finding that there were major scientific and legal flaws in the Delta smelt biological opinion and remanded the biological opinion to USFWS for reconsideration. The court's decision invalidated some of the restrictions on project operations contained in the Delta smelt biological opinion. On May 18, 2011, Judge Wanger issued a final decision, amended judgment directing USFWS to complete a new draft biological opinion by October 1, 2011, and to complete a final biological opinion with environmental documentation by December 1, 2013. Later

stipulations and orders changed the October 1, 2011, due date for a draft biological opinion to December 14, 2011, and changed the December 1, 2013, due date for the final biological opinion to December 1, 2014.

A draft biological opinion was issued on December 14, 2011. The draft biological opinion deferred specification of a reasonable and prudent alternative and an incidental take statement pending completion of environmental impact review under the National Environmental Policy Act (NEPA). The federal defendants and environmental interveners appealed the final judgment invalidating the 2008 Delta smelt biological opinion to the United States Court of Appeals for the Ninth Circuit. SWP and Central Valley Project contractor plaintiffs, including MWD, cross-appealed from the final judgment. Those appeals and cross-appeals were argued on September 10, 2012. On March 13, 2014, the Ninth Circuit reversed in part and affirmed in part the district court's decision. The Ninth Circuit reversed those portions of the district court decision which had found the 2008 Delta smelt biological opinion to be arbitrary and capricious, and held, instead, that the 2008 biological opinion was valid and lawful. MWD's deliveries from SWP were previously restricted under the 2008 biological opinion for a period prior to 2011. One practical result of the Ninth Circuit's decision was to legally approve the water supply restrictions in the 2008 biological opinion. These water supply restrictions could have a range of impacts on MWD's deliveries from SWP depending on hydrologic conditions. MWD and others subsequently filed motions for reconsideration of the Ninth Circuit's decision.

On May 25, 2010, the court granted the plaintiffs' request for a preliminary injunction in the Consolidated Salmon Cases, restraining enforcement of two requirements under the salmon biological opinion that limit exported water during the spring months based on San Joaquin River flows into the Bay-Delta and reverse flows on the Old and Middle Rivers. Hearings on motions for summary judgment in the Consolidated Salmon Cases were held on December 16, 2010. On September 20, 2011, Judge Wanger issued a decision on summary judgment, finding that the salmon biological opinion was flawed, and that some, but not all, of the project restrictions in the biological opinion were arbitrary and capricious. On December 12, 2011, Judge O'Neill (who was assigned to this case following Judge Wanger's retirement) issued a final judgment in the Consolidated Salmon Cases. The final judgment remands the 2009 salmon biological opinion to the National Marine Fisheries Service. It also directs that a new draft salmon biological opinion be issued by October 1, 2014, and that a final biological opinion be issued by February 1, 2016, after completion of environmental impact review under NEPA. The due date for the salmon biological opinion was later extended to February 1, 2017.

In January and February 2012, the federal defendants and environmental interveners filed appeals of the final judgment in the Consolidated Salmon Cases, and SWP and Central Valley Project contractors filed cross-appeals. On December 22, 2014, the Ninth Circuit reversed in part and affirmed in part the district court's decision. The Ninth Circuit reversed those portions of the district court decision which had found the 2009 salmon biological opinion to be arbitrary and capricious, and held, instead, that the 2009

biological opinion was valid and lawful. Any adverse impacts of this ruling on MWD's SWP supplies have not been determined.

These events have highlighted the challenges that water suppliers throughout the state currently face regarding supplies from the Delta.

On November 28, 2016, in consideration of several factors including existing storage in State Water Project conservation reservoirs, conservation constraints such as the conditions of the recent Biological Opinions for delta smelt and salmonids, the longfin smelt incidental take permit, and 2017 contractor demands, DWR announced an initial SWP allocation of 20 percent for 2017. On December 21, 2016, due to recent precipitation, runoff and water supply conditions, DWR increased the allocation from 20 percent to 45 percent, and on January 18, 2017, announced another increase from 45 to 60 percent for similar reasons. On April 14, 2017, DWR increased the allocation from 60 to 85 percent.

On February 7, 2017, the main flood control spillway at Oroville Dam, a significant reservoir on the SWP, experienced significant damage as DWR increased releases to manage higher inflows driven by continued precipitation in the Feather River basin. DWR halted releases on this spillway and diverted water over the emergency spillway for the first time ever. However, the emergency spillway quickly eroded, causing officials to order the temporary evacuation of downstream residents while ramping up water releases over the main spillway to control lake levels. The evacuation order was lifted on February 14, 2017. Subsequent shutdowns, inspections and maintenance continued on the main spill way and erosion and debris areas downstream of the dam, and DWP is planning to make permanent improvements in prepation for the following winter. Despite the damage to the main spillway and the unknowns associated with DWR's corresponding repair plan, water supplies are not expected to be adversly affected. This would result in an allocation that is higher than average, and higher than any allocation since 2011. Future water supplies are expected to be primarily dependent on hydrology.

Delta Policy

In November 2009, the State Legislature and then Governor Arnold Schwarzenegger passed the 2009 Comprehensive Water Package, which set a statewide conservation target for urban per capita water use of 20 percent reductions by 2020 and consisted of four policy bills and an $11.14 billion bond proposal designed to ensure a reliable water supply for California's future and to restore the Delta and other ecologically sensitive areas.

Senate Bill (SB) X7-1 (Simitian) of the 2009 Water Package established the coequal goals for the Delta: to provide a more reliable water supply for California, and to protect, restore, and enhance the Delta ecosystem. SB X7-1 also established a framework to achieve the co-equal goals for the Delta by creating a new Delta governance structure - including the Delta Stewardship Council, Delta Conservancy, and Delta Protection

Commission - and laying out a process for determining the consistency of the Bay Delta Conservation Plan (BDCP) with the co-equal goals.

Implementation of the four policy bills in the 2009 Water Package achieved several major milestones. For example, the Delta Plan, a comprehensive, long-term management plan for the Delta, was adopted by the Delta Stewardship Council on May 16, 2013.

The goal of BDCP was to provide the basis for the issuance of endangered species permits for the operation of SWP and Central Valley Project, and for Delta conveyance improvements.

On April 30, 2015, state and federal agencies proposed a new sub-alternative, Alternative 4A, which would replace Alternative 4 (the proposed BDCP) as the State's proposed project. Alternative 4A reflected the state's proposal to separate the conveyance facility and habitat restoration measures into two separate efforts: California WaterFix and California EcoRestore.

The California EcoRestore is a California Natural Resources Agency initiative to advance the restoration of at least 30,000 acres of Sacramento-San Joaquin Delta habitat by 2020. The restoration will be implemented on an accelerated timeline independent of the proposed water conveyance facilities included in the California WaterFix.

The environmental analysis of California WaterFix, as well as two other additional alternatives, and updated information from the 2013 BDCP Draft EIR/EIS were included in BDCP/California WaterFix Partially Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS). The RDEIR/SDEIS was released for public review on July 10, 2015. The comment period ended on October 30, 2015.

The California Department of Water Resources and the U.S. Bureau of Reclamation (BOR), the Lead Agencies, have completed the Bay Delta Conservation Plan/California WaterFix Final EIR/EIS. The Lead Agencies for the EIR/EIS analyzed in detail 18 action alternatives, as well as the No Action Alternative. Alternative 4A, or California WaterFix, is the preferred alternative. The Final EIR/EIS, released on December 22, 2016, discusses potential environmental impacts, and identifies mitigation measures that would help avoid or minimize impacts. It also provides responses to all substantive comments received on the 2013 Draft EIR/EIS and 2015 RDEIR/SDEIS. The Notice of Availability of the Final EIR/EIS was published by BOR in the Federal Register on December 30, 2016. On January 4, 2017, the Secretary issued an order to federal agencies involved in the California WaterFix stating the U.S. Fish and Wildlife Service will issue a final biological opinion by April 2017. A similar schedule is anticipated for the biological opinion to be issued by the National Marine Fisheries Service. Upon receipt of the biological opinions, BOR will be able to issue a Record of Decision for the project. Certification of the EIR/EIS under CEQA and final decision-making by DWR is expected at that same time.

Responsibilities of entities created by SB X7-1 are as follows:

- Delta Stewardship Council – Independent agency of the state composed of seven members with the responsibility to oversee and coordinate state agency actions within the Delta.
  - Develop a Delta Plan that will include all state and federal Delta ecosystem, flood management, water supply, and local economic sustainability efforts and serve as a guide for state and local agencies to ensure that their actions are consistent with their policies.
  - Develop performance measures to assess the progress of achieving the goals of the Delta Plan.
  - Determine compliance with the Delta Plan and serve as the appellate body in the event of disputes over the consistency of a project with the Delta Plan.
  - Ensure consistency of BDCP with the co-equal goals of water supply reliability and Delta restoration.

- Delta Conservancy – State entity governed by an eleven-member board with the responsibility to implement ecosystem restoration in the Delta and support efforts to advance environmental protection and the economic well-being of Delta residents.
  - Develop and adopt a strategic plan that will coordinate investments in the Delta's natural and cultural resources.
  - Promote the economic vitality in the Delta through increased tourism and the promotion of Delta legacy communities.
  - Promote environmental education about, and the public use of, public lands in the Delta.

- Delta Protection Commission – State commission with fifteen members charged with recognizing, preserving, protecting, and enhancing the unique resources of the Delta as an evolving place.
  - Provide a forum for Delta residents to engage in decisions regarding actions to recognize and enhance the cultural, recreational, and agricultural resources of the Delta.
  - Adopt an economic sustainability plan for the Delta, which is to include flood protection recommendations to state and local agencies, and is to be included in the Delta Stewardship Council's Delta Plan.

- Delta Watermaster
  - Exercise authority of the SWRCB and monitor and enforce orders, as well as license and permit terms and conditions, relating to water diversions in the Delta.

- Delta Independent Science Board – Standing board of no more than ten members made up of nationally or internationally prominent scientists with

appropriate expertise to evaluate a broad range of scientific programs that support adaptive management of the Delta.
    - Provide oversight of the scientific research, monitoring, and assessment programs that support adaptive management of the Delta.

- Delta Science Program – Led by a Delta Stewardship Council-appointed lead scientist.
    - Provide unbiased scientific information to inform decision-making in the Delta.

The $11.14 billion "Water Bond" was originally scheduled to be on the 2010 statewide ballot for voter consideration, but was postponed twice – initially to 2012 and then to 2014. In 2014 the legislature replaced the 2010 Water Bond with a new bond measure to provide $7.545 billion to fund investments in water projects and programs as part of a statewide, comprehensive water plan for California. This new measure, Proposition 1 – the Water Quality, Supply, and Infrastructure Improvement Act of 2014, was approved by the voters on November 4, 2014.

Colorado River

MWD owns and operates the CRA, which since 1942 has delivered water from the Colorado River to Southern California. The Colorado River currently supplies approximately 17 percent of Southern California's water needs, and on average makes up about 15 percent of LADWP's purchases from MWD. This source of supply has been secured to MWD through long-standing legal entitlements. However, extended drought conditions and increased demands by other users have recently impacted its reliability.

The Colorado River supplies come from watersheds of the Upper Colorado River Basin in the states of Colorado, Utah, and Wyoming. Due to the way that Colorado River supplies are apportioned, snowpack and runoff levels do not impact MWD water supplies in the current year. Instead, snowpack and runoff would impact storage levels at Lake Powell and Lake Mead, which would then affect the likelihood of surplus or shortage conditions in the future.

By MWD having two principal sources of supply that draw from two different watersheds, MWD is able to utilize supplies from the Colorado River to offset reductions in SWP supplies and buffer impacts of the California drought. MWD plans to use CRA deliveries, storage reserves and supplemental water transfers and purchases to meet regional demands.

Under a permanent service contract with the U.S. Secretary of the Interior (Secretary), MWD is entitled to receive water from the Colorado River and its tributaries. This water is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming (Basin States). Under a 1944 treaty, Mexico is allotted 1.5 million AF annually, except in extraordinary circumstances. There is long history of competition among users, but current conditions necessitate increased cooperation.

California is apportioned 4.4 million AF, annually, plus one-half of any surplus that may be available for use, collectively, in Arizona, California, and Nevada. In addition, California has historically been allowed to use Colorado River water apportioned to, but not used by, Arizona or Nevada. Since 2003, due to increased consumption, there has been no such unused, apportioned water available to California. Of the California apportionment, MWD holds the fourth priority right to 550,000 AFY under a 1931 priority system governing allotments to California. This is the last priority within California's basic apportionment of 4.4 million AF. Beyond the basic apportionment, MWD holds the fifth priority right to 662,000 AF of water. See Appendix F for more details.

Historically, MWD has been able to claim most of its legal entitlement of Colorado River water and could divert over 1.2 million AF in any year, but persistent drought conditions since 1999 have contributed to a decrease in these claims. The recent 16-year drought has been so severe that it has resulted in major reductions in water deliveries from the Colorado River. MWD's total CRA supply for calendar year 2016 was 985,000 AF and included a base supply 935,000 AF and water management actions of 50,000 AF.

Under the Colorado River Basin Project Act of 1968, the Secretary is required to issue an Annual Operating Plan describing CRA operations and projected releases. Considering drought conditions and declining storages, the 2014 release for Lake Powell was 7.48 million AF, which was the lowest since the filling of the reservoir in the 1960s. Moreover, reservoir storages along the CRA have declined dramatically.

The shortage predicament has increased management efforts by the Federal Government and states holding water rights. In May 2005, the Secretary directed the U. S. Bureau of Reclamation (BOR) to initiate the "Development of Lower Colorado River Basin Shortage Guidelines and Coordinated Management Strategies for Lakes Powell and Mead Under Low Reservoir Conditions." These were the first such guidelines to address shortage conditions, as opposed to normal and surplus conditions. Since May of 2005, and in response to the Secretary's directive, the seven Basin States have reached agreement to transform management of the Colorado River system water through conjunctive management of Lakes Mead and Powell, and the adoption of shortage guidelines.

In November 2007, BOR issued a Final EIS including new federal guidelines concerning the operation of the Colorado River system reservoirs. The Secretary issued the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encouraging agencies to develop conservation programs, and allowing the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions.

In January 2017, the 24-month look-ahead-study by BOR reported that Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier,

with an initial water year release volume of 8.23 million AF and the potential for an April adjustment to equalization or balancing releases in April 2017. The January 2017 24-Month Study indicated that an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 million AF in water year 2017.

Reliability Efforts for Southern California

MWD has been developing plans and making efforts to provide additional water supply reliability for the entire Southern California region. LADWP coordinates closely with MWD to ensure implementation of these water resource development plans. MWD's long-term plans to meet its member agencies' growing reliability needs are through: improvements to SWP as outlined in the California WaterFix and EcoRestore plans, conjunctive management efforts on the Colorado River, water transfer programs, outdoor conservation measures, and development of additional local resources, such as recycling, brackish water desalination, and seawater desalination. These plans are contained in MWD's 2015 IRP and 2015 UWMP, which can be found at the following links:

- MWD 2015 IRP: http://mwdh2o.com/PDF_About_Your_Water/2015%20IRP%20Update%20Report%20(web).pdf

- MWD 2015 UWMP: http://www.mwdh2o.com/PDF_About_Your_Water/2.4.2_Regional_Urban_Water Management_Plan.pdf

Additionally, MWD has more than 5.0 million AF of storage capacity available in reservoirs and banking/transfer programs, with approximately 1.25 million AF, inclusive of Intentionally Created Surplus, in that storage, and 626,000 AF in emergency storage as of January 1, 2017. MWD plans to add to storage in 2017. Storage was previously estimated to range from 2.0 to 2.2 million AF by the end of 2017 assuming 60 percent and 70 percent SWP allocations, respectively. The allocation was subsequently increased to 85 percent. MWD will exercise flexibility and opportunities within the storage program to increase storage depending on the final SWP allocation and supply/demand balance.

MWD's 2015 IRP builds upon the strong foundation of diversification and adaptation developed in previous IRPs. 2015 IRP reinforces MWD commitment to meeting the region's water supply needs through an evolving long-term strategy that calls for maintaining and stabilizing existing resources along with developing more conservation and new local supplies.

MWD's 2015 UWMP reports on water reliability and identifies projected supplies to meet the long-term demand within MWD's service area. Table V summarizes MWD's reliability in five-year increments extending to 2040 and is based on information contained in MWD's 2015 UWMP. As reported, MWD has supply capabilities that would

be sufficient to meet expected demands from 2020 through 2040 under average year, single dry-year and multiple dry-year hydrologic conditions. An in depth discussion on MWD is attached in Appendix F.

Table V
MWD System Forecast Supplies and Demands, Average Year (1922 - 2012 Hydrology)

	Supply (Thousands of AF per Year)				
Forecast year	**2020**	**2025**	**2030**	**2035**	**2040**
Current Programs					
In-Region Supplies and Programs	693	774	852	956	992
State Water Project[1]	1,555	1,576	1,606	1,632	1,632
Colorado River Aqueduct					
Colorado River Aqueduct Supply[2]	1,468	1,488	1,484	1,471	1,460
Aqueduct Capacity Limit[3]	1,200	1,200	1,200	1,200	1,200
Colorado Aqueduct Capability	1,200	1,200	1,200	1,200	1,200
Capability of Current Programs	**3,448**	**3,550**	**3,658**	**3,788**	**3,824**
Demands					
Total Demands on MWD	1,586	1,636	1,677	1,726	1,765
Imperial Irrigation District - San Diego County Water Authority Transfers and Canal Linings[4]	274	282	282	282	282
Total Demands on MWD	**1,860**	**1,918**	**1,959**	**2,008**	**2,047**
Surplus	**1,588**	**1,632**	**1,699**	**1,780**	**1,777**
Programs Under Development					
In-Region Supplies and Programs	43	80	118	160	200
State Water Project	20	20	268	268	268
Colorado River Aqueduct					
Colorado River Aqueduct Supply	5	25	25	25	25
Aqueduct Capacity Limit[2]	0	0	0	0	0
Colorado River Aqueduct Capability	0	0	0	0	0
Capability of Programs Under Development	**63**	**100**	**386**	**428**	**468**
Maximum MWD Supply Capability	**3,511**	**3,650**	**4,044**	**4,216**	**4,292**
Potential Surplus	**1,651**	**1,732**	**2,085**	**2,208**	**2,245**

1. Includes water transfers and groundwater banking associated with SWP.
2. Includes 296 TAF of non-MWD supplies conveyed in CRA for Imperial Irrigation District - San Diego County Water Authority Transfers and Canal Linings.
3. CRA has a capacity constraint of 1.20 MAF per year.
4. Does not include 16 TAF subject to satisfaction of conditions specified in agreement among MWD, the US, and the San Luis Rey Settlement.

Secondary Sources and Other Considerations

Stormwater capture, water conservation, and recycling will play an increasing role in meeting future water demands. LADWP has implemented stormwater capture, conservation and recycling programs with efforts under way to further promote and increase the level of these programs. LADWP is committed to supply a higher percentage of the City's water demand through local water supply development.

LADWP works closely with MWD, LASAN (wastewater agency), other regional water providers, and various stakeholders to develop and implement programs that reduce overall water use. One example of such collaboration is an integrated resources planning process.

City's IRP is a unique approach of technical integration and community involvement to guide policy decisions and water resources facilities planning. IRP recognizes the inter-relationship of water, wastewater, and runoff management. Initiation of IRP began in 1999 and culminated in its adoption in 2006. Through the stakeholder driven IRP process, detailed facilities plans were developed for the City's wastewater and stormwater systems through the planning horizon of 2020.

One Water LA 2040 (One Water LA) plan is an initiative building upon the success of the IRP. One Water LA extends IRP planning period to year 2040 and takes into consideration an additional emphasis on environmental, social, and sustainability factors. The overarching goal of One Water LA is to maximize resources through the integration of multi-beneficial collaborative programs and projects to make the City greener and more sustainable. One Water LA will follow in the footsteps of IRP and will be a stakeholder driven process with a goal of increased public involvement to represent Los Angeles' diversity in geography, interests, and demographics.

Summary of Water Demand and Supply Projections for 20 Years

Table VI tabulates the service reliability assessment for average weather year. Existing water conservation has been subtracted already from projected demands, but new water conservation is included as a supply source.

Table VI
Service Area Reliability Assessment for Average Weather Year

Demand and Supply Projections (in acre-feet)	Average Weather Conditions (FY 1961/62 to 2010/11) Fiscal Year Ending on June 30				
	2020	2025	2030	2035	2040
Total Water Demand[1]	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**
pLAn Water Demand Target	**485,600**	**533,000**	**540,100**	**551,100**	**565,600**
Existing / Planned Supplies					
Conservation (Additional Active[2] and Passive[3] after FY14/15)	125,800	110,900	111,600	109,100	108,100
Los Angeles Aqueduct[4]	275,700	293,400	291,000	288,600	286,200
Groundwater[5] (Net)	112,670	110,670	106,670	114,670	114,070
Recycled Water					
- Irrigation and Industrial Use	19,800	29,000	39,000	42,200	45,400
- Groundwater Replenishment	0	30,000	30,000	30,000	30,000
Stormwater Capture					
- Stormwater Reuse (Harvesting)	400	800	1,200	1,600	2,000
- Stormwater Recharge (Increased Pumping)	2,000	4,000	8,000	15,000	15,000
Subtotal	536,370	578,770	587,470	601,170	600,770
MWD Water Purchases					
With Existing/Planned Supplies	75,430	65,930	65,430	60,630	74,930
Total Supplies	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**
Potential Supplies					
Water Transfers[6]	40,000	40,000	40,000	40,000	40,000
Subtotal	40,000	40,000	40,000	40,000	40,000
MWD Water Purchases					
With Existing/Planned/Potential Supplies	35,430	25,930	25,430	20,630	34,930
Total Supplies	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**

[1] Total Demand with existing passive conservation

[2] Cumulative hardware savings since late 1980s reached 118,034 AFY by 2014-15.

[3] Additional non-hardware conservation required to meet water use reduction goals set in the Sustainable City pLAn.

[4] LADWP anticipates conserving 20,000 AFY of water usage for dust mitigation on Owens Lake after the Master Project is implemented in FY 2023-24. Los Angeles Aqueduct supply is estimated to decrease 0.1652% per year due to climate change impact.

[5] Net GW excludes Stormwater Recharge and Groundwater Replenishment supplies that contribute to increased pumping. The LADWP Groundwater Remediation project in the San Fernando Basin is expected in operation in 2021-22. Storage credit of 5,000 AFY will be used to maximize pumping in 2019-20 and thereafter. Sylmar Basin production will increase to 4,170 AFY from 2015-16 to 2038-39 to avoid the expiration of stored water credits, then go back to its entitlement of 3,570 AFY in 2039-40.

[6] Potential water transfer occurs in dry years with stored water acquired in average and wet years.

Service area reliability assessments for single-dry year and multiple-dry year conditions are shown in LADWP 2015 UWMP Exhibits 11F through 11H. Demands are met by the available supplies under all scenarios.

Rates

Capital costs to finance facilities for the delivery of water supply to LADWP's service area are supported through customer-billed water rates. The Board sets rates subject to approval of City Council by ordinance. The Board is obligated by City Charter to establish water rates and collect charges in an amount sufficient to service the water system indebtedness and to meet its expenses for operation and maintenance.

On March 15, 2016, City Council approved the new water rates and rate structure. New water rates, which became effective April 15, 2016, through Ordinance 184130 provide for modest rate increases each year over a five-year period for infrastructure improvements, meeting regulatory water quality requirements, Owens Valley mitigation measures, and expanding the local water supply, which includes recycled water, stormwater capture, conservation, and groundwater remediation. New water rate structure increases the number of tiers from two to four for single-family residential customers. Goal is to incentivize conservation while recovering the higher costs of providing water to high volume users. In keeping with cost of service principles, the incremental pricing for the tiers is based on the cost of water supply.

Findings

The Central Plaza Project is estimated to increase the total water demand within the site by 77 AF annually. This additional water demand has been accounted for in the City's overall total demand projections in the LADWP 2015 UWMP using a service area-wide approach that does not rely on individual development demand. The LADWP 2015 UWMP utilized SCAG's RTP data that provide for more reliable water demand forecasts, taking into account changes in population, housing units, and employment.

Based on Planning Department's determination that the Central Plaza Project is consistent with the demographic forecasts for the City from the 2012 SCAG RTP, LADWP finds that the Central Plaza Project water demand is included in the City's LADWP 2015 UWMP water demand projection. Furthermore, the LADWP 2015 UWMP forecasts adequate water supplies to meet all projected water demands in the City through the year 2040.

LADWP therefore concludes that the 77 AFY increase in the total water demand for the Central Plaza Project falls within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2040, as described in LADWP's 2015 UWMP. LADWP finds it will be able to meet the proposed water demand of the Central Plaza Project, as well as existing and planned future water demands of its service area.

Re: Request for a Water Supply Assessment for the Central Plaza Project located at 3440-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3281-3287 West 7th Street, and 666-678 South Irolo Street, Los Angeles, California 90010 in the Wilshire Community Plan

Dear Mr. Harasick, Mr. Pettijohn, and Ms. Hwang,

The City of Los Angeles Department of City Planning is preparing an Initial Study and Mitigated Negative Declaration (IS/MND) for the Central Plaza Project (CEQA Study Project or Project), in accordance with the California Environmental Quality Act (CEQA). The proposed development constitutes a "Project" as defined in Section 10912 (a) of the State Water Code, and is thus subject to the provisions for determining water availability as outlined in Sections 10910-10915 of the State Water Code. Pursuant to CEQA Guidelines Section 15206(b)(2)(A), this Project meets the criteria for being of "regional significance" because it includes the development of "A proposed residential development of more than 500 dwelling units."

Accordingly, we are requesting your assistance in preparing a water supply assessment (WSA) to determine the Los Angeles Department of Water and Power's (LADWP) ability to meet the water demands of the CEQA Study Project. Provided below is some general information about the location of the Project and a brief description of the proposed land uses.

Project Applicant

Central Plaza, LLC
3450 Wilshire Blvd. Suite 1200-115
Los Angeles, California 90010

Project Location and Site Description

The Project Site is located at 3432-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3265-3287 West 7th Street, and 666-678 South Irolo Street, Los Angeles, California 90005/90010 in the Wilshire Community Plan. The Site is bounded on the north by Wilshire Boulevard, on the west by Irolo Street, on the south by 7th Street, and on the east by Mariposa Avenue. The Site is subject to the following zoning information (ZI): ZI-1940 Wilshire Center / Koreatown Redevelopment Project; ZI-1117 MTA Project; ZI-2374 Los Angeles State Enterprise Zone; and ZI-2458 Transit Priority Area in the City of Los Angeles. The Site is one block east of Metro Purple Line's Wilshire/Normandie Station. See Table 1 for the Site information.

Table 1
Project Site

Address	APN	Zone	General Plan Land Use	Size (sf)
3432-3442 W. Wilshire Boulevard 659-669 S. Mariposa Avenue 3265 W. 7th Street	5094-002-BRK	C4-2 PB-2	Regional Center Commercial	103,873.7
3440-3470 W. Wilshire Boulevard 3281-3287 W. 7th Street		C4-2 PB-2 P-2		192,435.9
None		C4-2		1,352.4
678 S. Irolo Street				6,633.4
674 S. Irolo Street				5,425.3
670 S. Irolo Street				4,760.4
666-668 S. Irolo Street				2,834.4
None				880.5

Source: Zone Information & Map Access System (ZIMAS): http://zimas.lacity.org, December 2016.

Existing Uses

The Project Site is currently developed with four commercial office buildings with ground floor retail uses that front West Wilshire Boulevard and South Irolo Street (Existing Office Buildings), a three-story parking structure, and a five-story parking structure. The Existing Office Buildings contain approximately 760,456 feet of commercial uses. The three-story parking structure contains approximately 1,191 vehicle parking spaces. The five-story parking structure contains approximately 707 vehicle parking spaces.

Proposed Project

The mixed-use project will include approximately: (i) 641 apartment units; (ii) 18,454 square feet of commercial floor area (13,500 square feet of retail area and 4,954 square feet of restaurant area [3,454 square feet with 138 indoor seats of high-turnover restaurant and 1,500 square feet with 68 indoor seats of fast-food restaurant]); and (iii) 1,910 vehicle parking spaces. The project would involve demolishing the existing three-story parking structure, adding ground floor retail to the Existing Office Buildings, constructing three commercial kiosks along West Wilshire Boulevard and South Irolo Street, and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean (Project). The 23-story mixed-use building will include approximately 280 apartment units, rooftop amenities, and commercial space (Tower 1). The 28-story mixed use building will include approximately 361 apartment

units, rooftop amenities, and commercial space (Tower 2). Tower 1 and Tower 2 will share a podium with amenity space and four stories of above-grade and two stories of below-grade parking (Podium). No residential units exist on the Site. This project will not be a LEED project.

Landscaping

See Table 2, Landscaping, for the calculation of proposed areas. The Project will provide 21,860 square feet of new landscaped area.

Table 2
Landscaping

Plant Type	WUCOL	Irrigation Method	Irrigation Efficiency	Hydrozone Area (sf)
Level 1 (Retail)				
Trees	Medium – 0.5	Bubbler	0.81	48
Trees	Low – 0.2	Bubbler	0.81	238
Shrubs and Groundcover	Medium – 0.5	Drip	0.81	4,900
Shrubs and Groundcover	Low – 0.2	Drip	0.81	11,683
Vines	Medium – 0.5	Bubbler	0.81	96
			Subtotal	**16,965**
Level 5 (Pool Deck)				
Trees	Medium – 0.5	Bubbler	0.81	96
Trees	Low – 0.2	Bubbler	0.81	72
Shrubs and Groundcover	Medium – 0.5	Drip	0.81	1,108
Shrubs and Groundcover	Low – 0.2	Drip	0.81	2,793
			Subtotal	**4,015**
Roof Deck				
Shrubs and Groundcover	Medium – 0.5	Drip	0.81	264
Shrubs and Groundcover	Low – 0.2	Drip	0.81	616
			Subtotal	**880**
			Total	**21,860**
Table by CAJA Environmental Services, January 2017.				

The project's existing landscape is approximately 13,133 sf, which is comprised of:

- Medium Water-use Shrubs: 8,068 sf
- Medium Water-use Trees: 731 sf
- High Water-use Turf/Lawn: 4,334 sf

Estimated Future Water Demands

Using the water demand rates and methodology described in the City of Los Angeles, Department of Public Works, Bureau of Sanitation Sewer Generation Rates (2012), the proposed water demand estimate is shown in Table 3, Estimated Future Water Demand. The proposed development land uses will conform to Water-

Efficiency Requirements Ordinance No. 180822, 2013 California Plumbing Code, 2017 California Green Building Code (CALGreen), 2017 Los Angeles Plumbing Code, and 2017 Los Angeles Green Building Code.

Table 3
Estimated Future Water Demand

Use[1]	Size	Water Use Factor [2]	Base Demand (gpd)
Existing Uses			
3-story Parking Structure (to be removed)	266,571 sf	20 gallons / 1,000 sf	(5,331)
Proposed New Uses			
Residential – Studio	461 units	75 gallons / unit	34,575
Residential – 2 Bedroom	180 units	150 gallons / unit	27,000
Retail	13,500 sf	25 gallons / 1,000 sf	338
Restaurant – High Turnover	138 seats	30 gallons / seats	4,140
Restaurant – Fast-food	68 seats	25 gallons / seats	1,700
Parking Structure	483,684	20 gallons / 1,000 sf	9,674
Lobby and Leasing Office	2,620 sf	25 gallons / 1,000 sf	66
Indoor Amenity Spaces	10,720 sf	25 gallons / 1,000 sf	268
Outdoor Amenity Spaces	29,930 sf	25 gallons / 1,000 sf	748
Pool (20 ft x 60 ft x 4 ft)	4,800 cubic feet	100 gallons / day [3]	297
Water Feature (887 sf x 1.5 ft)	1,331 cubic feet	25 gallons / day [4]	80
Landscape	21,680 sf	To be calculated by LADWP	TBD
		Total Proposed	**TBD**

[1] *Proposed indoor water uses are based on 2012 City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table available at http://www.lacitysan.org/fmd/pdf/sfcfeerates.pdf.*
[2] *Provided by City of Los Angeles Department of City Planning in the Request for Water Supply Assessment letter and Scope Confirmation e-mail.*
[3] *1 cubic foot = 7.48 gallons. Includes amount to fill the pool twice per year, pro-rated by daily amount. Pool water loss due to evaporation is estimated at 100 gallons per day: http://www.americanleakdetection.com/swimming-pool-water-loss-calculator.php.*
[4] *Assume 25 gallons of evaporation per day.*
Pool Calculations: 35,904 gallons for full pool x 2 times per year / 365 days = 197 + 100 gallons = 297
Water Feature Calculations: 9,956 gallons for full water feature x 2 times per year / 365 days = 55 + 25 gallons = 80
Abbreviations: du - dwelling unit, sf- square feet, ft - feet, gpd - gallons per day, and af/y - acre feet per year.
Table by CAJA Environmental Services, January 2017.

Project Conformance with the General Plan

As proposed, the Project does not generally conform with the use and intensity of development permitted by the General Plan for this site without land use entitlement(s) to permit deviations from the Zoning Code. The City of Los Angeles (the City) is the Lead Agency for the Project. No General Plan Amendment is required. The Project will require approval of the following discretionary actions:[1]

1. Pursuant to Section 12.32.Q of the Los Angeles Municipal Code (the "**LAMC**"), a **Vesting Zone Change** for the Property from P and PB to C4;

---

[1] *Project representative, November 2016.*

2. Pursuant to Section 16.05 of the LAMC, **Site Plan Review** for a development that results in an increase of 50 or more dwelling units and/or guest rooms;

3. Pursuant to Section 12.24.W.1 of the LAMC, a **Master Conditional Use Permit** for the sale or dispensing of alcoholic beverages for onsite consumption; and

4. Pursuant to LAMC 17.15 of the LAMC, a **Vesting Tentative Tract** to merge the existing lots and re-subdivide the Property.

5. Any additional actions, approvals and permits from the City's Department of Building and Safety and Public Works (and other municipal agencies) for Project construction activities including, but not limited to the following: demolition, haul route, excavation, shoring, grading, foundation, building and interior improvements and the removal of trees on public and/or private property.

Project Conformance with the SCAG's 2012 and 2016 RTP/SCS

The 2012 RTP/SCS accommodates up to 3,991,700 persons and 1,455,700 households through 2020. The 2016 RTP/SCS accommodates 4,609,400 persons and 1,690,300 households by 2040. The Project would be consistent with the growth projections of both the 2012 and 2016 RTP/SCS.

Conclusion

Based on the above projections, the Department of City Planning is requesting your assistance in preparing a WSA pursuant to the requirements of SB 610. SB 610 requires a water supply assessment to evaluate whether total projected water supplies will meet the projected water demand for certain development projects that are otherwise subject to CEQA review.

Thank you for your assistance with this request. Your expert evaluation will help ensure that our analysis of the Project's impacts and water demand is accurate and complete. If you have any questions or comments, please contact Kinikia Gardner at (213) 978-1455 or Kinikia.Gardner@lacity.org.

Sincerely,

Kinikia Gardner

Water Conservation Commitment Letter

CENTRAL PLAZA, LLC

June 7, 2017

Richard F. Harasick
Senior Assistant General Manager for Water Systems
Los Angeles Department of Water & Power
111 North Hope Street, Room 1455
Los Angeles, CA 90012-5701

Re: WATER CONSERVATION COMMITMENTS FOR THE CENTRAL PLAZA PROJECT

Dear Mr. Harasick:

Central Plaza, LLC (Developer) proposes to develop the Central Plaza Project (the Project) located at 3432-3470 West Wilshire Boulevard, 659-699 South Mariposa Avenue, 3265-3287 West 7th Street, and 666-678 South Irolo Street, Los Angeles, California 90005/90010 in the Wilshire Community Plan. The project site, which encompasses approximately 7.36 acres, is generally bounded on the north by Wilshire Boulevard, on the west by Irolo Street, on the south by 7th Street, and on the east by Mariposa Avenue. The mixed-use project will include approximately: (i) 641 apartment units; (ii) 18,454 square feet of commercial floor area (13,500 square feet of retail area and 4,954 square feet of restaurant area); and (iii) 1,910 vehicle parking spaces. The project would involve demolishing the existing three-story parking structure, adding ground floor retail to the Existing Office Buildings, constructing three commercial kiosks along West Wilshire Boulevard and South Irolo Street, and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean.

The Developer understands the City of Los Angeles' policy that future water needs shall be met by expanding water recycling and conservation. The Developer has committed to implement the following water conservation measures that are in addition to those required by codes and ordinances for the entire Project:

- High Efficiency Toilets with a flush volume of 1.06 gallons per flush, or less, for residential units only
- Showerheads with a flow rate of 1.75 gallons per minute, or less, for residential units only
- Drip/ Subsurface Irrigation (Micro-Irrigation)
- Proper Hydro-zoning/Zoned Irrigation–(groups plants with similar water requirements together)
- Drought Tolerant Plants – 70% of total landscaping

The Developer has also committed to comply with the City of Los Angeles Low Impact Development Ordinances (City Ordinance No. 181899 and No. 183833) and to implement Best Management Practices that have stormwater recharge or reuse benefits for the entire Project as applicable:

- Catch Basin Insert - a device that can be inserted into an existing catch basin design to provide some level of runoff contaminant removal.
- Catch Basin Screens

- Cistern - captures stormwater runoff as it comes down through the roof gutter system, if infiltration is not feasible

The following is the information on plumbing fixture/appliance counts/estimates for the Project:

	Residential Dwelling Unit	Residential Common Area	Retail/ Commercial
Water Closets	N/A	13	13
Urinals	N/A	4	3
Lavatory Faucets	N/A	8	8
Kitchen Faucets	N/A	4	12
Commercial Kitchen Pre-Rinse	0	0	4
Showerheads	N/A	0	0
Clothes washer (Residential)	641	0	0
Dishwasher (Residential)	641	4	0
Dishwasher (Commercial)	0	0	2

Should you have any questions, please do not hesitate to call at (213) 788-3307.

Sincerely,

Signature

President

Adjudicated Groundwater Basin Judgments

- San Fernando Basin – Judgment No. 650079
- Sylmar Basin – Judgment No. 650079
- Central Basin – Judgment No, 786656

SUPERIOR COURT OF THE STATE OF CALIFORNIA

FOR THE COUNTY OF LOS ANGELES

THE CITY OF LOS ANGELES, Plaintiff, vs. CITY OF SAN FERNANDO, ET AL. Defendants.	No. 650079 JUDGMENT

There follows by consecutive paging Recitals (page 1), Definitions and List of Attachments (pages 1 to 6), Designation of Parties (page 6), Declaration re Geology and Hydrology (pages 6 to 12), Declaration of Rights (pages 12 to 21), Injunctions (pages 21 to 22), Continuing Jurisdiction (page 23), Watermaster (pages 23 to 29), Physical Solution (pages 29 to 34), and Miscellaneous Provisions (pages 34 to 35), and Attachments (pages 36 to 46). Each and all of said several parts constitute a single integrated Judgment herein.

4.2.3 Separate Ground Water Basins. The physical and geologic characteristics of each of the ground water basins, Eagle rock, Sylmar, Verdugo and San Fernando, cause impediments to inter-basin ground water flow whereby there is created separate underground reservoirs. Each of said basins contains a common source of water supply to parties extracting ground water from each of said basins. The amount of underflow from Sylmar Basin, Verdugo Basin and Eagle Rock Basin to San Fernando Basin is relatively small, and on the average has been approximately 540 acre feet per year from the Sylmar Basin; 80 acre feet per year from Verdugo Basin; and 50 acre feet per year from Eagle Rock Basin. Each has physiographic, geologic and hydrologic differences; one from the other, and each meets the hydrologic definition of "basin". The extractions of water in the respective basins affect the other water users within that basin but do not significantly or materially affect the ground water levels in any of the other basins. The underground reservoirs of Eagle Rock, Verdugo and Sylmar Basins are independent of one another and of the San Fernando Basin.

4.2.4 Safe Yield and Native Safe Yield. The safe yield and native safe yield, stated in acre feet, of the three largest basins for the year 1964-65 was as follows:

Basin	Safe Yield	Native Safe Yield
San Fernando	90,680	43,660
Sylmar	6,210	3,850
Verdugo	7,150	3,590

The safe yield of Eagle Rock Basin is derived from imported water delivered by Los Angeles. There is no measurable native safe yield.

4.2.5 Separate Basins -- Separate Rights. The rights of the parties to extract ground water within ULARA are separate and distinct as within each of the several ground water basins within said watershed.

4.2.6 Hydrologic Condition of Basins. The several basins within ULARA are in varying hydrologic conditions, which result in different legal consequences.

4.2.6.1 San Fernando Basin. The first full year of overdraft in San Fernando Basin was 1954-55. It remained in overdraft continuously until 1968, when an injunction

CENTRAL AND WEST BASIN WATER REPLENISHMENT DISTRICT, etc., Plaintiff, v. CHARLES E. ADAMS, et al., Defendants. CITY OF LAKEWOOD, a municipal corporation, Cross-Complaint, v. CHARLES E. ADAMS, et al., Cross-Defendants.	No. 786,656 SECOND AMENDED JUDGMENT (Declaring and establishing water rights in Central Basin and enjoining extractions therefrom in excess of specified quantities.)

The above-entitled matter duly and regularly came on for trial in Department 73 of the above-entitled Court (having been transferred thereto from Department 75 by order of the presiding Judge), before the Honorable Edmund M. Moor, specially assigned Judge, on May 17, 1965, at 10:00 a.m. Plaintiff was represented by its attorneys BEWLEY, KNOOP,

of the close of the water year ending September 30, 1978 in accordance with the Watermaster Reports on file with this Court and the records of the Plaintiff. This tabulation does not take into account additions or subtractions from any Allowed Pumping Allocation of a producer for the 1978-79 water year, nor other adjustments not representing change in fee title to water rights, such as leases of water rights, nor does it include the names of lessees of landowners where the lessees are exercising the water rights. The exercise of all water rights is subject, however, to the provisions of this Judgment is hereinafter contained. All of said rights are of the same legal force and effect and are without priority with reference to each other. Each party whose name is hereinafter set forth in the tabulation set forth in Appendix "2" of this judgment, and after whose name there appears under the column "Total Water Right" the figure "0" owns no rights to extract any ground water from Central Basin, and has no right to extract any ground water from Central Basin.

(b) Defendant The City of Los Angeles is the owner of the right to extract fifteen thousand (15,000) acre feet per annum of ground water from Central Basin. Defendant Department of Water and Power of the City of Los Angeles has no right to extract ground water from Central Basin except insofar as it has the right, power, duty or obligation on behalf of defendant The City of Los Angeles to exercise the water rights in Central Basin of defendant The City of Los Angeles. The exercise of said rights are subject, however, to the provisions of this judgment hereafter contained, including but not limited to, sharing with other parties in any subsequent decreases or increases in the quantity of extractions permitted from Central Basin, pursuant to continuing jurisdiction of the Court, on the basis that fifteen thousand (15,000) acre feet bears to the Allowed Pumping Allocations of the other parties.

(c) No party to this action is the owner of or has any right to extract ground water from Central Basin except as herein affirmatively determined.

2. Parties Enjoined as Regards Quantities of Extractions.

Appendix E

Water Supply Assessment Provisions
California Water Code Section 10910-10915

WATER CODE
SECTION 10910-10915

10910. (a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

(b) The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that may supply water for the project, the city or county shall prepare the water assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's

total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

(d) (1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:

(A) Written contracts or other proof of entitlement to an identified water supply.

(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.

(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.

(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.

(e) If no water has been received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts, the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall also include in its water supply assessment pursuant to subdivision (c), an

identification of the other public water systems or water service contractholders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts, to the same source of water as the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has identified as a source of water supply within its water supply assessments.

(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available,

including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project.

A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

(g) (1) Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.

(2) Prior to the expiration of the 90-day period, if the public water system intends to request an extension of time to prepare and adopt the assessment, the public water system shall meet with the city or county to request an extension of time, which shall not exceed 30 days, to prepare and adopt the assessment.

(3) If the public water system fails to request an extension of time, or fails to submit the assessment notwithstanding the extension of time granted pursuant to paragraph (2), the city or county may seek a writ of mandamus to compel the governing body of the public water system to comply with the requirements of this part relating to the submission of the water supply assessment.

(h) Notwithstanding any other provision of this part, if a project has been the subject of a water supply assessment that complies with the requirements of this part, no additional water supply assessment shall be required for subsequent projects that were part of a larger project for which a water supply assessment was completed and that has complied with the requirements of this part and for which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has concluded that its water supplies are sufficient to meet the projected water demand associated with the proposed project, in addition to the existing and planned future uses, including, but not limited to, agricultural and industrial uses, unless one or more of the following changes occurs:

(1) Changes in the project that result in a substantial increase

in water demand for the project.

(2) Changes in the circumstances or conditions substantially affecting the ability of the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), to provide a sufficient supply of water for the project.

(3) Significant new information becomes available which was not known and could not have been known at the time when the assessment was prepared.

10911. (a) If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. If the city or county, if either is required to comply with this part pursuant to subdivision (b), concludes as a result of its assessment, that water supplies are, or will be, insufficient, the city or county shall include in its water supply assessment its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. Those plans may include, but are not limited to, information concerning all of the following:

(1) The estimated total costs, and the proposed method of financing the costs, associated with acquiring the additional water supplies.

(2) All federal, state, and local permits, approvals, or entitlements that are anticipated to be required in order to acquire and develop the additional water supplies.

(3) Based on the considerations set forth in paragraphs (1) and (2), the estimated timeframes within which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), expects to be able to acquire additional water supplies.

(b) The city or county shall include the water supply assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision (a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.

(c) The city or county may include in any environmental document an evaluation of any information included in that environmental

document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

10912. For the purposes of this part, the following terms have the following meanings:

(a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

(b) If a public water system has fewer than 5,000 service connections, then "project" means any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of the public water system's existing service connections, or a mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system's existing service connections.

(c) "Public water system" means a system for the provision of piped water to the public for human consumption that has 3000 or more service connections. A public water system includes all of the

following:

(1) Any collection, treatment, storage, and distribution facility under control of the operator of the system which is used primarily in connection with the system.

(2) Any collection or pretreatment storage facility not under the control of the operator that is used primarily in connection with the system.

(3) Any person who treats water on behalf of one or more public water systems for the purpose of rendering it safe for human consumption.

10914. (a) Nothing in this part is intended to create a right or entitlement to water service or any specific level of water service.

(b) Nothing in this part is intended to either impose, expand, or limit any duty concerning the obligation of a public water system to provide certain service to its existing customers or to any future potential customers.

(c) Nothing in this part is intended to modify or otherwise change existing law with respect to projects which are not subject to this part.

(d) This part applies only to a project for which a notice of preparation is submitted on or after January 1, 1996.

10915. The County of San Diego is deemed to comply with this part if the Office of Planning and Research determines that all of the following conditions have been met:

(a) Proposition C, as approved by the voters of the County of San Diego in November 1988, requires the development of a regional growth management plan and directs the establishment of a regional planning and growth management review board.

(b) The County of San Diego and the cities in the county, by agreement, designate the San Diego Association of Governments as that review board.

(c) A regional growth management strategy that provides for a comprehensive regional strategy and a coordinated economic development and growth management program has been developed pursuant to Proposition C.

(d) The regional growth management strategy includes a water element to coordinate planning for water that is consistent with the

requirements of this part.

(e) The San Diego County Water Authority, by agreement with the San Diego Association of Governments in its capacity as the review board, uses the association's most recent regional growth forecasts for planning purposes and to implement the water element of the strategy.

(f) The procedures established by the review board for the development and approval of the regional growth management strategy, including the water element and any certification process established to ensure that a project is consistent with that element, comply with the requirements of this part.

(g) The environmental documents for a project located in the County of San Diego include information that accomplishes the same purposes as a water supply assessment that is prepared pursuant to Section 10910.

INTRODUCTION

This Appendix A provides general information regarding The Metropolitan Water District of Southern California ("Metropolitan"), including information regarding Metropolitan's operations and finances. Statements included or incorporated by reference in this Appendix A constitute "forward-looking statements." Such statements are generally identifiable by the terminology used such as "plan," "project," "expect," "estimate," "budget" or other similar words. Such statements are based on facts and assumptions set forth in Metropolitan's current planning documents including, without limitation, its most recent biennial budget. The achievement of results or other expectations contained in such forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause actual results, performance or achievements to be materially different from any future results, performance or achievements expressed or implied by such forward-looking statements. Actual results may differ from Metropolitan's forecasts. Metropolitan is not obligated to issue any updates or revisions to the forward-looking statements in any event.

Metropolitan maintains a website that may include information on programs or projects described in this Appendix A; however, none of the information on Metropolitan's website is incorporated by reference or intended to assist investors in making an investment decision or to provide any additional information with respect to the information included in this Appendix A. The information presented on Metropolitan's website is not part of the Official Statement and should not be relied upon in making investment decisions.

Formation and Purpose

Metropolitan is a metropolitan water district created in 1928 under authority of the Metropolitan Water District Act (California Statutes 1927, Chapter 429, as reenacted in 1969 as Chapter 209, as amended (herein referred to as the "Act")). The Act authorizes Metropolitan to: levy property taxes within its service area; establish water rates; impose charges for water standby and service availability; incur general obligation bonded indebtedness and issue revenue bonds, notes and short-term revenue certificates; execute contracts; and exercise the power of eminent domain for the purpose of acquiring property. In addition, Metropolitan's Board of Directors (the "Board") is authorized to establish terms and conditions under which additional areas may be annexed to Metropolitan's service area.

Metropolitan's primary purpose is to provide a supplemental supply of water for domestic and municipal uses at wholesale rates to its member public agencies. If additional water is available, such water may be sold for other beneficial uses. Metropolitan serves its member agencies as a water wholesaler and has no retail customers.

The mission of Metropolitan, as promulgated by the Board, is to provide its service area with adequate and reliable supplies of high quality water to meet present and future needs in an environmentally and economically responsible way.

Metropolitan's charges for water sales and availability are fixed by its Board, and are not subject to regulation or approval by the California Public Utilities Commission or any other state or federal agency. Metropolitan imports water from two principal sources: northern California via the Edmund G. Brown California Aqueduct (the "California Aqueduct") of the State Water Project owned by the State of California (the "State" or "California") and the Colorado River via the Colorado River Aqueduct ("CRA") owned by Metropolitan.

Member Agencies

Metropolitan is comprised of 26 member public agencies, including 14 cities, 11 municipal water districts, and one county water authority, which collectively serve the residents and businesses of more than 300 cities and numerous unincorporated communities. Member agencies request water from Metropolitan at

various delivery points within Metropolitan's system and pay for such water at uniform rates established by the Board for each class of water service. Metropolitan's water is a supplemental supply for its member agencies, most of whom have other sources of water. See "METROPOLITAN REVENUES–Principal Customers" in this Appendix A for a listing of the ten member agencies with the highest water purchases from Metropolitan during the fiscal year ended June 30, 2016. Metropolitan's member agencies may, from time to time, develop additional sources of water. No member is required to purchase water from Metropolitan, but all member agencies are required to pay readiness-to-serve charges whether or not they purchase water from Metropolitan. See "METROPOLITAN REVENUES–Rate Structure", "–Member Agency Purchase Orders" and "–Other Charges" in this Appendix A.

The following table lists the 26 member agencies of Metropolitan.

Municipal Water Districts		**Cities**		**County Water Authority**
Calleguas	Las Virgenes	Anaheim	Los Angeles	San Diego[(1)]
Central Basin	Orange County	Beverly Hills	Pasadena	
Eastern	Three Valleys	Burbank	San Fernando	
Foothill	West Basin	Compton	San Marino	
Inland Empire Utilities Agency		Fullerton	Santa Ana	
Upper San Gabriel Valley		Glendale	Santa Monica	
Western of Riverside County		Long Beach	Torrance	

(1) The San Diego County Water Authority, currently Metropolitan's largest customer, is a plaintiff in litigation challenging the allocation of costs to certain rates adopted by the Board and asserting other claims. See "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A.

Service Area

Metropolitan's service area comprises approximately 5,200 square miles and includes portions of the six counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura. When Metropolitan began delivering water in 1941, its service area consisted of approximately 625 square miles. Its service area has increased by 4,500 square miles since that time. The expansion was primarily the result of annexation of the service areas of additional member agencies.

Metropolitan estimates that approximately 18.8 million people lived in Metropolitan's service area in 2016, based on official estimates from the California Department of Finance and on population distribution estimates from the Southern California Association of Governments ("SCAG") and the San Diego Association of Governments ("SANDAG"). Population projections prepared by SCAG in 2012 and SANDAG in 2013, as part of their planning process to update regional transportation and land use plans, show expected population growth of about 18 percent in Metropolitan's service area between 2010 and 2035. The economy of Metropolitan's service area is exceptionally diverse. In 2015, the economy of the six counties which contain Metropolitan's service area had a gross domestic product larger than all but eleven nations of the world. Metropolitan has historically provided between 40 and 60 percent of the water used annually within its service area. For additional economic and demographic information concerning the six county area containing Metropolitan's service area, see Appendix E–"SELECTED DEMOGRAPHIC AND ECONOMIC INFORMATION FOR METROPOLITAN'S SERVICE AREA."

The climate in Metropolitan's service area ranges from moderate temperatures throughout the year in the coastal areas to hot and dry summers in the inland areas. Annual rainfall in an average year has historically been approximately 13 to 15 inches along the coastal area, up to 20 inches in foothill areas and less than 10 inches inland.

GOVERNANCE AND MANAGEMENT

Board of Directors

Metropolitan is governed by a 38-member Board of Directors, made up of representatives from all of Metropolitan's member agencies. Each member public agency is entitled to have at least one representative on the Board, plus an additional representative for each full five percent of the total assessed valuation of property in Metropolitan's service area that is within the member public agency. Changes in relative assessed valuation do not terminate any director's term. Accordingly, the Board may, from time to time, have more or fewer than 38 directors.

The Board includes business, professional and civic leaders. Directors are appointed by member agencies in accordance with those agencies' processes. They serve on the Board without compensation from Metropolitan. Voting is based on assessed valuation, with each member agency being entitled to cast one vote for each $10 million or major fractional part of $10 million of assessed valuation of property within the member agency, as shown by the assessment records of the county in which the member agency is located. The Board administers its policies through the Metropolitan Water District Administrative Code (the "Administrative Code"), which was adopted by the Board in 1977. The Administrative Code is periodically amended to reflect new policies or changes in existing policies that occur from time to time.

Management

Metropolitan's day-to-day management is under the direction of its General Manager, who serves at the pleasure of the Board, as do Metropolitan's General Counsel, General Auditor and Ethics Officer. Following is a biographical summary of Metropolitan's principal executive officers.

Jeffrey Kightlinger, General Manager – Mr. Kightlinger was appointed as General Manager in February 2006, leaving the position of General Counsel, which he had held since February 2002. Before becoming General Counsel, Mr. Kightlinger was a Deputy General Counsel and then Assistant General Counsel, representing Metropolitan primarily on Colorado River matters, environmental issues, water rights and a number of Metropolitan's water transfer and storage programs. Prior to joining Metropolitan in 1995, Mr. Kightlinger worked in private practice representing numerous public agencies including municipalities, redevelopment agencies and special districts. Mr. Kightlinger earned his bachelor's degree in history from the University of California, Berkeley, and his law degree from Santa Clara University.

Marcia Scully, General Counsel – Ms. Scully assumed the position of General Counsel in March 2012. She previously served as Metropolitan's Interim General Counsel from March 2011 to March 2012. Ms. Scully joined Metropolitan in 1995, after a decade of private law practice, providing legal representation to Metropolitan on construction, employment, Colorado River and significant litigation matters. From 1981 to 1985 she was assistant city attorney for the City of Inglewood. Ms. Scully served as president of University of Michigan's Alumnae Club of Los Angeles and is a recipient of the 1996 State Bar of California, District 7 President's Pro Bono Service Award and the Southern California Association of Non-Profit Housing Advocate of the Year Award. She is also a member of the League of Women Voters for Whittier and was appointed for two terms on the City of Whittier's Planning Commission, three years of which were served as chair. Ms. Scully earned a bachelor's degree in liberal arts from the University of Michigan, a master's degree in urban planning from Wayne State University and law degree from Loyola Law School.

Gerald C. Riss, General Auditor – Mr. Riss was appointed as Metropolitan's General Auditor in July 2002 and is responsible for the independent evaluation of the policies, procedures and systems of control throughout Metropolitan. Mr. Riss is a certified fraud examiner, certified financial services auditor and certified risk professional with more than 25 years of experience in accounting, audit and risk management. Prior to joining Metropolitan, Mr. Riss was Vice President and Assistant Division Head of Risk Management

Administration at United California Bank/Bank of the West. He also served as Senior Vice President, director of Risk Management and General Auditor of Tokai Bank of California from 1988 until its reorganization as United California Bank in 2001. He earned a bachelor's degree in accounting and master's degree in business administration from Wayne State University in Detroit, Michigan.

Deena Ghaly, Ethics Officer – Ms. Ghaly was appointed Ethics Officer in November 2012. Ms. Ghaly joined Metropolitan with over 20 years of legal and ethics-related experience. Prior to joining Metropolitan, she served as an administrative law judge for the California Office of Administrative Hearings. She previously was head of enforcement and general counsel for the Los Angeles City Ethics Commission, which administers and enforces the laws regarding campaign contributions, lobbying, and government ethics for the City of Los Angeles. Before moving to Southern California in 2001, Ms. Ghaly worked in New York City, where she headed the labor department in the general counsel's office of a large city agency. Licensed to practice law in California, New York and New Jersey, Ms. Ghaly is knowledgeable in workplace investigations, government ethics, regulatory affairs, and labor and employment matters. She has lectured throughout the nation on various topics, including parallel criminal and administrative prosecution, due process in administrative procedures, and effective internal investigations. Ms. Ghaly earned a bachelor's degree in philosophy from Wellesley College in Massachusetts and a law degree from Cornell Law School.

Gary Breaux, Assistant General Manager/Chief Financial Officer – Mr. Breaux has had extensive experience working for local governments since 1983. From 1994 until joining Metropolitan in October 2011, he served as Director of Finance for East Bay Municipal Utility District ("EBMUD"). At EBMUD, he was responsible for all financial areas, including treasury operations, debt management, rates, internal audit, accounting and reporting, risk management and customer and community services. Prior to joining EBMUD, he was Director of Finance for the City of Oakland, California. A native of Colorado, Mr. Breaux received a Bachelor of Science degree in Business from the University of Colorado in 1977 and a master's degree in Public Administration in 1987 from Virginia Commonwealth University.

Debra Man, Assistant General Manager/Chief Operating Officer – Ms. Man was appointed to her current position in December 2003. Ms. Man has worked at Metropolitan since 1986, beginning as an engineer and advancing to Chief of the Planning and Resources Division. As Chief of Planning and Resources she was responsible for major initiatives adopted by Metropolitan's Board, such as the Integrated Water Resources Plan, rate structure, and facility plans for expansion of Metropolitan's distribution system. In 1999, she was appointed as Vice President of Water Transfers and Exchanges, responsible for securing water supplies through agreements and partnerships with other water and agricultural interests in San Joaquin Valley and Southern California and demonstrating Metropolitan's water supply reliability in compliance with current laws. Ms. Man is a registered professional civil engineer in California and Hawaii. She has a bachelor's degree in civil engineering from the University of Hawaii and a master's degree in civil/environmental engineering from Stanford University.

Roger Patterson, Assistant General Manager/Strategic Initiatives – Mr. Patterson was appointed Assistant General Manager in March 2006. He is responsible for overseeing water supply and planning issues, including the Colorado River and State Water Project. He previously served as a consultant to Metropolitan on Colorado River issues. Mr. Patterson was the director of the Nebraska Department of Natural Resources from 1999 to 2005, where he was responsible for water administration, water planning, flood-plain delineation, dam safety and the state databank. Prior to his work in Nebraska, Mr. Patterson spent 25 years with the U.S. Bureau of Reclamation ("Bureau of Reclamation"), retiring from the Bureau of Reclamation as the Regional Director for the Mid-Pacific Region. He is a registered professional engineer in Nebraska and Colorado, and earned bachelor's and master's degrees in engineering from the University of Nebraska.

Fidencio M. Mares, Interim Assistant General Manager/Chief Administrative Officer – Mr. Mares was appointed the Interim Assistant General Manager/Chief Administrative Officer in July 2015 and is

responsible for the strategic direction and management of Metropolitan's administrative functions. His primary responsibilities include managing human resources, information technology, real property and administrative services. Prior to joining Metropolitan, Mr. Mares was the owner of the Mares Company, where he served as a consultant to companies in the overall assessment of their management programs and processes. Prior to becoming a consultant, Mares worked both in the private and public sectors, serving as vice president of human resources and corporate communications for Beckham Coulter and as chief administrative officer of BHP/Pacific Resources and President & CEO of Gas Operations. He worked for more than 15 years for The Gas Company in Hawaii and Southern California Edison Company. A graduate of the California State University, Fresno, he also serves on the National Board of Visitors (Distinguished Graduates) for the University.

Dee Zinke, Assistant General Manager/Chief External Affairs Officer– Ms. Zinke was appointed Assistant General Manager in January 2016. She is responsible for Metropolitan's communications, business outreach, education and legislative matters. She joined Metropolitan in 2009 as Manager of the Legislative Services Section. Before coming to Metropolitan, Ms. Zinke was the Manager of Governmental and Legislative Affairs at the Calleguas Municipal Water District for nearly 10 years, where she received recognition for her significant contributions to the Association of California Water Agencies, the Ventura County Special Districts Association and the Association of Water Agencies of Ventura County. During her tenure at Calleguas, she was named Chair of the Ventura County Watersheds Coalition and appointed by then-Secretary of Resources Mike Chrisman to the State Watershed Advisory Committee. Prior to her public service, she worked in the private sector as the Executive Officer and Senior Legislative Advocate for Building Industry Association of Greater Los Angeles and Ventura Counties and as Director of Communications for E-Systems, a defense contractor specializing in communication, surveillance and navigation systems in Washington, D.C. Ms. Zinke holds a Bachelor of Arts degree in Communication and Psychology from Virginia Polytechnic Institute and State University.

Employee Relations

The total number of regular full-time Metropolitan employees on January 1, 2017 was 1,765, of whom 1,223 were represented by AFSCME Local 1902, 95 by the Supervisors Association, 294 by the Management and Professional Employees Association and 129 by the Association of Confidential Employees. The remaining 24 employees are unrepresented. The four bargaining units represent 99 percent of Metropolitan's employees. The Memorandum of Understanding ("MOU") with each of the Association of Confidential Employees, the Management and Professional Employees Association and AFSCME Local 1902 covered the period January 1, 2011 through December 31, 2016. The MOU with the Supervisors Association covered the period September 13, 2011 to December 31, 2016. Although the contracts with the bargaining units are expired, the provisions of such contracts will govern until a successor contract is negotiated. The Board authorized the General Manager to exercise discretion under Administrative Code Section 6101(k) to enter into a successor MOU with the Management and Professional Employees Association on February 14, 2017. Negotiations with the remaining bargaining units are underway and are currently expected to be completed in early 2017.

Risk Management

Metropolitan is exposed to various risks of loss related to the design and construction of facilities, and the treatment and delivery of water. With the assistance of third party claims administrators, Metropolitan is self-insured for liability, property and workers' compensation. Metropolitan self-insures the first $25 million per liability occurrence, with commercial liability coverage of $75 million in excess of the self-insured retention. The $25 million self-insured retention is maintained as a separate restricted reserve. Metropolitan is also self-insured for loss or damage to its property, with the $25 million self-insured retention also being accessible for emergency repairs and Metropolitan property losses. In addition, Metropolitan obtains other excess and specialty insurance coverages such as directors' and officers' liability, fiduciary liability and aircraft hull and liability coverage.

Metropolitan self-insures the first $5 million for workers' compensation with statutory excess coverage. The self-insurance retentions and reserve levels currently maintained by Metropolitan may be modified by the Board at its sole discretion.

Information Security

Metropolitan has adopted and maintains an active Information Security program ("ISP") that includes comprehensive policies and procedures reviewed annually by its internal Information Security Team, Audit and independent third party auditors and consultants. Metropolitan has appointed an Information Security Manager who is responsible for overseeing the annual review of the ISP and its alignment with the strategic plan and direction of Metropolitan. Metropolitan's policies and procedures are consistent with public agency standards as well as staying aligned with governance, risk, and compliance. All Metropolitan users are required to participate in Metropolitan's Information Security education and awareness training. Metropolitan's Information Security Team is responsible for providing guidance and education on the implementation of new technologies based on Metropolitan's ISP as well as overseeing the monitoring of potential threats and vulnerabilities, utilizing and executing security controls to validate policy enforcement, protecting against virus and malware attacks, and investigating any potential unauthorized activity on Metropolitan's network.

METROPOLITAN'S WATER SUPPLY

General

Metropolitan's principal sources of water supplies are the State Water Project and the Colorado River. Metropolitan receives water delivered from the State Water Project under State Water Contract provisions, including contracted supplies, use of carryover storage in San Luis Reservoir, and surplus supplies. Metropolitan holds rights to a basic apportionment of Colorado River water and has priority rights to an additional amount depending on availability of surplus supplies. Water management programs supplement these Colorado River supplies. To secure additional supplies, Metropolitan also has groundwater banking partnerships and water transfer and storage arrangements within and outside its service area. Metropolitan's principal water supply sources, and other supply arrangements and water management are more fully described herein.

Metropolitan faces a number of challenges in providing adequate, reliable and high quality supplemental water supplies for southern California. These include, among others: (1) population growth within the service area; (2) increased competition for low-cost water supplies; (3) variable weather conditions; (4) increased environmental regulations; and (5) climate change. Metropolitan's resources and strategies for meeting these long-term challenges are set forth in its Integrated Water Resources Plan, as updated from time to time. See "–Integrated Water Resources Plan." In addition, Metropolitan manages water supplies in response to the prevailing hydrologic conditions by implementing its Water Surplus and Drought Management ("WSDM") Plan, and in times of prolonged or severe shortages, the Water Supply Allocation Plan (the "Water Supply Allocation Plan"). See "CONSERVATION AND WATER SHORTAGE MEASURES–Water Surplus and Drought Management Plan" and "–Water Supply Allocation Plan."

Hydrologic conditions can have a significant impact on Metropolitan's imported water supply sources. For Metropolitan's State Water Project supplies, precipitation in California's northern Sierra Nevada during the fall and winter helps replenish storage levels in Lake Oroville, a key State Water Project facility. The subsequent runoff from the spring snowmelt helps satisfy regulatory requirements in the San Francisco Bay/Sacramento-San Joaquin River Delta ("Bay-Delta") bolstering water supply reliability in the same year. See "–State Water Project – Bay-Delta Proceedings Affecting State Water Project." The source of Metropolitan's Colorado River supplies is primarily the watersheds of the Upper Colorado River basin in

the states of Colorado, Utah, and Wyoming. Although precipitation is primarily observed in the winter and spring, summer storms are common and can affect water supply conditions.

Uncertainties from potential future temperature and precipitation changes in a climate driven by increased concentrations of atmospheric carbon dioxide also present challenges. Areas of concern to California water planners identified by researchers include: reduction in Sierra Nevada and Colorado Basin snowpack; increased intensity and frequency of extreme weather events; and rising sea levels resulting in increased risk of damage from storms, high-tide events, and the erosion of levees and potential cutbacks of deliveries of imported water. While potential impacts from climate change remain subject to study and debate, climate change is among the uncertainties that Metropolitan seeks to address through its planning processes.

Current Water Conditions

Following the drought period from 2012-2015, current hydrologic conditions have improved. As of February 1, 2017, the northern Sierra precipitation was 197 percent of normal with a snowpack accumulation that was 140 percent of normal. Lake Oroville, the principal State Water Project reservoir, began flood control releases in early January. See "–Recent Events at Oroville Dam" below. On January 18, 2017, the California Department of Water Resources ("DWR") notified State Water Contractors that its calendar year 2017 allocation estimate to State Water Contractors was 60 percent of contracted amounts, or 1,146,900 acre-feet for Metropolitan. (An acre-foot is the amount of water that will cover one acre to a depth of one foot and equals approximately 326,000 gallons, which represents the needs of two average families in and around the home for one year.) See "–State Water Project."

As of February 1, 2017, the Upper Colorado River Basin snowpack measured 156 percent of normal and total system storage in the Colorado River Basin was 49 percent of capacity. As of such date, the projected base supply of Colorado River water in calendar year 2017 was estimated to be 960,000 acre-feet. See "–Colorado River Aqueduct."

See also "–Storage Capacity and Water in Storage."

Recent Events at Oroville Dam

Oroville Dam, the earthfill embankment dam on the Feather River which impounds Lake Oroville, is operated by DWR as a facility of the State Water Project. On February 7, 2017, the main flood control spillway at Oroville Dam, a gated and concrete lined facility, experienced significant damage as DWR increased releases to 55,000 cubic feet per second to manage higher inflows driven by continued precipitation in the Feather River basin. Subsequently, DWR halted releases at the main spillway to inspect the damage and conduct flow tests. After testing, the main spillway was returned to service on February 8 at a reduced flow rate to offset inflows into Lake Oroville. On February 11, the water elevation in Lake Oroville reached 901 feet, leading water to flow over the emergency spillway structure, an ungated, 1,730 foot long concrete barrier located adjacent to and north of the main flood control spillway structure. Releases from the emergency spillway flow uncontrolled down an earthen hillside to the Feather River. On February 12, erosion began to progress up the right side of the emergency spillway. Concerns about the erosion at the emergency spillway prompted DWR to increase releases through the damaged main spillway and led the Butte County Sheriff to evacuate downstream communities for two days to ensure the safety of the residents. As of February 14, water levels in Lake Oroville were 13 feet below the crest of the emergency spillway and the mandatory evacuation order was lifted. DWR has begun repairs to the erosion areas below the emergency spillway. As of February 15, 2017, the cause of the damage to the main spillway was unknown.

