GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage, or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurement are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, and the samplers initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging, and Sampling

The sequence in which monitoring activities are conducted are specified on the TSR. In general, wells are gauged beginning with the least-affected well and ending with the well that has highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected well to the most-affected well.

Decontamination

In order to reduce the possibility of cross-contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated to a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

LIMITATIONS

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.

Summary of Gauging and Sampling Activities
January 2007 through March 2007
76 Station 0981
1004 South La Cienega Boulevard
Los Angeles, CA

Project Coordinator: **Shari London**
Telephone: **714-428-7720**
Water Sampling Contractor: ***TRC***
Compiled by: **Alma Montaño**
Date(s) of Gauging/Sampling Event: **01/15/07**

Sample Points

Groundwater wells: **9** onsite, **5** offsite Wells gauged: **12** Wells sampled: **3**
Purging method: **Submersible pump**
Purge water disposal: **Crosby and Overton treatment facility**
Other Sample Points: **0** Type: **n/a**

Liquid Phase Hydrocarbons (LPH)

Wells with LPH: **0** Maximum thickness (feet): **n/a**
LPH removal frequency: **n/a** Method: **n/a**
Treatment or disposal of water/LPH: **n/a**

Hydrogeologic Parameters

Depth to groundwater (below TOC): Minimum: **13.5 feet** Maximum: **16.35 feet**
Average groundwater elevation (relative to available local datum): **110.96 feet**
Average change in groundwater elevation since previous event: **0.74 feet**
Interpreted groundwater gradient and flow direction:
Current event: **0.01 ft/ft, northeast and southeast**
Previous event: **0.02 ft/ft, southwest (10/16/06)**

Selected Laboratory Results

Wells with detected **Benzene:** **3** Wells above MCL (1.0 µg/l): **3**
Maximum reported benzene concentration: **1,600 µg/l (BC-5)**

Wells with	**TPH-G by GC/MS**	**3**	Maximum: **6,000 µg/l (BC-5)**
Wells with	**MTBE**	**3**	Maximum: **470 µg/l (BC-5)**
Wells with	**TBA 8260B**	**3**	Maximum: **1,600 µg/l (BC-5)**

Notes:

BC-11=Sampled Q2 and Q4 only, BC-13=Sampled Q2 and Q4 only, BC-14=Dry well, BC-15=Inaccessible, BC-7=Dry well, BC-8=Sampled Q2 and Q4 only, BC-9=Sampled Q2 and Q4 only, MW-1=Port dry, MW-18=Inaccessible, MW-19=Inaccessible, MW-2=Port sample, MW-20=Port dry,

This report presents the results of groundwater monitoring and sampling activities performed by TRC. Please contact the primary consultant for other specific information on this site.

TABLES

TABLE KEY

STANDARD ABBREVIATIONS

--	=	not analyzed, measured, or collected
LPH	=	liquid-phase hydrocarbons
Trace	=	less than 0.01 foot of LPH in well
µg/l	=	micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	=	milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	=	not detected at or above laboratory detection limit
TOC	=	top of casing (surveyed reference elevation)

ANALYTES

BTEX	=	benzene, toluene, ethylbenzene, and (total) xylenes
DIPE	=	di-isopropyl ether
ETBE	=	ethyl tertiary butyl ether
MTBE	=	methyl tertiary butyl ether
PCB	=	polychlorinated biphenyls
PCE	=	tetrachloroethene
TBA	=	tertiary butyl alcohol
TCA	=	trichloroethane
TCE	=	trichloroethene
TPH-G	=	total petroleum hydrocarbons with gasoline distinction
TPH-G (GC/MS)	=	total petroleum hydrocarbons with gasoline distinction utilizing EPA Method 8260B
TPH-D	=	total petroleum hydrocarbons with diesel distinction
TRPH	=	total recoverable petroleum hydrocarbons
TAME	=	tertiary amyl methyl ether
1,1-DCA	=	1,1-dichloroethane
1,2-DCA	=	1,2-dichloroethane (same as EDC, ethylene dichloride)
1,1-DCE	=	1,1-dichloroethene
1,2-DCE	=	1,2-dichloroethene (cis- and trans-)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation – Measured Depth to Water + (Dp x LPH Thickness), where Dp is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A "J" flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.
8. Groundwater vs. Time graphs may be corrected for apparent level changes due to resurvey.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurements are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, sample time, and the sampler's initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging and Sampling

The sequence in which monitoring activities are conducted are specified on the TSR. In general, wells are gauged beginning with the least affected well and ending with the well that has the highest concentration based on previous analytic results. After all gauging for the site is completed , wells are purged and/or sampled from the least-affected to the most-affected well.

Decontamination

In order to reduce the possibility of cross contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated to a particular wells, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

LIMITATIONS

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.

April 10, 2009

Mr. Daniel Pirotton
California Regional Water Quality Control Board

1004 South La Cienega Boulevard
Los Angeles, California
LARWQCB / EAOP File No. 900350016

DELTA

Dear Mr. Pirotton:

On behalf of ConocoPhillips, Delta Consultants (Delta) is pleased to present this *First Quarter 2009 Site Status Report* for 76 Service Station No. 250981, located at 1004 South La Cienega Boulevard in Los Angeles, California (the Site). This Site has been included in the Los Angeles Regional Water Quality Control Board (LARWQCB) Expedited Agency Oversight Program (EAOP).

BACKGROUND

In March 1986, four groundwater monitoring wells (B1, MW-1, MW-2, and B4) and one soil boring (B5) were drilled. In March 1987, two 10,000-gallon gasoline underground storage tanks (USTs) and one waste-oil UST were excavated and removed from the Site. The two gasoline USTs were replaced with two 12,000-gallon, double-walled, fiberglass-coated, steel USTs. Monitoring wells B1 and B4 were damaged during UST replacement activities and were subsequently abandoned. Hydrocarbon-affected soil was detected in soil samples collected from beneath the former gasoline USTs.

From January through July 1988, six on-site (BC-5 through BC-9 and BC-14) and four off-site (BC-10 through BC-13) groundwater monitoring wells were installed. In August 1992, two additional off-site groundwater monitoring wells (BC-15 and BC-16) were installed. In August 1997, off-site monitoring well MW-17 was installed, and in March 2000, off-site monitoring well MW-18 was installed southeast of the Site in Alfred Street. Fluid level monitoring and groundwater sampling have been performed at the Site on a quarterly, or more frequent, basis since February 1988 and continue to the present. Groundwater has historically occurred at depths of approximately 10.70 to 18 feet below ground surface (bgs), with a gradient predominantly directed to the south-southeast. Dissolved-phase petroleum hydrocarbons and liquid-phase hydrocarbons (LPH) have

911 South Primrose Suite K Monrovia, California 91016 USA
Phone: 626.256.6662 / 800.477.7411 Fax: 626.256.6263
www.deltaenv.com

been detected beneath the Site. From May 1989 to November 2004, LPH accumulations were manually recovered from on-site groundwater monitoring wells.

In July 1997, July 1998, and January 1999, dual-phase extraction (DPE) tests were performed at the Site, and approximately 650 pounds of hydrocarbons were recovered and destroyed. In addition, DPE tests were performed on a monthly basis during the fourth quarter of 1999. During this time, approximately 1,527 pounds of hydrocarbons were removed and destroyed. In total, approximately 2,178 pounds of hydrocarbons have been removed and destroyed from the Site via DPE activities.

In November 2002, recovery well MW-20 and vapor well VW-1 were drilled and installed in the southeast corner of the Site and adjacent to the western dispenser island, respectively.

In July 2003, off-site monitoring wells BC-10, BC-12, BC-16, and MW-17 were abandoned prior to redevelopment of the property located adjacent and south of the Site.

In September 2003, redevelopment of the property located adjacent to the Site (Ships Center property) was initiated. Excavation and soil handling activities were conducted in accordance with South Coast Air Quality Management (SCAQMD) Rule 1166 soil monitoring requirements.

In November 2005, TRC completed repairs to the Ships Center piping and the groundwater treatment system at the Site enabling the acceptance of groundwater from the basement sump in the Ships Center building. A total of approximately 8,175 tons of hydrocarbon-affected soil and 48,500 gallons of hydrocarbon-affected groundwater were removed from the Ships Center property during redevelopment activities.

In May 2007, off-site monitoring wells MW-21 and MW-22 were installed east and southeast of the Site. A maximum detectable total petroleum hydrocarbons as gasoline (TPH-g) concentration of 33 milligrams per kilogram (mg/kg) was present in the soil sample collected from monitoring well MW-21 at approximately 16.50 feet bgs. A maximum detectable benzene concentration of 0.0074 mg/kg was present in the soil sample collected from monitoring well MW-21 at approximately 21.50 feet bgs. No detectable concentrations of methyl tertiary butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), tertiary butyl alcohol (TBA), or ethanol were present in soil samples collected from monitoring wells MW-21 and MW-22.

On July 25, 2007, the TRC *Well Installation Report* summarizing well installation activities was submitted to the LARWQCB.

Consulting services for this Site were transferred from TRC to Delta on November 1, 2007.

Delta redeveloped the on-site groundwater monitoring wells on July 21, 2008 due to silting.

On October 24, 2008, Cascade Drilling, Inc., supervised by a staff geologist, abandoned groundwater monitoring well B-1. B-1 was abandoned by over drilling the entire well to a total depth of approximately 40 feet bgs. The open borehole was then backfilled with bentonite grout, to within approximately 1 foot of the surface. The bore hole was then capped and sealed with concrete to match the grade.

PROGRESS THIS QUARTER

On January 20, 2009, the *Well Abandonment Report* summarizing the October 2008 drilling activities was submitted to the LARWQCB.

Groundwater Monitoring and Sampling

Groundwater monitoring and sampling for the first quarter of 2009 was performed by TRC on January 8, 2009. A copy of the *Quarterly Monitoring Report, January through March 2009* prepared by TRC, dated February 11, 2009 is attached.

Depth to groundwater ranged from 13.49 feet below top of casing (TOC) to 16.93 feet below TOC. Groundwater elevation has increased an average of 0.74 feet to 110.37 feet above mean sea level from the previous quarter. Groundwater gradient was 0.015 feet per foot (ft/ft) with flow at northeast to the southeast. The previous quarter flow was to the southeast with a gradient of 0.05 ft/ft to the southeast.

Of the 14 groundwater monitoring wells (11 on-site and 3 off-site), only 9 wells could be sampled. In wells BC-8, BC-9, BC-11, BC-13, and MW-18 samples were only taken for second quarter of 2008 and the fourth quarter of 2008. Of the nine wells sampled, eight had concentrations of benzene greater than the maximum contaminant level of 1.0 microgram per liter (µg/L). TPH-g was found in nine groundwater monitoring wells, MTBE was found in six monitoring wells, and TBA was detected in three wells at the Site.

Groundwater monitoring well BC-5 contained the maximum concentrations of TPH-g (27,000 µg/L), benzene (8,000 µg/L), ethyl-benzene (1,600 µg/L), and total xylenes (3,900 µg/L). Groundwater monitoring well MW-21 had the highest concentration of toluene (740 µg/L). BC-7 had the highest concentration of MTBE (1,100 µg/L) and TBA (5,100 µg/L). Concentrations of DIPE, ETBE, TAME, and ethanol were below the laboratory's minimum detection limits for all the groundwater monitoring wells sampled at the Site.

The *Dissolved-Phase TPH-g*, *Benzene*, *MTBE*, and *TBA Concentration Maps* (Figures 3 through 6, TRC's *Quarterly Monitoring Report)* indicate that the lateral extent of the plume is not defined.

REMEDIATION SYSTEM UPDATE

The vapor extraction system has been operational at the Site since July 7, 2004. For the first quarter 2009, ESC reported that a total of 143 pounds of hydrocarbons were removed. The soil vapor extraction system operated for 1,508 hours from December 1, 2008 through February 28, 2009. The average hydrocarbon recovery for the first quarter 2009 was 0.095 pounds per hour (lbs/hr). To date, a total of 69,303 lbs of fuel hydrocarbons have been recovered since startup in July 2004. As of February 28, 2009, total system operation time has been 34,887 hours.

In November 2004, a groundwater treatment system began operation at the Site. During the period of December 1, 2008 through February 28, 2009, 46,341 gallons of groundwater were processed. Since startup, the treatment system has processed 1,848,032 gallons of water.

On October 13, 2008 the system was shut-off due to construction activities on-site. The system was subsequently restarted on January 5, 2009.

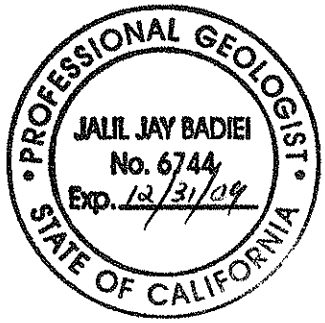
PLANNED PROGRESS NEXT QUARTER

Activities planned for the next quarter include:

- Continue quarterly groundwater monitoring and sampling;
- Continue operation of the vapor extraction and groundwater treatment system;
- Continue submitting quarterly status reports to the LARWQCB; and,
- ConocoPhillips and Delta will conduct a system performance review.

LIMITATIONS

The findings contained in this report represent Delta's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. This report is based upon a specific scope of work requested by the client. The Contract between Delta and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Delta's Client and anyone else specifically listed on this report. Delta will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Delta makes no express or implied warranty as to the contents of this report.



CLOSING REMARKS

This report has been prepared under the supervision of a California Registered/Certified Professional.

If yon have any questions regarding this report or need any additional information about this Site, please do not hesitate to contact Mr. Robert Baker at (626) 873-2731 or Ms. Shari London of ConocoPhillips at (714) 428-7720.

Sincerely,

DELTA CONSULTANTS

Jay Badiei, P.G.
Senior Project Geologist

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by B.H.A.S.A.L. to conduct a Preliminary Site Investigation (Phase II) on the property located at 1022-1026 La Cienega Blvd., Los Angeles, CA 90035 and report the findings (maps 1, 2).

Briefly, a auto repair shop operated on 1032 La Cienega Blvd. from the 1960's until 2007. This facility had 7 in-ground hoists. A visual inspection of the property located the former waste oil storage area, a sump, and a hole in the ground. There are 2 groundwater monitoring wells on the 1026 La Cienega property. These wells are part of a on-going groundwater cleanup on the 76 station that is located on the southeast corner of Olympic and La Cienega.

This investigation was conducted to obtain information on the subsurface soils and groundwater. The primary chemicals of concern are gasoline and it's additives in the groundwater, and hydrocarbons, primarily hydraulic fluid, in the soils.

SCOPE OF INVESTIGATION

This investigation was conducted without the oversight of a Government agency but in accordance with the "Interim Site Assessment & Cleanup Guidebook", as published by the CA Regional Water Quality Control Board - Region 4 (RWQCB) in May, 1996. This guidebook provides standards and protocols for subsurface

investigations of this type. It is intended to assess the chemical contamination of property and potential impact to ground water resources.

A Geoprobe was used to drill eleven soil borings. A description of the Geoprobe method of drilling and sampling is presented in the Appendix. Each soil boring was backfilled with bentonite clay, and patched on the surface with concrete. The location and depth of each soil boring is presented on map 2b.

Soil Boring	Location	Sample Depth in feet
B1	former hoist	12
B2	former hoist	12
B3	former hoist	12
B4	former hoist	12
B5	former hoist	10
B6	this soil boring was determined as unnecessary and not drilled	
B7	former sump	5
B8	former hoist	10
B9	former hoist	10
B10	former hole in the ground	5
B11	former hole in the ground	5
B12	waste oil storage area	5

Chain of Custody was maintained between the sampler and the analytical testing laboratory. The groundwater samples were analyzed for EPA Method 8260B (Volatile Organic Compounds) and EPA Method 8015g (Total Petroleum Hydrocarbons as gasoline). The soil samples were analyzed for EPA Method 8015M carbon chain (Total Petroleum Hydrocarbons by Carbon Range). EPA Method 8260B is specific to the additives in gasoline. EPA Method 8015M reports each range of hydrocarbons specific to gasoline, diesel, and heavy oils.

Analytical work was conducted by a State of California approved hazardous waste testing laboratory. The laboratory performed routine level Quality Assurance/Quality Control (QA/QC).

The seven former underground hoists were triple rinsed and disposed of off-site as scrap metal. The manifest for the rinseate and destruction certificate is included in the Appendix.

NEI geologist Gary Mann (California Professional Geologist #6589), supervised project protocol and report preparation. Logistics, communications, and field activities were conducted by NEI staff geologist Robert Maikisch (CA REA II #20190).

FINDINGS

Sediment:

The Unified Soils Classification System (USCS) is a standard system of describing sediments. It was first presented by the United States Army Corps of Engineers in 1953. A copy is presented in the Appendix. Refined Geologic Logs were prepared using the USCS, from splits of each soil sample.

The sediments encountered in the upper 10 feet are generally described as a brown, fine to medium sized, well rounded grains, very well sorted, silty, Sand and classified as SM by the USCS.

There are clay lenses and areas with coarser sands and fine gravel. This suggest this area was part of a migrating stream channel, and consistent with the historic aerial photograph of this area (historic photo 1928). The sediment is considered native and is consistent with the local geology. The local geologic setting is a Recent (Holocene) age alluvium (map 3).

Recent Alluvium is described as poorly sorted, unconsolidated, interbedded, sand, gravel, silt, and clay. The Recent geologic epoch is considered to represent the sediments that have accumulated during the previous 11,000 years.

Ground Water:

The depth to the aquifer is usually estimated by subtracting the elevation of the ground water table from the elevation of the site. The elevation of the site is obtained from the Hollywood topographic quadrangle published by the United States Geological Survey (map 4). The is no map available that displays the elevation of the ground water in this area. In this case the depth to groundwater was measured from the monitoring wells on the property. It is 16 feet deep.

The property is located in the Central Basin Pressure Area of the Central Basin (map 5). The Central Basin of the Coastal Plain is bordered by the Hollywood Basin on the north. The Pacific Ocean on the south, and the Newport-Inglewood uplift on the west. The east boundary is made up by the Repetto Hills and the Santa Fe Springs-Coyote Uplift. The hills of the Los Angeles area comprise

the lateral extent to the northeast.

The basin is a single structural unit with no obstructions to the flow of ground water. It is comprised of the alluvial cones of three major rivers and the smaller streams that discharge onto the plain forming compound alluvial cones. The four subdivisions of the basin are the Los Angeles Forebay Area, the Montebello Forebay Area, the Whittier Area, and the Central Basin Pressure Area.

The Central Basin Pressure Area is characterized by the ground water aquifers being contained by alternating layers of impermeable strata (clay layers). The historic natural ground water flow direction in this area is southwest. It is flowing in accordance with the natural topography and around the La Brea High (map 3a). The La Brea High is the formation labeled Qc on the geologic map.

Screening Levels:

The Action Level is the level at which action must be taken to protect human health and the environment. This is calculated by using Screening Levels obtained from the California Regional Water Quality Control Board (RWQCB), and the CA Department of Toxic Substances Control (DTSC).

The Screening Level for solvents in soil is determined by comparing a RWQCB calculated Attenuation Factor, the Maximum Contaminant Level (MCL), the depth to ground water, and the sediment type. The MCL's are obtained from California Code of

Regulations (CCR), Title 22. Table 2 in the Appendix presents the Attenuation Factors and MCL's. This basically involves multiplying the Maximum Contaminant Level (MCL) by the Attenuation Factor.

The Screening Level for hazardous concentrations of metals in soil is determined by using DTSC standards as published in CCR, Title 22. A summary is presented in the Appendix (Table 3). Table 3 also presents the average background concentration of metals in Western U.S. sediments. It basically sets limits on how much metal a sediment may contain before it is considered hazardous in California. DTSC in general works on a site by site basis, but this is a appropriate screening tool.

The Screening Level for hydrocarbons and the BTEX (Benzene, Toluene, Ethylbenzene, Xylene) compounds in soils is determined from Table 4.1 of the "Interim Site Assessment & Cleanup Guidebook" as published by the RWQCB. It is determined by comparing the hydrocarbon range, sediment type, and the depth to the ground water. It is presented for reference in the Appendix.

Analytical:

The Chain-of-Custody and Analytical Results from this investigation are presented in the Appendix.

TABLE 1

The analytical results are summarized for review: **nd** = not detected at the method reporting limit; - = not analyzed; AL = Action Level; MCL = Maximum Contaminant Level; **ppm** = parts per million; **ppb** = parts per billion; 1 ppm = 1000 ppb; * = See Below. Results in bold face type exceed Action Level/MCL.

CONCLUSIONS

Non-detectable concentrations of solvents and gasoline were reported in the groundwater.

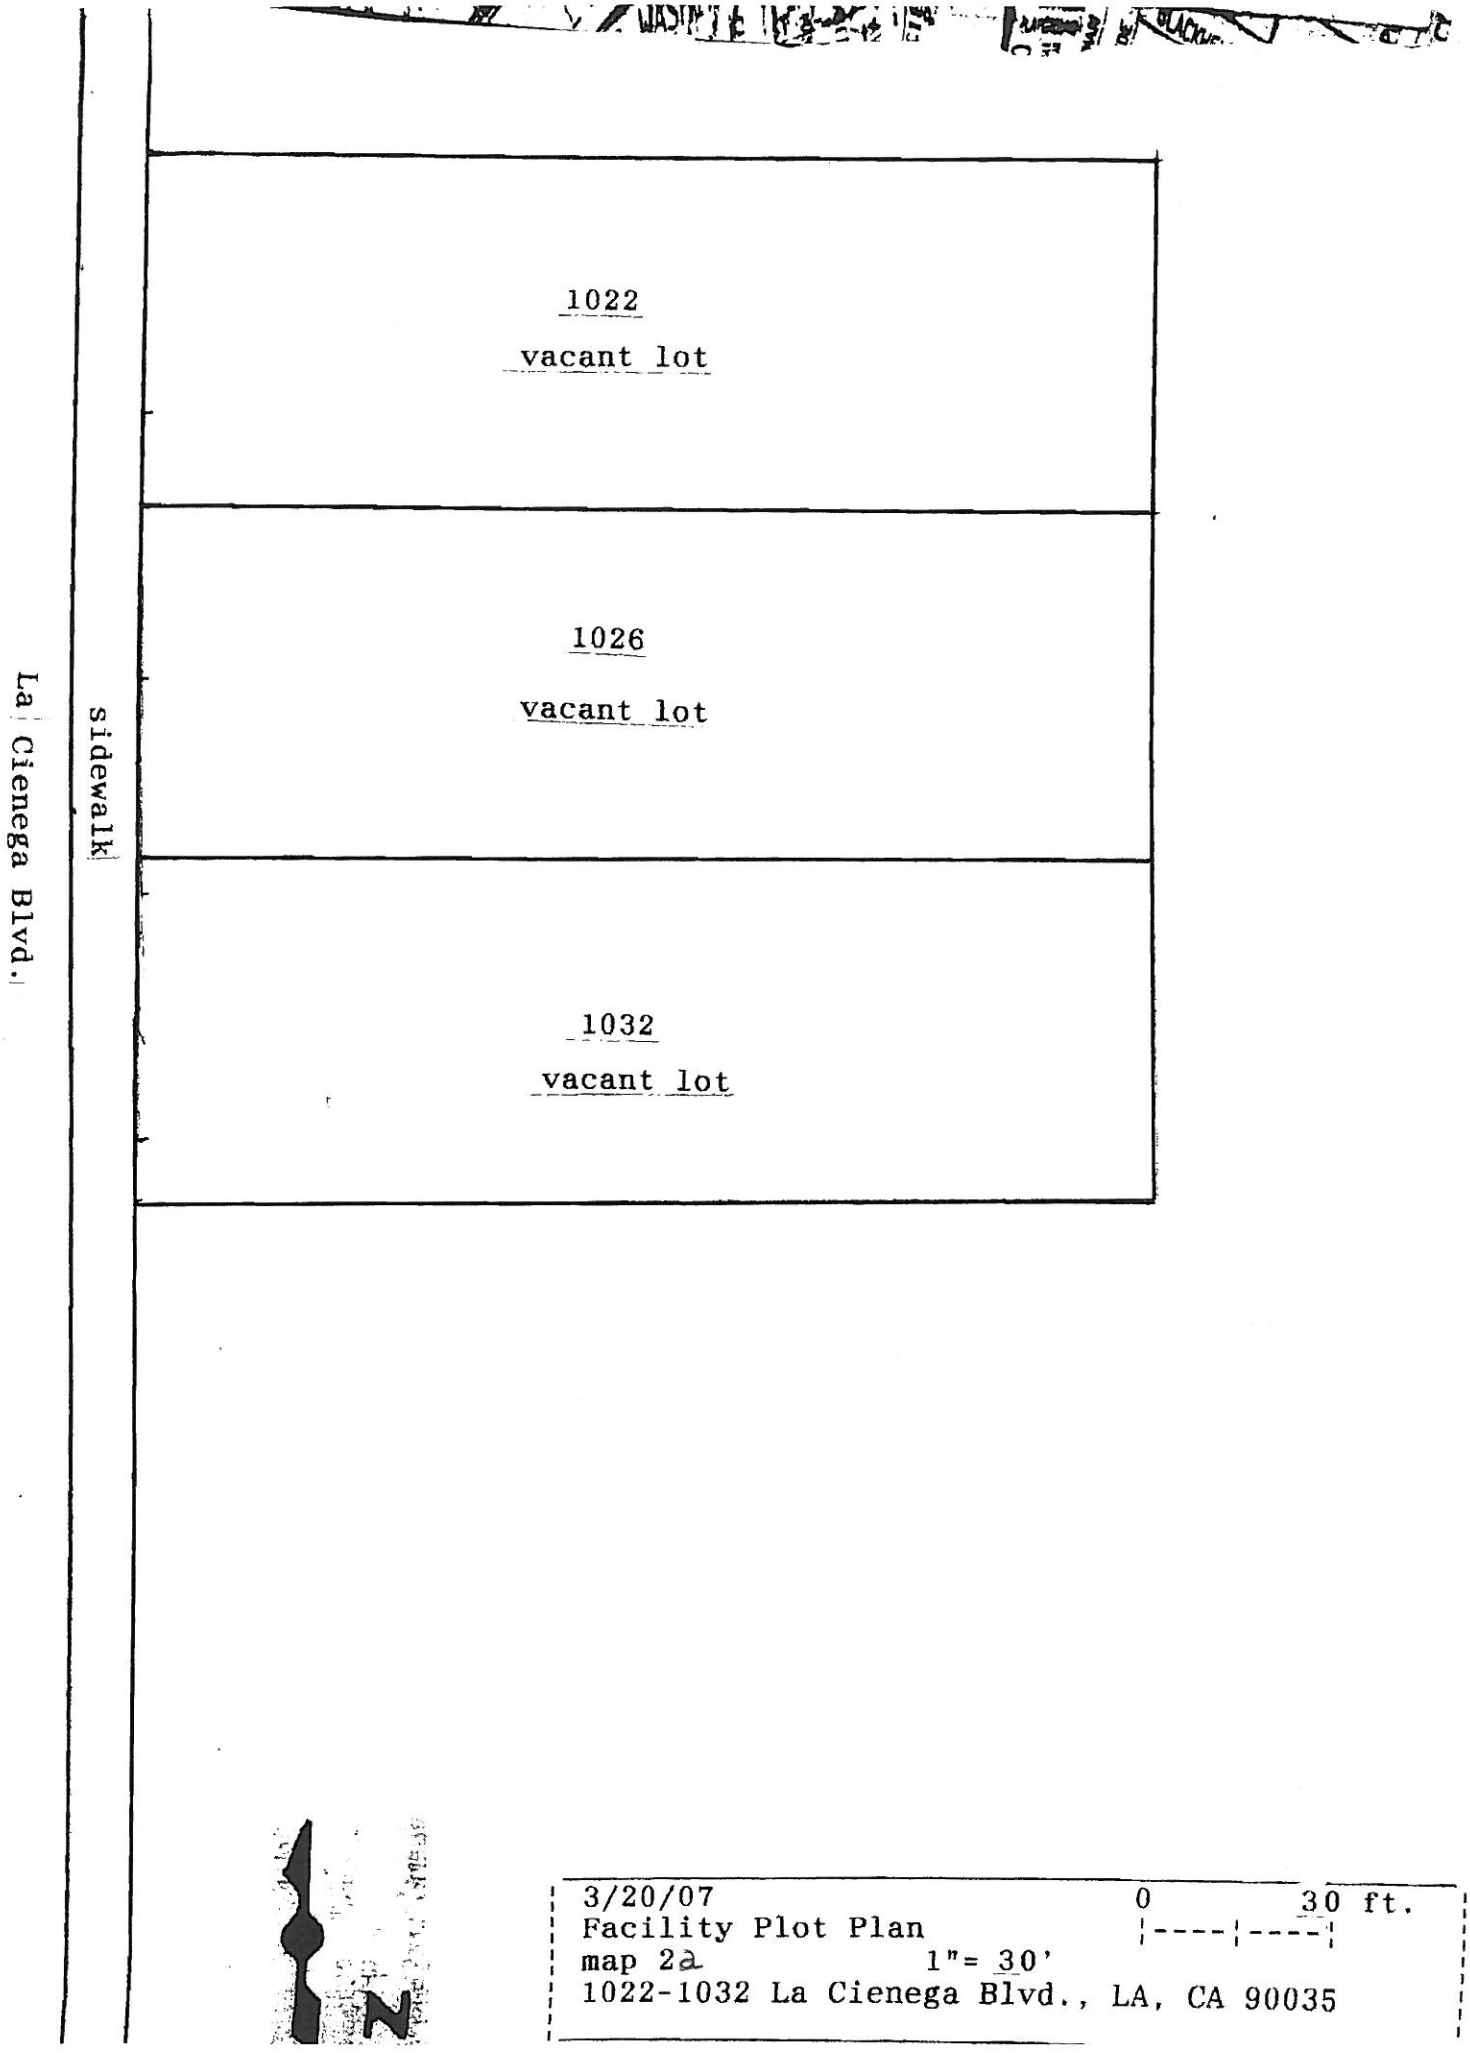
Non-detectable concentrations of gasoline, diesel fuel, and heavy oils were reported under the former hoists, in the former sump area, in the former waste oil storage area, and near a former hole in the ground.

Environmental impact has not occurred as a result of the former auto repair operation on the property. There is no threat to human health or the environment.

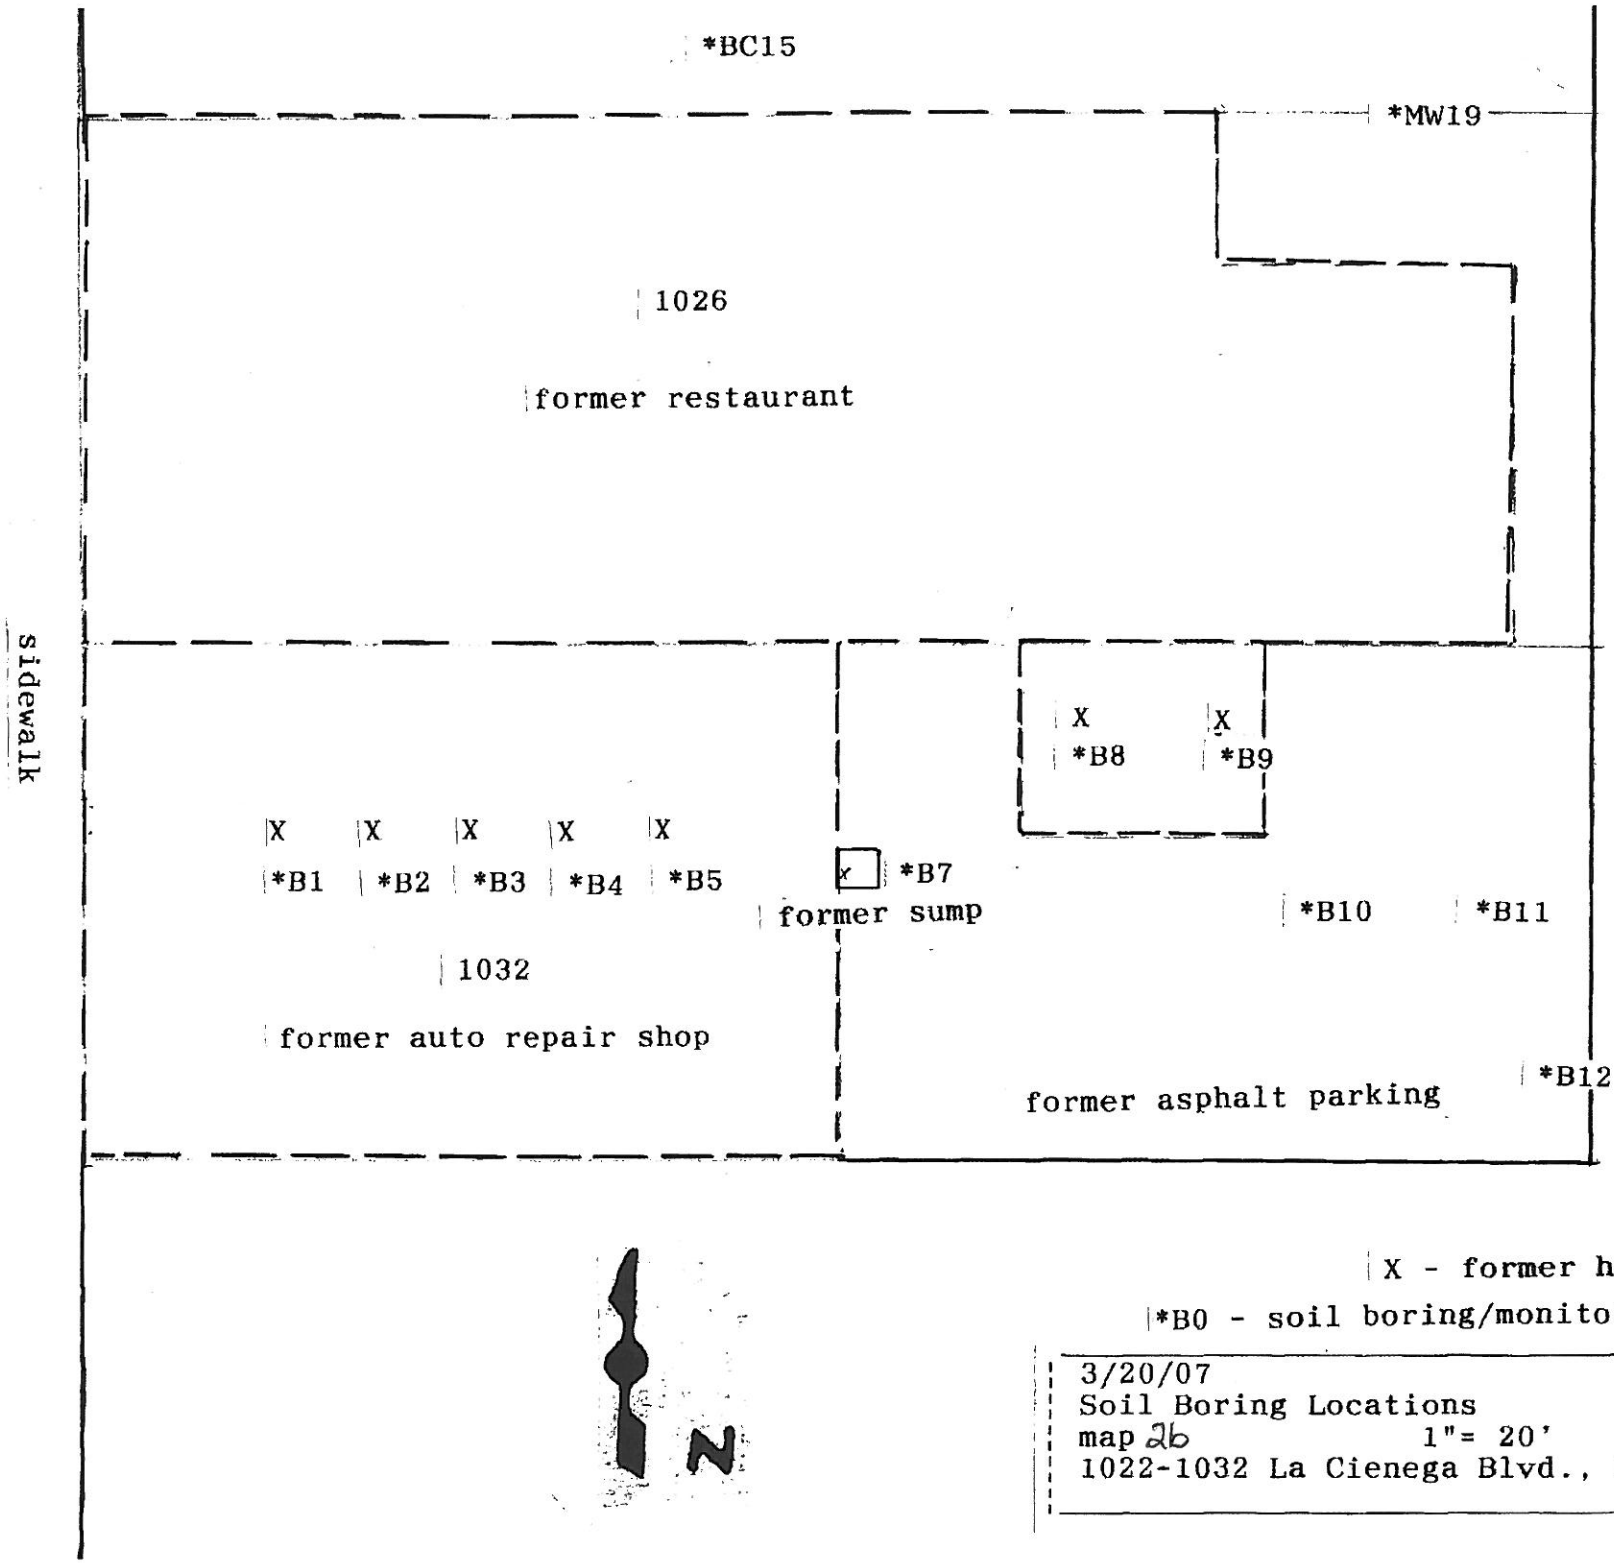
RECOMMENDATIONS

We recommend no additional environmental assessment work be required on the subject property at this time.

LIMITATIONS



This report has been prepared to impart accurate information concerning the procedures and findings of this action. The conclusions in this report are based upon the field methods, field observations, and analytical results as stated in the Scope of Investigation. No representation, warranties, or guaranties are given with respect to concealed or latent environmental impacts outside the documented Scope of Investigation.



CONFIDENTIALITY AGREEMENT

National Environmental, Inc. hereby agrees not to release this report, any portion of this report, or the results of the investigation to any party, except as required by law, without written/verbal consent from B.H.A.S.A.L. and Mr. Dean Isaacson.

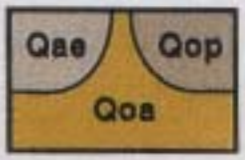
HOLLYWOOD—BURBANK (South 1/2) QUADRANGLES

LEGEND

SURFICIAL SEDIMENTS



unconsolidated detrital sediments; generally undissected

af *artificial cut and fill* **Qls** *landslide debris*

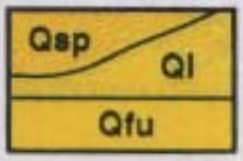
Qg *gravel and sand of major stream channels*

Qc *clay and sand of pre-development marshlands*

Qa *alluvium: clay, sand and gravel; includes gravel and sand of minor stream channels*

OLDER SURFICIAL SEDIMENTS

unconsolidated to weakly consolidated; dissected and eroded where elevated; late Pleistocene age



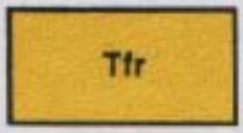
Qae *similar to* **Qa**, *but slightly elevated and dissected; includes alluvial fan sediments*

Qop *paleosoil in Baldwin Hills (Fox Hills residual paleosoil of Weber et al. 1982); moderately indurated, erosion-resistant, gray to rusty brown pebbly and sandy paleosoil or "hardpan" on* **Qoa**

Qoa *older alluvium, gray to light brown pebble-gravel, sand, silt, and clay of detritus derived from Santa Monica Mountains; similar to* **Qae**, *but slightly consolidated; in Baldwin Hills designated as Baldwin Hills sandy gravel (Weber et al. 1982), where it is much dissected and eroded*

—UNCONFORMITY—

in mountain areas



SHALLOW MARINE SEDIMENTS

shallow marine clastic sediments exposed in Baldwin Hills; weakly consolidated, eroded; Pleistocene age

Qsp *San Pedro Sand (of Wright 1987; Culver Sand of Weber et al. 1982): light gray to light brown sand, fine to coarse grained, pebbly; locally contains shell fragments*

Ql *Inglewood Formation (of Wright 1987; Weber et al. 1982): light gray, friable; fine grained sandstone and interbedded soft gray siltstone*

Qfu *upper Fernando (?) Formation (part of Inglewood Formation of Weber et al. 1982; Wright 1987): soft gray massive silty claystone, base not exposed*

FERNANDO FORMATION

(of Lamar 1970)

marine clastic; early Pliocene age (Repettian Stage)

Tfr *Repetto Member (Lamar 1970): in downtown Los Angeles, consolidated but crumbly gray to greenish-gray claystone-siltstone, in part sandy; vaguely bedded, locally fossiliferous*

10	1	1	1	7

* - CA Regional Water Quality Control Board, "Interim Site Assessment and Cleanup Guidebook", February, 1995.

1) The Cleanup Level for volatile organic compound (VOC) impacted soil is calculated from the attenuation factors on the above table and the maximum concentration limit (MCL).

2) The MCL's are obtained from California Code of Regulations (CCR), Title 22.

3) The Cleanup Level is obtained by multiplying the AF by the MCL. This is compared to the actual concentration of the chemical present in the sediment.

4) If the Cleanup Levels are above the actual concentrations in the sediment, Remedial Action may not be necessary.

TABLE 2: MCL, Koc, K_H, MAXIMUM VALUES OF ATTENUATION FACTOR FOR COMMON VOCs

Comparison of MCLs and PHGs

Maximum Contaminant Levels (MCLs)—health-protective **drinking water standards**—adopted by DHS are to be met by public water systems. MCLs take into account not only chemicals' health risks but also factors such as their detectability and treatability, as well as the costs of treatment. Health and Safety Code §116365(a) requires DHS to establish a contaminant's MCL at a level as close as is technically and economically feasible to its public health goal (PHG), placing primary emphasis on the protection of public health.

Health and Safety Code §116365(c) requires the **Office of Environmental Health Hazard Assessment** (OEHHA) to establish PHGs, which are concentrations of drinking water contaminants that pose no significant health risk if consumed for a lifetime, based on current risk assessment principles, practices, and methods. PHGs are established for (1) contaminants with MCLs, and (2) contaminants for which DHS will be adopting MCLs, *e.g.*, **perchlorate** and **chromium-6**.

Water systems also use PHGs to provide information about drinking water contaminants in annual **Consumer Confidence Reports**. Certain public water systems must provide a report to their customers about health risks from a contaminant that exceeds its PHG and about the cost of treatment to meet the PHG, and hold a public hearing on the report.

Once OEHHA establishes or revises a PHG for a contaminant with an MCL, DHS determines whether the MCL should be considered for possible revision. DHS subsequently conducts an in-depth risk management analysis to determine whether or not to propose a revision. For more information, see **MCL review status**.

The following table compares MCLs and PHGs and includes each contaminant's Detection Limit for Purposes of Reporting (DLR)—the level at which DHS is confident about the quantification of the chemical's presence. Analytical data are required to be submitted to DHS if they are at or above the DLR. Some data may be reported at levels below the DLR.