The State has requested federal emergency funding to help offset costs related to the response efforts. The Federal Emergency Management Agency has approved the State's request for federal assistance.

Following the rainy season, the spillways will be repaired on a more permanent basis in preparation for the following winter. DWR's initial assessments indicate costs may range from $100-200 million. These estimates are subject to revision as more detailed information becomes known. Metropolitan is unable to assess at this time what costs, if any, it will incur as a State Water Contractor, associated with the spillway repairs.

State Water Project water allocations to State Water Contractors for calendar year 2017 are currently estimated to be 60 percent of contracted amounts. In spite of the damage to the main spillway and the unknowns associated with DWR's corresponding repair plan, the State Water Project allocation is expected to increase from the current estimate of 60 percent. If realized, this would result in an allocation that is higher than average, and likely higher than any allocation since 2011. Nonetheless, future water supplies will be primarily dependent on hydrology.

Integrated Water Resources Plan

Overview. The Integrated Water Resources Plan ("IRP") is Metropolitan's principal water resources planning document. Metropolitan, its member agencies, subagencies and groundwater basin managers developed their first IRP as a long-term planning guideline for resources and capital investments. The purpose of the IRP was the development of a portfolio of preferred resources to meet the water supply reliability and water quality needs for the region in a cost-effective and environmentally sound manner. The first IRP was adopted by the Board in January 1996 and has been subsequently updated in 2004, 2010 and 2015.

On January 12, 2016, Metropolitan's Board adopted the most recent IRP update (the "2015 IRP Update") as a strategy to set goals and a framework for water resources development. This strategy enables Metropolitan and its member agencies to manage future challenges and changes in California's water conditions and to balance investments with water reliability benefits. The 2015 IRP Update provides an adaptive management approach to address future uncertainty, including uncertainty from climate change. It was formulated with input from member agencies, retail water agencies, and other stakeholders including water and wastewater managers, environmental and business interests and the community.

The 2015 IRP Update seeks to provide regional reliability through 2040 by stabilizing Metropolitan's traditional imported water supplies and continuing to develop additional conservation programs and local resources, with an increased emphasis on regional collaboration. It also advances long-term planning for potential future contingency resources, such as storm water capture and seawater desalination.

Specific projects that may be developed by Metropolitan in connection with the implementation of the 2015 IRP Update will be subject to future Board consideration and approval, as well as environmental and regulatory documentation and compliance. The 2015 IRP Update and associated materials are available on Metropolitan's website at: http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx. The information set forth on Metropolitan's website is not incorporated by reference.

An Adaptive Management Strategy. Adaptive water management, as opposed to a rigid set of planned actions over the coming decades, is the most nimble and cost-effective manner for Metropolitan and local water districts throughout Southern California to effectively prepare for the future. An adaptive management approach began to evolve with Metropolitan's first IRP in 1996, after drought-related shortages in 1991 prompted a rethinking of Southern California's long-term water strategy. Reliance on imported supplies to meet future water needs has decreased steadily over time, replaced by plans for local actions to

meet new demands. The 2015 IRP Update continues to build a robust portfolio approach to water management.

The following paragraphs describe the goals, approaches and targets for each of the resource areas that are needed to ensure reliability under planned conditions.

State Water Project. The State Water Project is one of Metropolitan's two major sources of water. The goal for State Water Project supplies is to adaptively manage flow and export regulations in the near term and to achieve a long-term Bay-Delta solution that addresses ecosystem and water supply reliability challenges. Achieving this goal will require continued participation and successful outcomes in the California WaterFix and the California EcoRestore efforts. See "–State Water Project" and "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A. The stated goal of the IRP is to manage State Water Project supplies in compliance with regulatory restrictions in the near-term for an average of 980,000 acre-feet of annual supplies, and to pursue a successful outcome in the California WaterFix and California EcoRestore efforts for long-term average supplies of approximately 1.2 million acre-feet annually from this resource. See "–State Water Project – Bay-Delta Proceedings Affecting State Water Project."

Colorado River Aqueduct. The CRA delivers water from the Colorado River, Metropolitan's original source of supply. Metropolitan has helped to fund and implement agricultural conservation programs, improvements to river operation facilities, land management programs and water transfers and exchanges through agreements with agricultural water districts in southern California, entities in Arizona and Nevada that use Colorado River water, and the Bureau of Reclamation. See "–Colorado River Aqueduct" and "–Water Transfer, Storage and Exchange Programs – Colorado River Aqueduct." The stated goal of the IRP for the CRA supplies is to maintain current levels of water supplies from existing programs, while also developing flexibility through dry-year programs and storage to ensure that a minimum of 900,000 acre-feet of CRA deliveries are available when needed, with a target of 1.2 million acre-feet in dry years.

Water Transfers and Exchanges. Under voluntary water transfer or exchange agreements, agricultural communities using irrigation water may periodically sell or conserve some of their water allotments for use in urban areas. The water may be delivered through existing State Water Project or CRA facilities, or may be exchanged for water that is delivered through such facilities. Metropolitan's policy toward potential transfers states that the transfers will be designed to protect and, where feasible, enhance environmental resources and avoid the mining of local groundwater supplies. See "–Water Transfer, Storage and Exchange Programs." The stated goal of the IRP is to pursue transfers and exchanges to hedge against shorter-term water demand and supply imbalances while long-term water supply solutions are developed and implemented.

Water Conservation. Conservation and other water use efficiencies are integral components of Metropolitan's IRP. Metropolitan has invested in conservation programs since the 1980s. Historically, most of the investments have been in water efficient fixtures in the residential sector. With outdoor water use comprising at least 50 percent of residential water demand, Metropolitan has increased its conservation efforts to target outdoor water use reduction in its service area. See "CONSERVATION AND WATER SHORTAGE MEASURES." The stated goal of the IRP is to pursue further water conservation savings of 485,000 acre-feet annually by 2040 through continued increased emphasis on outdoor water-use efficiency using incentives, outreach/education and other programs.

Local Water Supplies. Local supplies are a significant and growing component to the region's diverse water portfolio. While the extent to which each member agency's water supply is provided by imported water purchased from Metropolitan varies, in the aggregate, local supplies can provide over half of the region's water in a given year, and the maintenance of these supplies remain an integral part of the IRP. Similar to water conservation, local supplies serve the important function of reducing demands for imported water supplies and thereby making regional water system capacity and storage available and accessible to

meet the needs of the region. Local water supply projects may include, among other things, recycled water, groundwater recovery, conjunctive use, and seawater desalination. Metropolitan offers financial incentives to member agencies to help fund the development of a number of these types of local supply projects. The stated goal of the IRP is to seek to develop 230,000 acre-feet of additional local supplies produced by existing and future projects, with the region reaching a target of 2.4 million acre-feet of total dependable local supply by 2040. See "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A.

State Water Project

Background

One of Metropolitan's two major sources of water is the State Water Project, which is owned by the State, and managed and operated by DWR. The State Water Project is the largest state-built, multipurpose, user-financed water project in the country. It was designed and built primarily to deliver water, but also provides flood control, generates power for pumping, is used for recreation, and enhances habitat for fish and wildlife. The State Water Project provides irrigation water to 750,000 acres of farmland, mostly in the San Joaquin Valley, and provides municipal and industrial water to approximately 25 million of California's estimated 39.2 million residents, including the population within the service area of Metropolitan.

The State Water Project's watershed encompasses the mountains and waterways around the Feather River, the principal tributary of the Sacramento River, in the Sacramento Valley of Northern California. Through the State Water Project, Feather River water stored in and released from Oroville Dam (located about 70 miles north of Sacramento, east of the city of Oroville, California) and unregulated flows diverted directly from the Bay-Delta are transported south through the Central Valley of California, over the Tehachapi Mountains and into Southern California, via the California Aqueduct, to four delivery points near the northern and eastern boundaries of Metropolitan's service area. The total length of the California Aqueduct is approximately 444 miles long. See "METROPOLITAN'S WATER DELIVERY SYSTEM–Primary Facilities and Method of Delivery – State Water Project" in this Appendix A.

State Water Contract

In 1960, Metropolitan signed a water supply contract (as amended, the "State Water Contract") with DWR to receive water from the State Water Project. Metropolitan is one of 29 agencies and districts that have long-term contracts for water service from DWR (known collectively as the "State Water Contractors" and sometimes referred to herein as "Contractors"). Metropolitan is the largest of the State Water Contractors in terms of the number of people it serves (approximately 18.8 million), the share of State Water Project water that it has contracted to receive (approximately 46 percent), and the percentage of total annual payments made to DWR by agencies with State water contracts (approximately 52 percent for 2016). Metropolitan received its first delivery of State Water Project water in 1972.

Pursuant to the terms of the State water contracts, all water-supply related expenditures for capital and operations, maintenance, power, and replacement costs associated with the State Water Project facilities are paid for by the State Water Contractors. In exchange, Contractors have the right to participate in the system, with an entitlement to water service from the State Water Project and the right to use the portion of the State Water Project conveyance system necessary to deliver water to them. Each year DWR estimates the total State Water Project water available for delivery to the State Water Contractors and allocates the available project water among the State Water Contractors in accordance with the State water contracts. DWR's total water supply availability projections are refined over the course of the winter season based upon updated rainfall and snowpack values and allocations to the State Water Contractors are adjusted accordingly.

Metropolitan's State Water Contract has been amended a number of times since its original execution and delivery. Several of the amendments, entered into by DWR and various subsets of State Water Contractors, relate to the financing and construction of a variety of State Water Project facilities and

improvements and impose certain cost responsibility therefor on the affected Contractors, including Metropolitan. For a description of Metropolitan's financial obligations under its State Water Contract, including with respect to such amendments, see "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

Amendments, approved by Metropolitan's Board in 1995, and since executed by DWR and 27 of the State Water Contractors (collectively known as the "Monterey Amendment"), among other things, made explicit that the Contractors' rights to use the portion of the State Water Project conveyance system necessary to deliver water to them also includes the right to convey non-State Water Project water at no additional cost as long as capacity exists. These amendments also expanded the ability of the State Water Contractors to carry over State Water Project water in State Water Project storage facilities, allowed participating Contractors to borrow water from terminal reservoirs, and allowed Contractors to store water in groundwater storage facilities outside a Contractor's service area for later use. These amendments provided the means for individual Contractors to increase supply reliability through water transfers and storage outside their service area. Metropolitan has subsequently developed and actively manages a portfolio of water supplies to convey through the California Aqueduct pursuant to these contractual rights. See "–Water Transfer, Storage and Exchange Programs." The Monterey Amendment is the subject of ongoing litigation. See "–Related Litigation – Monterey Amendment Litigation" below.

Under its State Water Contract, Metropolitan has a contractual right to its proportionate share of the State Water Project water that DWR determines annually is available for allocation to the Contractors. This determination is made by DWR each year based on existing supplies in storage, forecasted hydrology, and other factors. Available State Water Project water is then allocated to the Contractors in proportion to the amounts set forth in "Table A" of their respective State water contract. Pursuant to Table A of its State Water Contract, Metropolitan is entitled to approximately 46 percent of the total annual allocation made available to State Water Contractors each year.

Metropolitan's State Water Contract, under a 100 percent allocation, provides Metropolitan 1,911,500 acre-feet of water. The 100 percent allocation is referred to as the contracted amount. Late each year, DWR announces an initial allocation estimate for the upcoming year, but periodically provides subsequent estimates throughout the year if warranted by developing precipitation and water supply conditions. From calendar years 2004 through 2016, the amount of water received by Metropolitan from the State Water Project, including water from water transfer, groundwater banking and exchange programs delivered through the California Aqueduct (described under "–Water Transfer, Storage and Exchange Programs"), varied from a low of 593,000 acre-feet in calendar year 2015 to a high of 1,800,000 acre-feet in 2004. In calendar year 2016, DWR's allocation to State Water Contractors was 60 percent of contracted amounts, or 1,146,000 acre-feet, for Metropolitan.

On December 1, 2016, DWR announced an initial calendar year 2017 allocation of 20 percent. On December 21, 2016, DWR increased the allocation estimate to 45 percent. On January 18, 2017, DWR increased the allocation estimate to 60 percent of contracted amounts based on runoff from storms that increased the combined storage in Oroville and San Luis Reservoir by over 600,000 acre-feet. This increased allocation estimate reflects improving hydrologic conditions in California and increasing storage levels in the State's major reservoirs, but also takes into account federally mandated environmental restrictions that have been imposed upon water deliveries from the Bay-Delta, including the biological opinions discussed below. See "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESA Biological Opinions." If necessary, Metropolitan may augment its State Water Project deliveries using withdrawals from its storage programs along the State Water Project and through water transfer and exchange programs. However, in light of current water conditions in California and the estimated 2017 allocation, supplies are expected to exceed projected demands and Metropolitan anticipates it will add water to its storage programs. See "–Water Transfer, Storage and Exchange Programs."

The term of Metropolitan's State Water Contract currently extends to December 31, 2035. Upon expiration of the State Water Contract term, Metropolitan has the option to continue service under substantially the same terms and conditions. Metropolitan and other State Water Contractors have undertaken negotiations with DWR to extend their State water contracts. In June 2014, DWR and the State Water Contractors reached an Agreement in Principle (the "Agreement in Principle") on an amendment to the State water contract to extend the contract and to make certain changes related to financial management of the State Water Project in the future. DWR and 25 of the State Water Contractors, including Metropolitan, have signed the Agreement in Principle. Under the Agreement in Principle, the term of the State water contract for each Contractor that signs an amendment would be extended until December 31, 2085. The Agreement in Principle will serve as the "proposed project" for purposes of environmental review under the California Environmental Quality Act ("CEQA"). DWR issued a Notice of Availability of the Draft Environmental Impact Report ("EIR") for the proposed project on August 17, 2016. The review period ended October 17, 2016. Following CEQA review, a State Water Project contract amendment will be prepared. Such amendment will be subject to review by the Legislature.

Bay-Delta Proceedings Affecting State Water Project

General. In addition to being a source of water for diversion into the State Water Project, the Bay-Delta is also the source of water for local agricultural, municipal and industrial needs, and, in addition, supports significant resident and anadromous fish and wildlife resources and important recreational uses of water. Both the State Water Project's upstream reservoir operations and its Bay-Delta diversions can at times affect these other uses of Bay-Delta water directly, or indirectly, through impacts on Bay-Delta water quality. A variety of proceedings and other activities are ongoing with the participation of various State and federal agencies, as well as California's environmental, urban and agricultural communities, in an effort to develop long-term, collectively-negotiated solutions to the environmental and water management issues concerning the Bay-Delta, and Metropolitan actively participates in these proceedings. Metropolitan cannot predict the ultimate outcome of any of the litigation or regulatory processes described below, but believes that a materially adverse impact on the operation of State Water Project pumps, Metropolitan's State Water Project deliveries or Metropolitan's water reserves could result.

SWRCB Regulatory Activities and Decisions. The State Water Resources Control Board (the "SWRCB") is the agency responsible for setting water quality standards and administering water rights throughout California. The SWRCB exercises its regulatory authority over the Bay-Delta by means of public proceedings leading to regulations and decisions that can affect the availability of water to Metropolitan and other users of State Water Project water. These include the Water Quality Control Plan ("WQCP") for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary, which establishes the water quality objectives and proposed flow regime of the estuary, and water rights decisions, which assign responsibility for implementing the objectives of the WQCP to users throughout the system by adjusting their respective water rights permits.

The WQCP gets reviewed periodically and new standards and allocations of responsibility can be imposed on the State Water Project as a result. The last review was completed in 2006, and the current review has been ongoing since approximately 2010.

Since 2000, SWRCB's Water Rights Decision 1641 ("D-1641") has governed the State Water Project's ability to export water from the Bay-Delta for delivery to Metropolitan and other agencies receiving water from the State Water Project. D-1641 allocated responsibility for meeting flow requirements and salinity and other water quality objectives established earlier by the WQCP. In response to ongoing drought conditions in 2014 and 2015, DWR and the Bureau of Reclamation requested temporary relief from certain WQCP standards and filed petitions requesting changes to D-1641 terms that govern outflows and salinity standards in the Bay-Delta. The SWRCB approved temporary urgency changes in the Bay-Delta in 2014 and 2015, enabling water to be conserved in reservoirs in case of continued drought.

Bay-Delta Planning Activities. In 2000, several State and federal agencies released the CALFED Bay Delta Programmatic Record of Decision ("ROD") and Environmental Impact Report/Environmental Impact Statement ("EIR/EIS") that outlined and disclosed the environmental impacts of a 30-year plan to improve the Bay-Delta's ecosystem, water supply reliability, water quality, and levee stability. The CALFED ROD remains in effect and many of the State, federal, and local projects begun under CALFED continue.

Building on CALFED and other Bay-Delta planning activities, in 2006 multiple State and federal resource agencies, water agencies, and other stakeholder groups entered into a planning agreement for the Bay-Delta Conservation Plan ("BDCP"). The BDCP was originally conceived as a comprehensive conservation strategy for the Bay-Delta designed to restore and protect ecosystem health, water supply, and water quality within a stable regulatory framework to be implemented over a 50-year time frame with corresponding long-term permit authorizations from fish and wildlife regulatory agencies. The BDCP includes both alternatives for new water conveyance infrastructure and extensive habitat restoration in the Bay-Delta.

In 2015, the State and federal lead agencies proposed an alternative implementation strategy and new alternatives to the BDCP to provide for the protection of water supplies conveyed through the Bay-Delta and the restoration of the ecosystem of the Bay-Delta, termed "California WaterFix" and "California EcoRestore," respectively. In this alternative approach, DWR and the Bureau of Reclamation would implement planned water conveyance improvements (California WaterFix) as a stand-alone project that would seek incidental take authorization for an unspecified period and would include only limited amounts of habitat restoration. The habitat restoration to be required would be that directly related to construction mitigation and the associated costs of such mitigation which would be underwritten by the public water agencies participating in the California WaterFix project. Ecosystem improvements and habitat restoration more generally (California EcoRestore) would be undertaken under a more phased approach than previously contemplated by the BDCP and would not be linked with the California WaterFix project or permits. Accelerated restoration actions totaling 30,000 acres of tidal marsh habitat were proposed to be undertaken in the coming decade to provide public benefits for listed fish in the Bay-Delta. (See also "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project.") Subsequent actions would be based on the proven merits of restoration. Preliminary cost estimates for the WaterFix alternative are currently estimated to be $17 billion. When a decision selecting the final project has been made, costs will be updated and allocated. Metropolitan anticipates that it could bear approximately 25 percent of the costs of the project. The Final EIR/EIS for the BDCP/California WaterFix was completed and made available to the public and other agencies on December 22, 2016. The Notice of Availability of the Final EIR/EIS was published by the Bureau of Reclamation in the Federal Register on December 30, 2016. On January 4, 2017, the U.S. Secretary of the Interior issued an order to federal agencies involved in the California WaterFix stating the U.S. Fish and Wildlife Service will issue a final biological opinion by April 2017. A similar schedule is anticipated for the biological opinion to be issued by the National Marine Fisheries Service. Upon receipt of the biological opinions, the Bureau of Reclamation will be able to issue a Record of Decision for the project. Certification of the EIR/EIS under CEQA and final decision-making by DWR is expected at that same time. See also "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project."

Related Litigation

California Water Impact Network Litigation. On September 3, 2010, the California Water Impact Network and two other non-profit organizations filed a petition for writ of mandate and for declaratory and injunctive relief in Sacramento Superior Court against the SWRCB and DWR. The petition alleges that by permitting and carrying out the export of large volumes of water from the Bay-Delta through the State Water Project, the SWRCB and DWR have failed to protect public trust fishery resources in the delta; have been diverting water from the Bay-Delta wastefully and unreasonably in violation of the prohibition against waste

and unreasonable use in the California Constitution; and have failed to enforce and comply with water quality and beneficial use standards in D-1641, the 1995 WQCP, and the federal Porter-Cologne Act. Among the relief sought in the petition is an injunction against Bay-Delta exports by the State Water Project pending compliance with the various laws and administrative orders that are alleged to have been violated. The State Water Contractors filed a motion to intervene in this action, which was granted on March 25, 2011. In August 2016, the court dismissed the case without prejudice based on the failure of the petitioners to bring the case to trial within five years of filing their original petition.

Monterey Amendment Litigation. On May 4, 2010, DWR completed an EIR and concluded a remedial CEQA review for the Monterey Amendment, which reflects the settlement of certain disputes regarding the allocation of State Water Project water. See "– State Water Contract" above. Central Delta Water Agency, South Delta Water Agency, California Water Impact Network, California Sportfishing Protection Alliance, and the Center For Biological Diversity filed a lawsuit against DWR in Sacramento County Superior Court challenging the validity of the EIR under CEQA and the validity of underlying agreements under a reverse validation action (the "Central Delta I" case). In January 2013, the Court ruled that the validation cause of action in Central Delta I was time barred by the statute of limitations. The court also held that DWR must complete a limited scope remedial CEQA review addressing the potential impacts of the Kern Water Bank, a portion of the Monterey Amendment that does not directly affect Metropolitan. The court also ruled that the State Water Project may continue to be operated under the terms of the Monterey Amendment while the remedial CEQA review is prepared and leaves in place the underlying project approvals while DWR prepares the remedial CEQA review. Plaintiffs appealed. Briefing by the parties was completed, but no date for oral argument has been set. Any adverse impact of this litigation and rulings on Metropolitan's State Water Project supplies cannot be determined at this time.

In September 2016, DWR certified the Final Revised Draft EIR for the Monterey Amendment, recorded a Notice of Determination, and filed papers in the trial demonstrating compliance with the court's order for remedial CEQA review. On October 21, 2016, the petitioner group from Central Delta I and a new lead petitioner, Center for Food Safety, filed litigation against DWR challenging this EIR and named Metropolitan and the other State Water Project contractors as respondent parties. Any adverse impact of this litigation and rulings on Metropolitan's State Water Project supplies cannot be determined at this time.

Colorado River Aqueduct

Background

The Colorado River was Metropolitan's original source of water after Metropolitan's establishment in 1928. Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. Water from the Colorado River and its tributaries is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming (collectively, the "Colorado River Basin States"), resulting in both competition and the need for cooperation among these holders of Colorado River entitlements. In addition, under a 1944 treaty, Mexico has an allotment of 1.5 million acre-feet of Colorado River water annually except in the event of extraordinary drought or serious accident to the delivery system in the United States, in which event the water allotted to Mexico would be curtailed. Mexico can also schedule delivery of an additional 200,000 acre-feet of Colorado River water per year if water is available in excess of the requirements in the United States and the 1.5 million acre-feet allotted to Mexico.

Construction of the CRA, which is owned and operated by Metropolitan, was undertaken by Metropolitan to provide for the transportation of its Colorado River water entitlement to its service area. The CRA originates at Lake Havasu on the Colorado River and extends approximately 242 miles through a series of pump stations and reservoirs to its terminus at Lake Mathews in Riverside County. Up to 1.25 million acre-feet of water per year may be conveyed through the CRA to Metropolitan's member agencies, subject to

availability of Colorado River water for delivery to Metropolitan as described below. Metropolitan first delivered CRA water to its member agencies in 1941.

Colorado River Water Apportionment and Seven-Party Agreement

Pursuant to the federal Boulder Canyon Project Act of 1928, California is apportioned the use of 4.4 million acre-feet of water from the Colorado River each year plus one-half of any surplus that may be available for use collectively in Arizona, California and Nevada (the "Lower Basin States"). Under an agreement entered into in 1931 among the California entities that expected to receive a portion of California's apportionment of Colorado River water (the "Seven-Party Agreement") and which has formed the basis for the distribution of Colorado River water made available to California, Metropolitan holds the fourth priority right to 550,000 acre-feet per year. This is the last priority within California's basic apportionment. In addition, Metropolitan holds the fifth priority right to 662,000 acre-feet of water, which is in excess of California's basic apportionment. Until 2003, Metropolitan had been able to take full advantage of its fifth priority right as a result of the availability of surplus water and water apportioned to Arizona and Nevada that was not needed by those states. However, during the 1990s Arizona and Nevada increased their use of water from the Colorado River, and by 2002 no unused apportionment was available for California. As a result, California has limited its annual use to 4.4 million acre-feet since 2003, not including supplies made available under water supply programs such as intentionally-created surplus and certain conservation and storage agreements. In addition, a severe drought in the Colorado River Basin from 2000-2004 reduced storage in system reservoirs, ending the availability of surplus deliveries to Metropolitan. Prior to 2003, Metropolitan could divert over 1.25 million acre-feet in any year, but since that time, Metropolitan's net diversions of Colorado River water have ranged from a low of nearly 633,000 acre-feet in 2006 to a high of approximately 1,179,000 acre-feet in 2015, and totaled over 996,000 acre-feet in 2016. Average annual net deliveries for 2007 through 2016 were approximately 962,000 acre-feet, with annual volumes dependent primarily on programs to augment supplies, including transfers of conserved water from agriculture. See "– Quantification Settlement Agreement" and "– Colorado River Operations: Surplus and Shortage Guidelines – Interim Surplus Guidelines" below. See also "–Water Transfer, Storage and Exchange Programs – Colorado River Aqueduct."

The following table sets forth the existing priorities of the California users of Colorado River water established under the 1931 Seven-Party Agreement.

[Remainder of page intentionally left blank.]

PRIORITIES UNDER THE 1931 CALIFORNIA SEVEN-PARTY AGREEMENT[1]

Priority	Description	Acre-Feet Annually
1	Palo Verde Irrigation District gross area of 104,500 acres of land in the Palo Verde Valley	3,850,000
2	Yuma Project in California not exceeding a gross area of 25,000 acres in California	
3(a)	Imperial Irrigation District and other lands in Imperial and Coachella Valleys[2] to be served by All-American Canal	
3(b)	Palo Verde Irrigation District - 16,000 acres of land on the Lower Palo Verde Mesa	
4	Metropolitan Water District of Southern California for use on the coastal plain	550,000
	SUBTOTAL	4,400,000
5(a)	Metropolitan Water District of Southern California for use on the coastal plain	550,000
5(b)	Metropolitan Water District of Southern California for use on the coastal plain[3]	112,000
6(a)	Imperial Irrigation District and other lands in Imperial and Coachella Valleys to be served by the All-American Canal	300,000
6(b)	Palo Verde Irrigation District - 16,000 acres of land on the Lower Palo Verde Mesa	
	TOTAL	5,362,000
7	Agricultural use in the Colorado River Basin in California	Remaining surplus

Source: Metropolitan.

(1) Agreement dated August 18, 1931, among Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District, Metropolitan, the City of Los Angeles, the City of San Diego and the County of San Diego. These priorities were memorialized in the agencies' respective water delivery contracts with the Secretary of the Interior.

(2) The Coachella Valley Water District serves Coachella Valley.

(3) In 1946, the City of San Diego, the San Diego County Water Authority, Metropolitan and the Secretary of the Interior entered into a contract that merged and added the City and County of San Diego's rights to storage and delivery of Colorado River water to the rights of Metropolitan.

Quantification Settlement Agreement

The Quantification Settlement Agreement ("QSA"), executed by the Coachella Valley Water District ("CVWD"), Imperial Irrigation District ("IID") and Metropolitan in October 2003, establishes Colorado River water use limits for IID and CVWD, and provides for specific acquisitions of conserved water and water supply arrangements for up to 75 years. The QSA and related agreements provide a framework for Metropolitan to enter into other cooperative Colorado River supply programs and set aside several disputes among California's Colorado River water agencies.

Specific programs under the QSA and related agreements include lining portions of the All-American and Coachella Canals, which were completed in 2009 and conserve approximately 96,000 acre-feet annually. As a result, about 80,000 acre-feet of conserved water is delivered to the San Diego County Water Authority ("SDCWA") by exchange with Metropolitan. Metropolitan takes delivery of the remaining 16,000 acre-feet annually. The 16,000 acre-feet provided annually to Metropolitan will eventually be made available for the benefit of the La Jolla, Pala, Pauma, Rincon and San Pasqual Bands of Mission Indians, the San Luis Rey River Indian Water Authority, the City of Escondido and the Vista Irrigation District, upon completion of a water rights settlement. Also included under the QSA is a delivery and exchange agreement between Metropolitan and CVWD that provides for Metropolitan, when requested, to deliver annually up to 35,000 acre-feet of Metropolitan's State Water Project contractual water to CVWD by exchange with Metropolitan's available Colorado River supplies. The QSA and related agreements also authorized the transfer of water (up to a maximum expected amount in 2021 of 205,000 acre-feet) annually by IID to SDCWA. See description below under the caption "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below; see also "METROPOLITAN REVENUES–Principal Customers" in this Appendix A. With full implementation of the programs identified in the QSA, at times when California is limited to its basic apportionment of 4.4 million acre-feet per year, Metropolitan expects to be able to annually divert to its service area approximately 850,000 acre-feet of Colorado River water plus water from other water augmentation programs it develops, including the Palo Verde Land Management, Crop Rotation and Water Supply Program (described under "Water Transfer, Storage and Exchange Programs–Colorado River Aqueduct" below), which provides up to approximately 133,000 acre-feet of water per year. (Amounts of Colorado River water received by Metropolitan in 2007 through 2016 are discussed under the heading "–Colorado River Aqueduct–Colorado River Water Apportionment and Seven-Party Agreement" above.)

A complicating factor in completing the QSA was the fate of the Salton Sea. The Sea and its environs provide a habitat complex supporting more than 400 species of birds. Located at the lowest elevation of an inland basin and fed primarily by agricultural drainage with no outflows other than evaporation, the Salton Sea was naturally trending towards hyper-salinity, which had already impacted the Salton Sea's fishery. Without mitigation, the transfer of water from IID to SDCWA, one of the core programs implemented under the QSA, would reduce the volume of agricultural drainage from IID's service area flowing into the Salton Sea, which would reduce the volume of water in the Sea, exposing shoreline and accelerating the natural trend of the Salton Sea to hyper-salinity. See "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below. In 2002, the SWRCB issued Water Rights Order 2002-0013, which gave approval for the transfer of water from IID to SDCWA and CVWD, and which required Salton Sea mitigation water deliveries from 2003 through 2017.

In 2003, to facilitate implementation of the QSA, the Legislature directed the Secretary for the California Natural Resources Agency to undertake a restoration study to determine a preferred alternative for the restoration of the Salton Sea ecosystem and the protection of wildlife dependent on that ecosystem. In May 2007, the Secretary submitted his $8.9 billion preferred alternative to the Legislature. While withholding authorization of the preferred alternative, in 2008 the Legislature directed the California Natural Resources Agency to undertake demonstration projects and investigations called for in the Secretary's May 2007 recommendation. Since then, the California Natural Resources Agency and the U.S. Fish and Wildlife Service have been developing various pilot-scale projects which are at various stages of planning and implementation.

Concerned that the California Natural Resources Agency has not made sufficient progress to develop a long-term restoration plan for the Salton Sea, in November 2014, IID filed a petition with the SWRCB asking it to modify the SWRCB's 2002 order. IID stated that it is concerned that the scheduled termination of mitigation water deliveries to the Salton Sea at the end of 2017 will result in the shrinking of the Sea and an increase in exposed playa and fugitive dust emissions. IID's petition requested that the SWRCB modify its order to include a requirement that "the State fulfill its statutory obligation to restore the Salton Sea as a

condition of the QSA transfers." See "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below. The SWRCB has held various workshops to receive input on the petition.

During the spring of 2015, the Governor tasked a number of individuals from his staff, known as the "Salton Sea Task Force," to look into actions that could be taken at the Sea. In October 2015, the Salton Sea Task Force announced that it would implement a number of actions to address the Salton Sea ecosystem, including immediate implementation and further development of the Salton Sea management plan, meeting a short-term goal by 2020 of 9,000-12,000 acres of habitat creation and dust suppression projects and a medium-term goal after 2020 of 18,000-25,000 acres of habitat creation and dust suppression projects. In August 2016, the U.S. Department of the Interior and the California Natural Resources Agency entered into an MOU which outlines the manner in which federal agencies would cooperate with State and local agencies to assist the Salton Sea Task Force in achieving its stated goals. While projects that are currently underway or are anticipated to begin in 2017 are not expected to meet the Salton Sea Task Force's short-term goal, the Salton Sea Task Force continues its efforts to identify a long-term plan for the Salton Sea for construction to begin as early as 2018. In the absence of a Salton Sea restoration project, the QSA and related agreements provide for the control of exposed playa by IID as a mitigation measure funded by CVWD, IID, and SDCWA, with the State of California obligated to meet all mitigation costs that exceed $133 million in 2003 dollars. Metropolitan has no obligation to pay any costs associated with restoration of the Salton Sea.

Sale of Water by the Imperial Irrigation District to San Diego County Water Authority

On April 29, 1998, SDCWA and IID executed an agreement (the "Transfer Agreement") for SDCWA's purchase from IID of Colorado River water that is conserved within IID. An amended Transfer Agreement, executed as one of the QSA agreements, set the maximum transfer amount at 205,000 acre-feet in 2021, with the transfer gradually ramping up to that amount over an approximately twenty-year period, then stabilizing at 200,000 acre-feet per year beginning in 2023.

No facilities exist to deliver water directly from IID to SDCWA. Accordingly, Metropolitan and SDCWA entered into an exchange agreement, pursuant to which SDCWA makes available to Metropolitan at its intake at Lake Havasu on the Colorado River the conserved Colorado River water acquired by SDCWA from IID and water allocated to SDCWA that has been conserved as a result of the lining of the All-American and Coachella Canals. See "–Quantification Settlement Agreement" above. Metropolitan delivers an equal volume of water from its own sources of supply through portions of its delivery system to SDCWA. The deliveries to both Metropolitan and SDCWA are deemed to be made in equal monthly increments. In consideration for the conserved water made available to Metropolitan by SDCWA, a lower rate is paid by SDCWA for the exchange water delivered by Metropolitan. The price payable by SDCWA is calculated using the charges set by Metropolitan's Board from time to time to be paid by its member agencies for the conveyance of water through Metropolitan's facilities. See "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A for a description of Metropolitan's charges for the conveyance of water through Metropolitan's facilities and litigation in which SDCWA is challenging such charges. In 2016, 178,493 acre-feet were delivered to Metropolitan by SDCWA for exchange, consisting of 100,000 acre-feet of IID conservation plus 78,493 acre-feet of conserved water from the Coachella Canal and All-American Canal lining projects.

Colorado River Operations: Surplus and Shortage Guidelines

General. The Secretary of the Interior is vested with the responsibility of managing the mainstream waters of the lower Colorado River pursuant to federal law. Each year, the Secretary of the Interior is required to declare the Colorado River water supply availability conditions for the Lower Basin States in terms of "normal," "surplus" or "shortage" and has adopted operations criteria in the form of guidelines to determine the availability of surplus or potential shortage allocations among the Lower Basin States and reservoir operations for such conditions.

Interim Surplus Guidelines. In January 2001, the Secretary of the Interior adopted guidelines (the "Interim Surplus Guidelines"), initially for use through 2016, in determining if there is surplus Colorado River water available for use in California, Arizona and Nevada. The Interim Surplus Guidelines were amended in 2007 and now extend through 2026. The purpose of the Interim Surplus Guidelines was to provide mainstream users of Colorado River water, particularly those in California who utilize surplus flows, a greater degree of predictability with respect to the availability and quantity of surplus water.

Under the Interim Surplus Guidelines, Metropolitan initially expected to divert up to 1.25 million acre-feet of Colorado River water annually under foreseeable runoff and reservoir storage scenarios from 2004 through 2016. However, an extended drought in the Colorado River Basin reduced these initial expectations. In May 2002, the Southern Nevada Water Authority ("SNWA") and Metropolitan entered into an Agreement Relating to Implementation of Interim Colorado River Surplus Guidelines, in which SNWA and Metropolitan agreed to the allocation of unused apportionment as provided in the Interim Surplus Guidelines and on the priority of SNWA for interstate banking of water in Arizona. SNWA and Metropolitan entered into a storage and interstate release agreement on October 21, 2004. Under this agreement, SNWA can request that Metropolitan store unused Nevada apportionment in California. The amount of water stored through 2014 under this agreement was approximately 205,000 acre-feet. In subsequent years, SNWA may request recovery of the stored water. As part of a 2012 executed amendment to the agreement, it is expected that SNWA will not request return of the water stored with Metropolitan before 2022. In October 2015, SNWA and Metropolitan executed an additional amendment to the agreement under which Metropolitan paid SNWA approximately $44.4 million and SNWA stored an additional 150,000 acre-feet with Metropolitan during 2015. Of that amount, 125,000 acre-feet has been added to SNWA's storage account with Metropolitan, increasing the total amount of water stored to approximately 330,000 acre-feet. When SNWA requests the return of any of the stored 125,000 acre-feet, SNWA will reimburse Metropolitan for an equivalent proportion of the $44.4 million plus inflation based on the amount of water returned. The stored water allowed Metropolitan to have a full water supply from the Colorado River in 2015.

Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead. In May 2005, the Secretary of the Interior directed the Bureau of Reclamation to develop additional strategies for improving coordinated management of the reservoirs of the Colorado River system. In November 2007, the Bureau of Reclamation issued a Final Environmental Impact Statement ("EIS") regarding new federal guidelines concerning the operation of the Colorado River system reservoirs, particularly during drought and low reservoir conditions. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage and surplus conditions in the Lower Basin, provide a mechanism for the storage and delivery of conserved system and non-system water in Lake Mead and extend the Interim Surplus Guidelines through 2026. The Secretary of the Interior issued the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs and allow the Colorado River Basin States to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions. Consistent with these legal protections, under the guidelines, Arizona and Nevada are first subject to the initial annual shortages identified by the Secretary up to 500,000 acre-feet.

The guidelines also created the Intentionally Created Surplus ("ICS") program, which allows the Lower Basin States to store conserved water in Lake Mead. Under this program, ICS water (water that has been conserved through an extraordinary conservation measure, such as land fallowing) is eligible for storage in Lake Mead by Metropolitan. See the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage" below. The Secretary of the Interior delivers the stored ICS water to Metropolitan in accordance with the terms of December 13, 2007, January 6, 2010, and November 20, 2012 Delivery Agreements between the United States and Metropolitan. As of January 1, 2017, Metropolitan had an estimated 71,000 acre-feet in its ICS accounts. These surplus accounts are made

up of water conserved by fallowing in the Palo Verde Valley, projects implemented with IID in its service area, groundwater desalination, the Warren H. Brock Reservoir Project, and the Yuma Desalting Plant pilot run, which have not been delivered to the region.

Related Litigation

Navajo Nation Litigation. The Navajo Nation filed litigation against the Department of the Interior, specifically the Bureau of Reclamation and the Bureau of Indian Affairs, in 2003, alleging that the Bureau of Reclamation has failed to determine the extent and quantity of the water rights of the Navajo Nation in the Colorado River and that the Bureau of Indian Affairs has failed to otherwise protect the interests of the Navajo Nation. The complaint challenges the adequacy of the environmental review for the Interim Surplus Guidelines (described under "– Colorado River Operations: Surplus and Shortage Guidelines" above) and seeks to prohibit the Department of the Interior from allocating any "surplus" water until such time as a determination of the rights of the Navajo Nation is completed. Metropolitan and other California water agencies filed motions to intervene in this action. In October 2004 the court granted the motions to intervene and stayed the litigation to allow negotiations among the Navajo Nation, federal defendants, Central Arizona Water Conservation District ("CAWCD"), State of Arizona and Arizona Department of Water Resources. After years of negotiations, a tentative settlement was proposed in 2012 that would provide the Navajo Nation with specified rights to water from the Little Colorado River and groundwater basins under the reservation, along with federal funding for development of water supply systems on the tribe's reservation. The proposed agreement was rejected by tribal councils for both the Navajo and the Hopi, who were seeking to intervene. On May 16, 2013, the stay of proceedings was lifted. On June 3, 2013, the Navajo Nation moved for leave to file a first amended complaint, which the court granted on June 27, 2013. The amended complaint added a legal challenge to the Lower Basin Shortage Guidelines adopted by the Secretary of the Interior in 2007 that allow Metropolitan and other Colorado River water users to store water in Lake Mead (described under "– Colorado River Operations: Surplus and Shortage Guidelines" above). Metropolitan has used these new guidelines to store over 500,000 acre-feet of water in Lake Mead, a portion of which has been delivered, and the remainder of which may be delivered at Metropolitan's request in future years. On July 22, 2014, the district court dismissed the lawsuit in its entirety, ruling that the Navajo Nation lacked standing and that the claim was barred against the federal defendants. The district court denied a motion by the Navajo Nation for leave to amend the complaint further after the dismissal. On September 19, 2014, the Navajo Nation appealed the dismissal of its claims related to the Interim Surplus Guidelines, the Lower Basin Shortage Guidelines, and breach of the federal trust obligation to the tribe. Briefing by the parties was completed by May 20, 2015. Oral argument in the Ninth Circuit Court of Appeals has been set for February 14, 2017. Metropolitan is unable to assess at this time the likelihood of success of this appeal or any future claims, or their potential effect on Colorado River water supplies.

Endangered Species Act and Other Environmental Considerations

Endangered Species Act Considerations – State Water Project

General. DWR has altered the operations of the State Water Project to accommodate species of fish listed as threatened or endangered under the Federal ESA or California ESA. Currently, five species (the winter-run and spring-run Chinook salmon, Delta smelt, North American green sturgeon and Central Valley steelhead) are listed under the ESAs. In addition, the longfin smelt is listed as a threatened species under the California ESA. These changes in project operations have limited the flexibility of the State Water Project and adversely affected State Water Project deliveries to Metropolitan. State Water Project operational requirements may be further modified in the future under new biological opinions for listed species under the Federal ESA or by the California Department of Fish and Wildlife's issuance of incidental take authorizations under the California ESA. Additionally, new litigation, listings of additional species or new regulatory requirements could further adversely affect State Water Project operations in the future by requiring additional export reductions, releases of additional water from storage or other operational changes impacting the water supply available for export. Such operational constraints are likely to continue until long-term solutions to the problems in the Bay-Delta are identified and implemented. See also "–State Water Project – Bay-Delta Proceedings Affecting State Water Project."

The Federal ESA requires that before any federal agency authorizes funds or carries out an action that may affect a listed species or designated critical habitat, it must consult with the appropriate federal fishery agency to determine whether the action would jeopardize the continued existence of any threatened or endangered species, or adversely modify habitat critical to the species' needs. The result of the consultation is known as a "biological opinion." In the biological opinion the federal fishery agency determines whether the action would cause jeopardy to a threatened or endangered species or adverse modification to critical habitat, and recommends reasonable and prudent alternatives or measures that would allow the action to proceed without causing jeopardy or adverse modification. The biological opinion also includes an "incidental take statement." The incidental take statement allows the action to go forward even though it will result in some level of "take," including harming or killing some members of the species, incidental to the agency action, provided that the agency action does not jeopardize the continued existence of any threatened or endangered species and complies with reasonable mitigation and minimization measures recommended by the federal fishery agency.

Delta Smelt and Salmon Federal ESA Biological Opinions. The United States Fish and Wildlife Service (USFWS) released a biological opinion on December 15, 2008 on the impacts of the State Water Project and the federal Central Valley Project on Delta smelt. On June 4, 2009, the National Marine Fisheries Service (NMFS) released a biological opinion for salmonid species. The water supply restrictions imposed by these biological opinions on Delta smelt and salmonid species have a range of impacts on Metropolitan's deliveries from the State Water Project, depending on hydrologic conditions. The impact on total State Water Project deliveries to State Water Contractors attributable to the Delta smelt and salmonid species biological opinions combined is estimated to be one million acre-feet in an average year, reducing total State Water Project deliveries to State Water Contractors from approximately 3.3 million acre-feet to approximately 2.3 million acre-feet for the year under average hydrology. Reductions are estimated to range from 0.3 million acre-feet during critically dry years to 1.3 million acre-feet in above normal water years. Total State Water Project delivery impacts to Metropolitan for calendar years 2008 through 2016 are estimated to be 2.0 million acre-feet.

Endangered Species Act Considerations - Colorado River

Federal and state environmental laws protecting fish species and other wildlife species have the potential to affect Colorado River operations. A number of species that are on either "endangered" or "threatened" lists under the ESAs are present in the area of the Lower Colorado River, including among others, the bonytail chub, razorback sucker, southwestern willow flycatcher and Yuma clapper rail. To address this issue, a broad-based state/federal/tribal/private regional partnership that includes water, hydroelectric power and wildlife management agencies in Arizona, California and Nevada have developed a multi-species conservation program for the main stem of the Lower Colorado River (the Lower Colorado River Multi-Species Conservation Program or "MSCP"). The MSCP allows Metropolitan to obtain federal and state permits for any incidental take of protected species resulting from current and future water and power operations of its Colorado River facilities and to minimize any uncertainty from additional listings of endangered species. The MSCP also covers operations of federal dams and power plants on the river that deliver water and hydroelectric power for use by Metropolitan and other agencies. The MSCP covers 27 species and habitat in the Lower Colorado River from Lake Mead to the Mexican border for a term of 50 years (commencing in 2005). Over the 50-year term of the program, the total cost to Metropolitan will be about $88.5 million (in 2003 dollars), and annual costs will range between $0.8 million and $4.7 million (in 2003 dollars).

Invasive Species - Mussel Control Programs

Zebra and quagga mussels are established in many regions of the United States. Mussels can reproduce quickly and, if left unmanaged, can clog intakes and raw water conveyance systems, alter or destroy fish habitats and affect lakes and beaches. Quagga mussels were introduced in the Great Lakes in the late 1980s. These organisms infest much of the Great Lakes basin, the St. Lawrence Seaway, and much of the Mississippi River drainage system. In January 2007 quagga mussels were discovered in Lake Mead. The

most likely source of the quagga mussel infestation in the Colorado River was recreational boats with exposure to water bodies around the Great Lakes. Metropolitan developed a program in 2007 to address the long term introduction of mussel larvae into the CRA from the Lower Colorado River, which is now heavily colonized from Lake Mead through Lake Havasu. The quagga mussel control program consists of surveillance activities and control measures. Surveillance activities are conducted annually in conjunction with regularly scheduled two- to three-week long CRA shutdowns, which have the added benefit of desiccating exposed quagga mussels. Control activities consist of continuous chlorination at Copper Basin, Lake Skinner outlet conduit, and Lake Mathews Forebay, quarterly chlorination of the outlet towers at Lake Skinner and Mathews, and physical removal of mussels from the trash racks in Lake Havasu. Recent shutdown inspections have demonstrated that the combined use of chlorine and regular cleaning during scheduled shutdowns effectively control mussel infestation in the CRA. Metropolitan's costs for controlling quagga mussels in the CRA are between $4 million and $5 million per year.

Quagga and zebra mussel populations are located within 16 miles of the State Water Project. An isolated population of zebra mussels is established in San Justo Reservoir in Central California and Lake Piru in Southern California has been infested with quagga mussels since 2013. To prevent the further spread of the mussels into the State Water Project, the Bay-Delta and other bodies of water and water systems, DWR has joined the California Department of Fish and Wildlife, as the lead agency, and other state and federal agencies on a number of activities. These include boat inspections, monitoring of water bodies and water systems and education of the public. In addition, DWR has developed a Rapid Response Plan, Vector Management Plan, and Long-Term Mussel Management and Control Plan as mandated by the California Fish and Game Code.

In December 2016, DWR found dead adult mussels in the Angeles Tunnel, which connects Pyramid Lake to Castaic Lake. Through DNA testing, they were confirmed to be quagga mussels. As a result of such findings, the California Department of Fish and Wildlife has deemed the State Water Project West Branch (including Pyramid and Castaic Lakes) to be infested with quagga mussels and has implemented boat inspection requirements on boats leaving Pyramid Lake and Castaic Lake to help prevent the spreading of the invasive species.

In February 2017, DWR detected mussel veligers (microscopic, free-floating larval lifestage) in water samples collected on the State Water Project East Branch at the North Park valve of the Santa Ana Valley Pipeline, which transports water from Silverwood Lake located in San Bernardino County to Lake Perris located in Riverside County. Extensive sampling has occurred upstream and downstream of the North Park valve and no mussels have been detected. Currently, there is no evidence of mussels in Silverwood Lake or Lake Perris.

There are no impacts on State Water Project allocation or deliveries at this time and the future level of mussel impacts is unknown. Metropolitan will coordinate with other agencies to increase the monitoring of mussels and adapt the existing quagga mussel control program for the State Water Project as required.

Water Transfer, Storage and Exchange Programs

General

To supplement its State Water Project and Colorado River water supplies, Metropolitan has developed and actively manages a portfolio of water supply programs, including water transfer, storage and exchange agreements, the supplies created by which are conveyed through the California Aqueduct of the State Water Project, utilizing Metropolitan's rights under its State Water Contract to use the portion of the State Water Project conveyance system necessary to deliver water to it, or through available CRA capacity. Consistent with its IRP, Metropolitan will continue to pursue voluntary water transfer and exchange programs with State, federal, public and private water districts and individuals to help mitigate supply/demand imbalances and provide additional dry-year supply sources. A summary description of certain of Metropolitan's supply programs are set forth below. In addition to the arrangements described

below, Metropolitan is entitled to storage and access to stored water in connection with various other storage programs and facilities. See "–Colorado River Aqueduct" above in this Appendix A, as well as the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

State Water Project

In addition to the basic State Water Project contract provisions, Metropolitan has other contract rights that accrue to the overall value of the State Water Project. Because each contractor is paying for physical facilities, they also have the right to use the facilities to move water supplies associated with agreements, water transfers and water exchanges. Metropolitan has entered into agreements and exchanges that provide additional water supplies.

Castaic Lake and Lake Perris. Metropolitan has contractual rights to store up to 65,000 acre-feet of water in Lake Perris (East Branch terminal reservoir) and 153,940 acre-feet of water in Castaic Lake (West Branch terminal reservoir). This storage provides Metropolitan with additional options for managing State Water Project deliveries to maximize yield from the project. Any water used must be returned to the State Water Project within five years or it is deducted from allocated amounts in the sixth year.

Metropolitan Article 56 Carryover. Metropolitan has the right to store its allocated contract amount for delivery in the following year. Metropolitan can store between 100,000 and 200,000 acre-feet, depending on the final water supply allocation percentage.

California's agricultural activities consume approximately 34 million acre-feet of water annually, which is approximately 80 percent of the total water used in the State for agricultural and urban uses and 40 percent of the water used for all consumptive uses, including environmental demands. Voluntary water transfers and exchanges can make a portion of this agricultural water supply available to support the State's urban areas. Such existing and potential water transfers and exchanges are an important element for improving the water supply reliability within Metropolitan's service area and accomplishing the reliability goal set by Metropolitan's Board. The portfolio of supplemental supplies that Metropolitan has developed to be conveyed through the State Water Project California Aqueduct extend from north of the Bay-Delta to Southern California. Certain of these arrangements are described below.

Yuba River Accord. Metropolitan entered into an agreement with DWR in December 2007 to purchase a portion of the water released by the Yuba County Water Agency ("YCWA"). YCWA was involved in a SWRCB proceeding in which it was required to increase Yuba River fishery flows. Within the framework of agreements known as the Yuba River Accord, DWR entered into an agreement for the long-term purchase of water from YCWA. The agreement permits YCWA to transfer additional supplies at its discretion. Metropolitan, other State Water Contractors, and the San Luis Delta Mendota Water Authority entered into separate agreements with DWR for the purchase of portions of the water made available. Metropolitan's agreement allows Metropolitan to purchase, in dry years through 2025, available water supplies which have ranged from approximately 6,555 acre-feet to 67,068 acre-feet per year.

In addition to water made available under the Yuba River Accord, Metropolitan has developed groundwater storage agreements that allow Metropolitan to store available supplies in the Central Valley for return later. Metropolitan has also developed exchanges and transfers with other State Water Contractors.

Arvin-Edison/Metropolitan Water Management Program. In December 1997, Metropolitan entered into an agreement with the Arvin-Edison Water Storage District ("Arvin-Edison"), an irrigation agency located southeast of Bakersfield, California. Under the program, Arvin-Edison stores water on behalf of Metropolitan. In January 2008, Metropolitan and Arvin-Edison amended the agreement to enhance the program's capabilities and to increase the delivery of water to the California Aqueduct. Up to 350,000 acre-feet of Metropolitan's water may be stored and Arvin-Edison is obligated to return up to 75,000 acre-feet of stored water in any year to Metropolitan, upon request. The agreement will terminate in 2035 unless

extended. To facilitate the program, new wells, spreading basins and a return conveyance facility connecting Arvin-Edison's existing facilities to the California Aqueduct have been constructed. The agreement also provides Metropolitan priority use of Arvin-Edison's facilities to convey high quality water available on the east side of the San Joaquin Valley to the California Aqueduct. Metropolitan's current storage account under the Arvin-Edison/Metropolitan Water Management Program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Semitropic/Metropolitan Groundwater Storage and Exchange Program. In 1994, Metropolitan entered into an agreement with the Semitropic Water Storage District ("Semitropic"), located adjacent to the California Aqueduct north of Bakersfield, to store water in the groundwater basin underlying land within Semitropic. The minimum annual yield available to Metropolitan from the program is 39,700 acre-feet of water and the maximum annual yield is 231,200 acre-feet of water depending on the available unused capacity and the State Water Project allocation. Metropolitan's current storage account under the Semitropic program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Kern Delta Storage Program. Metropolitan entered into an agreement with Kern Delta Water District ("Kern Delta") in May 2003, for a groundwater banking and exchange transfer program to allow Metropolitan to store up to 250,000 acre-feet of State Water Contract water in wet years and to permit Metropolitan, at Metropolitan's option, a return of up to 50,000 acre-feet of water annually during hydrologic and regulatory droughts.

Mojave Storage Program. Metropolitan entered into a groundwater banking and exchange transfer agreement with Mojave Water Agency ("Mojave") in October 2003. This agreement was amended in 2011 to allow for the cumulative storage of up to 390,000 acre-feet. The agreement allows for Metropolitan to store water in an exchange account for later return. Through 2021, and when the State Water Project allocation is 60 percent or less, Metropolitan can annually withdraw Mojave's State Water Project contractual amounts in excess of a 10 percent reserve. When the State Water Project allocation is over 60 percent, the reserved amount for Mojave's local needs increases to 20 percent. Under a 100 percent allocation, the State Water Contract provides Mojave 82,800 acre-feet of water. Metropolitan's current storage account under this program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Antelope Valley East Kern Storage and Exchange Program. In 2016, Metropolitan entered into an agreement with the Antelope Valley-East Kern Water Agency ("AVEK"), the third largest State Water Project Contractor, to both exchange supplies and store water in the Antelope Valley groundwater basin. Under this agreement, AVEK would provide at least 30,000 acre-feet over ten years of its unused Table A State Water Project water to Metropolitan. For every two acre-feet provided to Metropolitan as part of the exchange, AVEK would receive back one acre-foot in the future. For the one acre-foot that is retained by Metropolitan, Metropolitan would pay AVEK under a set price schedule based on the State Water Project allocation at the time. The payment would range from $587/acre-foot under a 5 percent State Water Project allocation to $38/acre-foot under an 86 percent State Water Project allocation.

San Bernardino Valley Municipal Water District Coordinated Operating Agreement. Metropolitan entered into an agreement with the San Bernardino Valley Municipal Water District ("SBVMWD") in April 2001 to coordinate the use of facilities and State Water Project water supplies. The agreement allows Metropolitan a minimum purchase of 20,000 acre-feet on an annual basis with the option to purchase additional water when available. The program includes 50,000 acre-feet of storage capacity for the carryover of water purchased from SBVMWD. In addition to water being supplied using the State Water Project, the previously stored water can be returned using an interconnection between the San Bernardino Central Feeder and Metropolitan's Inland Feeder.

San Gabriel Valley Municipal Water District and Other Exchange Programs. In 2013, Metropolitan entered into an agreement with the San Gabriel Valley Municipal Water District ("SGVMWD"). Under this agreement, Metropolitan delivers treated water to a SGVMWD subagency in exchange for twice as much untreated State Water Project supplies delivered into the groundwater basin that supplies this agency and metropolitan subagencies. Metropolitan can purchase at least 5,000 acre-feet per year, in excess of the unbalanced exchange amount. This program has the potential to increase Metropolitan's reliability by providing 115,000 acre-feet through 2035.

Metropolitan has been negotiating, and will continue to pursue, water purchase, storage and exchange programs with other agencies in the Sacramento and San Joaquin Valleys. These programs involve the storage of both State Water Project supplies and water purchased from other sources to enhance Metropolitan's dry-year supplies and the exchange of normal year supplies to enhance Metropolitan's water reliability and water quality, in view of dry conditions and potential impacts from the ESA cases discussed above under the heading "–Endangered Species Act and Other Environmental Considerations–Endangered Species Act Considerations - State Water Project." In 2016, Metropolitan entered into an agreement with the State Water Contractors, Inc. to pursue water transfer supplies. These purchases were not completed, however due to the 60 percent State Water Project allocation, which resulted in no conveyance capacity to move the transfer supplies to Metropolitan.

Metropolitan has also entered into an agreement with certain State Water Contractors for the exchange of a portion of its Colorado River supply for their State Water Project contracted amounts. One benefit of the agreement is reducing Metropolitan's State Water Project fixed costs in wetter years when there are more than sufficient supplies to meet Metropolitan's water management goals, while preserving its dry-year State Water Project Supply.

Metropolitan/CVWD/Desert Water Agency Exchange and Advance Delivery Agreement. Metropolitan has agreements with the CVWD and the Desert Water Agency ("DWA") in which Metropolitan exchanges its Colorado River water for those agencies' State Water Project contractual water on an annual basis. Because CVWD and DWA do not have a physical connection to the State Water Project, Metropolitan takes delivery of CVWD's and DWA's State Water Project supplies and delivers a like amount of Colorado River water to the agencies. In accordance with an advance delivery agreement executed by Metropolitan, CVWD and DWA, Metropolitan has delivered Colorado River water in advance to these agencies for storage in the Upper Coachella Valley groundwater basin. In years when it is necessary to augment available supplies to meet local demands, Metropolitan has the option to meet the exchange delivery obligation through drawdowns of the advance delivery account, rather than deliver its Colorado River supply. Metropolitan's current storage account under the CVWD/DWA program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage." In addition to the CVWD/DWA exchange agreements, Metropolitan has entered into separate agreements with CVWD and DWA for delivery of non-State Water Project supplies acquired by CVWD or DWA. Similarly, Metropolitan takes delivery of these supplies from State Water Project facilities and incurs an exchange obligation to CVWD or DWA. From 2008 through 2016, Metropolitan has received a net additional supply of 88,527 acre-feet of water acquired by CVWD and DWA.

Colorado River Aqueduct

Metropolitan has taken steps to augment its share of Colorado River water through agreements with other agencies that have rights to use such water, including through cooperative programs with other water agencies to conserve and develop supplies and through programs to exchange water with other agencies. These supplies are conveyed through the CRA. Metropolitan determines the delivery schedule of these supplies throughout the year based on changes in the availability of State Water Project and Colorado River water. Under certain of these programs, water may be delivered to Metropolitan's service area in the year made available or in a subsequent year as ICS water from Lake Mead storage. See "–Colorado River

Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead."

IID/Metropolitan Conservation Agreement. Under a 1988 water conservation agreement, as amended in 2003 and 2007 (the "1988 Conservation Agreement") between Metropolitan and IID, Metropolitan provided funding for IID to construct and operate a number of conservation projects that have conserved up to 109,460 acre-feet of water per year that has been provided to Metropolitan. As amended, the agreement's initial term has been extended to at least 2041 or 270 days after the termination of the QSA. In 2016, 105,000 acre-feet of conserved water was made available by IID to Metropolitan. Under the QSA and related agreements, Metropolitan, at the request of CVWD, forgoes up to 20,000 acre-feet of this water each year for diversion by CVWD. In 2015 and 2016, CVWD's requests were for 6,715 and an estimated 15,942 acre-feet, respectively, leaving 101,105 acre-feet in 2015 and an estimated 89,058 acre-feet in 2016 for Metropolitan. See "–Colorado River Aqueduct – Quantification Settlement Agreement."

Palo Verde Land Management, Crop Rotation and Water Supply Program. In August 2004, Metropolitan and the Palo Verde Irrigation District ("PVID") signed the program agreement for a Land Management, Crop Rotation and Water Supply Program. Under this program, participating landowners in the PVID service area are compensated for reducing water use by not irrigating a portion of their land. This program provides up to 133,000 acre-feet of water to be available to Metropolitan in certain years. The term of the program is 35 years. Fallowing began on January 1, 2005. In March 2009, Metropolitan and PVID entered into a supplemental fallowing program within PVID that provided for the fallowing of additional acreage in 2009 and 2010. In calendar years 2009 and 2010, an additional 24,100 acre-feet and 32,300 acre-feet of water, respectively, were saved and made available to Metropolitan under the supplemental program. The following table shows annual volumes of water saved and made available to Metropolitan under the Land Management, Crop Rotation and Water Supply Program with PVID:

WATER AVAILABLE FROM PVID LAND MANAGEMENT, CROP ROTATION AND WATER SUPPLY PROGRAM

Calendar Year	Volume (acre-feet)
2006	105,000
2007	72,300
2008	94,300
2009(1)	144,300
2010(1)	148,600
2011	122,200
2012	73,700
2013	32,750
2014	43,010
2015	94,480
2016(2)	125,000

(1) Includes water from the supplemental fallowing program that provided for fallowing of additional acreage in 2009 and 2010.
(2) Estimate.

Lake Mead Storage Program. As described under "–Colorado River Aqueduct–Colorado River Operations: Surplus and Shortage Guidelines–Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead," in December 2007, Metropolitan entered into agreements to set forth the guidelines under which ICS water is developed, and stored in and delivered from Lake Mead. The amount of water stored in Lake Mead must be created through extraordinary conservation,

system efficiency, or tributary conservation methods. Metropolitan has participated in projects to create ICS as described below:

Drop 2 (Warren H. Brock) Reservoir. In May 2008, Metropolitan provided $28.7 million to join the CAWCD and the SNWA in funding the Bureau of Reclamation's construction of an 8,000 acre-foot off-stream regulating reservoir near Drop 2 of the All-American Canal in Imperial County (officially named the Warren H. Brock Reservoir). Construction was completed in October 2010 and the Bureau of Reclamation refunded approximately $3.71 million in unused contingency funds to Metropolitan. The Warren H. Brock Reservoir conserves about 70,000 acre-feet of water per year by capturing and storing water that would otherwise be lost from the system. In return for its funding, Metropolitan received 100,000 acre-feet of water that was stored in Lake Mead for its future use, and has the ability to receive up to 25,000 acre-feet of water in any single year. Besides the additional water supply, the addition of the Warren H. Brock reservoir adds to the flexibility of Colorado River operations by storing underutilized Colorado River water orders caused by unexpected canal outages, changes in weather conditions, and high runoff into the Colorado River. As of January 1, 2016, Metropolitan had taken delivery of 43,992 acre-feet of this water, and had 56,008 acre-feet remaining in storage.

Yuma Desalting Plant. In September 2009, Metropolitan authorized participation with SNWA, the Colorado River Commission of Nevada, the CAWCD and the Bureau of Reclamation in the pilot operation of the Yuma Desalting Plant. The Bureau of Reclamation concluded the pilot operation of the Yuma Desalting Plant in March 2011. Metropolitan's contribution for the funding agreement was approximately $8.4 million, of which approximately $1.1 million was refunded to Metropolitan. Metropolitan's yield from the pilot run of the project was 24,397 acre-feet. As of January 1, 2016, that water was stored in Lake Mead for Metropolitan's future use.

Mexico Pilot Project. In November 2012, Metropolitan executed agreements in support of a program to augment Metropolitan's Colorado River supply from 2013 through 2017 through an international pilot project in Mexico. Metropolitan's total share of costs was $5 million for 47,500 acre-feet of project supplies. In December 2013, Metropolitan and IID executed an agreement under which IID has paid half of Metropolitan's program costs, or $2.5 million, in return for half of the project supplies, or 23,750 acre-feet. In addition, 23,750 acre-feet of conserved water will be credited to Metropolitan's binational ICS water account no later than December 31, 2017. See "–Colorado River Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead."

Storage Capacity and Water in Storage

Metropolitan's storage capacity, which includes reservoirs, conjunctive use and other groundwater storage programs within Metropolitan's service area and groundwater and surface storage accounts delivered through the State Water Project or CRA, is approximately 5.83 million acre-feet. In 2016, approximately 626,000 acre-feet of stored water was emergency storage that was reserved for use in the event of supply interruptions from earthquakes or similar emergencies (see "METROPOLITAN'S WATER DELIVERY SYSTEM–Seismic Considerations" in this Appendix A), as well as extended drought. Metropolitan's emergency storage requirement is established periodically to provide a six-month water supply at 75 percent of member agencies' retail demand under normal hydrologic conditions. Metropolitan's ability to replenish water storage, both in the local groundwater basins and in surface storage and banking programs, has been limited by Bay-Delta pumping restrictions under the biological opinions issued for listed species. See "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESAs Biological Opinions." Metropolitan replenishes its storage accounts when available imported supplies exceed demands. Effective storage management is dependent on having sufficient years of excess supplies to store water so that it can be used during times of shortage. Historically, excess supplies have been available in about seven of every ten years. Metropolitan forecasts that, with anticipated supply reductions from the State Water Project due to pumping

restrictions, it will need to draw down on storage in about seven of ten years and will be able to replenish storage in about three years out of ten. This reduction in available supplies extends the time required for storage to recover from drawdowns and could require Metropolitan to implement its Water Supply Allocation Plan during extended dry periods. See "CONSERVATION AND WATER SHORTAGE MEASURES–Water Supply Allocation Plan." As a result of increased State Water Project supplies and reduced demands from 2010 to 2012, Metropolitan rebuilt its storage after several years of withdrawals to approximately 3.375 million acre-feet, including emergency storage. This was the highest end-of-year total water reserves in Metropolitan's history. In 2014, Metropolitan withdrew approximately 1.2 million acre-feet from storage, reducing overall storage to approximately 1.8 million acre-feet. Approximately 300,000 acre-feet were withdrawn from storage reserves in 2015, leaving approximately 1.5 million acre-feet in storage reserves as of January 1, 2016. Approximately 350,000 acre-feet were returned to storage reserves in 2016, providing for nearly 1.9 million acre-feet in reserves as of January 1, 2017. The following table shows three years of Metropolitan's water in storage as of January 1, including emergency storage.

METROPOLITAN'S WATER STORAGE CAPACITY AND WATER IN STORAGE[(1)]
(in Acre-Feet)

Water Storage Resource	Storage Capacity	Water in Storage January 1, 2017	Water in Storage January 1, 2016	Water in Storage January 1, 2015
Colorado River Aqueduct

(footnotes on next page)

(footnotes to table on prior page)

(1) Water storage capacity and water in storage are measured based on engineering estimates and are subject to change.

(2) Flexible storage allocated to Metropolitan under its State Water Contract. Withdrawals must be returned within 5 years.

(3) Article 56 Carryover storage capacity is dependent on the annual State Water Project allocation, which varies from year to year. Article 56 supplies represent water that is allocated to a State Water Project contractor in a given year and carried over to the next year pursuant to the State Water Contract. The January 1, 2017 value includes 42,000 acre-feet of Article 56 carried over by Metropolitan on behalf of Desert Water Agency and Coachella Valley Water District.

(4) Includes Article 56 Carryover from prior years, non-project carryover, and carryover of curtailed deliveries pursuant to Article 14(b) of Metropolitan's State Water Contract.

(5) The Mojave Storage Program agreement was amended in 2011 to allow for cumulative storage of up to 390,000 acre-feet.

(6) Metropolitan's State Water Project carryover capacity ranges from 100,000 to 200,000 acre-feet, on a sliding scale that depends on the final State Water Project allocation. At allocations of 50 percent or less, Metropolitan may store 100,000 acre-feet, and at allocations of 75 percent or greater, Metropolitan may store up to 200,000 acre-feet. For the purposes of this table, the highest possible carryover capacity is displayed.

(7) Includes 298,000 acre-feet of emergency storage in Metropolitan's reservoirs in 2015, 2016, and 2017.

CONSERVATION AND WATER SHORTAGE MEASURES

General

The central objective of Metropolitan's water conservation program is to help ensure adequate, reliable and affordable water supplies for Southern California by actively promoting efficient water use. The importance of conservation to the region has increased in recent years because of drought conditions in the State Water Project watershed and court-ordered restrictions on Bay-Delta pumping, as described under "METROPOLITAN'S WATER SUPPLY–State Water Project – Bay-Delta Proceedings Affecting Water Supply" and "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESAs Biological Opinions." Conservation reduces the need to import water to deliver to member agencies through Metropolitan's system. Water conservation is an integral component of Metropolitan's IRP, WSDM Plan and Water Supply Allocation Plan.