Comparisons of PHGs, DLRs, and MCLs. Also included at results of drinking water source monitoring. Units are in milligrams per liter (mg/L), unless otherwise noted. For more about PHGs, go to **OEHHA's website**. Also, see **MCL review status**

Table 3 *

Action Levels for Metals

Total Threshold Limit Concentration - (TTLC)
Soluble Threshold Limit Concentration - (STLC)

Action Levels in parts per million (ppm).

Metal	TTLC	STLC
Antimony	500	15
Arsenic	500	5
Barium	10,000	100
Beryllium	75	0.75
Cadmium	100	1
Chromium VI	500	5
Chromium III	2,500	560
Cobalt	8,000	80
Copper	2,500	25
Flouride	18,000	180
Lead	1,000	5
Mercury	20	0.2
Molybdenum	3,500	350
Nickel	2,000	20
Selenium	100	1
Silver	500	5
Thallium	700	7
Vanadium	2,400	24
Zinc	5,000	250

* California Code of Regulations (CCR), Title 26

1) If the TTLC value of the sample is above the TTLC Action Level, the material is classified as hazardous.

2) If the TTLC value of the sample is between the TTLC and the STLC Action Levels, a STLC analyses must be run to determine if the material is hazardous.

3) If The STLC value of the sample is above the STLC ACtion Level, the material is classified as hazardous.

4) The STLC can not exceed more than 10% of the TTLC value. This is due to a laboratory dilution factor.

5) If the 10% value of the TTLC is above the STLC Action Level, the material is theoretically hazardous. In some cases, the actual STLC value may be below the theoretically predicted value, classifying the material as non-hazardous.

Background Concentrations For Selected Metals in Western United States Soils, in parts per million (ppm = mg/kg)

Metal	Mean	Standard Deviation	Range
Aluminum	58,000	2.00	5,000 - >100,000
Antimony	0.47	2.15	<1 - 2.6
Arsenic	5.5	1.98	<0.1 - 97
Barium	580	1.72	70 - 5,000
Beryllium	0.68	2.30	<1 - 15
Cadimum	1	--	<1 - 10
Chromium	41	2.19	3 - 2,000
Cobalt	7.1	1.97	<3 - 50
Copper	21	2.07	2 - 300
Iron	21,000	1.95	1,000 - >100,000
Lead	17	1.80	<10 - 700
Manganese	380	1.98	30 - 5,000
Mercury	0.046	2.33	<0.01 - 4.6
Molybdenum	0.85	2.17	<3 - 7
Nickel	15	2.10	<5 - 700
Selenium	0.23	2.43	<0.1 - 4.3
Silver	0.5	--	<0.5 - 5
Thallium	9.1	1.49	2.4 - 31
Vanadium	70	1.95	7 - 500
Zinc	55	1.79	<10 - 2,100

Table 4-1: Maximum Soil Screening Levels (mg/kg) for TPH and BTEX above Drinking Water Aquifers

	Distance Above Groundwater	Carbon Range		
		C4-C12	C13-C22	C23-C32
TPH	>150 feet	1,000	10,000	50,000
	20-150 feet	500	1,000	10,000
	<20 feet	100	100	1,000

	Distance Above Groundwater	Lithology			
		Gravel	Sand	Silt	Clay
BTEX	150 feet	B=0.044 T=2 E=8 X=23	B=0.077 T=4 E=17 X=48	B=0.165 T=9 E=34 X=93	B=0.8 T=43 E=170 X=465
	80 feet	B=0.022 T=1 E=4 X=11	B=0.033 T=2 E=7 X=20	B=0.066 T=4 E=15 X=40	B=0.34 T=18 E=73 X=200
	20 feet	B=0.011 T=0.15 E=0.7 X=1.75	B=0.011 T=0.3 E=0.7 X=1.75	B=0.011 T=0.45 E=2 X=5.3	B=0.044 T=2.3 E=9 X=24.5

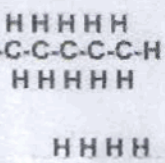
- TPH = Total petroleum hydrocarbons.
- BTEX = benzene, toluene, ethylbenzene, and xylenes, respectively. MCLs (ppm): B=0.001, T=0.15, E=0.7, X=1.75.
- MTBE (methyl tertiary butyl ether) must be included in BTEX analyses.
- BTEX screening concentrations determined per the attenuation factor method as described in RWQCB Guidance for VOC Impacted Sites (March 1996), with a natural degradation factor of 11 for benzene. Table values for BTEX can be linearly interpolated between distance above groundwater and are proportional to fraction of each lithological thickness.
- Values in Table 4-1 are for soils above drinking water aquifers. All groundwaters are considered as drinking water resources unless exempted by one of the criteria as defined under SWRCB Resolution 88-63 (TDS>3000 mg/L, or deliverability <200 gal/day, or existing contamination that cannot be reasonably treated). Regional Board staff will make a determination of potential water use at a particular site considering water quality objectives and beneficial uses. For non-drinking water aquifers, regardless of depth, TPH for ">150 feet" category in the table should be used; BTEX screening levels are set at 100 times respective MCLs as preliminary levels determined to be protective of human health and the environment.
- Distance above groundwater must be measured from the highest anticipated water level. Lithology is based on the USCS scale.
- For BTEX, each component is not to exceed the specified screening level.
- For TPH, the total allowable for each carbon range is not to be exceeded. In areas of naturally-occurring hydrocarbons, Regional Board staff will make allowance for TPH levels.
- BTEX to be analyzed by EPA Method 8020 or EPA Method 8260 (usually for confirmation).
- TPH to be analyzed by EPA Methods 418.1 plus 8015 (Modified). Ranges of TPH to be analyzed by GC/MS carbon range methods (EPA Method 8260) or EPA Method 8015 (Modified).

Hydrocarbons

A hydrocarbon is one of the most simple and primitive of organic compounds. All living organisms produce hydrocarbons, one such example is plants, they synthesize waxes containing hydrocarbons in order to prevent leaf surface decay. This is what makes their leaves shiny. Almost all useable supplies of hydrocarbons are obtained from fossil fuels - coal, petroleum, and natural gas.

Did you know that there are approximately 300,000 different natural hydrocarbon compounds, that mostly from oil reservoirs or coal deposits? Hydrocarbons contains only carbon and hydrogen atoms. These atoms link together to form straight, branched chains, or ring structures commonly called PAHs (poly aromatic hydrocarbons).

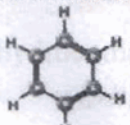
Examples of common hydrocarbons are: gasoline, diesel fuels, lighter fluid, propane, home heating oil, marine and motor oil, fuels, cleaning solvents, hydraulic fluids, crude oil and lubricating oils.



Hydrocarbon Chains

Product	Carbon Chain	Molecular Formula	Boiling Point	Melting Point	State	Uses
Methane	C1	CH_4	-161	-182.5	Gas	Fuel, carbon black, gasoline
Ethane	C2	C_2H_6	-88	-183.3	Gas	Chemistry
Propane	C3	C_3H_8	-46	-189.7	Gas	Cigarette lighter fuel and barbecues.
Butane	C4	C_4H_{10}	-1	-138.40	Gas	Cigarette lighters fuel and barbecues.
Pentane	C5	C_5H_{12}	36.1	-129.7	Liquid	Solvents, dry cleaning, refrigerant
Hexane	C6	C_6H_{14}	68.7	-95.3	Liquid	Motor fuel
Heptane	C7	C_7H_{16}	98.4	-90.6	Liquid	Solvents
Octane	C8	C_8H_{118}	125.7	-56.8	Liquid	Solvents
Nonane	C9	C_9H_{20}	150.8	-53.5	Liquid	Solvents
Decane	C10	$C_{10}H_{22}$	174.1	-29.7	Liquid	Solvents
Kerosene	C12 - C16		200 - 315		Liquid	Diesel, heating oil, lighting/oil stove fuels.
Fuel Oil	C15 - C18		Up to 375		Liquid	Furnace oils, diesels
Lubricating Oils	C16 - C20		350 up		Liquid	Lubrication
Grease, Vaseline	C20 & up				Semisolid	Lubrication, sizing paper
Paraffin - Wax	C26 & up				Solid	Candles, match sticks, household canning
Pitch and Tar	C26 & up				Residue	Roofing, paving, rubber
Petroleum Coke	C26 & up				Residue	Fuel, carbon electrode

The carbon atoms of different hydrocarbons are organized into two general groups:



Aliphatic - a straight or branched chain.

Straight chain (pentane) C_5H_{12}

Aromatic - contains 1 or more benzene rings. Their name comes from the fact that many have strong, pungent aromas. A PAH is a group of benzene rings which have branched chains of carbon.

Aromatic (benzene)

Soil and Groundwater Sampling and Decontamination Protocol

Geoprobe

The Geoprobe uses a 1.5" to 2" outside diameter hollow steel probe. The probe is driven into the ground using a hydraulic ram until the sample interval is reached. A 24" X 1" Acetate, Teflon, or steel liner is inserted into the probe, and driven into the soil. It is recovered, and a 6 inch section is cut away from the sampling tube. The ends of the tube are capped with Teflon sheets and plastic caps, They are sealed with a Silicon based tape. Disposal latex gloves are worn when collecting the sample.

Each sample is then labeled with the project #, soil boring # and depth, sampling date, and the analytical tests to be conducted. It is then placed in a cooler for cold storage for transportation to the laboratory.

The soil not used for sampling is used in the field to be described using the Unified Soils Classification System (USCS). Any unusual discoloration or odors are noted, and occasionally a photoionization detector is used to screen the sample. This is done by placing the sample in a glass jar, and allowing it to sit in the sun for 5 minutes. After that the headspace is measured for volatile compounds. This information is presented in a geologic log in the report.

When sampling ground water the probe is driven to the ground water depth. A stainless steel wire mesh screen is inserted into the probe and ground water enters the probe. A stainless steel mini bailer is then used to collect the sample. The bailer is emptied into 40 milliliter glass containers and sealed with a Teflon cap. The sample is then labeled, and placed in the cooler.

Decontamination of the probe is performed after each sample is collected. Decontamination consists of washing the equipment in a solution of TSP (tri-sodium phosphate), a rinse in tap water, and a final rinse in tap/distilled water. This is commonly referred to as the three bucket method. This method is generally effective in removing residual contaminants and avoiding cross contamination between samples. In the event the equipment is to be reused immediately, it is dried off with a paper towel.

NEI utilizes only California certified analytical laboratories, and chain of custody is maintained between the sampler and the laboratory. Quality Control/Quality Assurance data is requested for all samples submitted.

The upper 15' of the wells are to be removed for the construction of new underground parking.

Notes / Comments (Department Use Only)

DEFINITIONS

Alluvium	-	A general term for all detrital deposits resulting from the operations of modern rivers. Including sendiments deposited in river beds, flood plains, lakes, fans at the foot of mountain slopes, and estuaries.
Anticline	-	Inclined toward each other,as,the ridge tiles of the roof of a house.
Aquiclude	-	A formation which,, although porous and capable of absorbing water slowly, will not transmit it fast enough to furnish an appreciable supply for a well or spring.
Aquifer	-	A geologic formation , group of formations, or part of a formation that transmite water in sufficient quantity to supply pumping wells or sprins.
Basin	-	An extensive depressed area into which the adjacent land drains, and having no surface outlet.
Dome	-	A roughly symmetrical upfold, the beds dipping in all directions, more or less equally, from a point.
Echelon	-	Seperate faults having parallel but steplike trends.
Formation	-	A geological mappable unit, the primary unit of formal mapping or distinction. Most formations possess certain distinctive or combinations of distinctive lithic features. Formations may be combined into groups or subdivided into members.
Fluvial	-	Produced by river/stream action.
Fault	-	A fracture or fracture zone along which there has been displacement of the sides relative to one another paralel to the fracture.
Hydrologic	-	Pertaining to the occurrence, circulation, distribution, and properties of the water of the earth and the earths atmosphere.
Marine	-	Of, belonging to, or caused by the sea.
Syncline	-	A fold in rocks in which the strata (formations) dip inward from both sides toward the axis.
Uplift	-	Elevation of any extensive part of the earths surface relative to some other parts.

PERSONNEL SUMMARIES

Mr. Alex T. Feucht- California (CA) Certified Engineering Geologist #2027, CA Registered Geologist #4433, CA Registered Environmental Assessor #4085. Mr. Feucht received his BS degree in geology from the University of Wisconsin at Madison, and his MS degree in geology from the University of Montana, Missoula. He spent 17 years working as a petroleum exploration geologist for Texaco, and has over 20 years experience as a environmental consultant.

Barry Keller, Ph.D.- CA Registered Hydrogeologist #370, CA Registered Geologist #4460. Dr. Keller received his Ph.D. in geophysics from the University of California Santa Barbara in 1984, his MS degree in geology from the California Institute of Technology in 1969. Dr. Keller has over 25 years experience applying geophysics and hydrogeology to all aspects of environmental protection. His work briefly includes petroleum and mineral exploration, US Military base clean-ups, development of environmental regulation for the World Bank in South America, hazardous waste management, fresh water delivery systems, and computer modeling. Dr. Keller has numerous publications in all of these fields.

Mr. Craig A. Kitchen- CA Registered Environmental Assessor #5086. Mr. Kitchen studied at California State University at Los Angeles and is an environmental scientist. He is 40 hour OSHA certified, and the director of safety and environmental affairs at a large manufacturing concern. He has over 20 years of experience in the storage, utilization, and disposal of hazardous materials and wastestreams. He is currently specialized in facility compliance audits, site investigations, and oversight of consulting services.

Mr. Robert J. Maikisch- CA Registered Environmental Assessor II #20190, CA REA I #2224. Mr. Maikisch received his BS degree in geology from Bradley University, Illinois. He has completed graduate studies in hydrogeology and stratigraphy at the Colorado School of Mines in Golden, CO. He spent 6 years working for Noranda Exploration as a technician and geologist, and has US EPA level training in Radon gas detection and mitigation. He is one of NEI's founders, with over 20 years experience as a environmental consultant.

Mr. Gary M. Mann- CA Registered Geologist #6589. Mr. Mann received his MS degree in geology from the California State University at Hayward, and his BS degree in geology from the California State University at Long Beach. He spent 12 years as a geologist for the United States Geological Survey, involved in remote sensing and seismic reflection, and has written several publications. He is currently specialized in the application of ground penetrating radar for subsurface imaging. He has over 10 years experience in all aspects of environmental consulting.

Ms. Mya L. Raggio- Environmental Assessor and Project Manager, Ms. Raggio studied at Saddleback University. She has over a year of experience in the environmental industry, and is currently focused on studies in Industrial Hygiene.

Mr. William R. Shofner – CA Registered Environmental Assessor I # 05826. Mr. Shofner received a BS degree in geology from San Diego State University. He was employed as an environmental geologist for over 7 years, and has been an independent geologist for over 10 years, providing geologic services to over 25 geotechnical and environmental consulting firms.

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by the Beverly Hills Adjacent Senior Assisted Living, LLC. to conduct a Site Investigation (Phase II) on the property located at 1042 S. La Cienega Blvd. and report the findings (maps 1-2).

Briefly, the property was developed in the early 1950's with the current 2 story apartment building, pool, and associated parking. The purpose of this investigation is to determine if the property has been impacted from a former auto repair center that was immediately to the north and a nearby gasoline station that had a leaking underground storage tank.

The primary contaminants of concern are gasoline and associated additives. The planned vapor barrier and recommended monitoring wells will insure environmental safety requirements will be met in the future.

SCOPE OF INVESTIGATION

This investigation was conducted without the oversight of a Government agency, but in accordance with the "Interim Site Assessment & Cleanup Guidebook", as published by the California Regional Water Quality Control Board – Los Angeles Region (RWQCB) in May. 1996. This guidebook provides standards and protocols for subsurface investigations of this type. It is intended to assess the chemical contamination of property and potential impact to ground water resources.

A Geoprobe was used to drill 9 soil borings. Soil samples were collected from each soil boring at the 10 foot depth. Ground water grab samples were collected from 6 of the soil borings at approximately the 16 foot depth. A description of the Geoprobe method of drilling and sampling is included in the Appendix. Each soil boring was backfilled with bentonite clay. The surface was patched with concrete. The location of each soil boring is presented on map 2.

Soil Sample/Boring/Depth	Location
S1-B1-10’	adjacent property to the north
S2-B2-10’	adjacent property to the north
S3-B3-10’	adjacent property to the north
S4-B3-H_2O	B3 ground water
S5-B4-10’	adjacent property to the north
S6-B4-H_2O	B4 ground water
S7-B5-10’	north parking area
S8-B5-H_2O	B5 ground water
S9-B6-10’	north parking area
S10-B6-H_2O	B6 ground water
S11-B7-10’	south parking area
S12-B7-H_2O	B7 ground water
S13-B8-10’	south parking area
S14-B8-H_2O	B8 ground water
S15-B9-10’	south parking area

Chain of Custody was maintained between the sampler and the analytical testing laboratory. Each soil sample was analyzed for EPA Method 8260B (Total Volatile Organic Compounds), and EPA Method 8015M carbon chain (Total Petroleum Hydrocarbons by carbon chain). Each ground water sample was analyzed for EPA Method 8260B and EPA Method 8015g (Total Recoverable Petroleum Hydrocarbons as gasoline). EPA Method 8260B is specific to all industrial solvents that may have been utilized on the property to the north, and gasoline additives that may have migrated from the nearby gas station. EPA Method 8015M is specific to fuel and motor oils. This test also specifies what hydrocarbons are present and in what quantity. EPA Method 8015g is specific to the gasoline range hydrocarbons C5-C12.

Analytical work was conducted by a State of California approved hazardous waste testing laboratory. The laboratory performed routine level Quality Assurance/Quality Control (QA/QC).

NEI Geologist Gary Mann (CA PG #6589), supervised project protocol and report preparation. Logistics, communications, field activities, and reporting were conducted by NEI Geologist Robert Maikisch (CA REA II #20190).

FINDINGS

Sediment:

In an effort to make this section more understandable, definitions of the common geologic terms used in this report are presented at the end of the text. The Unified Soils Classification System (USCS) is a standard system of describing sediments. It was first presented by the United States Army Corp of Engineers in 1953. A copy is presented in the Appendix. Refined Geologic Logs were prepared using the USCS, from splits of each soil sample. Photographs of representative soil boring cuttings are presented for reference in the Appendix.

The property is located on the northern Coastal Plain at an elevation of 125 feet above mean sea level. It is underlain by 150 to 200 feet of Holocene age alluvium (map 3a). The Coastal Plain has a length of about 50 miles, and a width of 12 to 20 miles. On the Coastal Plain during the late Pleistocene and Holocene geologic epochs, fluvial deposition, associated with the rivers and streams that drain from the interior, has built up the surface from a shallow sea bottom to an alluvial plain (map 5b).

Holocene age alluvium is described as poorly sorted, unconsolidated, interbedded, sand, gravel, silt, and clay. The Holocene geologic epoch represent the sediments that have accumulated during the previous 11,000 years. Late Pleistocene alluvium is similar to Holocene alluvium except it may be semi-consolidated. The late Pleistocene geologic epoch represents the sediments deposited from 700,000 to 11,000 years ago.

The sediments encountered were generally a fine sized, very well sorted, sand, with the exception of B2 and B3 which was a silty, clay. Soil borings B5-B7 encountered a, fine to coarse sized, well sorted, sand, with 10-15% percent fine sized gravel up to 5 mm in size. They are classified as SW by the USCS. The sediment in soil borings B2 and B3 are classified as CL. Both sediment types are considered native, and consistent with the local geology (map 3b).

Historically a stream channel drained through the property (maps 4b-4c). The coarse sand deposits from B5 and B7 are indicative of this historic buried channel. The soil boring collected from B3 on the property to the north also encountered the coarser grained material. The geologic log is included in the Pertinent Excerpts from the NEI investigation report. The

"Dissolved Phase TBA" map from the TRC Quarterly report also suggests the presence of the coarser grained material. It is included in the Pertinent Excerpts as figure 6. The approximate area of the channel is presented in the historic photograph dated 1928.

Soil borings B2 and B3 are clay. This suggests the presence of a clay lens. Ground water would tend to migrate around this clay lens into the coarser materials. This could account for the absence of gasoline in the ground water in soil borings B3 and B6. The presence of a clay lens would be consistent with the sedimentation patterns associated with a migrating stream channel (cross section). Soil boring B8 and B9 from the previous report encountered a similar clay lens (pertinent excerpts).

Ground Water:

The property is located in the hydrologic Central Basin Pressure Area. The Central Basin of the Coastal Plain is bordered by the Hollywood Basin on the north, the Pacific Ocean on the south, and the Newport-Inglewood Uplift on the west. The east boundary is made up by the Repetto Hills and the Santa Fe Springs-Coyote Uplift. The hills of the Los Angeles area comprise the northwest boundary.

The Basin is a single structural unit with no obstructions to the flow of ground water. It is comprised of the alluvial cones of the three major rivers, and the smaller streams, that discharge onto the plain forming a compound alluvial cone. The four subdivisions of the basin area, the Los Angeles Forebay Area, the Montebello Forebay Area, the Whittier Forebay area, and the Central Basin Pressure Area.

The Forebay areas of the Central Basin are broadly characterized by the aquifers being unconfined, allowing ground water to rise and fall freely. The Central Basin Pressure Area is broadly characterized by aquifers being confined by layers of impermeable strata, and pressurizing the interbedded aquifers.

In the absence of direct measurements, the depth to the aquifer is estimated by subtracting the elevation of the ground water table from the elevation of the site. The elevation of the site is obtained from the Hollywood topographic quadrangle as published by the United States Geological Survey in 1966 (map 4). The ground water in this area is not currently utilized for

municipal purposes, and regional ground water contour maps are not available. The elevation of the ground water table was obtained from direct measurement of the ground water monitoring wells on the property to the north in 2007. In this case the ground water is approximately 16 feet deep.

Screening Levels:

The Action Level is the level at which action must be taken to protect human health and the environment. This is calculated using Screening Levels obtained from the RWQCB, and the Cal/EPA, Department of Toxic Substances Control (DTSC).