Metropolitan's conservation program has largely been developed to assist its member agencies in meeting the "best management practices" ("BMPs") of the California Urban Water Conservation Council's Memorandum of Understanding Regarding Urban Water Conservation in California ("CUWCC MOU") and to meet the conservation goals of the most recent IRP Update. See "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan." Under the terms of the CUWCC MOU and Metropolitan's Conservation Credits Program, Metropolitan administers regional conservation programs and also co-funds member agency conservation programs designed to achieve greater water use efficiency in residential, commercial, industrial, institutional and landscape uses. Metropolitan uses its Water Stewardship Rate, which is charged for every acre-foot of water conveyed by Metropolitan, together with available grant funds, to fund conservation incentives and other water management programs. All users of Metropolitan's system benefit from the system capacity made available by investments in demand management programs like the Conservation Credits Program. See "METROPOLITAN REVENUES–Rate Structure – Water Stewardship Rate" in this Appendix A. Direct spending by Metropolitan on active conservation incentives, including rebates for water-saving plumbing fixtures, appliances and equipment, from fiscal year 1989-90 through fiscal year 2015-16 was about $731 million. The 2015 IRP Update estimates that 1,197,000 acre-feet of water will be conserved annually in southern California by 2025. See also "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A and "–Drought Response Actions" below.

In addition to ongoing conservation, Metropolitan has developed a WSDM Plan, which splits resource actions into two major categories: Surplus Actions and Shortage Actions. See "–Water Surplus and Drought Management Plan." Conservation and water efficiency programs are part of Metropolitan's resource management strategy which makes up these Surplus and Shortage actions.

Metropolitan's Water Supply Allocation Plan allocates Metropolitan's water supplies among its member agencies, based on the principles contained in the WSDM Plan, to reduce water use and drawdowns from water storage reserves. See "–Water Supply Allocation Plan." Metropolitan's member agencies and retail water suppliers in Metropolitan's service area also have the ability to implement water conservation and allocation programs, and some of the retail suppliers in Metropolitan's service area have initiated conservation measures. The success of conservation measures in conjunction with the Water Supply Allocation Plan is evidenced as a contributing factor in the lower than budgeted water sales during fiscal years 2009-10, 2010-11, 2011-12 and 2015-16.

Legislation approved in November 2009 sets a statewide conservation target for urban per capita water use of 20 percent reductions by 2020 (with credits for existing conservation) at the retail level, providing an additional catalyst for conservation by member agencies and retail suppliers. Metropolitan's water sales projections incorporate an estimate of conservation savings that will reduce retail demands. Current projections include an estimate of additional water use efficiency savings that would result from local agencies reducing their per capita water use in response to the 20 percent by 2020 conservation savings goals required by the 2009 legislation, as well as an estimate of additional conservation that would have to occur to reach Metropolitan's IRP goal of reducing overall regional per capita water use by 20 percent by 2020.

Water Surplus and Drought Management Plan

In addition to the long-term planning guidelines and strategy provided by its IRP, Metropolitan has developed its WSDM Plan for the on-going management of its resources and water supplies in response to hydrologic conditions. The WSDM Plan, which was adopted by Metropolitan's Board in April 1999, evolved from Metropolitan's experiences during the droughts of 1976-77 and 1987-92. The WSDM Plan is a planning document that Metropolitan uses to guide inter-year and intra-year storage operations, and splits resource actions into two major categories: surplus actions and shortage actions. The surplus actions emphasize storage of surplus water inside the region, followed by storage of surplus water outside the region. The shortage actions emphasize critical storage programs and facilities and conservation programs that make up part of Metropolitan's response to shortages. Implementation of the plan is directed by a WSDM team, made up of Metropolitan staff, that meets regularly throughout the year and more frequently between November and April as hydrologic conditions develop. The WSDM team develops and recommends storage actions to senior management on a regular basis and provides updates to the Board on hydrological conditions, storage levels and planned storage actions through detailed reports.

Water Supply Allocation Plan

In times of prolonged or severe water shortages, Metropolitan manages its water supplies through the implementation of its Water Supply Allocation Plan. The Water Supply Allocation Plan was originally approved by Metropolitan's Board in February 2008, and has been implemented three times since its adoption, including most recently in April 2015. The Water Supply Allocation Plan provides a formula for equitable distribution of available water supplies in case of extreme water shortages within Metropolitan's service area. In December 2014, the Board approved certain adjustments to the formula for calculating member agency supply allocations during subsequent periods of implementation of the Water Supply Allocation Plan. Although the Act gives each of Metropolitan's member agencies a preferential entitlement to purchase a portion of the water served by Metropolitan (see "METROPOLITAN REVENUES–Preferential Rights"), historically, these rights have not been used in allocating Metropolitan's water. Metropolitan's member agencies and retail water suppliers in Metropolitan's service area also may implement water conservation and allocation programs within their respective service territories in times of shortage. See also "–Drought Response Actions."

On April 14, 2015, the Board declared a Water Supply Condition 3 and the implementation of the Water Supply Allocation Plan at a Level 3 Regional Shortage Level, effective July 1, 2015 through June 30, 2016. Implementation of the Water Supply Allocation Plan at a Level 3 Regional Shortage Level, and

response to the Governor's Order and related implementing regulations (described under "–Drought Response Actions"), reduced supplies delivered by Metropolitan to Metropolitan's member agencies to approximately 1.6 million acre-feet in fiscal year 2015-16. See also "CONSERVATION AND WATER SHORTAGE MEASURES–General." Due to improved hydrologic conditions, on May 10, 2016, the Board rescinded the Water Supply Allocation Plan, declared a Condition 2 Water Supply Alert, and decided not to implement the Water Supply Allocation Plan for fiscal year 2016-17. In April 2017, the Board will evaluate current water supply conditions and determine if implementation of the Water Supply Allocation Plan is needed for fiscal year 2017-18. In light of current hydrologic conditions and current DWR State Water Project allocation estimates, implementation of the Water Supply Allocation Plan for fiscal year 2017-18 is not currently expected.

Drought Response Actions

The most recent drought of 2012-2015 represents one of the driest periods in the hydrologic record since 1931-1934. In calendar years 2012-2015, to offset reductions in State Water Project supplies and mitigate impacts of the California drought, in addition to utilizing the limited available supplies from the Colorado River and State Water Project deliveries, Metropolitan met water demands in its service area by supplemental water transfers and purchases, and drawing on storage reserves, while also encouraging responsible and efficient water use to lower demands.

As noted under "–Water Supply Allocation Plan" above, actions taken in response to the drought by the State, Metropolitan's Board, and Metropolitan member agencies have contributed to reduced demands in Metropolitan's service area. Following the declaration by Governor Brown on January 17, 2014 of a drought state of emergency for California, on April 1, 2015 Governor Brown issued an Executive Order ("Order") calling for a 25 percent reduction in consumer water use in response to the historically dry conditions. The Governor's Order was implemented through emergency regulation adopted by the SWRCB. On May 18, 2016, the SWRCB adopted modifications to the emergency regulation which replace the state-mandated conservation targets with a supply-based approach that mandates urban water suppliers take actions to ensure at least a three year supply of water to their customers under drought conditions. As a wholesale water agency providing a supplemental water supply to its member agencies, Metropolitan is not subject to the requirements of the Order, which applies to retail water agencies. However, water sales of Metropolitan's member agencies have declined as a result of conservation efforts and other actions taken to comply with the Order and implementing regulation. In addition, since Governor Brown's initial drought emergency proclamation in January 2014, Metropolitan has worked proactively with its member agencies to conserve water supplies in its service area, and significantly expanded its water conservation and outreach programs and increased funding for conservation incentive programs. See "CONSERVATION AND WATER SHORTAGE MEASURES–General." In calendar year 2016, Metropolitan returned approximately 350,000 acre-feet of water to storage and continued to encourage responsible and efficient water use.

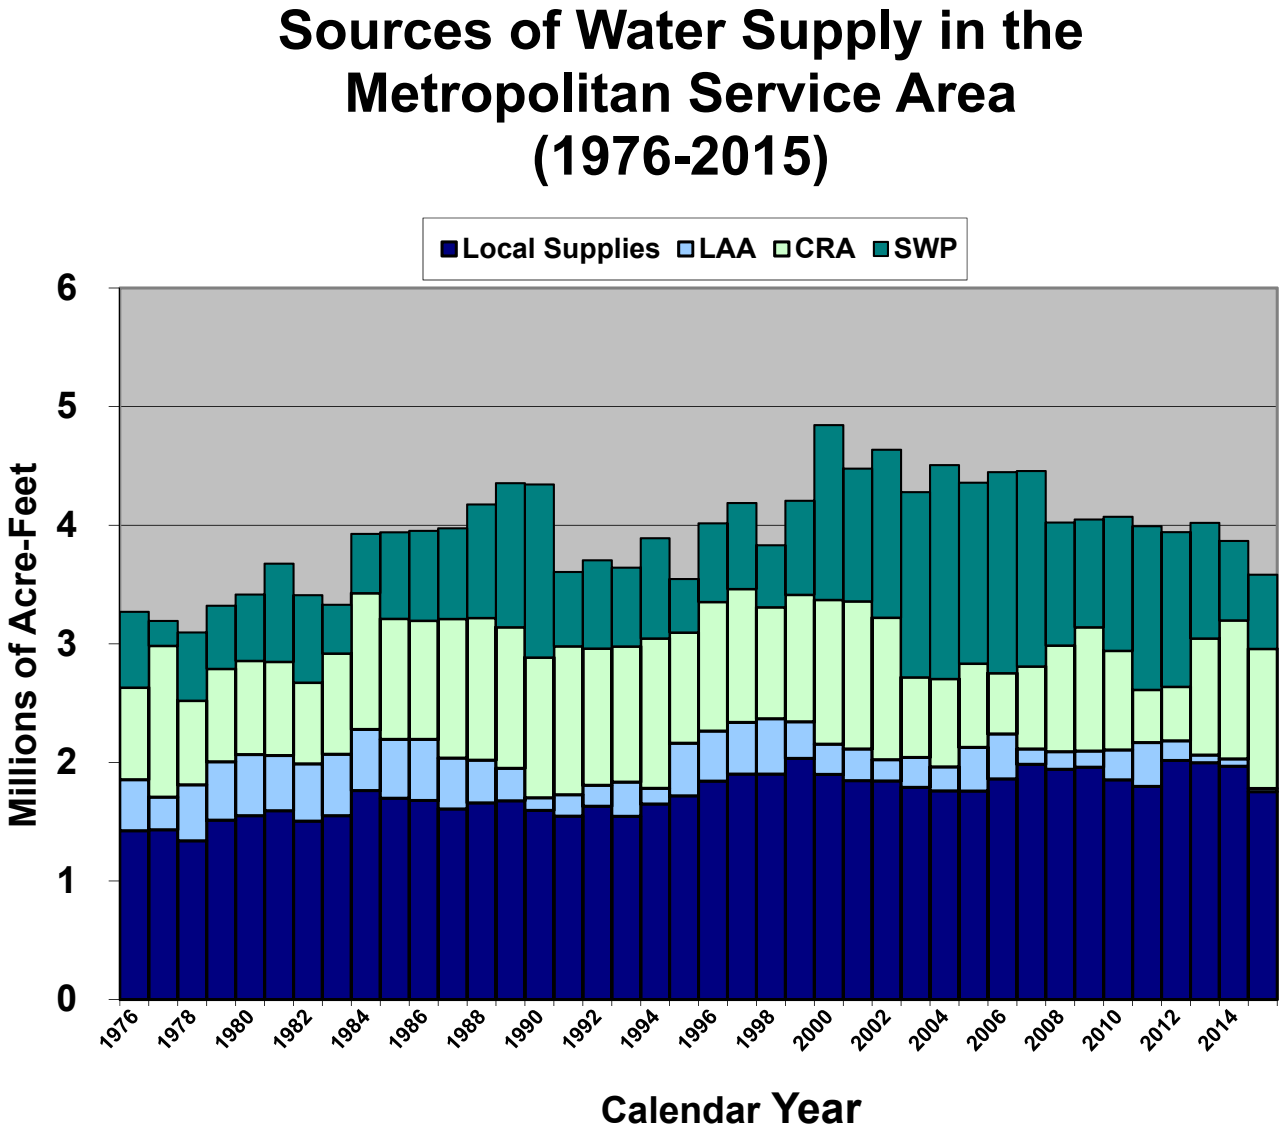
REGIONAL WATER RESOURCES

The water supply for Metropolitan's service area is provided in part by Metropolitan and in part by non-Metropolitan sources available to members. Approximately 60 percent of the water supply for Metropolitan's service area is imported water received by Metropolitan from the CRA and the State Water Project and by the City of Los Angeles (the "City") from the Los Angeles Aqueduct. While the City is one of the largest water customers of Metropolitan, it receives a substantial portion of its water from the Los Angeles Aqueduct and local groundwater supply. The balance of water within the region is produced locally, primarily from groundwater supplies and runoff.

Metropolitan's member agencies are not required to purchase or use any of the water available from Metropolitan. Some agencies depend on Metropolitan to supply nearly all of their water needs, regardless of the weather. Other agencies, with local surface reservoirs or aqueducts that capture rain or snowfall, rely on Metropolitan more in dry years than in years with heavy rainfall, while others, with ample groundwater supplies, purchase Metropolitan water only to supplement local supplies and to recharge groundwater basins.

The demand for supplemental supplies provided by Metropolitan is dependent on water use at the retail consumer level and the amount of locally supplied and conserved water. See "CONSERVATION AND WATER SHORTAGE MEASURES" in this Appendix A and "–Local Water Supplies" below. Consumer demand and locally supplied water vary from year to year, resulting in variability in water sales. Future reliance on Metropolitan supplies will depend on, among other things, local projects and the amount of water, if any, that may be derived from sources other than Metropolitan. In recent years, supplies and demands have been affected by drought, water use restrictions, economic conditions, weather conditions and environmental laws, regulations and judicial decisions, as described in this Appendix A under "METROPOLITAN'S WATER SUPPLY." For information on Metropolitan's water sales revenues, see "METROPOLITAN REVENUES" and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

The following graph shows a summary of the regional sources of water supply for the years 1976 to 2015. Local supplies available within Metropolitan's service area are augmented by water imported by the City through the Los Angeles Aqueduct and Metropolitan supplies provided through the CRA and State Water Project.



Source: Metropolitan.

The major sources of water available to some or all of Metropolitan's member agencies in addition to supplies provided by Metropolitan are described below.

Los Angeles Aqueduct

The City, through its Department of Water and Power ("LADWP"), operates its Los Angeles Aqueduct system to import water from the Owens Valley and the Mono Basin on the eastern slopes of the Sierra Nevada in eastern California. Prior to the 1990-1991 drought, the City had imported an average of 440,000 acre-feet of water annually from the combined Owens Valley/Mono Basin system, of which about 90,000 acre-feet came from the Mono Basin. Under the Mono Lake Basin Water Right Decision (Decision 1631) issued in September 1994, which revised LADWP's water rights licenses in the Mono Basin, the City is limited to export 4,500 acre-feet annually when Mono Lake elevation is between 6,377 to 6,380 feet above mean sea level, and 16,000 acre-feet annually when the elevation is between 6,380 to 6,391 feet above mean sea level, on April 1 of the runoff year. On April 1, 2016, the water level of Mono Lake was 6,378.1 feet above mean sea level. Therefore, Mono Basin water exports for runoff year 2016 were limited to 4,500 acre-feet. The 4,500 acre-feet export limit will remain until the water level in Mono Lake reaches 6,380 feet above mean sea level. Once the elevation of Mono Lake reaches 6,391 feet above mean sea level, a moderate increase in water exports from the Mono Basin above the 16,000 acre-feet limit will be permitted pursuant to Decision 1631.

Pursuant to the City's turnout agreement with DWR, AVEK and Metropolitan, LADWP commenced construction in 2010 of the turnout facilities along the California Aqueduct within AVEK's service area. Upon completion, which is expected in 2017, the turnout will enable delivery of water from the California Aqueduct to the Los Angeles Aqueduct. Conditions precedent to such delivery of water include obtaining agreements for the transfer of non-State Water Project water directly from farmers, water districts or others in Northern and Central California, available capacity in the California Aqueduct and compliance with State Water Project water quality requirements. The agreement allows for use of the turnout for delivery of non-State Water Project water to the City in amounts not to exceed the supplies lost to the City as a result of its Eastern Sierra environmental obligations.

Historically, the Los Angeles Aqueduct and local groundwater supplies have been nearly sufficient to meet the City's water demands during normal water supply years. As a result, prior to the 1990-1991 drought, only about 13 percent of the City's water needs (approximately 82,000 acre-feet) were supplied by Metropolitan. From fiscal year 2000-01 to fiscal year 2015-16, approximately 31 to 75 percent of the City's total water requirements were met by Metropolitan. For the five fiscal years ended June 30, 2016, the City's water deliveries from Metropolitan averaged approximately 348,680 acre-feet per year, which constituted approximately 64 percent of the City's total water supply. Deliveries from Metropolitan to the City during this period varied between approximately 166,000 acre-feet per year and approximately 442,000 acre-feet per year. See "METROPOLITAN REVENUES–Principal Customers" in this Appendix A. According to LADWP's 2015 Urban Water Management Plan, the City is planning to increase locally-developed supplies including recycled water, new conservation, stormwater capture and local groundwater from the average for the five-year period ending June 30, 2015 of 14 percent to 47 percent of its normal year supplies by fiscal year 2039-40. Accordingly, the City's reliance on Metropolitan supplies is expected to decrease from the five year average ending June 30, 2016 of 64 percent to 11 percent of its normal year supplies by fiscal year 2039-40. However, the City may still purchase up to 311,000 acre-feet per year or 44 percent of its dry year supplies from Metropolitan until 2040. This corresponds to an increase from normal to dry years of approximately 237,000 acre-feet in potential demand for supplies from Metropolitan.

LADWP analyzed the additional impacts to the Los Angeles Aqueduct's water supply deliveries for various environmental projects aimed at improving air quality and fish and riparian habitat in the Owens Valley. In November 2014, LADWP reached an agreement over implementation of dust control measures on Owens Lake which saved approximately 12,000 to 14,000 acre-feet of water in 2015 and is expected to expand water savings in the future. LADWP reports that in 2016, 71,400 acre-feet of water was devoted to

dust and environmental mitigation projects in the Owens Valley and Eastern Sierra, resulting in the need to purchase an equivalent amount of Metropolitan supply.

Local Water Supplies

Local water supplies are made up of groundwater, groundwater recovery, surface runoff, recycled water, and seawater desalination. Metropolitan supports local resources development through its Local Resources Program ("LRP"), which provides financial incentives up to $340 per acre-foot of water production from local water recycling, groundwater recovery and seawater desalination projects. Metropolitan utilizes conjunctive use of groundwater to encourage storage in groundwater basins. Member agencies and other local agencies have also independently funded and developed additional local supplies, including groundwater clean-up, recycled water and desalination of brackish or high salt content water.

Metropolitan's water sales projections are based in part on projections of locally-supplied water. Projections of future local supplies are based on estimated yields from sources and projects that are currently producing water or are under construction at the time a water sales projection is made. Additional reductions in Metropolitan's water sales projections are made to account for future local supply augmentation projects, based on the IRP Update goals. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Projections" and "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A.

Groundwater. Demands for about 1.35 million acre-feet per year, about one-third of the annual water demands for approximately 18.8 million residents of Metropolitan's service area, are met from groundwater production. Local groundwater supplies are supported by recycled water, which is blended with imported water and recharged into groundwater basins, and also used for creating seawater barriers that protect coastal aquifers from seawater intrusion.

Member Agency Storage Programs. Metropolitan has developed a number of local programs to work with its member agencies to increase storage in groundwater basins. Metropolitan has encouraged storage through its cyclic and conjunctive use storage programs. These programs allow Metropolitan to deliver water into a groundwater basin in advance of agency demands. Metropolitan has drawn on dry-year supply from cyclic storage accounts and nine contractual conjunctive use storage programs to address shortages from the State Water Project and the CRA.

Cyclic storage agreements allow pre-delivery of imported water for recharge into groundwater basins in excess of an agency's planned and budgeted deliveries making best use of available capacity in conveyance pipelines, use of storm channels for delivery to spreading basins, and spreading basins. This water is then purchased at a later time when the agency has a need for groundwater replenishment deliveries.

Conjunctive use agreements provide for storage of imported water that can be called for use by Metropolitan during dry, drought, or emergency conditions. During a dry period, Metropolitan has the option to call water stored in the groundwater basins pursuant to its contractual conjunctive use agreements. At the time of the call, the member agency pays Metropolitan the prevailing rate for that water. Nine conjunctive use projects provide about 210,000 acre-feet of groundwater storage and have a combined extraction capacity of about 70,000 acre-feet per year. As of January 2017, the balance in the nine accounts was approximately 1,000 acre-feet. See table "Metropolitan's Water Storage Capacity and Water in Storage" under "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A.

Recovered Groundwater. Contamination of groundwater supplies is a growing threat to local groundwater production. Metropolitan has been supporting increased groundwater production and improved regional supply reliability by offering financial incentives to agencies for production and treatment of degraded groundwater since 1991. Metropolitan has executed agreements with local agencies to provide financial incentives to 25 projects that recover contaminated groundwater with total contract yields of about

118,000 acre-feet per year. During fiscal year 2015-16, Metropolitan provided incentives for approximately 49,000 acre-feet of recovered water under these agreements. Total groundwater recovery use under executed agreements is expected to grow to 79,000 acre-feet in 2020.

Surface Runoff. Local surface water resources consist of runoff captured in storage reservoirs and diversions from streams. Since 1980, agencies have used an average of 116,000 acre-feet per calendar year of local surface water. Local surface water supplies are heavily influenced by year to year local weather conditions, varying from a high of 188,000 acre-feet in calendar year 1998 to a low of 65,000 acre-feet in calendar year 2003.

Recycled Water. Metropolitan has supported recycled water use to offset water demands and improve regional supply reliability by offering financial incentives to agencies for production and sales of recycled water since 1982. Metropolitan has executed agreements with local agencies to provide financial incentives to 82 recycled water projects with total contract yields of about 323,000 acre-feet per year. During fiscal year 2015-16, Metropolitan provided incentives for approximately 179,000 acre-feet of reclaimed water under these agreements. Total recycled water use under executed agreements is expected to be approximately 193,000 acre-feet by 2020.

Seawater Desalination. Metropolitan's IRP includes seawater desalination as a part of the region's local supply that could help increase supply reliability in Metropolitan's service area. The IRP also supports foundational actions to lay the groundwork for accelerating seawater desalination development as needed in the future. To encourage local development, Metropolitan has signed Seawater Desalination Program ("SDP") incentive agreements with three of its member agencies: Long Beach, Municipal Water District of Orange County ("MWDOC") and West Basin Municipal Water District. The SDP agreements provide incentives to the member agencies of up to $250 per acre-foot when the desalinated supplies are produced. Agreement terms are for the earlier of 25 years or through 2040 and are designed to phase out if Metropolitan's rates surpass the unit cost of producing desalinated seawater. SDP agreements are subject to final approval by Metropolitan's Board after review of the complete project description and environmental documentation. These projects are currently in the development phase and collectively, if completed, are anticipated to produce up to 46,000 acre-feet annually. Each agreement automatically terminates in 2020 if the related project is not operational by that time. In October 2014, seawater desalination projects became eligible for funding under Metropolitan's Local Resources Program.

In late 2015, Poseidon Resources LLC ("Poseidon") completed and began operating the 56,000 acre-foot capacity Carlsbad Desalination Project ("Carlsbad Project") and associated pipeline. The SDCWA has a purchase agreement with Poseidon for a minimum of 48,000 acre-feet per year with an option to purchase an additional 8,000 acre-feet per year. Other seawater desalination projects that could provide supplies to Metropolitan's service area are under development or consideration. In partnership with the Orange County Water District, Poseidon is also developing a 56,000 acre-feet per year plant in Huntington Beach which is currently in the permitting phase. SDCWA is also studying the potential for a seawater desalination plant in Camp Pendleton which would initially produce up to 56,000 acre-feet per year and potentially up to 168,000 acre-feet per year with a phased build out. Calleguas Municipal Water District is studying the potential for a 20,000 to 80,000 acre-feet per year project in Ventura County. Otay Water District, located in San Diego County along the Mexico border, is considering the feasibility of purchasing water from a seawater desalination project in Rosarito Beach, Mexico. The 56,000 to 112,000 acre-feet per year project is in the pre-construction phase, and could also supply Metropolitan's service area through exchange agreements. Approvals from a number of U.S. and Mexican federal agencies, along with State and local approvals, would be needed for the cross-border project to proceed.

METROPOLITAN'S WATER DELIVERY SYSTEM

Primary Facilities and Method of Delivery

Metropolitan's water delivery system is made up of three basic components: the CRA, the California Aqueduct of the State Water Project and Metropolitan's internal water distribution system. Metropolitan's delivery system is integrated and designed to meet the differing needs of its member agencies. Metropolitan seeks redundancy in its delivery system to assure reliability in the event of an outage. Improvements are designed to increase the flexibility of the system. Since local sources of water are generally used to their maximum each year, growth in the demand for water is partially met by Metropolitan. Accordingly, the operation of Metropolitan's water system is being made more reliable through the rehabilitation of key facilities as needed, improved preventive maintenance programs and the upgrading of Metropolitan's operational control systems. See "CAPITAL INVESTMENT PLAN" in this Appendix A.

Colorado River Aqueduct. Work on the CRA commenced in 1933 and water deliveries started in 1941. Additional facilities were completed by 1961 to meet additional requirements of Metropolitan's member agencies. The CRA is 242 miles long, starting at the Lake Havasu intake and ending at the Lake Mathews terminal reservoir. Metropolitan owns all of the components of the CRA, which include five pumping plants, 64 miles of canal, 92 miles of tunnels, 55 miles of concrete conduits and 144 underground siphons totaling 29 miles in length. The pumping plants lift the water approximately 1,617 feet over several mountain ranges to Metropolitan's service area. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct" in this Appendix A.

State Water Project. The initial portions of the State Water Project serving Metropolitan were completed in 1973. The State Water Project, managed and operated by DWR, is one of the largest water supply projects undertaken in the history of water development. The State Water Project facilities dedicated to water delivery consist of a complex system of dams, reservoirs, power plants, pumping plants, canals and aqueducts to deliver water. Water from rainfall and snowmelt runoff is captured and stored in State Water Project conservation facilities and then delivered through State Water Project transportation facilities to water agencies and districts located throughout the Upper Feather River, Bay Area, Central Valley, Central Coast, and Southern California. Metropolitan receives water from the State Water Project through the main stem of the aqueduct system, the California Aqueduct, which is 444 miles long and includes 381 miles of canals and siphons, 49 miles of pipelines or tunnels and 13 miles of channels and reservoirs.

As described herein, Metropolitan is the largest (in terms of number of people it serves, share of State Water Project water it has contracted to receive, and percentage of total annual payments made to DWR therefor) of twenty-nine agencies and districts that have entered into contracts with DWR to receive a water entitlement from the State Water Project. Contractors pay all costs of the facilities in exchange for participation rights in the system. Thus, Contractors also have the right to use the portion of the State Water Project conveyance system necessary to deliver water to them at no additional cost as long as capacity exists. See "METROPOLITAN'S WATER SUPPLY–State Water Project" in this Appendix A.

Internal Distribution System. Metropolitan's internal water distribution system includes components that were built beginning in the 1930s and through the present. Metropolitan owns all of these components, including 14 dams and reservoirs, five regional treatment plants, over 800 miles of transmission pipelines, feeders and canals, and 16 hydroelectric plants with an aggregate capacity of 131 megawatts.

Diamond Valley Lake. Diamond Valley Lake, a man-made reservoir, built, owned and operated by Metropolitan, is located southwest of the city of Hemet, California. It covers approximately 4,410 acres and has capacity to hold approximately 810,000 acre-feet or 265 billion gallons of water. Diamond Valley Lake was constructed to serve approximately 90 percent of Metropolitan's service area by gravity flow. Imported water is delivered to Diamond Valley Lake during surplus periods. The reservoir provides more reliable delivery of imported water from the State Water Project and the CRA during summer months, droughts and emergencies. In addition, Diamond Valley Lake is capable of providing more than one-third of Southern

California's water needs from storage for approximately six months after a major earthquake (assuming that there has been no impairment of Metropolitan's internal distribution network). See the table "Metropolitan's Water Storage Capacity and Water in Storage" under "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A for the amount of water in storage at Diamond Valley Lake. Excavation at the project site began in May 1995. Diamond Valley Lake was completed in March 2000, at a total cost of $2 billion, and was in full operation in December 2001.

Inland Feeder. Metropolitan's Inland Feeder is a 44-mile-long conveyance system that connects the State Water Project to Diamond Valley Lake and the CRA. The Inland Feeder provides greater flexibility in managing Metropolitan's major water supplies and allows greater amounts of State Water Project water to be accepted during wet seasons for storage in Diamond Valley Lake. In addition, the Inland Feeder increases the conveyance capacity from the East Branch of the State Water Project by 1,000 cubic feet per second, allowing the East Branch to operate up to its full capacity. Construction of the Inland Feeder was completed in September 2009 at a total cost of $1.14 billion.

Operations Control Center. Metropolitan's water conveyance and distribution system operations are coordinated from the Operations Control Center ("OCC") located in the Eagle Rock area of Los Angeles. The OCC plans, balances and schedules daily water and power operations to meet member agencies' demands, taking into consideration the operational limits of the entire system.

Water Treatment

Metropolitan filters and disinfects water at five water treatment plants: the F.E. Weymouth Treatment Plant, the Joseph Jensen Treatment Plant, the Henry J. Mills Treatment Plant, the Robert B. Diemer Treatment Plant, and the Robert A. Skinner Treatment Plant. In recent years, the plants typically treat between 0.8 billion and 1.0 billion gallons of water per day, and have a maximum capacity of approximately 2.6 billion gallons per day. Approximately 50 percent of Metropolitan's water deliveries are treated water.

Federal and state regulatory agencies continually monitor and establish new water quality standards. New water quality standards could affect availability of water and impose significant compliance costs on Metropolitan. The federal Safe Drinking Water Act ("SDWA") establishes drinking water quality standards, monitoring, and public notification and enforcement requirements for public water systems. To achieve these objectives, the USEPA, as the lead regulatory authority, promulgates national drinking water regulations and develops the mechanism for individual states to assume primary enforcement responsibilities. The SWRCB Division of Drinking Water ("DDW"), formerly the Drinking Water Program under the California Department of Public Health ("CDPH"), has primary responsibility for the regulation of public water supply systems in the State. Drinking water delivered to customers must comply with statutory and regulatory water quality standards designed to protect public health and safety that are now administered by DDW. Metropolitan operates its five water treatment plants under a domestic water supply permit issued by DDW which is amended, as necessary, such as when significant facility modifications occur. Metropolitan operates and maintains water storage, treatment and conveyance facilities, implements watershed management and protection activities, performs inspections, monitors drinking water quality, and submits monthly and annual compliance reports. In addition, public water system discharges to state and federal waters are regulated under general National Pollutant Discharge Elimination System ("NPDES") permits. The SWRCB issued these NPDES permits to Metropolitan which contain numerical effluent limitations, monitoring, reporting, and notification requirements for water discharges from the facilities and pipelines of Metropolitan's water supply and distribution system.

Metropolitan continually monitors new water quality laws and regulations and frequently comments on new legislative proposals and regulatory rules. Metropolitan is currently operating in compliance with all state and federal drinking water regulations and permit requirements.

Seismic Considerations

General. Although the magnitude of damages resulting from a significant seismic event are impossible to predict, Metropolitan's water conveyance and distribution facilities are designed either to withstand a maximum probable seismic event or to minimize the potential repair time in the event of damage. The five pumping plants on the CRA have been buttressed to better withstand seismic events. Other components of the CRA are monitored for any necessary rehabilitation and repair. Metropolitan personnel and independent consultants periodically reevaluate the internal water distribution system's vulnerability to earthquakes. As facilities are evaluated and identified for seismic retrofitting, they are prioritized, with those facilities necessary for delivering or treating water scheduled for upgrade before non-critical facilities. However, major portions of the California Aqueduct and the CRA are located near major earthquake faults, including the San Andreas Fault. A significant earthquake could damage structures and interrupt the supply of water, adversely affecting Metropolitan's revenues and its ability to pay its obligations. Therefore, emergency supplies are stored for use throughout Metropolitan's service area, and a six-month reserve supply of water normally held in local storage (including emergency storage in Diamond Valley Lake) provides reasonable assurance of continuing water supplies during and after such events (assuming there has been no impairment of Metropolitan's internal distribution network).

Metropolitan has an ongoing surveillance program that monitors the safety and structural performance of its 14 dams and reservoirs. Operating personnel perform regular inspections that include monitoring and analyzing seepage flows and pressures. Engineers responsible for dam safety review the inspection data and monitor the horizontal and vertical movements for each dam. Major on-site inspections are performed at least twice each year. Instruments that transmit seismic acceleration time histories for analysis any time a dam is subjected to strong motion during an earthquake are located at a number of selected sites.

In addition, Metropolitan has developed an emergency plan that calls for specific levels of response appropriate to an earthquake's magnitude and location. Included in this plan are various communication tools, as well as a structured plan of management that varies with the severity of the event. Pre-designated personnel follow detailed steps for field facility inspection and distribution system patrol. Approximately 40 employees are designated to respond immediately under certain identifiable seismic events. An emergency operations center is maintained at the OCC. The OCC, which is specifically designed to be earthquake resistant, contains communication equipment, including a radio transmitter, microwave capability and a response line linking Metropolitan with its member agencies, DWR, other utilities and the State's Office of Emergency Services.

Metropolitan also maintains machine, fabrication and coating shops at its facility in La Verne, California. Several construction projects have been completed to upgrade and expand these shops. A total of nearly $40 million has been invested to enhance Metropolitan's capacity not only to provide fabrication and coating services for planned rehabilitation work, maintenance activities, and capital projects, but also to perform emergency fabrication support to Metropolitan and its member agencies. Metropolitan has also maintained reimbursable agreements with DWR to perform machining, fabrication, and coating services for critical repair and rehabilitation of State Water Project facilities. These agreements have enhanced timely and cost-effective emergency response capabilities. Materials to fabricate pipe and other appurtenant fittings are kept in inventory at the La Verne site. In the event of earthquake damage, Metropolitan has taken measures to provide the design and fabrication capacity to fabricate pipe and related fittings. Metropolitan is also staffed to perform emergency repairs and has pre-qualified contractors for emergency repair needs at various locations throughout Metropolitan's service area.

State Water Project Facilities- California Aqueduct. The California Aqueduct crosses all major faults either by canal at ground level or by pipeline at very shallow depths to ease repair in case of damage from movement along a fault. State Water Project facilities are designed to withstand major earthquakes along a local fault or magnitude 8.1 earthquakes along the San Andreas Fault without major damage. Dams, for example, are designed to accommodate movement along their foundations and to resist earthquake forces

on their embankments. Earthquake loads have been taken into consideration in the design of project structures such as pumping and power plants. The location of check structures on the canal allows for hydraulic isolation of the fault-crossing repair.

While the dams, canals, pump stations and other constructed State Water Project facilities have been designed to withstand earthquake forces, the critical supply of water from Northern California must traverse the Bay-Delta through hundreds of miles of varying levels of engineered levees that are susceptible to major failures due to flood and seismic risk. In the event of a failure of the Bay-Delta levees, the quality of the Bay-Delta's water could be severely compromised as salt water comes in from the San Francisco Bay. Metropolitan's supply of State Water Project water would be adversely impacted if pumps that move Bay-Delta water southward to the Central Valley and Southern California are shut down to contain the salt water intrusion. Metropolitan estimates that stored water supplies, CRA supplies and local water resources that would be available in case of a levee breach or other interruption in State Water Project supplies would meet demands in Metropolitan's service area for approximately twelve months. See "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A. Since the State and federal governments control the Bay-Delta levees, repair of any levee failures would be the responsibility of and controlled by the State and federal governments.

Metropolitan, in cooperation with the State Water Contractors, developed recommendations to DWR for emergency preparedness measures to maintain continuity in export water supplies and water quality during emergency events. These measures include improvements to emergency construction materials stockpiles in the Bay-Delta, improved emergency contracting capabilities, strategic levee improvements and other structural measures of importance to Bay-Delta water export interests, including development of an emergency freshwater pathway to export facilities in a severe earthquake. DWR utilized $12 million in fiscal year 2007-08 for initial stockpiling of rock for emergency levee repairs and development of Bay-Delta land and marine loading facilities and has identified future funding for expanded stockpiles.

State Water Project-Perris Dam. Perris Dam forms Lake Perris, the southernmost terminal reservoir for the State Water Project in Riverside County, with maximum capacity of approximately 130,000 acre-feet of water. Metropolitan uses water from Lake Perris for delivery to customers in Riverside and San Diego counties. Deliveries from the lake are used as a redundant source for the Mills Water Treatment Plant, drought supply from a flexible storage account, and for consumptive use by Metropolitan's customers. DWR reported in July 2005 that seismic studies indicate that DWR's Perris Dam facility could sustain damage from moderate earthquakes along the San Jacinto or San Andreas faults due to potential weaknesses in the dam's foundation. In late 2005, DWR lowered the water level in the reservoir by about 25 feet and reduced the amount of water stored in the reservoir to about 75,000 acre-feet as DWR evaluated alternatives for repair of the dam. In December 2006, DWR completed a study identifying various repair options, began additional geologic exploration along the base of Perris Dam and started preliminary design. DWR's preferred alternative is to repair the dam to restore the reservoir to its historical level. On November 11, 2011, DWR certified the final EIR and filed a Notice of Determination stating its intent to proceed with the preferred alternative. DWR estimates that repairs will cost approximately $141 million to be completed in mid-2017. Under the original allocation of joint costs for this facility, the State would have paid approximately six percent of the repair costs. However, because of the recreational benefit this facility provides to the public, the Legislature has approved a recommendation from DWR that the State assume 32.2 percent of these repair costs. The remaining 67.8 percent of repairs costs will be paid for by the three agencies that use the water stored in Lake Perris: Metropolitan (42.9 percent), DWA (3.0 percent) and CVWD (21.9 percent). DWR recovers the cost of repairs through its annual statement of charges sent to each agency. See "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

Security Measures

Metropolitan conducts ground and air patrols of the CRA and monitoring and testing at all treatment plants and along the CRA. Similarly, DWR has in place security measures reasonably designed to protect critical facilities of the State Water Project, including both ground and air patrols of the State Water Project.

Although Metropolitan has constructed redundant systems and other safeguards to ensure its ability to continually deliver water to its customers, and DWR has made similar efforts, a terrorist attack or other security breach against water facilities could materially impair Metropolitan's ability to deliver water to its customers, its operations, and revenues and its ability to pay its obligations.

CAPITAL INVESTMENT PLAN

General Description

Metropolitan's current Capital Investment Plan (the "Capital Investment Plan" or "CIP") involves expansion and rehabilitation of existing facilities and construction of new facilities to meet future water demands, ensure system reliability as well as enhance operational efficiency and flexibility, and comply with water quality regulations. Metropolitan's CIP is regularly reviewed and updated. Metropolitan's biennial budget process includes a review of the projected long-term capital needs and the development of a capital expenditure forecast for the ten-year financial forecast, as well as the identification of the capital priorities of Metropolitan over the biennial budget term. Implementation and construction of specific elements of the program are subject to Board approval, and the amount and timing of borrowings will depend upon, among other factors, status of construction activity and water demands within Metropolitan's service area. From time to time, projects that have been undertaken are delayed, redesigned or deferred by Metropolitan for various reasons, and no assurance can be given that a project in the CIP will be completed in accordance with its original schedule or that any project will be completed as currently planned. In addition, from time to time, when circumstances warrant, Metropolitan's Board may approve capital expenditures other than or in addition to those contemplated by the CIP at the time of the then current biennial budget.

Projection of Capital Investment Plan Expenditures

The table below sets forth the projected CIP expenditures in the adopted biennial budget for fiscal years 2016-17 and 2017-18, including replacement and refurbishment expenditures, by project type for the fiscal years ending June 30, 2017 through 2021. This estimate is updated every two years as a result of the periodic review and adoption of the capital budget by Metropolitan's Board of Directors. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

CAPITAL INVESTMENT PLAN
PROJECTION OF EXPENDITURES[1] [2]
(Fiscal Years Ended June 30 - Dollars in Thousands)

Cost of Service	2017	2018	2019	2020	2021	Total
Conveyance & Aqueduct	$ 19,772	$ 32,934	$ 32,433	$ 30,396	$ 29,042	$ 144,578
Storage	1,455	--	--	--	--	1,455
Distribution	50,818	80,197	95,411	107,446	126,015	459,887
Treatment	88,345	67,691	55,746	50,292	37,678	299,753
Administrative and General	36,649	18,846	16,325	11,398	7,229	90,448
Hydroelectric	2,960	332	84	468	36	3,880
Total[2]	$200,000[3]	$200,000	$200,000	$200,000	$200,000	$1,000,000

Source: Metropolitan.

(1) Fiscal years 2016-17 and 2017-18 based on the adopted biennial budget for fiscal years 2016-17 and 2017-18. Fiscal years 2018-19 through 2020-21 based on the ten-year financial forecast provided in the adopted biennial budget. Totals are rounded.

(2) Annual totals include replacement and refurbishment expenditures for fiscal years 2016-17 through 2020-21 of $115 million, $159 million, $176 million, $182 million, and $192 million, respectively, for a total of $823 million for fiscal years 2016-17 through 2020-21.

(3) Fiscal year 2016-17 capital expenditures are currently estimated to be approximately $212 million.

The above projections do not include amounts for contingencies, but include escalation at 2.77 percent per year for projects for which formal construction contracts have not been awarded. Additional

capital costs may arise in the future as a result of, among other things, federal and State water quality regulations, project changes and mitigation measures necessary to satisfy environmental and regulatory requirements, and for additional facilities. See "METROPOLITAN'S WATER DELIVERY SYSTEM–Water Treatment" in this Appendix A.

Capital Investment Plan Financing

The CIP requires funding from debt financing (see "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A) as well as from pay-as-you-go funding. The Board has adopted an internal funding objective to fund 60 percent of capital program expenditures from current revenues. The remainder of capital program expenditures will be funded through the issuance from time to time of water revenue bonds, which are payable from Net Operating Revenues. However, as in prior years, pay-as-you-go funding may be reduced or increased by the Board during the fiscal year.

On April 8, 2014, Metropolitan's Board approved a total of $466 million for pay-as-you-go expenditures as part of the biennial budget for fiscal year 2014-15 and fiscal year 2015-16. These pay-as-you-go funds, together with funds available in the Replacement and Refurbishment Fund, were expected to fund $513 million in capital expenditures for fiscal year 2014-15 and fiscal year 2015-16. On October 13, 2015, Metropolitan's Board adopted an ordinance finding that the interests of the district require the use of new revenue bonds in an amount not to exceed $500 million. On December 17, 2015, Metropolitan issued its $208,255,000 Water Revenue Bonds, 2015 Authorization Series A to reimburse certain pay-as-you-go capital expenditures and to fund a portion of fiscal year 2016-17 capital expenditures.

Metropolitan's budget assumptions for the adopted biennial budget for fiscal years 2016-17 and 2017-18 and projections for later years provide for the issuance of approximately $80 million of additional water revenue bonds to fund or to reimburse prior capital expenditures in each of fiscal years 2016-17 through 2020-21. These revenue bonds could be issued either as Senior Revenue Bonds under the Senior Debt Resolutions or as Subordinate Revenue Bonds under the Subordinate Debt Resolutions (each as defined under "METROPOLITAN EXPENSES–Limitations on Additional Revenue Bonds" in this Appendix A). The cost of these projected bond issues are reflected in the financial projections under, "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. Metropolitan expects to issue its $80,000,000 Water Revenue Bonds, 2017 Authorization Series A in March 2017 for the purposes of financing a portion of its capital expenditures through fiscal year 2017-18.

Other Capital Expenses

On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves.

On March 8, 2016, Metropolitan's Board authorized the General Manager to enter into an agreement to purchase certain property from Delta Wetlands Properties, LLC in Contra Costa, San Joaquin, and Solano Counties (the "Delta Islands"). Although no determination has been made, potential applications for these properties include: (1) tidal wetlands; (2) water quality; (3) studies and research; (4) re-creation of food web; (5) subsidence studies or prevention; (6) habitat restoration; (7) mitigation credits; (8) carbon sequestration; (9) emergency preparedness, including seismic preparation and study; (10) water transfers; and (11) using portions for access or staging of a future Delta fix, like the proposed California Water Fix project. On July 18, 2016, escrow closed and purchase of these properties was completed. On December 21, 2016, Metropolitan issued its $175,000,000 Subordinate Water Revenue Bonds, 2016 Authorization Series A (Taxable) to reimburse itself for the purchase. See "METROPOLITAN EXPENSES–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations" in this Appendix A.

Major Projects of Metropolitan's Capital Investment Plan

Oxidation Retrofit Facilities. The oxidation retrofit facilities program includes the design and construction of oxidation facilities and appurtenances at all five of Metropolitan's treatment plants. This program is intended to allow Metropolitan to meet drinking water standards for disinfection by-products and reduce taste and odor incidents. The oxidation retrofit improvements have been completed at three treatment plants: the Henry J. Mills Treatment Plant, the Joseph Jensen Treatment Plant and the Robert B. Diemer Treatment Plant. Completion of the improvements at the F.E. Weymouth plant is expected in 2017. Total oxidation program costs at the F.E. Weymouth plant are estimated to be $270.0 million. Oxidation retrofit at the Robert A. Skinner plant was substantially completed in December 2009 and operational in 2010, with additional follow-up work planned for completion in June 2018. The total estimated cost for all prior and projected oxidation retrofit facilities program improvements at the five treatment plants is approximately $1.12 billion, with $1.07 billion spent through September 2016. Budgeted aggregate capital expenditures for improvements remaining to be completed at the F.E. Weymouth and Robert A. Skinner plants for fiscal years 2016-17 and 2017-18 are $25 million.

F.E. Weymouth Treatment Plant Improvements. The F.E. Weymouth Treatment Plant, built in 1938, is Metropolitan's oldest water treatment facility. It has been subsequently expanded several times since its original construction. Metropolitan has completed several upgrades and refurbishment/replacement projects to maintain the plant's reliability and improve its efficiency. These include power systems upgrades, a residual solids dewatering facility, refurbishment/replacement of the mechanical equipment in two of the eight flocculation and settling basins, a new plant maintenance facility, new chemical feed systems and storage tanks, replacement of the plant domestic/fire water system, seismic upgrades to the plant inlet structure and filter buildings, and a new chlorine handling and containment facility. Planned projects over the next several years include refurbishment of the plant's filters and settling basins, seismic retrofits to the administration building, and replacement of the valves used to control filter operation. The cost estimate for all prior and projected improvements at the Weymouth plant, not including the ozone facilities, is approximately $407.1 million, with $243 million spent through September 2016. Budgeted aggregate capital expenditures for improvements at the Weymouth plant for fiscal years 2016-17 and 2017-18 are $31.5 million.

Robert B. Diemer Treatment Plant Improvements. The Robert B. Diemer Treatment Plant, built in in 1963 and subsequently expanded in 1968, is Metropolitan's second oldest water treatment facility. Several upgrades and refurbishment/replacement projects have been completed at the Diemer plant, including power system upgrades, a new residual solids dewatering facility, new vehicle and plant maintenance facilities, new chemical feed systems and storage tanks, a new chlorine handling and containment facility, construction of a roller-compacted concrete slope stabilization system and a new secondary access road. Planned projects over the next several years include refurbishment of the plant's settling basins, seismic retrofits to the filter buildings and administration building, and replacement of the valves used to control filter operation. The current cost estimate for all prior and projected improvements at the Diemer Treatment Plant, not including the ozone facilities, is approximately $381.1 million, with $234.5 million spent through September 2016. Budgeted aggregate capital expenditures for improvements at the Diemer plant for fiscal years 2016-17 and 2017-18 are $42.3 million.

Colorado River Aqueduct Facilities. As previously noted, deliveries through the CRA began in 1941. Through annual inspections and maintenance activities, the performance and reliability of the various components of the CRA are regularly evaluated. Projects under the CRA facilities program are designed to replace or refurbish facilities and components on the CRA system in order to reliably convey water from the Colorado River to Southern California. A variety of projects have been completed over the past 10 years, including, among other things, replacement of high voltage circuit breakers and transformers at the five pumping plant switchyards, refurbishment of operators and power centers on the head gates downstream of the pumping plants, replacement of several miles of deteriorated concrete canal liner, new wastewater systems at the Hinds and Eagle Mountain Pumping Plants, and replacement of the outlet gates and appurtenant electrical, mechanical, and control systems at the Copper Basin Reservoir. Refurbishment or

replacement of many of the electrical system components, including the transformers, circuit breakers and motor control centers, is currently under way. Additionally, many of the mechanical and electrical components at all five pumping plants will be evaluated and replaced or refurbished over the next several years. The currently projected cost estimate for all prior and planned refurbishment or replacement projects is $650.2 million. Costs through September 2016 were $208.2 million. Budgeted aggregate capital expenditures for improvements on the CRA for fiscal years 2016-17 and 2017-18 are $87.9 million.

Distribution System – Prestressed Concrete Cylinder Pipe. Metropolitan's distribution system is comprised of approximately 830 miles of pipelines ranging in diameter from 30 inches to over 200 inches. (See "METROPOLITAN'S WATER DELIVERY SYSTEM" in this Appendix A.) 163 miles of the distribution system is made up of prestressed concrete cylinder pipe ("PCCP"). In response to PCCP failures experienced by several water agencies, Metropolitan initiated the PCCP Assessment Program in December 1996 to evaluate the condition of Metropolitan's PCCP lines and investigate inspection and refurbishment methods. As a result, Metropolitan has identified and made repairs to several sections of PCCP. The costs for these repairs through September 2016 were $90.3 million. Rather than continue to make spot repairs to pipe segments, Metropolitan has initiated a long-term capital program to rehabilitate approximately 100 miles of PCCP in five pipelines. The estimated cost to reline all 100 miles of PCCP is approximately $2.6 billion and is expected to be undertaken over a period of approximately 20 years. Budgeted aggregate capital expenditures for PCCP rehabilitation for fiscal years 2016-17 and 2017-18 are $39.3 million.

Distribution System – Refurbishments and Improvements. In addition to the long-term program to rehabilitate Metropolitan's PCCP lines, several other components of the distribution system are being refurbished and/or improved. Ongoing projects to ensure the reliability of the distribution system, primarily due to age, include multiple replacements or refurbishments of isolation and control valves and gates, lining replacement on the Etiwanda Pipeline and portions of the Orange County Feeder, a new steel liner for the Bernasconi Tunnel, seismic upgrades to the Santa Ana River Bridge, refurbishment to pressure control and hydroelectric power facilities, system improvements to provide drought relief, and various other upgrades totaling approximately $228.2 million through September 2016. The currently projected cost estimate for the prior and planned refurbishment or replacement projects, other than the PCCP relining, is $749.3 million. For fiscal years 2016-17 and 2017-18, budgeted aggregate capital expenditures for improvements on the distribution system, other than PCCP rehabilitation, are $74.2 million.

METROPOLITAN REVENUES

General

Until water deliveries began in 1941, Metropolitan's activities were, by necessity, supported entirely through the collection of *ad valorem* property taxes. Since the mid-1980s, water sales revenues have provided approximately 75 to 85 percent of total revenues and *ad valorem* property taxes have accounted for about 10 percent of revenues, declining to seven percent of revenues in fiscal year 2015-16. See "–Revenue Allocation Policy and Tax Revenues." The remaining revenues have been derived principally from the sale of hydroelectric power, interest on investments and additional revenue sources (water standby charges and availability of service charges) beginning in 1992. *Ad valorem* taxes do not constitute a part of Operating Revenues and are not available to make payments with respect to the water revenue bonds issued by Metropolitan.

The basic rate for untreated water service for domestic and municipal uses is $666 per acre-foot at the Tier 1 level, which became effective January 1, 2017. This rate will increase to $695 effective January 1, 2018. See "–Rate Structure" and "–Water Rates." The *ad valorem* tax rate for Metropolitan purposes has gradually been reduced from a peak equivalent rate of 0.1250 percent of full assessed valuation in fiscal year 1945-46 to 0.0035 percent of full assessed valuation for fiscal year 2016-17. The rates charged by Metropolitan represent the cost of Metropolitan wholesale water service to its member agencies, and not the cost of water to the ultimate consumer. Metropolitan does not exercise control over the rates charged by its member agencies or their subagencies to their customers.

Summary of Revenues by Source

The following table sets forth Metropolitan's sources of revenues for the five fiscal years ended June 30, 2016. The table provides cash basis information for fiscal year 2012, and modified accrual basis information for fiscal years 2013-2016. All information is unaudited. Audited financial statements for the fiscal years ended June 30, 2016 and June 30, 2015 and unaudited financial statements for the six months ended December 31, 2016 and December 31, 2015 are provided in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF REVENUES BY SOURCE[1]
Fiscal Years Ended June 30
(Dollars in Millions)

	2012	2013	2014	2015	2016
Water Sales[2]	$1,062	$1,283	$1,485	$1,383	$1,166
Net Tax Collections[3]	90	95	95	104	108
Additional Revenue Sources[4]	167	173	182	199	200
Interest on Investments	18	(2)	19	16	17
Hydroelectric Power Sales	31	25	15	8	7
Other Revenues [5]	54	23	19	163	246
Total Receipts	$1,422	$1,597	$1,815	$1,873	$1,744

Source: Metropolitan.

(1) Does not include any proceeds from the sale of bonded indebtedness.
(2) Gross revenues in each year are for sales in the twelve months ended June 30 of such year. Water sales revenues include revenues from water wheeling and exchanges.
(3) *Ad valorem* taxes levied by Metropolitan are applied solely to the payment of outstanding general obligation bonds of Metropolitan and to State Water Contract obligations.
(4) Includes receipts derived from water standby charges, readiness-to-serve, and capacity charges.
(5) Includes miscellaneous revenues and Build America Bonds (BABs) subsidy payment of $13.3 million, $12.7 million, $12.3 million, $12.3 million, and $12.3 million, in fiscal years 2011-12 through 2015-16, respectively. In fiscal years 2014-15 and 2015-16, includes $142 million and $222 million of water conservation and water purchase expenditures, funded from a like amount of funds transferred from the Water Management Fund.

Revenue Allocation Policy and Tax Revenues

The Board determines the water revenue requirement for each fiscal year after first projecting the *ad valorem* tax levy for that year. The tax levy for any year is subject to limits imposed by the State Constitution, the Act and Board policy and to the requirement under the State Water Contract that in the event that Metropolitan fails or is unable to raise sufficient funds by other means, Metropolitan must levy upon all property within its boundaries not exempt from taxation a tax or assessment sufficient to provide for all payments under the State Water Contract. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. From fiscal year 1990-91 through 2012-13, and pursuant to the Act, the tax levy was set to not exceed the amount needed to pay debt service on Metropolitan's general obligation bonds and to satisfy a portion of Metropolitan's State Water Contract obligation. However, Metropolitan has authority to impose a greater tax levy to pay debt service on Metropolitan's general obligation bonds and to satisfy Metropolitan's State Water Contract obligations in full if, following a public hearing, the Board finds that such revenue is essential Metropolitan's fiscal integrity. For each fiscal year since 2013-14, the Board has exercised that authority and voted to suspend the tax limit clause in the Act, maintaining the fiscal year 2012-13 *ad valorem* tax rate for fiscal years 2013-14 through 2016-17. Any deficiency between tax levy receipts and Metropolitan's share of debt service obligations on general obligation bonded debt issued by the State is expected to be paid from Operating Revenues, as defined in the Senior Debt Resolutions (defined herein under "METROPOLITAN EXPENSES–Limitations on Additional Revenue Bonds").

Water Sales Revenues

General; Authority. Water rates are established by the Board and are not subject to regulation or approval by the Public Utilities Commission of California or by any other local, State or federal agency. In accordance with the Act, water rates must be uniform for like classes of service. Metropolitan currently provides two classes of water service (1) full service treated and untreated, and (2) wheeling service. See "–Classes of Water Service."

No member agency of Metropolitan is obligated to purchase water from Metropolitan. However, 21 of Metropolitan's 26 member agencies have entered into 10-year voluntary water supply purchase orders ("Purchase Orders") effective through December 31, 2024. See "–Member Agency Purchase Orders." Consumer demand and locally supplied water vary from year to year, resulting in variability in water sales revenues. Metropolitan uses its financial reserves and budgetary tools to manage the financial impact of the variability in revenues due to fluctuations in annual water sales. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

Payment Procedure. Water is delivered to the member agencies on demand and is metered at the point of delivery. Member agencies are billed monthly and a late charge of one percent of the delinquent payment is assessed for a payment that is delinquent for no more than five business days. A late charge of two percent of the amount of the delinquent payment is charged for a payment that is delinquent for more than five business days for each month or portion of a month that the payment remains delinquent. Metropolitan has the authority to suspend service to any member agency delinquent for more than 30 days. Delinquencies have been rare; in such instances late charges have been collected. No service has been suspended because of delinquencies.

Water Sales. The following table sets forth the acre-feet of water sold and water sales (including sales from water wheeling and exchanges) for the five fiscal years ended June 30, 2016. Water sales revenues of Metropolitan for the four fiscal years ended June 30, 2013 through June 30, 2016, respectively, on an accrual basis, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF WATER SOLD AND WATER SALES
Fiscal Years Ended June 30

Year	Acre-Feet[(1)] Sold	Water Sales[(2)] (in millions)	Dollars Per Acre-Foot[(3)]	Average Dollars Per 1,000 Gallons
2012	1,676,855	$1,062.5	$634	$1.94
2013	1,856,685	1,282.5	691	2.12
2014	2,043,720	1,484.6	726	2.23
2015	1,905,502	1,383.0	726	2.23
2016	1,623,052	1,166.0	718	2.20

Source: Metropolitan.

(1) Year ended April 30 for fiscal year 2011-12, water sales recorded on a cash-basis. Beginning fiscal year 2012-13, water sales recorded on an accrual basis, with water sales for the fiscal year ended June 30.

(2) Water Sales in fiscal year 2011-12 are recorded on a cash basis for sales in the twelve months ended April 30 of such year, with rates and charges invoiced in May and payable by the last business day of June of each year. Water sales for fiscal years 2012-13 through 2015-16 are recorded on a modified accrual basis for sales in the twelve months ended June 30 of such year, with rates and charges recorded as revenues in the same months as invoiced. Includes revenues from water wheeling and exchanges.

(3) Gross water sales divided by acre-feet sold. An acre-foot is approximately 326,000 gallons. See table entitled "SUMMARY OF WATER RATES" under "–Water Rates" for a description of water rates and classes of service.

Principal Customers

Total water sales accrued for the fiscal year ended June 30, 2016 were 1.62 million acre-feet, generating $1.17 billion in water sales revenues for such period. Metropolitan's ten largest water customers in the year ended June 30, 2016 are shown in the following table, on an accrual basis. The SDCWA has filed litigation challenging Metropolitan's rates. See "–Litigation Challenging Rate Structure."

TEN LARGEST WATER CUSTOMERS
Year Ended June 30, 2016
Accrual Basis (Dollars in Millions)

Agency	Water Sales Revenues[1]	Percent of Total	Water Sales in Acre-Feet[1]	Percent of Total
San Diego County Water Authority	$ 270.9	23.2%	465,568	28.7%
City of Los Angeles	224.3	19.2	332,527	20.5
MWD of Orange County	140.3	12.0	171,666	10.6
West Basin MWD	100.0	8.6	107,319	6.6
Calleguas MWD	77.7	6.7	83,346	5.1
Eastern MWD	53.1	4.6	62,631	3.9
Western MWD	51.6	4.4	65,532	4.0
Three Valleys MWD	42.5	3.6	54,356	3.3
Central Basin MWD	35.5	3.0	46,745	2.9
City of Long Beach	24.3	2.1	27,684	1.7
Total	$1,020.2	87.5%	1,417,374	87.3%
Total Water Sales Revenues	$1,166.0	**Total Acre-Feet**	1,623,052	

Source: Metropolitan.

(1) Includes wheeling and exchange water sales, revenues and deliveries.

Rate Structure

The following rates and charges are elements of Metropolitan's rate structure for full service water deliveries:

Tier 1 and Tier 2 Water Supply Rates. The rate structure recovers supply costs through a two-tiered price structure. The Tier 1 Supply Rate supports a regional approach through the uniform, postage stamp rate. The Tier 1 Supply Rate is calculated as the amount of the total supply revenue requirement that is not covered by the Tier 2 Supply Rate divided by the estimated amount of Tier 1 water sales. The Tier 2 Supply Rate is a volumetric rate that reflects Metropolitan's cost of purchasing water transfers north of the Delta. Member agencies are charged the Tier 1 or Tier 2 Water Supply Rate for water purchases, as described under "–Member Agency Purchase Orders."

System Access Rate. The System Access Rate (SAR) recovers the cost of the Conveyance and Distribution System that is used on an average annual basis through a uniform, volumetric rate. The SAR is charged for each acre-foot of water transported by Metropolitan, regardless of the ownership of the water being transported. All users (including member agencies and third-party wheelers) using the Metropolitan system to transport water pay the same SAR for the use of the system conveyance and distribution capacity to meet average annual demands.

Water Stewardship Rate. The Water Stewardship Rate (WSR) provides a dedicated source of funding for conservation and local resources development through a uniform, volumetric rate. The WSR is

charged to each acre-foot of water delivered by Metropolitan, regardless of the water being transported. All users (member agencies and third-party wheelers) benefit from the system capacity made available by investments in Demand Management Programs like Metropolitan's Conservation Credits Program and Local Resources Program. Therefore, all users pay the WSR.

System Power Rate. The System Power Rate (SPR) recovers the cost of energy required to pump water to Southern California through the State Water Project and CRA. The cost of power is recovered through a uniform, volumetric rate. The SPR is applied to all deliveries of Metropolitan water to member agencies. Wheeling parties pay for actual cost (not system average) of power needed to move the water. Member agencies engaging in wheeling transaction of up to one year pay the wheeling rate (consisting of the actual cost of power, SAR, WSR, and an administrative fee). Other wheeling transactions are pursuant to individual contracts.

Treatment Surcharge. The Treatment Surcharge recovers all of the costs of providing treatment capacity and operations through a uniform, volumetric rate per acre-foot of treated water sales. The Treatment Surcharge is charged to all treated water sales.

The amount of each of these rates since January 1, 2012, is shown in the table entitled "SUMMARY OF WATER RATES" under "–Water Rates."

Member Agency Purchase Orders

The current rate structure allows member agencies to choose to purchase water from Metropolitan by means of a Purchase Order. Purchase Orders are voluntary agreements that determine the amount of water that a member agency can purchase at the Tier 1 Supply Rate. They allow member agencies to purchase a greater amount of water at the lower Tier 1 Supply Rate than would otherwise be authorized by the Administrative Code. In exchange for the higher Tier 1 Maximum, the member agency commits to purchase a specific amount of water (based on past purchase levels) over the term of the agreement. Such agreements allow member agencies to manage costs and provide Metropolitan with a measure of secure revenue.

In November 2014, the Metropolitan Board approved new Purchase Orders effective January 1, 2015 through December 31, 2024 (the "Purchase Order Term"). Twenty-one of the twenty-six member agencies have Purchase Orders, which commit the member agencies to purchase a minimum amount of supply from Metropolitan (the "Purchase Order Commitment").

The key terms of the Purchase Orders include:

- A ten-year term, effective January 1, 2015 through December 31, 2024;
- A higher Tier 1 limit based on the Base Period Demand, determined by the member agency's choice between (1) the Revised Base Firm Demand, which is the highest fiscal year purchases during the 13-year period of fiscal year 1989-90 through fiscal year 2001-02, or (2) the highest year purchases in the most recent 12-year period of fiscal year 2002-03 through 2013-14. The demand base is unique for each member agency, reflecting its use of Metropolitan's system water over time;
- An overall purchase commitment by the member agency based on the Demand Base period chosen, times ten to reflect the ten-year Purchase Order term. Those agencies choosing the more recent 12-year period may have a higher Tier 1 Maximum and commitment. The commitment is also unique for each member agency;
- The opportunity to reset the Base Period Demand using a five-year rolling average;

- Any obligation to pay the Tier 2 Supply Rate will be calculated over the ten-year period, consistent with the calculation of any Purchase Order commitment obligation; and

- An appeals process for agencies with unmet purchase commitments that will allow each acre-foot of unmet commitment to be reduced by the amount of production from a local resource project that commences operation on or after January 1, 2014.

Member agencies that do not have Purchase Orders in effect are subject to Tier 2 Supply Rates for amounts exceeding 60 percent of their base amount (equal to the member agency's highest fiscal year demand between 1989-90 and 2001-02) annually.

Other Charges

The following paragraphs describe the additional charges for the availability of Metropolitan's water:

Readiness-to-Serve Charge. The Readiness-to-Serve Charge ("RTS") recovers the cost of the portion of the system that is available to provide emergency service and available capacity during outages and hydrologic variability. The RTS is a fixed charge that is allocated among the member agencies based on a ten-fiscal year rolling average of firm demands. Water transfers and exchanges are included for purposes of calculating the ten-fiscal-year rolling average. The Standby Charge, described below, will continue to be collected at the request of member agency and applied as a direct offset to the member agency's RTS obligation. The RTS generated $154.0 million in fiscal year 2013-14, $162.0 million in 2014-15, and $155.5 million in 2015-16. Based on the adopted rates and charges, the RTS is projected to generate $144 million in fiscal year 2016-17 and $137.5 million in fiscal year 2017-18.

Water Standby Charges. The Standby Charge is authorized by the State Legislature and has been levied by Metropolitan since fiscal year 1992-93. Metropolitan will continue to levy the Standby Charge only within the service areas of the member agencies that request that the Standby Charge be utilized to help fund a member agency's RTS obligation. See "– Readiness-to-Serve Charge" above. The Standby Charge for each acre or parcel of less than an acre will vary from member agency to member agency, reflecting current rates, which have remained the same since fiscal year 1993-94, and range from $6.94 to $15 for each acre or parcel less than an acre within Metropolitan's service area, subject to specified exempt categories. Standby charges are assessments under the terms of Proposition 218, a State constitutional ballot initiative approved by the voters on November 5, 1996, but Metropolitan's current standby charges are exempt from Proposition 218's procedural requirements. See "–California Ballot Initiatives."

Twenty-two member agencies collect their RTS charges through standby charges. For fiscal years 2013-14, 2014-15, and 2015-16, RTS charges collected by means of such standby charges were $41.7 million, $41.7 million, and $42.8 million, respectively.

Capacity Charge. The Capacity Charge recovers costs incurred to provide peaking capacity within Metropolitan's distribution system. The Capacity Charge provides a price signal to encourage agencies to reduce peak demands on the distribution system and to shift demands that occur during the May 1 through September 30 period into the October 1 through April 30 period. This results in more efficient utilization of Metropolitan's existing infrastructure and deferring capacity expansion costs. Each member agency will pay the Capacity Charge per cubic feet per second based on a three-year trailing maximum peak day demand. Effective January 1, 2014, the Capacity Charge was $8,600 per cubic feet per second. The Capacity Charge was $11,100 per cubic feet per second on January 1, 2015, and $10,900 per cubic feet per second on January 1, 2016, and will be $8,000 per cubic feet per second on January 1, 2017, and $8,700 per cubic feet per second on January 1, 2018. The Capacity Charge is projected to generate $39.7 million in fiscal year 2016-17 and $35.2 million in fiscal year 2017-18.

Classes of Water Service

Metropolitan offers two classes of water service:

(1) *Full Service Water* - Full service water service, formerly known as non-interruptible water service, includes water sold to member agencies for domestic and municipal uses; and

(2) Wheeling Service - Wheeling Service refers to the use of Metropolitan's facilities, including its rights to use State Water Project facilities, to transport water not owned or controlled by Metropolitan to its member public agencies, in transactions entered into by Metropolitan for a period of up to one year.

The applicable rate components and fixed charges for each class of water service are shown in the chart below.

Current Services and Rate Components

	Rates & Charges That Apply					
Service	**System Access**	**Water Stewardship**	**System Power**	**Tier 1/ Tier 2**	**Readiness to Serve**	**Capacity Charge**
Full Service (Treated or Untreated)	Yes	Yes	Yes	Yes	Yes	Yes
Wheeling Service	Yes	Yes	No	No	Yes	Yes

Metropolitan offers two programs that encourage the member agencies to increase groundwater and emergency storage and for which certain Metropolitan charges are inapplicable.

(1) Conjunctive Use Program. The Conjunctive Use Program is operated through individual agreements with member and retail agencies for groundwater storage within Metropolitan's service area. Wet-year imported supplies are stored to enhance reliability during dry, drought, and emergency conditions. Metropolitan has the option to call water stored in the groundwater basins for the participating member agency pursuant to its contractual conjunctive use agreement. At the time of the call, the member agency pays the prevailing rate for that water, but the deliveries are excluded from the calculation of the Capacity Charge because Conjunctive Use Program deliveries are made at Metropolitan's Discretion. See "REGIONAL WATER RESOURCES–Local Water Supplies."

(2) Emergency Storage Program. The Emergency Storage Program is used for delivering water for emergency storage in surface water reservoirs and storage tanks. Emergency Storage Program purposes include initially filling a newly constructed reservoir or storage tank and replacing water used during an emergency.

The applicable rate components and fixed charges applicable for each such program are shown in the following chart.