The screening level for solvents in soil is determined by comparing a RWQCB calculated Attenuation Factor, the Maximum Contaminant Level (MCL), the depth to ground water, and the sediment type. The MCL's are obtained from California Code of Regulations (CCR), Title 22. Table 2 in the Appendix presents the Attenuation Factors and MCL's. The screening level for soils is obtained basically by multiplying the MCL by the Attenuation Factor. The screening level for ground water is simply the Maximum Contaminant Level (MCL) as presented in Table 2.

The screening level for hazardous concentrations of metals in soil is determined by using DTSC standards as published in CCR, Title 22. A summary is presented in the Appendix (Table 3). Table 3 also presents the average background concentration of metals in Western U.S. sediments. It basically sets limits on how much metal a sediment may contain before it is considered hazardous. DTSC in general works on a site by site basis, but this is an appropriate screening tool.

The screening level for hydrocarbons and the BTEX (Benzene, Toluene, Ethylbenzene, Xylene) compounds in soils is determined from Table 4.1 of the "Interim Site Assessment & Cleanup Guidebook" as published by the RWQCB. It is determined by comparing the hydrocarbon range, sediment type, and the depth to ground water. It is presented in the Appendix.

Gasoline, it's additives, and several breakdown products were discovered in soil boring B2 and the ground water samples from B4 and B5. The screening levels for soil when ground water is less than 20 feet deep are summarized:

Chemical	Action Level
Gasoline/C5-C12	100.0 ppm
Ethylbenzene	0.70 ppm
Xylene	1.75 ppm
Benzene	0.011 ppm
Toluene	0.15 ppm
MTBE	0.013 ppm

The MCL's for drinking water are summarized:

Chemical	Action Level
Gasoline/C5-C12	nd
Ethylbenzene	0.30 ppm
Xylene	1.75 ppm
Benzene	0.001 ppm
Toluene	0.15 ppm
MTBE	0.013 ppm

Analytical:

The Chain-of-Custody and Analytical Results from this investigation are presented in the Appendix. The analytical results are summarized for review: **nd** = not detected at the method reporting limit; **-** = not analyzed; **AL** = Action Level; **MCL** = Maximum Contaminant Level; **ppm** = parts per million; **ppb** = parts per billion; 1 ppm = 1000 ppb; ***** = See Below. Results in bold face type exceed the screening level.

Naphthalene is also known as white tar. It is a breakdown product of hydrocarbons, and is a indicator of degradation of gasoline. It is hazardous as a irritant to humans in it’s pure form, but poses no threat at these concentrations.

The presence of gasoline and it’s additives in the soil boring B2 would be consistent with the clay acting to absorb the migratory vapor from the ground water. The volatile compounds associated with gasoline have a greater affinity for the molecular interlayer of the clay than the natural bond. The clay has a tendency to contain the gasoline and it’s additives.

CONCLUSIONS

Concentrations of gasoline were reported from the ground water grab samples from soil borings B4 and B5. The soil samples from the 10 foot depth of B4 and B5 do not indicate a surface release had occurred. The soil sample from the 5 foot depth of soil boring B12 from the previous investigation is in the immediate area of soil boring B4, and did not have any concentrations of hydrocarbons.

The results from the Site Investigation on the former auto repair garage, conducted by NEI in March, 2007, did not detect hydrocarbons from the former hoist areas, sump, or oil stained area. The ground water samples from monitoring wells BC-15 and MW-19 were non-detectable for gasoline and it’s additives. This suggests the gasoline in the ground water had likely passed these wells. The presence of Naphthalene and several benzene byproducts suggests the gasoline in the ground water has had sufficient time to partially break down.

The review of the historical data from the release at the 76 gas station indicates gasoline was present in the ground water in 2005. We conclude the leading edge of the gasoline plume has reached the northern edge of the subject property in concentrations above current drinking water standards.

The Action Level for Benzene in ground water is 0.001 ppm. The concentration of Benzene in the ground water grab sample from soil boring B4 is 0.0028 ppm. The plume is apparently migrating south and southwest. It is also possibly migrating around a clay lens in the immediate area of the property.

The sediment type of soil boring B5 is similar to the sediment type in soil boring B7. The grains are fine to course in size. This sediment type is also present in soil boring B3 from the investigation on 1032 S. La Cienega. This geologic data, and map data, suggests a historic stream channel may be present. While gasoline and associated additives are not yet detected in soil borings B7, B8, or B9, we anticipate the leading edge of the gasoline plume to reach the soil boring B7 area in the future.

The concentrations of gasoline reported from the 10 foot depth of soil boring B2 (2.8 ppm) are well below the screening level of 100 ppm and may be considered insignificant. These finding are suggestive of clay acting to trap migrating gasoline vapors off the ground water.

RECOMMENDATIONS

It is our understanding that a vapor barrier is planned for the future development of this property as a retirement home. The vapor barrier should be effective in protecting any future occupants of the planned facility from migratory vapors off the ground water.

Ground water monitoring wells should be placed in areas that will not put holes in the planned vapor barrier, but allow for monitoring of the gasoline plume as it passes under the subject property. A recommended is the property to the south of the planned new development.

The concentrations of gasoline in the ground water are relatively low, and we do not anticipate any vapors migrating 16 feet to the surface in concentrations that will be hazardous to human health or the environment. Since this ground water is not used for municipal purposes the contamination poses no immediate threat to drinking water supplies, or the proposed development.

LIMITATIONS

This report has been prepared to impart accurate information concerning the procedures and findings of this action. The conclusions in this report are based upon the field methods, field observations, and analytical results, as stated in the Scope of Investigation. No representation, warranties, or guaranties are given with respect to concealed or latent environmental impacts outside the documented Scope of Investigation.

CONFIDENTIALITY AGREEMENT

National Environmental, Inc. hereby agrees not to release this report, any portion of this report, or the results of the investigation to any party, except as required by law, without written or verbal consent from Beverly Hills Adjacent Senior Assisted Living, LLC.

DEFINITIONS

Alluvium	-	A general term for all detrital deposits resulting from the operations of modern rivers. Including sendiments deposited in river beds, flood plains, lakes, fans at the foot of mountain slopes, and estuaries.
Anticline	-	Inclined toward each other,as,the ridge tiles of the roof of a house.
Aquiclude	-	A formation which,, although porous and capable of absorbing water slowly, will not transmit it fast enough to furnish an appreciable supply for a well or spring.
Aquifer	-	A geologic formation , group of formations, or part of a formation that transmite water in sufficient quantity to supply pumping wells or sprins.
Basin	-	An extensive depressed area into which the adjacent land drains, and having no surface outlet.
Dome	-	A roughly symmetrical upfold, the beds dipping in all directions, more or less equally, from a point.
Echelon	-	Seperate faults having parallel but steplike trends.
Formation	-	A geological mappable unit, the primary unit of formal mapping or distinction. Most formations possess certain distinctive or combinations of distinctive lithic features. Formations may be combined into groups or subdivided into members.
Fluvial	-	Produced by river/stream action.
Fault	-	A fracture or fracture zone along which there has been displacement of the sides relative to one another paralel to the fracture.
Hydrologic	-	Pertaining to the occurrence, circulation, distribution, and properties of the water of the earth and the earths atmosphere.
Marine	-	Of, belonging to, or caused by the sea.
Syncline	-	A fold in rocks in which the strata (formations) dip inward from both sides toward the axis.
Uplift	-	Elevation of any extensive part of the earths surface relative to some other parts.

PERSONNEL SUMMARIES

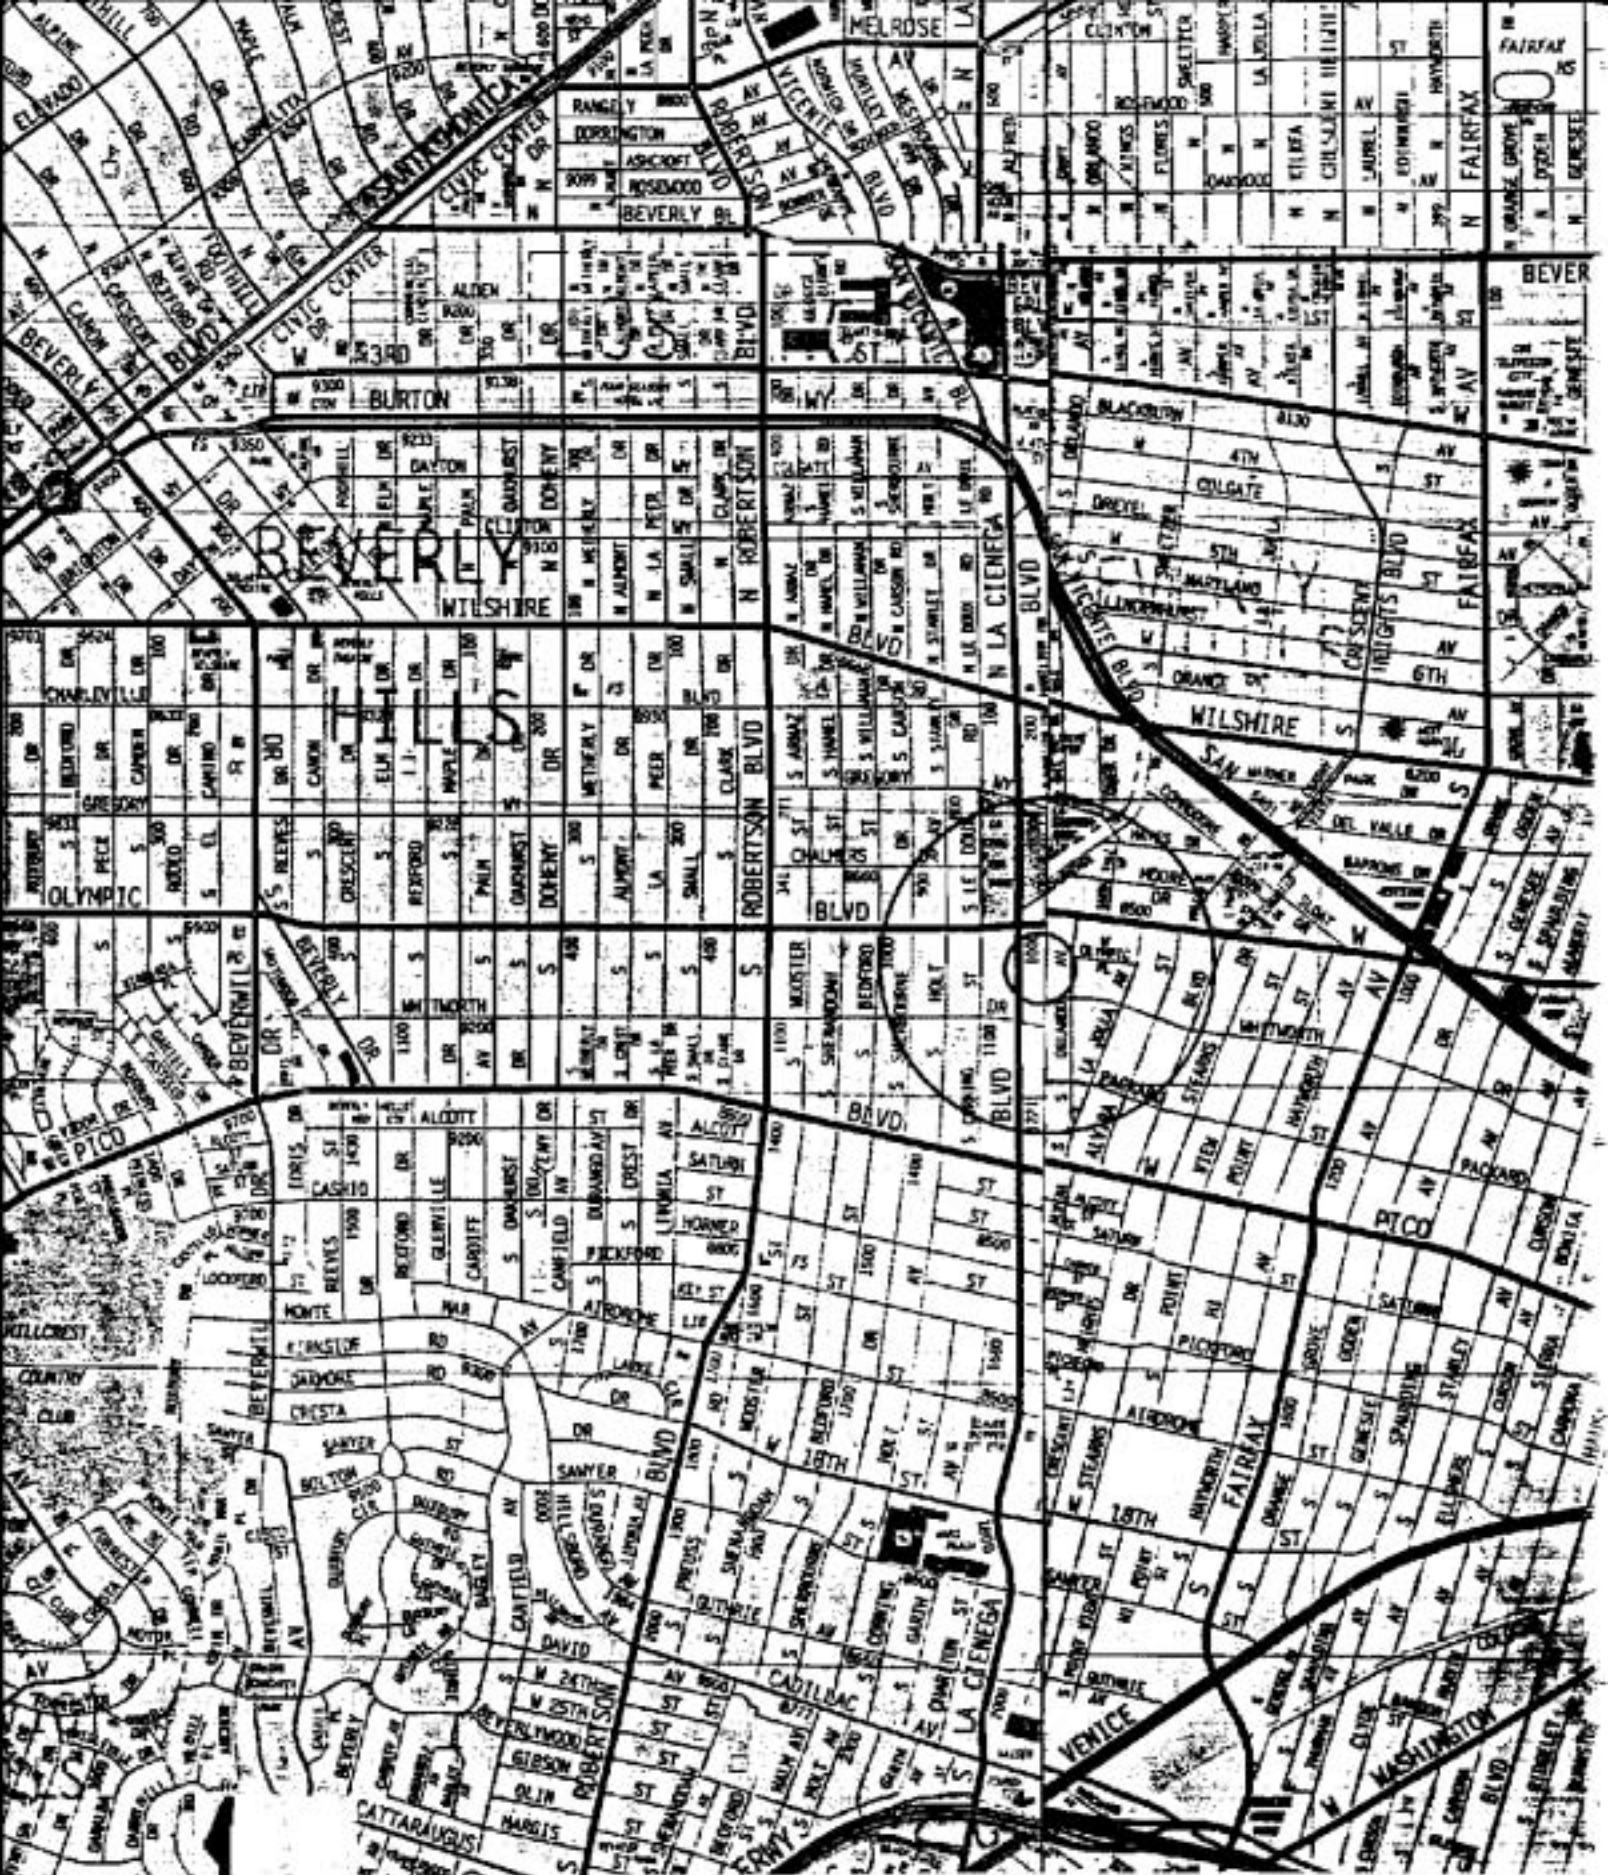
Mr. Alex T. Feucht- California (CA) Certified Engineering Geologist #2027, CA Registered Geologist #4433, CA Registered Environmental Assessor #4085. Mr. Feucht received his BS degree in geology from the University of Wisconsin at Madison, and his MS degree in geology from the University of Montana, Missoula. He spent 17 years working as a petroleum exploration geologist for Texaco, and has over 20 years experience as a environmental consultant.

Barry Keller, Ph.D.- CA Registered Hydrogeologist #370, CA Registered Geologist #4460. Dr. Keller received his Ph.D. in geophysics from the University of California Santa Barbara in 1984, his MS degree in geology from the California Institute of Technology in 1969. Dr. Keller has over 25 years experience applying geophysics and hydrogeology to all aspects of environmental protection. His work briefly includes petroleum and mineral exploration, US Military base clean-ups, development of environmental regulation for the World Bank in South America, hazardous waste management, fresh water delivery systems, and computer modeling. Dr. Keller has numerous publications in all of these fields.

Mr. Craig A. Kitchen- CA Registered Environmental Assessor #5086. Mr. Kitchen studied at California State University at Los Angeles and is an environmental scientist. He is 40 hour OSHA certified, and the director of safety and environmental affairs at a large manufacturing concern. He has over 20 years of experience in the storage, utilization, and disposal of hazardous materials and wastestreams. He is currently specialized in facility compliance audits, site investigations, and oversight of consulting services.

Mr. Robert J. Maikisch- CA Registered Environmental Assessor II #20190, CA REA I #2224. Mr. Maikisch received his BS degree in geology from Bradley University, Illinois. He has completed graduate studies in hydrogeology and stratigraphy at the Colorado School of Mines in Golden, CO. He spent 6 years working for Noranda Exploration as a technician and geologist, and has US EPA level training in Radon gas detection and mitigation. He is one of NEI's founders, with over 20 years experience as a environmental consultant.

Mr. Gary M. Mann- CA Registered Geologist #6589. Mr. Mann received his MS degree in geology from the California State University at Hayward, and his BS degree in geology from the California State University at Long Beach. He spent 12 years as a geologist for the United States Geological Survey, involved in remote sensing and seismic reflection, and has written several publications. He is currently specialized in the application of ground penetrating radar for subsurface imaging. He has over 10 years experience in all aspects of environmental consulting.



Ms. Mya L. Raggio- Environmental Assessor and Project Manager, Ms. Raggio studied at Saddleback University. She has over a year of experience in the environmental industry, and is currently focused on studies in Industrial Hygiene.

Mr. William R. Shofner – CA Registered Environmental Assessor I # 05826. Mr. Shofner received a BS degree in geology from San Diego State University. He was employed as an environmental geologist for over 7 years, and has been an independent geologist for over 10 years, providing geologic services to over 25 geotechnical and environmental consulting firms.

* - CA Regional Water Quality Control Board, "Interim Site Assessment and Cleanup Guidebook", February, 1995.

1) The Cleanup Level for volatile organic compound (VOC) impacted soil is calculated from the attenuation factors on the above table and the maximum concentration limit (MCL).

2) The MCL's are obtained from California Code of Regulations (CCR), Title 22.

3) The Cleanup Level is obtained by multiplying the AF by the MCL. This is compared to the actual concentration of the chemical present in the sediment.

4) If the Cleanup Levels are above the actual concentrations in the sediment, Remedial Action may not be necessary.

TABLE 2: MCL, Koc, K_h, MAXIMUM VALUES OF ATTENUATION FACTOR FOR COMMON VOCs

Compound	MCL(µg/l)[a]	Koc(ml/g)[b]	K_h(-)[c]	AF_{MAX}

Note: Authority cited: Sections 100275, 116350 and 116365, Health and Safety Code. Reference: Sections 116365, 116385 and 116555, Health and Safety Code.

HISTORY

1. Repealer of section and renumbering and amendment of section 64445.5 to section 64441 filed 9-8-94 as an emergency; operative 9-8-94 (Register 94, No. 36). A Certificate of Compliance must be transmitted to OAL by 1-6-95 or emergency language will be repealed by operation of law on the following day. For prior history, see Register 90, No. 13.

2. Repealer of section and renumbering and amendment of section 64445.5 to section 64444 refiled 1-3-95 as an emergency; operative 1-3-95 (Register 95, No. 1). A Certificate of Compliance must be transmitted to OAL by 5-3-95 or emergency language will be repealed by operation of law on the following day.

3. Repealer of section and renumbering and amendment of former section 64444.5

Review of MCLs in Response to PHGs

Last Update: December 6, 2002

Comparison of MCLs and PHGs

Maximum Contaminant Levels (MCLs)—health-protective **drinking water standards**—adopted by DHS are to be met by public water systems. MCLs take into account not only chemicals' health risks but also factors such as their detectability and treatability, as well as the costs of treatment. Health and Safety Code §116365(a) requires DHS to establish a contaminant's MCL at a level as close as is technically and economically feasible to its public health goal (PHG), placing primary emphasis on the protection of public health.