Current Programs and Rate Components

	Rates & Charges That Apply					
Full Service Program	**System Access**	**Water Stewardship**	**System Power**	**Tier 1/ Tier 2**	**Readiness to Serve**	**Capacity Charge**
Conjunctive Use Program	Yes	Yes	Yes	Yes	Yes	No
Emergency Storage Program	Yes	Yes	Yes	No*	No	No

*Emergency Storage Program pays the Tier 1 Supply Rate; purchases under Emergency Storage program do not count towards a member agency's Tier 1 Maximum.

Water Rates

The following table sets forth Metropolitan's water rates by category beginning January 1, 2012. See also "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Revenues" in this Appendix A. In addition to the base rates for untreated water sold in the different classes of service, the columns labeled "Treated" include the surcharge that Metropolitan charges for water treated at its water treatment plants. See "–Rate Structure" and "–Classes of Water Service" above for a description of current rates. See also "–Litigation Challenging Rate Structure" for a description of litigation challenging Metropolitan's water rates.

SUMMARY OF WATER RATES
(Dollars per Acre-Foot)

	SUPPLY RATE		SYSTEM ACCESS RATE	WATER STEWARDSHIP RATE	SYSTEM POWER RATE	TREATMENT SURCHARGE
	Tier 1	Tier 2				
January 1, 2012	$164[1]	$290	$217	$43	$136	$234
January 1, 2013	$140	$290	$223	$41	$189	$254
January 1, 2014	$148	$290	$243	$41	$161	$297
January 1, 2015	$158	$290	$257	$41	$126	$341
January 1, 2016	$156	$290	$259	$41	$138	$348
January 1, 2017*	$201	$295	$289	$52	$124	$313
January 1, 2018*	$209	$295	$299	$55	$132	$320

	FULL SERVICE TREATED[2]		FULL SERVICE UNTREATED[3]		INTERIM AGRICULTURAL PROGRAM		REPLENISHMENT RATE	
	Tier 1	Tier 2	Tier 1	Tier 2	Treated	Untreated	Treated	Untreated
January 1, 2012	$794	$920	$560	$686	$765	$537	$651	$442
January 1, 2013	$847	$997	$593	$743	**	**	**	**
January 1, 2014	$890	$1,032	$593	$735	**	**	**	**
January 1, 2015	$923	$1,055	$582	$714	**	**	**	**
January 1, 2016	$942	$1,076	$594	$728	**	**	**	**
January 1, 2017*	$979	$1,073	$666	$760	**	**	**	**
January 1, 2018*	$1,015	$1,101	$695	$781	**	**	**	**

Source: Metropolitan.

* Rates effective January 1, 2017 and January 1, 2018 were adopted by Metropolitan's Board on April 12, 2016.

** The Interim Agricultural Water Program and Replenishment Service Program were discontinued after 2012. The Interim Agricultural Water Program provided a discounted rate for agricultural water users that, pursuant to the Act, were permitted to receive only surplus water not needed for domestic or municipal purposes. Under the Replenishment Service Program, water was sold at a discounted rate to member agencies, subject to interruption upon notice by Metropolitan. The program allowed Metropolitan to deliver surplus imported water to local groundwater basins and surface storage facilities when supplies were available, with the intent that member agencies could reduce imported water deliveries from Metropolitan during periods of high demand, emergencies or times of shortage.

(1) Includes $58 per acre-foot Delta Supply Surcharge for January 1, 2012.

(2) Full service treated water rates are the sum of the applicable Supply Rate, System Access Rate, Water Stewardship Rate, System Power Rate and Treatment Surcharge.

(3) Full service untreated water rates are the sum of the applicable Supply Rate, System Access Rate, Water Stewardship Rate and System Power Rate.

Financial Reserve Policy

Metropolitan's reserve policy currently provides for a minimum unrestricted reserve balance at June 30 of each year that is based on probability studies of the wet periods that affect Metropolitan's water sales. The policy establishes a minimum targeted unrestricted reserve level based on an 18-month revenue shortfall estimate and a target level based on an additional two years revenue shortfall estimate. Funds representing the minimum reserve level are held in the Revenue Remainder Fund, and any funds in excess of the minimum reserve level are held in the Water Rate Stabilization Fund. Metropolitan established the Water Rate Stabilization Fund for the principal purpose of maintaining stable and predictable water rates and charges. If Metropolitan's fixed charge coverage ratio, which measures the total coverage of all fixed obligations (which includes all revenue bond debt service obligations, State Water Contract capital payments paid from current year operations and subordinate obligations) after payment of operating expenditures, is less than 1.2 times, funds above the target reserve level may be utilized for funding of capital expenditures or for the redemption, defeasance or purchase of outstanding bonds or commercial paper, as determined by the Board. If Metropolitan's fixed charge coverage ratio, is at or above 1.2 times, funds above the target may be used for any lawful purpose of Metropolitan, as determined by the Board. See "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

At June 30, 2016, unrestricted reserves, which consist of the Water Rate Stabilization Fund and the Revenue Remainder Fund, totaled $475 million on a modified accrual basis. As of June 30, 2016, the minimum reserve requirement was $205 million and the target reserve level was $490 million.

From time to time, Metropolitan's Board approves the use of unrestricted reserves. On May 26, 2015, Metropolitan's Board approved the use of $160 million of unrestricted reserves, above the target reserve level, for conservation incentives. In addition, $50 million from the Water Stewardship Fund and $140 million from the Water Management Fund funded conservation incentives. On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves. On September 22, 2015, Metropolitan's Board approved $44.4 million to pay SNWA to store 150,000 acre-feet of water with Metropolitan. Metropolitan took delivery of this water in 2015. When SNWA requests the return of any of the stored water, SNWA will reimburse Metropolitan for an equivalent proportion of the $44.4 million, based on the amount of water returned plus inflation. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Interim Surplus Guidelines*"* in this Appendix A.

Due to SDCWA's litigation challenging Metropolitan's rates and pursuant to the exchange agreement between Metropolitan and SDCWA, Metropolitan is required to set aside funds based on the quantities of exchange water that Metropolitan provides to SDCWA and the amount of charges disputed by SDCWA. This amount included disputed payments and interest earned thereon, which is based on the rate earned by Metropolitan's investment portfolio. In April 2016, Metropolitan transferred these funds from unrestricted financial reserves to a new designated fund, the Exchange Agreement Set-Aside Fund. As of December 31, 2016, Metropolitan had set aside $278.7 million in the Exchange Agreement Set-Aside Fund. This amount includes disputed payments and interest earned thereon based on the rate earned by Metropolitan's investment portfolio. The amounts held do not include the statutory prejudgment interest, post-judgment interest, attorneys' fees, or costs awards, none of which the exchange agreement requires to be held. Amounts held pursuant to the exchange agreement will continue to accumulate based on the quantities of exchange water that Metropolitan provides to SDCWA and the payments disputed by SDCWA, until the litigation, including all appeals, is concluded. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct – Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" and "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A.

As described below, Metropolitan has executed two $200 million Short-Term Revolving Credit Facilities (as defined below), under which Metropolitan may borrow from time-to-time. Funds drawn under

the Short-Term Revolving Credit Facilities may be used for any lawful purpose. In April 2016, Metropolitan drew $125 million from each Short-Term Revolving Credit Facility (as defined below), for a total of $250 million, and deposited these amounts in Metropolitan's unrestricted financial reserves. An additional draw of approximately $50 million is expected by the end of June 2017, with such amount to be deposited in Metropolitan's unrestricted financial reserves. See "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Senior Parity Obligations – Short-Term Revolving Credit Facilities" in this Appendix A.

Metropolitan projects that its unrestricted reserves as of June 30, 2017 will be approximately $378 million. This amount does not include funds held in the Exchange Agreement Set-Aside Fund. This projection is based on the assumptions set forth in the table entitled "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" under "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. In addition, this projection is based on the assumption that Metropolitan's Board will not authorize the use of any additional amounts in the unrestricted reserves.

California Ballot Initiatives

Proposition 218, a State ballot initiative known as the "Right to Vote on Taxes Act," was approved by the voters on November 5, 1996 adding Articles XIIIC and XIIID to the California Constitution. Article XIIID provides substantive and procedural requirements on the imposition, extension or increase of any "fee" or "charge" levied by a local government upon a parcel of real property or upon a person as an incident of property ownership. As a wholesaler, Metropolitan serves water to its member agencies, not to persons or properties as an incident of property ownership. Thus, water rates charged by Metropolitan to its member agencies are not property related fees and charges and therefore are exempt from the requirements of Article XIIID. Fees for retail water service by Metropolitan's member agencies or their agencies are subject to the requirements of Article XIIID.

Article XIIID also imposes certain procedures with respect to assessments. Under Article XIIID, "standby charges" are considered "assessments" and must follow the procedures required for "assessments," unless they were in existence on the effective date of Article XIIID. Metropolitan has imposed its water standby charges since 1992 and therefore its current standby charges are exempt from the Article XIIID procedures. Changes to Metropolitan's current standby charges could require notice to property owners and approval by a majority of such owners returning mail-in ballots approving or rejecting any imposition or increase of such standby charge. Twenty-two member agencies have elected to collect all or a portion of their readiness-to-serve charges through standby charges. See "–Other Charges – Readiness-to-Serve Charge" and "– Water Standby Charges" above. Even if Article XIIID is construed to limit the ability of Metropolitan and its member agencies to impose or collect standby charges, the member agencies will continue to be obligated to pay the readiness-to-serve charges.

Article XIIIC makes all taxes general or special taxes and imposes voting requirements for each kind of tax. It also extends the people's initiative power to reduce or repeal previously authorized local taxes, assessments, fees and charges. This extension of the initiative power is not limited by the terms of Article XIIIC to fees imposed after November 6, 1996 or to property-related fees and charges and absent other authority could result in retroactive reduction in existing taxes, assessments or fees and charges.

Proposition 26, a State ballot initiative aimed at restricting regulatory fees and charges, was approved by the California voters on November 2, 2010. Proposition 26 broadens the definition of "tax" in Article XIIIC of the California Constitution to include levies, charges and exactions imposed by local governments, except for charges imposed for benefits or privileges or for services or products granted to the payor (and not provided to those not charged) that do not exceed their reasonable cost; regulatory fees that do not exceed the cost of regulation and are allocated in a fair or reasonable manner; fees for the use of local governmental property; fines and penalties imposed for violations of law; real property development fees; and assessments and property-related fees imposed under Article XIIID of the California Constitution.

Special taxes imposed by a special district such as Metropolitan are subject to approval by two-thirds of the electorate voting on the ballot measure for authorization. Proposition 26 applies to charges imposed or increased by local governments after the date of its approval. Metropolitan believes its water rates and charges are not taxes under Proposition 26. SDCWA's lawsuit challenging the rates adopted by Metropolitan in April 2012, part of which became effective January 1, 2013 and part of which became effective January 1, 2014, alleged that such rates violate Proposition 26. On April 24, 2014, a trial court decision stated such rates, effective in 2013 and 2014, violate Proposition 26. The trial court's rulings, including the decision that specific rates violate certain laws, are on appeal. (See "–Litigation Challenging Rate Structure.")

Propositions 218 and 26 were adopted as measures that qualified for the ballot pursuant to the State's initiative process. From time to time, other initiative measures could be adopted or legislative measures could be approved by the Legislature, which may place limitations on the ability of Metropolitan or its member agencies to increase revenues or to increase appropriations. Such measures may further affect Metropolitan's ability to collect taxes, assessments or fees and charges, which could have an effect on Metropolitan's revenues.

Preferential Rights

Section 135 of the Act gives each of Metropolitan's member agencies a preferential entitlement to purchase a portion of the water served by Metropolitan, based upon a ratio of all payments on tax assessments and otherwise, except purchases of water, made to Metropolitan by the member agency compared to total payments made by all member agencies on tax assessments and otherwise since Metropolitan was formed, except purchases of water. Historically, these rights have not been used in allocating Metropolitan's water. The California Court of Appeal has upheld Metropolitan's methodology for calculation of the respective member agencies' preferential rights under Section 135 of the Act. SDCWA's litigation challenging Metropolitan's water rates also challenges Metropolitan's exclusion of payments for exchange water from the calculation of SDCWA's preferential right. On August 28, 2015, the trial court ruled that SDCWA "is entitled to a judicial declaration (a) that Metropolitan's current methodology for calculating San Diego's preferential rights violates Section 135 of the Metropolitan Water District Act; and (b) directing Metropolitan to include San Diego's payments for the transportation of water under the Exchange Agreement in Metropolitan's calculation of San Diego's preferential rights." This ruling is subject to appeal. See "–Litigation Challenging Rate Structure."

Litigation Challenging Rate Structure

SDCWA filed *San Diego County Water Authority v. Metropolitan Water District of Southern California, et al.* on June 11, 2010. The complaint alleges that the rates adopted by the Board on April 13, 2010, which became effective January 1, 2011 and January 1, 2012, misallocate certain State Water Contract costs to the System Access Rate and the System Power Rate, and thus to charges for transportation of water, and that this results in an overcharge to SDCWA by at least $24.5 million per year. The complaint alleges that all State Water Project costs should be allocated instead to Metropolitan's Supply Rate, even though under the State Water Contract Metropolitan is billed separately for transportation, power and supply costs. It states additionally that Metropolitan will overcharge SDCWA by another $5.4 million per year by including the Water Stewardship Rate in transportation charges. Eight of Metropolitan's member agencies (the Cities of Glendale, Los Angeles and Torrance, MWDOC and Foothill, Las Virgenes, Three Valleys and West Basin Municipal Water Districts) answered the complaint in support of Metropolitan. IID joined the litigation in support of SDCWA's challenge to Metropolitan's charges for transportation of water, but withdrew and dismissed all claims against Metropolitan with prejudice on October 30, 2013.

The complaint requested a court order invalidating the rates adopted April 13, 2010, and that Metropolitan be mandated to allocate costs associated with the State Water Contract and the Water Stewardship Rate to water supply rates and not to transportation rates. Rates in effect in prior years are not

challenged in this lawsuit. Metropolitan contends that its rates are reasonable, equitably apportioned among its member agencies and lawful, and were adopted under a valid rate structure and cost of service approach developed in a multi-year collaborative process with its member agencies that was adopted in 2001 and has been in place since 2003. Nevertheless, to the extent that a final court ruling invalidates Metropolitan's adopted rates, Metropolitan will be obligated to reconsider and modify rates to comply with any final court rulings related to Metropolitan's rates. While components of the rate structure and costs may change as a result of any final ruling, Metropolitan expects that aggregate rates and charges would still recover Metropolitan's cost of service. As such, revenues would not be affected. If Metropolitan's rates are revised in the manner proposed by SDCWA in the complaint, other member agencies may pay higher rates unless other actions are taken by the Board.

SDCWA filed its First Amended Petition for Writ of Mandate and Complaint on October 27, 2011, adding five new claims to this litigation, two of which were eliminated from the case on January 4, 2012. The three remaining new claims are for breach of the water exchange agreement between Metropolitan and SDCWA (described herein under "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct–Sale of Water by the Imperial Irrigation District to San Diego County Water Authority") based on allegedly illegal rates; improper exclusion of SDCWA's payments under this exchange agreement from calculation of SDCWA's preferential rights to purchase Metropolitan supplies (see "–Preferential Rights"); and illegality of the "rate structure integrity" provision in conservation and local resources incentive agreements between Metropolitan and SDCWA. The "rate structure integrity" provision permits the Board to terminate incentives payable under conservation and local resources incentive agreements between Metropolitan and a member agency due to certain actions by the member agency to challenge the rates that are the source of incentive payments. In June 2011, Metropolitan's Board authorized termination of two incentive agreements with SDCWA under the "rate structure integrity" provision in such agreements after SDCWA filed its initial complaint challenging Metropolitan's rates. SDCWA filed a Second Amended Petition for Writ of Mandate and Complaint on April 17, 2012, which contains additional allegations but no new causes of action.

On June 8, 2012, SDCWA filed a new lawsuit challenging the rates adopted by Metropolitan on April 10, 2012 and effective on January 1, 2013 and January 1, 2014. See "–Rate Structure" above and "–Water Rates" for a description of Metropolitan's water rate structure and the rates and charges adopted on April 10, 2012. The complaint contains allegations similar to those in the Second Amended Petition for Writ of Mandate and Complaint and new allegations asserting that Metropolitan's rates, adopted in April 2012, violate Proposition 26. See "–California Ballot Initiatives" for a description of Proposition 26. Metropolitan contends that its rates adopted on April 10, 2012 are reasonable, equitably apportioned among its member agencies and lawful and were adopted under a valid rate structure and cost of service approach. Ten of Metropolitan's member agencies (the eight member agency parties to SDCWA's first lawsuit, Eastern Municipal Water District and Western Municipal Water District of Riverside County) answered the complaint in support of Metropolitan and IID joined the litigation in support of SDCWA. Subsequently, IID dismissed all claims with prejudice in this second case too, and the City of Glendale withdrew from both cases.

SDCWA filed a Third Amended Petition for Writ of Mandate and Complaint on January 23, 2013, to add new allegations that Metropolitan's rates adopted in April 2010 did not meet the requirements of Proposition 26, approved by California voters in November 2010. The court granted Metropolitan's motion to strike allegations relating to Proposition 26 on March 29, 2013, expressly ruling that SDCWA may not allege a violation of Proposition 26 in its challenge to the rates adopted in April 2010. This ruling does not affect SDCWA's separate challenge to Metropolitan's rates adopted in April 2012, which also includes Proposition 26 allegations. On December 4, 2013, the court granted Metropolitan's motion for summary adjudication of the cause of action alleging illegality of the "rate structure integrity" provision in conservation and local resources incentive agreements, dismissing this claim in the first lawsuit.

Trial of the first phase of both lawsuits before the Superior Court of California, County of San Francisco (Case Nos. CPF-10-510830 and CPF-12-512466) concluded January 23, 2014. This phase concerned the challenges to Metropolitan's rates. On April 24, 2014, the trial court issued its "Statement of Decision on Rate Setting Challenges," determining that SDCWA prevailed on two of its claims and that Metropolitan prevailed on the third claim. The trial court found that there was not sufficient evidence in the administrative record to support Metropolitan's inclusion in its transportation rates, and hence in its wheeling rate, of 100 percent of (1) payments it makes to the California Department of Water Resources for the State Water Project, or (2) the costs incurred by Metropolitan for conservation and local water supply development programs recovered through the Water Stewardship Rate. The trial court decision stated that the System Access Rate, System Power Rate, Water Stewardship Rate and wheeling rate violate specified statutes and the common law and such rates effective in 2013 and 2014 violate Proposition 26. The trial court's decision was based on its conclusion that these rates are unfair to wheelers. The trial court found that SDCWA failed to prove its "dry-year peaking" claim that Metropolitan's rates do not adequately account for variations in member agency purchases.

SDCWA's claims asserting breach of the exchange agreement and miscalculation of preferential rights were tried in a second phase of the case which concluded April 30, 2015. On August 28, 2015, the trial court issued a final statement of decision for the second phase. The decision found in favor of SDCWA on both claims and that SDCWA is entitled to contract damages in the amount of $188,295,602 plus interest. On October 9 and 30, 2015, the trial court granted SDCWA's motion for prejudgment interest at the statutory rate of 10 percent on these damages. The prejudgment interest award through entry of judgment is $46,637,180. After entry of judgment, post-judgment interest began accruing at the statutory rate of 7 percent. On November 18, 2015, the court issued the Final Judgment and a Peremptory Writ of Mandate in the 2010 and 2012 SDCWA v. Metropolitan cases. On January 21, 2016, the trial court awarded $320,084 in costs to SDCWA, after deducting amounts based on Metropolitan's motion. On March 24, 2016, the trial court awarded $8,910,354 in attorneys' fees to SDCWA, rejecting its demand for over $17.0 million. Metropolitan filed a Notice of Appeal of the Judgment and Writ in each case, and SDCWA filed a Notice of Cross-Appeal of the court's ruling on the rate structure integrity provision claim and the attorneys' fees order. Appellate briefing by the parties was completed on October 28, 2016. No date for oral argument has been set. Metropolitan is unable to assess at this time the likelihood of success of this litigation, including the appeal, or any future claims.

Due to SDCWA's litigation challenging Metropolitan's rates, and pursuant to the exchange agreement between Metropolitan and SDCWA, as of December 31, 2016, Metropolitan held $278.7 million in a designated fund, the Exchange Agreement Set-Aside Fund. See "–Financial Reserve Policy." This amount includes both SDCWA's disputed payments and interest earned thereon, which is based on the rate earned by Metropolitan's investment portfolio. Amounts held pursuant to the exchange agreement will continue to accumulate based on the quantities of exchange water that Metropolitan provides to SDCWA and the payments disputed by SDCWA, until the litigation, including all appeals, is concluded. The amounts held do not include the statutory prejudgment interest, post-judgment interest, attorneys' fees, or costs awards, none of which the exchange agreement requires to be held.

In May 2014, SDCWA filed a new lawsuit asserting essentially the same rate claims and breach of contract claim in connection with the Board's April 2014 rate adoption. Metropolitan filed its answer on June 30, 2014. On February 9, 2015, pursuant to stipulation by the parties, the San Francisco Superior Court ordered that the case be stayed. The stay may be lifted upon motion by any party. On November 20, 2015, SDCWA filed a motion to partially lift the stay. On December 21, 2015, the trial court decided that motion and the case remains stayed. Metropolitan is unable to assess at this time the likelihood of success of this case, any possible appeal or any future claims.

On April 13, 2016, SDCWA filed a new lawsuit that alleges all rates and charges for 2017 and 2018 adopted by Metropolitan's Board on April 12, 2016 violate the California Constitution, statutes, and common

law. The Petition for Writ of Mandate and Complaint asserts misallocation of costs as alleged in the previous cases listed above and additional claims of over-collection and misallocation of costs and procedural violations, and states SDCWA intends to amend to allege further claims including breach of contract. In a claim letter dated May 2, 2016, SDCWA asserted three breaches of the exchange agreement: the same breach alleged in the previous cases listed above, breach of the set-aside provision noted above, and breach of a provision concerning characterizing exchange water for certain purposes in the same manner as local water of other member agencies. On June 30, 2016, the nine member agencies that are interested parties to the 2010, 2012, and 2014 cases filed answers to also join the 2016 case as interested parties in support of Metropolitan. On October 27, 2016, SDCWA filed a Motion for Leave to File Amended Complaint alleging the same exchange agreement breach alleged in the previous cases listed above and breach of the set-aside provision noted above relating to the manner in which Metropolitan has set aside the amounts. The proposed amended petition/complaint also requests a judicial declaration that, if a judgment is owed to SDCWA under the exchange agreement, SDCWA will not be required to pay any portion of that judgment, and requests a refund to SDCWA of any amount Metropolitan has collected in excess of the reasonable costs of services provided or, alternatively, a reduction in SDCWA's future fees. On September 27, 2016, the case was transferred to San Francisco Superior Court. On November 10, 2016, pursuant to stipulation by the parties, the court ordered that the case be stayed pending final resolution of the appeals of the 2010 and 2012 SDCWA v. Metropolitan cases. Metropolitan is unable to assess at this time the likelihood of success of this case, any possible appeal or any future claims.

Other Revenue Sources

Hydroelectric Power Recovery Revenues. Metropolitan has constructed 16 small hydroelectric plants on its distribution system. The plants are located in Los Angeles, Orange, Riverside and San Diego Counties at existing pressure control structures and other locations. The combined generating capacity of these plants is approximately 131 megawatts. The total capital cost of the 16 facilities is approximately $176.1 million. Since 2000, annual energy generation sales revenues have ranged between $7.5 million and nearly $29.6 million. Energy generation sales revenues were $8.5 million in fiscal year 2014-15 and $7.5 million in fiscal year 2015-16. Low State Water Project supplies and reduced demands due to mandatory conservation resulted in diminished flows thorough Metropolitan's pipelines and hydroelectric power plants and decreased revenues.

Investment Income. In fiscal years 2013-14, 2014-15, and 2015-16, Metropolitan's earnings on investments, including adjustments for gains and losses and premiums and discounts, including construction account and trust fund earnings, excluding gains and losses on swap terminations, on an accrual basis (audited) were $21.2 million, $22.3 million, and $19.4 million, respectively.

Investment of Moneys in Funds and Accounts

All moneys in any of the funds and accounts established pursuant to Metropolitan's water revenue or general obligation bond resolutions are invested by the Treasurer in accordance with Metropolitan's Statement of Investment Policy. All Metropolitan funds available for investment are currently invested in United States Treasury and agency securities, commercial paper, negotiable certificates of deposit, banker's acceptances, corporate notes, municipal bonds, asset-backed securities, mortgage-backed securities and the California Local Agency Investment Fund ("LAIF"). The LAIF is a voluntary program created by statute as an investment alternative for California's local governments and special districts. LAIF permits such local agencies to participate in an investment portfolio, which invests billions of dollars, using the investment expertise of the State Treasurer's Office.

The Statement of Investment Policy provides that in managing Metropolitan's investments, the primary objective shall be to safeguard the principal of the invested funds. The secondary objective shall be to meet all liquidity requirements and the third objective shall be to achieve a return on the invested funds. Although the Statement of Investment Policy permits investments in some asset-backed securities, the

portfolio does not include any of the special investment vehicles related to sub-prime mortgages. The Statement of Investment Policy allows Metropolitan to exceed the portfolio and single issuer limits for purchases of California local agency securities when purchasing Metropolitan tendered bonds in conjunction with its self-liquidity program. See "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Variable Rate and Swap Obligations" in this Appendix A. Metropolitan's current investments comply with the Statement of Investment Policy.

As of December 31, 2016, the total market value (cash-basis) of all Metropolitan funds was $1.37 billion, including bond reserves of $53.9 million. The market value of Metropolitan's investment portfolio is subject to market fluctuation and volatility and general economic conditions. Over the three years ended December 31, 2016, the market value of the month-end balance of Metropolitan's investment portfolio (excluding bond reserve funds) averaged approximately $1.23 billion. The minimum month-end balance of Metropolitan's investment portfolio (excluding bond reserve funds) during such period was approximately $936.3 million on August 31, 2016. See Footnote 3 to Metropolitan's audited financial statements in Appendix B for additional information on the investment portfolio.

Metropolitan's administrative code requires that (1) the Treasurer provide an annual Statement of Investment Policy for approval by Metropolitan's Board, (2) the Treasurer provide a monthly investment report to the Board and the General Manager showing by fund the description, maturity date, yield, par, cost and current market value of each security, and (3) the General Counsel review as to eligibility the securities invested in by the Treasurer for that month and report his or her determinations to the Board. The Board approved the Statement of Investment Policy for fiscal year 2016-17 on June 14, 2016.

Subject to the provisions of Metropolitan's water revenue or general obligation bond resolutions, obligations purchased by the investment of bond proceeds in the various funds and accounts established pursuant to a bond resolution are deemed at all times to be a part of such funds and accounts and any income realized from investment of amounts on deposit in any fund or account therein will be credited to such fund or account. The Treasurer is required to sell or present for redemption any investments whenever it may be necessary to do so in order to provide moneys to meet required payments or transfers from such funds and accounts. For the purpose of determining at any given time the balance in any such funds, any such investments constituting a part of such funds and accounts will be valued at the then estimated or appraised market value of such investments.

All investments, including those authorized by law from time to time for investments by public agencies, contain certain risks. Such risks include, but are not limited to, a lower rate of return than expected and loss or delayed receipt of principal. The occurrence of these events with respect to amounts held under Metropolitan's water revenue or general obligation revenue bond resolutions, or other amounts held by Metropolitan, could have a material adverse effect on Metropolitan's finances. These risks may be mitigated, but are not eliminated, by limitations imposed on the portfolio management process by Metropolitan's Statement of Investment Policy.

The Statement of Investment Policy requires that investments have a minimum credit rating of "A1/P1/F1" for short-term securities and "A" for longer-term securities at the time of purchase. If immediate liquidation of a security downgraded below these levels is not in the best interests of Metropolitan, the Treasurer or investment manager, in consultation with an ad hoc committee made up of the Chairman of the Board, the Chairman of the Finance and Insurance Committee and the General Manager, and with the concurrence of the General Counsel, may dispose of the security in an orderly and prudent manner considering the circumstances, under terms and conditions approved by a majority of the members of such ad hoc committee. The Treasurer is required to include a description of any securities that have been downgraded below investment grade and the status of their disposition in the Treasurer's monthly report.

The Statement of Investment Policy also limits the amount of securities that can be purchased by category, as well as by issuer, and prohibits investments that can result in zero interest income. Metropolitan's securities are settled on a delivery versus payment basis and are held by an independent third-party custodian. See APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)" for a description of Metropolitan's investments at September 30, 2016.

Metropolitan retains two outside investment firms to manage the long-term portion of Metropolitan's portfolio. The outside managers are required to adhere to Metropolitan's Statement of Investment Policy. As of December 31, 2016, such managers were managing approximately $342.3 million in investments on behalf of Metropolitan. Metropolitan's Statement of Investment Policy may be changed at any time by the Board (subject to State law provisions relating to authorized investments). There can be no assurance that the State law and/or the Statement of Investment Policy will not be amended in the future to allow for investments that are currently not permitted under State law or the Statement of Investment Policy, or that the objectives of Metropolitan with respect to investments or its investment holdings at any point in time will not change.

METROPOLITAN EXPENSES

General

The following table sets forth a summary of Metropolitan's expenses, by major function, for the five years ended June 30, 2016. The table provides cash basis information for fiscal year 2012, and modified accrual basis information for fiscal years 2013-2016. All information is unaudited. Expenses of Metropolitan for the fiscal years ended June 30, 2016 and June 30, 2015, on an accrual basis, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF EXPENSES
Fiscal Years Ended June 30
(Dollars in Millions)

	2012	2013	2014	2015	2016
Operation and Maintenance Costs[1]	$ 425	$ 456	$ 512	$ 697	$ 799
Total State Water Project[2]	536	480	465	436	512
Total Debt Service	323	339	384	303	332
Construction Disbursements from Revenues[3]	44	55	117	210	273
Other[4]	3	5	6	7	6
Total Disbursements (net of reimbursements)	$1,331	$1,335	$1,484	$1,653	$1,922

Source: Metropolitan.

(1) Includes operation and maintenance, debt administration, conservation and local resource programs, CRA power, and water supply expenses. For fiscal years 2014-15 and 2015-16, includes $142 million, and $222 million, respectively, of conservation projects funded from transfers from the Water Management Fund.

(2) Includes both operating and capital expense portions.

(3) At the discretion of the Board, in any given year, Metropolitan may increase or decrease funding available for construction disbursements to be paid from revenues. Includes $160 million for acquiring properties in Riverside and Imperial Counties, funded by $160 million from the Replacement and Refurbishment Fund Reserves. Does not include expenditures of bond proceeds.

(4) Includes operating equipment.

Revenue Bond Indebtedness and Other Obligations

As of February 1, 2017, Metropolitan had total outstanding indebtedness, secured by a lien on Net Operating Revenues, of $4.49 billion. This indebtedness is comprised of $4.06 billion water revenue bonds, issued under the Senior Debt Resolutions (defined below), which includes $3.01 billion fixed rate revenue bonds, and $1.04 billion variable rate revenue bonds; $250.0 million Short-Term Revolving Credit Facilities, which pay a variable rate, and are on parity with the senior lien water revenue bonds; $175.0 million subordinate water revenue bonds issued under the Subordinate Debt Resolutions (defined below), which pay a variable rate; and $8.6 million State of California Revolving Fund Loan, on parity with the subordinate water revenue bonds. In addition, Metropolitan has $493.6 million of fixed-payor interest rate swaps which provides a fixed interest rate hedge to an equivalent amount of variable rate debt. Metropolitan's revenue bonds and other revenue obligations are more fully described in this section below.

Limitations on Additional Revenue Bonds

Resolution 8329, adopted by Metropolitan's Board on July 9, 1991, as amended and supplemented (collectively with all such supplemental resolutions, the "Senior Debt Resolutions"), provides for the issuance of Metropolitan's senior lien water revenue bonds. The Senior Debt Resolutions establish limitations on the issuance of additional obligations payable from Net Operating Revenues. Under the Senior Debt Resolutions, no additional bonds, notes or other evidences of indebtedness payable out of Operating Revenues may be issued having any priority in payment of principal, redemption premium, if any, or interest over any water revenue bonds authorized by the Senior Debt Resolutions ("Senior Revenue Bonds") or other obligations of Metropolitan having a lien and charge upon, or being payable from, the Net Operating Revenues on parity with such Senior Revenue Bonds ("Senior Parity Obligations"). No additional Senior Revenue Bonds or Senior Parity Obligations may be issued or incurred unless the conditions of the Senior Debt Resolutions have been satisfied.

Resolution 9199, adopted by Metropolitan's Board on March 8, 2016, as amended and supplemented (collectively with all such supplemental resolutions, the "Subordinate Debt Resolutions," and together with the Senior Debt Resolutions, the "Revenue Bond Resolutions"), provides for the issuance of Metropolitan's subordinate water revenue bonds and other obligations secured by a pledge of Net Operating Revenues that is subordinate to the pledge securing Senior Revenue Bonds and Senior Parity Obligations. The Subordinate Debt Resolutions establish limitations on the issuance of additional obligations payable from Net Operating Revenues. Under the Subordinate Debt Resolutions, with the exception of Senior Revenue Bonds and Senior Parity Obligations, no additional bonds, notes or other evidences of indebtedness payable out of Operating Revenues may be issued having any priority in payment of principal, redemption premium, if any, or interest over any subordinate water revenue bonds authorized by the Subordinate Debt Resolutions ("Subordinate Revenue Bonds" and, together with Senior Revenue Bonds, "Revenue Bonds") or other obligations of Metropolitan having a lien and charge upon, or being payable from, the Net Operating Revenues on parity with the Subordinate Revenue Bonds ("Subordinate Parity Obligations"). No additional Subordinate Revenue Bonds or Subordinate Parity Obligations may be issued or incurred unless the conditions of the Subordinate Debt Resolutions have been satisfied.

The laws governing Metropolitan's ability to issue water revenue bonds currently provide two additional limitations on indebtedness that may be incurred by Metropolitan. The Act provides for a limit on general obligation bonds, water revenue bonds and other evidences of indebtedness at 15 percent of the assessed value of all taxable property within Metropolitan's service area. As of February 1, 2017, outstanding general obligation bonds, water revenue bonds and other evidences of indebtedness in the amount of $4.58 billion represented approximately 0.18 percent of the fiscal year 2016-17 taxable assessed valuation of $2,583 billion. The second limitation under the Act specifies that no revenue bonds may be issued, except for the purpose of refunding, unless the amount of net assets of Metropolitan as shown on its balance sheet as of the end of the last fiscal year prior to the issuance of such bonds, equals at least 100 percent of the aggregate amount of revenue bonds outstanding following the issuance of such bonds. The net

assets of Metropolitan at June 30, 2016 were $6.68 billion. The aggregate amount of revenue bonds outstanding as of February 1, 2017 was $4.23 billion. The limitation does not apply to other forms of financing available to Metropolitan. Audited financial statements including the net assets of Metropolitan as of June 30, 2016 and June 30, 2015, respectively, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2015 AND JUNE 30, 2014 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Metropolitan provides no assurance that the Act's limitations on indebtedness will not be revised or removed by future legislation. Limitations under the Revenue Bond Resolutions respecting the issuance of additional obligations payable from Net Operating Revenues on parity with the Senior Revenue Bonds and Subordinate Revenue Bonds of Metropolitan will remain in effect so long as any Senior Revenue Bonds and Subordinate Revenue Bonds authorized pursuant to the Revenue Bond Resolutions are outstanding, provided however, that the Revenue Bond Resolutions are subject to amendment and supplement in accordance with their terms.

Variable Rate Exposure Policy

As of February 1, 2017, Metropolitan had outstanding $1.30 billion of variable rate obligations issued under the Senior Debt Resolutions, including variable rate Senior Revenue Bonds (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations– Variable Rate and Swap Obligations") and Senior Parity Obligations incurred pursuant to Short-Term Revolving Credit Facilities (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations–Senior Parity Obligations–Short-Term Revolving Credit Facilities" below). In addition, as of February 1, 2017, all of Metropolitan's $175 million of outstanding Subordinate Revenue Bonds issued under the Subordinate Debt Resolutions were variable rate obligations (described under "–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations–Subordinate Revenue Bonds" below.

As of February 1, 2017, of Metropolitan's $1.47 billion of variable rate obligations, $493.6 million of such variable rate demand obligations are treated by Metropolitan as fixed rate debt, by virtue of interest rate swap agreements (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations–Variable Rate and Swap Obligations–Interest Rate Swap Transactions"), for the purpose of calculating debt service requirements. The remaining $974.7 million of variable rate obligations represent approximately 21.7 percent of total outstanding water revenue secured indebtedness (including Senior Revenue Bonds and Senior Parity Debt and Subordinate Revenue Bonds and Subordinate Debt), as of February 1, 2017.

Metropolitan's variable rate exposure policy requires that variable rate debt be managed to limit net interest cost increases within a fiscal year as a result of interest rate changes to no more than $5 million. In addition, the maximum amount of variable interest rate exposure (excluding variable rate bonds associated with interest rate swap agreements) is limited to 40 percent of total outstanding water revenue bond debt. Variable rate debt capacity will be reevaluated as interest rates change and managed within these parameters.

Outstanding Senior Revenue Bonds and Senior Parity Obligations

Senior Revenue Bonds

The water revenue bonds issued under the Senior Debt Resolutions outstanding as of February 1, 2017, are set forth below:

Name of Issue	Principal Outstanding
Water Revenue Refunding Bonds, 1993 Series A	$ 70,340,000
Water Revenue Bonds, 2000 Authorization, Series B-3[(1)]	88,800,000
Water Revenue Bonds, 2006 Authorization, Series A	302,245,000
Water Revenue Refunding Bonds, 2008 Series B	119,830,000
Water Revenue Refunding Bonds, 2008 Series C	27,255,000
Water Revenue Bonds, 2008 Authorization, Series A	174,530,000
Water Revenue Refunding Bonds, 2009 Series A-2[(1)]	104,180,000
Water Revenue Refunding Bonds, 2009 Series B	106,690,000
Water Revenue Refunding Bonds, 2009 Series C	91,165,000
Water Revenue Bonds, 2008 Authorization, Series B	10,360,000
Water Revenue Bonds, 2008 Authorization, Series C[(2)]	78,385,000
Water Revenue Bonds, 2008 Authorization, Series D[(2)]	250,000,000
Water Revenue Refunding Bonds, 2009 Series D	50,005,000
Water Revenue Refunding Bonds, 2009 Series E	12,715,000
Water Revenue Bonds, 2010 Authorization, Series A[(2)]	250,000,000
Water Revenue Refunding Bonds, 2010 Series B	74,325,000
Water Revenue Refunding Bonds, 2011 Series A-1[(1)]	64,305,000
Water Revenue Refunding Bonds, 2011 Series A-2[(1)]	49,920,000
Water Revenue Refunding Bonds, 2011 Series A-3[(1)]	64,300,000
Water Revenue Refunding Bonds, 2011 Series A-4[(1)]	49,920,000
Water Revenue Refunding Bonds, 2011 Series B	5,080,000
Water Revenue Refunding Bonds, 2011 Series C	147,435,000
Water Revenue Refunding Bonds, 2012 Series A	181,180,000
Water Revenue Refunding Bonds, 2012 Series B-1 and B-2[(1)]	98,585,000
Water Revenue Refunding Bonds, 2012 Series C	175,635,000
Water Revenue Refunding Bonds, 2012 Series F	59,335,000
Water Revenue Refunding Bonds, 2012 Series G	111,890,000
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series D[(1)]	87,445,000
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series E[(1)]	104,820,000
Water Revenue Refunding Bonds, 2014 Series A	95,935,000
Water Revenue Refunding Bonds, 2014 Series B	10,575,000
Water Revenue Refunding Bonds, 2014 Series C-1–C-3	30,335,000
Special Variable Rate Water Revenue Refunding Bonds, 2014 Series D[(1)]	38,465,000
Water Revenue Refunding Bonds, 2014 Series E	86,060,000
Water Revenue Refunding Bonds, 2014 Series G-2–G-5	43,275,000
Special Variable Rate Water Revenue Refunding Bonds, 2015 Series A-1 and A-2[(1)]	188,900,000
Water Revenue Bonds, 2015 Authorization, Series A	208,255,000
Water Revenue Refunding Bonds, 2016 Series A	239,455,000
Special Variable Rate Water Revenue Refunding Bonds, 2016 Series B-1 and B-2[(1)]	103,670,000
Total	**$4,055,600,000**

Source: Metropolitan.

(1) Outstanding variable rate obligation.

(2) Designated as "Build America Bonds" pursuant to the American Recovery and Reinvestment Act of 2009.

Variable Rate and Swap Obligations

As of February 1, 2017, Metropolitan had outstanding $1.30 billion of variable rate obligations issued under the Senior Debt Resolutions, including variable rate Senior Revenue Bonds (described under this caption "–Variable Rate and Swap Obligations") and Senior Parity Obligations incurred pursuant to Short-Term Revolving Credit Facilities (described under "–Short-Term Revolving Credit Facilities" below).

The outstanding variable rate Senior Revenue Bonds include bonds bearing interest in the Index Mode or Flexible Index Mode (the "Index Tender Bonds"), special variable rate bonds initially designated as self-liquidity bonds (the "Self-Liquidity Bonds") and variable rate demand obligations supported by standby bond purchase agreements between Metropolitan and various liquidity providers.

Index Tender Bonds. The Index Tender Bonds have substantially similar terms and conditions; however, the mandatory tender dates and related tender periods for the Index Tender Bonds may differ. The

Index Tender Bonds bear interest at a rate that fluctuates weekly based on the SIFMA Municipal Swap Index published weekly by Municipal Market Data plus a spread. The Index Tender Bonds outstanding as of February 1, 2017, are summarized in the following table:

Index Tender Bonds

Series	Date of Issuance	Original Principal Amount Issued	Next Scheduled Mandatory Tender Date	Maturity Date
2009 A-2	May 20, 2009	$104,180,000	July 10, 2017	July 1, 2030
2011 A-1	June 2, 2011	64,305,000	July 10, 2017	July 1, 2036
2011 A-2	June 2, 2011	49,920,000	March 27, 2018	July 1, 2036
2011 A-3	June 2, 2011	64,300,000	July 10, 2017	July 1, 2036
2011 A-4	June 2, 2011	49,920,000	March 27, 2018	July 1, 2036
2012 B-1	April 27, 2012	49,295,000	March 27, 2018	July 1, 2027
2012 B-2	April 27, 2012	49,290,000	March 27, 2018	July 1, 2027
2013 E (1)	July 2, 2013	104,820,000	June 5, 2017	July 1, 2030
Total		**$536,030,000**		

Source: Metropolitan.

(1) Flexible Index Mode Bonds. The terms and conditions of Flexible Index Mode Bonds are substantially similar to Index Mode Bonds except that each tender period may not exceed 270 days.

The Index Tender Bonds are subject to mandatory tender under certain circumstances, including on certain scheduled mandatory tender dates (unless earlier remarketed or otherwise retired). Metropolitan anticipates that it will pay the purchase price of tendered Index Tender Bonds from the proceeds of remarketing such Index Tender Bonds or from other available funds. Metropolitan's obligation to pay the purchase price of any tendered Index Tender Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Index Tender Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. Metropolitan has not secured any liquidity facility or letter of credit to support the payment of the purchase price of Index Tender Bonds in connection with a scheduled mandatory tender. If the purchase price of the Index Tender Bonds of any Series is not paid from the proceeds of remarketing or other funds following a scheduled mandatory tender, such Index Tender Bonds then will bear interest at a default rate of up to 12 percent per annum until purchased by Metropolitan or redeemed. Failure to pay the purchase price of a series of Index Tender Bonds on a scheduled mandatory tender date is a default under the related paying agent agreement, upon the occurrence and continuance of which a majority in aggregate principal amount of the owners of such series of Index Tender Bonds may elect a bondholders' committee to exercise rights and powers of such owners under such paying agent agreement. Failure to pay the purchase price of a series of Index Tender Bonds on a scheduled mandatory tender date is not a default under the Senior Debt Resolutions. If the purchase price of the Index Tender Bonds of any series is not paid on a scheduled mandatory tender date, such Index Tender Bonds will also be subject to special mandatory redemption, in part, 18, 36 and 54 months following the purchase default. Any such special mandatory redemption payment will constitute an obligation payable on parity with the Senior Revenue Bonds and Senior Parity Obligations and senior to the Subordinate Revenue Bonds and Subordinate Parity Obligations.

Self-Liquidity Bonds. As of February 1, 2017, Metropolitan had $314.8 million of outstanding Self-Liquidity Bonds issued under the Senior Debt Resolutions. The Self-Liquidity Bonds are subject to optional tender upon seven days' notice by the owners thereof and mandatory tender upon specified events. Metropolitan is irrevocably committed to purchase all Self-Liquidity Bonds tendered pursuant to any optional or mandatory tender to the extent that remarketing proceeds are insufficient therefor and no standby bond purchase agreement or other liquidity facility is in effect. Metropolitan's obligation to pay the purchase

price of any tendered Self-Liquidity Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Self-Liquidity Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. In addition, Metropolitan's investment policy permits it to purchase tendered Self-Liquidity Bonds as an investment for its investment portfolio (other than from amounts in its investment portfolio consisting of bond reserve funds). Thus, while Metropolitan is only obligated to purchase tendered Self-Liquidity Bonds from Net Operating Revenues, it may use the cash and investments in its investment portfolio (other than amounts in its investment portfolio consisting of bond reserve funds and amounts posted as collateral with interest rate swap counterparties as described below) to purchase tendered Self-Liquidity Bonds. Metropolitan has not secured any liquidity facility or letter of credit to pay the purchase price of any tendered Self-Liquidity Bonds; however, Metropolitan has entered into a Revolving Credit Agreement (as described below) pursuant to which it may make borrowings for the purpose of paying the purchase price of Self-Liquidity Bonds. See "–Senior Parity Obligations – Wells Fargo Revolving Credit Agreement." Failure to pay the purchase price of Self-Liquidity Bonds upon optional or mandatory tender is not a default under the related paying agent agreement or a default under the Senior Debt Resolutions.

The following table lists the outstanding Self-Liquidity Bonds as of February 1, 2017.

Self-Liquidity Bonds

Name of Issue	Principal Outstanding
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series D	$ 87,445,000
Special Variable Rate Water Revenue Refunding Bonds, 2014 Series D	38,465,000
Special Variable Rate Water Revenue Refunding Bonds, 2015 Series A-1 and A-2	188,900,000
Total	$314,810,000

Source: Metropolitan.

Liquidity Supported Bonds. The interest rates for Metropolitan's other variable rate demand obligations issued under the Senior Debt Resolutions, totaling $192.5 million as of February 1, 2017, are reset on a daily basis. Such variable rate demand obligations are supported by Standby Bond Purchase Agreements between Metropolitan and liquidity providers that provide for purchase of variable rate bonds by the applicable liquidity provider upon tender of such variable rate bonds and a failed remarketing. Metropolitan has secured its obligation to repay principal and interest advanced under the Standby Bond Purchase Agreements as Senior Parity Obligations. A decline in the creditworthiness of a liquidity provider will likely result in an increase in the interest rate of the applicable variable rate bonds, as well as an increase in the risk of a failed remarketing of such tendered variable rate bonds. Variable rate bonds purchased by a liquidity provider bear interest at a significantly higher interest rate and Metropolitan's obligation to reimburse the liquidity provider may convert the term of the variable rate bonds purchased by the liquidity provider into a term loan amortizable under the terms of the current liquidity facilities over a period of up to three years, depending on the applicable liquidity facility.

The following table lists the liquidity providers, the expiration date of each facility and the principal amount of outstanding variable rate demand obligations covered under each facility as of February 1, 2017.

Liquidity Facilities and Expiration Dates

Liquidity Provider	Bond Issue	Principal Outstanding	Facility Expiration
Wells Fargo Bank, N.A.	2000 Authorization Series B-3	$ 88,800,000	April 2017[(1)]
Landesbank Hessen-Thuringen Girozentrale (Helaba)	2016 Series B-1 and Series B-2	$103,670,000	September 2019
Total		$192,470,000	

Source: Metropolitan.

(1) Metropolitan expects to replace such liquidity facility prior to its expiration date.

Interest Rate Swap Transactions. By resolution adopted on September 11, 2001, Metropolitan's Board authorized the execution of interest rate swap transactions and related agreements in accordance with a master swap policy, which was subsequently amended by resolutions adopted on July 14, 2009 and May 11, 2010. Metropolitan may execute interest rate swaps if the transaction can be expected to reduce exposure to changes in interest rates on a particular financial transaction or in the management of interest rate risk derived from Metropolitan's overall asset/liability balance, result in a lower net cost of borrowing or achieve a higher net rate of return on investments made in connection with or incidental to the issuance, incurring or carrying of Metropolitan's obligations or investments, or manage variable interest rate exposure consistent with prudent debt practices and Board-approved guidelines. The Chief Financial Officer reports to the Finance and Insurance Committee of Metropolitan's Board each quarter on outstanding swap transactions, including notional amounts outstanding, counterparty exposures and termination values based on then-existing market conditions.

Metropolitan currently has one type of interest rate swap, referred to in the table below as "Fixed Payor Swaps." Under this type of swap, Metropolitan receives payments that are calculated by reference to a floating interest rate and makes payments that are calculated by reference to a fixed interest rate.

Metropolitan's obligations to make regularly scheduled net payments under the terms of the interest rate swap agreements are payable on a parity with the Senior Parity Obligations. Termination payments under the 2002A and 2002B interest rate swap agreements would be payable on a parity with the Senior Parity Obligations. Termination payments under all other interest rate swap agreements would be on parity with the Subordinate Parity Obligations.

The following swap transactions were outstanding as of February 1, 2017:

FIXED PAYOR SWAPS:

Designation	Notional Amount Outstanding	Swap Counterparty	Fixed Payor Rate	MWD Receives	Maturity Date
2002 A	$75,838,400	Morgan Stanley Capital Services, Inc.	3.300%	57.74% of one-month LIBOR	7/1/2025
2002 B	28,371,600	JPMorgan Chase Bank	3.300	57.74% of one-month LIBOR	7/1/2025
2003	158,597,500	Wells Fargo Bank	3.257	61.20% of one-month LIBOR	7/1/2030
2003	158,597,500	JPMorgan Chase Bank	3.257	61.20% of one-month LIBOR	7/1/2030
2004 C	7,760,500	Morgan Stanley Capital Services, Inc.	2.980	61.55% of one-month LIBOR	10/1/2029
2004 C	6,349,500	Citigroup Financial Products, Inc.	2.980	61.55% of one-month LIBOR	10/1/2029
2005	29,057,500	JPMorgan Chase Bank	3.360	70% of 3-month LIBOR	7/1/2030
2005	29,057,500	Citigroup Financial Products, Inc.	3.360	70% of 3-month LIBOR	7/1/2030
Total	$493,630,000				

Source: Metropolitan.

These interest rate swap agreements entail risk to Metropolitan. The counterparty may fail or be unable to perform, interest rates may vary from assumptions, Metropolitan may be required to post collateral in favor of its counterparties and Metropolitan may be required to make significant payments in the event of an early termination of an interest rate swap. Metropolitan believes that if such an event were to occur, it would not have a material adverse impact on its financial position. Metropolitan seeks to manage counterparty risk by diversifying its swap counterparties, limiting exposure to any one counterparty, requiring collateralization or other credit enhancement to secure swap payment obligations, and by requiring minimum credit rating levels. Initially swap counterparties must be rated at least "Aa3" or "AA-", or equivalent by any two of the nationally recognized credit rating agencies; or use a "AAA" subsidiary as rated by at least one nationally recognized credit rating agency. Should the credit rating of an existing swap counterparty drop below the required levels, Metropolitan may enter into additional swaps if those swaps are "offsetting" and risk-reducing swaps. Each counterparty is initially required to have minimum capitalization of at least $150 million. See Note 5(f) in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Early termination of an interest rate swap agreement could occur due to a default by either party or the occurrence of a termination event. As of December 31, 2016, Metropolitan would have been required to pay to its counterparties termination payments if some of its swaps were terminated on that date. Metropolitan's net exposure to its counterparties for all such termination payments on that date was approximately $75.3 million. Metropolitan does not presently anticipate early termination of any of its interest rate swap agreements due to default by either party or the occurrence of a termination event. However, effective June 28, 2012, Metropolitan exercised optional early termination provisions to terminate all or a portion of certain interest rate swap agreements totaling a notional amount of $322 million. Effective February 12, 2014, Metropolitan exercised optional early termination provisions to terminate a portion of certain interest rate swap agreements, totaling a notional amount of $147 million. Effective July 29, 2014,

Metropolitan optionally terminated portions of certain interest rate swap agreements totaling a notional amount of $163 million.

Metropolitan is required to post collateral in favor of a counterparty to the extent that Metropolitan's total exposure for termination payments to that counterparty exceeds the threshold specified in the applicable swap agreement. Conversely, the counterparties are required to release collateral to Metropolitan or post collateral for the benefit of Metropolitan as market conditions become favorable to Metropolitan. As of December 31, 2016, Metropolitan had no collateral posted with any counterparty. The highest, month-end, amount of collateral posted was $36.8 million, on June 30, 2012, which was based on an outstanding swap notional amount of $1.4 billion. The amount of required collateral varies from time to time due primarily to interest rate movements and can change significantly over a short period of time. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. In the future, Metropolitan may be required to post additional collateral, or may be entitled to a reduction or return of the required collateral amount. Collateral deposited by Metropolitan is held by the counterparties; a bankruptcy of any counterparty holding collateral posted by Metropolitan could adversely affect the return of the collateral to Metropolitan. Moreover, posting collateral limits Metropolitan's liquidity. If collateral requirements increase significantly, Metropolitan's liquidity may be materially adversely affected. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A.

Term Mode Bonds

As of February 1, 2017, Metropolitan had outstanding $73.6 million of Senior Revenue Bonds bearing interest in a term mode, comprised of $30.3 million of 2014 Series C Bonds in three series, and $43.3 million of 2014 Series G in four series (collectively, the "Term Mode Bonds"). The Term Mode Bonds initially bear interest at a fixed rate for a specified period from their date of issuance, after which there shall be determined a new interest mode for each series (which may be another term mode, a daily mode, a weekly mode, a short-term mode or an index mode) or the Term Mode Bonds may be converted to bear fixed interest rates through the maturity date thereof. The owners of the Term Mode Bonds of a series must tender for purchase, and Metropolitan must purchase, all of the Term Mode Bonds of such series on the specified scheduled mandatory tender date of each term period for such series. The Term Mode Bonds outstanding as of February 1, 2017, are summarized in the following table:

Term Mode Bonds

Series	Original Principal Amount Issued	Next Scheduled Mandatory Tender Date
2014 C-1	$13,505,000	October 1, 2019
2014 C-2	14,020,000	October 1, 2020
2014 C-3	2,810,000	October 1, 2021
2014 G-2	14,300,000	October 1, 2017
2011 G-3	11,165,000	October 1, 2018
2012 G-4	11,605,000	October 1, 2019
2012 G-5	6,205,000	October 1, 2020
Total	**$73,610,000**	

Source: Metropolitan.

Metropolitan will pay the principal of, and interest on, the Term Mode Bonds on parity with its other Senior Revenue Bonds. Metropolitan anticipates that it will pay the purchase price of tendered Term Mode Bonds from the proceeds of remarketing such Term Mode Bonds or from other available funds. Metropolitan's obligation to pay the purchase price of any tendered Term Mode Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Term Mode Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to

the Subordinate Revenue Bonds and Subordinate Parity Obligations. Metropolitan has not secured any liquidity facility or letter of credit to support the payment of the purchase price of Term Mode Bonds in connection with any scheduled mandatory tender. If the purchase price of the Term Mode Bonds of any series is not paid from the proceeds of remarketing or other funds following a scheduled mandatory tender, such Term Mode Bonds will then bear interest at a default rate of up to 12 percent per annum until purchased by Metropolitan or redeemed. Failure to pay the purchase price of a series of Term Mode Bonds on a scheduled mandatory tender date is a default under the related paying agent agreement, upon the occurrence and continuance of which a majority in aggregate principal amount of the owners of such series of Term Mode Bonds may elect a bondholders' committee to exercise rights and powers of such owners under such paying agent agreement. Failure to pay the purchase price of a series of Term Mode Bonds on a scheduled mandatory tender date is not a default under the Senior Debt Resolutions. If the purchase price of the Term Mode Bonds of any series is not paid on a scheduled mandatory tender date, such Term Mode Bonds will also be subject to special mandatory redemption, in part, 18, 36 and 54 months following the purchase default. Any such special mandatory redemption payment will constitute an obligation payable on parity with the Senior Revenue Bonds and Senior Parity Obligations.

Build America Bonds

Metropolitan previously issued and designated three series of Senior Revenue Bonds in the aggregate principal amount of $578,385,000 as "Build America Bonds" under the provisions of the American Recovery and Reinvestment Act of 2009 (the "Build America Bonds"). Metropolitan currently expects to receive cash subsidies from the United States Treasury (the "Interest Subsidy Payments") equal to 35 percent of the interest payable on all such outstanding Build America Bonds less any federal budget sequestration offsets as described in the following paragraph. The Interest Subsidy Payments in connection with the Build America Bonds do not constitute Operating Revenues under the Senior Debt Resolutions or the Subordinate Debt Resolutions. Such Interest Subsidy Payments will constitute Additional Revenues, which Metropolitan may take into consideration when establishing its rates and charges and will be available to Metropolitan to pay principal of and interest on Metropolitan's Bonds.

The Budget Control Act of 2011 (the "Budget Control Act") provided for increases in the federal debt limit and established procedures designed to reduce the federal budget deficit. The Budget Control Act provided that a failure to reduce the deficit would result in sequestration, which are automatic, generally across-the-board, spending reductions. These reductions began on March 1, 2013 pursuant to an executive order that reduced budgetary authority for expenditures subject to sequestration, including subsidies for Build America Bonds. Pursuant to this executive order, the approximately $6.64 million Interest Subsidy Payment that Metropolitan was to receive on or about July 1, 2013 was reduced by 8.7 percent, or $578,000, to $6.06 million. Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2014 were reduced by the federal fiscal year 2014 sequestration rate of 7.2 percent and Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2015 were reduced by the federal fiscal year 2015 sequestration rate of 7.3 percent. Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2016 were reduced by the federal fiscal year 2016 sequestration rate of 6.8 percent, and Interest Subsidy Payments processed on or after October 1, 2016 and on or before September 30, 2017 are anticipated to be reduced by the federal fiscal year 2017 sequestration rate of 6.9 percent. The sequestration reduction rate will be applied unless and until a law is enacted that cancels or otherwise impacts the sequester, at which time the sequestration reduction rate is subject to change. Metropolitan can offer no assurances as to future subsidy payments and expects that once it receives less than any full 35 percent subsidy payment, the United States Treasury will not thereafter reimburse Metropolitan for payments not made.

Senior Parity Obligations

Short-Term Revolving Credit Facilities. In April 2016, Metropolitan entered into a noteholder's agreement with RBC Municipal Products, LLC ("RBC") for the purchase by RBC and sale by Metropolitan of Metropolitan's Index Notes, Series 2016 ("RBC Facility"). Also in April 2016, Metropolitan entered into

a note purchase and continuing covenant agreement with U.S. Bank National Association ("US Bank"), for the purchase by US Bank and sale by Metropolitan of Metropolitan's Flexible Rate Revolving Notes, Series 2016 ("US Bank Facility," and together with the RBC Facility, the "Short-Term Revolving Credit Facilities"). Metropolitan is permitted to sell up to $200 million of notes (including, subject to certain terms and conditions, notes to refund maturing notes) under each of the Short-Term Revolving Credit Facilities during the term of the respective bank's commitment to purchase notes thereunder, which currently extends to April 5, 2019, for an aggregate amount of available borrowings of $400 million. Metropolitan may borrow, pay down and re-borrow amounts under each of the Short-Term Revolving Credit Facilities. Currently, Metropolitan has sold approximately $250 million of notes under the Short-Term Revolving Credit Facilities ($125 million under the RBC Facility and approximately $125 million under the US Bank Facility). Of that amount, Metropolitan has deposited $250 million in its unrestricted financial reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. An additional draw of approximately $50 million is expected by the end of June 2017. Subject to the satisfaction of certain terms and conditions, unpaid principal remaining outstanding at the April 5, 2019 commitment end date may be amortizable over a period of approximately one to three years, depending on the applicable facility.

Each of the Short-Term Revolving Credit Facilities bears interest at a variable rate of interest. The US Bank Facility bears interest at a spread to one-month London interbank offering rate ("LIBOR") for taxable borrowings or to 70 percent of one-month LIBOR for tax-exempt borrowings, while the RBC Facility bears interest at a spread to one-month LIBOR for taxable borrowings or to the SIFMA Municipal Swap Index for tax-exempt borrowings. Under the Short-Term Revolving Credit Facilities, upon a failure by Metropolitan to perform or observe its covenants, a default in other specified indebtedness of Metropolitan, or other specified events of default, each bank could terminate its commitments and declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the Short-Term Credit Facilities as Senior Parity Obligations.

In the Short-Term Revolving Credit Facilities agreements, Metropolitan designated the principal and interest payable as Excluded Principal Payments under the Senior Debt Resolutions and thus, for purposes of calculating Maximum Annual Debt Service, included the amount of principal and interest due and payable under the Short-Term Revolving Credit Facilities on a schedule of Assumed Debt Service. This schedule of Assumed Debt Service assumes that Metropolitan will pay the principal under the Short-Term Revolving Credit Facilities over a period of 30 years at a fixed interest rate of approximately 3.3 percent.

Wells Fargo Revolving Credit Agreement. On July 1, 2015, Metropolitan executed a revolving credit agreement with Wells Fargo Bank, N.A. (the "Wells Fargo Revolving Credit Agreement"). Under the terms and conditions of the Wells Fargo Revolving Credit Agreement, Metropolitan will be able to borrow up to $180 million for purposes of paying the purchase price of any Self-Liquidity Bonds. The scheduled expiration date of the Wells Fargo Revolving Credit Agreement is July 1, 2018. On November 4, 2015, Wells Fargo Bank assigned $100 million of its share of the Wells Fargo Revolving Credit Agreement to the Industrial and Commercial Bank of China ("ICBC"). Wells Fargo will retain the remaining $80 million commitment. ICBC assumed all of Wells Fargo's obligations with respect to its $100 million share under the Wells Fargo Revolving Credit Agreement.

Under the Wells Fargo Revolving Credit Agreement, a failure by Metropolitan to perform or observe certain covenants could result in a termination of Wells Fargo Bank and ICBC's commitments and entitle them to declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the Wells Fargo Revolving Credit Agreement as Senior Parity Obligations. Metropolitan has no obligation to make borrowings under, maintain, or renew the Wells Fargo Revolving Credit Agreement. See "–Limitations on Additional Revenue Bonds" above.

In the Wells Fargo Revolving Credit Agreement, Metropolitan designated the principal and interest payable as Excluded Principal Payments under the Senior Debt Resolutions and thus, for purposes of calculating Maximum Annual Debt Service, included the amount of principal and interest due and payable

under the Revolving Credit Agreements on a schedule of Assumed Debt Service. This schedule of Assumed Debt Service assumes that Metropolitan will pay the principal under the Revolving Credit Agreements over a period of 30 years at a fixed interest rate of 3.75 percent. Pursuant to the terms of the Senior Debt Resolutions, while the Wells Fargo Revolving Credit Agreement is in force and effect, when Metropolitan calculates its covenant relating to the creation or incurrence of additional indebtedness, it will add an amount to its Net Operating Revenues relating to an assumed annual debt service payment that Metropolitan would receive if it were to use the proceeds of the Wells Fargo Revolving Credit Agreement to purchase Self-Liquidity Bonds.

Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations

Subordinate Revenue Bonds

In December 2016, Metropolitan entered into a Continuing Covenant Agreement with Bank of America, N.A. ("BANA", and the "2016 BANA Agreement"), for the purchase by BANA and sale by Metropolitan of Metropolitan's $175 million Subordinate Water Revenue Bonds, 2016 Authorization Series A (the "Subordinate 2016 Series A Bonds"), which is the first series of bonds issued under the Subordinate Debt Resolutions. Proceeds were used to reimburse Metropolitan for the purchase of the Delta Islands in the San Francisco Bay\Sacramento-San Joaquin River Delta that was funded from Metropolitan's reserves in July 2016. See "CAPITAL INVESTMENT PLAN–Other Capital Expenses" and "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A.

The Subordinate 2016 Series A Bonds bears interest at a variable rate of interest, at a spread to one-month LIBOR. Under the 2016 BANA Agreement, upon a failure by Metropolitan to perform or observe its covenants, a default in other specified indebtedness of Metropolitan, or other specified events of default, BANA could terminate its commitments and declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the 2016 BANA Agreement as a Subordinate Parity Obligation. The Subordinate 2016 Series A Bonds are Index Tender Bonds and are subject to mandatory tender for purchase on the scheduled mandatory tender date of December 21, 2018, or, if directed by BANA upon the occurrence and continuance of an event of default under the 2016 BANA Agreement, five business days after receipt of such direction. On or before the scheduled mandatory tender date, Metropolitan may request an extension of the 2016 BANA Agreement for another tender period or may request BANA to purchase the Subordinate 2016 Series A Bonds in another interest rate mode, or Metropolitan may seek to remarket the 2016 Series A Bonds to another bank or in the public debt markets. In the event the 2016 BANA Agreement is not extended, Metropolitan is obligated under the 2016 BANA Agreement to cause unremarketed Subordinate 2016 Series A Bonds to be redeemed five business days after the scheduled mandatory tender date in the event the purchase price of the Subordinate 2016 Series A Bonds is not paid from the proceeds of a remarketing or other funds on the scheduled mandatory tender date. A failure to pay the purchase price of the Subordinate 2016 Series A Bonds upon a mandatory tender would constitute a default under the Subordinate Debt Resolutions if not remedied within five business days.

The water revenue bonds issued under the Subordinate Debt Resolutions outstanding as of February 1, 2017, are set forth below:

Name of Issue	Principal Outstanding
Subordinate Water Revenue Bonds, 2016 Authorization Series A[(1)]	$175,000,000

Source: Metropolitan.

(1) Outstanding variable rate obligation.

Subordinate Parity Obligations

In 2003, Metropolitan obtained a $20 million California Safe Drinking Water Revolving Fund Loan in 2003 at an interest rate of 2.39 percent per annum to reimburse construction costs for oxidation retrofit facilities at the Henry J. Mills Treatment Plant in Riverside County. The loan payment obligation is subordinate to the Senior Revenue Bonds and Senior Obligations and on parity with the Subordinate Revenue Bonds. As of February 1, 2017, the principal balance outstanding was $8.6 million.

Other Junior Obligations

Metropolitan currently is authorized to issue up to $400,000,000 of Commercial Paper Notes payable from Net Operating Revenues on a basis subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. Although no Commercial Paper Notes are currently outstanding, the authorization remains in full force and effect and Metropolitan may issue Commercial Paper Notes from time to time.

General Obligation Bonds

As of February 1, 2017, $92,865,000 aggregate principal amount of general obligation bonds payable from *ad valorem* property taxes were outstanding. See "METROPOLITAN REVENUES–General" and "–Revenue Allocation Policy and Tax Revenues" in this Appendix A. Metropolitan's revenue bonds are not payable from the levy of *ad valorem* property taxes.

General Obligation Bonds	Amount Issued[(1)]	Principal Outstanding
Waterworks General Obligation Refunding Bonds, 2009 Series A	$45,515,000	$30,745,000
Waterworks General Obligation Refunding Bonds, 2010 Series A	39,485,000	23,065,000
Waterworks General Obligation Refunding Bonds, 2014 Series A	49,645,000	39,055,000
Total	$134,645,000	$92,865,000

Source: Metropolitan.

(1) Voters authorized Metropolitan to issue $850,000,000 of Waterworks General Obligation Bonds, Election 1966, in multiple series, in a special election held on June 7, 1966. This authorization has been fully utilized. This table lists bonds that refunded such Waterworks General Obligation Bonds, Election 1966.

State Water Contract Obligations

General. As described herein, in 1960, Metropolitan entered into its State Water Contract with DWR to receive water from the State Water Project. All expenditures for capital and operations, maintenance, power and replacement costs associated with the State Water Project facilities used for water delivery are paid for by the 29 Contractors that have executed State Water Contracts with DWR, including Metropolitan. Contractors are obligated to pay allocable portions of the cost of construction of the system and ongoing operating and maintenance costs through at least 2035, regardless of quantities of water available from the project. Other payments are based on deliveries requested and actual deliveries received, costs of power required for actual deliveries of water, and offsets for credits received. In exchange, Contractors have the right to participate in the system, with an entitlement to water service from the State Water Project and the right to use the portion of the State Water Project conveyance system necessary to deliver water to them at no additional cost as long as capacity exists. Metropolitan's State Water Contract accounts for nearly one-half of the total entitlement for State Water Project water contracted for by all Contractors.

DWR and other State Water Project Contractors, including Metropolitan, have reached an Agreement in Principle to extend their State Water Contracts to 2085 and to make certain changes related to the financial management of the State Water Project in the future. See "METROPOLITAN'S WATER SUPPLY–State Water Project" in this Appendix A.

Metropolitan's payment obligation for the State Water Project for the fiscal year ended June 30, 2016 was $511 million, which amount reflects prior year's credits of $61.6 million. For the fiscal year ended June 30, 2016, Metropolitan's payment obligations under the State Water Contract were approximately 27 percent of Metropolitan's total annual expenses. A portion of Metropolitan's annual property tax levy is for payment of State Water Contract obligations, as described above under "METROPOLITAN REVENUES–General" in this Appendix A. See Note 9(a) to Metropolitan's audited financial statements in Appendix B for an estimate of Metropolitan's payment obligations under the State Water Contract. Also see "–Power Sources and Costs" below for a description of current and future costs for electric power required to operate State Water Project pumping systems and a description of litigation involving the federal relicensing of the Hyatt-Thermalito hydroelectric generating facilities at Lake Oroville.

The State Water Contract requires that in the event that Metropolitan fails or is unable to raise sufficient funds by other means, Metropolitan must levy upon all property within its boundaries not exempt from taxation a tax or assessment sufficient to provide for all payments under the State Water Contract. Currently, a portion of the capital costs under the State Water Contract are paid from *ad valorem* taxes levied by Metropolitan. In the opinion of Metropolitan's General Counsel, a tax increase to provide for additional payments under the State Water Contract would be within the exemption permitted under Article XIIIA of the State Constitution as a tax to pay pre-1978 voter approved indebtedness.

Metropolitan capitalizes its share of the State Water Project capital costs as participation rights in State Water Project facilities as such costs are costs paid in exchange for participation in the system, regardless of whether there is water available to be delivered. Unamortized participation rights essentially represent a prepayment for future costs as Metropolitan will likely continue to participate in the system at least through 2035. Metropolitan's share of system operating and maintenance costs are annually expensed.

DWR and various subsets of the State Water Contractors have entered into amendments to the State Water Contract related to the financing of certain State Water Project facilities. The amendments establish procedures to provide for the payment of construction costs financed by DWR bonds by establishing separate subcategories of charges to produces the revenues required to pay all of the annual financing costs (including coverage on the allocable bonds) relating to the financed project. If any affected Contractor defaults on payment under certain of such amendments, the shortfall may be collected from the non-defaulting affected Contractors, subject to certain limitations.

These amendments represent additional long-term obligations of Metropolitan, as described below.

Devil Canyon-Castaic Contract. On June 23, 1972, Metropolitan and five other southern California public agencies entered into a contract (the "Devil Canyon-Castaic Contract") with DWR for the financing and construction of the Devil Canyon and Castaic power recovery facilities, located on the aqueduct system of the State Water Project. Under this contract, DWR agreed to build the Devil Canyon and Castaic facilities, using the proceeds of revenue bonds issued by DWR under the State Central Valley Project Act. DWR also agreed to use and apply the power made available by the construction and operation of such facilities to deliver water to Metropolitan and the other contracting agencies. Metropolitan, in turn, agreed to pay to DWR 88 percent of the debt service on the revenue bonds issued by DWR. For calendar year 2016, this represented a payment of $7.8 million. In addition, Metropolitan agreed to pay 78.5 percent of the operation and maintenance expenses of the Devil Canyon facilities and 96 percent of the operation and maintenance expenses of the Castaic facilities. Metropolitan's obligations under the Devil Canyon-Castaic Contract continue until the bonds are fully retired in 2022 even if DWR is unable to operate the facilities or deliver power from these facilities.

Off-Aqueduct Power Facilities. In addition to system "on-aqueduct" power facilities costs, DWR has, either on its own or by joint venture, financed certain off-aqueduct power facilities. The power generated is utilized by the system for water transportation and other State Water Project purposes. Power

generated in excess of system needs is marketed to various utilities and the California Independent System Operator. Metropolitan is entitled to a proportionate share of the revenues resulting from sales of excess power. By virtue of a 1982 amendment to the State Water Contract and the other water supply contracts, Metropolitan and the other water contractors are responsible for paying the capital and operating costs of the off-aqueduct power facilities regardless of the amount of power generated. Other costs of Metropolitan in relation to the State Water Project and the State Water Contract may increase as a result of restructuring of California's electric utility industry and new Federal Energy Regulatory Commission ("FERC") regulations.

East Branch Enlargement Amendment. In 1986, Metropolitan's State Water Contract and the water supply contracts of certain other State Water Project Contractors were amended for the purpose, among others, of financing the enlargement of the East Branch of the California Aqueduct. Under the amendment, enlargement of the East Branch can be initiated either at Metropolitan's request or by DWR finding that enlargement is needed to meet demands.

The amendment establishes a separate subcategory of the Transportation Charge under the State Water Contract for the East Branch Enlargement and provides for the payment of costs associated with financing and operating the East Branch Enlargement. Under the amendment, the annual financing costs for such facilities financed by bonds issued by DWR are allocated among the participating contractors based upon the delivery capacity increase allocable to each participating contractor. Such costs include, but are not limited to, debt service, including coverage requirements, deposits to reserves, and certain operation and maintenance expenses, less any credits, interest earnings or other moneys received by DWR in connection with this facility.

If any participating contractor defaults on payment of its allocable charges under the amendment, among other things, the non-defaulting participating contractors may assume responsibility for such charges and receive delivery capability that would otherwise be available to the defaulting participating contractor in proportion to the non-defaulting contractor's participation in the East Branch Enlargement. If participating contractors fail to cure the default, Metropolitan will, in exchange for the delivery capability that would otherwise be available to the defaulting participating contractor, assume responsibility for the capital charges of the defaulting participating contractor.

Water System Revenue Bond Amendment. In 1987, the State Water Contract and other water supply contracts were amended for the purpose of financing State Water Project facilities through revenue bonds. This amendment establishes a separate subcategory of the Delta Water Charge and the Transportation Charge for projects financed with DWR water system revenue bonds. This subcategory of charge provides the revenues required to pay the annual financing costs of the bonds and consists of two elements. The first element is an annual charge for repayment of capital costs of certain revenue bond financed water system facilities under the existing water supply contract procedures. The second element is a water system revenue bond surcharge to pay the difference between the total annual charges under the first element and the annual financing costs, including coverage and reserves, of DWR's water system revenue bonds.

If any contractor defaults on payment of its allocable charges under this amendment, DWR is required to allocate a portion of the default to each of the nondefaulting contractors, subject to certain limitations, including a provision that no nondefaulting contractor may be charged more than 125 percent of the amount of its annual payment in the absence of any such default. Under certain circumstances, the nondefaulting contractors would be entitled to receive an allocation of the water supply of the defaulting contractor.

The following table sets forth Metropolitan's projected costs of State Water Project water based upon DWR's Annual Billing to Metropolitan for calendar year 2017 and, for fiscal year 2016-17, preliminary financial results through December 30, 2016. For all other years the projections are based on Metropolitan's adopted biennial budget for fiscal years 2016-17 and 2017-18 and the ten-year financial forecast included in

the adopted budget. See "METROPOLITAN'S WATER SUPPLY–State Water Project – Bay-Delta Proceedings Affecting State Water Project – Bay-Delta Planning Activities" in this Appendix A.

PROJECTED COSTS OF METROPOLITAN FOR STATE WATER PROJECT WATER[(1)]
(Dollars in Millions)

Year Ending June 30	Capital Costs	Minimum OMP&R[(2)]	Power Costs[(3)]	Refunds & Credits	Total[(4)]
2017	$173.4	$225.0	$150.0	$(46.4)	$502.0
2018	184.2	294.7	158.4	(37.9)	599.4
2019	195.3	315.9	170.4	(36.1)	645.5
2020	212.1	340.5	191.1	(35.0)	708.7
2021	236.3	264.8	212.1	(34.7)	778.6

Source: Metropolitan.

(1) Projections are based upon DWR's Annual Billing to Metropolitan for 2017 and attachments (dated July 1, 2015) and, for fiscal year 2016-17, preliminary financial results through December 31, 2016. For other years, the projections are based on Metropolitan's adopted biennial budget for fiscal years 2016-17 and 2017-18, and the ten-year financial forecast included in the adopted budget. All costs are adjusted from calendar year to fiscal year periods ending June 30. The total charges shown above differ from those shown in Note 9 of Metropolitan's audited financial statements for the fiscal year ended June 30, 2016 and June 30, 2015, in Appendix B, due to the inclusion of allowances for inflation and anticipated construction of additional State Water Project facilities. See "METROPOLITAN EXPENSES–Power Sources and Costs – State Water Project" in this Appendix A.

(2) Minimum Operations, Maintenance, Power and Replacement ("OMP&R") represents costs which are fixed and do not vary with the amount of water delivered.

(3) Assumptions for water deliveries through the California Aqueduct (not including SBVMWD and DWA/CVWD transfers and exchanges) into Metropolitan's service area and to storage programs are as follows: 0.75 million acre-feet for fiscal year 2016-17, 0.77 million acre-feet for fiscal year 2017-18, 0.82 million acre-feet for fiscal year 2018-19, 0.88 million acre-feet for fiscal year 2019-20, and 0.93 million acre-feet for fiscal year 2020-21. Availability of State Water Project supplies vary and deliveries may include transfers and storage. All deliveries are within maximum contract amount and are based upon availability, as determined by hydrology, water quality and wildlife conditions. See "METROPOLITAN'S WATER SUPPLY–State Water Project" and "–Endangered Species Act and Other Environmental Considerations" in this Appendix A.

(4) Annual totals include California WaterFix related costs for the fiscal years ended June 30, 2017 through June 30, 2021 of $-0- in fiscal year 2016-17 and fiscal year 2017-18, $20 million in fiscal year 2018-19, $38 million in fiscal year 2019-20, and $63 million in fiscal year 2020-21. Projected California WaterFix costs are reflected in the ten-year financial forecast provided in the biennial budget for fiscal years 2016-17 and 2017-18 that was approved by Metropolitan's Board on April 12, 2016.

Other Long-Term Commitments

Metropolitan also has various ongoing fixed annual obligations under its contract with the United States Department of Energy for power from the Hoover Power Plant. Under the terms of the Hoover Power Plant contract, Metropolitan purchases energy to pump water through the CRA. In fiscal year 2015-16 Metropolitan paid approximately $15.7 million under this contract. Payments made under the Hoover Power Plant contract are treated as operation and maintenance expenses. On March 12, 2014, Metropolitan and the other Hoover Contractors funded the defeasance of $124 million of bonds issued by the U.S. Treasury Department for facilities related to the Hoover Dam and Power Plant. Following this repayment, Metropolitan expects to reduce its annual payment for Hoover power by approximately $2.3 million.

Power Sources and Costs

Current and future costs for electric power required for operating the pumping systems of the CRA and the State Water Project are a substantial part of Metropolitan's overall expenses. Expenses for electric power for the CRA (not including credits from power sales and related revenues) for the fiscal years 2014-15 and 2015-16 were approximately $39.2 million, and $35.5 million, respectively. Expenses for electric power

and transmission service for the State Water Project for fiscal years 2014-15 and 2015-16 were approximately $140.8 million and $125.4 million, respectively. Given the continuing uncertainty surrounding the electricity markets in California and in the electric industry in general, Metropolitan is unable to give any assurance with respect to the magnitude of future power costs.

Colorado River Aqueduct. Generally, 55 to 70 percent of the annual power requirements for pumping at full capacity (1.25 million acre-feet of Colorado River water) in Metropolitan's CRA are secured through long-term contracts with the United States Department of Energy for energy generated from facilities located on the Colorado River (Hoover Power Plant and Parker Power Plant) and Southern California Edison ("Edison"). These contracts provide Metropolitan with reliable and economical power resources to pump Colorado River water to Metropolitan's service area.

The Hoover Power Allocation Act of 2011 (H.R. 470) requires the Western Area Power Administration (Western) to renew existing contracts for electric energy generated at the Hoover Power Plant for an additional 50 years through September 2067. The contractors will retain 95 percent of their existing power rights. Metropolitan and Western have completed negotiations and have executed the new contract.

As provided for under the Hoover Power Allocation Act of 2011 (H.R. 470), Metropolitan has executed a 50-year agreement with the Western Area Power Administration for the continued purchase of electric energy generated at the Hoover Power Plant through September 2067. Under the successor agreement (which will replace Metropolitan's existing Hoover contract expiring in 2017), Metropolitan will retain 95 percent of its existing power rights.

The remaining approximately 30 to 45 percent of annual pumping power requirements for full capacity pumping on the CRA is obtained through energy purchases from municipal and investor-owned utilities or power marketers. Gross diversions of water from Lake Havasu for the fiscal years ended June 30, 2015 and June 30, 2016 were approximately 1.2 million acre-feet and 1.1 million acre-feet, respectively, including Metropolitan's basic apportionment of Colorado River water and supplies from water transfer and storage programs.

The Metropolitan-Edison 1987 Service and Interchange Agreement includes provisions for the sharing of the benefits realized by the integrated operation of Edison's and Metropolitan's electric systems. Under this agreement, with a prior year pumping operation of 1 million acre-feet, Edison provides Metropolitan additional energy (benefit energy) sufficient to pump approximately 140,000 acre-feet annually. As the amount of pumping is increased, the amount of benefit energy provided by Edison is reduced.

Depending on pumping conditions, Metropolitan can require additional energy in excess of the base resources available to Metropolitan from the Hoover Power Plant, the Parker Power Plant, and Edison benefit energy. Metropolitan is a member of the Western Systems Power Pool ("WSPP"), and utilizes its industry standard form contract to make wholesale power purchases at market cost. Metropolitan also purchases California market-priced power through its agreement with Edison. In fiscal years 2014-15 and 2015-16, Metropolitan purchased approximately 710,000 and 690,000 megawatt-hours, respectively, of additional energy.

The Metropolitan-Edison 1987 Service and Interchange Agreement will expire on September 30, 2017. Metropolitan is negotiating with several parties on successor agreements. In particular, Metropolitan will no longer receive benefit energy from Edison. Metropolitan anticipates market power purchases will replace benefit energy and has reflected the additional costs in the CRA power cost projections for fiscal year 2017-18 and the ten-year financial forecast.

State Water Project. The State Water Project's power requirements are met from a diverse mix of resources, including State-owned hydroelectric generating facilities. DWR has long-term contracts with Metropolitan (hydropower), Kern River Conservation District (hydropower), Northern California Power Agency (natural gas generation), Alameda Municipal Power (geothermal and landfill gas), Sun Power Corporation (solar) and Dominion Solar Holdings (solar). The remainder of its power needs is met by short-term purchases. Metropolitan pays approximately 70 percent of State Water Project power costs.

DWR is seeking renewal of the license issued by FERC for the State Water Project's Hyatt-Thermalito hydroelectric generating facilities at Lake Oroville. A Settlement Agreement containing recommended conditions for the new license was submitted to FERC in March 2006. That agreement was signed by over 50 stakeholders, including Metropolitan and other State Water Contractors. With only a few minor modifications, FERC staff recommended that the Settlement Agreement be adopted as the condition for the new license. DWR issued a Final EIR for the relicensing project on July 22, 2008. On August 21, 2008, Butte County and Plumas County filed separate lawsuits against DWR challenging the adequacy of the Final EIR. This lawsuit also named all of the signatories to the Settlement Agreement as "real parties in interest," since they could be adversely affected by this litigation. On May 16, 2012, the trial court found that the EIR prepared in conjunction with the relicensing was adequate and dismissed the lawsuit against DWR. On August 7, 2012, Butte and Plumas Counties filed a notice of appeal. Briefing on the appeal was completed in May 2013. Supplemental briefing was completed in the fall of 2016. No date has been set for oral argument. Regulatory permits and authorizations are also required before the new license can take effect. In December 2016, the National Marine Fisheries Service issued a biological opinion setting forth the terms and conditions under which the relicensing project must operate in order to avoid adverse impacts to threatened and endangered species. This was the last major regulatory hurdle prior to FERC issuing a new license. Metropolitan anticipates that FERC will issue the new license in 2017. However, FERC has issued one-year renewals of the existing license since its initial expiration date on January 31, 2007, and is expected to issue successive one-year renewals until a new license is obtained.

DWR receives transmission service from the California Independent System Operator ("CAISO"), a nonprofit public benefit corporation formed in 1996 pursuant to legislation that restructured and deregulated the electric utility industry in California. The transmission service providers participating in the CAISO may seek increased transmission rates, subject to the approval of FERC. DWR has the right to contest any such proposed increase. DWR may be subject to increases in the cost of transmission service as new electric grid facilities are constructed.

Defined Benefit Pension Plan and Other Post-Employment Benefits

Metropolitan is a member of the California Public Employees' Retirement System ("PERS"), a multiple-employer pension system that provides a contributory defined-benefit pension for substantially all Metropolitan employees. PERS provides retirement and disability benefits, annual cost-of-living adjustments and death benefits to plan members and beneficiaries. PERS acts as a common investment and administrative agent for participating public entities within the State. PERS is a contributory plan deriving funds from employee contributions as well as from employer contributions and earnings from investments. A menu of benefit provisions is established by State statutes within the Public Employees' Retirement Law. Metropolitan selects optional benefit provisions from the benefit menu by contract with PERS.

Metropolitan makes contributions to PERS based on actuarially determined employer contribution rates. The actuarial methods and assumptions used are those adopted by the PERS Board of Administration. Employees are required to contribute seven percent of their earnings (excluding overtime pay) to PERS. Pursuant to the current memoranda of understanding, Metropolitan contributes the requisite seven percent contribution for all employees represented by the Management and Professional Employees Association, the Association of Confidential Employees, Supervisors and Professional Personnel Association and AFSCME Local 1902 and who were hired prior to January 1, 2012. Employees in all four bargaining

units who were hired on or after January 1, 2012, pay the full seven percent employee contribution to PERS. Metropolitan contributes the entire seven percent on behalf of unrepresented employees. Employees hired on or after January 1, 2013 and who are "new" PERS members as defined by Public Employees' Pension Reform Act of 2013 pay a member contribution of 6.75 and 6.00 percent in fiscal years 2016-17 and 2017-18, respectively. In addition, Metropolitan is required to contribute the actuarially determined remaining amounts necessary to fund the benefits for its members.

The contribution requirements of the plan members are established by State statute and the employer contribution rate is established and may be amended by PERS. The fiscal year 2015-16 contribution is based on the June 30, 2013 valuation report, the fiscal year 2016-17 contribution is based on the June 30, 2014 valuation report, and the fiscal year 2017-18 contribution is based on the June 30, 2015 valuation report. The PERS' projected investment return (the discount rate) for each of these fiscal years is 7.5 percent.

For fiscal year 2015-16, Metropolitan contributed 19.74 percent of annual covered payroll. The fiscal year 2015-16 annual pension cost was $50.8 million, of which $12.4 million was for Metropolitan's pick-up of the employees' seven percent share. For fiscal years 2016-17 and 2017-18, Metropolitan is required to contribute 20.75 and 22.89 percent of annual covered payroll, respectively, in addition to member contributions paid by Metropolitan.

Metropolitan's required contributions to PERS fluctuate each year and include a normal cost component and a component equal to an amortized amount of the unfunded liability. Many assumptions are used to estimate the ultimate liability of pensions and the contributions that will be required to meet those obligations. The PERS Board of Administration has adjusted and may in the future further adjust certain assumptions used in the PERS actuarial valuations, which adjustments may increase Metropolitan's required contributions to PERS in future years. Accordingly, Metropolitan cannot provide any assurances that its required contributions to PERS in future years will not significantly increase (or otherwise vary) from any past or current projected levels of contributions.

On April 17, 2013, the PERS Board of Administration approved changes to the amortization and rate smoothing policies to spread all gains and losses over a fixed 30-year period from a rolling 30-year period, and to recognize increases or decreases in investment returns over a 5-year period versus a 15-year period beginning with the June 30, 2013 valuations. In addition, PERS no longer uses an actuarial valuation of assets and instead uses the market value of assets to determine contribution rates per PERS direct smoothing policy. These changes will result in higher employer contribution rates in the near term but lower rates in the long term. The new policies are effective for determining contribution requirements beginning fiscal year 2015-16. On December 21, 2016 the PERS Board of Administration approved lowering the discount rate to 7.00 percent over a three year period. As a result, the discount rate for fiscal year 2018-19 will be 7.375 percent, for fiscal year 2019-20 it will be 7.25 percent, and for fiscal year 2020-21 it will be 7.00 percent. PERS has estimated that with a reduction in the rate of return to 7.00 percent, most employers could expect a 1 to 3 percent increase in the normal cost for miscellaneous plans. As a result, required contributions of employers, including Metropolitan, toward unfunded accrued liabilities, and as a percentage of payroll for normal costs, are expected to increase. The following table shows the funding progress of Metropolitan's pension plan.

The following table shows the funding progress of Metropolitan's pension plan.

Metropolitan Pension Plan Assets
(dollars in billions)

				Funded (Unfunded)		Funded Ratios	
Valuation Date	**Accrued Liability**	**Actuarial Value of Assets**	**Market Value of Assets**	**Actuarial Value**	**Market Value**	**Actuarial Value**	**Market Value**

Source: California Public Employees' Retirement System.

Effective July 1, 2014, Metropolitan implemented Governmental Accounting Standards Board Statement No. 68, *Accounting and Financial Reporting for Pensions – an amendment of GASB Statement No. 27* (GASB 68), affecting the reporting of pension liabilities for accounting purposes. Under GASB 68, Metropolitan is required to report the Net Pension Liability (*i.e.*, the difference between the Total Pension Liability and the Pension Plan's Net Position or market value of assets) in its financial statements.

For Metropolitan's fiscal year ended June 30, 2016 financial statements, the Net Pension Liability reported for the Miscellaneous Plan was $479.6 million (an increase of $72.8 million over the prior year), representing a Total Pension Liability as of such date of $2,038.6 million (an increase of $69.2 million over the prior year) less the Plan Fiduciary Net Position as of such date of $1,559.0 million (a decrease of $3.5 million over the prior year). For fiscal year 2016, the Miscellaneous Plan Net Pension Liability as a percentage of covered-employee payroll was 231.10 percent and the Plan Net Position as a percentage of the Total Pension Liability was 76.48 percent. The Net Pension Liability for Metropolitan's Miscellaneous Plan for the year ended June 30, 2016 was measured as of June 30, 2015, and the Total Pension Liability used to calculate the Net Pension Liability was determined by an annual actuarial valuation as of that date.

For the fiscal year ended June 30, 2015 financial statements, Metropolitan reported a Net Pension Liability of $406.8 million (a decrease of $118.1 million over the prior year), representing a Total Pension Liability as of such date of $1,969.3 million (an increase of $86.3 million over the prior year) less the Plan Fiduciary Net Position as of such date of $1,562.5 million (an increase of $204.4 million over the prior year). For fiscal year 2015, the Miscellaneous Plan Net Pension Liability as a percentage of covered-employee payroll was 200.53 percent and the Plan Net Position as a percentage of the Total Pension Liability was 79.34 percent. The Net Pension Liability for Metropolitan's Miscellaneous Plan for the year ended June 30, 2015 was measured as of June 30, 2014, and the Total Pension Liability used to calculate the Net Pension Liability was determined by an annual actuarial valuation as of that date.

For more information on the plan, see APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC

FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Metropolitan currently provides post-employment medical insurance to retirees and pays the post-employment medical insurance premiums to PERS. On January 1, 2012, Metropolitan implemented a longer vesting schedule for retiree medical benefits, which applies to all new employees hired on or after January 1, 2012. Payments for this benefit were $23.1 million in fiscal year 2015-16. Under Governmental Accounting Standards Board Statement No. 45, Accounting and Financial Reporting by Employers for Post-employment Benefits Other Than Pensions, Metropolitan is required to account for and report the outstanding obligations and commitments related to such benefits, commonly referred to as other post-employment benefits (OPEB), on an accrual basis.

The actuarial valuation dated June 30, 2015, was released in June of 2016. This valuation indicates that the Annual Required Contribution (ARC) in fiscal years 2016-17 and 2017-18 will be $29.3 million and $30.1 million, respectively. The ARC was based on the entry-age normal actuarial cost method with contributions determined as a level percent of pay. The actuarial assumptions included (a) a 7.25 percent investment rate of return, (b) a general inflation component of 3.0 percent and (c) increases to basic medical premiums of 7.0 percent for non-Medicare plans for 2017, grading down to 5.0 percent for 2021 and thereafter. As of June 30, 2015, the date of the OPEB actuarial report, the unfunded actuarial accrued liability was estimated to be $258.8 million. The unfunded actuarial accrued liability is amortized over a fixed 30-year period starting with fiscal year 2007-08 and ending in 2037. Changes to assumptions, actuarial gains and losses, and plan changes are amortized over a fixed 15-year period.

In September 2013, Metropolitan's Board established an irrevocable OPEB trust fund with an initial deposit of $40.0 million. During fiscal year 2013-14, the Board approved funding of an additional $100.0 million which was deposited into the irrevocable OPEB trust fund. As part of its biennial budget process, the Board approved the full funding of the ARC for fiscal years 2016-17 and 2017-18.

Governmental Accounting Standards Board Statement No. 75, *Accounting and Financial Reporting for Postemployment Benefits Other than Pensions*, was issued in June 2015, relating to accounting and financial reporting by state and local governments for OPEB. This statement establishes standards for measuring and recognizing liabilities, deferred outflows and deferred inflows of resources, and expenses. For defined benefit OPEB, this statement identifies the methods and assumptions that should be used to project benefit payments, discount projected benefit payments to their actuarial present value, and attribute that present value to periods of employee service. Note disclosure and required supplementary information requirements about OPEB also are addressed. This statement is effective for Metropolitan for 2018. Major changes would be: (i) the inclusion of net OPEB liabilities on Metropolitan's Statement of Net Position (they are currently included as notes to Metropolitan's financial statements); and (ii) more variable OPEB expense as it will now be based on the net OPEB liability change between reporting dates, with some sources of change recognized immediately and others spread over years, instead of being based on actual contributions.

HISTORICAL AND PROJECTED REVENUES AND EXPENSES

The "Historical and Projected Revenues and Expenses" table below provides a summary of revenues and expenses of Metropolitan prepared on a modified accrual basis. This is consistent with the adopted biennial budget for fiscal years 2016-17 and 2017-18. The table does not reflect the accrual basis of accounting, which is used to prepare Metropolitan's annual audited financial statements. The modified accrual basis of accounting varies from the accrual basis of accounting in the following respects: depreciation and amortization will not be recorded and payments of debt service will be recorded when due and payable. Under the modified accrual basis of accounting, revenues are recognized in the fiscal year in which they are

earned and expenses are recognized when incurred. Thus water sales revenues are recognized in the month the water is sold and expenses are recognized when goods have been received and services have been rendered. The change to modified accrual accounting is for budgeting purposes and Metropolitan will continue to calculate compliance with its rate covenant, limitations on additional bonds and other financial covenants in the Resolutions in accordance with their terms.

The projections are based on assumptions concerning future events and circumstances that may impact revenues and expenses and represent management's best estimates of results at this time. See footnotes to the table below entitled "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" for relevant assumptions, including projected water sales and average annual increase in the effective water rate, and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" for a discussion of potential impacts. Some assumptions inevitably will not materialize and unanticipated events and circumstances may occur. Therefore, the actual results achieved during the projection period will vary from the projections and the variations may be material.

Metropolitan's resource planning projections are developed using a comprehensive analytical process that incorporates demographic growth projections from recognized regional planning entities, historical and projected data acquired through coordination with local agencies, and the use of generally accepted empirical and analytical methodologies. See "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A. Metropolitan has conservatively set the water sales projections in the following table. Due to the variability of supplemental wholesale water sales and unpredictability of future hydrologic conditions, sales projections are based on long-term average forecasts consistent with Metropolitan's latest Board adopted Integrated Resources Plan, the 2015 IRP Update.

Nevertheless, Metropolitan's assumptions have been questioned by directors representing SDCWA on Metropolitan's Board. Metropolitan has reviewed SDCWA's concerns and, while recognizing that assumptions may vary, believes that the estimates and assumptions that support Metropolitan's projections are reasonable based upon history, experience and other factors as described above.

Metropolitan's water sales projections are the result of a comprehensive retail demand, conservation, and local supply estimation process, including supply projections from member agencies and other water providers within Metropolitan's service area. Retail demands for water are estimated with a model driven by projections of relevant demographics provided by SCAG and SANDAG. Retail demands are adjusted downward for conservation savings and local supplies, with the remainder being the estimated demand for Metropolitan supplies. Conservation savings estimates include all conservation programs in place to date as well as estimates of future conservation program goals that will result from regional 20 percent reductions by 2020 conservation savings. See "CONSERVATION AND WATER SHORTAGE MEASURES" in this Appendix A. Local supplies include water produced by local agencies from various sources including but not limited to groundwater, surface water, locally-owned imported supplies, recycled water, and seawater desalination (see "REGIONAL WATER RESOURCES" in this Appendix A). For example, water sales projections for fiscal year 2016-17 assumed that local projects such as groundwater recovery and desalination projects (see "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A) would become operational and produce local supplies in 2017. For additional description of Metropolitan's water sales projections, see "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

The water sales projections used to determine water rates and charges assume an average year hydrology. Actual water sales are likely to vary from projections. As shown in the *Historical Water Sales* chart below, sales can vary significantly from average and demonstrates the degree to which Metropolitan's commitments to meet supplemental demands can impact sales. In years when actual sales exceed projections, the revenues from water sales during the fiscal year will exceed budget, potentially resulting in

an increase in financial reserves. In years when actual sales are less than projections, Metropolitan uses various tools to manage reductions in revenues, such as reducing expenses below budgeted levels, reducing funding of capital from revenues, and drawing on reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. Metropolitan considers actual sales, revenues and expenses, and financial reserve balances in setting rates for future fiscal years.

Projections for fiscal year 2016-17 in the following table reflect actual financial results through December 31, 2016 and revised projections for the balance of the fiscal year. The financial projections for fiscal year 2017-18 reflects the adopted biennial budget that was approved by the Board on April 12, 2016, with revised preliminary water sales projections as of February 2017, but with no adjustments for lower expenses that can accompany lower water sales. Financial projections for fiscal years 2018-19 through 2020-21 are reflected in the ten-year financial forecast provided in the adopted biennial budget. This includes the projected issuance of $320 million of bonds in fiscal years 2017-18 through 2019-21 to finance the CIP. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Revenues" and "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

Water sales were 1.62 million acre-feet in fiscal year 2015-16. Water sales are projected to be 1.60 million acre-feet in fiscal year 2016-17 and 1.50 million acre-feet for fiscal year 2017-18, and 1.75 million acre-feet for fiscal years 2018-19 through 2020-21. Rates and charges increased by 1.5 percent on January 1, 2015 and January 1, 2016, and by 4.0 percent on January 1, 2017. On April 12, 2016 the Board adopted average increases in rate and charges of 4.0 percent, which will become effective on January 1, 2018. Rates and charges are projected to increase an average of 4.5 percent annually thereafter. Actual rates and charges to be effective in 2019 and thereafter are subject to adoption by Metropolitan's Board. The projections were prepared by Metropolitan and have not been reviewed by independent certified public accountants or any entity other than Metropolitan. Dollar amounts are rounded.

(Footnotes on next page)

(Footnotes to table on prior page)

(a) Unaudited. Prepared on a modified accrual basis. Projected revenues and expenses in fiscal year 2016-17 are based on preliminary financial results through December 31, 2016, and revised projections for the balance of fiscal year 2016-17. Projections for fiscal year 2017-18 are based on assumptions and estimates used in the adopted biennial budget for fiscal years 2016-17 and 2017-18 and revised for water sales of 1.5 million acre-feet. Projections for fiscal years 2018-19 through 2020-21 are based on assumptions and estimates used in the adopted fiscal years 2016-17 and 2017-18 biennial budget and reflect the projected issuance of additional bonds.

(b) During the fiscal years ended June 30, 2013 through June 30, 2016, annual water sales (in acre-feet) were 1.86 million, 2.04 million, 1.905 million and 1.62 million, respectively. See "METROPOLITAN REVENUES–Water Sales Revenues," the table entitled "SUMMARY OF WATER SOLD AND WATER SALES" in this Appendix A. The water sales projections (in acre-feet) are 1.60 million acre-feet for fiscal year 2016-17, 1.50 million acre-feet for fiscal years 2017-18, and 1.75 million acre-feet for fiscal years 2018-19, 2019-20 and 2020-21. Projections reflect Board adopted rate and charge increases of 4.0 percent, effective on January 1, 2017 and January 1, 2018. Rates and charges are projected to increase an average of 4.5 percent per fiscal year thereafter, subject to adoption by Metropolitan's Board. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES."

(c) Includes receipts from water standby, readiness-to-serve, and capacity charges. The term Operating Revenues excludes *ad valorem* taxes. See "METROPOLITAN REVENUES–Other Charges" in this Appendix A.

(d) Water Transfer Costs are included in operation and maintenance expenses for purposes of calculating the debt service coverage on all Obligations.

(e) Includes on- and off-aqueduct power and operation, maintenance, power and replacement costs payable under the State Water Contract. See "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

(f) May include lease and rental net proceeds, net proceeds from sale of surplus property, reimbursements, and federal interest subsidy payments for Build America Bonds.

(g) Reflects transfers from the Water Management Fund, the Water Stewardship Fund, and the Water Rate Stabilization Fund, of $142 million in fiscal year 2014-15, $222 million in fiscal year 2015-16, and projected transfers of $46 million in fiscal year 2016-17 to fund a like amount of costs for conservation and supply programs. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES."

(h) Includes CRA power sales.

(i) Does not include interest applicable to Bond Construction Funds, the Excess Earnings Funds, other trust funds and the Deferred Compensation Trust Fund. Fiscal year 2012-13 included Fair Value Adjustment of $(13.8) million, as per modified accrual accounting

(j) Adjusted Net Operating Revenues is the sum of all available revenues that the revenue bond resolutions specify may be considered by Metropolitan in setting rates and issuing additional Senior Revenue Bonds and Senior Parity Obligations and Subordinate Revenue Bonds and Subordinate Parity Obligations.

(k) Includes debt service on outstanding Senior Revenue Bonds, and additional Senior Revenue Bonds (projected). Assumes issuance of $80 million annually in additional Senior Revenue Bonds as provided in budget assumptions for the adopted biennial budget for fiscal years 2016-17 and 2017-18 and as projected for fiscal years 2018-19, 2019-20, and 2020-21. For fiscal years 2013-14 and 2014-15, reflects the defeasance of the 2004 Series B Water Revenue Refunding Bonds, payable on July 1, 2014, through a payment of $33.7 million to an escrow account on May 29, 2014. Fiscal year 2015-16 debt service increased $7.0 million for debt service paid on June 30, 2016, rather than July 1, 2017 and fiscal year 2016-17 debt service was therefore reduced by $7.0 million. See "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

(l) Consisting of subordinate lien California Safe Drinking Water Revolving Fund Loan and Subordinate 2016 Series A Bonds.

(m) Adjusted Net Operating Revenues divided by the sum of debt service on outstanding Senior Revenue Bonds and additional Senior Revenue Bonds (projected).

(n) Adjusted Net Operating Revenues, divided by the sum of debt service on outstanding Senior Revenue Bonds, Senior Parity Obligations, Subordinate Revenue Bonds and Subordinate Parity Obligations, including the subordinate lien California Safe Drinking Water Revolving Fund Loan and projected Revenue Bonds. See "METROPOLITAN EXPENSES–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations" in this Appendix A.

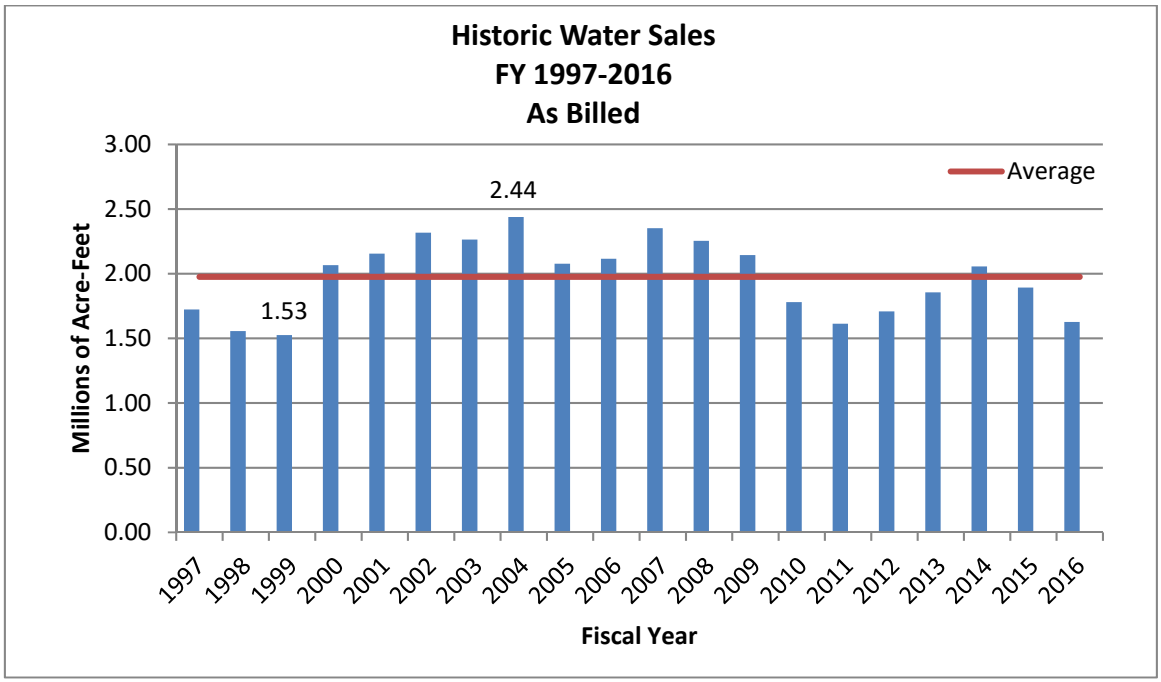
(o) Adjusted Net Operating Revenues, divided by the sum of State Water Contract capital costs paid from current year operations and debt service on outstanding Revenue Bonds, the subordinate lien California Safe Drinking Water Revolving Fund Loan, Subordinate 2016 Series A Bonds and additional Revenue Bonds (projected).

(p) For Fiscal Year 2012-13, includes amounts that were transferred prior to June 30, 2013: $25 million to the Water Transfer Fund, $25 million to a trust to pre-fund Metropolitan's unfunded liability for other post-employment benefits, and $25 million for pay-as-you-go Construction. For Fiscal Year 2013-14, includes amounts transferred prior to June 30, 2014: $100 million to a trust to pre-fund Metropolitan's unfunded liability for other post-employment benefits; $100 million for pay-as-you-go Construction, $232 million to the Water Management Fund, for water purchases to replenish storage and funding drought response programs. For Fiscal Year 2014-15, includes amounts transferred prior to June 30, 2015: $160 million to the Water Management Fund, for water conservation programs. For fiscal year 2015-16, Metropolitan used $264 million for acquiring properties in Riverside and Imperial Counties, funded by $160 million from the Replacement and Refurbishment Fund Reserves and the balance from unrestricted reserves. This land purchase is reflected as a pay-as-you-go expenditure for fiscal year 2015-16.

(q) The financial projection for fiscal year 2017-18 reflects the revised preliminary water sales projection of 1.50 million acre-feet and a corresponding reduction in projected water sales revenues. It does not take into account any potential reduction in expenses that may accompany such reduced water sales. As discussed, Metropolitan uses its financial reserves and budgetary tools to manage the financial impact of the variability in revenues due to fluctuations in annual water sales. See also "METROPOLITAN REVENUES–Financial Reserve Policy."

Water Sales Projections

Water sales forecast in the table above for fiscal year 2016-17 is 1.60 million acre-feet, 100 thousand acre-feet under budget. The updated water sales forecast is 1.50 million acre-feet for fiscal year 2017-18, and 1.75 million acre-feet for fiscal years 2018-19 and 2019-21, consistent with the biennial budget and ten-year financial forecast. For purposes of comparison, Metropolitan's highest water sales during the past 20 fiscal years was approximately 2.44 million acre-feet in fiscal year 2003-04 and the lowest was 1.53 million acre-feet in fiscal year 1998-1999. The chart below shows the last 20 fiscal years of water sales.



Water Sales Revenues

Metropolitan relies on revenues from water sales for about 85 to 90 percent of its total revenues. In adopting the budget and rates and charges for each fiscal year, Metropolitan's board reviews the anticipated revenue requirements and projected water sales to determine the rates necessary to produce the required revenues to be derived from water sales during the fiscal year. Metropolitan sets rates and charges estimated to provide operating revenues sufficient, with other sources of funds, to provide for payment of its expenses. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

Metropolitan's Board has adopted annual increases in water rates each year beginning with the rates effective January 1, 2004. See "METROPOLITAN REVENUES–Rate Structure" and "–Classes of Water Service" in this Appendix A. On April 10, 2012, Metropolitan's Board adopted annual water rate increases of 5.0 percent, which became effective January 1, 2013 and January 1, 2014. On April 8, 2014, Metropolitan's Board adopted 1.5 percent average water rate increases effective January 1, 2015, and January 1, 2016, and on April 12, 2016, Metropolitan's Board adopted an average 4.0 percent water rate increase, effective January 1, 2017, and an additional average 4.0 percent water rate increase effective January 1, 2018.

Projected Fiscal Year 2016-17 Results

Projections for fiscal year 2016-17, in the table above, are based on preliminary financial results through December 31, 2016, and revised projections for the balance of fiscal year 2016-17. The financial

projection for fiscal year 2017-18 reflects the adopted biennial budget for this fiscal year as approved by the Board on April 12, 2016, with revised preliminary water sales projections. Financial projections for fiscal years 2018-19 through 2020-21 are reflected in the ten-year financial forecast provided in the adopted biennial budget. The fiscal year 2016-17 and 2017-18 biennial budget and rates set the stage for predictable and reasonable rate increases over the ten-year planning period, with Board adopted rate increases of 4.0 percent annually in both fiscal years 2016-17 and 2017-18, and projected average increases of 4.5 percent per year thereafter. Actual rates and charges to be effective in fiscal year 2018-19 and thereafter are subject to adoption by Metropolitan's Board as part of the biennial budget process, at which point the ten-year forecast will also be updated as well. Increases in rates and charges reflect the impact of reduced water sales projections, increasing operations and maintenance costs, and increasing State Water Project costs, when compared to prior fiscal years.

Metropolitan's revenues exceeded expenses during fiscal year 2014-15, resulting in a significant increase in unrestricted reserves. On May 29, 2015, Metropolitan's Board approved the use of $160 million of unrestricted reserves over the target reserve level, $50 million from the Water Stewardship Fund, and $140 million from the Water Management Fund to fund conservation incentives. As of June 30, 2015, Metropolitan's unrestricted reserves were $476 million, on a modified accrual basis. On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves. Unrestricted reserves, as of April 30, 2016, include $250 million drawn from Short-Term Revolving Credit Facilities with RBC Municipal Products, LLC, and U.S. Bank N.A, and deposited in Metropolitan's financial reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" and "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Senior Parity Obligations – Short-Term Revolving Credit Facilities" in this Appendix A.

In fiscal years 2014-15 and 2015-16, Adjusted Net Operating Revenues reflect the use of $142 million and $222 million respectively, from reserves to fund a like amount of costs for conservation and supply programs. In fiscal year 2016-17, $46 million of Adjusted Net Operating Revenues are projected to come from reserves to fund a like amount of costs for conservation and supply programs.

Financial projections for fiscal year 2016-17 reflect lower water sales revenues that are estimated to be $107.0 million, or 8 percent, below budget, based on the revised water sales projection of 1.60 million acre-feet, compared to the budgeted 1.70 million acre-feet, a reduction of 6 percent.

Operation and maintenance expenses in fiscal year 2016-17 are projected to be $1.01 billion, which represents approximately 63 percent of total costs. These expenses include the costs of labor, electrical power, materials and supplies of both Metropolitan and its contractual share of the State Water Project. Metropolitan's operation and maintenance expenditures are project to be on budget in fiscal year 2016-17. Metropolitan's State Water Project costs are projected to be $80.3 million lower than budgeted. Overall, projected expenditures for the twelve months ending June 30, 2017 are $1.6 billion. This is $89 million, or 5 percent, less than budgeted expenditures.

The combination of lower than budgeted water sales revenue and expenditures has resulted in projected fiscal year 2016-17 revenue bond debt service coverage to be 1.48x and fixed charge coverage to be 1.26x, compared to budgeted debt service coverage of 1.55x and budgeted fixed charge coverage of 1.27x. Fiscal year 2016-17 capital expenditures, currently estimated at $212 million, will be primarily funded by pay-as-you-go funding and the remainder from bond proceeds. Metropolitan's unrestricted reserves are projected to be approximately $378 million at June 30, 2017. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. This amount does not include funds held in the Exchange Agreement Set-Aside Fund.

See also the "Management's Discussion and Analysis" contained in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Water Supply Assessment Checklist

Water Supply Assessment Checklist

Water Code Section	Water Supply Assessment Content	Page # in WSA
10910(c)(2)	Incorporate data from UWMP.	1-46
10910(d)(1)	Identification of existing water supply entitlements, water rights, or water service contracts relevant to identified water supply for proposed project, and description of quantity of water received in prior years.	26-46
10910(d)(2)(A)	Written contracts or other proof of entitlement to an identified water supply.	26-46
10910(d)(2)(B)	Capital outlay program for financing the delivery of a water supply that has been adopted.	46
10910(d)(2)(C)	Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.	15-46
10910(d)(2)(D)	Any necessary regulatory approval to deliver/convey the water supply.	15-46
10910(f)(1)	Review of any information contained in the UWMP relevant to the identified water supply for the proposed project.	1-46
10910(f)(2)	Description of any groundwater basin(s) from which proposed project will be supplied. For basins with adjudicated groundwater pumping rights, include a copy of the order/decree adopted by the court or the board and a description of quantity of groundwater public water system has the legal right to pump under the order/decree.	26-28, 31-33, Appendix D
10910(f)(3)	Description and analysis of amount and location of groundwater pumped for the past 5 years from any groundwater basin from which the proposed project will be supplied.	31-33
10910(f)(4)	Description and analysis of amount and location of groundwater that is projected to be pumped from any basin to provided water to the proposed project.	26-28, 31-33
10910(f)(5)	Analysis of sufficiency of groundwater from the basins from which the proposed project will be supplied to meet projected water demand of the proposed project.	26-28, 31-33

Mitigation Monitoring Program

3440 Wilshire Project
ENV-2016-3693-MND

1 Introduction

This Mitigation Monitoring Program (MMP) has been prepared pursuant to Public Resources Code Section 21081.6, which requires a Lead Agency to adopt a "reporting or monitoring program for changes to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment." In addition, Section 15097(a) of the State CEQA Guidelines requires that a public agency adopt a program for monitoring or reporting mitigation measures and project revisions, which it has required to mitigate or avoid significant environmental effects. This MMP has been prepared in compliance with the requirements of CEQA, Public Resources Code Section 21081.6 and Section 15097 of the CEQA Guidelines.

The City of Los Angeles is the Lead Agency for the Project and therefore is responsible for administering and implementing the MMP. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity that accepts the delegation; however, until mitigation measures have been completed, the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.

A Mitigated Negative Declaration (MND) has been prepared to address the potential environmental impacts of the Project. The evaluation of the Project's impacts in the MND applies mitigation measures (MM) needed to avoid or reduce potentially significant environmental impacts. This MMP is designed to monitor implementation of the MMs identified for the Project.

2 Organization

As shown on the following pages, each identified mitigation measure for the Project is listed and categorized by environmental impact area, with accompanying identification of the following:

- Enforcement Agency: the agency with the power to enforce the MM.
- Monitoring Agency: the agency to which reports involving feasibility, compliance, implementation, and development are made.
- Monitoring Phase: the phase of the Project during which the MM shall be monitored.
- Monitoring Frequency : the frequency at which the MM shall be monitored.

- Action Indicating Compliance: the action by which the Enforcement or Monitoring Agency indicates that compliance with the required MM has been implemented.

3 Administrative Procedures and Enforcement

This MMP shall be enforced throughout all phases of the Project. The Applicant shall be responsible for implementing each MM and shall be obligated to provide certification, as identified below, to the appropriate monitoring and enforcement agencies that each MM has been implemented. The Applicant shall maintain records demonstrating compliance with each MM. Such records shall be made available to the City upon request.

During the construction phase and prior to the issuance of building permits, the Applicant shall retain an independent Construction Monitor (either via the City or through a third-party consultant), approved by the Department of City Planning, who shall be responsible for monitoring implementation of MMs during construction activities consistent with the monitoring phase and frequency set forth in this MMP.

The Construction Monitor shall also prepare documentation of the Applicant's compliance with the MMs during construction every 90 days in a form satisfactory to the Department of City Planning. The documentation must be signed by the Applicant and Construction Monitor and be included as part of the Applicant's Compliance Report. The Construction Monitor shall be obligated to immediately report to the Enforcement Agency any non-compliance with the MMs within two businesses days if the Applicant does not correct the non-compliance within a reasonable time of notification to the Applicant by the monitor or if the non-compliance is repeated. Such non-compliance shall be appropriately addressed by the Enforcement Agency.

4 Program Modification

After review and approval of the final MMP by the Lead Agency, minor changes and modifications to the MMP are permitted, but can only be made subject to City approval. The Lead Agency, in conjunction with any appropriate agencies or departments, will determine the adequacy of any proposed change or modification. This flexibility is necessary in light of the nature of the MMP and the need to protect the environment. No changes will be permitted unless the MMP continues to satisfy the requirements of CEQA, as determined by the Lead Agency.

The Project shall be in substantial conformance with the MMs contained in this MMP. The enforcing departments or agencies may determine substantial conformance with MMs in the MMP in their reasonable discretion. If the department or agency cannot find substantial conformance, a MM may be modified or deleted as follows: the enforcing department or agency, or the decision maker for a subsequent discretionary project related approval finds that the modification or deletion complies with CEQA, including CEQA Guidelines Sections 15162 and 15164, which could include the preparation of an addendum or subsequent environmental clearance, if necessary, to analyze the impacts from the modifications to or deletion of the MMs. Any addendum or subsequent CEQA clearance shall explain why the MM is no longer

needed, not feasible, or the other basis for modifying or deleting the MM, and that the modification will not result in a new significant impact consistent with the requirements of CEQA. Under this process, the modification or deletion of a MM shall not, in and of itself, require a modification to any Project discretionary approval unless the Director of Planning also finds that the change to the MM results in a substantial change to the Project or the non-environmental conditions of approval.

5 Mitigation Monitoring Program

Mitigation Measure: TRAN-MM-1 Construction Activity Near Schools

The developer shall maintain ongoing contact with administrators of RFK Community Schools. The administrators shall be contacted when demolition, grading and construction activity begin on the Project Site so that students and their parents will know when such activities are to occur. The developer shall obtain school walk and bus routes to the schools from either the administrators or from LAUSD's Transportation Branch (323) 342-1400 and guarantee that safe and convenient pedestrian and bus routes to the school are maintained.

Impact Area: Transportation

Enforcement Agency: City of Los Angeles Department of Transportation

Monitoring Agency: City of Los Angeles Department of Transportation

Monitoring Phase: Pre-construction; construction

Monitoring Frequency: Once at Project plan check prior to issuance of grading or building permit; once during field inspection

Action Indicating Compliance: Plan approval and issuance of grading permit; field inspection sign-off

Mitigation Measure: TRAN-MM-2 Safety Hazards

- The developer shall install appropriate construction related traffic signs around the Project Site to ensure pedestrian and vehicle safety.
- The Applicant shall plan construction and construction staging as to maintain pedestrian access on adjacent sidewalks throughout all construction phases. This requires the applicant to maintain adequate and safe pedestrian protection, including physical separation (including utilization of barriers such as K-Rails or scaffolding) from

work space and vehicular traffic, and overhead protection, due to sidewalk closure or blockage, at all times.

- Temporary pedestrian facilities shall be adjacent to the Project Site and provide safe, accessible routes that replicate as nearly as practical the most desirable characteristics of the existing facility.

- Covered walkways shall be provided where pedestrians are exposed to potential injury from falling objects.

- Applicant shall keep sidewalk open during construction until only when it is absolutely required to close or block sidewalk for construction and/or construction staging. Sidewalk shall be reopened as soon as reasonably feasible taking construction and construction staging into account.

Impact Area: Transportation

Enforcement Agency: City of Los Angeles Department of Transportation

Monitoring Agency: City of Los Angeles Department of Transportation

Monitoring Phase: Pre-construction; construction

Monitoring Frequency: Once at Project plan check prior to issuance of grading or building permit; once during field inspection

Action Indicating Compliance: Plan approval and issuance of grading permit; field inspection sign-off

Project Design Features

3440 Wilshire Project
ENV-2016-3693-MND

In addition to the required mitigation measures, the project also includes project design features that prevent any significant impacts from occurring through design. These project design features are included below, and are conditions of the project that must be monitored and enforced as if they were mitigation measures. While these project design features are not required by the code, the City of Los Angeles has required them of the project, and they may not be deleted except by public hearing. These project design features are listed below:

Project Design Feature: TRAN-PDF-1

A Construction Traffic Management Plan will be developed by the contractor and approved by the City of Los Angeles to alleviate construction period impacts, which may include but is not limited to the following measures:

- Provide off-site truck staging in a legal area furnished by the construction truck contractor. Anticipated truck access to the project site will be off Mariposa Avenue and 7th Street.

- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.

- As parking lane and/or sidewalk closures are anticipated along 7th Street, worksite traffic control plan(s), approved by the City of Los Angeles, should be implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.

- Establish requirements for loading/unloading and storage of materials on the project site, where parking spaces would be encumbered, length of time traffic travel lanes can be encumbered, sidewalk closings or pedestrian diversions to ensure the safety of the pedestrian and access to local businesses and residences.

- Ensure that access will remain unobstructed for land uses in proximity to the project site during project construction.

- Coordinate with the City and emergency service providers to ensure adequate access is maintained to the project site and neighboring businesses and residences.

A Construction Worker Parking Plan will also be developed by the contractor and approved by the City of Los Angeles to ensure that the parking location requirements for construction workers will be strictly enforced. These could include but are not limited to the following measures:

- During construction activities when construction worker parking cannot be accommodated on the project site, the plan shall identify alternate parking location(s) for construction workers and the method of transportation to and from the project site (if beyond walking distance) for approval by the City 30 days prior to commencement of construction.

- Provide all construction contractors with written information on where their workers and their subcontractors are permitted to park, and provide clear consequences to violators for failure to follow these regulations. This information will clearly state that no parking is permitted on residential streets.

Impact Area: Transportation

Enforcement Agency: City of Los Angeles Department of Transportation

Monitoring Agency: City of Los Angeles Department of Transportation

Monitoring Phase: Pre-construction; construction

Monitoring Frequency: Once at Project plan check prior to issuance of grading or building permit; once during field inspection

Action Indicating Compliance: Plan approval and issuance of grading permit; field inspection sign-off

ERRATUM to the Initial Study/ Mitigated Negative Declaration

3440 Wilshire Project

Case Number: ENV-2016-3693-MND

PREPARED FOR:
The City of Los Angeles
Department of City Planning

PREPARED BY:
CAJA Environmental Services, LLC
15350 Sherman Way, Suite 315
Van Nuys, CA 91406

APPLICANT:
Central Plaza, LLC
3450 Wilshire Blvd. Suite 1200-115
Los Angeles, CA 90010

March 2, 2020

PROJECT BACKGROUND

The Site currently consists of 6 subdivided lots and a non-subdivided remainder. The Project is requesting a Vesting Tentative Tract to merge the existing lots and re-subdivide the Site into 6 lots: 1) ground (master) lot with a lot area of 316,438 square feet; 2) residential (apartment) (airspace) with up to 640 residential units in up to 701,315 square feet of floor area; 3) commercial (retail) (airspace) with an allocation of two commercial condominiums comprising up to 2,360 square feet of commercial space; 4) parking (residential, commercial, office, and bike) (airspace); 5) existing 5-story parking structure (airspace); and 6) commercial (retail) (airspace) with an allocation of two commercial condominiums comprising up to 3,700 square feet of commercial space.

The mixed-use project will include**:** (i) 640 apartment units (441 studio units and 199 2-bedroom units); (ii) 10,738 square feet of commercial floor area (5,538 square feet of retail area and 5,200 square feet of restaurant area [3,700 square feet with 138 indoor and outdoor patio seats of high-turnover restaurant and 1,500 square feet with 68 indoor and outdoor patio seats of fast-food restaurant]); (iii) 1,921 vehicle parking spaces (consisting of 500 residential and 714 commercial spaces and 707 existing spaces to remain**)**. The Project would involve demolishing the existing three-story parking structure, constructing two commercial kiosks (one 1,073 square foot, 16 foot in height kiosk along Irolo Street and one 805 square foot, 16 foot in height kiosk along the pedestrian space between the existing buildings and proposed building, just off Mariposa Avenue), and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean. The Project provides 500 residential (23 short-term and 477 long-term) and 1,340 commercial (5 short-term and 1,335 long-term) bicycle parking spaces.

There are 30 trees in the public right-of-way, of which one is a protected species and will not be removed. Of the 29 non-protected street trees, 19 trees would be removed and replaced. There are 29 trees on the private portion of the Project Site, none of which are protected species. Of these, 24 would be removed. The amount of soils removed or exported would be 137,000 cubic yards.

A Draft Initial Study/Mitigated Negative Declaration (IS/MND) was prepared for the Project and circulated from February 6, 2020 through March 9, 2020, for a 33-day public review. The Draft IS/MND identified potential impacts and mitigation measures associated with Transportation, and found that mitigation measures identified in the Draft IS/MND would reduce impact levels to less than significant.

ERRATUM

This Erratum addresses modifications to Section IX. Hazards and Hazardous Materials in the published Draft IS/MND. Deletions to text of the Draft IS/MND are shown with strikethrough. Additions to text of the Draft IS/MND are shown with italic text and underline. Portions of the Draft IS/MND text to remain are included to provide context for the corrections.

Section IX. Hazardous and Hazardous Materials [IS/MND page B-143]

…

Methane

The Project Site is ~~not~~ within a Methane Buffer Zone. *Therefore, the Project is required to comply with Los Angeles Department of Building and Safety (LADBS) regulatory requirements for methane defined in the Los Angeles Methane Seepage Regulations (LAMC, Chapter IX, Article 1, Division 71), including requirements for site testing, including appropriate Site Design Level, which will prevent or retard potential methane gas seepage into the building.*

The methane designation is correctly noted in the Preliminary Geotechnical Engineering Investigation, Geotechnologies, Inc., December 5, 2018 (included as Appendix G-1 to the IS/MND), which was approved by the LADBS in Soils Approval Letter, Los Angeles Department of Building and Safety, December 24, 2018 (included as Appendix G-2 to the IS/MND).

This correction does not constitute new information since the technical appendices included as part of the administrative case file in the IS/MND noted this designation.

This correction does not constitute mitigation because there is an existing regulatory compliance process in place that the Project would comply as part of the building permit process and plan check. No new identified significant impact or worsening of an impact would occur.

Recirculation is Not Required

Once an MND has been circulated, it may need to be recirculated for another round of review and comment if it is "substantially revised" after the public notice of the first circulation period has been given. (CEQA Guidelines § 15073.5(a).) A substantial revision includes two situations (CEQA Guidelines § 15073.5(b)):

1. A new, avoidable significant effect is identified, and to reduce that effect to a level of insignificance, mitigation measures or project revisions must be added.

2. The lead agency finds that the mitigation measures or project revisions originally included in the negative declaration will not reduce potentially significant impacts to a level of insignificance, and new mitigation measures or project revisions are required.

Recirculation is required when the addition of new information deprives the public of a meaningful opportunity to comment on substantial adverse project impacts or feasible mitigation measures or alternatives that are not adopted. (Laurel Heights Improvement Ass'n v Regents of Univ. of Cal. (1993) 6 Cal.4th 1112, 1130 ("Laurel Heights II") (emphasis added); CEQA Guidelines § 15088.5(a).) The purpose of recirculation is to give the public and other agencies an opportunity to evaluate the new data and the validity of conclusions drawn from it. (Silverado Modjeska Recreation & Park Dist. v. County of Orange (2011) 197 Cal.App.4th 282, 305; Save

Our Peninsula Comm. v. Monterey County Bd. of Supervisors (2001) 87 Cal.App.4th 99, 131; Sutter Sensible Planning, Inc. v Board of Supervisors (1981) 122 Cal.App.3d 813, 822.) The critical issue in determining whether recirculation is required is whether any new information added to the environment document is substantial. (Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova (2007) 40 Cal.4th 41 449.)

Recirculation is not required where the new information added to the MND "merely clarifies or amplifies [citations] or makes insignificant modifications in [citation] an adequate" MND. (CEQA Guidelines § 15088.5(b); Sutter Sensible Planning Inc., 122 Cal.App.3d at 822-823; Marin Mun. Water Dist. v. KG Land Cal. Corp. (1991) 235 Cal.App.3d 1652, 1667 [recirculation was not required when the final environmental document contained a revised water moratorium estimate because the new information merely served to clarify an environmental effect that was adequately discussed in the draft document].) Recirculation is "intended to be an exception, rather than the rule." (Laurel Heights II, 6 Cal.4th at 1132.)

Unless these changes result in a new impacts unavoidable impacts or new mitigation measures, recirculation is not required. (W. Placer Citizens for an Agric. & Rural Envtl. v. County of Placer (2006) 144 Cal.App.4th 890, 898 [changes in the project that "reflect an improvement in the environmental condition when compared to the original project or the mitigated design alternatives" do not necessitate recirculation]; Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899 ("Rialto Citizens").)

As is the case here, the addition of new information that clarifies, amplifies, or makes insignificant modifications to an MND does not require recirculation. (CEQA Guidelines § 15073.5(c)(4).) New information will only require recirculation when it amounts to a substantial revision of the MND, as defined above. (CEQA Guidelines § 15073.5(b).) As demonstrated herein, is neither a significant, avoidable impact that requires the addition of mitigation measures nor ineffective mitigation measure requiring revisions.

Conclusion

The information contained in this section clarifies, amplifies, or refines information in the IS/MND but does not make any changes that would meet the definition of "significant new information" as defined above. The information added does not change the IS/MND in a way that deprives the public of a meaningful opportunity to comment upon a new or substantially increased significant environmental effect of the Project. As analyzed in the IS/MND, the whole of the record supports the conclusion that the Project would result in impacts below a level of significance.

The City, as lead agency, has reviewed the information in this Erratum and has determined that it does not change any of the basic findings or conclusions of the Draft IS/MND, nor does it constitute "substantial revisions" pursuant to CEQA Guidelines Section 15073.5, or require recirculation of the Draft IS/MND. This Erratum, combined with the Draft IS/MND, including technical appendices and reports thereof, comprise the Final IS/MND.

ERRATUM to the Initial Study/ Mitigated Negative Declaration

3440 Wilshire Project

Case Number: ENV-2016-3693-MND

PREPARED FOR:
The City of Los Angeles
Department of City Planning

PREPARED BY:
CAJA Environmental Services, LLC
15350 Sherman Way, Suite 315
Van Nuys, CA 91406

APPLICANT:
Central Plaza, LLC
3450 Wilshire Blvd. Suite 1200-115
Los Angeles, CA 90010

March 10, 2020

PROJECT BACKGROUND

The Project Site currently consists of 6 subdivided lots and a non-subdivided remainder. The Project is requesting a Vesting Tentative Tract to merge the existing lots and re-subdivide the Site into 6 lots: 1) ground (master) lot with a lot area of 316,438 square feet; 2) residential (apartment) (airspace) with up to 640 residential units in up to 701,315 square feet of floor area; 3) commercial (retail) (airspace) with an allocation of two commercial condominiums comprising up to 2,360 square feet of commercial space; 4) parking (residential, commercial, office, and bike) (airspace); 5) existing 5-story parking structure (airspace); and 6) commercial (retail) (airspace) with an allocation of two commercial condominiums comprising up to 3,700 square feet of commercial space. The applicant also filed an incidental request under Case No. CPC-2016-3692-VZC-MCUP-SPR, for a Vesting Zone Change from PB-2 and P-2 to C4-2, a Master Conditional Use Permit to permit on-site alcoholic beverages, and Site Plan Review for developments with over 50 dwelling units.

The mixed-use project will include**:** (i) 640 apartment units (441 studio units and 199 two-bedroom units); (ii) 10,738 square feet of commercial floor area (5,538 square feet of retail area and 5,200 square feet of restaurant area [3,700 square feet with 138 indoor and outdoor patio seats of high-turnover restaurant and 1,500 square feet with 68 indoor and outdoor patio seats of fast-food restaurant]); (iii) 1,921 vehicle parking spaces (consisting of 714 residential and 500 commercial spaces and 707 existing spaces to remain**)**. The Project would involve demolishing the existing three-story parking structure, constructing two commercial kiosks (a 1,073 square foot kiosk, 16 foot in height along Irolo Street and a 805 square foot kiosk, 16 foot in height along the pedestrian space between the existing buildings and proposed building, off Mariposa Avenue), and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean. The Project provides 500 residential (23 short-term and 477 long-term) and 1,340 commercial (5 short-term and 1,335 long-term) bicycle parking spaces.

There are 30 trees in the public right-of-way, of which one is a protected species and will not be removed. Of the 29 non-protected street trees, 19 trees would be removed and replaced. There are 29 trees on the private portion of the Project Site, none of which are protected species. Of these, 24 would be removed. The amount of soils removed or exported would be 137,000 cubic yards.

A Draft Initial Study/Mitigated Negative Declaration (IS/MND) was prepared for the Project and circulated from February 6, 2020 through March 9, 2020, for a 33-day public review. The Draft IS/MND identified potential impacts and mitigation measures associated with Transportation, and found that mitigation measures identified in the Draft IS/MND would reduce impact levels to less than significant. An Erratum dated March 2, 2020, was prepared to address modifications to Section IX. Hazards and Hazardous Materials in the published Draft IS/MND, pertaining to the methane buffer zone designation applicable to the site.

ERRATUM

This Erratum addresses modifications to the designation of proposed vehicular parking spaces in the published Draft IS/MND. Deletions to text of the Draft IS/MND are shown with

strikethrough. Additions to text of the Draft IS/MND are shown with italic text and underline. Portions of the Draft IS/MND text to remain are included to provide context for the corrections.

Cover Page of the IS/MND

…

(iii) 1,921 vehicle parking spaces (consisting of 500 *commercial* ~~residential~~ and 714 *residential* ~~commercial~~ spaces and 707 existing spaces to remain).

The designation of commercial and residential parking spaces was inadvertently swapped on the Cover page only. The MND document, including the Project Description's Table A-5 (Vehicle Parking) has the correct designation. The total number of parking spaces remains correct. As shown in the MND and Project Plans, the Project's new parking spaces and remaining existing parking spaces meet the total number of required parking spaces.

This correction does not constitute new information since the technical appendices included as part of the administrative case file in the IS/MND noted this designation.

This correction does not constitute mitigation because there is an existing regulatory compliance process in place that the Project would comply as part of the building permit process and plan check. No new identified significant impact or worsening of an impact would occur.

Recirculation is Not Required

Once an MND has been circulated, it may need to be recirculated for another round of review and comment if it is "substantially revised" after the public notice of the first circulation period has been given. (CEQA Guidelines § 15073.5(a).) A substantial revision includes two situations (CEQA Guidelines § 15073.5(b)):

1. A new, avoidable significant effect is identified, and to reduce that effect to a level of insignificance, mitigation measures or project revisions must be added.

2. The lead agency finds that the mitigation measures or project revisions originally included in the negative declaration will not reduce potentially significant impacts to a level of insignificance, and new mitigation measures or project revisions are required.

Recirculation is required when the addition of new information deprives the public of a meaningful opportunity to comment on substantial adverse project impacts or feasible mitigation measures or alternatives that are not adopted. (Laurel Heights Improvement Ass'n v Regents of Univ. of Cal. (1993) 6 Cal.4th 1112, 1130 ("Laurel Heights II") (emphasis added); CEQA Guidelines § 15088.5(a).) The purpose of recirculation is to give the public and other agencies an opportunity to evaluate the new data and the validity of conclusions drawn from it. (Silverado Modjeska Recreation & Park Dist. v. County of Orange (2011) 197 Cal.App.4th 282, 305; Save Our Peninsula Comm. v. Monterey County Bd. of Supervisors (2001) 87 Cal.App.4th 99, 131; Sutter Sensible Planning, Inc. v Board of Supervisors (1981) 122 Cal.App.3d 813, 822.) The

critical issue in determining whether recirculation is required is whether any new information added to the environment document is substantial. (Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova (2007) 40 Cal.4th 41 449.)

Recirculation is not required where the new information added to the MND "merely clarifies or amplifies [citations] or makes insignificant modifications in [citation] an adequate" MND. (CEQA Guidelines § 15088.5(b); Sutter Sensible Planning Inc., 122 Cal.App.3d at 822-823; Marin Mun. Water Dist. v. KG Land Cal. Corp. (1991) 235 Cal.App.3d 1652, 1667 [recirculation was not required when the final environmental document contained a revised water moratorium estimate because the new information merely served to clarify an environmental effect that was adequately discussed in the draft document].) Recirculation is "intended to be an exception, rather than the rule." (Laurel Heights II, 6 Cal.4th at 1132.)

Unless these changes result in a new impacts unavoidable impacts or new mitigation measures, recirculation is not required. (W. Placer Citizens for an Agric. & Rural Envtl. v. County of Placer (2006) 144 Cal.App.4th 890, 898 [changes in the project that "reflect an improvement in the environmental condition when compared to the original project or the mitigated design alternatives" do not necessitate recirculation]; Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899 ("Rialto Citizens").)