Health and Safety Code §116365(c) requires the **Office of Environmental Health Hazard Assessment** (OEHHA) to establish PHGs, which are concentrations of drinking water contaminants that pose no significant health risk if consumed for a lifetime, based on current risk assessment principles, practices, and methods. PHGs are established for (1) contaminants with MCLs, and (2) contaminants for which DHS will be adopting MCLs, *e.g.*, **perchlorate** and **chromium-6**.

Water systems also use PHGs to provide information about drinking water contaminants in annual **Consumer Confidence Reports**. Certain public water systems must provide a report to their customers about health risks from a contaminant that exceeds its PHG and about the cost of treatment to meet the PHG, and hold a public hearing on the report.

Once OEHHA establishes or revises a PHG for a contaminant with an MCL, DHS determines whether the MCL should be considered for possible revision. DHS subsequently conducts an in-depth risk management analysis to determine whether or not to propose a revision. For more information, see **MCL review status**.

The following table compares MCLs and PHGs and includes each contaminant's Detection Limit for Purposes of Reporting (DLR)--the level at which DHS is confident about the quantification of the chemical's presence. Analytical data are required to be submitted to DHS if they are at or above the DLR. Some data may be reported at levels below the DLR.

Comparisons of PHGs, DLRs, and MCLs. Also included at results of drinking water source monitoring. Units are in milligrams per liter (mg/L), unless otherwise noted. For more about PHGs, go to **OEHHA's website**. Also, see **MCL review status**

#detects/ #sampled	Contaminant	PHG	DLR	MCL	Date of PHG

Action Levels for Metals

Total Threshold Limit Concentration - (TTLC)
Soluble Threshold Limit Concentration - (STLC)

Action Levels in parts per million (ppm).

Metal	TTLC	STLC
Antimony	500	15
Arsenic	500	5
Barium	10,000	100
Beryllium	75	0.75
Cadmium	100	1
Chromium VI	500	5
Chromium III	2,500	560
Cobalt	8,000	80
Copper	2,500	25
Flouride	18,000	180
Lead	1,000	5
Mercury	20	0.2
Molybdenum	3,500	350
Nickel	2,000	20
Selenium	100	1
Silver	500	5
Thallium	700	7
Vanadium	2,400	24
Zinc	5,000	250

* California Code of Regulations (CCR), Title 26

1) If the TTLC value of the sample is above the TTLC Action Level, the material is classified as hazardous.

2) If the TTLC value of the sample is between the TTLC and the STLC Action Levels, a STLC analyses must be run to determine if the material is hazardous.

3) If The STLC value of the sample is above the STLC ACtion Level, the material is classified as hazardous.

4) The STLC can not exceed more than 10% of the TTLC value. This is due to a laboratory dilution factor.

5) If the 10% value of the TTLC is above the STLC Action Level, the material is theoretically hazardous. In some cases, the actual STLC value may be below the theoretically predicted value, classifying the material as non-hazardous.

Background Concentrations For Selected Metals in Western United States Soils, in parts per million (ppm = mg/kg)

Metal	Mean	Standard Deviation	Range
Aluminum	58,000	2.00	5,000 - >100,000

Table 4-1: Maximum Soil Screening Levels (mg/kg) for TPH and BTEX above Drinking Water Aquifers

	Distance Above Groundwater	Carbon Range		
TPH		C4-C12	C13-C22	C23-C32
	>150 feet	1,000	10,000	50,000
	20-150 feet	500	1,000	10,000
	<20 feet	100	100	1,000

	Distance Above Groundwater	Lithology			
BTEX		Gravel	Sand	Silt	Clay
	150 feet	B=0.044 T=2 E=8 X=23	B=0.077 T=4 E=17 X=48	B=0.165 T=9 E=34 X=93	B=0.8 T=43 E=170 X=465
	80 feet	B=0.022 T=1 E=4 X=11	B=0.033 T=2 E=7 X=20	B=0.066 T=4 E=15 X=40	B=0.34 T=18 E=73 X=200
	20 feet	B=0.011 T=0.15 E=0.7 X=1.75	B=0.011 T=0.3 E=0.7 X=1.75	B=0.011 T=0.45 E=2 X=5.3	B=0.044 T=2.3 E=9 X=24.5

- TPH = Total petroleum hydrocarbons.
- BTEX = benzene, toluene, ethylbenzene, and xylenes, respectively. MCLs (ppm): B=0.001, T=0.15, E=0.7, X=1.75.
- MTBE (methyl tertiary butyl ether) must be included in BTEX analyses.
- BTEX screening concentrations determined per the attenuation factor method as described in RWQCB Guidance for VOC Impacted Sites (March 1996), with a natural degradation factor of 11 for benzene. Table values for BTEX can be linearly interpolated between distance above groundwater and are proportional to fraction of each lithological thickness.
- Values in Table 4-1 are for soils above drinking water aquifers. All groundwaters are considered as drinking water resources unless exempted by one of the criteria as defined under SWRCB Resolution 88-63 (TDS>3000 mg/L, or deliverability <200 gal/day, or existing contamination that cannot be reasonably treated). Regional Board staff will make a determination of potential water use at a particular site considering water quality objectives and beneficial uses. For non-drinking water aquifers, regardless of depth, TPH for ">150 feet" category in the table should be used; BTEX screening levels are set at 100 times respective MCLs as preliminary levels determined to be protective of human health and the environment.
- Distance above groundwater must be measured from the highest anticipated water level. Lithology is based on the USCS scale.
- For BTEX, each component is not to exceed the specified screening level.
- For TPH, the total allowable for each carbon range is not to be exceeded. In areas of naturally-occurring hydrocarbons, Regional Board staff will make allowance for TPH levels.
- BTEX to be analyzed by EPA Method 8020 or EPA Method 8260 (usually for confirmation).
- TPH to be analyzed by EPA Methods 418.1 plus 8015 (Modified). Ranges of TPH to be analyzed by GC/MS carbon range methods (EPA Method 8260) or EPA Method 8015 (Modified).

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by B.H.A.S.A.L. to conduct a Preliminary Site Investigation (Phase II) on the property located at 1022-1026 La Cienega Blvd., Los Angeles, CA 90035 and report the findings (maps 1, 2).

Briefly, a auto repair shop operated on 1032 La Cienega Blvd. from the 1960's until 2007. This facility had 7 in-ground hoists. A visual inspection of the property located the former waste oil storage area, a sump, and a hole in the ground. There are 2 groundwater monitoring wells on the 1026 La Cienega property. These wells are part of a on-going groundwater cleanup on the 76 station that is located on the southeast corner of Olympic and La Cienega.

This investigation was conducted to obtain information on the subsurface soils and groundwater. The primary chemicals of concern are gasoline and it's additives in the groundwater, and hydrocarbons, primarily hydraulic fluid, in the soils.

SCOPE OF INVESTIGATION

This investigation was conducted without the oversight of a Government agency but in accordance with the "Interim Site Assessment & Cleanup Guidebook", as published by the CA Regional Water Quality Control Board - Region 4 (RWQCB) in May, 1996. This guidebook provides standards and protocols for subsurface

TABLE 1

The analytical results are summarized for review: **nd** = not detected at the method reporting limit; - = not analyzed; **AL** = Action Level; MCL = Maximum Contaminant Level; **ppm** = parts per million; **ppb** = parts per billion; 1 ppm = 1000 ppb; * = See Below. Results in bold face type exceed Action Level/MCL.

Sample #/Location/ depth	8015M (ppm)	8015g (ppb)	8260B (ppb)
S1-B1-12'	nd	-	-
S2-B2-12'	nd	-	-
S3-B3-12'	nd	-	-
S4-B4-12'	nd	-	-
S5-B5-10'	nd	-	-
S7-B7-5'	nd	-	-
S8-B8-10'	nd	-	-
S9-B9-10'	nd	-	-
S10-B10-5'	nd	-	-
S11-B11-5'	nd	-	-
S12-B12-5'	nd	-	-
S13-MW19	-	nd	nd
S14-MW15	-	nd	nd

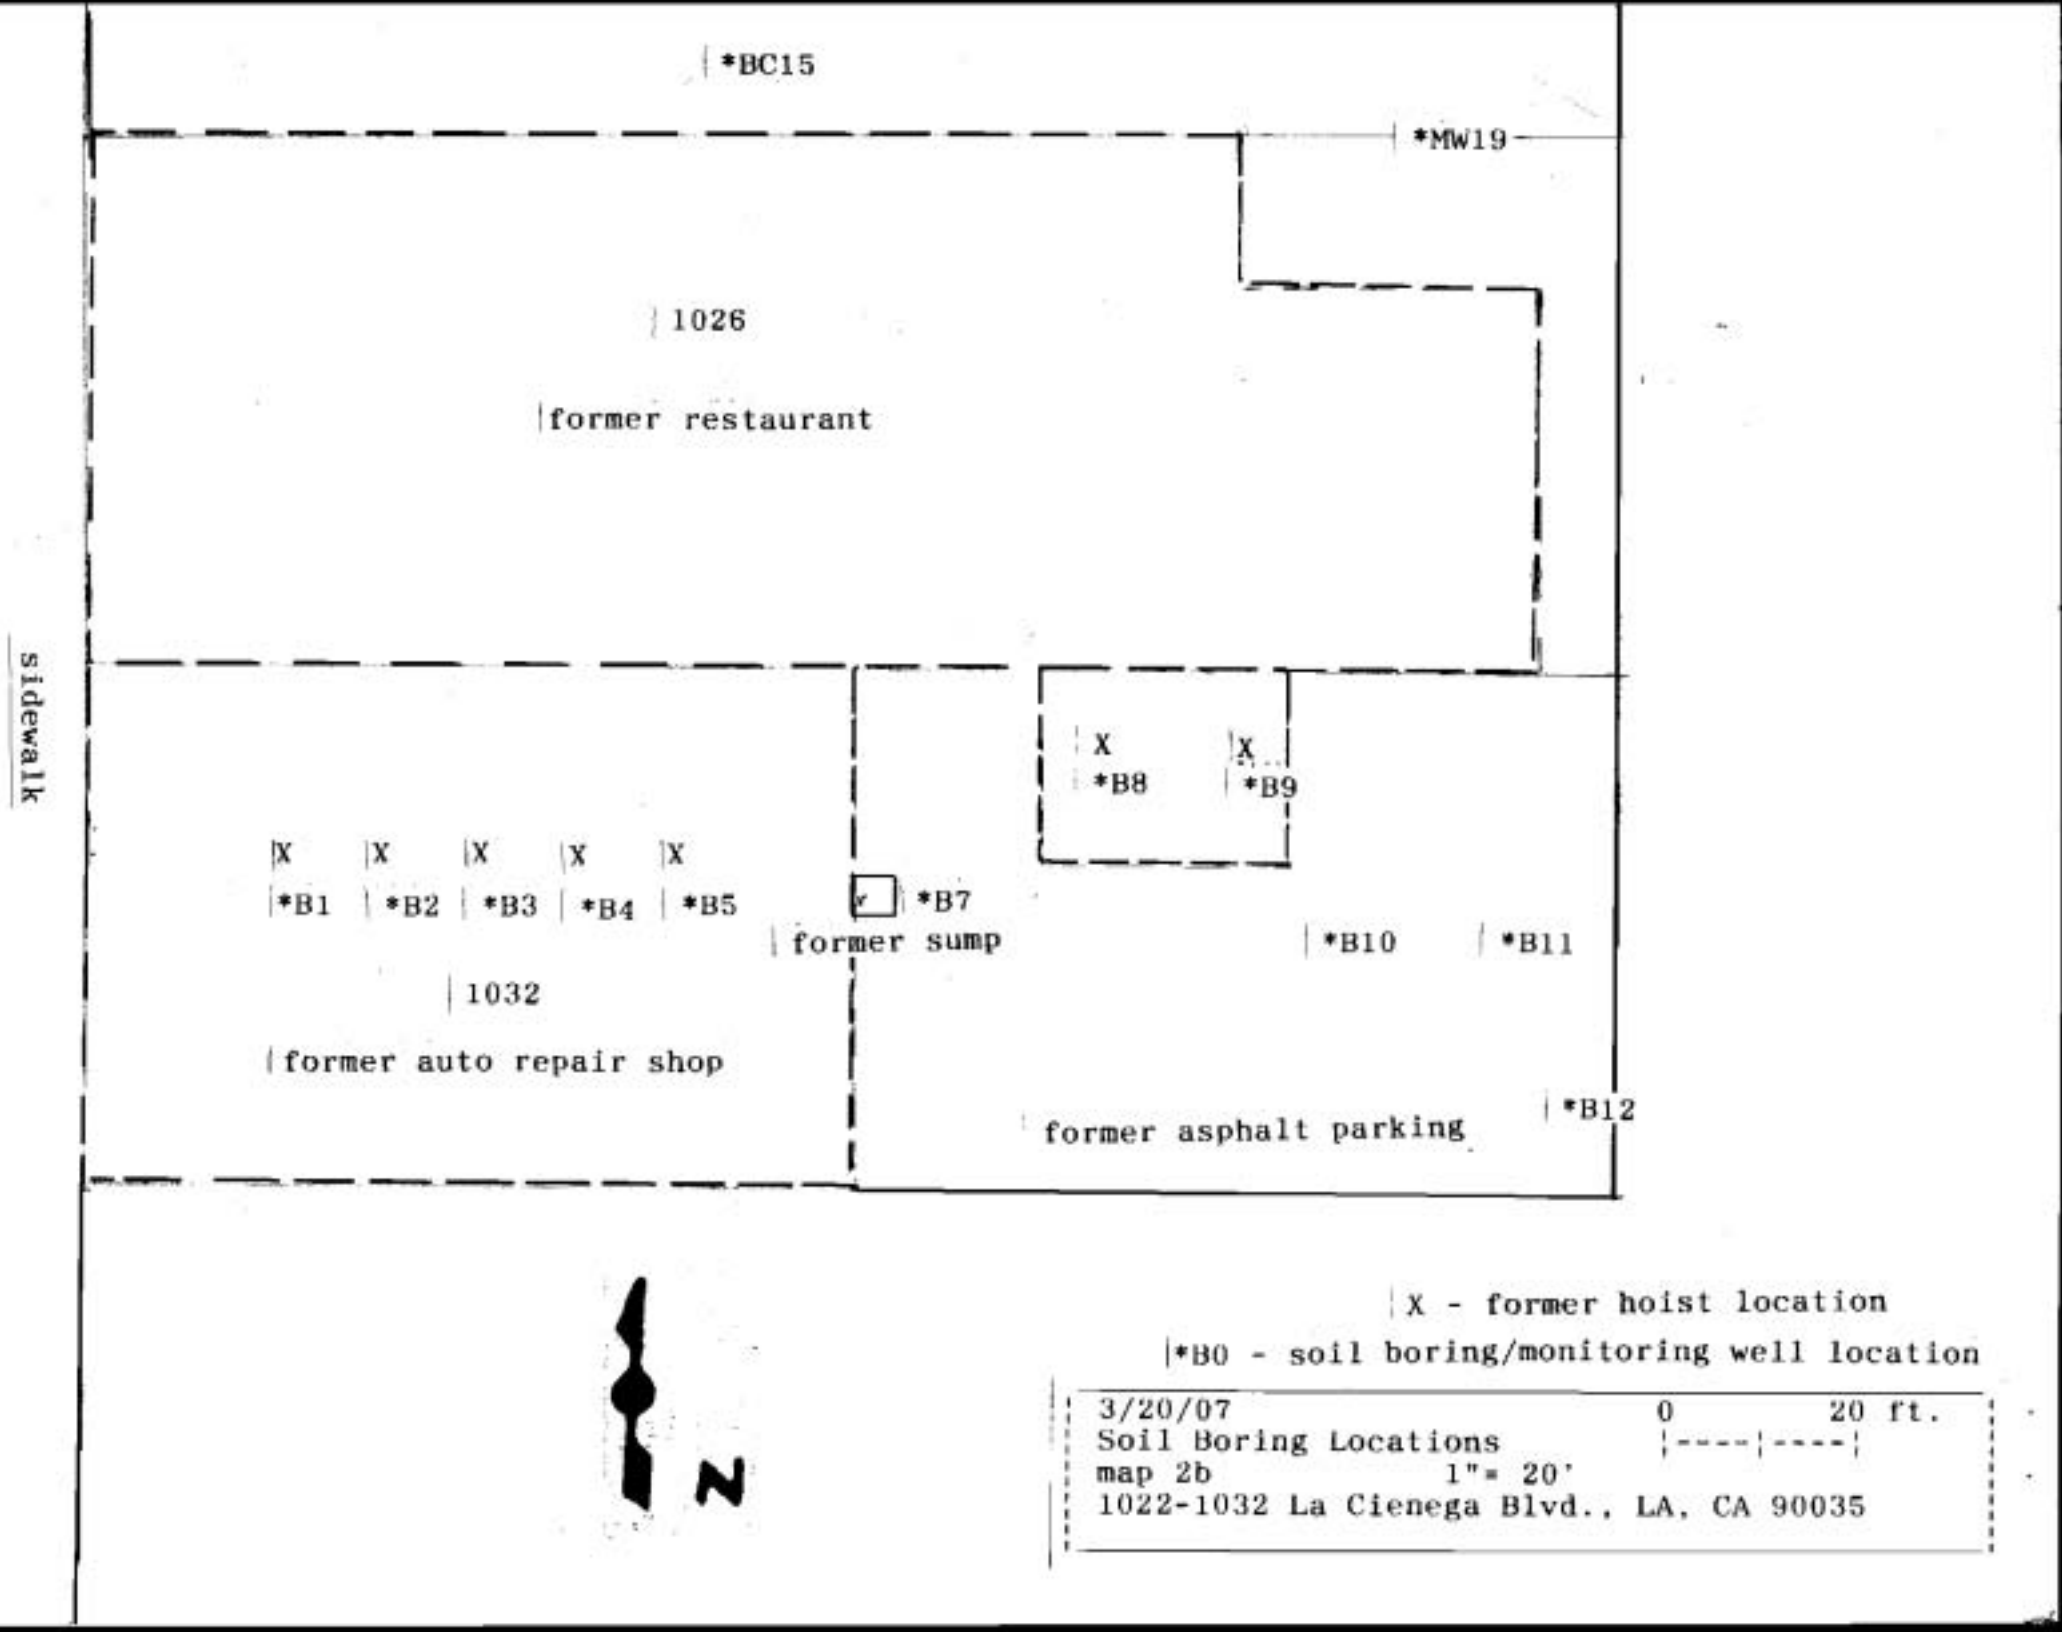
CONCLUSIONS

Non-detectable concentrations of solvents and gasoline were reported in the groundwater.

Non-detectable concentrations of gasoline, diesel fuel, and heavy oils were reported under the former hoists, in the former sump area, in the former waste oil storage area, and near a former hole in the ground.

Environmental impact has not occurred as a result of the former auto repair operation on the property. There is no threat to human health or the environment.

RECOMMENDATIONS



We recommend no additional environmental assessment work be required on the subject property at this time.

LIMITATIONS

This report has been prepared to impart accurate information concerning the procedures and findings of this action. The conclusions in this report are based upon the field methods, field observations, and analytical results as stated in the Scope of Investigation. No representation, warranties, or guaranties are given with respect to concealed or latent environmental impacts outside the documented Scope of Investigation.

CONFIDENTIALITY AGREEMENT

National Environmental, Inc. hereby agrees not to release this report, any portion of this report, or the results of the investigation to any party, except as required by law, without written/verbal consent from B.H.A.S.A.L. and Mr. Dean Isaacson.

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by the Beverly Hills Adjacent Senior Assisted Living, LLC. to conduct a Site Investigation (Phase II) on the property located at 1042 S. La Cienega Blvd. and report the findings (maps 1-2).

Briefly, the property was developed in the early 1950's with the current 2 story apartment building, pool, and associated parking. The purpose of this investigation is to determine if the property has been impacted from a former auto repair center that was immediately to the north and a nearby gasoline station that had a leaking underground storage tank.

The primary contaminants of concern are gasoline and associated additives. The planned vapor barrier and recommended monitoring wells will insure environmental safety requirements will be met in the future.

SCOPE OF INVESTIGATION

This investigation was conducted without the oversight of a Government agency, but in accordance with the "Interim Site Assessment & Cleanup Guidebook", as published by the California Regional Water Quality Control Board – Los Angeles Region (RWQCB) in May. 1996. This guidebook provides standards and protocols for subsurface investigations of this type. It is intended to assess the chemical contamination of property and potential impact to ground water resources.

A Geoprobe was used to drill 9 soil borings. Soil samples were collected from each soil boring at the 10 foot depth. Ground water grab samples were collected from 6 of the soil borings at approximately the 16 foot depth. A description of the Geoprobe method of drilling and sampling is included in the Appendix. Each soil boring was backfilled with bentonite clay. The surface was patched with concrete. The location of each soil boring is presented on map 2.

Soil Sample/Boring/Depth	Location
S1-B1-10’	adjacent property to the north
S2-B2-10’	adjacent property to the north
S3-B3-10’	adjacent property to the north
S4-B3-H_2O	B3 ground water
S5-B4-10’	adjacent property to the north
S6-B4-H_2O	B4 ground water
S7-B5-10’	north parking area
S8-B5-H_2O	B5 ground water
S9-B6-10’	north parking area
S10-B6-H_2O	B6 ground water
S11-B7-10’	south parking area
S12-B7-H_2O	B7 ground water
S13-B8-10’	south parking area
S14-B8-H_2O	B8 ground water
S15-B9-10’	south parking area

Chain of Custody was maintained between the sampler and the analytical testing laboratory. Each soil sample was analyzed for EPA Method 8260B (Total Volatile Organic Compounds), and EPA Method 8015M carbon chain (Total Petroleum Hydrocarbons by carbon chain). Each ground water sample was analyzed for EPA Method 8260B and EPA Method 8015g (Total Recoverable Petroleum Hydrocarbons as gasoline). EPA Method 8260B is specific to all industrial solvents that may have been utilized on the property to the north, and gasoline additives that may have migrated from the nearby gas station. EPA Method 8015M is specific to fuel and motor oils. This test also specifies what hydrocarbons are present and in what quantity. EPA Method 8015g is specific to the gasoline range hydrocarbons C5-C12.