As is the case here, the addition of new information that clarifies, amplifies, or makes insignificant modifications to an MND does not require recirculation. (CEQA Guidelines § 15073.5(c)(4).) New information will only require recirculation when it amounts to a substantial revision of the MND, as defined above. (CEQA Guidelines § 15073.5(b).) As demonstrated herein, is neither a significant, avoidable impact that requires the addition of mitigation measures nor ineffective mitigation measure requiring revisions.

Conclusion

The information contained in this section clarifies, amplifies, or refines information in the IS/MND but does not make any changes that would meet the definition of "significant new information" as defined above. The information added does not change the IS/MND in a way that deprives the public of a meaningful opportunity to comment upon a new or substantially increased significant environmental effect of the Project. As analyzed in the IS/MND, the whole of the record supports the conclusion that the Project would result in impacts below a level of significance.

The City, as lead agency, has reviewed the information in this Erratum and has determined that it does not change any of the basic findings or conclusions of the Draft IS/MND, nor does it constitute "substantial revisions" pursuant to CEQA Guidelines Section 15073.5, or require recirculation of the Draft IS/MND. This Erratum, combined with the Draft IS/MND, including technical appendices and reports thereof, comprise the Final IS/MND.

INITIAL SUBMISSIONS

The following submissions by the public are in compliance with the Commission Rules and Operating Procedures (ROPs), Rule 4.3a. The Commission's ROPs can be accessed at **http://planning.lacity.org**, by selecting "Commissions, Boards & Hearings" and selecting the specific Commission.

The following submissions are not integrated or addressed in the Staff Report but have been distributed to the Commission.

Material which does not comply with the submission rules is not distributed to the Commission.

Re: Comment on the Initial Study/Mitigated Negative Declaration for the 3440 Wilshire Project; CPC-2016-3692-VZC-MCUP-SPR; VTT-74602

Dear Honorable Members of the Los Angeles City Planning Commission and Ms. Wan:

I am writing on behalf of Supporters Alliance for Environmental Responsibility and its members living in and around the City of Los Angeles ("SAFER"). These comments support SAFER's appeal of the Initial Study/Mitigated Negative Declaration ("IS/MND") for the 3440 Wilshire Project, a mixed use development proposed for a 7.3-acre lot area located at 3432-3470 Wilshire Boulevard in Los Angeles, and the related project approvals (the "Project"). After reviewing the IS/MND, we conclude that it fails to analyze all environmental impacts and to implement all necessary mitigation measures. SAFER respectfully requests that the City Planning Commission grant SAFER's appeal and send the Project back to staff to prepare an EIR in order to incorporate our concerns discussed below.

This comment has been prepared with the assistance of Certified Industrial Hygienist, Francis "Bud" Offermann, PE, CIH. Mr. Offerman's comment and curriculum vitae are attached as Exhibit A hereto and is incorporated herein by reference in its entirety. This comment was also prepared with assistance from Ecologist Shawn Smallwood, Ph.D. Dr. Smallwood's comments and curriculum vitae are attached as Exhibit B hereto and is incorporated herein by reference in its entirety. Finally, this comment has been prepared with the assistance of the

environmental consulting firm Soil/Water/Air Protection Enterprise ("SWAPE"). SWAPE's comment the consultants' curriculum vitae are attached as Exhibit C hereto and are incorporated herein by reference in their entirety.

I. PROJECT DESCRIPTION

The Project proposes to develop a mixed-use project on a 7.3-acre site consisting: 1) 640 apartment units; 2) 10,738 square feet ("sq. ft.") of commercial floor area; and 2) 1,921 vehicle parking spaces. The Project site is currently developed with four commercial office buildings with ground floor retail uses that front West Wilshire Boulevard and South Irolo Street (the "Existing Office Buildings"), a three-story parking garage, a five-story parking structure, two vehicle driveways, and internal private roadways. The Project involves demolishing the existing three-story parking structure, constructing two commercial kiosks, and constructing a 23-story mixed-use building and a 28-story mixed-use building on top of a podium that is four stories above grade and two stories subterranean. The commercial space will consist of 5,538 sq. ft. of retail area and 5,200 sq. ft. of restaurant area. The restaurant area will consist of 3,700 sq. ft. with 138 indoor and outdoor patio seats of high-turnover restaurant and 1,500 sq. ft. with 68 indoor and outdoor patio seats of fast-food restaurant.

II. LEGAL STANDARD

As the California Supreme Court has held, "[i]f no EIR has been prepared for a nonexempt project, but substantial evidence in the record supports a fair argument that the project may result in significant adverse impacts, the proper remedy is to order preparation of an EIR." *Communities for a Better Env't v. South Coast Air Quality Mgmt. Dist.* (2010) 48 Cal.4th 310, 319-320 (*CBE v. SCAQMD*) (citing *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 75, 88; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491, 504–505). "Significant environmental effect" is defined very broadly as "a substantial or potentially substantial adverse change in the environment." Pub. Res. Code ("PRC") § 21068; *see also* 14 CCR § 15382. An effect on the environment need not be "momentous" to meet the CEQA test for significance; it is enough that the impacts are "not trivial*." No Oil, Inc.*, 13 Cal.3d at 83. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." *Communities for a Better Env't v. Cal. Res. Agency* (2002) 103 Cal.App.4th 98, 109 (*CBE v. CRA*).

The EIR is the very heart of CEQA. *Bakersfield Citizens for Local Control v. City of Bakersfield (*2004) 124 Cal.App.4th 1184, 1214 (*Bakersfield Citizens*); *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 927. The EIR is an "environmental 'alarm bell' whose purpose is to alert the public and its responsible officials to environmental changes before they have reached the ecological points of no return." *Bakersfield Citizens*, 124 Cal.App.4th at 1220. The EIR also functions as a "document of accountability," intended to "demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." *Laurel Heights Improvements Assn. v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 392. The EIR process "protects not only the environment but also informed self-

government." *Pocket Protectors*, 124 Cal.App.4th at 927.

An EIR is required if "there is substantial evidence, in light of the whole record before the lead agency, that the project may have a significant effect on the environment." PRC § 21080(d); see also *Pocket Protectors*, 124 Cal.App.4th at 927. In very limited circumstances, an agency may avoid preparing an EIR by issuing a negative declaration, a written statement briefly indicating that a project will have no significant impact thus requiring no EIR (14 CCR § 15371), only if there is not even a "fair argument" that the project will have a significant environmental effect. PRC, §§ 21100, 21064. Since "[t]he adoption of a negative declaration . . . has a terminal effect on the environmental review process," by allowing the agency "to dispense with the duty [to prepare an EIR]," negative declarations are allowed only in cases where "the proposed project will not affect the environment at all." *Citizens of Lake Murray v. San Diego* (1989) 129 Cal.App.3d 436, 440.

Where an initial study shows that the project may have a significant effect on the environment, a mitigated negative declaration may be appropriate. However, a mitigated negative declaration is proper *only* if the project revisions would avoid or mitigate the potentially significant effects identified in the initial study "to a point where clearly no significant effect on the environment would occur, and…there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment." PRC §§ 21064.5 and 21080(c)(2); *Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 331. In that context, "may" means a reasonable possibility of a significant effect on the environment. PRC §§ 21082.2(a), 21100, 21151(a); *Pocket Protectors*, 124 Cal.App.4th at 927; *League for Protection of Oakland's etc. Historic Res. v. City of Oakland* (1997) 52 Cal.App.4th 896, 904–05.

Under the "fair argument" standard, an EIR is required if any substantial evidence in the record indicates that a project may have an adverse environmental effect—even if contrary evidence exists to support the agency's decision. 14 CCR § 15064(f)(1); *Pocket Protectors,* 124 Cal.App.4th at 931; *Stanislaus Audubon Society v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150-51; *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602. The "fair argument" standard creates a "low threshold" favoring environmental review through an EIR rather than through issuance of negative declarations or notices of exemption from CEQA. *Pocket Protectors*, 124 Cal.App.4th at 928.

The "fair argument" standard is virtually the opposite of the typical deferential standard accorded to agencies. As a leading CEQA treatise explains:

> This 'fair argument' standard is very different from the standard normally followed by public agencies in making administrative determinations. Ordinarily, public agencies weigh the evidence in the record before them and reach a decision based on a preponderance of the evidence. [Citations]. The fair argument standard, by contrast, prevents the lead agency from weighing competing evidence to determine who has a better argument concerning the likelihood or extent of a potential environmental impact. The lead agency's decision is thus

> largely legal rather than factual; it does not resolve conflicts in the evidence but determines only whether substantial evidence exists in the record to support the prescribed fair argument.

Kostka & Zischke*, Practice Under CEQA*, §6.29, pp. 273-274. The Courts have explained that "it is a question of law, not fact, whether a fair argument exists, and the courts owe no deference to the lead agency's determination. Review is de novo, with *a preference for resolving doubts in favor of environmental review*." *Pocket Protectors*, 124 Cal.App.4th at 928 (emphasis in original).

CEQA requires that an environmental document include a description of the project's environmental setting or "baseline." CEQA Guidelines § 15063(d)(2). The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. *CBE v. SCAQMD*, 48 Cal.4th at 321. CEQA Guidelines section 15125(a) states, in pertinent part, that a lead agency's environmental review under CEQA:

> …must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant.

See Save Our Peninsula Committee v. County of Monterey (2001) 87 Cal.App.4th 99, 124–25 ("*Save Our Peninsula*").) As the court of appeal has explained, "the impacts of the project must be measured against the 'real conditions on the ground,'" and not against hypothetical permitted levels. *Id*. at 121–23.

III. DISCUSSION

A. There is Substantial Evidence of a Fair Argument that the Project Will Have a Significant Health Risk Impact from its Indoor Air Quality Impacts.

Certified Industrial Hygienist, Francis "Bud" Offermann, PE, CIH, has conducted a review of the proposed Project and relevant documents regarding the Project's indoor air emissions. Indoor Environmental Engineering Comments (April 10, 2020) (Exhibit A). Mr. Offermann concludes that it is likely that the Project will expose residents of the Project to significant impacts related to indoor air quality, and in particular, emissions of the cancer-causing chemical formaldehyde. Mr. Offermann is a leading expert on indoor air quality and has published extensively on the topic. *See* attached CV.

Mr. Offermann explains that many composite wood products used in modern apartment home construction contain formaldehyde-based glues which off-gas formaldehyde over a very long time period. He states, "The primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and particleboard. These materials are commonly used in building construction for

flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims." Offermann, pp. 2-3.

Formaldehyde is a known human carcinogen. Mr. Offermann states that there is a fair argument that future residents of the Project will be exposed to a cancer risk from formaldehyde of approximately 112 per million, assuming all materials are compliant with the California Air Resources Board's formaldehyde airborne toxics control measure. *Id*., p. 3. This more than 11 times the SCAQMD's CEQA significance threshold for airborne cancer risk of 10 per million. In addition, Mr. Offermann concludes that people working the commercial spaces of the Project will be exposed to an increased cancer risk from formaldehyde of 16.4 per million, which also exceeds the threshold of significance. *Id*. at 5. Mr. Offermann concludes that these significant environmental impacts should be analyzed in an EIR and mitigation measures should be imposed to reduce the risk of formaldehyde exposure. *Id*., p .45.

Mr. Offermann also notes that the high cancer risk that may be posed by the Project's indoor air emissions likely will be exacerbated by the additional cancer risk that exists as a result of the Project's location near roadways with moderate to high traffic (i.e. Wilshire Boulevard, S. Mariposa Boulevard, Sm. Normandy Ave., and W. 7th Street) and the high levels of PM 2.5 already present in the ambient air. Offermann, pp. 10-11. No analysis has been conducted of the significant cumulative health impacts that will result to future residents of the Project.

Mr. Offermann concludes that these significant environmental impacts should be analyzed in an EIR and mitigation measures should be imposed to reduce the risk of formaldehyde exposure. *Id*. Mr. Offermann identifies mitigation measures that are available to reduce these significant health risks, including the installation of air filters and a requirement that the applicant use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins or ultra-low emitting formaldehyde (ULEF) resins in the buildings' interiors. *Id*. at 12-13.

The City has a duty to investigate issues relating to a project's potential environmental impacts, especially those issues raised by an expert's comments. *See Cty. Sanitation Dist. No. 2 v. Cty. of Kern*, (2005) 127 Cal.App.4th 1544, 1597–98 ("under CEQA, the lead agency bears a burden to investigate potential environmental impacts"). In addition to assessing the Project's potential health impacts to residents, Mr. Offermann identifies the investigatory path that the City should be following in developing an EIR to more precisely evaluate the Projects' future formaldehyde emissions and establishing mitigation measures that reduce the cancer risk below the SCAQMD level. *Id*., pp. 5-10. Such an analysis would be similar in form to the air quality modeling and traffic modeling typically conducted as part of a CEQA review.

The failure to address the project's formaldehyde emissions is contrary to the California Supreme Court's decision in *California Building Industry Ass'n v. Bay Area Air Quality Mgmt. Dist.* (2015) 62 Cal.4th 369, 386 ("*CBIA"*). At issue in *CBIA* was whether the Air District could enact CEQA guidelines that advised lead agencies that they must analyze the impacts of adjacent environmental conditions on a project. The Supreme Court held that CEQA does not generally

require lead agencies to consider the environment's effects on a project. *CBIA*, 62 Cal.4th at 800-801. However, to the extent a project may exacerbate existing adverse environmental conditions at or near a project site, those would still have to be considered pursuant to CEQA. *Id*. at 801 ("CEQA calls upon an agency to evaluate existing conditions in order to assess whether a project could exacerbate hazards that are already present"). In so holding, the Court expressly held that CEQA's statutory language required lead agencies to disclose and analyze "impacts on ***a project's users or residents*** that arise ***from the project's effects*** on the environment." *Id*. at 800 (emphasis added).

The carcinogenic formaldehyde emissions identified by Mr. Offermann are not an existing environmental condition. Those emissions to the air will be from the Project. Residents and workers will be users of the Project. Currently, there is presumably little if any formaldehyde emissions at the site. Once the project is built, emissions will begin at levels that pose significant health risks. Rather than excusing the City from addressing the impacts of carcinogens emitted into the indoor air from the project, the Supreme Court in *CBIA* expressly finds that this type of effect by the project on the environment and a "project's users and residents" must be addressed in the CEQA process.

The Supreme Court's reasoning is well-grounded in CEQA's statutory language. CEQA expressly includes a project's effects on human beings as an effect on the environment that must be addressed in an environmental review. "Section 21083(b)(3)'s express language, for example, requires a finding of a 'significant effect on the environment' (§ 21083(b)) whenever the 'environmental effects of a project will cause substantial adverse effects *on human beings,* either directly or indirectly.'" *CBIA*, 62 Cal.4th at 800 (emphasis in original). Likewise, "the Legislature has made clear—in declarations accompanying CEQA's enactment—that public health and safety are of great importance in the statutory scheme." *Id*., citing e.g., §§ 21000, subds. (b), (c), (d), (g), 21001, subds. (b), (d). It goes without saying that the hundreds of future residents of the Project are human beings and the health and safety of those workers is as important to CEQA's safeguards as nearby residents currently living near the project site.

Because Mr. Offermann's expert review is substantial evidence of a fair argument of a significant environmental impact to future users of the project, an EIR must be prepared to disclose and mitigate those impacts.

B. The IS/MND Failed to Adequately Analyze and Mitigate the Potential Adverse Impacts of the Project on Wildlife.

The comment of Dr. Shawn Smallwood is attached as Exhibit B. Dr. Smallwood has identified several issues with the IS/MND for the Project. His concerns are summarized below.

1. <u>There is substantial evidence that Project may have a significant impact on bird species from window collisions.</u>

According to wildlife expert Dr. Shawn Smallwood, the Project will have a significant impact on birds as a result of window collisions. The City has not analyzed or mitigated these

potential impacts to special-species birds. Analyzing the potential impact on wildlife of window collisions is especially important because "[w]indow collisions are often characterized as either the second or third largest source of human-caused bird mortality." Smallwood, p. 6.

The wildlife database eBirds lists 44 special-status species of birds have been document right around the Project site. Smallwood, p. 2. Of these 44 species, Dr. Smallwood determined that 15 have been known to collide with windows. *Id*. "Many of these species are undoubtedly already experiencing annual mortality caused by window collisions in Los Angeles, but the proposed new project would substantially add window-collision hazards to birds flying over Los Angeles. A fair argument can be made for the need to prepare an EIR to assess project impacts from bird-window collisions, and to formulate appropriate mitigation." *Id.*

Dr. Smallwood reviewed a number of studies in order to calculate the number of bird collisions that would occur annually as a result of the Project. Smallwood, p. 7-8. According to his calculations, each m^2 of glass would result in 0.077 bird deaths per year. *Id.* at 8. Dr. Smallwood then looked at the building design for the Project and estimated that the Project would include approximately at least 24,000 m^2 of glass windows. *Id*. Based on the estimated 24,000 m^2 of glass windows and the 0.077 bird deaths per m^2 of glass windows, Dr. Smallwood estimates that the project could result in 1,848 bird deaths per year. *Id*. Over 50 years, this will amount to 92,400 bird deaths. *Id*. Most of these deaths would be of birds protected under Fish & Game Code section 3513. *Id*.

These bird deaths constitute a significant impact that must be analyzed. *Id*. The City must prepare an EIR to disclose, analyze, and mitigate the full scope of the Project's impact resulting from window collisions.

2. <u>There is no evidence to support the IS/MND's conclusion that the Project will not have a significant impact on biological species.</u>

No wildlife surveys were conducted by biologist in preparation of the IS/MND. As a result, the IS/MND fails to inform the public and decisionmakers about avian use of the area. Dr. Smallwood explains that "[s]urveys are needed to learn how many of each bird species fly through the area and at what times of day (and night)." Smallwood, p. 2. Conducting these types of surveys could then inform an analysis of collision risk and mitigion measures to reduce that risk. *Id*. Mitigation measures may include things like interior light mangement and design modiications to facades facing the previaling approach directions of mighrating birds. *Id*. Wihtout conducting surceys, there is no substantail evidncec to support the IS/MND's conclusion that the Project will not have a signficant impact on biological resources.

3. <u>The City fails to mitigate the Project's adverse impact on bird species from window collisions.</u>

In order to mitigate the impact of the window collisions on bird species, Dr. Smallwood has suggested several mitigation measures. As a starting point, before construction, "[a]ny new

project should be informed by preconstruction surveys of daytime and nocturnal flight activity." Smallwood, p. 13. Dr. Smallwood explains:

> [Pre-construction] surveys can reveal the one or more façades facing the prevailing approach direction of birds, and these revelations can help prioritize where certain types of mitigation can be targeted. It is critical to formulate effective measures prior to construction, because post-construction options will be limited, likely more expensive, and probably less effective.

Id.

Dr. Smallwood also notes the importance of post-construction fatality monitoring, which he says "should be an essential feature of any new building project." Smallwood, p. 12. These surveys should be combined with threshold fatality rates that would trigger additional mitigation. *Id*. at 15. The City should identify candidate impact-reduction measures that can be implemented in case the original measure(s) proves ineffective or inadequate, including compensatory mitigation.

In addition, for mitigation measures involving the siting and design of the Project, Dr. Smallwood suggests: (1) deciding on the location of structures; (2) deciding on the façade and orientation of structures; (3) selecting types and sizes of windows; (4) minimizing transparency through two parallel façades; (5) minimizing views of interior plants; (6) landscaping so as to increase distance between windows and vegetation; (7) monitoring for fatalities to identify seasonal and spatial patterns; and (8) adjusted light management, window markings, and other measures as needed based on survey results. Smallwood, p. 14. Dr. Smallwood also suggests that the City also look to the guidelines developed by the American Bird Conservancy and the City of San Francisco to minimize injuries and fatalities to bird species. *Id*.

Finally, Dr. Smallwood recommends compensatory mitigation including contributions to wildlife rehabilitation facilities to cover the costs of injured animals that may be delivered to these facilities for care from this Project or other projects. Smallwood, p. 15. These and other feasible mitigation measures must be considered in an EIR.

4. <u>The IS/MND fails to adequately analyze the Project's impact on wildlife movement.</u>

The IS/MND improperly dismisses the Project's potential to impact wildlife movement based on the urbanized location of the Project, which, the IS/MND claims, does not support a wildlife corridor. These conclusions rely on a false CEQA standard. A project will have a significant biological impact if it would "[i]nterfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." CEQA Guidelines, App. G. As Dr. Smallwood explains:

> [W]hether a site supports a wildlife movement corridor is not the standard at issue with Initial Study question 4d; rather, it is whether the project would interfere with wildlife movement. City of Los Angeles apparently neglected to consider that birds fly. Birds fly to forage, defend territories, disperse, and migrate. Birds, including special-status species of birds, inhabit the airspaces of Los Angeles, some as residents of Los Angeles and others as dispersers or migrants. Inserting two high-rises into the airspaces used by birds would interfere with wildlife movement while also killing many birds. Collision mortality would be worsened by constructing two high-rises as planned – high-rises composed of glass façades.

Smallwood, p. 2.

Because of its reliance on a false CEQA standard for determining impacts on wildlife movement, the IS/MND contains no evidence to support the conclusion that the Project will not have a significant impact on wildlife movement. In contrast, Dr. Smallwood's comments constitute substantial evidence that the Project will have a significant impact on wildlife movement. As a result, an EIR must be prepared to analyze the Project's impacts on wildlife movement.

5. The IS/MND fails to analyze the Project's cumulative biological impacts.

The IS/MND does not include an analysis of the Project's potential cumulative biological impacts on the grounds that no wildlife habitat occurs in the City of Los Angeles. Smallwood, p. 14. As a result, the IS/MND provides no analysis of the Project's cumulative contribution to window collisions. *Id*. Dr. Smallwood explains that "[t]his missing analysis is a critical shortfall, because bird abundance across North American has declined 29% over the last 48 years (Rosenberg et al. 2019). The proposed project alone is predicted to kill 1,848 bird deaths per year (95% CI: 960-2,640), which would add to many thousands more killed by windows in Los Angeles." *Id*. The City violates CEQA by not conducting an analysis of the Project's cumulative impact to biological resources as a result of window collisions.

C. The IS/MND's Traffic Analysis is Not Supported by Substantial Evidence and Greatly Underestimates Project-Generated Traffic.

A significant transportation impact would occur if roadways and intersections that would carry project-generated traffic would exceed adopted City of Los Angeles Department of Transportation thresholds of significance. IS/MND, B-215. The IS/MND's conclusion that the Project will not result in significant transportation impacts is not supported by substantial evidence. As described below, and in the expert comments of traffic engineer Dan Smith (attached hereto as Exhibit B), the IS/MND greatly underestimates the vehicle trips generated by the Project. Mr. Smith concludes that there is "overwhelming evidence that there is fair argument that demonstrates that the Project's impacts are not fully disclosed and mitigated in the IS/MND. Consequently, the Project cannot be approved under a mitigated negative declaration and a full EIR must be prepared." Smith, p. 5.

1. The IS/MND underestimates traffic generated from the retail component of the Project.

The Project includes 5,538 square feet of commercial retail space. The IS/MND estimates the gross number of trips generated from this retail space based on *Trip Generation, 10th Edition's* average rates for Land Use Category 820, which is the land use category for "Shopping Center." Smith, p. 2. But Traffic Engineer Dan Smith explains in his expert comments, that this land use is inapplicable to the Project because 5,538 square feet of retail space is not a shopping center. *Id*. To generate the average trip rates used for the Shopping Center land use category requires approximately 400,000 square feet of floor area. *Id*. Mr. Smith determined that a convenience market would be a much more accurate land use category to use. *Id*. Using the *Trip Generation, 10th Edition*, shopping centers generate daily vehicle trips at an average rate of 37.75 trips per thousand square feet of floor area, where as convenience markets generate 762.28 trips per thousand square feet. *Id.* This amounts to 20 times more traffic generated from the retail space than was disclosed in the IS/MND. The same flaw is reflected in the IS/MND's peak hour trip analysis.

Making matters worse, the IS/MND then discounts 90 percent of the gross trip generation of this small retail space. *Id*. This 90 percent reduction is based on 15 percent for trips internal to the Project, 25 percent as transit trips, and 50 percent as trips attached to passerby traffic. *Id*. As Mr. Smith explains, these reductions do not hold up to scrutiny. "[T]he notion that the convenience retail would attract 50 percent of its patronage from existing passerby vehicle traffic is absurd." *Id*. Mr. Smith explains that these types of passerby attraction rates are normally attained by convenience markets on busy urban or suburban streets and where the retail store has its own surface parking lot. *Id*. Here, in contrast, the retail space is contained within a larger building, where the passerby is forced to enter and leave a large parking garage. *Id.* Moreover, the retail space is not visible from either Wilshire Boulevard or Irolo. It is only visible form S. Mariposa Avenue and/or W. 7th Street. *Id*. The IS/MND discloses that S. Mariposa carries only 680 vehicles past the Project site in the A.M. peak hour and 672 in the P.M. peak hour, while W. 7th Street carries only 349 vehicles past the Project site in the A.M. peak hour and 542 in the P.M. peak hour. IS/MND Appendix K-1, Figure 1. Mr. Smith concludes that "These totals are insufficient to support the claimed passerby attraction discount, particularly where the on-street parking spaces are usually occupied and passers-by would be forced to enter and leave a parking garage." *Id*. "The notion that 25 percent of the people visiting a convenience market would make purposeful transit trips to reach that market is similarly implausible. This is likely to be true only of a handful of employees of the market." *Id*.

2. The IS/MND underestimates traffic generated from the fast-casual restaurant component of the Project.

Like the retail space, the IS/MND assumes again that 90 percent of the fast-casual restaurant's gross trip generation will not add to traffic except at Project driveways. Just as with the retail space, the IS/MND reduces traffic by 90 percent, with 50 percent attracted from passer-by traffic, 25 percent from transit, and 15 percent internal. Smith, p. 3. Mr. Smith concludes that "[a]ll of the discussion above with respect to the discounting of trips to a convenience

market is similarly applicable to the fast-causal restaurant." *Id*.

3. The IS/MND underestimates traffic generated from the high-turnover sit-down restaurant component of the Project.

The Project also includes a high-turnover sit-down restaurant. For this component of the Project, the IS/MND discounts 60 percent of the trip generation, made up of 25 percent transit, 20 percent passer-by attraction, and 15 percent internal. *Id.* But Mr. Smith points out that "[e]xcept for negligible numbers of restaurant employees, few if any people would take transit in a purposeful trip to reach or depart from a restaurant of this type. Certainly, patrons of the restaurant will include persons who arrived and will depart the area via transit but these comprise part if not most of the attracted passer-by category." *Id*. The need for drivers to park inside a parking garage and the fact that the restaurant will only be visible from the lightly trafficked S. Mariposa and W. 7th street further minimizes the patrons that will be attracted from street traffic. *Id.*

4. The IS/MND underestimates traffic generated from the residential component of the Project.

For the residential portion of the Project, the IS/MND analysis assumes a 15 percent internalization deduction. It does not, however apply a 25 percent transit deduction to the peak hour trip generation because, the IS/MND says, the basin trip generation rate was derived from surveys of similar local area residential high rises, where the transit utilization was already reflected in the observed vehicle trip generation rate. Mr. Smith raises the question of "whether or not those surveyed buildings had comparable trip internalization that would have already been reflected in the observed vehicle trip rates." Smith, p. 4. The IS/MND must be revised to make this clarification.

Mr. Smith's comments constitute substantial evidence that the Project's traffic impact have been significantly underestimated. The IS/MND must be revised to address these inaccuracies.

5. The IS/MND fails to account for trips by transportation network company services.

Mr. Smith explains that the rise of transportation network companies ("TNCs") (also known as ride hailing services) like Uber and Lyft, has substantially changed the nature of transportation in urban areas. Smith, p. 4. Recent research has shown that TNCs are problematic because: "a) a large part of the transportation demand they serve is drawn from trips that would otherwise been carried out by walking, bicycling or transit, b) a large share of the trips they serve are induced trips – trips that would not be made at all were the service not available or trips to distant destinations that would have been satisfied locally by walking absent the service and c) each passenger service trip actually involves 2 vehicle trips – the trip from where the vehicle is circulating or waiting to the point of call and the trip from the point of call to the actual destination." *Id*. Despite the major impact of TNCs on transportation in Los Angeles and

elsewhere, the IS/MND makes no effort to estimate the transportation impacts of TNC services related to the Project. Without counting any trips generated by TNCs, the IS/MND underestimates the Project's transportation impact.

D. The IS/MND Fails to Establish a Baseline for Hazardous Substances.

SWAPE, an environmental consulting firm, reviewed the IS/MND. SWAPE's comment letter is attached as Exhibit C and their findings are summarized in the following sections.

SWAPE notes that the Phase I Environmental Site Assessment ("Phase I Assessment") prepared for the Project site in 2014 identified an 8,000 gallon oil underground storage tank ("UST"), and three USTs associated with a gas station formerly located at the site. SWAPE, p. 1. According to the Phase I, the 8,000-gallon UST was removed in 1988.

However, SWAPE points out that there is no record of removal of the three gas station USTs cite in the Phase I. SWAPE, pp. 1-2. Instead, there is only a vague statement that:

> An Application for Permit; Abandonment by Removal Fire Department-City of Los Angeles, was also reviewed as part of our previous assessment, which discussed the removal of one waste oil UST and two gasoline USTs, dated June 8, 1988.

While the application for removal is cited in the Phase I, there is no documentation of the actual removal of the three USTs. References to the gas station USTs in the Phase I use uncertain language. For example:

> It is suspected that these USTs were related to the gas & oil station noted on the 1961 Sanborn Map.
>
> It should also be noted that based on our regulatory review, the Subject [Project site] was identified as a registered storage tank site featuring a "inactive" regulatory status for two previous onsite "regulated unleaded" USTs. These gasoline USTs are suspected to be associated with the removal of the aforementioned gasoline USTs noted in the permit.

Without documentation of removal of the USTs, the Phase I fails to confirm the presence or absence of the USTs at the Project site. *Id*. SWAPE concludes that a Phase II is necessary to identify the presence or absence of the USTs and to conduct soil and soil vapor sampling. Without this information, the IS/MND fails to establish a baseline set of environmental conditions against which environmental impact can be evaluated.

It is well-established that CEQA requires analysis of toxic soil contamination that may be disturbed by a Project, and that the effects of this disturbance on human health and the environment must be analyzed. CEQA requires a finding that a project has a "significant effect on the environment" if "the environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly." (PRC §21083(b)(3).) As the Court of Appeal has stated, "[a] new project located in an area that will expose its occupants to preexisting dangerous pollutants can be said to have substantial adverse effect on human beings."

(*Cal. Building Industry Assn. v. Bay Area Air Quality Mgm't Dist.* (2013) 218 Cal.App.4th 1171 (*CBIA v. BAAQMD*).) The existence of toxic soil contamination at a project site is a significant impact requiring review and mitigation in an EIR. (*McQueen v. Bd. of Dirs.* (1988) 202 Cal.App.3d 1136, 1149; *Assoc. For A Cleaner Env't v. Yosemite Comm. College Dist.* (2004) 116 Cal.App.4th 629 (*ACE v. Yosemite*).) This mitigation may not be deferred until a future time after Project approval. (*Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d 296, 306; *Citizens for Responsible Equitable Envt'l Dev. v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 330-31 (*CREED*).)

The City must thoroughly investigate the site and prepare an EIR to adequately analyze and mitigate the potential impact of USTs at the Project site.

E. The IS/MND Relied on Unsubstantiated Input Parameters to Estimate Project Emissions and Thus Failed to Adequately Analyze the Project's Air Quality Impacts.

The IS/MND for the Project relies on emissions calculated from the California Emissions Estimator Model Version CalEEMod.2016.3.2 ("CalEEMod"). This model relies on recommended default values for on-site specific information related to a number of factors. The model is used to generate a project's construction and operational emissions. SWAPE reviewed the Project's CalEEMod output files and found that the values input into the model were unsubstantiated or inconsistent with information provided in the IS/MND. This results in an underestimation of the Project's emissions. As a result, the Project may have a significant air quality impacts and an EIR is required to properly analyze these potential impacts.

1. <u>The IS/MND uses an incorrect construction schedule.</u>

According to the IS/MND, the Project's building construction period for Tower 1 and 2 would each be 19 months, with Tower 1 construction starting in June 2022, and Tower 2 construction starting in June 2024. IS/MND, p. A-15, Table A-8. When combined with 2 months of site prep and 3 months of grading, this amounts to a total of 43-months of active construction. However, the CalEEMod output files show that the model included a construction schedule that lasted 48 months, rather than 43 months, and failed to include the five-month break between construction of Tower 1 and Tower 2. SWAPE, p. 4. According to the "User Entered Comments & Non-Default Data" table, the justification for this was "consultant assumptions." IS/MND, App. C, pp. 1, 31, 66. This does not justify the inconsistency between the model and the information provided in the IS/MND. SWAPE, p. 5.

SWAPE explains that "[b]y spreading out construction emissions over a 48-month period, rather than the 43-month period indicated by the IS/MND, maximum daily emissions associated with construction are artificially reduced." *Id*. Because the construction schedule used in the CalEEMod model is incorrect, the model underestimates the Project's construction-related emissions.

2. The IS/MND underestimated the number of hauling trips during site preparation and grading.

The CalEEMod output files indicate that several of the hauling, vendor, and worker trips were manually altered from their default values. SWAPE, p. 5. According to the "User Entered Comments & Non-Default Data" table, the justification for this was "Developer information." IS/MND, App. C, pp. 2, 32, 67. No information is provided to justify these changes. The Traffic Study provides an estimate of *peak daily* trips for each construction phase, but does not provide the *total* number of hauling, vendor, and worker trips for each phase, which is what was changed in the model.

In addition, the Traffic Study estimates a maximum daily number of hauling trips of one. As a result, the CalEEMod model should have included *at least* one hauling trip for construction. Yet the CalEEMod output files demonstrate that the model failed to include any hauling trips for construction. SWAPE, p. 6. The model is therefore inconsistent with the model. *Id*.

The number of worker, hauling, and vendor trips and the associated vehicle miles traveled ("VMT") are used by CalEEMod to determine the exhaust emissions associated with the vehicle use and fugitive dust emissions. SWAPE, p. 6. "[B]y failing to include the correct number of hauling, vendor, and worker trips, the model underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance." *Id*.

3. The IS/MND made unsubstantiated changes to acres of grading in the CalEEMod model.

The amount of grading included in the CalEEMod model was manually reduced for different phases from 33 to 2.33 acres and from 30 to zero acres. SWAPE, p. 7. According to the "User Entered Comments & Non-Default Data" table, the justification for this was "Developer information." But nothing in the IS/MND provides evidence to justify these reductions. The number of acres to be graded in the CalEEMod model is used to calculate fugitive dust emissions associated with dozers, graders, scrapers, and haul trucks. *Id*. By under reporting the acres of grading required as part of construction, the model underestimates construction-related emissions.

4. The IS/MND relied on unsubstantiated construction mitigation measures.

The CalEEMod output files show that the model included the following construction-related mitigation measures: "Replace Ground Cover," "Water Exposed Area," and "Clean Paved Roads." SWAPE, p. 7 (citing Appendix C, pp. 8-9, 39, 73-74). The model also included a 46% reduction in particulate matter emissions as a result of cleaning paved roads. *Id*. (citing Appendix C, pp. 2, 32, 67). The "User Entered Comments & Non-Default Data" provided the following justification: "Assumes SCAQMD Rule 403 control efficiencies." *Id*.

The IS/MND explains:

> [I]t is mandatory for all construction projects in the Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Rule 403 control requirements include measures to prevent the generation of visible dust plumes. Measures include, but are not limited to, applying water and/or soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system or other control measures to remove bulk material from tires and vehicle undercarriages before vehicles exit the Project Site, and maintaining effective cover over exposed areas. Compliance with Rule 403 would reduce regional PM2.5 and PM10 emissions associated with construction activities by approximately 61 percent.

IS/MND, p. B-41(emphasis added).

Accordingly, the Project has the option to either apply water and/or soil binders but has not committed to either or both. Moreover, Rule 403 fails to justify the 46% reduction in particulate matter as a result of "clean paved roads." Without evidence that this equates to a mitigation measure that is mandatory and enforceable, the reduction is not supported by substantial evidence and should not be included in the model.

5. The IS/MND relied on an unsubstantiated number of daily trips.

The IS/MND includes a 25% "transit credit" for both retail and multifamily housing trip generation. IS/MND, App. K-1, pp. 24, Table 4. According to the Traffic Study, this reduction credit was based on the 2016 Los Angeles Department of Transportation's ("LADOT") "Traffic Study Policies and Procedures." *Id*. Reliance on this document is misplaced. As SWAPE points out, this document was replaced by the City in 2019 with the LADOT's "Transportation Assessment Guidelines ("TAG"). SWAPE, p. 3. The TAG now provides that "LADOT, **at its discretion, may allow up to** a 25% transit/walk trip generation reduction" applied "**on a case by case basis.**" *Id*. SWAPE reviewed the Traffic Study and found no verification of or permission to rely on the 25% reduction by LADOT. *Id*. Without this information, the IS/MND errs in relying on the 25% transit reduction credit, and the Project's traffic counts may be underestimated.

F. The IS/MND Failed to Adequately Evaluate Health Risks from Diesel Particulate Matter Emissions

1. The IS/MND lacks substantial evidence to support its finding that the Project's emissions will not cause a significant health impact.

The IS/MND concludes that the health risk impact from diesel particulate matter related to Project construction and operation will be less than significant. In making this finding, the IS/MND does not conduct a quantified a health risk assessment ("HRA") for Project construction or operation. SWAPE, p. 8. The IS/MND attempts to justify this by stating:

> Because there is such a short-term exposure period, construction TAC emissions would result in a less-than significant impact. Therefore, construction of the Project would not expose sensitive receptors to substantial diesel PM concentrations, and this impact would be less than significant.

IS/MND, p. B-46. The IS/MND explains the omission of an operational HRA as follows:

> [T]he SCAQMD recommends that health risk assessments be conducted for substantial sources of diesel particulate emissions (e.g., truck stops and warehouse distribution facilities) and has provided guidance for analyzing mobile source diesel emissions.[48] The Project would not generate a substantial number of truck trips since it would not be a truck stop or distribution center. Based on the limited activity of TAC sources, the Project would not warrant the need for a health risk assessment associated with on-site activities. Therefore, Project impacts would be less than significant.

IS/MND p. B-48.

The IS/MND's failure to conduct an operational HRA is inconsistent with the approach recommended by the California Office of Environmental Health Hazard Assessment ("OEHHA"). SWAPE, p. 10. OEHHA recommends a health risk assessment of a project's operational emissions for projects that will be in place for more than 6 months. *Id*. Projects lasting more than 6 months should be evaluated for the duration of the project, and an exposure duration of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident. *Id*. The Project would last at least 30 years and certainly much longer than six months. These recommendations reflect the most recent health risk assessment policy.

Rather than preparing an HRA, the IS/MND relies on a Localized Significance Threshold ("LST") methodology to support its finding that the Project will not have a significant health risk impact. Reliance on the LST methodology is incorrect. As the SCAQMD guidance on the LST explains, the LST methodology only evaluates impact from criteria pollutants (NOx, CO, PM10, and PM2.5). SWAPE, p. 9. Toxic air contaminants ("TACs") such as diesel particulate matter ("DPM") are not criteria pollutants. *Id*. By relying on the LST analysis, the IS/MND failed to analyze TAC exposure as a result Project construction and operation. Without this information, the City lacks substantial evidence to support the IS/MND's conclusion that the Project will not have a significant health risk impact.

2. <u>SWAPE conducted a screening-level health risk assessment that indicates a significant health risk impact.</u>

SWAPE prepared a screening-level HRA to evaluate potential impacts from Project construction and operation. SWAPE used AERSCREEN, the leading screening-level air quality

dispersion model. SWAPE, p. 11. SWAPE used a sensitive receptor distance of 100 meters[1] and analyzed impacts to individuals at different stages of life based on OEHHA and SCAQMD guidance utilizing age sensitivity factors. SWAPE, pp. 11-14.

SWAPE found that the excess cancer risk for adults, children, and infants at a sensitive receptor located approximately 100 meters away over the course of Project construction and operation are approximately 12, 99, and 43 in one million, respectively. SWAPE, p. 14. Moreover, the excess lifetime cancer risk over the course of a Project operation is approximately 160 in one million. *Id*.) The risks to adults, children, infants, and lifetime residents appreciably exceed the SCAQMD's threshold of 10 in one million.[2] SWAPE's analysis constitutes substantial evidence that the Project may have a significant health impact as a result of diesel particulate emissions. The City must prepare an EIR with a more refined HRA that is representative of site conditions in order to evaluate the Project's health risk impact and to include suitable mitigation measures.

G. Contrary to the IS/MND's Conclusion, the Project Will Have a Significant GHG Impact.

1. The IS/MND's GHG analysis violates CEQA.

The IS/MND concludes that the Project's GHG impact would be less than significant as a result of consistency with CARB's Climate Change Scoping Plan., SCAG's 2016-2040 TRP/SCS, the City's LA Green Plan, and the City's Sustainable City pLAn. IS/MND, p. B-111. Specifically, the IS/MND states,

> [G]iven the Project's consistency with State, SCAG, and City GHG emission reduction goals and objectives, the Project is consistent with applicable plans, policies, and regulations adopted for the purpose of reducing the emissions of GHGs. *In the absence of adopted standards and established significance thresholds*, and given this consistency, it is concluded that the Project's incremental contribution to greenhouse gas emissions and their effects on climate change would not be cumulatively considerable.

IS/MND, p. B-139 (emphasis added).

[1] The closest sensitive receptor is located 18 meters from the Project site. However, 100 meters was used in the HRA based on AERSCREEN output files which demonstrate that the maximally exposed receptor is located 100 meters from the Project site. SWAPE, p. 12.
[2] While OEHHA and SCAQMD recommend using age sensitivity factors in conducting an HRA, even without using age sensitivity factors, the SWAPE determined that the excess cancer risks would exceed the threshold of significance. SWAPE, p. 14. The excess cancer risk posed to adults and children would be 12 and 33 in one million, while the excess lifetime cancer risk over the course of a Project operation would be 49 in one million. *Id*.

The IS/MND's justifications and conclusion that the Project's GHG impacts are less-than-significant violate CEQA for several reasons.

First, none of these regulatory plans meet the criteria for an officially adopted GHG reduction program, commonly referred to as a Climate Action Plan ("CAP"), for use as a threshold of significance for GHG emissions. SWAPE, pp. 15-16. As CEQA Guideline section 15064.4(b)(3) makes clear, a qualified CAP "must be adopted by the relevant public agency through a public review process," and, as explained by CEQA Guideline section 15183.5(b)(1), the CAP should include:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);
(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels; and

Here, the IS/MND fails to demonstrate that CARB's Climate Change Scoping Plan., SCAG's 2016-2040 TRP/SCS, the City's LA Green Plan, or the City's Sustainable City pLAn include the above-listed requirements to be considered a qualified CAP for the City. As such, the IS/MND leaves an analytical gap and fails to demonstrate that compliance with said plans can be used for project-level significance determination. *Id*.

Second, reliance on these plans is misplaced because the plans are either not directly applicable to the Project, are outdated, or the Project is not consistent with the plan at all. For example, consistency with the LA Green Plan is misplaced because the LA Green Plan does not include project-level measures. Instead, the mitigation measures in the plan are primarily city-level actions. SWAPE, p. 16. Similarly, reliance on the Sustainable City pLAn cannot be relied on because it is out of date and has been superseded by the LA Green New Deal. SWAPE, p. 18. In addition, while the IS/MND claims that the Project is consistent with CARB's Scoping Plan or SCAG's 2016-2040 RTP/SCS, SWAPE found dozens of inconsistencies between the Project and the plans. SWAPE, pp. 19-32. These inconsistencies must be analyzed and remedies in an EIR.

Moreover, consistency with relevant policies cannot be used to determine a Project's significance, as projects must incorporate emission reductions measures beyond those that comprise basic requirements. The California Supreme Court has made clear that just because "a project is designed to meet high building efficiency and conservation standards … does not

establish that its [GHG] emissions from transportation activities lack significant impacts." (*Center for Biological Diversity v. Cal. Dept. of Fish and Wildlife* ("*Newhall Ranch*") (2015) 62 Cal.4th 204, 229.) As such, newer developments must be more GHG-efficient. (*See Newhall Ranch,* 62 Cal.4th at 226.)

2. The Project will have a significant GHG impact.

Since the IS/MND improperly relies entirely on consistency with CARB's Climate Change Scoping Plan., SCAG's 2016-2040 TRP/SCS, the City's LA Green Plan, and the City's Sustainable City pLAn to determine GHG impact significance, the IS/MND fails to compare the Project's GHG emissions to the correct SCAQMD thresholds.

SCAQMD has interim thresholds that the City should have compared the Project's GHG emissions to. SWAPE, p. 32. When compared to the thresholds, even when relying on the IS/MND's incorrect and unsubstantiated CalEEMod model, the Project would result in a significant GHG impact. The IS/MND's CalEEMod output files demonstrate that the Project's mitigated emissions include approximately 8,699 MT CO_2e/year (amortized construction and operational emissions). This far exceeds the SCAQMD 3,000 MT CO_2e/year mixed-use development threshold. SWAPE, p. 36. These exceedances are even greater when SWAPE updated the CalEEMod model to correct the above-identified deficiencies. *Id*. at 37. SWAPE's updated model shows the Project will emit 9,502.4 MT CO_2e/year. *Id*.

SWAPE Annual Greenhouse Gas Emissions	
Project Phase	**Proposed Project (MT CO_2e/year)**
Construction (amortized over 30 years)	255.6
Area	11.1
Energy	4,530.7
Mobile	3,968.9
Waste	190.1
Water	546.0
Total	**9,502.4**
Threshold	3,000
Exceed?	***Yes***

Because the project threshold is exceeded, a service population analysis is warranted. *Id*. SWAPE found that, dividing the Project's GHG emission by its service population of 1,88- people means that the Project would emit approximately 4.63 MT CO_2e/SP/year, which exceeds the SCAQMD 2035 efficiency target of 3.0 of MT CO_2e/SP/year. *Id.* at 36-37. SWAPE's updated CalEEMod model reveals an even greater service population efficiency of 5.05 MT CO_2e/SP/year.

SWAPE Service Population Efficiency Analysis	
Project Phase	**Proposed Project ($MT CO_2e/yr$)**
Total	**9502.37**
Service Population	1880.00
Service Population Efficiency	**5.05**
Threshold	3.00
Exceed?	***Yes***

SWAPE's comments constitute substantial evidence that the Project may have a significant greenhouse gas impact. This impact must be fully analyzed and mitigated in an EIR. SWAPE's comments include a number of mitigation measures available to reduce the Project's GHG emissions, and these should all be considered by the City.

H. The Project Lacks Sufficient Affordable Housing in Conflict with Ballot Measure JJJ.

Only 5% (32 units) of the Project's 640 units will be set aside for affordable housing. IS/MND, p. B-174. All 32 of the affordable housing units will be considered Moderate Income housing, using the State's level of affordability and Los Angeles Housing Community Investment Department's schedule of rents. Not a single unit being made available for Low Income, Very Low Income, or Extremely Low-Income tenants. This lack of affordable housing units violates t Measure JJJ.

Measure JJJ, as codified at Los Angeles Municipal Code ("LAMC") section 11.5.11, was approved by Los Angeles voters on November 8, 2016 and became effective on December 13, 2016. The residential affordability requirements of Measure JJJ apply to projects with ten or more residential units which seek: (1) a discretionary General Plan Amendment; (2) any zone change or height-district change that results in increased allowable residential floor area, density, or height; or (3) a residential use where such use was not allowed previously. (LAMC § 11.5.11(a).)

Pursuant to Measure JJJ, "Rental Projects" which satisfy at least one of the above provisions must provide the following:

(i) No less than the affordability percentage corresponding to the level of density increase as provided in California Government Code Section 65915(f), inclusive of any Replacement Units; or

(ii) If the General Plan amendment, zone change or height district change results in a residential density increase greater than 35%, then the Project shall provide no less than 5% of the total units at rents affordable to Extremely Low Income households, and either 6% of the total units at

rents affordable to Very Low Income households or 15% of the total units at rents affordable to Lower Income households, inclusive of any Replacement Units; or

(iii) If the General Plan amendment, zone change or height district change allows a residential use where not previously allowed, then the Project shall provide no less than 5% of the total units at rents affordable to Extremely Low Income households, and either 11% of the total units at rents affordable to Very Low Income households or 20% of the total units at rents affordable to Lower Income households, inclusive of any Replacement Units. (LAMC § 11.5.11(a)(1).)

Measure JJJ also contains alternative compliance options under which a project can satisfy Measure JJJ's affordability provisions without providing affordable units on-site. These alternative compliance options are (1) construction of affordable units off-site, (2) acquiring property containing "At-Risk Affordable Units," or (3) payment of an in-lieu fee. (LAMC § 11.5.11(b).)

The Project site's General Plan land use designation is currently Regional Center Commercial. The lots that make up the Project site are zoned PB-2, and P-2, which are for parking buildings and surface or underground parking. Residential units are not permitted in PB-2 or P-2 zones. The Project proposes to rezone the entire Project site to C4, which is a commercial zone that may include R4 uses, which include multiple dwelling residential uses. Since the Project will have ten or more residential units and is seeking a zone change that results in increased allowable residential floor area, Measure JJJ applies. LAMC § 11.5.11(a). Specifically, the zone change will allow a residential use where not previously allowed. As a result, "the Project shall provide no less than 5% of the total units at rents affordable to Extremely Low Income households, and either 11% of the total units at rents affordable to Very Low Income households or 20% of the total units at rents affordable to Lower Income households, inclusive of any Replacement Units." LAMC § 11.5.11(a)(1). The Project does not meet the requirements of Measure JJJ because it will only provide 5% of total units at rents affordable to Moderate Income households. The Project must be revised to comply with the affordable housing requirements of Measure JJJ.

IV. CONCLUSION

In light of the above comments, the City must prepare an EIR for the Project and the draft EIR should be circulated for public review and comment in accordance with CEQA. Thank you for considering these comments.

Sincerely,

Rebecca L. Davis

Subject: Indoor Air Quality: 3440 Wilshire Project – Los Angeles, CA (IEE File Reference: P-4349)

Pages: 16

Indoor Air Quality Impacts

Indoor air quality (IAQ) directly impacts the comfort and health of building occupants, and the achievement of acceptable IAQ in newly constructed and renovated buildings is a well-recognized design objective. For example, IAQ is addressed by major high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014). Indoor air quality in homes is particularly important because occupants, on average, spend approximately ninety percent of their time indoors with the majority of this time spent at home (EPA, 2011). Some segments of the population that are most susceptible to the effects of poor IAQ, such as the very young and the elderly, occupy their homes almost continuously. Additionally, an increasing number of adults are working from home at least some of the time during the workweek. Indoor air quality also is a serious concern for workers in hotels, offices and other business establishments.

The concentrations of many air pollutants often are elevated in homes and other buildings relative to outdoor air because many of the materials and products used indoors contain and release a variety of pollutants to air (Hodgson et al., 2002; Offermann and Hodgson,

2011). With respect to indoor air contaminants for which inhalation is the primary route of exposure, the critical design and construction parameters are the provision of adequate ventilation and the reduction of indoor sources of the contaminants.

Indoor Formaldehyde Concentrations Impact. In the California New Home Study (CNHS) of 108 new homes in California (Offermann, 2009), 25 air contaminants were measured, and formaldehyde was identified as the indoor air contaminant with the highest cancer risk as determined by the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), No Significant Risk Levels (NSRL) for carcinogens. The NSRL is the daily intake level calculated to result in one excess case of cancer in an exposed population of 100,000 (i.e., ten in one million cancer risk) and for formaldehyde is 40 µg/day. The NSRL concentration of formaldehyde that represents a daily dose of 40 µg is 2 µg/m^3, assuming a continuous 24-hour exposure, a total daily inhaled air volume of 20 m^3, and 100% absorption by the respiratory system. All of the CNHS homes exceeded this NSRL concentration of 2 µg/m^3. The median indoor formaldehyde concentration was 36 µg/m^3, and ranged from 4.8 to 136 µg/m^3, which corresponds to a median exceedance of the 2 µg/m^3 NSRL concentration of 18 and a range of 2.3 to 68.

Therefore, the cancer risk of a resident living in a California home with the median indoor formaldehyde concentration of 36 µg/m^3, is 180 per million as a result of formaldehyde alone. The CEQA significance threshold for airborne cancer risk is 10 per million, as established by the South Coast Air Quality Management District (SCAQMD, 2015).

Besides being a human carcinogen, formaldehyde is also a potent eye and respiratory irritant. In the CNHS, many homes exceeded the non-cancer reference exposure levels (RELs) prescribed by California Office of Environmental Health Hazard Assessment (OEHHA, 2017b). The percentage of homes exceeding the RELs ranged from 98% for the Chronic REL of 9 µg/m^3 to 28% for the Acute REL of 55 µg/m^3.

The primary source of formaldehyde indoors is composite wood products manufactured with urea-formaldehyde resins, such as plywood, medium density fiberboard, and

particleboard. These materials are commonly used in building construction for flooring, cabinetry, baseboards, window shades, interior doors, and window and door trims.

In January 2009, the California Air Resources Board (CARB) adopted an airborne toxics control measure (ATCM) to reduce formaldehyde emissions from composite wood products, including hardwood plywood, particleboard, medium density fiberboard, and also furniture and other finished products made with these wood products (California Air Resources Board 2009). While this formaldehyde ATCM has resulted in reduced emissions from composite wood products sold in California, they do not preclude that homes built with composite wood products meeting the CARB ATCM will have indoor formaldehyde concentrations that are below cancer and non-cancer exposure guidelines.

A follow up study to the California New Home Study (CNHS) was conducted in 2016-2018 (Chan et. al., 2019), and found that the median indoor formaldehyde in new homes mostly (69 of 70) built in 2012 or later with CARB Phase 2 Formaldehyde ATCM materials had lower indoor formaldehyde concentrations, with a median indoor concentrations of 22.4 $\mu g/m^3$ (18.2 ppb) as compared to a median of 36 $\mu g/m^3$ found in the 2007 CNHS.

Thus, while new homes built after the 2009 CARB formaldehyde ATCM have a 38% lower median indoor formaldehyde concentration and cancer risk, the median lifetime cancer risk is still 112 per million for homes built with CARB compliant composite wood products, which is more than 11 times the OEHHA 10 in a million cancer risk threshold (OEHHA, 2017a).

With respect to this project, the buildings in the 3440 Wilshire Project in Los Angels, CA consist of residential and commercial retail spaces

The residential occupants will potentially have continuous exposure (e.g. 24 hours per day, 52 weeks per year). These exposures are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in residential construction.

Because these residences will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor residential formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 22.4 $\mu g/m^3$ (Chan et. al., 2019)

Assuming that the residential occupants inhale 20 m^3 of air per day, the average 70-year lifetime formaldehyde daily dose is 448 µg/day for continuous exposure in the residences. This exposure represents a cancer risk of 112 per million, which is more than 11 times the Bay Area Air Quality Management District CEQA cancer risk of 10 per million (BAAQMD, 2007). For occupants that do not have continuous exposure, the cancer risk will be proportionally less but still substantially over the BAAQMD CEQA cancer risk of 10 per million (e.g. for 12/hour/day occupancy, more than 5 times the BAAQMD CEQA cancer risk of 10 per million).

The employees of the commercial spaces are also expected to experience significant indoor exposures (e.g., 40 hours per week, 50 weeks per year). These exposures for employees are anticipated to result in significant cancer risks resulting from exposures to formaldehyde released by the building materials and furnishing commonly found in offices, warehouses, residences and hotels.

Because these commercial will be constructed with CARB Phase 2 Formaldehyde ATCM materials, and be ventilated with the minimum code required amount of outdoor air, the indoor warehouse formaldehyde concentrations are likely similar to those concentrations observed in residences built with CARB Phase 2 Formaldehyde ATCM materials, which is a median of 22.4 $\mu g/m^3$ (Chan et. al., 2019).

Assuming that the commercial space employees work 8 hours per day and inhale 20 m^3 of air per day, the formaldehyde dose per work-day at the offices is 149 µg/day.

Assuming that the commercial space employees work 5 days per week and 50 weeks per year for 45 years (start at age 20 and retire at age 65) the average 70-year lifetime

formaldehyde daily dose is 65.6 µg/day.

This is 1.64 times the NSRL (OEHHA, 2017a) of 40 µg/day and represents a cancer risk of 16.4 per million, which exceeds the CEQA cancer risk of 10 per million. This impact should be analyzed in an environmental impact report ("EIR"), and the agency should impose all feasible mitigation measures to reduce this impact.

Several feasible mitigation measures are discussed below and these and other measures should be analyzed in an EIR.

While measurements of the indoor concentrations of formaldehyde in residences built with CARB Phase 2 Formaldehyde ATCM materials (Chan et. al., 2019), indicate that indoor formaldehyde concentrations in buildings built with similar materials (e.g. hotels, residences, offices, warehouses, schools) will pose cancer risks in excess of the CEQA cancer risk of 10 per million, a determination of the cancer risk that is specific to this project and the materials used to construct these buildings can and should be conducted prior to completion of the environmental review.

The following describes a method that should be used prior to construction in the environmental review under CEQA, for determining whether the indoor concentrations resulting from the formaldehyde emissions of the specific building materials/furnishings selected for the building exceed cancer and non-cancer guidelines. Such a design analyses can be used to identify those materials/furnishings prior to the completion of the City's CEQA review and project approval, that have formaldehyde emission rates that contribute to indoor concentrations that exceed cancer and non-cancer guidelines, so that alternative lower emitting materials/furnishings may be selected and/or higher minimum outdoor air ventilation rates can be increased to achieve acceptable indoor concentrations and incorporated as mitigation measures for this project.

Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment.

This formaldehyde emissions assessment should be used in the environmental review under CEQA to assess the indoor formaldehyde concentrations from the proposed loading of building materials/furnishings, the area-specific formaldehyde emission rate data for building materials/furnishings, and the design minimum outdoor air ventilation rates. This assessment allows the applicant (and the City) to determine before the conclusion of the environmental review process and the building materials/furnishings are specified, purchased, and installed if the total chemical emissions will exceed cancer and non-cancer guidelines, and if so, allow for changes in the selection of specific material/furnishings and/or the design minimum outdoor air ventilations rates such that cancer and non-cancer guidelines are not exceeded.

1.) Define Indoor Air Quality Zones. Divide the building into separate indoor air quality zones, (IAQ Zones). IAQ Zones are defined as areas of well-mixed air. Thus, each ventilation system with recirculating air is considered a single zone, and each room or group of rooms where air is not recirculated (e.g. 100% outdoor air) is considered a separate zone. For IAQ Zones with the same construction material/furnishings and design minimum outdoor air ventilation rates. (e.g. hotel rooms, apartments, condominiums, etc.) the formaldehyde emission rates need only be assessed for a single IAQ Zone of that type.

2.) Calculate Material/Furnishing Loading. For each IAQ Zone, determine the building material and furnishing loadings (e.g., m^2 of material/m^2 floor area, units of furnishings/m^2 floor area) from an inventory of all potential indoor formaldehyde sources, including flooring, ceiling tiles, furnishings, finishes, insulation, sealants, adhesives, and any products constructed with composite wood products containing urea-formaldehyde resins (e.g., plywood, medium density fiberboard, particleboard).

3.) Calculate the Formaldehyde Emission Rate. For each building material, calculate the formaldehyde emission rate (µg/h) from the product of the area-specific formaldehyde emission rate (µg/m^2-h) and the area (m^2) of material in the IAQ Zone, and from each furnishing (e.g. chairs, desks, etc.) from the unit-specific formaldehyde emission rate (µg/unit-h) and the number of units in the IAQ Zone.

NOTE: As a result of the high-performance building rating systems and building codes (California Building Standards Commission, 2014; USGBC, 2014), most manufacturers of building materials furnishings sold in the United States conduct chemical emission rate tests using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017), or other equivalent chemical emission rate testing methods. Most manufacturers of building furnishings sold in the United States conduct chemical emission rate tests using ANSI/BIFMA M7.1 Standard Test Method for Determining VOC Emissions (BIFMA, 2018), or other equivalent chemical emission rate testing methods.

CDPH, BIFMA, and other chemical emission rate testing programs, typically certify that a material or furnishing does not create indoor chemical concentrations in excess of the maximum concentrations permitted by their certification. For instance, the CDPH emission rate testing requires that the measured emission rates when input into an office, school, or residential model do not exceed one-half of the OEHHA Chronic Exposure Guidelines (OEHHA, 2017b) for the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017). These certifications themselves do not provide the actual area-specific formaldehyde emission rate (i.e., $\mu g/m^2$-h) of the product, but rather provide data that the formaldehyde emission rates do not exceed the maximum rate allowed for the certification. Thus for example, the data for a certification of a specific type of flooring may be used to calculate that the area-specific emission rate of formaldehyde is less than 31 $\mu g/m^2$-h, but not the actual measured specific emission rate, which may be 3, 18, or 30 $\mu g/m^2$-h. These area-specific emission rates determined from the product certifications of CDPH, BIFA, and other certification programs can be used as an initial estimate of the formaldehyde emission rate.

If the actual area-specific emission rates of a building material or furnishing is needed (i.e. the initial emission rates estimates from the product certifications are higher than desired), then that data can be acquired by requesting from the manufacturer the complete chemical emission rate test report. For instance if the complete CDPH emission test report is requested for a CDHP certified product, that report will provide the actual area-specific

emission rates for not only the 35 specific VOCs, including formaldehyde, listed in Table 4-1 of the CDPH test method (CDPH, 2017), but also all of the cancer and reproductive/developmental chemicals listed in the California Proposition 65 Safe Harbor Levels (OEHHA, 2017a), all of the toxic air contaminants (TACs) in the California Air Resources Board Toxic Air Contamination List (CARB, 2011), and the 10 chemicals with the greatest emission rates.

Alternatively, a sample of the building material or furnishing can be submitted to a chemical emission rate testing laboratory, such as Berkeley Analytical Laboratory (https://berkeleyanalytical.com), to measure the formaldehyde emission rate.

4.) Calculate the Total Formaldehyde Emission Rate. For each IAQ Zone, calculate the total formaldehyde emission rate (i.e. µg/h) from the individual formaldehyde emission rates from each of the building material/furnishings as determined in Step 3.

5.) Calculate the Indoor Formaldehyde Concentration. For each IAQ Zone, calculate the indoor formaldehyde concentration (µg/m^3) from Equation 1 by dividing the total formaldehyde emission rates (i.e. µg/h) as determined in Step 4, by the design minimum outdoor air ventilation rate (m^3/h) for the IAQ Zone.

$$C_{in} = \frac{E_{total}}{Q_{oa}} \quad \text{(Equation 1)}$$

where:

C_{in} = indoor formaldehyde concentration (µg/m^3)

E_{total} = total formaldehyde emission rate (µg/h) into the IAQ Zone.

Q_{oa} = design minimum outdoor air ventilation rate to the IAQ Zone (m^3/h)

The above Equation 1 is based upon mass balance theory, and is referenced in Section 3.10.2 “Calculation of Estimated Building Concentrations” of the California Department of Health “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers”, (CDPH, 2017).

6.) Calculate the Indoor Exposure Cancer and Non-Cancer Health Risks. For each IAQ Zone, calculate the cancer and non-cancer health risks from the indoor formaldehyde concentrations determined in Step 5 and as described in the OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines; Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015).

7.) Mitigate Indoor Formaldehyde Exposures of exceeding the CEQA Cancer and/or Non-Cancer Health Risks. In each IAQ Zone, provide mitigation for any formaldehyde exposure risk as determined in Step 6, that exceeds the CEQA cancer risk of 10 per million or the CEQA non-cancer Hazard Quotient of 1.0.

Provide the source and/or ventilation mitigation required in all IAQ Zones to reduce the health risks of the chemical exposures below the CEQA cancer and non-cancer health risks.

Source mitigation for formaldehyde may include:

1.) reducing the amount materials and/or furnishings that emit formaldehyde
2.) substituting a different material with a lower area-specific emission rate of formaldehyde

Ventilation mitigation for formaldehyde emitted from building materials and/or furnishings may include:

1.) increasing the design minimum outdoor air ventilation rate to the IAQ Zone.

NOTE: Mitigating the formaldehyde emissions through use of less material/furnishings, or use of lower emitting materials/furnishings, is the preferred mitigation option, as mitigation with increased outdoor air ventilation increases initial and operating costs associated with the heating/cooling systems.

Further, we are not asking that the builder to "speculate" on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile

Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017), and use the procedure described earlier (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Impact. Another important finding of the CNHS, was that the outdoor air ventilation rates in the homes were very low. Outdoor air ventilation is a very important factor influencing the indoor concentrations of air contaminants, as it is the primary removal mechanism of all indoor air generated air contaminants. Lower outdoor air exchange rates cause indoor generated air contaminants to accumulate to higher indoor air concentrations. Many homeowners rarely open their windows or doors for ventilation as a result of their concerns for security/safety, noise, dust, and odor concerns (Price, 2007). In the CNHS field study, 32% of the homes did not use their windows during the 24-hour Test Day, and 15% of the homes did not use their windows during the entire preceding week. Most of the homes with no window usage were homes in the winter field session. Thus, a substantial percentage of homeowners never open their windows, especially in the winter season. The median 24-hour measurement was 0.26 ach, with a range of 0.09 ach to 5.3 ach. A total of 67% of the homes had outdoor air exchange rates below the minimum California Building Code (2001) requirement of 0.35 ach. Thus, the relatively tight envelope construction, combined with the fact that many people never open their windows for ventilation, results in homes with low outdoor air exchange rates and higher indoor air contaminant concentrations.

The 3440 Wilshire Project in Los Angeles, CA is close to roads with moderate to high traffic (e.g. Wilshire Boulevard, S. Mariposa Boulevard, S. Normandy Avenue, and W. 7th Street. As a result of the outdoor vehicle traffic noise, the Project site is likely to be a sound impacted site. The noise analyses provided in the Mitigated Negative Declaration (CAJA Environmental Services, 2020), reports in Tables B. 13-7 and B.13-8 Future + Project AM and PM Peak Hour Mobile Source Noise Levels, that the noise levels will range from 60.8 to 64.0 dBA L_{eq} 1hr.

As a result of the high outdoor noise levels, the current project will require the need for mechanical supply of outdoor air ventilation air to allow for a habitable interior environment with closed windows and doors. Such a ventilation system would allow windows and doors to be kept closed at the occupant's discretion to control exterior noise within building interiors.

$PM_{2.5}$ Outdoor Concentrations Impact. An additional impact of the nearby motor vehicle traffic associated with this project, are the outdoor concentrations of $PM_{2.5}$. According to the Mitigated Negative Declaration (CAJA Environmental Services, 2020), this Project is located in the Los Angels County portion of the South Coast Air Basin, which is a State and Federal non-attainment area for $PM_{2.5}$.

An air quality analyses should to be conducted to determine the concentrations of $PM_{2.5}$ in the outdoor and indoor air that people inhale each day. This air quality analyses needs to consider the cumulative impacts of the project related emissions, existing and projected future emissions from local $PM_{2.5}$ sources (e.g. stationary sources, motor vehicles, and airport traffic) upon the outdoor air concentrations at the project site. If the outdoor concentrations are determined to exceed the California and National annual average $PM_{2.5}$ exceedence concentration of 12 $\mu g/m^3$, or the National 24-hour average exceedence concentration of 35 $\mu g/m^3$, then the buildings need to have a mechanical supply of outdoor air that has air filtration with sufficient $PM_{2.5}$ removal efficiency, such that the indoor concentrations of outdoor $PM_{2.5}$ particles is less than the California and National $PM_{2.5}$ annual and 24-hour standards.

It is my experience that based on the projected high traffic noise levels, the annual average concentration of $PM_{2.5}$ will exceed the California and National $PM_{2.5}$ annual and 24-hour standards and warrant installation of high efficiency air filters (i.e. MERV 13 or higher) in all mechanically supplied outdoor air ventilation systems.

Indoor Air Quality Impact Mitigation Measures

The following are recommended mitigation measures to minimize the impacts upon indoor quality:

- indoor formaldehyde concentrations
- outdoor air ventilation
- $PM_{2.5}$ outdoor air concentrations

Indoor Formaldehyde Concentrations Mitigation. Use only composite wood materials (e.g. hardwood plywood, medium density fiberboard, particleboard) for all interior finish systems that are made with CARB approved no-added formaldehyde (NAF) resins or ultra-low emitting formaldehyde (ULEF) resins (CARB, 2009). Other projects such as the AC by Marriott Hotel – West San Jose Project (Asset Gas SC Inc.) and 2525 North Main Street, Santa Ana (AC 2525 Main LLC, 2019) have entered into settlement agreements stipulating the use of composite wood materials only containing NAF or ULEF resins.

Alternatively, conduct the previously described Pre-Construction Building Material/Furnishing Chemical Emissions Assessment, to determine that the combination of formaldehyde emissions from building materials and furnishings do not create indoor formaldehyde concentrations that exceed the CEQA cancer and non-cancer health risks.