Analytical work was conducted by a State of California approved hazardous waste testing laboratory. The laboratory performed routine level Quality Assurance/Quality Control (QA/QC).

NEI Geologist Gary Mann (CA PG #6589), supervised project protocol and report preparation. Logistics, communications, field activities, and reporting were conducted by NEI Geologist Robert Maikisch (CA REA II #20190).

FINDINGS

Sediment:

In an effort to make this section more understandable, definitions of the common geologic terms used in this report are presented at the end of the text. The Unified Soils Classification System (USCS) is a standard system of describing sediments. It was first presented by the United States Army Corp of Engineers in 1953. A copy is presented in the Appendix. Refined Geologic Logs were prepared using the USCS, from splits of each soil sample. Photographs of representative soil boring cuttings are presented for reference in the Appendix.

The property is located on the northern Coastal Plain at an elevation of 125 feet above mean sea level. It is underlain by 150 to 200 feet of Holocene age alluvium (map 3a). The Coastal Plain has a length of about 50 miles, and a width of 12 to 20 miles. On the Coastal Plain during the late Pleistocene and Holocene geologic epochs, fluvial deposition, associated with the rivers and streams that drain from the interior, has built up the surface from a shallow sea bottom to an alluvial plain (map 5b).

Holocene age alluvium is described as poorly sorted, unconsolidated, interbedded, sand, gravel, silt, and clay. The Holocene geologic epoch represent the sediments that have accumulated during the previous 11,000 years. Late Pleistocene alluvium is similar to Holocene alluvium except it may be semi-consolidated. The late Pleistocene geologic epoch represents the sediments deposited from 700,000 to 11,000 years ago.

The sediments encountered were generally a fine sized, very well sorted, sand, with the exception of B2 and B3 which was a silty, clay. Soil borings B5-B7 encountered a, fine to coarse sized, well sorted, sand, with 10-15% percent fine sized gravel up to 5 mm in size. They are classified as SW by the USCS. The sediment in soil borings B2 and B3 are classified as CL. Both sediment types are considered native, and consistent with the local geology (map 3b).

Historically a stream channel drained through the property (maps 4b-4c). The coarse sand deposits from B5 and B7 are indicative of this historic buried channel. The soil boring collected from B3 on the property to the north also encountered the coarser grained material. The geologic log is included in the Pertinent Excerpts from the NEI investigation report. The

"Dissolved Phase TBA" map from the TRC Quarterly report also suggests the presence of the coarser grained material. It is included in the Pertinent Excerpts as figure 6. The approximate area of the channel is presented in the historic photograph dated 1928.

Soil borings B2 and B3 are clay. This suggests the presence of a clay lens. Ground water would tend to migrate around this clay lens into the coarser materials. This could account for the absence of gasoline in the ground water in soil borings B3 and B6. The presence of a clay lens would be consistent with the sedimentation patterns associated with a migrating stream channel (cross section). Soil boring B8 and B9 from the previous report encountered a similar clay lens (pertinent excerpts).

Ground Water:

The property is located in the hydrologic Central Basin Pressure Area. The Central Basin of the Coastal Plain is bordered by the Hollywood Basin on the north, the Pacific Ocean on the south, and the Newport-Inglewood Uplift on the west. The east boundary is made up by the Repetto Hills and the Santa Fe Springs-Coyote Uplift. The hills of the Los Angeles area comprise the northwest boundary.

The Basin is a single structural unit with no obstructions to the flow of ground water. It is comprised of the alluvial cones of the three major rivers, and the smaller streams, that discharge onto the plain forming a compound alluvial cone. The four subdivisions of the basin area, the Los Angeles Forebay Area, the Montebello Forebay Area, the Whittier Forebay area, and the Central Basin Pressure Area.

The Forebay areas of the Central Basin are broadly characterized by the aquifers being unconfined, allowing ground water to rise and fall freely. The Central Basin Pressure Area is broadly characterized by aquifers being confined by layers of impermeable strata, and pressurizing the interbedded aquifers.

In the absence of direct measurements, the depth to the aquifer is estimated by subtracting the elevation of the ground water table from the elevation of the site. The elevation of the site is obtained from the Hollywood topographic quadrangle as published by the United States Geological Survey in 1966 (map 4). The ground water in this area is not currently utilized for

municipal purposes, and regional ground water contour maps are not available. The elevation of the ground water table was obtained from direct measurement of the ground water monitoring wells on the property to the north in 2007. In this case the ground water is approximately 16 feet deep.

Screening Levels:

The Action Level is the level at which action must be taken to protect human health and the environment. This is calculated using Screening Levels obtained from the RWQCB, and the Cal/EPA, Department of Toxic Substances Control (DTSC).

The screening level for solvents in soil is determined by comparing a RWQCB calculated Attenuation Factor, the Maximum Contaminant Level (MCL), the depth to ground water, and the sediment type. The MCL's are obtained from California Code of Regulations (CCR), Title 22. Table 2 in the Appendix presents the Attenuation Factors and MCL's. The screening level for soils is obtained basically by multiplying the MCL by the Attenuation Factor. The screening level for ground water is simply the Maximum Contaminant Level (MCL) as presented in Table 2.

The screening level for hazardous concentrations of metals in soil is determined by using DTSC standards as published in CCR, Title 22. A summary is presented in the Appendix (Table 3). Table 3 also presents the average background concentration of metals in Western U.S. sediments. It basically sets limits on how much metal a sediment may contain before it is considered hazardous. DTSC in general works on a site by site basis, but this is an appropriate screening tool.

The screening level for hydrocarbons and the BTEX (Benzene, Toluene, Ethylbenzene, Xylene) compounds in soils is determined from Table 4.1 of the "Interim Site Assessment & Cleanup Guidebook" as published by the RWQCB. It is determined by comparing the hydrocarbon range, sediment type, and the depth to ground water. It is presented in the Appendix.

Gasoline, it's additives, and several breakdown products were discovered in soil boring B2 and the ground water samples from B4 and B5. The screening levels for soil when ground water is less than 20 feet deep are summarized:

Chemical	Action Level
Gasoline/C5-C12	100.0 ppm
Ethylbenzene	0.70 ppm
Xylene	1.75 ppm
Benzene	0.011 ppm
Toluene	0.15 ppm
MTBE	0.013 ppm

The MCL's for drinking water are summarized:

Chemical	Action Level
Gasoline/C5-C12	nd
Ethylbenzene	0.30 ppm
Xylene	1.75 ppm
Benzene	0.001 ppm
Toluene	0.15 ppm
MTBE	0.013 ppm

Analytical:

The Chain-of-Custody and Analytical Results from this investigation are presented in the Appendix. The analytical results are summarized for review: **nd** = not detected at the method reporting limit; **-** = not analyzed; **AL** = Action Level; **MCL** = Maximum Contaminant Level; **ppm** = parts per million; **ppb** = parts per billion; 1 ppm = 1000 ppb; ***** = See Below. Results in bold face type exceed the screening level.

Naphthalene is also known as white tar. It is a breakdown product of hydrocarbons, and is a indicator of degradation of gasoline. It is hazardous as a irritant to humans in it’s pure form, but poses no threat at these concentrations.

The presence of gasoline and it’s additives in the soil boring B2 would be consistent with the clay acting to absorb the migratory vapor from the ground water. The volatile compounds associated with gasoline have a greater affinity for the molecular interlayer of the clay than the natural bond. The clay has a tendency to contain the gasoline and it’s additives.

CONCLUSIONS

Concentrations of gasoline were reported from the ground water grab samples from soil borings B4 and B5. The soil samples from the 10 foot depth of B4 and B5 do not indicate a surface release had occurred. The soil sample from the 5 foot depth of soil boring B12 from the previous investigation is in the immediate area of soil boring B4, and did not have any concentrations of hydrocarbons.

The results from the Site Investigation on the former auto repair garage, conducted by NEI in March, 2007, did not detect hydrocarbons from the former hoist areas, sump, or oil stained area. The ground water samples from monitoring wells BC-15 and MW-19 were non-detectable for gasoline and it’s additives. This suggests the gasoline in the ground water had likely passed these wells. The presence of Naphthalene and several benzene byproducts suggests the gasoline in the ground water has had sufficient time to partially break down.

The review of the historical data from the release at the 76 gas station indicates gasoline was present in the ground water in 2005. We conclude the leading edge of the gasoline plume has reached the northern edge of the subject property in concentrations above current drinking water standards.

The Action Level for Benzene in ground water is 0.001 ppm. The concentration of Benzene in the ground water grab sample from soil boring B4 is 0.0028 ppm. The plume is apparently migrating south and southwest. It is also possibly migrating around a clay lens in the immediate area of the property.

The sediment type of soil boring B5 is similar to the sediment type in soil boring B7. The grains are fine to course in size. This sediment type is also present in soil boring B3 from the investigation on 1032 S. La Cienega. This geologic data, and map data, suggests a historic stream channel may be present. While gasoline and associated additives are not yet detected in soil borings B7, B8, or B9, we anticipate the leading edge of the gasoline plume to reach the soil boring B7 area in the future.

The concentrations of gasoline reported from the 10 foot depth of soil boring B2 (2.8 ppm) are well below the screening level of 100 ppm and may be considered insignificant. These finding are suggestive of clay acting to trap migrating gasoline vapors off the ground water.

RECOMMENDATIONS

It is our understanding that a vapor barrier is planned for the future development of this property as a retirement home. The vapor barrier should be effective in protecting any future occupants of the planned facility from migratory vapors off the ground water.

Ground water monitoring wells should be placed in areas that will not put holes in the planned vapor barrier, but allow for monitoring of the gasoline plume as it passes under the subject property. A recommended is the property to the south of the planned new development.

The concentrations of gasoline in the ground water are relatively low, and we do not anticipate any vapors migrating 16 feet to the surface in concentrations that will be hazardous to human health or the environment. Since this ground water is not used for municipal purposes the contamination poses no immediate threat to drinking water supplies, or the proposed development.

LIMITATIONS

This report has been prepared to impart accurate information concerning the procedures and findings of this action. The conclusions in this report are based upon the field methods, field observations, and analytical results, as stated in the Scope of Investigation. No representation, warranties, or guaranties are given with respect to concealed or latent environmental impacts outside the documented Scope of Investigation.

CONFIDENTIALITY AGREEMENT

National Environmental, Inc. hereby agrees not to release this report, any portion of this report, or the results of the investigation to any party, except as required by law, without written or verbal consent from Beverly Hills Adjacent Senior Assisted Living, LLC.

DEFINITIONS

Alluvium	-	A general term for all detrital deposits resulting from the operations of modern rivers. Including sendiments deposited in river beds, flood plains, lakes, fans at the foot of mountain slopes, and estuaries.
Anticline	-	Inclined toward each other,as,the ridge tiles of the roof of a house.
Aquiclude	-	A formation which,, although porous and capable of absorbing water slowly, will not transmit it fast enough to furnish an appreciable supply for a well or spring.
Aquifer	-	A geologic formation , group of formations, or part of a formation that transmite water in sufficient quantity to supply pumping wells or sprins.
Basin	-	An extensive depressed area into which the adjacent land drains, and having no surface outlet.
Dome	-	A roughly symmetrical upfold, the beds dipping in all directions, more or less equally, from a point.
Echelon	-	Seperate faults having parallel but steplike trends.
Formation	-	A geological mappable unit, the primary unit of formal mapping or distinction. Most formations possess certain distinctive or combinations of distinctive lithic features. Formations may be combined into groups or subdivided into members.
Fluvial	-	Produced by river/stream action.
Fault	-	A fracture or fracture zone along which there has been displacement of the sides relative to one another paralel to the fracture.
Hydrologic	-	Pertaining to the occurrence, circulation, distribution, and properties of the water of the earth and the earths atmosphere.
Marine	-	Of, belonging to, or caused by the sea.
Syncline	-	A fold in rocks in which the strata (formations) dip inward from both sides toward the axis.
Uplift	-	Elevation of any extensive part of the earths surface relative to some other parts.

PERSONNEL SUMMARIES

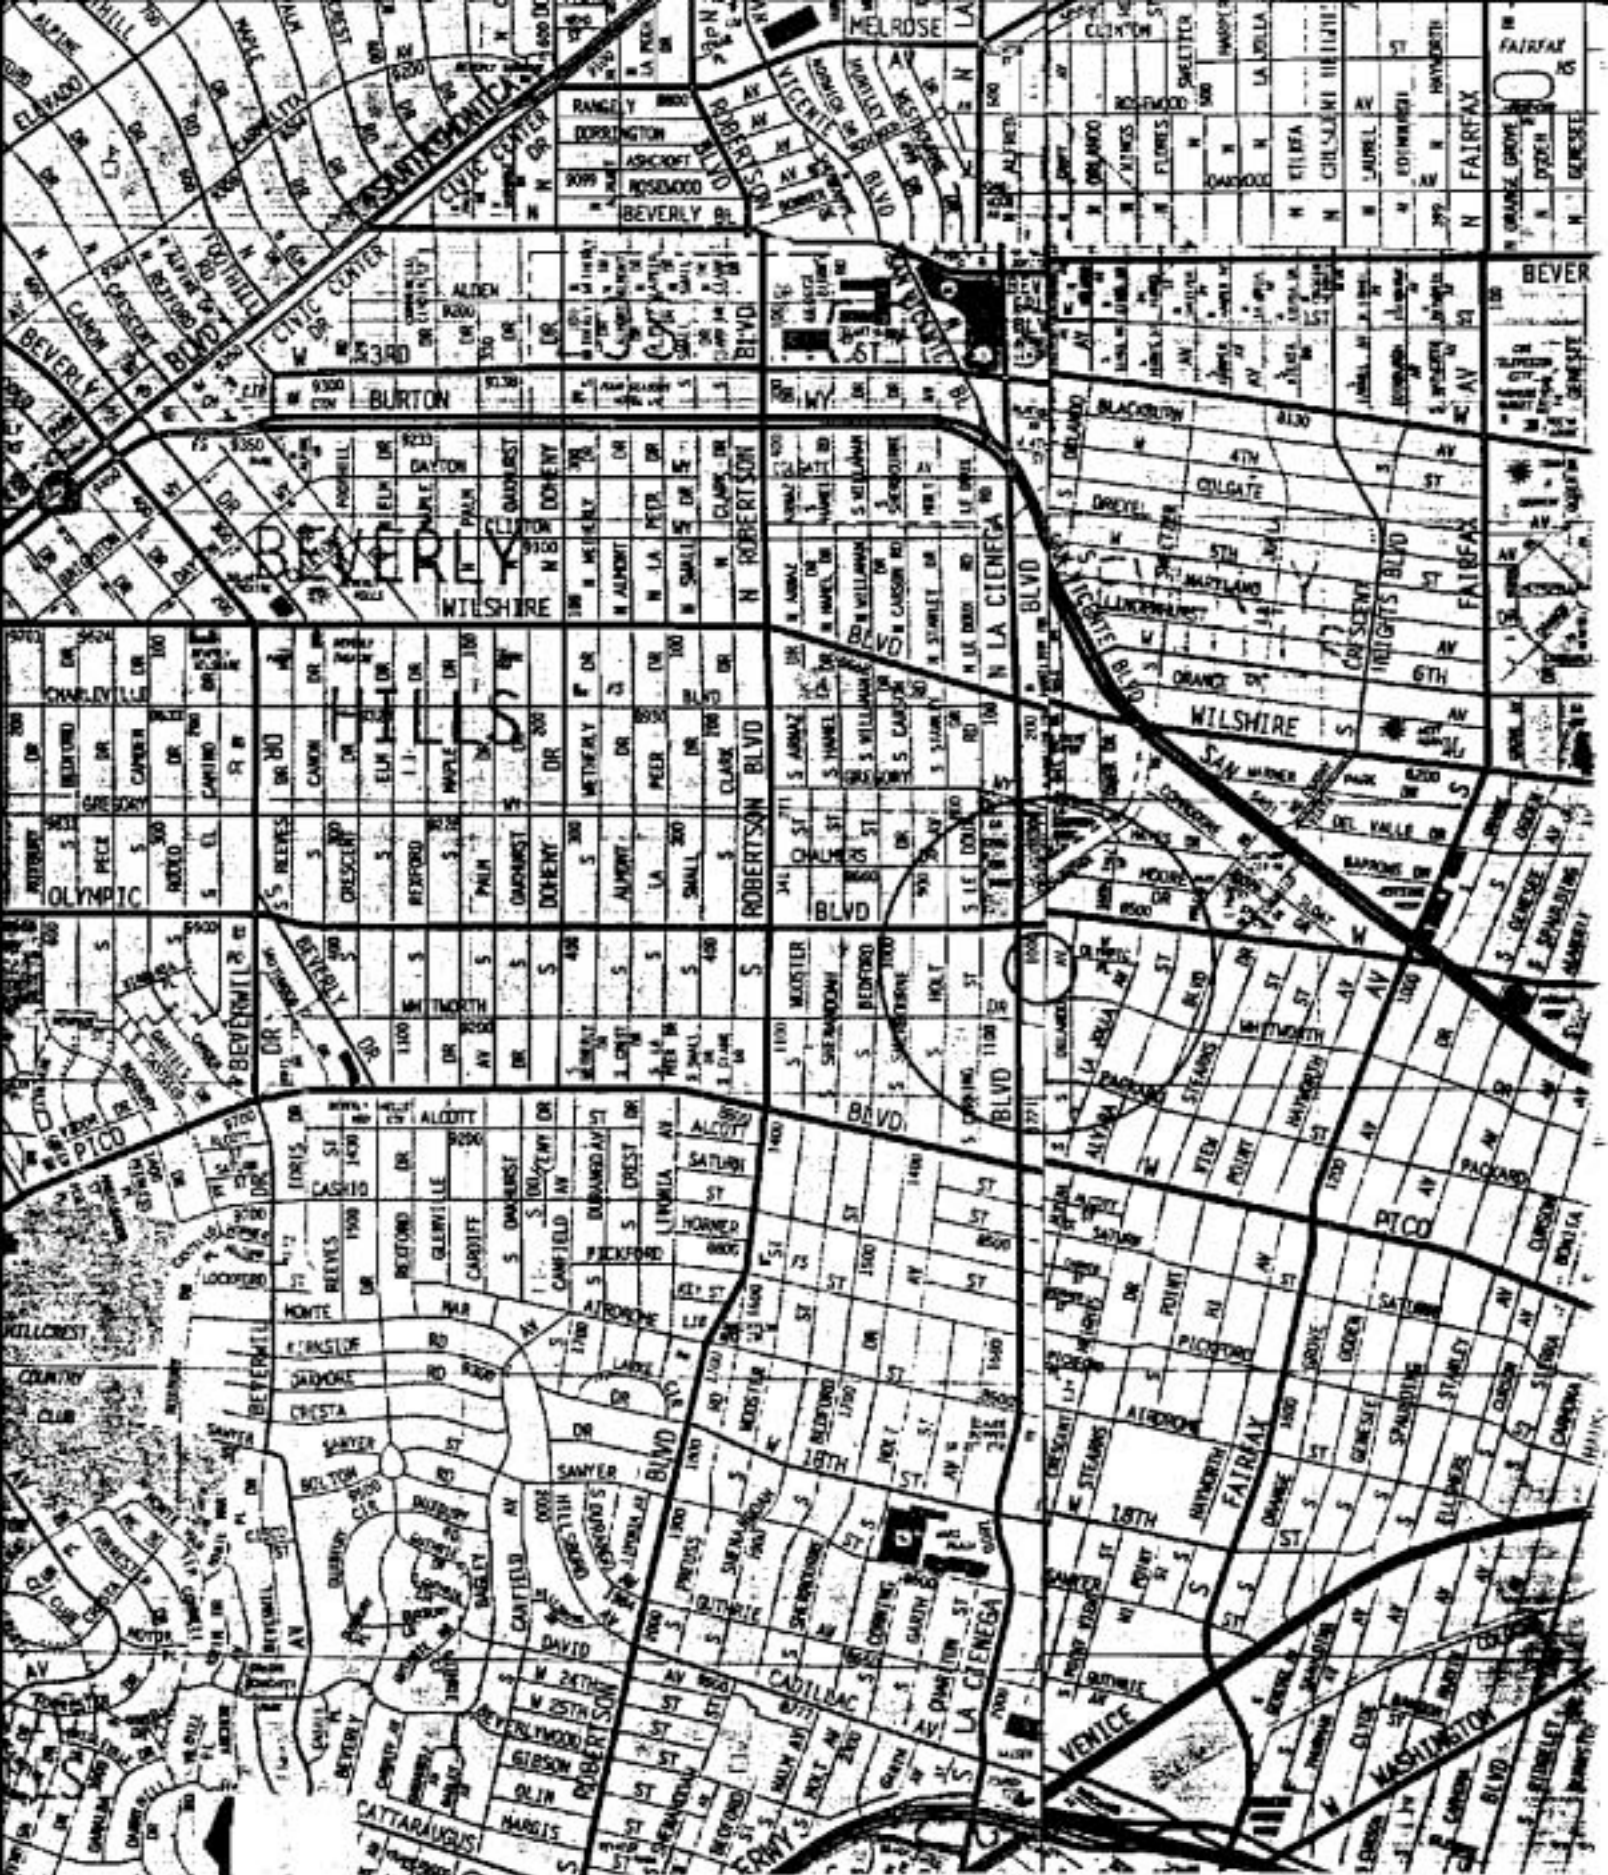
Mr. Alex T. Feucht- California (CA) Certified Engineering Geologist #2027, CA Registered Geologist #4433, CA Registered Environmental Assessor #4085. Mr. Feucht received his BS degree in geology from the University of Wisconsin at Madison, and his MS degree in geology from the University of Montana, Missoula. He spent 17 years working as a petroleum exploration geologist for Texaco, and has over 20 years experience as a environmental consultant.

Barry Keller, Ph.D.- CA Registered Hydrogeologist #370, CA Registered Geologist #4460. Dr. Keller received his Ph.D. in geophysics from the University of California Santa Barbara in 1984, his MS degree in geology from the California Institute of Technology in 1969. Dr. Keller has over 25 years experience applying geophysics and hydrogeology to all aspects of environmental protection. His work briefly includes petroleum and mineral exploration, US Military base clean-ups, development of environmental regulation for the World Bank in South America, hazardous waste management, fresh water delivery systems, and computer modeling. Dr. Keller has numerous publications in all of these fields.

Mr. Craig A. Kitchen- CA Registered Environmental Assessor #5086. Mr. Kitchen studied at California State University at Los Angeles and is an environmental scientist. He is 40 hour OSHA certified, and the director of safety and environmental affairs at a large manufacturing concern. He has over 20 years of experience in the storage, utilization, and disposal of hazardous materials and wastestreams. He is currently specialized in facility compliance audits, site investigations, and oversight of consulting services.

Mr. Robert J. Maikisch- CA Registered Environmental Assessor II #20190, CA REA I #2224. Mr. Maikisch received his BS degree in geology from Bradley University, Illinois. He has completed graduate studies in hydrogeology and stratigraphy at the Colorado School of Mines in Golden, CO. He spent 6 years working for Noranda Exploration as a technician and geologist, and has US EPA level training in Radon gas detection and mitigation. He is one of NEI's founders, with over 20 years experience as a environmental consultant.

Mr. Gary M. Mann- CA Registered Geologist #6589. Mr. Mann received his MS degree in geology from the California State University at Hayward, and his BS degree in geology from the California State University at Long Beach. He spent 12 years as a geologist for the United States Geological Survey, involved in remote sensing and seismic reflection, and has written several publications. He is currently specialized in the application of ground penetrating radar for subsurface imaging. He has over 10 years experience in all aspects of environmental consulting.



Ms. Mya L. Raggio- Environmental Assessor and Project Manager, Ms. Raggio studied at Saddleback University. She has over a year of experience in the environmental industry, and is currently focused on studies in Industrial Hygiene.

Mr. William R. Shofner – CA Registered Environmental Assessor I # 05826. Mr. Shofner received a BS degree in geology from San Diego State University. He was employed as an environmental geologist for over 7 years, and has been an independent geologist for over 10 years, providing geologic services to over 25 geotechnical and environmental consulting firms.

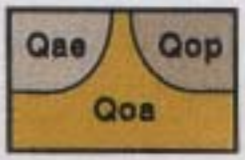
LEGEND

SURFICIAL SEDIMENTS



unconsolidated detrital sediments; generally undissected

af *artificial cut and fill* **Qls** *landslide debris*

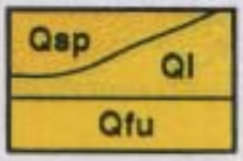
Qg *gravel and sand of major stream channels*

Qc *clay and sand of pre-development marshlands*

Qa *alluvium: clay, sand and gravel; includes gravel and sand of minor stream channels*

OLDER SURFICIAL SEDIMENTS

unconsolidated to weakly consolidated; dissected and eroded where elevated; late Pleistocene age



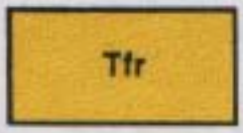
Qae *similar to* **Qa**, *but slightly elevated and dissected; includes alluvial fan sediments*

Qop *paleosoil in Baldwin Hills (Fox Hills residual paleosoil of Weber et al. 1982); moderately indurated, erosion-resistant, gray to rusty brown pebbly and sandy paleosoil or "hardpan" on* **Qoa**

Qoa *older alluvium, gray to light brown pebble-gravel, sand, silt, and clay of detritus derived from Santa Monica Mountains; similar to* **Qae**, *but slightly consolidated; in Baldwin Hills designated as Baldwin Hills sandy gravel (Weber et al. 1982), where it is much dissected and eroded*

—UNCONFORMITY—

in mountain areas



SHALLOW MARINE SEDIMENTS

shallow marine clastic sediments exposed in Baldwin Hills; weakly consolidated, eroded; Pleistocene age

Qsp *San Pedro Sand (of Wright 1987; Culver Sand of Weber et al. 1982): light gray to light brown sand, fine to coarse grained, pebbly; locally contains shell fragments*

Ql *Inglewood Formation (of Wright 1987; Weber et al. 1982): light gray, friable; fine grained sandstone and interbedded soft gray siltstone*

Qfu *upper Fernando (?) Formation (part of Inglewood Formation of Weber et al. 1982; Wright 1987): soft gray massive silty claystone, base not exposed*

FERNANDO FORMATION

(of Lamar 1970)

marine clastic; early Pliocene age (Repettian Stage)

Tfr *Repetto Member (Lamar 1970): in downtown Los Angeles, consolidated but crumbly gray to greenish-gray claystone-siltstone, in part sandy; vaguely bedded, locally fossiliferous*

* - CA Regional Water Quality Control Board, "Interim Site Assessment and Cleanup Guidebook", February, 1995.

1) The Cleanup Level for volatile organic compound (VOC) impacted soil is calculated from the attenuation factors on the above table and the maximum concentration limit (MCL).

2) The MCL's are obtained from California Code of Regulations (CCR), Title 22.

3) The Cleanup Level is obtained by multiplying the AF by the MCL. This is compared to the actual concentration of the chemical present in the sediment.

4) If the Cleanup Levels are above the actual concentrations in the sediment, Remedial Action may not be necessary.

TABLE 2: MCL, Koc, K_h, MAXIMUM VALUES OF ATTENUATION FACTOR FOR COMMON VOCs

Compound	MCL(µg/l)[a]	Koc(ml/g)[b]	K_h(-)[c]	AF_{MAX}
Acetone	610[c]	2	0.0009	3.2

[FNa1] MCL is for either a single isomer or the sum of the isomers.

Note: Authority cited: Sections 100275, 116350 and 116365, Health and Safety Code. Reference: Sections 116365, 116385 and 116555, Health and Safety Code.

HISTORY

1. Repealer of section and renumbering and amendment of section 64445.5 to section 64441 filed 9-8-94 as an emergency; operative 9-8-94 (Register 94, No. 36). A Certificate of Compliance must be transmitted to OAL by 1-6-95 or emergency language will be repealed by operation of law on the following day. For prior history, see Register 90, No. 13.

2. Repealer of section and renumbering and amendment of section 64445.5 to section 64444 refiled 1-3-95 as an emergency; operative 1-3-95 (Register 95, No. 1). A Certificate of Compliance must be transmitted to OAL by 5-3-95 or emergency language will be repealed by operation of law on the following day.

3. Repealer of section and renumbering and amendment of former section 64444.5

Review of MCLs in Response to PHGs

Last Update: December 6, 2002

Comparison of MCLs and PHGs

Maximum Contaminant Levels (MCLs)—health-protective **drinking water standards**—adopted by DHS are to be met by public water systems. MCLs take into account not only chemicals' health risks but also factors such as their detectability and treatability, as well as the costs of treatment. Health and Safety Code §116365(a) requires DHS to establish a contaminant's MCL at a level as close as is technically and economically feasible to its public health goal (PHG), placing primary emphasis on the protection of public health.

Health and Safety Code §116365(c) requires the **Office of Environmental Health Hazard Assessment** (OEHHA) to establish PHGs, which are concentrations of drinking water contaminants that pose no significant health risk if consumed for a lifetime, based on current risk assessment principles, practices, and methods. PHGs are established for (1) contaminants with MCLs, and (2) contaminants for which DHS will be adopting MCLs, *e.g.*, **perchlorate** and **chromium-6**.

Water systems also use PHGs to provide information about drinking water contaminants in annual **Consumer Confidence Reports**. Certain public water systems must provide a report to their customers about health risks from a contaminant that exceeds its PHG and about the cost of treatment to meet the PHG, and hold a public hearing on the report.

Once OEHHA establishes or revises a PHG for a contaminant with an MCL, DHS determines whether the MCL should be considered for possible revision. DHS subsequently conducts an in-depth risk management analysis to determine whether or not to propose a revision. For more information, see **MCL review status**.

The following table compares MCLs and PHGs and includes each contaminant's Detection Limit for Purposes of Reporting (DLR)--the level at which DHS is confident about the quantification of the chemical's presence. Analytical data are required to be submitted to DHS if they are at or above the DLR. Some data may be reported at levels below the DLR.

Comparisons of PHGs, DLRs, and MCLs. Also included at results of drinking water source monitoring. Units are in milligrams per liter (mg/L), unless otherwise noted. For more about PHGs, go to **OEHHA's website**. Also, see **MCL review status**

#detects/ #sampled	Contaminant	PHG	DLR	MCL	Date of PHG

Silver	500	5
Thallium	700	7
Vanadium	2,400	24
Zinc	5,000	250

* California Code of Regulations (CCR), Title 26

1) If the TTLC value of the sample is above the TTLC Action Level, the material is classified as hazardous.

2) If the TTLC value of the sample is between the TTLC and the STLC Action Levels, a STLC analyses must be run to determine if the material is hazardous.

3) If The STLC value of the sample is above the STLC ACtion Level, the material is classified as hazardous.

4) The STLC can not exceed more than 10% of the TTLC value. This is due to a laboratory dilution factor.

5) If the 10% value of the TTLC is above the STLC Action Level, the material is theoretically hazardous. In some cases, the actual STLC value may be below the theoretically predicted value, classifying the material as non-hazardous.

Background Concentrations For Selected Metals in Western United States Soils, in parts per million (ppm = mg/kg)

Metal	Mean	Standard Deviation	Range
Aluminum	58,000	2.00	5,000 - >100,000

Shacklette, H.T., and Boerngen, J.G, USGS Professional Paper 1270 (1984)
Conner, J.J. and Shacklette, H.T., USGS Professional Paper 574-F (1975)

Table 4-1: Maximum Soil Screening Levels (mg/kg) for TPH and BTEX above Drinking Water Aquifers

	Distance Above Groundwater	Carbon Range		
TPH		C4-C12	C13-C22	C23-C32
	>150 feet	1,000	10,000	50,000
	20-150 feet	500	1,000	10,000
	<20 feet	100	100	1,000

	Distance Above Groundwater	Lithology			
BTEX		Gravel	Sand	Silt	Clay
	150 feet	B=0.044 T=2 E=8 X=23	B=0.077 T=4 E=17 X=48	B=0.165 T=9 E=34 X=93	B=0.8 T=43 E=170 X=465
	80 feet	B=0.022 T=1 E=4 X=11	B=0.033 T=2 E=7 X=20	B=0.066 T=4 E=15 X=40	B=0.34 T=18 E=73 X=200
	20 feet	B=0.011 T=0.15 E=0.7 X=1.75	B=0.011 T=0.3 E=0.7 X=1.75	B=0.011 T=0.45 E=2 X=5.3	B=0.044 T=2.3 E=9 X=24.5

- TPH = Total petroleum hydrocarbons.
- BTEX = benzene, toluene, ethylbenzene, and xylenes, respectively. MCLs (ppm): B=0.001, T=0.15, E=0.7, X=1.75.
- MTBE (methyl tertiary butyl ether) must be included in BTEX analyses.
- BTEX screening concentrations determined per the attenuation factor method as described in RWQCB Guidance for VOC Impacted Sites (March 1996), with a natural degradation factor of 11 for benzene. Table values for BTEX can be linearly interpolated between distance above groundwater and are proportional to fraction of each lithological thickness.
- Values in Table 4-1 are for soils above drinking water aquifers. All groundwaters are considered as drinking water resources unless exempted by one of the criteria as defined under SWRCB Resolution 88-63 (TDS>3000 mg/L, or deliverability <200 gal/day, or existing contamination that cannot be reasonably treated). Regional Board staff will make a determination of potential water use at a particular site considering water quality objectives and beneficial uses. For non-drinking water aquifers, regardless of depth, TPH for ">150 feet" category in the table should be used; BTEX screening levels are set at 100 times respective MCLs as preliminary levels determined to be protective of human health and the environment.
- Distance above groundwater must be measured from the highest anticipated water level. Lithology is based on the USCS scale.
- For BTEX, each component is not to exceed the specified screening level.
- For TPH, the total allowable for each carbon range is not to be exceeded. In areas of naturally-occurring hydrocarbons, Regional Board staff will make allowance for TPH levels.
- BTEX to be analyzed by EPA Method 8020 or EPA Method 8260 (usually for confirmation).
- TPH to be analyzed by EPA Methods 418.1 plus 8015 (Modified). Ranges of TPH to be analyzed by GC/MS carbon range methods (EPA Method 8260) or EPA Method 8015 (Modified).

(VIA PAPER COPY AND COMPACT DISC)

Subject: **DRAFT SOIL, SOIL GAS, AND GROUNDWATER SAMPLING REPORT FOR CONTIGUOUS VACANT LOTS AT 1022, 1026, 1032, AND 1042–1054 SOUTH LA CIENEGA BOULEVARD LOS ANGELES, CALIFORNIA (SRC/SCH LLC V. UNION OIL OF CALIFORNIA, ET AL. LOS ANGELES SUPERIOR COURT CASE NO. BC471071 FILE NO. 70185-2639)**

Dear Mr. Smith:

In accordance with your request, Holguin, Fahan & Associates, Inc. (HFA) is pleased to present this soil, soil gas, and groundwater sampling report for the above-referenced site.

Holguin, Fahan & Associates, Inc. trusts that this information meets the requirements of Steptoe & Johnson, LLP. If you have any questions or require additional information, please contact Mr. Mark R. Fahan at (805) 701-1416 or Mark_Fahan@hfa.com.

Respectfully submitted,

Mark R. Fahan, PG
Vice President

INTRODUCTION

Steptoe & Johnson, LLP, contracted Holguin, Fahan & Associates, Inc. (HFA) to prepare this soil, soil gas, and groundwater sampling report for the contiguous four parcels located at 1022, 1026, 1032, and 1042–1054 South La Cienega Boulevard, Los Angeles, California (see Figure 1 - Site Location Map and Figure 2 - Plot Plan). The four parcels are owned by Beverly Hills Adjacent Senior Assisted Living LLC (BHASAL) and by SRC.SCH LLC. Site access for performing the subject sampling was provided by site access agreements between Chevron Environmental Management Company (EMC) and the above-referenced property owners. The work was performed in accordance with HFA's soil gas and groundwater sampling plan dated August 15, 2012 (HFA, 2012), as modified by subsequent emailed communications and field decisions. The four parcels were unpaved, vacant lots at the time of the sampling activities. Mr. Matt Houser of Blaine Tech Services, Inc. provided access to the four parcels and observed all site work on behalf of the property owners.

SITE EVALUATION METHODS AND RESULTS

PRE-FIELD ACTIVITIES

Prior to performing any subsurface work, HFA:

- obtained a well permit from the County of Los Angeles (see Appendix 1 for a copy of the permit);
- performed a pre-drilling site visit to investigate and mark all proposed drilling locations;
- ordered a utility markout from Underground Service Alert of Southern California;
- performed a land survey to locate proposed sampling locations, the proposed building footprints, and selected previous sampling locations (see Appendix 2 for the survey data);
- performed a geophysical investigation of all proposed drilling locations to identify subsurface utilities; and
- cleared each drilling location of subsurface lines using hand-auger or vacuum digging techniques to a diameter larger than the hollow-stem augers and the CPT rods and 5 feet in depth (see Appendix 3 for HFA's clearance procedures).

CONE PENETRATION WITH PORE-PRESSURE TESTING

On November 9, 2012, HFA oversaw Gregg Drilling and Testing, Inc. (Gregg Drilling) advance nine CPTu borings to depths from 20 to 36 fbg to determine detailed lithology beneath the site (see Figure 2 for locations). The CPTu equipment automatically collects CPTu data at approximate 5-centimeter intervals during boring advancement and identifies the soil type at each interval based on standard correlations of the CPTu data to lithology (see Appendix 4 for Gregg Drilling's CPTu procedures). The soil types encountered by the CPTu included sand, silt, clay, and mixtures of these soil types (see Figure 2 for the cross-section locations; Figure 3 - CPT Cross-Section A-A'; and Figure 4 - CPT Cross-Sections B-B', C'-C', and D-D'; Appendix 4 for Gregg Drilling's CPTu results). Gregg Drilling immediately abandoned the CPTu borings by backfilling with grout using the tremie method.

GROUNDWATER MONITORING WELL AND SOIL GAS PROBE INSTALLATION

On November 26 through 30, 2012, HFA oversaw Cascade Drilling LP (Cascade Drilling) install and sample four soil gas probes (G-1, G-2, G-4, G-5) and five groundwater monitoring wells (W-1

through W-5) (see Figure 2 for the locations). The boreholes for the wells and probes were drilled using hollow-stem auger techniques. Soil samples were collected at 5-foot intervals and were screened in the field for VOCs with a PID and logged under the supervision of a State of California professional geologist (see Appendix 3 for the procedures). The soil samples at 5, 15, and 25 fbg from each of the five groundwater monitoring well locations were collected for laboratory analysis for COCs using Encore® samplers in accordance with EPA Method 5035. The Encore® soil samples were chilled to a temperature of 4°C and transported under chain of custody to TestAmerica Laboratories, Inc. (TestAmerica). TestAmerica analyzed the soil samples for TPH as gasoline using EPA Method 8015B, and for BTEX, naphthalene, MTBE, TBA, TAME, DIPE, and ETBE, and other VOCs using EPA Method 8260B. Select soil samples from the groundwater monitoring well borings and soil gas probe borings were collected in steel sleeves and analyzed for bulk density using ASTM Method D2937 and for total porosity, air-filled porosity, and water-filled porosity using API Method RP 40 (see Appendix 3 for the sampling procedures).

Soil encountered during drilling of the well and probe locations consisted of sand, silt, clay, and mixtures of these soil types (see Appendix 5 for HFA's log of exploratory borings). The laboratory results for the soil samples are summarized in Table 1 - Summary of Soil Sample Analytical Results, Table 2 - Summary of Additional Soil Sample Analytical Results, and Table 3 - Summary of Soil Sample Geotechnical Results (see Appendix 6 for the laboratory reports).

Each groundwater monitoring well was drilled to a depth of 25 fbg using a 10-inch-diameter, hollow-stem auger, and installed using 4-inch-diameter PVC casing with a screened interval from 10 to 25 fbg (see Appendix 3 for the procedures, and Appendix 5 for the well construction details). Each soil gas probe was drilled to 13 fbg using a 6-inch-diameter, hollow-stem auger, and installed using two stainless-steel probes centered at 5.5 and 12.5 fbg and connected to the surface via teflon tubing (see Appendix 5 for the well construction details, and Appendix 7 for the procedures).

GROUNDWATER CHARACTERIZATION AND SAMPLING RESULTS

On December 6, 2012, Cascade Drilling developed the groundwater monitoring wells by surging and bailing. Also on December 6, 2012, WM Surveys, Inc. surveyed the groundwater monitoring wells (see Appendix 2 for the survey data). On December 10, 2012, HFA gauged, purged, and sampled groundwater monitoring wells W-1 through W-5 (see Appendix 8 for the procedures). No PSH was detected in any of the wells. HFA purged each well with a hand pump until temperature, conductivity, and pH stabilized (at least 15 gallons per well) and after purging collected samples from the top of the water column with a bailer (see Appendix 8 for the procedures, and Appendix 9 for the well sampling forms). The groundwater samples were chilled to a temperature of 4°C and transported under chain of custody to TestAmerica, where the

groundwater samples were analyzed for TPH as gasoline using EPA Method 8015B; for BTEX, MTBE, TBA, TAME, DIPE, ETBE, and other VOCs using EPA Method 8260B; for semi-VOCs using EPA Method 8270C; for chloride using EPA Method 300.0; for metals using EPA Method 6020; and for TDS, total and non-amenable cyanide, and dissolved sulfide using general chemistry methods. Additionally, HFA gauged several of the off-site groundwater monitoring wells associated with the nearby 76 service station to obtain groundwater elevations in the site vicinity.

Depth to groundwater ranged from 15.20 (76 station well BC-6) to 17.49 ft-TOC (well W-21) (see Figure 5 - Groundwater Elevation Map, and Table 4 - Summary of Groundwater Monitoring Results). The maximum concentrations of select COCs for groundwater samples collected from the new wells W-1 through W-5 are summarized in the following table (see Table 4 for summary data, and Appendix 6 for the laboratory reports)

SUMMARY OF MAXIMUM COC CONCENTRATIONS IN GROUNDWATER

CONSTITUENT	MAXIMUM CONCENTRATION (µg/l)	WELL ID
TPH as gasoline	130	W-1
Benzene	7.5	W-1
Toluene	<2	all wells
Ethylbenzene	<2	all wells
Total Xylenes	3.8	W-1
MTBE	2.4	W-3
TBA	<10	all wells

<# = not detected at the reporting limit indicated.

The only detectable TPH as gasoline and benzene are for well W-1 and the only detectable MTBE is for well W-3 (see Figure 6 - TPH as Gasoline/Benzene/MTBE Concentrations In Groundwater). The results of the duplicate sample for sample W-1 are similar to the original results (see Table 4 and Appendix 6).

SOIL GAS SAMPLING

On December 12, 2012, HFA oversaw H&P Mobile Geochemistry, Inc. (H&P) collect soil gas samples in general accordance with the procedures in DTSC (2011) and DTSC et al. (2012) (see Appendix 7 for the procedures). H&P collected the samples in Summa canisters that were 100% certified clean (total of eight samples plus a duplicate). Laboratory-grade helium was used for

leak detection during soil gas sampling (see Appendix 10 for the leak test procedures). H&P analyzed the samples for TPH as gasoline, BTEX, MTBE, TBA, TAME, DIPE, ETBE, and naphthalene using EPA Method TO-15; for nitrogen, oxygen, and carbon dioxide using ASTM Method 1945-96; for helium using ASTM Method D1945M; and for methane using EPA Method 8015M.