It is important to note that we are not asking that the builder to "speculate" on what and how much composite materials be used, but rather at the design stage to select composite wood materials based on the formaldehyde emission rates that manufacturers routinely conduct using the California Department of Health "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions for Indoor Sources Using Environmental Chambers", (CDPH, 2017), and use the procedure described earlier (i.e. Pre-Construction Building Material/Furnishing Formaldehyde Emissions Assessment) to insure that the materials selected achieve acceptable cancer risks from material off gassing of formaldehyde.

Outdoor Air Ventilation Mitigation. Provide each habitable room with a continuous mechanical supply of outdoor air that meets or exceeds the California 2016 Building Energy Efficiency Standards (California Energy Commission, 2015) requirements of the greater of 15 cfm/occupant or 0.15 cfm/ft^2 of floor area. Following installation of the system conduct testing and balancing to insure that required amount of outdoor air is entering each habitable room and provide a written report documenting the outdoor airflow rates. Do not use exhaust only mechanical outdoor air systems, use only balanced outdoor air supply and exhaust systems or outdoor air supply only systems. Provide a manual for the occupants or maintenance personnel, that describes the purpose of the mechanical outdoor air system and the operation and maintenance requirements of the system.

$PM_{2.5}$ Outdoor Air Concentration Mitigation. Install air filtration with sufficient $PM_{2.5}$ removal efficiency (e.g. MERV 13 or higher) to filter the outdoor air entering the mechanical outdoor air supply systems, such that the indoor concentrations of outdoor $PM_{2.5}$ particles are less than the California and National $PM_{2.5}$ annual and 24-hour standards. Install the air filters in the system such that they are accessible for replacement by the occupants or maintenance personnel. Include in the mechanical outdoor air ventilation system manual instructions on how to replace the air filters and the estimated frequency of replacement.

Education

M.S. Mechanical Engineering (1985)
Stanford University, Stanford, CA.

Graduate Studies in Air Pollution Monitoring and Control (1980)
University of California, Berkeley, CA.

B.S. in Mechanical Engineering (1976)
Rensselaer Polytechnic Institute, Troy, N.Y.

Professional Experience

President: Indoor Environmental Engineering, San Francisco, CA. December, 1981 - present.

Direct team of environmental scientists, chemists, and mechanical engineers in conducting State and Federal research regarding indoor air quality instrumentation development, building air quality field studies, ventilation and air cleaning performance measurements, and chemical emission rate testing.

Provide design side input to architects regarding selection of building materials and ventilation system components to ensure a high quality indoor environment.

Direct Indoor Air Quality Consulting Team for the winning design proposal for the new State of Washington Ecology Department building.

Develop a full-scale ventilation test facility for measuring the performance of air diffusers; ASHRAE 129, Air Change Effectiveness, and ASHRAE 113, Air Diffusion Performance Index.

Develop a chemical emission rate testing laboratory for measuring the chemical emissions from building materials, furnishings, and equipment.

Principle Investigator of the California New Homes Study (2005-2007). Measured ventilation and indoor air quality in 108 new single family detached homes in northern and southern California.

Develop and teach IAQ professional development workshops to building owners, managers, hygienists, and engineers.

Air Pollution Engineer: Earth Metrics Inc., Burlingame, CA, October, 1985 to March, 1987.

Responsible for development of an air pollution laboratory including installation a forced choice olfactometer, tracer gas electron capture chromatograph, and associated calibration facilities. Field team leader for studies of fugitive odor emissions from sewage treatment plants, entrainment of fume hood exhausts into computer chip fabrication rooms, and indoor air quality investigations.

Staff Scientist: Building Ventilation and Indoor Air Quality Program, Energy and Environment Division, Lawrence Berkeley Laboratory, Berkeley, CA. January, 1980 to August, 1984.

Deputy project leader for the Control Techniques group; responsible for laboratory and field studies aimed at evaluating the performance of indoor air pollutant control strategies (i.e. ventilation, filtration, precipitation, absorption, adsorption, and source control).

Coordinated field and laboratory studies of air-to-air heat exchangers including evaluation of thermal performance, ventilation efficiency, cross-stream contaminant transfer, and the effects of freezing/defrosting.

Developed an *in situ* test protocol for evaluating the performance of air cleaning systems and introduced the concept of effective cleaning rate (ECR) also known as the Clean Air Delivery Rate (CADR).

Coordinated laboratory studies of portable and ducted air cleaning systems and their effect on indoor concentrations of respirable particles and radon progeny.

Co-designed an automated instrument system for measuring residential ventilation rates and radon concentrations.

Designed hardware and software for a multi-channel automated data acquisition system used to evaluate the performance of air-to-air heat transfer equipment.

Assistant Chief Engineer: Alta Bates Hospital, Berkeley, CA, October, 1979 to January, 1980.

Responsible for energy management projects involving installation of power factor correction capacitors on large inductive electrical devices and installation of steam meters on physical plant steam lines. Member of Local 39, International Union of Operating Engineers.

Manufacturing Engineer: American Precision Industries, Buffalo, NY, October, 1977 to October, 1979.

Responsible for reorganizing the manufacturing procedures regarding production of shell and tube heat exchangers. Designed customized automatic assembly, welding, and testing equipment. Designed a large paint spray booth. Prepared economic studies justifying new equipment purchases. Safety Director.

Project Engineer: Arcata Graphics, Buffalo, N.Y. June, 1976 to October, 1977.

Responsible for the design and installation of a bulk ink storage and distribution system and high speed automatic counting and marking equipment. Also coordinated material handling studies which led to the purchase and installation of new equipment.

PROFESSIONAL ORGANIZATION MEMBERSHIP

American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

- Chairman of SPC-145P, Standards Project Committee - Test Method for Assessing the Performance of Gas Phase Air Cleaning Equipment (1991-1992)
- Member SPC-129P, Standards Project Committee - Test Method for Ventilation Effectiveness (1986-97)
  - Member of Drafting Committee
- Member Environmental Health Committee (1992-1994, 1997-2001, 2007-2010)
  - Chairman of EHC Research Subcommittee
  - Member of Man Made Mineral Fiber Position Paper Subcommittee
  - Member of the IAQ Position Paper Committee
  - Member of the Legionella Position Paper Committee
  - Member of the Limiting Indoor Mold and Dampness in Buildings Position Paper Committee
- Member SSPC-62, Standing Standards Project Committee - Ventilation for Acceptable Indoor Air Quality (1992 to 2000)
  - Chairman of Source Control and Air Cleaning Subcommittee
- Chairman of TC-4.10, Indoor Environmental Modeling (1988-92)
  - Member of Research Subcommittee
- Chairman of TC-2.3, Gaseous Air Contaminants and Control Equipment (1989-92)
  - Member of Research Subcommittee

American Society for Testing and Materials (ASTM)

- D-22 Sampling and Analysis of Atmospheres
  - Member of Indoor Air Quality Subcommittee
- E-06 Performance of Building Constructions

American Board of Industrial Hygiene (ABIH)

American Conference of Governmental Industrial Hygienists (ACGIH)

- Bioaerosols Committee (2007-2013)

American Industrial Hygiene Association (AIHA)

Cal-OSHA Indoor Air Quality Advisory Committee

International Society of Indoor Air Quality and Climate (ISIAQ)

- Co-Chairman of Task Force on HVAC Hygiene

U. S. Green Building Council (USGBC)
- Member of the IEQ Technical Advisory Group (2007-2009)
- Member of the IAQ Performance Testing Work Group (2010-2012)

Western Construction Consultants (WESTCON)

PROFESSIONAL CREDENTIALS

Licensed Professional Engineer - Mechanical Engineering

Certified Industrial Hygienist - American Board of Industrial Hygienists

SCIENTIFIC MEETINGS AND SYMPOSIA

Biological Contamination, Diagnosis, and Mitigation, Indoor Air'90, Toronto, Canada, August, 1990.

Models for Predicting Air Quality, Indoor Air'90, Toronto, Canada, August, 1990.

Microbes in Building Materials and Systems, Indoor Air '93, Helsinki, Finland, July, 1993.

Microorganisms in Indoor Air Assessment and Evaluation of Health Effects and Probable Causes, Walnut Creek, CA, February 27, 1997.

Controlling Microbial Moisture Problems in Buildings, Walnut Creek, CA, February 27, 1997.

Scientific Advisory Committee, Roomvent 98, 6th International Conference on Air Distribution in Rooms, KTH, Stockholm, Sweden, June 14-17, 1998.

Moisture and Mould, Indoor Air '99, Edinburgh, Scotland, August, 1999.

Ventilation Modeling and Simulation, Indoor Air '99, Edinburgh, Scotland, August, 1999.

Microbial Growth in Materials, Healthy Buildings 2000, Espoo, Finland, August, 2000.

Co-Chair, Bioaerosols X- Exposures in Residences, Indoor Air 2002, Monterey, CA, July 2002.

Healthy Indoor Environments, Anaheim, CA, April 2003.

Chair, Environmental Tobacco Smoke in Multi-Family Homes, Indoor Air 2008, Copenhagen, Denmark, July 2008.

Co-Chair, ISIAQ Task Force Workshop; HVAC Hygiene, Indoor Air 2002, Monterey, CA, July 2002.

Chair, ETS in Multi-Family Housing: Exposures, Controls, and Legalities Forum, Healthy Buildings 2009, Syracuse, CA, September 14, 2009.

Chair, Energy Conservation and IAQ in Residences Workshop, Indoor Air 2011, Austin, TX, June 6, 2011.

Chair, Electronic Cigarettes: Chemical Emissions and Exposures Colloquium, Indoor Air 2016, Ghent, Belgium, July 4, 2016.

SPECIAL CONSULTATION

Provide consultation to the American Home Appliance Manufacturers on the development of a standard for testing portable air cleaners, AHAM Standard AC-1.

Served as an expert witness and special consultant for the U.S. Federal Trade Commission regarding the performance claims found in advertisements of portable air cleaners and residential furnace filters.

Conducted a forensic investigation for a San Mateo, CA pro se defendant, regarding an alleged homicide where the victim was kidnapped in a steamer trunk. Determined the air exchange rate in the steamer trunk and how long the person could survive.

Conducted *in situ* measurement of human exposure to toluene fumes released during nailpolish application for a plaintiffs attorney pursuing a California Proposition 65 product labeling case. June, 1993.

Conducted a forensic *in situ* investigation for the Butte County, CA Sheriff's Department of the emissions of a portable heater used in the bedroom of two twin one year old girls who suffered simultaneous crib death.

Consult with OSHA on the 1995 proposed new regulation regarding indoor air quality and environmental tobacco smoke.

Consult with EPA on the proposed Building Alliance program and with OSHA on the proposed new OSHA IAQ regulation.

Johnson Controls Audit/Certification Expert Review; Milwaukee, WI. May 28-29, 1997.

Winner of the nationally published 1999 Request for Proposals by the State of Washington to conduct a comprehensive indoor air quality investigation of the Washington State Department of Ecology building in Lacey, WA.

Selected by the State of California Attorney General's Office in August, 2000 to conduct a comprehensive indoor air quality investigation of the Tulare County Court House.

Lawrence Berkeley Laboratory IAQ Experts Workshop: "Cause and Prevention of Sick Building Problems in Offices: The Experience of Indoor Environmental Quality Investigators", Berkeley, California, May 26-27, 2004.

Provide consultation and chemical emission rate testing to the State of California Attorney General's Office in 2013-2015 regarding the chemical emissions from e-cigarettes.

RE: 3440 Wilshire Project

To Whom It May Concern,

I write to comment on the City of Los Angeles (2016) Initial Study and Negative Declaration (IS/MND) prepared for the 3440 Wilshire Project, which I understand would add 1,472,509 ft^2 of floor space between a 23-story building and a 28-story building, and including 10,738 ft^2 of commercial floor space and 839 residential units on 7.36 acres of land. I estimate the project's façades would support about 24,000 m^2 of glass windows and balcony rails, which would pose collision hazards to birds. Adding to the collision hazards would be the abundant use of window recessing, over-window balconies, between-building interior space, and use of transparent glass and abundant interior lighting at night. I write to comment on bird-window collisions that would result from this project – a type of impact that is not addressed in the IS/MND.

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, habitat restoration, interactions between wildlife and human infrastructure and activities, conservation of rare and endangered species, and on the ecology of invading species. I perform research on wildlife mortality caused by wind turbines, electric distribution lines, agricultural practices, and road traffic. I authored numerous papers on special-status species issues, including "Using the best scientific data for endangered species conservation" (Smallwood et al. 1999), and "Suggested standards for science applied to conservation issues" (Smallwood et al. 2001). I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-three years, including at many proposed project sites. My CV is attached.

BIOLOGICAL IMPACTS ASSESSMENT

I disagree with the determinations of 'No Impact' to Initial Study questions 4a and 4d made by City of Los Angeles (2016). City of Los Angeles reasoned that special-status species do not occur in the urbanized landscape of the City, so the proposed project would risk no significant impacts to special-status species of wildlife. The City further reasoned that the urbanized location of the project does not support a wildlife movement corridor, so the project would risk no significant impacts to wildlife movement. However, whether a site supports a wildlife movement corridor is not the standard at issue with Initial Study question 4d; rather, it is whether the project would interfere with wildlife movement. City of Los Angeles apparentely neglected to consider that birds fly. Birds fly to forage, defend territories, disperse, and migrate. Birds, including special-status species of birds, inhabit the airspaces of Los Angeles, some as residents of Los Angeles and others as dispersers or migrants. Inserting two high-rises into the airspaces used by birds would interfere with wildlife movement while also killing many birds. Collision mortality would be worsened by constructing two high-rises as planned – high-rises composed of glass façades.

City of Los Angeles (2016) mischaracterizes bird occurrences in the urban environment of Los Angeles. Based on recent eBird records, 44 special-status species of birds have been documented right around the site of the proposed project (Table 1). Fifteen of these species have been known to collide with windows (Table 1). Many of these species are undoubtedly already experiencing annual mortality caused by window collisions in Los Angeles, but the proposed new project would substantially add window-collision hazards to birds flying over Los Angeles. A fair argument can be made for the need to prepare an EIR to assess project impacts from bird-window collisions, and to formulate appropriate mitigation.

WINDOW COLLISIONS

Recent advances in structural glass engineering have contributed to a proliferation of glass windows on building façades. This proliferation is readily observable in newer buildings and in recent project planning documents, and it is represented by a worldwide 20% increase in glass manufacturing for building construction since 2016. Increasing window to wall ratios and glass façades have become popular for multiple reasons, including a growing demand for 'daylighting.' Not only is glass a major feature of the Project, but depictions of the project are of buildings gleaming in transparent glass in daylight and lit from the interior in the evening hours (IS/MND Appendix A updated in January 2020).

The IS/MND has not been prepared with the benefit of survey visits by wildlife biologists, so it inadequately informs the public about avian use of the area. Surveys are needed to learn how many of each bird species fly through the area and at what times of day (and night). Nocturnal surveys can be performed using a thermal-imaging camera or radar. Such surveys would inform of collision risk, and could inform mitigation strategies involving interior light management and design modifications to facades facing the prevailing approach directions of migrating birds. Below I review the bird-

window collision issue, hypothesized causal factors and recommended mitigation solutions. I also predict bird-window collision rates based on studies performed across the USA at structures ranging widely in height, window-to-wall ratio, types of glass, orientation, and structural context. My aim is to make a robust prediction from this range of study conditions, and to present the associated large confidence interval that I believe is appropriate in the face of uncertainty over how many birds fly through the project area and what proportion of the birds are more susceptible that others to window collision.

Glass-façades of buildings intercept and kill many birds, but these façades are differentially hazardous to birds based on spatial extent, contiguity, orientation, and other factors. At Washington State University, Johnson and Hudson (1976) found 266 bird fatalities of 41 species within 73 months of monitoring of a three-story glass walkway (no fatality adjustments attempted). Prior to marking the windows to warn birds of the collision hazard, the collision rate was 84.7 per year. At that rate, and not attempting to adjust the fatality estimate for the proportion of fatalities not found, 4,235 birds were likely killed over the 50 years since the start of their study, and that's at a relatively small building façade (Figure 1). Accounting for the proportion of fatalities not found, the number of birds killed by this walkway over the last 50 years would have been about 12,705. And this is just for one 3-story, glass-sided walkway between two college campus buildings.

Figure 1. *A walkway connecting two buildings at Washington State University where one of the earliest studies of bird collision mortality found 85 bird fatalities per year prior to marking windows (254 annual deaths adjusted for the proportion not found). Given that the window markers have long since disappeared, this walkway has likely killed at least 12,705 birds since 1968, and continues to kill birds. Notice that the transparent glass on both sides of the walkway gives the impression of unimpeded airspace that can be navigated safely by birds familiar with flying between tree branches. Also note the reflected images of trees, which can mislead birds into seeing safe perch sites. Further note the distances of ornamental trees, which allow birds taking off from those trees to reach full speed upon arrival at the windows.*

Table 1. *Reports of special-status species occurrences within close proximity of the proposed project site.*

[1] Listed as FE and FT = federal endangered and threatened species, BCC = U.S. Fish and Wildlife Service Bird Species of Conservation Concern, CE and CT = California endangered and threatened species, SSC = California species of special concern (not threatened with extinction, but rare, very restricted in range, declining throughout range, peripheral portion of species' range, associated with habitat that is declining in extent), CFP = California Fully Protected (CDFW Code 3511), FGC 3503.5 = California Department of Fish and Wildlife Code 3503.5 (Birds of prey), and SSC1, SSC2 and SSC3 = California Bird Species of Special Concern priorities 1, 2 and 3, respectively (Shuford and Gardali 2008), and TWL = Taxa to Watch List (Shuford and Gardali 2008).

Window collisions are often characterized as either the second or third largest source or human-caused bird mortality. The numbers behind these characterizations are often attributed to Klem's (1990) and Dunn's (1993) estimates of about 100 million to 1 billion bird fatalities in the USA, or more recently Loss et al.'s (2014) estimate of 365-988 million bird fatalities in the USA or Calvert et al.'s (2013) and Machtans et al.'s (2013) estimates of 22.4 million and 25 million bird fatalities in Canada, respectively. However, these estimates and their interpretation warrant examination because they were based on opportunistic sampling, volunteer study participation, and fatality monitoring by more inexperienced than experienced searchers.

Klem's (1990) estimate was based on speculation that 1 to 10 birds are killed per building per year, and this speculated range was extended to the number of buildings estimated by the US Census Bureau in 1986. Klem's speculation was supported by fatality monitoring at only two houses, one in Illinois and the other in New York. Also, the basis of his fatality rate extension has changed greatly since 1986. Whereas his estimate served the need to alert the public of the possible magnitude of the bird-window collision issue, it was highly uncertain at the time and undoubtedly outdated more than three decades hence. Indeed, by 2010 Klem (2010) characterized the upper end of his estimated range – 1 billion bird fatalities – as conservative. Furthermore, the estimate lumped species together as if all birds are the same and the loss of all birds to windows has the same level of impact.

Homes with birdfeeders are associated with higher rates of window collisions than are homes without birdfeeders (Kummer and Bayne 2015, Kummer et al. 2016a), so the developed area might pose even greater hazard to birds if it includes numerous birdfeeders. Another factor potentially biasing national or North American estimates low was revealed by Bracey et al.'s (2016) finding that trained fatality searchers found 2.6× the number of fatalities found by homeowners on the days when both trained searchers and homeowners searched around homes. The difference in carcass detection was 30.4-fold when involving carcasses volitionally placed by Bracey et al. (2016) in blind detection trials. This much larger difference in trial carcass detection rates likely resulted because their placements did not include the sounds that typically alert homeowners to actual window collisions, but this explanation also raises the question of how often homeowner participants with such studies miss detecting window-caused fatalities because they did not hear the collisions.

By the time Loss et al. (2014) performed their effort to estimate annual USA bird-window fatalities, many more fatality monitoring studies had been reported or were underway. Loss et al. (2014) were able to incorporate many more fatality rates based on scientific monitoring, and they were more careful about which fatality rates to include. However, they included estimates based on fatality monitoring by homeowners, which in one study were found to detect only 38% of the available window fatalities (Bracey et al. 2016). Loss et al. (2014) excluded all fatality records lacking a dead bird in hand, such as injured birds or feather or blood spots on windows. Loss et al.'s (2014) fatality metric was the number of fatalities per building (where in this context a building can include a house, low-rise, or high-rise structure), but they assumed that this metric was based on window collisions. Because most of the bird-window collision studies were

limited to migration seasons, Loss et al. (2014) developed an admittedly assumption-laden correction factor for making annual estimates. Also, only 2 of the studies included adjustments for carcass persistence and searcher detection error, and it was unclear how and to what degree fatality rates were adjusted for these factors. Although Loss et al. (2014) attempted to account for some biases as well as for large sources of uncertainty mostly resulting from an opportunistic rather than systematic sampling data source, their estimated annual fatality rate across the USA was highly uncertain and vulnerable to multiple biases, most of which would have resulted in fatality estimates biased low.

In my review of bird-window collision monitoring, I found that the search radius around homes and buildings was very narrow, usually 2 meters. Based on my experience with bird collisions in other contexts, I would expect that a large portion of bird-window collision victims would end up farther than 2 m from the windows, especially when the windows are higher up on tall buildings. In my experience, searcher detection rates tend to be low for small birds deposited on ground with vegetation cover or woodchips or other types of organic matter. Also, vertebrate scavengers entrain on anthropogenic sources of mortality and quickly remove many of the carcasses, thereby preventing the fatality searcher from detecting these fatalities. Adjusting fatality rates for these factors – search radius bias, searcher detection error, and carcass persistence rates – would greatly increase nationwide estimates of bird-window collision fatalities.

Buildings can intercept many nocturnal migrants as well as birds flying in daylight. As mentioned above, Johnson and Hudson (1976) found 266 bird fatalities of 41 species within 73 months of monitoring of a four-story glass walkway at Washington State University (no adjustments attempted). Somerlot (2003) found 21 bird fatalities among 13 buildings on a university campus within only 61 days. Monitoring twice per week, Hager at al. (2008) found 215 bird fatalities of 48 species, or 55 birds/building/year, and at another site they found 142 bird fatalities of 37 species for 24 birds/building/year. Gelb and Delacretaz (2009) recorded 5,400 bird fatalities under buildings in New York City, based on a decade of monitoring only during migration periods, and some of the high-rises were associated with hundreds of fatalities each. Klem et al. (2009) monitored 73 building façades in New York City during 114 days of two migratory periods, tallying 549 collision victims, nearly 5 birds per day. Borden et al. (2010) surveyed a 1.8 km route 3 times per week during 12-month period and found 271 bird fatalities of 50 species. Parkins et al. (2015) found 35 bird fatalities of 16 species within only 45 days of monitoring under 4 building façades. From 24 days of survey over a 48 day span, Porter and Huang (2015) found 47 fatalities under 8 buildings on a university campus. Sabo et al. (2016) found 27 bird fatalities over 61 days of searches under 31 windows. In San Francisco, Kahle et al. (2016) found 355 collision victims within 1,762 days under a 5-story building. Ocampo-Peñuela et al. (2016) searched the perimeters of 6 buildings on a university campus, finding 86 fatalities after 63 days of surveys. One of these buildings produced 61 of the 86 fatalities, and another building with collision-deterrent glass caused only 2 of the fatalities, thereby indicating a wide range in impacts likely influenced by various factors. There is ample evidence available to support my prediction that the proposed project would result in many collision fatalities of birds.

Project Impact Prediction

Predicting the number of bird collisions at a new project is challenging because the study of window collisions remains in its early stages. Researchers have yet to agree on a collision rate metric. Some have reported findings as collisions per building per year and some as collisions per building per day. Some have reported findings as collisions per m^2 of window. The problem with the temporal factor in the collision rate metrics has been monitoring time spans varying from a few days to 10 years, and even in the case of the 10-year span, monitoring was largely restricted to spring and fall migration seasons. Short-term monitoring during one or two seasons of the year cannot represent a 'year,' but monitoring has rarely spanned a full year. Using 'buildings' in the metric treats buildings as all the same size, when we know they are not. Using square meters of glass in the metric treats glass as the only barrier upon which birds collide against a building's façade, when we know it is not. It also treats all glass as equal, even though we know that collision risk varies by type of glass as well as multiple factors related to contextual settings.

Without the benefit of more advanced understanding of window collision factors, my prediction of project impacts will be uncertain. Klem's (1990) often-cited national estimate of avian collision rate relied on an assumed average collision rate of 1 to 10 birds per building per year, but studies since then have all reported higher rates of collisions 12 to 352 birds per building per year. Because the more recent studies were likely performed at buildings known or suspected to cause many collisions, collision rates from them could be biased high. By the time of these comments I had reviewed and processed results of bird collision monitoring at 181 buildings and façades for which bird collisions per m^2 of glass per year could be calculated and averaged (Johnson and Hudson 1976, O'Connell 2001, Somerlot 2003, Hager et al. 2008, Borden et al. 2010, Hager et al. 2013, Porter and Huang 2015, Parkins et al. 2015, Kahle et al. 2016, Ocampo-Peñuela et al. 2016, Sabo et al. 2016, Barton et al. 2017, Schneider et al. 2018). These study results averaged 0.077 bird deaths per m^2 of glass per year (95% CI: 0.04-0.11). Looking over the proposed building design, I estimated the buildings would include at least 24,000 m^2 of glass windows, which applied to the mean fatality rate would predict **1,848 bird deaths per year (95% CI: 960-2,640)** at the buildings. The 50-year toll from this average annual fatality rate would be 92,400 bird deaths (95% CI: 48,000-132,000), which would continue until the buildings are either renovated to reduce bird collisions or they come down. The vast majority of these deaths would be of birds newly protected under Fish and Game Code section 3513, which was amended by Governor Newsom's signing of AB 454 on 27 September 2019 to reinstate as state law the recently repealed federal Migratory Bird Treaty Act. If the project moves forward as proposed, and annually kills hundreds of birds protected by AB 454, the project will cause significant unmitigated impacts.

As mentioned earlier, the accuracy of my window collision predictions depends on factors known or hypothesized to affect window collision rates. However, from the national average collision rate, I used all the variation in collision rates that was available and which resulted from a wide range in building height, type of glass, indoor and outdoor landscaping, interior light management, window to wall ratio, and

structural context of the façade. This variation contributed to a robust bird-window collision rate represented by a wide 95% confidence interval. According to the confidence interval, which again was based on the wide range of conditions in the underlying data, the proposed project built as designed at 100 locations would be predicted to kill between 960 and 2,640 birds per year at 95 of those 100 locations, leaving the other 5 to kill birds at rates either lower or higher than this range. Even at the low end of the interval, the death toll would be excessive, amounting to 48,000 bird deaths over 50 years. This impact would be significant, especially considering that the predicted fatality rate can be prevented by implementing appropriate mitigation measures. A fair argument can be made for the need to prepare an EIR to assess project impacts from bird-window collisions, and to formulate appropriate mitigation.

Below I will discuss hypothesized bird-window collision factors, and I will recommend mitigation measures.

Bird-Window Collision Factors

Below is a list of collision factors I found in the scientific literature. Following this list are specific notes and findings taken from the literature and my own experience.

(1) Inherent hazard of a structure in the airspace used for nocturnal migration or other flights
(2) Window transparency, falsely revealing passage through structure or to indoor plants
(3) Window reflectance, falsely depicting vegetation, competitors, or open airspace
(4) Black hole or passage effect
(5) Window or façade extent, or proportion of façade consisting of window or other reflective surface
(6) Size of window
(7) Type of glass
(8) Lighting, which is correlated with window extent and building operations
(9) Height of structure (collision mechanisms shift with height above ground)
(10) Orientation of façade with respect to winds and solar exposure
(11) Structural layout causing confusion and entrapment
(12) Context in terms of urban-rural gradient, or surrounding extent of impervious surface vs vegetation
(13) Height, structure, and extent of vegetation grown near home or building
(14) Presence of birdfeeders or other attractants
(15) Relative abundance
(16) Season of the year
(17) Ecology, demography and behavior
(18) Predatory attacks or cues provoking fear of attack
(19) Aggressive social interactions

(1) Inherent hazard of structure in airspace.—Not all of a structure's collision risk can be attributed to windows. Overing (1938) reported 576 birds collided with the Washington Monument in 90 minutes on one night, 12 September 1937. The average annual fatality

count had been 328 birds from 1932 through 1936. Gelb and Delacretaz (2009) and Klem et al. (2009) also reported finding collision victims at buildings lacking windows, although many fewer than they found at buildings fitted with widows. The takeaway is that any building going up at the project site would likely kill birds, although the impacts of a glass-sided building would likely be much greater.

(2) Window transparency.—Widely believed as one of the two principal factors contributing to avian collisions with buildings is the transparency of glass used in windows on the buildings (Klem 1989). Gelb and Delacretaz (2009) felt that many of the collisions they detected occurred where transparent windows revealed interior vegetation.

(3) Window reflectance.—Widely believed as one of the two principal factors contributing to avian collisions with buildings is the reflectance of glass used in windows on the buildings (Klem 1989). Reflectance can deceptively depict open airspace, vegetation as habitat destination, or competitive rivals as self-images (Klem 1989). Gelb and Delacretaz (2009) felt that many of the collisions they detected occurred toward the lower parts of buildings where large glass exteriors reflected outdoor vegetation. Klem et al. (2009) and Borden et al. (2010) also found that reflected outdoor vegetation associated positively with collisions.

(4) Black hole or passage effect.—Although this factor was not often mentioned in the bird-window collision literature, it was suggested in Sheppard and Phillips (2015). The black hole or passage effect is the deceptive appearance of a cavity or darkened ledge that certain species of bird typically approach with speed when seeking roosting sites. The deception is achieved when shadows from awnings or the interior light conditions give the appearance of cavities or protected ledges. This factor appears potentially to be nuanced variations on transparency or reflectance or possibly an interaction effect of both of these factors.

(5) Window or façade extent.—Klem et al. (2009), Borden et al. (2010), Hager et al. (2013), and Ocampo-Peñuela et al. (2016) reported increased collision fatalities at buildings with larger reflective façades or higher proportions of façades composed of windows. However, Porter and Huang (2015) found a negative relationship between fatalities found and proportion of façade that was glazed.

(6) Size of window.—According to Kahle et al. (2016), collision rates were higher on large-pane windows compared to small-pane windows.

(7) Type of glass.—Klem et al. (2009) found that collision fatalities associated with the type of glass used on buildings. Otherwise, little attention has been directed towards the types of glass in buildings.

(8) Lighting.—Parkins et al. (2015) found that light emission from buildings correlated positively with percent glass on the façade, suggesting that lighting is linked to the extent of windows. Zink and Eckles (2010) reported fatality reductions, including an 80% reduction at a Chicago high-rise, upon the initiation of the Lights-out Program.

However, Zink and Eckles (2010) provided no information on their search effort, such as the number of searches or search interval or search area around each building.

(9) Height of structure.—I found little if any hypothesis-testing related to building height, including whether another suite of factors might relate to collision victims of high-rises. Are migrants more commonly the victims of high-rises or of smaller buildings?

(10) Orientation of façade.—Some studies tested façade orientation, but not convincingly. Confounding factors such as the extent and types of windows would require large sample sizes of collision victims to parse out the variation so that some portion of it could be attributed to orientation of façade. Whether certain orientations cause disproportionately stronger or more realistic-appearing reflections ought to be testable through measurement, but counting dead birds under façades of different orientations would help.

(11) Structural layout.—Bird-safe building guidelines have illustrated examples of structural layouts associated with high rates of bird-window collisions, but little attention has been directed towards hazardous structural layouts in the scientific literature. An exception was Johnson and Hudson (1976), who found high collision rates at 3 stories of glassed-in walkways atop an open breezeway, located on a break in slope with trees on one side of the structure and open sky on the other, Washington State University.

(12) Context in urban-rural gradient.—Numbers of fatalities found in monitoring have associated negatively with increasing developed area surrounding the building (Hager et al. 2013), and positively with more rural settings (Kummer et al. 2016a).

(13) Height, structure and extent of vegetation near building.—Correlations have sometimes been found between collision rates and the presence or extent of vegetation near windows (Hager et al. 2008, Borden et al. 2010, Kummer et al. 2016a, Ocampo-Peñuela et al. 2016). However, Porter and Huang (2015) found a negative relationship between fatalities found and vegetation cover near the building. In my experience, what probably matters most is the distance from the building that vegetation occurs. If the vegetation that is used by birds is very close to a glass façade, then birds coming from that glass will be less likely to attain sufficient speed upon arrival at the façade to result in a fatal injury. Too far away and there is probably no relationship. But 30 to 50 m away, birds alighting from vegetation can attain lethal speeds by the time they arrive at the windows.

(14) Presence of birdfeeders.—Dunn (1993) reported a weak correlation ($r = 0.13$, $P < 0.001$) between number of birds killed by home windows and the number of birds counted at feeders. However, Kummer and Bayne (2015) found that experimental installment of birdfeeders at homes increased bird collisions with windows 1.84-fold.

(15) Relative abundance.—Collision rates have often been assumed to increase with local density or relative abundance (Klem 1989), and positive correlations have been

measured (Dunn 1993, Hager et al. 2008). However, Hager and Craig (2014) found a negative correlation between fatality rates and relative abundance near buildings.

(16) Season of the year.—Borden et al. (2010) found 90% of collision fatalities during spring and fall migration periods. The significance of this finding is magnified by 7-day carcass persistence rates of 0.45 and 0.35 in spring and fall, rates which were considerably lower than during winter and summer (Hager et al. 2012). In other words, the concentration of fatalities during migration seasons would increase after applying seasonally-explicit adjustments for carcass persistence. Fatalities caused by collisions into the glass façades of the project's building would likely be concentrated in fall and spring migration periods.

(17) Ecology, demography and behavior.—Klem (1989) noted that certain types of birds were not found as common window-caused fatalities, including soaring hawks and waterbirds. Cusa et al. (2015) found that species colliding with buildings surrounded by higher levels of urban greenery were foliage gleaners, and species colliding with buildings surrounded by higher levels of urbanization were ground foragers. Sabo et al. (2016) found no difference in age class, but did find that migrants are more susceptible to collision than resident birds.

(18) Predatory attacks.—Panic flights caused by raptors were mentioned in 16% of window strike reports in Dunn's (1993) study. I have witnessed Cooper's hawks chasing birds into windows, including house finches next door to my home and a northern mocking bird chased directly into my office window. Predatory birds likely to collide with the project's windows would include Peregrine falcon, red-shouldered hawk, Cooper's hawk, and sharp-shinned hawk.

(19) Aggressive social interactions.—I found no hypothesis-testing of the roles of aggressive social interactions in the literature other than the occasional anecdotal account of birds attacking their self-images reflected from windows. However, I have witnessed birds chasing each other and sometimes these chases resulting in one of the birds hitting a window.

Window Collision Solutions

Given the magnitude of bird-window collision impacts, there are obviously great opportunities for reducing and minimizing these impacts going forward. Existing structures can be modified or retrofitted to reduce impacts, and proposed new structures can be more carefully sited, designed, and managed to minimize impacts. However, the costs of some of these measures can be high and can vary greatly, but most importantly the efficacies of many of these measures remain uncertain. Both the costs and effectiveness of all of these measures can be better understood through experimentation and careful scientific investigation. **Post-construction fatality monitoring should be an essential feature of any new building project**. Below is a listing of mitigation options, along with some notes and findings from the literature.

Any new project should be informed by preconstruction surveys of daytime and nocturnal flight activity. Such surveys can reveal the one or more façades facing the prevailing approach direction of birds, and these revelations can help prioritize where certain types of mitigation can be targeted. It is critical to formulate effective measures prior to construction, because post-construction options will be limited, likely more expensive, and probably less effective.

(1) Retrofitting to reduce impacts

(1A) Marking windows
(1B) Managing outdoor landscape vegetation
(1C) Managing indoor landscape vegetation
(1D) Managing nocturnal lighting

(1A) Marking windows.—Whereas Klem (1990) found no deterrent effect from decals on windows, Johnson and Hudson (1976) reported a fatality reduction of about 69% after placing decals on windows. In an experiment of opportunity, Ocampo-Peñuela et al. (2016) found only 2 of 86 fatalities at one of 6 buildings – the only building with windows treated with a bird deterrent film. At the building with fritted glass, bird collisions were 82% lower than at other buildings with untreated windows. Kahle et al. (2016) added external window shades to some windowed façades to reduce fatalities 82% and 95%. Many external and internal glass markers have been tested experimentally, some showing no effect and some showing strong deterrent effects (Klem 1989, 1990, 2009, 2011; Klem and Saenger 2013; Rössler et al. 2015).

Following up on the results of Johnson and Hudson (1976), I decided to mark windows of my home, where I have documented 5 bird collision fatalities between the time I moved in and 6 years later. I marked my windows with decals delivered to me via US Postal Service from a commercial vendor. I have documented no fatalities at my windows during the 8 years hence. On 8 December 2018, I photographed a ruby-crowned kinglet pulling up short of my window (Figure 2), right at one of my installed markers. In my assessment, markers can be effective in some situations.

Figure 2. *Ruby-crowned kinglet puts on the brakes in front of a decal I applied to mark windows of my home, 8 December 2018. This window killed birds prior to marking, but I have found no window collision victims since marking the windows. Windows with attractive built-in marking are commercially available.*

(2) Siting and Designing to minimize impacts

(2A) Deciding on location of structure
(2B) Deciding on façade and orientation
(2C) Selecting type and sizes of windows
(2D) Designing to minimize transparency through two parallel façades
(2E) Designing to minimize views of interior plants
(2F) Landscaping to increase distances between windows and trees and shrubs

(3) Monitoring for adaptive management to reduce impacts

(3A) Systematic monitoring for fatalities to identify seasonal and spatial patterns
(3B) Adjust light management, window marking and other measures as needed.

Guidelines on Building Design

If the project goes forward, it should at a minimum adhere to available guidelines on building design intended to minimize collision hazards to birds. The American Bird Conservancy (ABC) produced an excellent set of guidelines recommending actions to: (1) Minimize use of glass; (2) Placing glass behind some type of screening (grilles, shutters, exterior shades); (3) Using glass with inherent properties to reduce collisions, such as patterns, window films, decals or tape; and (4) Turning off lights during migration seasons (Sheppard and Phillips 2015). The City of San Francisco (San Francisco Planning Department 2011) also has a set of building design guidelines, based on the excellent guidelines produced by the New York City Audubon Society (Orff et al. 2007). The ABC document and both the New York and San Francisco documents provide excellent alerting of potential bird-collision hazards as well as many visual examples. The San Francisco Planning Department's (2011) building design guidelines are more comprehensive than those of New York City, but they could have gone further. For example, the San Francisco guidelines probably should have also covered scientific monitoring of impacts as well as compensatory mitigation for impacts that could not be avoided, minimized or reduced. Monitoring and the use of compensatory mitigation should be incorporated at any new building project because the measures recommended in the available guidelines remain of uncertain effectiveness, and even if these measures are effective, they will not reduce collision fatalities to zero. The only way to assess effectiveness and to quantify post-construction fatalities is to monitor the project for fatalities.

CUMULATIVE IMPACTS

City of Los Angeles (2016) denies that wildlife habitat occurs in the City. The IS/MND therefore provides no analysis of cumulative impacts on birds caused by window collisions in the City, nor any analysis of the proposed project's contribution to cumulative impacts of window collisions. This missing analysis is a critical shortfall, because bird abundance across North American has declined 29% over the last 48 years (Rosenberg et al. 2019). The proposed project alone is predicted to kill 1,848 bird deaths per year (95% CI: 960-2,640), which would add to many thousands more killed by windows in Los Angeles. City of Los Angeles needs to provide an estimate of the extent of windows already constructed, as well as an estimate of projected future extent

of windows in the City. From such estimates, the City's cumulative toll on birds colliding with windows can be estimated.

Given the predicted avian death toll resulting from the project, and the obvious need for a cumulative effects analysis, a fair argument can be made for the need to prepare an EIR to assess project impacts and formulate appropriate mitigation.

MITIGATION

Bird surveys need to be performed to adequately characterize flight patterns across the project area. These surveys need to inform an EIR, which should require adherence to the available guidelines on minimizing bird-window collisions (see earlier comments). Compensatory mitigation should be formulated for those collision fatalities that cannot be avoided through implementation of guidelines. Unavoidable collision fatalities should be measured through two or more years of post-construction fatality monitoring, and the EIR should tie levels of compensatory mitigation to threshold fatality rates.

Fund Wildlife Rehabilitation Facilities

Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Most of the wildlife injuries will likely be caused by window collisions. But the project's impacts can also be offset by funding the treatment of injuries to animals caused by other buildings, electric lines, cars, and house cats.

Thank you for your attention,

_____

Cell (530) 601-6857
puma@dcn.org

Born May 3, 1963 in Sacramento, California. Married, father of two.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;
- Wildlife monitoring and field study using GPS, thermal imaging, behavior surveys;
- Using systems analysis and experimental design principles to identify meaningful ecological patterns that inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 477 professional publications, including:
- 81 peer reviewed publications
- 24 in non-reviewed proceedings
- 370 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 87 public presentations of research results at meetings
- Reviewed many professional papers and reports
- Testified in 4 court cases.

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The

five-member committee investigated causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC reviewed the science underlying the Alameda County Avian Protection Program, and advised the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Subject: Comments on the 3440 Wilshire Project (Case No. ENV-2016-3693-MND)

Dear Mr. Drury,

We have reviewed the January 2020 Initial Study/Mitigated Negative Declaration ("IS/MND") for the 3440 Wilshire Project ("Project") located in the City of Los Angeles ("City"). The Project proposes to demolish an existing 3-story parking structure with 1,191 spaces totaling 266,571-SF and maintain four existing commercial office buildings with ground floor retail space and an existing 5-story parking structure with 707 spaces. Furthermore, the Project proposes to construct up to 640 residential units totaling 701,315-SF, 10,738-SF of commercial space, including 5,538-SF of retail space, a 3,700-SF high turnover restaurant, and a 1,500-SF fast food restaurant, as well as 2 commercial kiosks totaling 1,878-SF, and 1,214 parking spaces on the 7.26-acre site.

Our review concludes that the IS/MND fails to adequately evaluate the Project's hazards, air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. A DEIR should be prepared to adequately assess and mitigate the potential hazards, air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

Hazards and Hazardous Materials

A 2014 Phase I Environmental Site Assessment (ESA) performed for the Project site (Appendix H) identified an 8,000-gallon oil storage underground storage tank (UST) and a three USTs associated with a former gas station on the site. The 8,000-gallon UST was reportedly removed in 1988, according to the Phase I.

No record of removal of the three gas station USTs was cited in the Phase I – the Phase I only vaguely states (p. 1):

> "An Application for Permit; Abandonment by Removal Fire Department-City of Los Angeles, was also reviewed as part of our previous assessment, which discussed the removal of one waste oil UST and two gasoline USTs, dated June 8, 1988."

Only the application for removal is cited in the Phase I – no documentation of the actual removal of the USTs is cited in the Phase I. In fact, the Phase I can only state with respect to the gas station USTs (p. 1):

> "It is suspected that these USTs were related to the gas & oil station noted on the 1961 Sanborn Map."

> "It should also be noted that based on our regulatory review, the Subject [Project site] was identified as a registered storage tank site featuring a "inactive" regulatory status for two previous onsite "regulated unleaded" USTs. These gasoline USTs are suspected to be associated with the removal of the aforementioned gasoline USTs noted in the permit."

The Phase I failed to confirm the presence of the of the USTs at the Project site. A Phase II ESA is necessary for inclusion in a DEIR to include the results of a geophysical survey, a report commonly used to identify large underground objects such as a UST, to confirm the presence or absence of USTs at the Project site. A Phase II is also necessary to include the results of soil and soil vapor sampling from the locations where the presence (or the former presence) of the USTs is likely, based on the geophysical survey.

Air Quality

Unsubstantiated Reductions to Number of Daily Trips

Review of the Traffic Study, provided as Appendix K-1 to the IS/MND, reveals that the analysis includes an unsubstantiated reduction to the Project's estimated trip generation. Specifically, the Traffic Study includes a 25% "Transit Credit" reduction for both the retail and multifamily housing trip generation (see excerpt below) (Appendix K-1, pp. 24, Table 4).

TABLE 4
3440 WILSHIRE PROJECT
TRIP GENERATION - ITE 10TH EDITION

Land Use	ITE Land Use Code	Size	Trip Generation Rates [a] Daily	AM Peak Hour Rate	AM Peak Hour In%	AM Peak Hour Out%	PM Peak Hour Rate	PM Peak Hour In%	PM Peak Hour Out%	Daily
PROPOSED PROJECT										
Retail	820	18.454 ksf	37.75	0.94	62%	38%	3.81	48%	52%	697
Less: Internal Capture [b]			*15%*		*15%*	*15%*		*15%*	*15%*	*(105)*
Less: Transit Credit [c]			*25%*	*25%*			*25%*			*(148)*
Total Driveway Trips										444
Less: Pass-by [d]			*50%*	*50%*			*50%*			*(222)*
Net External Vehicle Trips										222
Multifamily Houseing (High-Rise) [e]	222	641 DU	4.45	0.23	12%	88%	0.3	70%	30%	2,852
Internal Capture [b]			*15%*		*15%*	*15%*		*15%*	*15%*	*(428)*
Less: Transit Credit [f]			*25%*							*(606)*
Net External Vehicle Trips										1,818
TOTAL DRIVEWAY TRIPS										2,262
NET INCREMENTAL EXTERNAL TRIPS										2,040

According to the Traffic Study, this reduction is based on the Los Angeles Department of Transportation's ("LADOT") *Traffic Study Policies and Procedures* (Appendix K-1, pp. 24). However, this is incorrect. The LADOT's *Traffic Study Policies and Procedures* document is from 2016 and has since been replaced and updated by the LADOT's 2019 *Transportation Assessment Guidelines (*"TAG"*)*.[1] According to this more recent document, "LADOT, **at its discretion, may allow up to** a 25% transit/walk trip generation reduction" applied "**on a case by case basis**" (emphasis added) (p. 39). However, review of the Traffic Study demonstrates that no verification of this 25% reduction was provided by LADOT and, as a result, we are unable to certify that it is correct. Thus, the number of daily trips calculated for the Project may be underestimated and should not be utilized in the model or relied upon to determine Project significance.

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The IS/MND's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2.[2] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act (CEQA) requires that such changes be justified by substantial evidence.[3] Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters were utilized in calculating the Project's air pollutant

[1] "Los Angeles Department of Transportation (LADOT) Transportation Assessment Guidelines." July 2019, LADOT, available at: https://ladot.lacity.org/sites/default/files/documents/ta_guidelines_-20190731_0.pdf.
[2] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.
[3] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 1, 9.

emissions and make known which default values were changed as well as provide justification for the values selected.[4]

Review of the Project's air modeling demonstrates that the IS/MND underestimates emissions associated with Project activities. As previously stated, the IS/MND's air quality analysis relies on air pollutant emissions calculated using CalEEMod. When reviewing the Project's CalEEMod output files, provided as Appendix C to the IS/MND, we found that several of the values inputted into the model were not consistent with information disclosed in the IS/MND. As a result, the Project's construction and operational emissions are underestimated. An EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Use of an Incorrect Construction Schedule

According to the IS/MND, the proposed Project's building construction period for Tower 1 would last approximately 19 months, beginning in June 2022 and ending in January 2024, and the building construction period for Tower 2 would last approximately 19 months, beginning in June 2024 and ending in January 2026 (see excerpt below) (p. A-15, Table A-8).

Table A-8
Construction Schedule

Phase	Tower 1		Tower 2	
	Scheduled	Length	Scheduled	Length
Demolition	Jan 2022 – March 2022	2 months	Under Tower 1	
Site Prep	Within demolition		Under Tower 1	
Grading	March 2022 – June 2022	3 months	Under Tower 1	
Construction	June 2022 – January 2024	19 months	June 2024 – January 2026	19 months
Architectural Coatings	August 2023 – January 2024	5 months	August 2025 – January 2026	5 months
Construction schedule, including start, end, and duration dates are estimates only. Client provided information, September 2018.				

As you can see in the excerpt above, the IS/MND proposes two 19-month construction periods for the two towers, along with 2 months of site prep and demolition and 3 months of grading, for a total of 43-months of active construction. However, review of the IS/MND's CalEEMod output files demonstrates that the model included a construction schedule that lasted over 43-months and failed to include the 5-month break between the construction of Tower 1 and construction of Tower 2 (see excerpt below) (Appendix C, pp. 6-7, 37, 71-72).

[4] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, fn 1, p. 11, 12 – 13. A key feature of the CalEEMod program is the "remarks" feature, where the user explains why a default setting was replaced by a "user defined" value. These remarks are included in the report.

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days	Phase Description
1	Demolition	Demolition	1/3/2022	1/31/2022	5	21	
2	Site Preparation	Site Preparation	2/1/2022	2/28/2022	5	20	
3	Grading	Grading	3/1/2022	5/31/2022	5	66	
4	Building Construction	Building Construction	6/1/2022	1/2/2026	5	938	
5	Architectural Coating	Architectural Coating	3/1/2025	1/2/2026	5	220	

As you can see in the excerpt above, the Project's construction schedule is inconsistent with the information provided in the IS/MND, as the length of active construction exceeds 43-months. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[5] According to the "User Entered Comments & Non-Default Data" table, the justification provided is: "Consultant assumptions" (Appendix C, pp. 1, 31, 66). However, the construction schedule used in the model is inconsistent with the information provided in the IS/MND, as discussed above. As we cannot verify "consultant assumptions," we are unable to verify this longer construction schedule.

By spreading out construction emissions over a 48-month period, rather than the 43-month period indicated by the IS/MND, maximum daily emissions associated with construction are artificially reduced. Thus, the construction schedule included in the model is incorrect, and as a result, the model may underestimate the Project's construction-related emissions.

Underestimated Number of Hauling Truck Trips

Review of the Project's CalEEMod output files demonstrates that several of the hauling, vendor, and worker trips were manually altered (see excerpt below) (Appendix C, pp. 3, 33, 68).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripLength	20.00	30.00
tblTripsAndVMT	HaulingTripLength	20.00	30.00
tblTripsAndVMT	HaulingTripNumber	17,125.00	13,700.00
tblTripsAndVMT	VendorTripNumber	0.00	4.00
tblTripsAndVMT	VendorTripNumber	0.00	4.00
tblTripsAndVMT	VendorTripNumber	0.00	4.00
tblTripsAndVMT	VendorTripNumber	196.00	20.00
tblTripsAndVMT	VendorTripNumber	0.00	40.00
tblTripsAndVMT	WorkerTripNumber	30.00	15.00
tblTripsAndVMT	WorkerTripNumber	28.00	20.00
tblTripsAndVMT	WorkerTripNumber	788.00	200.00
tblTripsAndVMT	WorkerTripNumber	158.00	5.00

As you can see in the excerpt above, numerous hauling, vendor, and worker trip values were manually altered. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[6] According to the "User Entered Comments & Non-Default Data" table, the justification provided for this change is: "Developer information" (Appendix C, pp. 2, 32, 67). However, the Project

[5] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[6] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

documents fail to address these changes. Furthermore, while the Traffic Study includes estimates of *peak daily* trips for each construction phase, this fails to substantiate the changes to the *total* numbers of hauling, vendor, and worker trips for each phase (Appendix K-1, p. 45, Table 13).

Furthermore, the Traffic Study estimates a maximum daily number of hauling truck trips of 1 for Construction (see excerpt below) (Appendix K-1, p. 45, Table 13).

Peak Daily Activity Under Each Phase

	Demolition & Site Preparation	Grading	Construction	Architectural Coating
Construction Workers	*15*	*20*	*200*	*5*
Passenger Car Equivalent (PCE) factor	1.0	1.0	1.0	1.0
Haul Trucks	*30*	*55*	*1*	*0*
Passenger Car Equivalent (PCE) factor	2.5	2.5	2.5	2.5
Delivery/Equipment Trucks	*4*	*4*	*20*	*40*
Passenger Car Equivalent (PCE) factor	2.0	2.0	2.0	2.0

Thus, the model should have included *at least* 1 hauling trip for construction. However, review of the Project's CalEEMod output files demonstrates that 0 hauling truck trips were included for construction (see excerpt below) (Appendix C, pp. 8, 39, 73).

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length	Worker Vehicle Class	Vendor Vehicle Class	Hauling Vehicle Class
Demolition	12	15.00	4.00	1,978.00	14.70	6.90	30.00	LD_Mix	HDT_Mix	HHDT
Site Preparation	6	15.00	4.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Grading	11	20.00	4.00	13,700.00	14.70	6.90	30.00	LD_Mix	HDT_Mix	HHDT
Building Construction	16	200.00	20.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Architectural Coating	2	5.00	40.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT

As you can see in the excerpt above, the model failed to include any hauling trips for construction. Thus, the model is inconsistent with the IS/MND. This inconsistency, as well as the unsubstantiated changes described above, presents an issue; the number of worker, hauling, and vendor trips and associated vehicle miles traveled ("VMT") are used by CalEEMod to determine the exhaust emissions associated with on-road vehicle use and fugitive dust emissions.[7] Thus, by failing to include the correct number of hauling, vendor, and worker trips, the model underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

[7] CAPCOA (Oct 2017) CalEEMod User's Guide: Appendix A, p. 13, http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6.

Unsubstantiated Changes to Acres of Grading

Review of the Project's CalEEMod output files demonstrates that the amount of grading included in the model was manually reduced from 33 to 2.33 acres, and the amount of grading included in the model was manually reduced from 30 to 0 acres (see excerpt below) (Appendix C, pp. 2, 32, 67).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	33.00	2.33
tblGrading	AcresOfGrading	30.00	0.00

As you can see in the excerpt above, the number of acres of grading for the site preparation and grading construction phases were reduced in the model. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[8] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "Developer information" (Appendix C, pp. 2, 32, 67). However, the IS/MND and associated appendices fail to mention or justify these changes, and as a result, we cannot verify the altered values. This presents an issue, as the CalEEMod User's Guide states that grading is used by the model to calculate fugitive dust emissions associated with dozers, graders, scrapers, and haul trucks. [9] Thus, by potentially underestimating the acres of grading required by the Project, the model underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Application of Construction Mitigation Measures

Review of the Project's CalEEMod output files demonstrates that the following construction-related mitigation measures were included in the model: "Replace Ground Cover," "Water Exposed Area," and "Clean Paved Roads" (see excerpt below) (Appendix C, pp. 8-9, 39, 73-74).

3.1 Mitigation Measures Construction

Replace Ground Cover
Water Exposed Area
Clean Paved Roads

Furthermore, the model included a 46% reduction of particulate matter emissions as a result of cleaning paved roads (see excerpt below) (Appendix C, pp. 2, 32, 67).

Table Name	Column Name	Default Value	New Value
tblConstDustMitigation	CleanPavedRoadPercentReduction	0	46

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[10] According to the "User Entered Comments & Non-Default Data" table, these measures are

[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[9] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 31, 33.
[10] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

justified by stating: "Assumes SCAQMD Rule 403 control efficiencies" (Appendix C, pp. 2, 32, 67). Furthermore, according to the IS/MND,

> "[I]t is mandatory for all construction projects in the Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Rule 403 control requirements include measures to prevent the generation of visible dust plumes. Measures include, but are not limited to, applying water and/or soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system or other control measures to remove bulk material from tires and vehicle undercarriages before vehicles exit the Project Site, and maintaining effective cover over exposed areas. Compliance with Rule 403 would reduce regional PM2.5 and PM10 emissions associated with construction activities by approximately 61 percent" (emphasis added) (p. B-41).

As you can see in the excerpt above, the Project has the option to either apply water **and/or** soil binders but has not actually committed to either one. Furthermore, this explanation fails to justify the inclusion of the "Clean Paved Roads" mitigation measure or address the 46% reduction included in the model. Finally, the IS/MND states that compliance with Rule 403 would reduce particulate matter emissions by 61%, but also fails to explain or justify this calculation. As a result, we are unable to verify the inclusion of these mitigation measures and reductions in the model. Thus, emissions may be underestimated and the model should not be relied upon to determine Project significance.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The IS/MND concludes that the Project's construction and operational health risk impacts would be less than significant as a result of LST analysis, without conducting a quantified construction or operational health risk assessment ("HRA") (p. B-46). In an attempt to justify the omission of a construction HRA, the IS/MND states:

> "Because there is such a short-term exposure period, construction TAC emissions would result in a less-than significant impact. **Therefore, construction of the Project would not expose sensitive receptors to substantial diesel PM concentrations, and this impact would be less than significant**" (p. B-46).

Furthermore, regarding the omission of an operational HRA, the IS/MND states:

> "[T]he SCAQMD recommends that health risk assessments be conducted for substantial sources of diesel particulate emissions (e.g., truck stops and warehouse distribution facilities) and has provided guidance for analyzing mobile source diesel emissions.[48] The Project would not generate a substantial number of truck trips since it would not be a truck stop or distribution center. Based on the limited activity of TAC sources, the Project would not warrant the need for a health risk assessment associated with on-site activities. **Therefore, Project impacts would be less than significant**" (p. B-48).

However, this justification and subsequent less than significant impact finding is incorrect for several reasons.

First, while the LST method assesses the impact of pollutants at a local level, it only evaluates impacts from criteria air pollutants. According to the Final Localized Significance Threshold Methodology document prepared by the SCAQMD, the LST analysis is only applicable to NO_x, CO, PM_{10}, and $PM_{2.5}$ emissions, which are collectively referred to as criteria air pollutants.[11] Because the LST method can only be applied to criteria air pollutants, this method cannot be used to determine whether emissions from diesel particulate matter ("DPM"), a known human carcinogen, will result in a significant health risk impact to nearby sensitive receptors. As a result, health risk impacts from exposure to toxic air contaminants ("TACs"), such as DPM, were not analyzed for the proposed Project, thus leaving a gap within the IS/MND's analysis.

Second, the IS/MND's claim that "the SCAQMD recommends that health risk assessments be conducted for substantial sources of diesel particulate emissions (e.g., truck stops and warehouse distribution facilities) and has provided guidance for analyzing mobile source diesel emissions.[48]" is incorrect and unsubstantiated (p. B-48). Specifically, the reference cited as a source for this justification, footnote 48, SCAQMD's *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Emissions,* fails to substantiate this argument. According to the SCAQMD website discussing Mobile Source Toxics Analysis and this document in particular, "[i]t is suggested that projects with diesel powered mobile sources use the following guidance document to quantify potential cancer risks from the diesel particulate emissions."[12] Review of the IS/MND and CalEEMod model reveals that the proposed Project will, in fact, include mobile emissions during both construction and operation (see excerpts below) (Appendix C, pp. 8, 26).

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length	Worker Vehicle Class	Vendor Vehicle Class	Hauling Vehicle Class
Demolition	12	15.00	4.00	1,978.00	14.70	6.90	30.00	LD_Mix	HDT_Mix	HHDT
Site Preparation	6	15.00	4.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Grading	11	20.00	4.00	13,700.00	14.70	6.90	30.00	LD_Mix	HDT_Mix	HHDT
Building Construction	16	200.00	20.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Architectural Coating	2	5.00	40.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT

	Average Daily Trip Rate			Unmitigated	Mitigated
Land Use	Weekday	Saturday	Sunday	Annual VMT	Annual VMT
Apartments High Rise	1,817.60	1,817.60	1817.60	6,991,856	6,991,856
Enclosed Parking with Elevator	0.00	0.00	0.00		
Strip Mall	66.48	66.48	66.48	229,312	229,312
Fast Food Restaurant w/o Drive Thru	201.08	201.08	201.08	602,965	602,965
High Turnover (Sit Down Restaurant)	264.22	264.22	264.22	847,516	847,516
Total	2,349.38	2,349.38	2,349.38	8,671,650	8,671,650

As you can see in the excerpts above, the proposed Project is anticipated to produce mobile source emissions as a result of worker, vendor, and hauling trips during Project construction, as well as roughly 2,349 daily trips throughout Project operation, according to the model. Thus, the IS/MND's claim that "[t]he Project would not generate a substantial number of truck trips since it would not be a truck stop

[11] "Final Localized Significance Threshold Methodology." SCAQMD, Revised July 2008, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf.

[12] "Mobile Source Toxics Analysis." SCAQMD, *available at:* http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis.

or distribution center" is incorrect. As a result, per the SCAQMD's *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Emissions*, as cited by the IS/MND, the proposed Project should have conducted a quantified HRA.

Third, the omission of a quantified HRA is inconsistent with the most recent guidance published by the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California. In February 2015, OEHHA released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments*.[13] This document describes the types of projects that warrant the preparation of an HRA. Construction of the Project will produce emissions of DPM through the exhaust stacks of construction equipment over a construction period of approximately 43-months, as stated by the IS/MND (p. A-15, Table A-8). The OEHHA document recommends that all short-term projects lasting at least two months be evaluated for cancer risks to nearby sensitive receptors.[14] Therefore, per OEHHA guidelines, we recommend that health risk impacts from Project construction be evaluated by a revised CEQA evaluation. Furthermore, once construction of the Project is complete, the Project will operate for many years. As previously stated, the Traffic Study indicates that operation of the Project would generate a net increase of approximately 2,262 daily vehicle trips, which will generate additional exhaust emissions and continue to expose nearby sensitive receptors to DPM emissions (Appendix K-1, 19, Table 4). The OEHHA document recommends that exposure from projects lasting more than 6 months be evaluated for the duration of the project, and recommends that an exposure duration of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident ("MEIR").[15] Even though we were not provided with the expected lifetime of the Project, we can reasonably assume that the Project will operate for at least 30 years, if not more. Therefore, we recommend that health risk impacts from Project operation also be evaluated in a revised CEQA evaluation, as a 30-year exposure duration vastly exceeds the 2-month and 6-month requirements set forth by OEHHA. These recommendations reflect the most recent health risk policy, and as such, we recommend that an updated assessment of health risks to nearby sensitive receptors from Project construction and operation be included in a revised CEQA evaluation for the Project.

Fourth, by claiming a less than significant impact without conducting a quantified HRA for Project construction and operation, the IS/MND fails to compare the excess health risk to the SCAQMD's specific numeric threshold of 10 in one million.[16] Thus, the IS/MND cannot conclude less than significant health risk impacts resulting from Project construction and operation without quantifying emissions to compare to the proper threshold.

[16] "South Coast AQMD Air Quality Significance Thresholds." SCAQMD, April 2019, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2

Screening-Level Assessment Indicates Significant Impact

In an effort to demonstrate the potential risk posed by Project construction and operation to nearby sensitive receptors, we prepared a simple screening-level HRA. The results of our assessment, as described below, provide substantial evidence that the Project's construction and operational DPM emissions may result in a potentially significant health risk impact not previously identified by the IS/MND.

In order to conduct our screening level risk assessment, we relied upon AERSCREEN, which is a screening level air quality dispersion model. [17] The model replaced SCREEN3, and AERSCREEN is included in the OEHHA[18] and the California Air Pollution Control Officers Associated (CAPCOA)[19] guidance as the appropriate air dispersion model for Level 2 health risk screening assessments ("HRSAs"). A Level 2 HRSA utilizes a limited amount of site-specific information to generate maximum reasonable downwind concentrations of air contaminants to which nearby sensitive receptors may be exposed. If an unacceptable air quality hazard is determined to be possible using AERSCREEN, a more refined modeling approach is required prior to approval of the Project.

We prepared a preliminary HRA of the Project's construction and operational health-related impact to residential sensitive receptors using the annual PM_{10} exhaust estimates from SWAPE's updated CalEEMod. According to the IS/MND, the closest sensitive receptor is located approximately 60 feet, or 18 meters, east of the Project site (p. B-29). Consistent with recommendations set forth by OEHHA, we assumed exposure begins during the third trimester stage of life. The Project's construction CalEEMod output files indicate that construction activities will generate approximately 342 pounds of DPM over the 1,459-day construction period. The AERSCREEN model relies on a continuous average emission rate to simulate maximum downward concentrations from point, area, and volume emission sources. To account for the variability in equipment usage and truck trips over Project construction, we calculated an average DPM emission rate by the following equation:

$$Emission\ Rate\ \left(\frac{grams}{second}\right) = \frac{342.2\ lbs}{1{,}459\ days} \times \frac{453.6\ grams}{lbs} \times \frac{1\ day}{24\ hours} \times \frac{1\ hour}{3{,}600\ seconds} = \mathbf{0.001231}\boldsymbol{g/s}$$

Using this equation, we estimated a construction emission rate of 0.001231 grams per second ("g/s"). Subtracting the 1,459-day construction period from the total residential duration of 30 years, we assumed that after Project construction, the sensitive receptor would be exposed to the Project's operational DPM for an additional 26 years, approximately. The Project's operational CalEEMod emissions, calculated by subtracting the existing emissions from the proposed Project, indicate that operational activities will generate approximately 193 pounds of DPM per year throughout operation.

[17] "AERSCREEN Released as the EPA Recommended Screening Model," USEPA, April 11, 2011, *available at:* http://www.epa.gov/ttn/scram/guidance/clarification/20110411_AERSCREEN_Release_Memo.pdf
[18] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf
[19] "Health Risk Assessments for Proposed Land Use Projects," CAPCOA, July 2009, *available at:* http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA_HRA_LU_Guidelines_8-6-09.pdf

Applying the same equation used to estimate the construction DPM rate, we estimated the following emission rate for Project operation:

$$Emission\ Rate\ \left(\frac{grams}{second}\right) = \frac{192.8\ lbs}{365\ days} \times \frac{453.6\ grams}{lbs} \times \frac{1\ day}{24\ hours} \times \frac{1\ hour}{3{,}600\ seconds} = \mathbf{0.002773\ g/s}$$

Using this equation, we estimated an operational emission rate of 0.002773 g/s. Construction and operational activity was simulated as a 7.26-acre rectangular area source in AERSCREEN with dimensions of 182.5 by 161 meters. A release height of three meters was selected to represent the height of exhaust stacks on operational equipment and other heavy-duty vehicles, and an initial vertical dimension of one and a half meters was used to simulate instantaneous plume dispersion upon release. An urban meteorological setting was selected with model-default inputs for wind speed and direction distribution.

The AERSCREEN model generates maximum reasonable estimates of single-hour DPM concentrations from the Project site. EPA guidance suggests that in screening procedures, the annualized average concentration of an air pollutant be estimated by multiplying the single-hour concentration by 10%.[20] As previously stated, there are residential receptors located approximately 18 meters from the Project boundary. However, review of the AERSCREEN output files demonstrates that the *maximally* exposed receptor is located 100 meters from the Project site. The single-hour concentration estimated by AERSCREEN for Project construction is approximately 1.302 µg/m^3 DPM at approximately 100 meters downwind. Multiplying this single-hour concentration by 10%, we get an annualized average concentration of 0.1302 µg/m^3 for Project construction at the MEIR. For Project operation, the single-hour concentration estimated by AERSCREEN is 2.933 µg/m^3 DPM at approximately 100 meters downwind. Multiplying this single-hour concentration by 10%, we get an annualized average concentration of 0.2933 µg/m^3 for Project operation at the MEIR.

We calculated the excess cancer risk to the MEIR using applicable HRA methodologies prescribed by OEHHA. Consistent with the construction schedule included in the IS/MND, the annualized average concentration for construction was used for the entire third trimester of pregnancy (0.25 years), the entire infantile stage of life (0 – 2 years), and the first 1.75 years of the child stages of life (2 – 16 years). The annualized average concentration for operation was used for the remainder of the 30-year exposure period, which makes up the remainder of the child stages of life (2 – 16 years) and entire adult stage of life (16 – 30 years).

Consistent with OEHHA[21], SCAQMD, BAAQMD, and SJVAPCD guidance, we used Age Sensitivity Factors ("ASF") to account for the heightened susceptibility of young children to the carcinogenic toxicity of air

[20] "Screening Procedures for Estimating the Air Quality Impact of Stationary Sources Revised." EPA, 1992, *available at*: http://www.epa.gov/ttn/scram/guidance/guide/EPA-454R-92-019_OCR.pdf; *see also* "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 4-36.

[21] "The Office of Environmental Health Hazards Assessment issued updated guidance for the preparation of health risk assessments in March 2015 (OEHHA 2015)" (p. 5.2-29).

pollution.[22, 23, 24, 25] According to this guidance, the quantified cancer risk should be multiplied by a factor of ten during the third trimester of pregnancy and during the first two years of life (infant) as well as multiplied by a factor of three during the child stage of life (2 to 16 years). We also included the quantified cancer risk without adjusting for the heightened susceptibility of young children to the carcinogenic toxicity of air pollution in accordance with older OEHHA guidance from 2003. This guidance utilizes a less health protective scenario than what is currently recommended by SCAQMD, the air quality district responsible for the City, and several other air districts in the state. Furthermore, in accordance with guidance set forth by OEHHA, we used the 95th percentile breathing rates for infants.[26] Finally, according to SCAQMD guidance, we used a Fraction of Time At Home ("FAH") Value of 1 for the 3rd trimester and infant receptors.[27] We used a cancer potency factor of 1.1 (mg/kg-day)$^{-1}$ and an averaging time of 25,550 days. The results of our calculations are shown below.

The Maximally Exposed Individual at an Existing Residential Receptor						
Activity	**Duration (years)**	**Concentration (ug/m3)**	**Breathing Rate (L/kg-day)**	**Cancer Risk without ASFs***	**ASF**	**Cancer Risk with ASFs***

* We, along with CARB and SCAQMD, recommend using the more updated and health protective 2015 OEHHA guidance, which includes ASFs.