Laboratory analytical results indicated a single benzene detection of 3.7 $\mu g/m^3$ in the sample collected at 12.5 fbg from location G-5. All other soil gas samples did not contain benzene at concentrations above the reporting limit. Ethylbenzene was detected in at a maximum concentration of 4.6 $\mu g/m^3$ at 12.5 fbg from locations G-2 and G-5. The maximum naphthalene concentration was 10 $\mu g/m^3$ in the sample collected at 5.5 fbg from location G-4 (see Table 5 - Summary of Soil Gas Sample Analytical Results, and Appendix 6 for the laboratory reports).

H&P performed a leak test at each sampling location using helium as the tracer. The helium concentration was maintained above 50% in the helium shroud (see Appendix 6 for H&P's log of vapor sampling with a helium shroud). DTSC et al.'s (2012) acceptance limit for quantitative leak testing is 5% of the ambient (shroud) concentration, so the acceptance limit for the current sample set is 2.5% helium. The maximum helium concentration is 0.7%, well below the acceptance limit. A replicate sample of sample G-2-12.5' had VOC concentrations slightly higher than the original sample (see Table 5).

WASTE MANAGEMENT

Soil cuttings and decontamination water were temporarily stored onsite in 55-gallon DOT-approved drums, pending receipt of laboratory analytical results. The soil and groundwater wastes were awaiting removal at the time of this report. Laboratory reports for samples collected for waste profiling are included in Appendix 6.

SUMMARY

Between November 9 and November 30, 2012, HFA advanced nine CPTu borings and installed five groundwater monitoring wells and four soil gas probes. Soil encountered during the CPTu borings and drilling of the well and probe locations consisted of sand, silt, clay, and mixtures of these soil types.

On December 10, 2012, HFA gauged, purged, and sampled the groundwater monitoring wells and gauged several of the off-site groundwater monitoring wells associated with the nearby 76 service station. No PSH was detected. Depth to groundwater ranged from 15.20 (76 service station well BC-6) to 17.49 ft-TOC (well W-21). Laboratory analytical results for groundwater samples indicated maximum benzene and MTBE concentrations at 7.5 and 2.4 μg/l, respectively.

On December 12, 2012, HFA sampled the soil gas probes. Laboratory analytical results of soil gas samples indicated maximum benzene, ethylbenzene, and naphthalene concentrations of 3.7, 4.6, and 10 $\mu g/m^3$, respectively.

Type and Amount of Sealant	Type of Perforator	Size of Perforations	Method of Upper Seal Pressure Application

CONSULTANT INFORMATION

Company: Holguin, Fahan + Associates
Address: 16 North Oak Street | City: Ventura | State: CA | Zip Code: 93001
Project Manager: Jeff Nobriga | Telephone Number: (805) 766-8427 | Fax Number: (805) 641-1654

ATTENTION: WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS DEPARTMENT.

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction, and decommissioning data deemed necessary by the County Environmental Health Division Of Los Angeles County.

Signature of Applicant: [signature] Printed Name: Jeff Nobriga

THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED OFF BY THE DEPUTY HEALTH OFFICER. WELL CONSTRUCTION OR DECOMMISSIONING CANNOT BE INITIATED WITHOUT A WORK PLAN APPROVAL FROM THIS DEPARTMENT.

**********(DEPARTMENT USE ONLY)**********

WORK PLAN APPROVAL This Approval is Valid for 180 Days	REHS MICHELLE TSIEBOS	DATE 10/11/12
Conditions: On 10/09/12 $2,595 was paid for permit # 892388/1-5 to install 5 monitoring wells. Maintain all setbacks. Observe the workplan submitted. Ensure fieldwork oversight by a licensed professional. Please notify me at least 2 business days ahead of fieldwork by E-MAIL = MTSIEBOS@DH.LACOUNTY.GOV		
FINAL INSPECTION The placement of the annular seal must be witnessed by a Deputy Health Officer for the permit to be valid. Contact this Department to arrange for an appointment.	REHS	DATE

NOTICE

This well permit approval is limited to compliance with the California Well Standards and the Los Angeles County Code and does not grant any rights to construct, reconstruct, or decommission any well. The applicant is responsible for securing all other necessary permits such as: coastal commission, water rights, encroachment, utility lines detection, city public works division.

APPENDIX 3.

SOIL BORING, DIRECT-PUSH SAMPLING, AND WELL CONSTRUCTION PROCEDURES

SOIL BORING, DIRECT-PUSH SAMPLING, AND WELL CONSTRUCTION PROCEDURES

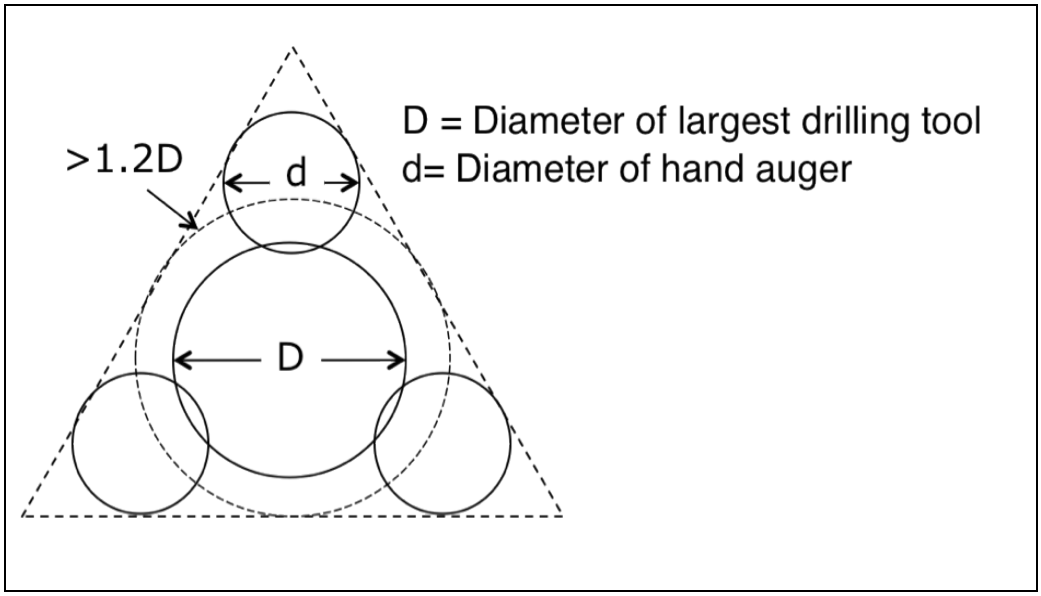
PRE-DRILLING PROTOCOL

Planning

Prior to the start of drilling, necessary permits, site access agreements, and/or encroachment permits are obtained. As-built drawings are obtained if possible. At least 2 weeks in advance of drilling, notifications are made to the property owner, client representative, on-site facility manager, regulatory agency, and/or other appropriate parties. Underground Service Alert of Southern California, Arizona Blue Stake, or an equivalent utility locating service is notified prior to drilling. A geophysical survey may be conducted to attempt to locate subsurface utilities. Site plans and/or as-built drawings are compared to actual conditions observed at the site. The property owner/retailer is interviewed to gain information about locations of former UST systems (including dispensers, product lines, and vent lines). A visual inspection is made of the locations of the existing UST system, and scars and patches in pavement are noted.

In order to determine the natural subsurface conditions, better recognize fill conditions, and prevent cross contamination, the first sampling location is generally located the furthest from any suspected underground improvement.

Hole Clearance



Hole clearance is performed prior to mechanical drilling (e.g. direct push, hollow stem auger, or rotary drilling). The minimum hole clearance depth is 8 feet below grade (fbg) and the minimum diameter to be cleared is 120 percent of the diameter of the largest tool to be advanced (unless the client specifies another clearance protocol). If a subsurface utility was identified within 10 feet of the drilling location (based on as-built drawings, geophysical markouts, etc.) and the utility may be deeper than 8 feet (especially gravity-drain sewage lines), then clearance is continued vertically to the anticipated maximum possible depth of the utility. Hole clearance is performed by any of the following soft-dig methods.

- Air knife: The hole is cleared using an air knife and air vacuum to make a hole at least 120 percent of the diameter of the largest tool to be advanced and to a minimum depth of 8 fbg. The drill tool is then lowered into the hole until rests on the bottom of the cleared hole, at which point drilling commences. If the hole is cleared a day or more before drilling, the hole may be backfilled or covered to prevent possible accidents from leaving an open hole. If the hole is backfilled, drilling is performed slowly and carefully through the cleared interval and the position of the drill stem is continuously monitored for lateral drift. Additionally, both the cleared hole and the drilling tool (e.g. hollow stem auger, direct push rod) must be vertical such that the drilling tool remains within the backfill to the total depth of the cleared hole and does not touch the undisturbed sidewalls where utility lines may be present. Drilling/pushing is stopped if the drill stem drifts outside the cleared area.

- Manual clearance for narrow-diameter tools: Clearance for narrow-diameter tools such as direct push rods may be accomplished with a single hand-dug hole that is at least 120 percent of the diameter of the largest tool to be advanced and to a minimum depth of 8 fbg. The hand digging is performed with minimal force, especially in areas of possible fiberglass lines such as near fueling facilities. For direct push drilling tools, the hole is backfilled/compacted with native or other fill to provide support to the rods during pushing. Drilling/pushing is performed slowly and carefully through the cleared interval and the position of the rod is continuously monitored for lateral drift. Additionally, both the cleared hole and the drilling tool must be vertical such that the drilling tool remains within the backfill to the total depth of the cleared hole and does not touch the undisturbed sidewalls where utility lines may be present. Drilling/pushing is stopped if the rod drifts outside the cleared area.

- Manual clearance of large-diameter hole: If air-knife clearance is not feasible for a larger-diameter tool such as a hollow stem auger, a single hole is hand-dug to at least 120 percent of the diameter of the largest tool to be advanced and to a minimum depth of 8 fbg. The hand digging is performed with multiple holes dug with a hand auger and/or posthole digger with minimal force, especially in areas of possible fiberglass lines such as near fueling facilities. The drill tool is then lowered into the hole until rests on the bottom of the cleared hole, at which point drilling commences. If the hole is cleared a day or more before drilling, the hole may backfilled or covered to prevent possible accidents from leaving an open hole. If the hole is backfilled, drilling is performed slowly and carefully through the cleared interval and the position of the drill stem is continuously monitored for lateral drift. Additionally, both the cleared hole and the drilling tool (e.g. hollow stem auger, direct push rod) must be vertical such that the drilling tool remains within the backfill to the total depth of the cleared hole and does not touch the undisturbed sidewalls where utility lines may be present. Drilling/pushing is stopped if the drill stem drifts outside the cleared area.

- Manual clearance of large-diameter hole with multiple narrow-diameter holes: If air-knife and manual clearance are not feasible for a larger-diameter tool such as a hollow stem auger, a minimum of three locations are hand-dug to a minimum depth of 8 fbg. The hand digging is performed with minimal force, especially in areas of possible fiberglass lines such as near fueling facilities. The three locations are spaced at the corners of an equilateral triangle that is large enough to contain a circle that is at least 120 percent of the diameter of the largest tool to be advanced (see diagram).

Minimum spacing of hand-cleared holes.

Because drill bits tend to follow the path of least resistance, this method requires a fourth hand-dug hole in the center of the triangle to act as a pilot hole for the drill. This center pilot hole is dug left open to guide the drill tool, but the three (or more) outer holes are backfilled and compacted with native or other fill to reduce drift of the drilling tool into these holes and out of the cleared area.

This method clears the area of subsurface lines outside the large triangle. However, depending on the diameters of the hand auger/post hole digger (d) and the diameter to be cleared (D), an evaluation is made as to whether a subsurface line could have been missed within the cleared area between the hand-dug holes. If so, the center pilot hole and if need be more holes are hand-dug within the triangle to the same depth as the other 3 holes; the number of clearance holes must be sufficient to ensure that utility lines could not be missed within the cleared area. When using this method, the holes are dug as near to vertical as possible to ensure the same spacing at 8 fbg as at the surface.

The air knife method is the standard, preferred method of hole clearance for larger tools (hollow stem auger or rotary drilling), and the single hand auger/post hole digger method is the preferred method for smaller tools (direct push rods). The triangle method has limitations and should only be used if the other methods are not feasible.

If subsurface conditions prevent adequate subsurface clearance, the field activities cease until the client gives written approval of a procedure for continuation. Alternate or additional subsurface clearance procedures may also be employed, as required by clients, permit

conditions, and/or anticipated subsurface conditions (for example, near major utility corridors or in hard soils).

When pea gravel, fill sand, or other non-indigenous material is encountered, the sampling location is abandoned unless the absence of subsurface facilities can be demonstrated and client approval to proceed is obtained. If any portion of a UST system is encountered, or if there is any possibility that it has been encountered, the work ceases, and the client is notified immediately.

SOIL SAMPLING PROCEDURES

Soil samples are collected using one of the following methods:

- Manual drilling: Manual drilling utilizes a hand auger. Soil samples are collected with a drive sampler outfitted with steel or brass sleeves. The specific equipment used is noted on a log of exploratory boring.

- Truck-mounted, powered drilling: Truck-mounted, powered drilling utilizes hollow-stem flight auger drilling, air rotary drilling, percussion hammer drilling, or similar technologies. Soil samples are collected in steel or brass sleeves with a California-modified, split-spoon sampler or, for specific projects, a continuous sampler. The specific equipment used is noted on a log of exploratory boring.

- Direct push sampling: Direct push sampling utilizes Geoprobes, cone penetrometer testing rigs, or similar technologies. Soil samples are collected with a drive sampler outfitted with steel, acetate or brass sleeves. The specific equipment used is noted on a log of soil sample descriptions.

Before each soil sampling episode, the sampling equipment is decontaminated using a non-phosphate soap and water wash. The equipment is then rinsed in a bucket of tap water, followed by a second and third bucket of tap water as a final rinse. The last rinse may be de-ionized or distilled to meet technical or regulatory project requirements. For rinsing small equipment, clean rags moistened with clean water (tap, de-ionized or distilled) or spray bottles with clean water may be used. The drill augers or direct-push rods are decontaminated with a steam cleaner between each soil boring (truck-mounted rigs). The decontamination water is disposed of off site or, if local regulations allow, is disposed on bare ground in the vicinity of the wells.

Soil samples that are collected in sample sleeves are covered with aluminum foil or Teflon tape followed by plastic caps. If EPA Method 5035 is required, then 5 to 20 grams of soil is extracted from the sample and placed in methanol-preserved or sodium bisulfate-preserved containers supplied by the laboratory, or subsamples are collected using Encore samplers. During the

sampling process, soil samples and cuttings are field screened for VOCs using a photoionization detector calibrated to an isobutylene or hexane standard. The calibration information is recorded on an equipment calibration log. Any soil staining or discoloration is visually identified. Soils are classified according to the Unified Soil Classification System. Specific geologic and hydrogeologic information collected includes grading, plasticity, density, stiffness, mineral composition, moisture content, soil structure, grain size, degree of rounding, and other features that could affect contaminant transport. All data are recorded on a soil boring log under the supervision of a geologist registered in the state in which the site is located. A soil boring log is completed for each soil sampling location and includes the following minimum information:

- date of drilling;
- project name and location;
- soil sample names and depths;
- soil descriptions and classifications;
- standard penetration counts (rigs);
- photoionization detector readings;
- drilling equipment;
- soil boring diameter;
- sampling equipment;
- depth to groundwater in soil boring;
- name of person performing logging;
- name of supervising registered geologist; and
- name of drilling company (rigs and direct push).

The samples are labeled, sealed, recorded on a chain-of-custody record, and stored in a cooler while on-site and in transport to the state-certified, hazardous waste testing laboratory or office. The cooler has sufficient water ice to maintain appropriate temperature.

Cuttings from the soil borings are stored in 55-gallon, Department of Transportation (DOT) approved drums, roll-off bins, or other appropriate containers, as approved by the client. Each container is labeled as waste material or non-hazardous waste, with the number of the soil boring(s) from which the waste was derived, the date the waste was generated, the generator name, and other pertinent information. The waste is stored at the site of generation, or at another location approved by the client until sample laboratory analytical results are obtained, at which time the soil is disposed of appropriately.

HYDROPUNCH GROUNDWATER SAMPLING PROCEDURES

Hydropunch sampling of groundwater is designed for collecting discrete, one-time samples of groundwater for analysis during drilling or direct-push operations. The hydropunch sampler consists of a 5-foot long, 1.5-inch diameter screen sheathed by a 2-inch diameter, steel barrel. A disposable point is connected to the bottom of the screen. The hydropunch assembly is lowered through the hollow-stem auger and driven into the undisturbed soils below the base of the hole, or is pushed into the soil using a direct push rig. The outer sheath is then retracted to expose the screen. A bailer is then lowered into the hydropunch assembly and retrieves a sample of the groundwater within the assembly.

The extracted groundwater is collected in chilled, 40-milliliter, volatile organic analysis vials having Teflon-lined caps, or other appropriate containers as required by the respective analytical method. For organic compound analyses, hydrochloric acid preservative may be added to the containers by the laboratory to lower sample pH. Samples are stored in a cooler while on-site and in transport to the laboratory or office. The cooler has sufficient ice to maintain appropriate temperature prior to collecting samples. The VOA vials are kept chilled both prior to and after filling. Warm containers are not used when volatile compounds are the target analytes. Analysis is performed by a state-certified, hazardous waste testing laboratory.

Documentation requirements include:

- sample identification number;
- borehole identification number;
- time and date of sample collection;
- depth at which Hydropunch sample was collected;
- name of person collecting sample;
- number and types of sample containers; and
- type of preservative used, if any.

BOREHOLE COMPLETION PROCEDURES

All sampling locations are either properly abandoned or completed as a well.

Abandonment

Each borehole/sample location that is not completed as a well is backfilled with bentonite grout, neat cement, concrete, or bentonite chips with a permeability less than that of the surrounding soils, and/or soil cuttings, depending on local regulatory requirements or client instructions. Grout is placed by the tremie method. Backfilling is performed carefully to avoid bridging. The type of backfill material is noted on the log.

Well Installation

Wells are designed according to applicable state and local regulations as well as project needs. Details of the well design and construction are recorded on the log and include the following minimum information (in addition to the items noted above for soil borings):

- detailed drawing of well;
- type of well (groundwater, vadose, or air sparging);
- casing diameter and material;
- screen slot size;
- well depth and screen length (±1 foot);
- filter pack material, size, and placement depths;
- annular seal material and placement depths; and
- surface seal design/construction.

Groundwater monitoring wells are generally designed with 30 feet of slotted casing that crosses the water table, unless site conditions, project needs, or local regulations dictate a different well design. Vadose wells are designed with slotted casing appropriate for the project needs, e.g. slotted in hydrocarbon-containing intervals for vapor extraction. Air sparging wells are typically designed with 5 feet of slotted casing placed 15 feet below the water table. The sand pack is placed at least two feet above the top of the screen, and at least 3 feet of low permeability seal material is placed between the sand pack and the surface seal, unless shallow groundwater conditions exist (less than 5 fbg). The sand pack and low permeability seal material are placed in the annular space from the bottom up using the tremie method.

When drilling in asphalt, a 24-inch round cut is made for the well pad. When drilling on concrete, a 2 x 2-foot square or 24-inch circle is sawcut. The well cover is traffic-rated and has a white lid with a black triangle painted on it or a black lid with a white triangle. The well number is labeled on the outside of the well box/pad and/or the inside of the well box. The casing has a notch or indication on its north side indicating a unique measuring/surveying point. Well casings are capped with a locking or slip well cap.

Well Development

Well development is conducted by the use of surge blocks, bailers, pumps, or other appropriate methods in accordance with the requirements of the California Department of Water Resources Bulletin #74–81 dated December 1981, or ASTM International 4448-85a (as required by the ADEQ). Only formation water is used for surging the well. Well development continues until non-turbid groundwater is produced or turbidity stabilizes. The method of development and the volume of groundwater produced are recorded in the field log. All purged groundwater is held on-site, or at another location approved by the client, in sealed, 55-gallon DOT approved drums or other appropriate containers pending transport to an approved recycling facility.

APPENDIX 4.

CPT PROCEDURES AND RESULTS

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*. The soundings were conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.80.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and penetration pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2007) ASTM standards (D 5778-07).

The cone also contains a porous filter element located directly behind the cone tip (u_2). It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain penetration pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (*PPDT's*) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with oil under vacuum pressure to ensure accurate and fast dissipation.

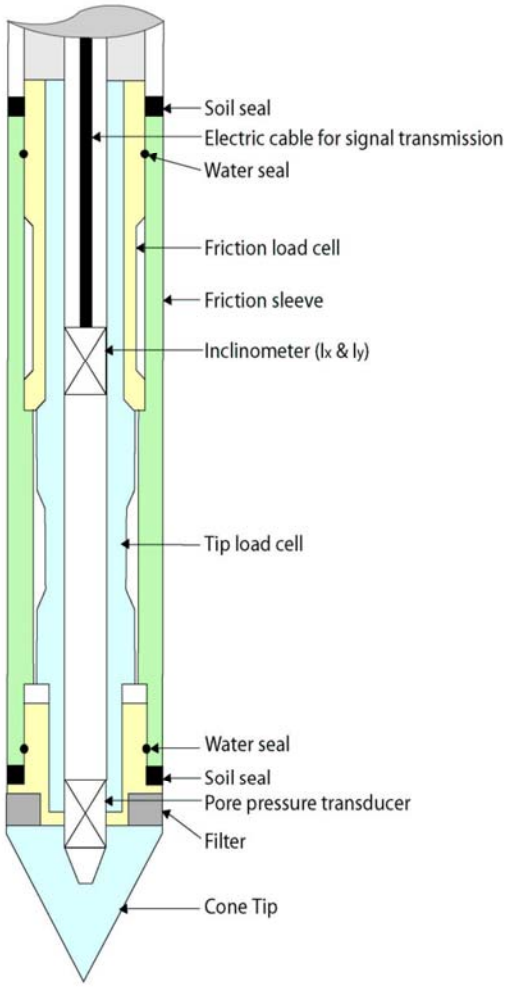


Figure CPT