As demonstrated in the table above, the excess cancer risk to adults, children, infants, and during the 3rd trimester of pregnancy at the MEIR located approximately 100 meters away, over the course of Project construction and operation, utilizing age sensitivity factors, are approximately 12, 99, 43, and 1.8 in one million, respectively. The excess cancer risk over the course of a residential lifetime (30 years), utilizing age sensitivity factors, is approximately 160 in one million. The infant, child, adult, and lifetime cancer risks all exceed the SCAQMD threshold of 10 in one million, thus resulting in a potentially significant impact not previously addressed or identified by the IS/MND. Utilizing age sensitivity factors is the most conservative, health-protective analysis according to the most recent guidance by OEHHA and recommendations from the air district. Results without age sensitivity factors are presented in the table above, although we **do not** recommend utilizing these values for health risk analysis. Regardless, the excess cancer risk posed to adults, children, infants, and during the third trimester of pregnancy at the MEIR, located approximately 100 meters away, over the course of Project construction and operation, without age sensitivity factors, are approximately 12, 33, 4.3, and 0.18 in one million, respectively. The excess cancer risk over the course of a residential lifetime (30 years) at the MEIR, without age sensitivity factors, is approximately 49 in one million. The child, adult, and lifetime cancer risks, without age sensitivity factors, exceed the SCAQMD threshold of 10 in one million, thus resulting in a potentially significant impact not previously addressed or identified. While we recommend the use of age sensitivity factors, health risk impacts exceed the SCAQMD threshold regardless.

An agency must include an analysis of health risks that connects the Project's air emissions with the health risk posed by those emissions. Our analysis represents a screening-level HRA, which is known to be conservative and tends to err on the side of health protection. [28] The purpose of the screening-level construction and operational HRA shown above is to demonstrate the link between the proposed Project's emissions and the potential health risk. Our screening-level HRA demonstrates that construction and operation of the Project could result in a potentially significant health risk impact, when correct exposure assumptions and up-to-date, applicable guidance are used. Therefore, since our screening-level HRA indicates a potentially significant impact, the City should prepare a CEQA analysis with a revised HRA which makes a reasonable effort to connect the Project's air quality emissions and

[28] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 1-5

the potential health risks posed to nearby receptors. Thus, the City should prepare an updated, quantified air pollution model as well as an updated, quantified refined health risk assessment which adequately and accurately evaluates health risk impacts associated with both Project construction and operation.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The IS/MND concludes that the Project's construction and operation would result in annual greenhouse gas ("GHG") emissions of 8,698 metric tons of CO_2 equivalent per year (MT CO_2e/yr) (p. B-112, B-113, Table B.8-4). In addition, the IS/MND relies upon the Project's consistency with CARB's Climate Change Scoping Plan, SCAG's 2016–2040 RTP/SCS, the City's LA Green Plan, and the City's Sustainable City pLAn in order to determine the significance of the Project's GHG impact (p. B-111). Specifically, the IS/MND states:

> "[G]iven the Project's consistency with State, SCAG, and City GHG emission reduction goals and objectives, the Project is consistent with applicable plans, policies, and regulations adopted for the purpose of reducing the emissions of GHGs. *In the absence of adopted standards and established significance thresholds*, and given this consistency, it is concluded that the Project's incremental contribution to greenhouse gas emissions and their effects on climate change would not be cumulatively considerable" (emphasis added) (p. B-139).

As you can see in the excerpt above, the IS/MND claims that there are no SCAQMD-established significance thresholds, and as a result, relies upon the Project's consistency with applicable plans, policies, and regulations. However, these justifications and the subsequent less than significant impact conclusion are incorrect for several reasons.

1) CARB's Scoping Plan, 2016–2040 RTP/SCS, LA Green Plan, and Sustainable City pLAn cannot be relied upon to determine Project significance;
2) Incorrect reliance on the LA Green Plan;
3) Incorrect reliance on the Sustainable City pLAn;
4) Failure to demonstrate consistency with the Climate Change Scoping Plan, 2016–2040 RTP/SCS, LA Green Plan, and Sustainable City pLAn;
5) Failure to apply the relevant SCAQMD threshold;
6) Incorrect and unsubstantiated air model demonstrates a potentially significant GHG impact; and
7) SWAPE's updated analysis demonstrates a potentially significant GHG impact.

(1) The Climate Change Scoping Plan, 2016–2040 RTP/SCS, LA Green Plan, and Sustainable City pLAn are not Qualified CAPs

As discussed above, the IS/MND relies upon the Project's consistency with CARB's Climate Change Scoping Plan, SCAG's 2016–2040 RTP/SCS, the City's LA Green Plan, and the Sustainable City pLAn to determine Project GHG significance. However, these plans do not qualify as adequate GHG reduction plans or Climate Action Plans ("CAP"). CEQA Guidelines §§ 15064.4(b)(3) and 15183(b) allow a lead agency to consider a project's consistency with a statewide, regional, or local plan adopted to achieve

the reduction or mitigation of GHG emissions. When read together, CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) indicate that qualified GHG reduction plans or CAPs should include the following features:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);
(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

Collectively, these features connect qualitative measures to quantitative results, which become binding through proper monitoring and enforcement—all resulting in GHG reductions that demonstrate that the project's impacts are not cumulatively considerable. Here, however, the IS/MND fails to demonstrate that these plans include the above-listed requirements. As such, the IS/MND fails to demonstrate that compliance with these plans can be used to determine the Project's GHG significance. Thus, the IS/MND's GHG analysis regarding CARB's Climate Change Scoping Plan, SCAG's 2016–2040 RTP/SCS, the City's LA Green Plan, and the Sustainable City pLAn should not be relied upon to determine Project significance.

(2) Incorrect Reliance on the LA Green Plan

As discussed above, the IS/MND relies upon the Project's consistency with the City's LA Green Plan to determine the significance of the Project's GHG impact (p. B-138). However, this is incorrect, as the LA Green Plan fails to include project-level measures.

Review of the IS/MND's consistency evaluation with the LA Green Plan demonstrates that the measures discussed are predominantly city-level actions or measures (see excerpt below) (p. B-135, B-136, B-137).

Table B.8-9
Consistency with Applicable GHG Emissions Goals and Actions of the LA Green Plan

Action		Description	Consistency Analysis
Focus Area: Energy			
E6	Present a comprehensive set of green building policies to guide and support private sector development.	The City initiated an effort to establish green building requirements, paired with incentives, for medium- to large- private projects. Buildings account for a majority of electricity use. Each building site relates to a wide range of environmental issues faced by the City, so addressing each site in a comprehensive manner will provide a variety of environmental benefits.	**Consistent.** While this action primarily applies to the City, the Project would be designed and operated to meet the applicable requirements of the State Green Building Standards Code and the City's Green Building Code.
Focus Area: Water			
W1	Meet all additional demand for water resulting from growth through water conservation and recycling.	The Mayor's Office and LADWP developed the *Securing LA's Water Supply* plan, which is an aggressive, multi-faceted approach to developing a locally sustainable water supply. The plan includes a set of key short-term and long-term strategies to secure our water future, such as: Short-Term Conservation Strategies: • Enforcing prohibited uses of water (levying fines and sanctions against water abusers and increase water conservation awareness). • Expanding the list of prohibited uses of water (possible further restrictions on watering landscape and washing/rinsing vehicles without a self-closing nozzle). • Extending outreach efforts, water conservation incentives, and rebates. • Encouraging regional conservation measures (encourage all water agencies in the region to adopt water conservation ordinances which include prohibited uses and enforcement). Long-Term Conservation Strategies:	**Consistent.** While this action primarily applies to the City and LADWP, the Project would incorporate water conservation features to reduce indoor water use by at least 20 percent. Water conservation measures include: Energy Star-certified appliances in residential units and use of ultra low flow toilets and hand wash faucets in public facilities. Further detail is provided in **Section B.19, Utilities and Service Systems - Water**, of the MND.

As you can see in the above excerpt, actions E6 and W1 required by the LA Green Plan are aimed at the City and are not project-level measures. Furthermore, regarding the LA Green Plan, the IS/MND states:

> "To facilitate implementation of the LA Green Plan, **the City** has a Climate LA Plan that lays out **departmental programs to implement** the Action Plan's initiatives. **The City** also adopted the Los Angeles Green Building Code, as discussed below" (emphasis added) (p. B-109).

This excerpt further demonstrates that the LA Green Plan includes *city-wide initiatives*, not *project-level measures*. As a result, the IS/MND's reliance on the LA Green Plan to determine the Project's GHG significance is incorrect, and the less than significant impact determination should not be relied upon.

(3) Incorrect Reliance on the Sustainable City pLAn

As discussed above, the IS/MND relies upon the Project's consistency with the Sustainable City pLAn to determine the Project's GHG significance (p. B-138). However, this is incorrect for two reasons.

First, the April 2015 Sustainable City pLAn referenced in the IS/MND is outdated and superseded by the L.A. Green New Deal. According to the L.A. Green New Deal:

> "When the Mayor released the first Sustainable City pLAn in 2015 he committed to annual progress reports and a major update to the pLAn every four years…This report is the first four-year update to the 2015 pLAn. It augments, expands, and elaborates in even more detail L.A.'s vision for a sustainable future and it tackles the climate emergency with accelerated targets and new aggressive goals. This is L.A.'s Green New Deal."[29]

As you can see in the excerpt above, the Sustainable City pLAn requires a major update every 4 years and has been replaced by the LA Green New Deal. As such, the IS/MND's reliance on the Sustainable City pLAn and GHG significance determination is incorrect.

Second, both the Sustainable City pLAn and the L.A. Green New Deal fail to include project-level measures for land use development projects.[30] Regarding the Project's consistency with the Sustainable City pLAn, the IS/MND states:

> "Specific targets ***related to*** housing and development and mobility and transit include the decrease of vehicle miles traveled per capita by 5 percent by 2025, and increasing trips made by walking, biking or transit by at least 35 percent by 2025. The Project would ***generally comply with these aspirations*** as the Project is an infill development consisting of residential, hotel, and commercial uses on the Project Site, which is located near regional and local transit services" (emphasis added) (p. B-138).

As you can see, the Sustainable City pLAn contains city-level goals that *relate* to housing and development, not project-level measures. Similarly, review of the L.A. Green New Deal demonstrates that it also fails to include project-level measures. As such, the IS/MND's reliance on the Sustainable City pLAn is incorrect and the IS/MND GHG significance determination should not be relied upon.

(4) Failure to Demonstrate Consistency with CARB's Scoping Plan and SCAG's 2016–2040 RTP/SCS

As previously stated, the IS/MND claims that the proposed Project is consistent with CARB's Climate Change Scoping Plan and SCAG's 2016–2040 RTP/SCS, and as a result, the Project will result in less than significant GHG impacts. However, review of the aforementioned plans reveals that the Project is inconsistent with several goals and policies of the plans, including but not limited to those listed below:

[29] "L.A.'s Green New Deal." 2019, available at: http://plan.lamayor.org/sites/default/files/pLAn_2019_final.pdf, p. 8.

[30] "L.A.'s Green New Deal." 2019, available at: http://plan.lamayor.org/sites/default/files/pLAn_2019_final.pdf, p. 8.

CARB 2017 Scoping Plan[31]	
Measures – Construction	
Enforce idling time restrictions for construction vehicles	Here, the IS/MND states that "[i]n 2004, CARB adopted an ATCM [airborne toxic control measure] to limit heavy-duty diesel motor vehicle idling" (p. B-18). Furthermore, the IS/MND states that "Section 2485 in CCR Title 13 states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) used during construction shall be limited to five minutes at any location" (p. B-19). However, the IS/MND fails to mention any idling time restrictions for construction vehicles other than heavy-duty vehicles (over 10,000 pounds). Without evaluating the feasibility of implementing this measure across all vehicles, the proposed Project has not adequately demonstrated compliance. Furthermore, simply stating that these plans and policies have adopted idling time restriction requirements does not guarantee that the Project would enforce these restrictions. Thus, the Project fails to demonstrate that these policies would be implemented, monitored, and enforced.
Require construction vehicles to operate with the highest tier engines commercially available	Here, while the IS/MND discusses the USEPA Tier 1 through Tier 4 engine emission reductions, the IS/MND fails to specify the use of Tier 4 Final mitigation or evaluate the feasibility of obtaining these cleaner engines (p. B-16). As a result, the proposed Project fails to require construction vehicles to operate with the highest tier engines commercially available. Thus, the Project is not consistent with this measure.
Divert and recycle construction and demolition waste, and use locally-sourced building materials with a high recycled material content to the greatest extent feasible	Here, the IS/MND states that construction of the proposed Project "would generate approximately 1,560 tons of construction waste" (p. B-256). The IS/MND goes on to state that "California Assembly Bill (AB) 939, also known as the Integrated Waste Management Act, requires each city and county in the state to divert 50 percent of its solid waste from landfill disposal through source reduction, recycling, and composting" (p. B-256).

[31] California Air Resources Board ("CARB") (Jan. 2017) 2017 Scoping Plan, Appendix B-Local Action, *available at:* https://ww3.arb.ca.gov/cc/scopingplan/2030sp_appb_localaction_final.pdf, p. 8-10.

	However, the IS/MND fails to include any information regarding construction and demolition waste reduction beyond what is already required. The IS/MND also fails to indicate how the proposed Project will implement, monitor, and enforce these requirements. Furthermore, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Recycling of asphalt, concrete, metal, wood and carboard waste generated during demolition and construction" (emphasis added) (p. B-67). However, the IS/MND fails to require this measure, stating that measures *could include* recycling during demolition and construction. The IS/MND also fails to evaluate the feasibility of this measure, or discuss the Project's implementation, monitoring, and enforcement. Thus, the proposed Project does not reduce demolition and construction waste "to the greatest extent feasible," and the Project is not consistent with this measure.
Minimize tree removal, and mitigate indirect GHG emissions increases that occur due to vegetation removal, loss of sequestration, and soil disturbance	According to the IS/MND, "There are 30 trees in the public right-of-way (sidewalk or called a street tree), of which one is a protected species and will not be removed. Of the 29 non-protected street trees, 19 trees would be removed and replaced. There are 29 trees on the private portion of the Project Site, none of which are protected species. Of these, 24 would be removed. The amount of soils removed or exported would be 137,000 cubic yards" (pp. 2). However, the IS/MND fails to discuss ways to minimize tree removal or mitigate GHG emissions increases due to vegetation removal, loss of sequestration, and soil disturbance. Thus, the Project is not consistent with this measure.
Increase use of electric and renewable fuel powered construction equipment and require renewable diesel fuel where commercially available	Here, the IS/MND states that "[h]eavy duty construction equipment needed during construction of the Project would include air compressors, concrete pumps, forklifts, lifts, welders, backhoes, dozers, forklifts, lifts, loaders, and rollers, the majority of which would be diesel fueled. Construction equipment fuels would be provided by local or regional suppliers and vendors" (p. B-74). However, the IS/MND fails to address renewable diesel fuel or evaluate if it is available. Thus, the Project is not consistent with this measure.

Require diesel equipment fleets to be lower emitting than any current emission standard	Here, the IS/MND fails to require that diesel equipment fleets be lower emitting than current standards. Thus, the Project is not consistent with this measure.
Measures – Operation	
Comply with lead agency's standards for mitigating transportation impacts under SB 743	Here, the IS/MND states that "[t]he City of Los Angeles Department of Transportation (LADOT) has developed the Transportation Impact Study Guidelines (TISG) (December 2016) to provide the public, private consultants, and City staff with standards, guidelines, objectives, and criteria to be used in the preparation of a transportation impact study" (p. B-110). However, this is incorrect, as the LADOT has most recently released its Transportation Assessment Guidelines (TAG) in July 2019 that supersede the previous 2016 guidance. Thus, the IS/MND's analysis relies upon outdated guidance. Furthermore, the TAG relies upon the California Office of Planning and Research (OPR) 2018 Technical Advisory, which "recommends that a per capita or per employee VMT that is fifteen percent below that of existing development may be a reasonable threshold."[32] According to the LADOT's TAG document, "[t]he California Natural Resources Agency certified and adopted the CEQA Guidelines in December of 2018, and are now in effect."[33] In order to comply with the transportation standards under SB 743, the Project should have demonstrated a per capita VMT that is at least 15% below existing development. Thus, the Project is not consistent with this measure.
Dedicate on-site parking for shared vehicles	Here, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Provision of electric vehicle charging stations in the parking structure; 5% of total spaces will be designated for low emitting, fuel efficient and carpool/van pool vehicles" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* designated parking for shared vehicles. The IS/MND also fails to evaluate the feasibility of implementing, monitoring, and

[32] "Technical Advisory on Evaluating Transportation Impacts in CEQA" California Office of Planning and Research (OPR), December 2018, *available at:* http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf, p. 10.
[33] "Transportation Assessment Guidelines" Los Angeles Department of Transportation (LADOT), July 2019, *available at:* https://ladot.lacity.org/sites/default/files/documents/ta_guidelines_-20190731_0.pdf, p. 15.

	enforcing this measure. Thus, we cannot verify this measure and the Project is not consistent.
Require on-site renewable energy generation	Here, the IS/MND states that the "LADWP is required to commit to the use of renewable energy sources for compliance with the California Renewable Energy Resources Act" (p. B-62, B-79, B-120 Table B.8-6). The IS/MND goes on to state, "[w]ith respect to on-site renewable energy sources, because of the Project's location, there are no local sources of energy from the following sources: biodiesel, biomass hydroelectric and small hydro, digester gas, fuel cells, landfill gas, municipal solid waste, ocean thermal, ocean wave, and tidal current technologies, or multi-fuel facilities using renewable fuels" (p. B-80). However, while other locations may be "more suitable for large-scale solar power generation" and there may be a "lack of sufficient wind in the Los Angeles basin," the IS/MND fails to discuss potentially feasible options, such as small-scale solar generation or other sources (B-80). Furthermore, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…15% of the roof area set aside for future solar panels" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* rooftop solar panels. The IS/MND also fails to evaluate the measure's feasibility, or discuss the Project's potential to implement, monitor, and enforce it. As a result, the Project fails to comply with this measure.
Require cool roofs and "cool parking" that promotes cool surface treatment for new parking facilities as well as existing surface lots undergoing resurfacing	Here, the IS/MND fails to address "cool parking" or the promotion of cool surface treatment for parking facilities. While the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Installation of a "cool roof" that reflects the sun's heat and reduces urban heat island effect," the IS/MND fails to require this measure, stating that measures *could* include a cool roof (emphasis added) (p. B-67-68). The IS/MND also fails to evaluate the feasibility of implementing, monitoring, and enforcing the measure on the Project site. Thus, the Project is not consistent with this measure.

Require solar-ready roofs	Here, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…15% of the roof area set aside for future solar panels" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* rooftop solar panels. The IS/MND also fails to evaluate the feasibility of this measure, or the Project's potential to implement, monitor, and enforce the measure on the Project site. Thus, the Project is not consistent with this measure.
Require organic collection in new developments	Here, while the IS/MND discusses recycling, it fails to mention organic collection (p. B-258-259). Thus, the Project is not consistent with this measure.
Require low-water landscaping in new developments (see CALGreen Divisions 4.3 and 5.3 and the Model Water Efficient Landscape Ordinance [MWELO], which is referenced in CALGreen). Require water efficient landscape maintenance to conserve water and reduce landscape waste.	Here, the IS/MND states that "[l]andscaping water use is estimated per California Code of Regulations Title 23, Division 2, Chapter 2.7. Model Water Efficient Landscape Ordinance" (p. B-249, Table B.19-1). The IS/MND also states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Use of indigenous and/or water-appropriate plants in landscaping" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* use of indigenous and/or water-appropriate plants in landscaping. The IS/MND also fails to discuss the Project's potential to implement, monitor, and enforce the Model Water Efficient Landscape Ordinance or the feasibility of using indigenous and/or water-appropriate plants. As a result, the Project is not consistent with this measure.
Achieve Zero Net Energy performance building standards prior to dates required by the Energy Code	Here, the IS/MND states that the CARB Scoping Plan First Update "discussed new residential and commercial building energy efficiency improvements, specifically identifying progress towards zero net energy buildings" (p. B-100). However, the IS/MND fails to indicate that the proposed Project would even attempt to achieve Zero Net Energy performance, as required by the Energy Code. Thus, the Project is not consistent with this measure.
Encourage new construction, including municipal building construction, to achieve third-party green building certifications,	Here, the IS/MND fails to mention green building certifications, such as the GreenPoint Rated program,

such as the GreenPoint Rated program, LEED rating system, or Living Building Challenge	LEED rating system, or Living Building Challenge. As a result, the Project is not consistent with this measure.
Require the design of bike lanes to connect to the regional bicycle network	Here, the IS/MND states that "S. Oxford Avenue contains a bike lane that extends from W. 3rd Street northwards. W. 7th Street contains a bike lane from S. Catalina Street eastwards" (p. B-238). However, the IS/MND fails to indicate that the proposed Project would require or even include the design of bike lanes to connect to the regional bicycle network. Thus, the Project is not consistent with this measure.
Expand urban forestry and green infrastructure in new land development	Here, the IS/MND fails to mention or evaluate the Project's potential to expand urban forestry and green infrastructure. Thus, the Project is not consistent with this measure.
Require preferential parking spaces for park and ride to incentivize carpooling, vanpooling, commuter bus, electric vehicles, and rail service use	Here, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Provision of electric vehicle charging stations in the parking structure; 5% of total spaces will be designated for low emitting, fuel efficient and carpool/van pool vehicles" (emphasis added) (p. B-67-68). However, the IS/MND fails mention requiring preferential parking spaces for park and ride. Thus, we cannot verify this measure will be required and the Project may not be consistent.
Develop a rideshare program targeting commuters to major employment centers	Here, the IS/MND fails to mention or evaluate the feasibility of implementing, monitoring, and enforcing a rideshare program on the Project site, specifically targeting commuters to major employment centers. Thus, the proposed Project is not consistent with this measure.
Require the design of bus stops/shelters/express lanes in new developments to promote the usage of mass-transit	Here, the IS/MND fails to mention or require the design of bus stops/shelters/express lanes for the proposed Project. Thus, the proposed Project is not consistent with this measure.
Require gas outlets in residential backyards for use with outdoor cooking appliances such as gas barbeques if natural gas service is available	Here, the IS/MND fails to mention or require gas outlets in residential backyards. Thus, the proposed Project is not consistent with this measure.
Require the installation of electrical outlets on the exterior walls of both the front and back of residences to promote the use of electric landscape maintenance equipment	Here, the IS/MND fails to mention or require the installation of electrical outlets on the exterior walls of both the front and back of residences. Thus, the proposed Project is not consistent with this measure.

Require the design of the electric outlets and/or wiring in new residential unit garages to promote electric vehicle usage	Here, the IS/MND fails to mention or require the design of the electric outlets and/or wiring in new residential unit garages to promote electric vehicle usage. Thus, the proposed Project is not consistent with this measure.
Require electric vehicle charging station (Conductive/inductive) and signage for non-residential developments	Here, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Provision of electric vehicle charging stations in the parking structure" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* electric charging stations. The IS/MND also fails to evaluate the feasibility of implementing, monitoring, and enforcing this measure on the Project site. Furthermore, the IS/MND states that "Project Site signage would include building identification, wayfinding, and security markings" (p. A-13). However, the IS/MND fails to demonstrate that the Project would include signage dedicated to electric vehicle charging stations. Finally, the IS/MND failed to discuss how the measure would be implemented, monitored, and enforced. Thus, the Project is not consistent with this measure.
Provide electric outlets to promote the use of electric landscape maintenance equipment to the extent feasible on parks and public/quasi-public lands	Here, the IS/MND fails to mention electric outlets or the promotion of electric landscape maintenance equipment. Thus, the Project is not consistent with this measure.
Require each residential unit to be "solar ready," including installing the appropriate hardware and proper structural engineering	Here, the IS/MND mentions solar ready buildings in regard to the City's Green Building Code (Section 99.04.211) (p. B-80). However, the IS/MND fails to *require* that each residential unit will be "solar ready" or mention installation of the appropriate hardware and proper structural engineering. Thus, we cannot confirm that this will actually be implemented, monitored, and enforced on the Project site, and the Project is not consistent with this measure.
Require the installation of energy conserving appliances such as on-demand tank-less water heaters and whole-house fans	Here, the IS/MND states that "[s]pecific measures to be incorporated into the Project **to the extent feasible could include, but are not limited to**:…Use of Energy Star appliances in residential units" (emphasis added) (p. B-67-68). The IS/MND goes on to state that "Energy Star-certified and high-efficiency clothes washers and dishwashers, nonresidential kitchen faucets (except

	restaurant kitchens) with ha maximum flow rate of 1.5 gallons per minute, and installation of tankless and on-demand water heaters in commercial kitchens and restrooms, **when appropriate**" (emphasis added) (p. B-125, Table B.8-6). However, the IS/MND fails to require this measure, stating that measures *could include* use of energy star appliances in residential units. Finally, the IS/MND fails to mention or address whole-house fans. Thus, as the IS/MND fails to actually *require* this measure, or discuss the Project's potential to implement, monitor, and enforce the measure, we cannot verify its inclusion and the Project may be inconsistent.
Require each residential and commercial building equip buildings with energy efficient AC units and heating systems with programmable thermostats/timers	Here, the IS/MND states, "[a]s required under SB 350, doubling of the energy efficiency savings from final end uses of retail customers by 2030 would primarily rely on the existing suite of building energy efficiency standards under the California Code of Regulations (CCR), Title 24, Part 6 (consistency with this regulation is discussed below) and utility-sponsored programs such as rebates for high-efficiency appliances, heating ventilation and air-conditioning (HVAC) systems and insulation. The Project would support this action/strategy because it includes compliance with specific requirements of the Los Angeles Green Code" (p. B-121, Table B.8-6). However, the IS/MND fails to indicate any *project-specific* requirements for energy efficient AC units or heating systems with programmable thermostats/timers. Thus, the Project is not consistent with this measure.
Require large-scale residential developments and commercial buildings to report energy use, and set specific targets for per-capita energy use	Here, the IS/MND fails to mention or require the residential and commercial buildings included in the proposed Project to report energy use or set specific targets or per-capita energy use. Thus, the Project is not consistent with this measure.
Require each residential and commercial building to utilize low flow water fixtures such as low flow toilets and faucets (see CALGreen Divisions 4.3 and 5.3 as well as Appendices A4.3 and A5.3)	Here, the IS/MND states that "[s]pecific measures to be incorporated into the Project **to the extent feasible could include, but are not limited to**:…Use of ultra-low-flow toilets and low-flow metered hand-wash faucets in public facilities" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* use of ultra-low-flow toilets and low-flow faucets. The IS/MND also fails to evaluate the

	feasibility of this measure or elaborate on the Project's potential to implement, monitor, and enforce it. Thus, the Project is not consistent with this measure.
Require the use of energy-efficient lighting for all street, parking, and area lighting	The IS/MND fails to require the use of energy-efficient lighting for street, parking, and area lighting. While the IS/MND states that "[s]pecific measures to be incorporated into the Project **to the extent feasible could include, but are not limited to**:…Use of energy efficient lighting," it fails to evaluate the feasibility of this measure or elaborate on the Project's potential to implement, monitor, and enforce the measure (emphasis added) (p. B-67-B-68). Thus, the Project is not consistent with this measure.
Require the landscaping design for parking lots to utilize tree cover and compost/mulch	Here, the IS/MND fails to mention or consider tree cover or compost/mulch in the landscaping design for parking lots. Thus, the Project is not consistent with this measure.
Incorporate water retention in the design of parking lots and landscaping, including using compost/mulch	Here, the IS/MND fails to incorporate water retention into the design of parking lots and landscaping, including the use of compost/mulch. Thus, the Project is not consistent with this measure.
Require the development project to propose an off-site mitigation project which should generate carbon credits equivalent to the anticipated GHG emission reductions. This would be implemented via an approved protocol for carbon credits from California Air Pollution Control Officers Association (CAPCOA), the California Air Resources Board, or other similar entities determined acceptable by the local air district	Here, the IS/MND fails to mention or require off-site mitigation projects or carbon credits. The IS/MND also fails to discuss the CAPCOA GHG Reduction Exchange Program, American Carbon Registry (ACR), Climate Action Reserve (CAR) or other similar carbon credit registries. Thus, the Project is not consistent with this measure.
Require the project to purchase carbon credits from the CAPCOA GHG Reduction Exchange Program, American Carbon Registry (ACR), Climate Action Reserve (CAR) or other similar carbon credit registry determined to be acceptable by the local air district	Here, the IS/MND fails to mention the CAPCOA GHG Reduction Exchange Program, American Carbon Registry (ACR), Climate Action Reserve (CAR) or other similar carbon credit registries. Thus, the Project is not consistent with this measure.
Consider generating or purchasing local and California-only carbon credits as the preferred mechanism to implement its offsite mitigation measure for GHG	Here, the IS/MND fails to mention or consider carbon credits, or California-only carbon credits. Thus, the Project is not consistent with this measure.

emissions and that will facilitate the State's efforts in achieving the GHG emission reduction goal	

SCAG 2016 – 2040 RTP/SCS[34]	
Measures – Air Quality (transportation control measures TCM)	
Reduce emissions with the use of clean fuels and reducing petroleum dependency.	Here, while the IS/MND mentions several policies that increase the use of clean fuels and reduce petroleum dependency, the IS/MND fails to demonstrate how the Project would implement this measure (p. B-64, B-94, B-127). Thus, the Project is not consistent with this measure.
Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas	Here, the IS/MND states that "it is mandatory for all construction projects in the Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Rule 403 control requirements include measures to prevent the generation of visible dust plumes. Measures include, but are not limited to, applying water and/or soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system or other control measures to remove bulk material from tires and vehicle undercarriages before vehicles exit the Project Site, and maintaining effective cover over exposed areas" (p. B-41). Thus, the Project has the option to *either* apply water *and/or* soil binders but has not actually committed to either. The IS/MND also fails to discuss the Project's potential to implement, monitor, and enforce the use of watering trucks to minimize dust. As a result, the Project is not consistent with this measure.
Revegetate disturbed lands, including vehicular paths created during construction to avoid future off-road vehicular activities.	Here, the IS/MND states that "it is mandatory for all construction projects in the Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Rule 403 control requirements include measures to prevent the generation of visible dust plumes. Measures include, but are not limited to, applying water and/or soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system or other control measures to remove bulk material from tires and vehicle undercarriages

[34] Southern California Association of Governments ("SCAG") (Apr. 2016) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, *available at:* https://ww3.arb.ca.gov/cc/scopingplan/2030sp_appb_localaction_final.pdf, p.

	before vehicles exit the Project Site, and maintaining effective cover over exposed areas" (p. B-41). As such, the Project has the option to reestablish ground cover *and/or* implement one of the other measures listed but has not committed to any one measure. The IS/MND also fails to discuss the Project's potential to implement, monitor, and enforce the measure. Thus, the Project is not consistent with this measure.
As appropriate, require that portable engine-driven equipment units used at the project work site, with the exception of on-road and offroad motor vehicles, obtain ARB Portable Equipment Registration with the state or local district permit.	Here, the IS/MND fails to require that portable engine-driven equipment units obtain ARB Portable Equipment Registration. Thus, the Project is not consistent with this measure.
Measures – Greenhouse Gases	
Incorporate Best Available Control Technology (BACT) during design, construction and operation of projects to minimize greenhouse gas emissions.	Here, the IS/MND states that CARB's Airborne Toxic Contro Measure "requires that best available control technology turnovers or retrofits be fully implemented by 2023 for large and medium equipment fleets and by 2028 for small fleets" (p. B-65). However, stating that this requirement exists does not demonstrate that the Project would implement, monitor, and enforce the measure during design, construction, and operation. Furthermore, the Project is anticipated to begin construction in 2022, so the 2023 and 2028 requirements would not be achieved by the time that construction of the Project begins (Appendix C, pp. 6, 37, 71). Thus, the Project is not consistent with this measure.
Use energy- and fuel-efficient vehicles and equipment.	Here, while the IS/MND discusses the USEPA Tier 1 through Tier 4 engine emission reductions, the IS/MND fails to require the use or evaluate the feasibility of obtaining these cleaner engines (p. B-16). As a result, the proposed Project fails to require the use of energy- and fuel-efficient vehicles and equipment. Thus, the Project is not consistent with this measure.
Incorporate design measures to reduce greenhouse gas emissions from solid waste management through encouraging solid waste recycling and reuse.	Regarding solid waste recycling, the IS/MND states, "In compliance with LAMC provisions, the Project shall provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of nonhazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, and

	metals" (p. B-257). The IS/MND goes on to state, "In compliance with AB341, recycling bins shall be provided at appropriate locations to promote recycling of paper, metal, glass and other recyclable material. These bins shall be emptied and recycled accordingly as a part of the Project's regular solid waste disposal program. The Project Applicant shall only contract for waste disposal services with a company that recycles solid waste in compliance with AB3 41" (p. B-257). However, the IS/MND fails to discuss the Project's potential to implement, monitor, and enforce this measure. Furthermore, the IS/MND fails to mention how the Project would encourage the reuse of solid waste. Thus, the Project is not consistent with this measure.
Incorporate design measures to reduce energy consumption and increase use of renewable energy	Here, the IS/MND states that the "LADWP is required to commit to the use of renewable energy sources for compliance with the California Renewable Energy Resources Act" (p. B-62, B-79, B-120 Table B.8-6). The IS/MND goes on to state, "[w]ith respect to on-site renewable energy sources, because of the Project's location, there are no local sources of energy from the following sources: biodiesel, biomass hydroelectric and small hydro, digester gas, fuel cells, landfill gas, municipal solid waste, ocean thermal, ocean wave, and tidal current technologies, or multi-fuel facilities using renewable fuels" (p. B-80). However, while other locations may be "more suitable for large-scale solar power generation" and there may be a "lack of sufficient wind in the Los Angeles basin," the IS/MND fails to discuss potentially feasible options, such as small-scale solar generation or other sources (B-80). Furthermore, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…15% of the roof area set aside for future solar panels" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* rooftop solar panels. The IS/MND also fails to evaluate the measure's feasibility, or discuss the Project's potential to implement, monitor, and enforce it. As a result, the Project fails to comply with this measure.

Plant shade trees in or near construction projects where feasible.	Here, the IS/MND fails to mention planting shade trees during construction. Thus, the Project is not consistent with this measure.
Construct buildings to Leadership in Energy and Environmental Design (LEED) certified standards.	Here, the IS/MND fails to mention or consider constructing buildings to LEED standards. Thus, the Project is not consistent with this measure.
Measures – Transportation, Traffic and Safety	
Promote ride sharing programs e.g., by designating a certain percentage of parking spaces for high-occupancy vehicles, providing larger parking spaces to accommodate vans used for ride-sharing, and designating adequate passenger loading and unloading and waiting areas.	Here, the IS/MND states that "[s]pecific measures to be incorporated into the **Project to the extent feasible could include, but are not limited to**:…Provision of electric vehicle charging stations in the parking structure; 5% of total spaces will be designated for low emitting, fuel efficient and carpool/van pool vehicles" (emphasis added) (p. B-67-68). However, the IS/MND fails to require this measure, stating that measures *could include* designated parking for shared vehicles. The IS/MND also fails to evaluate the feasibility of this measure or the Project's potential to implement, monitor, and enforce this measure on the Project site. Finally, the IS/MND fails to mention designating passenger loading and unloading and waiting areas. Thus, the Project is not consistent with this measure.
Encourage bicycling to transit facilities by providing additional bicycle parking, locker facilities, and bike lane access to transit facilities when feasible.	Here, the IS/MND states that "S. Oxford Avenue contains a bike lane that extends from W. 3rd Street northwards. W. 7th Street contains a bike lane from S. Catalina Street eastwards" (p. B-238). The IS/MND goes on to state that "[t]he Project would provide residents and visitors with convenient access to public transit and opportunities for walking and biking, including the installation of bicycle parking spaces in accordance with LAMC requirements" (p. B-136). However, the IS/MND fails to evaluate the feasibility of this measure or the Project's potential to implement, monitor, and enforce this measure on the Project site. The IS/MND also fails to indicate that the Project would provide locker facilities and bike lane access to transit facilities. Thus, the Project is not consistent with this measure.
Encourage the use of public transit systems by • enhancing safety and cleanliness on vehicles and in and around stations • providing shuttle service to public transit	Here, the IS/MND states that "[t]he Project would provide residents and visitors with convenient access to public transit and opportunities for walking and biking" (p. B-136). However, the IS/MND fails to describe what specific measures the Project would incorporate to achieve this.

• offering public transit incentives • providing public education and publicity about public transportation services.	The IS/MND also fails to mention how the Project would enhance safety and cleanliness on vehicles and in and around stations, provide shuttle service to public transit, offer public transit incentives, or provide public education and publicity about public transportation services. Thus, the Project is not consistent with this measure.

As the above tables indicate, the IS/MND fails to provide sufficient information and analysis to determine Project consistency with various measures under CARB's Climate Change Scoping Plan and SCAG's 2016–2040 RTP/SCS. Thus, we cannot verify that "the Project is consistent with applicable plans, policies, and regulations adopted for the purpose of reducing the emissions of GHGs" as indicated in the IS/MND (p. B-139). As a result, we recommend that an updated CEQA evaluation include further information and analysis in order to conclude consistency for the proposed Project.

(5) Inconsistent with Evolving Scientific Knowledge and Regulatory Schemes

As a result of reliance upon CARB's Climate Change Scoping Plan, SCAG's 2016–2040 RTP/SCS, the City's LA Green Plan, and the Sustainable City pLAn, the IS/MND fails to compare the Project's GHG emissions to correct SCAQMD thresholds. As explained below, consistent with CEQA Guidelines, the SCAQMD's interim thresholds should have been used by the IS/MND to evaluate the Project's GHG impact. It is commonly recognized by California air districts that a project's impact on climate change is cumulative in nature.[35] According to the Technical Advisory prepared by the Office of Planning and Research

[35] *See e.g.,* SCAQMD (Oct. 2008), *supra* fn. 28, p. 1-4-5 (citing the OPR Technical Advisor: "When assessing whether a project's effects on climate change are 'cumulatively considerable' even though its GHG contribution may be individually limited, the lead agency must consider the impact of the project when viewed in connection with the effects of past, current, and probable future projects."), http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf; Bay Area Air Quality Management District ("BAAQMD") (May 2017) CEQA Air Quality Guidelines, p. 2-1 ("No single project could generate enough GHG emissions to noticeably change the global average temperature [but rather] [t]he combination of GHG emissions from past, present, and future projects contribute substantially to the phenomenon of global climate change and its associated environmental impacts."), http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en; San Luis Obispo County Air Pollution Control District ("SLOAPCD") (Mar. 28, 2012) GHG Threshold and Supporting Evidence, p. 5 ("No single land use project could generate enough GHG emissions to noticeably change the global average temperature. Cumulative GHG emissions, however, contribute to global climate change and its significant adverse environmental impacts. Thus, the primary goal in adopting GHG significance thresholds, analytical methodologies, and mitigation measures is to ensure new land use development provides its fair share of the GHG reductions needed to address cumulative environmental impacts from those emissions.), https://storage.googleapis.com/slocleanair-org/images/cms/upload/files/Greenhouse%20Gas%20Thresholds%20and%20Supporting%20Evidence%204-2-2012.pdf; Sacramento Metropolitan Air Quality Management District ("SMAQMD") (May 2018) Guide to Air Quality Assessment in Sacramento County, p. 6-1-3, ("(GHG) emissions adversely affect the environment through contributing, on a cumulative basis, to global climate change … *the District recommends that lead agencies address the impacts of climate change on a proposed project and its ability to adapt to these changes in CEQA documents*… [thus urging] evaluating whether the GHG emissions associated with a proposed project will be responsible for making a cumulatively considerable contribution to global climate change."[emphasis original]), http://www.airquality.org/LandUseTransportation/Documents/Ch6GHGFinal5-2018.pdf.

("OPR"), "[t]he potential effects of a project may be individually limited but cumulatively considerable[]" and that "[l]ead agencies should not dismiss a proposed project's direct and/or indirect climate change impacts without careful consideration, supported by substantial evidence … [including] analysis should be provided for any project that may significantly contribute to new GHG emissions, either individually or cumulatively, directly or indirectly."[36] Furthermore, OPR rightfully acknowledge, consistent with state regulatory schemes and CEQA case law, that "thresholds cannot be used to determine automatically whether a given effect will or will not be significant; instead, thresholds of significance can be used only as a measure of whether a certain environmental effect will normally be determined to be significant or normally will be determined to be less than significant by the agency."[37] Recognizing this principle, CEQA Guidelines 15064.7(c) permits the use of thresholds developed by other public agencies.

Similarly, the California Supreme Court has made clear that CEQA demands robust GHG analysis to assess a project's impact on climate change, and while lead agencies have discretion, that discretion must be exercised "based to the extent possible on scientific and factual data" and "stay[ing] in step with evolving scientific knowledge and state regulatory schemes." *Cleveland National Forest Foundation v. San Diego Assn. of Governments* ("*Cleveland II*") (2017) 3 Cal.5th 497, 504, 515, 518 (quoting CEQA Guidelines § 15064(b)); *see also* 519 (noting to meet the State's long-term climate goals, "regulatory clarification, together with improved methods of analysis, may well change the manner in which CEQA analysis of long-term [GHG] emission impacts is conducted."). Hence, a GHG analysis which "understates the severity of a project's impacts impedes meaningful public discussion and skews the decision maker's perspective concerning the environmental consequences of the project, the necessity for mitigation measures, and the appropriateness of project approval." *Id*., on remand ("*Cleveland III*"), 17 Cal.App.5th 413, 444; *see also Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564 (quoting *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392).

SCAQMD's multi-tiered approach under its *Interim Threshold* was not officially adopted as a valid threshold or part of a plan "adopted by the relevant public agency through a public review process" as CEQA requires.[38] Moreover, SCAQMD developed its thresholds when AB 32 was the governing statute for GHG reductions in California. AB 32 requires California to reduce GHG emissions to 1990 levels by 2020. Health & Saf. Code § 38500 *et seq*. However, in September 2016, before the release of the IS/MND, Governor Brown signed Senate Bill 32, enacting Health & Saf. Code § 38566. This statute ("SB 32") requires California to achieve a new, more aggressive 40 percent reduction in GHG emissions over the 1990 level by the end of 2030.

Consistent with the edicts of SB 32, other air control districts have adopted more aggressive GHG thresholds for project-level analysis, including but not limited to the Sacramento Metropolitan Air Quality Management District (SMAQMD), the Bay Area Air Quality Management District (BAAQMD), and

Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1109), http://opr.ca.gov/docs/20171127_Comprehensive_CEQA_Guidelines_Package_Nov_2017.pdf.

[38] SCAQMD (Dec. 5, 2008), *supra* fn. 50, p. 3.

the San Luis Obispo Air Pollution Control District (SLOAPCD) (as summarized in the tables below). Given the cumulative nature of GHG emissions and consistent with CEQA Guidelines § 15064.7(c), these recommended thresholds are appropriate for projects in the SCAQMD regions.

SMAQMD (May 2018) Guide to Air Quality Assessment[39]

Land Development and Construction Projects		
	Construction Phase	Operational Phase
Greenhouse Gas Emissions (GHG) Thresholds		
GHG as CO2e	1,100 metric tons/year	1,100 metric tons/year

Stationary Source Only		
	Construction Phase	Operational Phase
Greenhouse Gas Emissions (GHG) Thresholds		
GHG as CO2e	1,100 metric tons/year	10,000 metric tons/year

1) Construction phase of all project types – 1,100 MT CO_2e/yr.
2) Operational phase of a land development project – 1,100 MT CO_2e/yr (noting a 72-room hotel and a 122-unit high-rise apartment building would each be equivalent to the 1,100 MT CO_2e/yr threshold).[40]
3) Stationary source operational emissions – 10,000 MT CO_2e/yr.

BAAQMD (May 2017) CEQA Air Quality Guidelines[41]

GHGs – Projects other than Stationary Sources	Compliance with Qualified GHG Reduction Strategy OR 1,100 MT of CO_2e/yr OR 4.6 MT CO_2e/SP/yr (residents+employees)
GHGs –Stationary Sources	10,000 MT/yr

While providing 10,000 MT CO_2e/yr for stationary-source projects, other projects (e.g., residential, commercial, public land uses):

1) CAP: Compliance with a qualified GHG Reduction Strategy; or
2) Bright Line: Annual emissions less than 1,100 MT CO_2e/year; or
3) Efficiency Level: 4.6 MT CO_2e/SP/year (residents + employees). [42]

---

[39] SMAQMD (May 2018), *supra* fn. 50, p. 6-10-12; *see also* SMAQMD Thresholds of Significance Table, http://www.airquality.org/LandUseTransportation/Documents/CH2ThresholdsTable5-2015.pdf.

[40] SMAQMD (Apr. 2018) SMAQMD Operational Screening Levels (showing that a 190-room hotel like Option A or a 160-unit high-rise apartment like Option B would exceed the 72-room and 122-unit thresholds), http://www.airquality.org/LandUseTransportation/Documents/Ch4+Ch6OperationalScreening4-2018.pdf.

[41] BAAQMD (May 2017), *supra* fn. 50, p. 2-2-4. Like the SCAQMD area, BAAQMD is designated as a nonattainment area for state/national ozone and particulate matter (PM) and thresholds would seem particularly apt for the 5th and Hill Project. *Compare id*. at p. 2-1 *with* SCAQMD NAAQS/CAAQS Attainment Status (noting "extreme" and "serious" nonattainment for multiple ozone and PM standards), http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf.

[42] The BAAQMD has not formally adopted an efficiency level after 2020. However, other projects within BAAQMD's jurisdiction have extrapolated 2030 efficiency thresholds in order to comply with SB 32 reduction targets. For example, the Park View Towers Project's Addendum to the Final Supplemental Environmental Impact Report utilizes a 2030 efficiency threshold of 2.6 MT CO_2e/year. Based on this efficiency threshold, the proposed Project would exceed threshold and result in a significant impact. Park View Tower's Addendum available at: http://www.sanjoseca.gov/DocumentCenter/View/80743

SLOAPCD (Mar. 2012) GHG Thresholds and Supporting Evidence[43]

GHG Emissions Threshold Summary	
Residential and Commercial Projects	Compliance with Qualified GHG Reduction Strategy OR Bright-Line Threshold of 1,150 MT of CO_2e/yr. OR Efficiency Threshold of 4.9 MT CO_2e/SP*/yr.
Industrial (Stationary Sources)	10,000 MT of CO_2e/yr.

1) CAP: Consistency with qualitative reduction strategies (e.g., Climate Action Plans).
2) Bright-Line Threshold: 1,150 MT CO_2e/year after inclusion of emission-reducing features of a proposed project, those still exceeding the threshold would have to reduce their emissions below that level to be considered less than significant.
3) Efficiency-Based Threshold: 4.9 MT CO_2e/SP/year dependent on per capita basis for residential projects or the sum of jobs and residents for mixed-use projects (noting 0.64 employees per 1,000 SF of hotel development).

Although more demanding, the above-listed thresholds adopted by these air districts are analogous with the application of SCAQMD's screening threshold for mixed-use developments (3,000 MT CO_2e/year) and SCAQMD's Tier 4 efficiency target goals (4.8 MTCO_2e/SP/year for target year 2020 and 3.0 MTCO_2e/SP/year for target year 2035).[44] The actions taken by other air districts to reduce GHG emissions through more stringent thresholds is the most persuasive rationale as to why the *Interim Thresholds* apply as the current standard set of evolving scientific knowledge and regulatory schemes. Even though the SCAQMD's interim thresholds may be outdated and may not be officially adopted, they are consistent with the methods of analysis that are regularly practiced by other air districts and furthers CEQA's demand for "'conservative analysis' to afford 'fullest possible protection of the environment.'"[45] Hence, the IS/MND's GHG analysis is not consistent with evolving standards, nor is the conclusion that the Project has a less than significant GHG impact supported by substantial evidence.

Regents of University of California* (1988) 47 Cal.3d 376, 390 ("The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.") (internal citations omitted).

(6) Incorrect and Unsubstantiated Air Model Demonstrate a Potentially Significant Impact

Notwithstanding the IS/MND CalEEMod's underestimated emissions, as discussed above, the Project's CalEEMod output files demonstrate that the Project would result in a potentially significant GHG impact.

The IS/MND's CalEEMod output files demonstrate that the Project's mitigated emissions include roughly 8,699 MT CO_2e/yr (amortized construction and operational emissions). When we compare the Project's GHG emissions to the 3,000 MT CO_2e/year mixed-use threshold (SCAQMD Tier 3 Option #1), we find that the Project's GHG emissions exceed the threshold (see table below).

IS/MND Annual Greenhouse Gas Emissions	
Project Phase	**Proposed Project (MT CO_2e/year)**
Construction (amortized over 30 years)	139.8
Area	11.1
Energy	4,530.7
Mobile	3,281.0
Waste	190.1
Water	546.0
Total	**8,698.7**
Threshold	3,000
Exceed?	***Yes***

As demonstrated in the table above, the proposed Project, even when modeled with underestimated emissions, would exceed the SCAQMD's 3,000 MT CO_2e/yr mixed-use threshold. Hence, a service population analysis is warranted. According to CAPCOA's *CEQA & Climate Change* report, service population is defined as "the sum of the number of residents and the number of jobs supported by the project."[46] According to the IS/MND, the Project would require 50 employees (p. B-35). According to the IS/MND's CalEEMod model, the residential land use would house 1,830 people. Thus, we estimate a service population of 1,880.[47] Dividing the Project's GHG emissions by a service population of 1,880 people, we find that the Project would emit approximately 4.63 MT CO_2e/SP/yr (see table below).[48]

IS/MND Service Population Efficiency Analysis	
Project Phase	**Proposed Project (MT CO_2e/year)**
Total	**8,698.67**
Service Population	1,880

[46] CAPCOA (Jan. 2008) CEQA & Climate Change, p. 71-72, http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf.
[47] Calculated: 50 employees + 1,830 residents = 1,880 service population.
[48] Calculated: (8,698.7 MT CO_2e/year) / (1,880 service population) = (4.63 MT CO_2e/SP/year)

Service Population Efficiency	4.63
Threshold	3.00
Exceed?	***Yes***

When we compare the Project's per service population GHG emissions to the SCAQMD 2035 efficiency target of 3.0 MT CO_2e/SP/yr, we find that the Project would result in a significant GHG impact not previously identified or addressed by the IS/MND. According to CEQA Guidelines § 15064.4(b), if there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, a full CEQA analysis must be prepared for the project. Therefore, an updated CEQA analysis must be prepared for the Project, and mitigation should be implemented where necessary, per CEQA Guidelines.

(7) Updated Analysis Demonstrates a Potentially Significant GHG Impact

Applicable thresholds and site-specific modeling demonstrate that the proposed Project would result in a potentially significant GHG impact not previously identified or addressed by the IS/MND. The updated CalEEMod output files, modeled by SWAPE with Project-specific information, disclose the Project's mitigated emissions, which include approximately 7,667 MT CO_2e of total construction emissions (sum of 2022, 2023, 2024, 2025, and 2026) and approximately 9,247 MT CO_2e/yr of annual operational emissions (sum of area, energy, mobile, waste, and water-related emissions). When we compare the Project's GHG emissions to the 3,000 MT CO_2e/yr mixed-use threshold (SCAQMD Tier 3 Option #1), we find that the Project's GHG emissions exceed the threshold (see table below).

SWAPE Annual Greenhouse Gas Emissions	
Project Phase	**Proposed Project (MT CO_2e/year)**
Construction (amortized over 30 years)	255.6
Area	11.1
Energy	4,530.7
Mobile	3,968.9
Waste	190.1
Water	546.0
Total	**9,502.4**
Threshold	3,000
Exceed?	***Yes***

As demonstrated in the table above, the proposed Project would exceed the SCAQMD's 3,000 MT CO_2e/yr mixed-use threshold. Hence, a service population analysis is warranted. When dividing the Project's GHG emissions (amortized construction + operational) by a service population value of 1,880 people, we find that the Project would emit approximately 5.05 MT CO_2e/SP/yr.[49] This exceeds the

[49] Calculated: (9,502 MT CO_2e/year) / (1,880 service population) = (5.05 MT CO_2e/SP/year).

SCAQMD 2035 efficiency target of 3.0 MT CO_2e/SP/yr and the inapplicable SCAQMD 2020 threshold of 4.8 MT CO_2e/SP/yr (see table below).

SWAPE Service Population Efficiency Analysis	
Project Phase	**Proposed Project (MT CO_2e/yr)**
Total	**9502.37**
Service Population	1880.00
Service Population Efficiency	**5.05**
Threshold	3.00
Exceed?	***Yes***

As the table above demonstrates, the Project's GHG emissions exceed the SCAQMD's 2035 service population efficiency threshold of 3.0 MT CO_2e/SP/yr, thus resulting in a significant impact not previously assessed or identified in the IS/MND. Thus, an updated GHG analysis should be prepared in a Project-specific EIR and additional mitigation should be incorporated accordingly (see below).

Feasible Mitigation Measures Available to Reduce Construction Emissions

Our analysis demonstrates that, when Project activities are modeled correctly, the Project's health risk and GHG impacts would be potentially significant. Therefore, additional mitigation measures must be identified and incorporated in an IS/MND to reduce these emissions to a less than significant level.

Additional mitigation measures can be found in CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures,* which attempt to reduce GHG levels, as well as reduce criteria air pollutants such as particulate matter, VOCs, and NO_x.[50] Mitigation for criteria pollutant emissions should include consideration of the following measures in an effort to reduce construction emissions.[51]

Require Implementation of Diesel Control Measures

The Northeast Diesel Collaborative (NEDC) is a regionally coordinated initiative to reduce diesel emissions, improve public health, and promote clean diesel technology. The NEDC recommends that contracts for all construction projects require the following diesel control measures: [52]

- All diesel generators on site for more than 10 total days must be equipped with emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85 percent.

[50] http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

[51] For measures to reduce operational DPM emissions, see section titled "Additional Feasible Mitigation Measures Available to Reduce Operational Emissions" on p. 42 of this letter. These measures would effectively reduce operational emissions, DPM emissions, and GHG emissions.

[52] Diesel Emission Controls in Construction Projects, *available at:* http://www2.epa.gov/sites/production/files/2015-09/documents/nedc-model-contract-sepcification.pdf

- All diesel vehicles, construction equipment, and generators on site shall be fueled with ultra-low sulfur diesel fuel (ULSD) or a biodiesel blend[53] approved by the original engine manufacturer with sulfur content of 15 parts per million (ppm) or less.

Repower or Replace Older Construction Equipment Engines

The NEDC recognizes that availability of equipment that meets the EPA's newer standards is limited.[54] Due to this limitation, the NEDC proposes actions that can reduce emissions from existing equipment in the *Best Practices for Clean Diesel Construction* report.[55] These actions include but are not limited to:

- Repowering equipment (i.e. replacing older engines with newer, cleaner engines and leaving the body of the equipment intact).

Engine repower may be a cost-effective emissions reduction strategy when a vehicle or machine has a long useful life and the cost of the engine does not approach the cost of the entire vehicle or machine. Examples of good potential replacement candidates include marine vessels, locomotives, and large construction machines.[56] Older diesel vehicles or machines can be repowered with newer diesel engines or in some cases with engines that operate on alternative fuels. The original engine is taken out of service and a new engine with reduced emission characteristics is installed. Significant emission reductions can be achieved, depending on the newer engine and the vehicle or machine's ability to accept a more modern engine and emission control system.

- Replacement of older equipment with equipment meeting the latest emission standards.

Engine replacement can include substituting a cleaner highway engine for a nonroad engine. Diesel equipment may also be replaced with other technologies or fuels. Examples include hybrid switcher locomotives, electric cranes, LNG, CNG, LPG or propane yard tractors, forklifts or loaders. Replacements often require some re-engineering work due to differences in size and configuration. Typically, there are benefits in fuel efficiency, reliability, warranty, and maintenance costs.[57]

Install Retrofit Devices on Existing Construction Equipment

PM emissions from alternatively-fueled construction equipment can be further reduced by installing retrofit devices on existing and/or new equipment. The most common retrofit technologies are retrofit devices for engine exhaust after-treatment. These devices are installed in the exhaust system to reduce

---

[53] Biodiesel blends are only to be used in conjunction with the technologies which have been verified for use with biodiesel blends and are subject to the following requirements: http://www.arb.ca.gov/diesel/verdev/reg/biodieselcompliance.pdf

[54] https://www.northeastdiesel.org/pdf/construction/BestPractices4CleanDieselConstructionAug2012.pdf

[57] Cleaner Fuels, EPA, *available at:*https://www.epa.gov/verified-diesel-tech/learn-about-verified-technologies-clean-diesel#cleaner

emissions and should not impact engine or vehicle operation. [58] It should be noted that actual emissions reductions and costs will depend on specific manufacturers, technologies and applications.

Use Electric and Hybrid Construction Equipment

CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*[59] report also proposes the use of electric and/or hybrid construction equipment to mitigate DPM emissions. When construction equipment is powered by grid electricity rather than fossil fuel, direct emissions from fuel combustion are replaced with indirect emissions associated with the electricity used to power the equipment. When construction equipment is powered by hybrid-electric drives, emissions from fuel combustion are also greatly reduced. Electric construction equipment is available commercially from companies such as Peterson Pacific Corporation,[60] which specialize in mechanical processing equipment like grinders and shredders. Equipment powered by hybrid-electric drives is commercially available from companies such as Caterpillar.[61] For example, Caterpillar reports that during an 8-hour shift, its D7E hybrid dozer burns 19.5 percent fewer gallons of fuel than a conventional dozer while achieving a 10.3 percent increase in productivity. The D7E model burns 6.2 gallons per hour compared to a conventional dozer which burns 7.7 gallons per hour.[62] Fuel usage and savings are dependent on the make and model of the equipment.

Implement a Construction Vehicle Inventory Tracking System

CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*[63] report recommends that the Project Applicant provide a detailed plan that discusses a construction vehicle inventory tracking system to ensure compliances with construction mitigation measures. The system should include strategies such as requiring engine run time meters on equipment, documenting the serial number, horsepower, manufacture age, fuel, etc. of all onsite equipment and daily logging of the operating hours of the equipment. Specifically, for each on-road construction vehicle, nonroad construction equipment, or generator, the contractor should submit to the developer's representative a report prior to bringing said equipment on site that includes:[64]

- Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, and engine serial number.
- The type of emission control technology installed, serial number, make, model, manufacturer, and EPA/CARB verification number/level.

[64] Diesel Emission Controls in Construction Projects, *available at:*http://www2.epa.gov/sites/production/files/2015-09/documents/nedc-model-contract-sepcification.pdf

- The Certification Statement[65] signed and printed on the contractor's letterhead.

Furthermore, the contractor should submit to the developer's representative a monthly report that, for each on-road construction vehicle, nonroad construction equipment, or generator onsite, includes: [66]

- Hour-meter readings on arrival on-site, the first and last day of every month, and off-site date.
- Any problems with the equipment or emission controls.
- Certified copies of fuel deliveries for the time period that identify: source of supply, quantity of fuel, and quantity of fuel (including sulfur content as percent by weight).

Enhanced Exhaust Control Practices

In addition, we also recommend that the Project implement the following mitigation measures that are recommended by the Sacramento Metropolitan Air Quality Management District ("SMAQMD")[67]:

1. The project representative shall submit to the lead agency a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used an aggregate of 40 or more hours during any portion of the construction project.
    - The inventory shall include the horsepower rating, engine model year, and projected hours of use for each piece of equipment.
    - The project representative shall provide the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman.
    - This information shall be submitted at least 4 business days prior to the use of subject heavy-duty off-road equipment.
    - The inventory shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs.
2. The project representative shall provide a plan for approval by the lead agency demonstrating that the heavy-duty off-road vehicles (50 horsepower or more) to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project wide fleet-average 20% NOX reduction and 45% particulate reduction compared to the most recent California Air Resources Board (ARB) fleet average.
    - This plan shall be submitted in conjunction with the equipment inventory.
    - Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available.
    - The District's Construction Mitigation Calculator can be used to identify an equipment fleet that achieves this reduction.

---

[65] Diesel Emission Controls in Construction Projects, *available at:*http://www2.epa.gov/sites/production/files/2015-09/documents/nedc-model-contract-sepcification.pdf The NEDC Model Certification Statement can be found in Appendix A.

[66] Diesel Emission Controls in Construction Projects, *available at:*http://www2.epa.gov/sites/production/files/2015-09/documents/nedc-model-contract-sepcification.pdf

[67]http://www.airquality.org/ceqa/Ch3EnhancedExhaustControl_10-2013.pdf

3. The project shall ensure that emissions from all off-road diesel-powered equipment used on the project site do not exceed 40% opacity for more than three minutes in any one hour.
    - Any equipment found to exceed 40 percent opacity (or Ringelmann 2.0) shall be repaired immediately. Non-compliant equipment will be documented and a summary provided to the lead agency monthly.
    - A visual survey of all in-operation equipment shall be made at least weekly.
    - A monthly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey.
4. The District and/or other officials may conduct site inspections to determine compliance.

Use of Spray Equipment with Greater Transfer Efficiencies

Various coatings and adhesives are required to be applied by specified methods such as electrostatic spray, high-volume, low-pressure (HVLP) spray, roll coater, flow coater, dip coater, etc. in order to maximize the transfer efficiency. Transfer efficiency is defined as the ratio of the weight of coating solids adhering to an object to the total weight of coating solids used in the application process, expressed as a percentage. For spray applications, the rules typically require the use of either electrostatic spray equipment or HVLP spray equipment. Specifically, the SCAQMD has been able to certify HVLP spray applicators and other application technologies at efficiency rates of 65 percent or greater.[68] Thus, a revised CEQA evaluation should consider this measure to reduce air quality impacts.

These measures offer a cost-effective, feasible way to incorporate lower-emitting equipment into the Project's construction fleet, which reduces construction emissions. A revised CEQA evaluation should be prepared to include additional mitigation, as well as include an updated air quality analysis that ensures the necessary mitigation measures are implemented. The revised CEQA evaluation should also demonstrate a commitment to the implementation of these measures prior to Project approval to ensure that construction-related emissions are reduced to the maximum extent possible.

Feasible Mitigation Measures Available to Reduce Operational Emissions

In an effort to reduce the Project's operational emissions, we identified several mitigation measures that are applicable to the Project. Feasible mitigation measures can be found in CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures,* which attempt to reduce emissions.[69] Therefore, to reduce the Project's operational emissions, consideration of the following measures should be made:

- Integrate affordable and below market rate housing
- Energy-related mitigation:
    - Install programmable thermostat timers
    - Establish onsite renewable energy systems, including solar power and wind power
    - Limit outdoor lighting requirements

[68] http://www.aqmd.gov/home/permits/spray-equipment-transfer-efficiency
[69] http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

    - Reduce unnecessary outdoor lighting by utilizing design features such as limiting the hours of operation of outdoor lighting.
    - Provide education on energy efficiency to residents, customers, and/or tenants. Provide information on energy management services for large energy users.
    - Meet "reach" goals for building energy efficiency and renewable energy use.
    - Limit the use of outdoor lighting to only that needed for safety and security purposes.
    - Require use of electric or alternatively fueled sweepers with HEPA filters.
    - Include energy storage where appropriate to optimize renewable energy generation systems and avoid peak energy use.
    - Prohibit gas powered landscape equipment and implement electric yard equipment
- Transportation-related mitigation:
    - Provide EV parking
    - Require residential area parking permits
    - Implement ride-sharing, vanpool, shuttle, bike-sharing programs
    - Provide bike parking near transit
    - Provide local shuttles
    - Implement area or cordon pricing
    - Install a park-and-ride lot
- Water-related mitigation:
    - Install an infiltration basin to provide an opportunity for 100% of the storm water to infiltrate on-site.
    - Install a system to reutilize gray water
    - Use locally-sourced water supply
    - Plant native and drought-resistant trees and vegetation
- Develop and follow a "green streets guide" that requires:
    - Use of minimal amounts of concrete and asphalt;
    - Use of groundcovers rather than pavement to reduce heat reflection.[70]
- Implement Project design features such as:
    - Shade HVAC equipment from direct sunlight;
    - Install high-albedo white thermoplastic polyolefin roof membrane;
    - Install formaldehyde-free insulation; and
    - Use recycled-content gypsum board.
    - Require all buildings to become "LEED" and "WELL" certified.
- Plant low-VOC emitting shade trees, e.g., in parking lots to reduce evaporative emissions from parked vehicles.

[70] Cool Houston Plan; http://www.harcresearch.org/sites/default/files/documents/projects/CoolHoustonPlan_0.pdf

Finally, the Kimball Business Park Project Final Environmental Impact Report includes various feasible mitigation measures that would reduce on-site area emissions that are applicable to the proposed Project's retail land use, and include, but are not limited to:[71]

- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure/within the heating and cooling distribution system.
- Installation of dual-paned or other energy efficient windows.
- Installation of automatic devices to turn off lights where they are not needed.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduces emissions released during Project operation. A revised CEQA evaluation should be prepared to include additional mitigation measures, as well as include an updated air quality analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The revised CEQA evaluation should also demonstrate commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

[71] Mitigation Monitoring Plan for the Kimball Business Park Project Final Environmental Impact Report, July 2016.

AERSCREEN 16216

3440 Wilshire Operation

3440 Wilshire Operation

---------- DATA ENTRY VALIDATION ----------

	METRIC	ENGLISH
** AREADATA **	---	---
Emission Rate:	0.277E-02 g/s	0.220E-01 lb/hr
Area Height:	3.00 meters	9.84 feet
Area Source Length:	182.50 meters	598.75 feet
Area Source Width:	161.00 meters	528.22 feet
Vertical Dimension:	1.50 meters	4.92 feet
Model Mode:	URBAN	
Population:	3990000	
Dist to Ambient Air:	1.0 meters	3. feet

** BUILDING DATA **

No Building Downwash Parameters

** TERRAIN DATA **

No Terrain Elevations

Source Base Elevation: 0.0 meters 0.0 feet

Probe distance: 5000. meters 16404. feet

No flagpole receptors

No discrete receptors used

** FUMIGATION DATA **

No fumigation requested

** METEOROLOGY DATA **

Min/Max Temperature: 250.0 / 310.0 K -9.7 / 98.3 Deg F

Minimum Wind Speed: 0.5 m/s

Anemometer Height: 10.000 meters

Dominant Surface Profile: Urban

Dominant Climate Type: Average Moisture

Surface friction velocity (u*): not adjusted

DEBUG OPTION ON

AERSCREEN output file:

2020.04.14_3440Wilshire_Operational.out

*** AERSCREEN Run is Ready to Begin

No terrain used, AERMAP will not be run

3440 Wilshire Boulevard Future

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	1,921.00	Space	1.00	768,400.00	0
Fast Food Restaurant w/o Drive Thru	2.00	1000sqft	0.05	2,000.00	0
High Turnover (Sit Down Restaurant)	4.60	1000sqft	0.09	4,600.00	0
Apartments High Rise	640.00	Dwelling Unit	1.10	701,315.00	1830
Strip Mall	5.54	1000sqft	0.09	5,538.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	11			**Operational Year**	2026
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

3440 Wilshire Boulevard Future - Los Angeles-South Coast County, Annual

Project Characteristics -

Land Use - Consistent with IS/MND's model.

Construction Phase - See SWAPE comment about construction schedule.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Same as Tower 1 Construction.

Off-road Equipment - Same as Tower 1 Construction.

Trips and VMT - See SWAPE comment about hauling, vendor, and worker trips.

Demolition - Consistent with IS/MND's model.

Grading - See SWAPE comment about acres of grading. Material export consistent with IS/MND's model.

Vehicle Trips - See SWAPE comment about trip rates.

Woodstoves - Consistent with IS/MND's model.

Construction Off-road Equipment Mitigation - See SWAPE comment about construction-related mitigation measures.

1.3 User Entered Comments & Non-Default Data

3440 Wilshire Boulevard Future - Los Angeles-South Coast County, Summer

Project Characteristics -

Land Use - Consistent with IS/MND's model.

Construction Phase - See SWAPE comment about construction schedule.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Consistent with IS/MND's model.

Off-road Equipment - Same as Tower 1 Construction.

Off-road Equipment - Same as Tower 1 Construction.

Trips and VMT - See SWAPE comment about hauling, vendor, and worker trips.

Demolition - Consistent with IS/MND's model.

Grading - See SWAPE comment about acres of grading. Material export consistent with IS/MND's model.

Vehicle Trips - See SWAPE comment about trip rates.

Woodstoves - Consistent with IS/MND's model.

Construction Off-road Equipment Mitigation - See SWAPE comment about construction-related mitigation measures.

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education:

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on VOC filtration.
M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.
B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience:

Dr. Rosenfeld is the Co-Founder and Principal Environmental Chemist at Soil Water Air Protection Enterprise (SWAPE). His focus is the fate and transport of environmental contaminants, risk assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling, oil spills, boilers, incinerators and other industrial and agricultural sources relating to nuisance and personal injury. His project experience ranges from monitoring and modeling of pollution sources as they relate to human and ecological health. Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing petroleum, chlorinated solvents, pesticides, radioactive waste, PCBs, PAHs, dioxins, furans, volatile organics, semi-volatile organics, perchlorate, heavy metals, asbestos, PFOA, unusual polymers, MtBE, fuel oxygenates and odor. Dr. Rosenfeld has evaluated greenhouse gas emissions using various modeling programs recommended by California Air Quality Management Districts.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist
Bureau of Land Management, Kremmling Colorado 1990; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993.

Deposition and/or Trial Testimony:
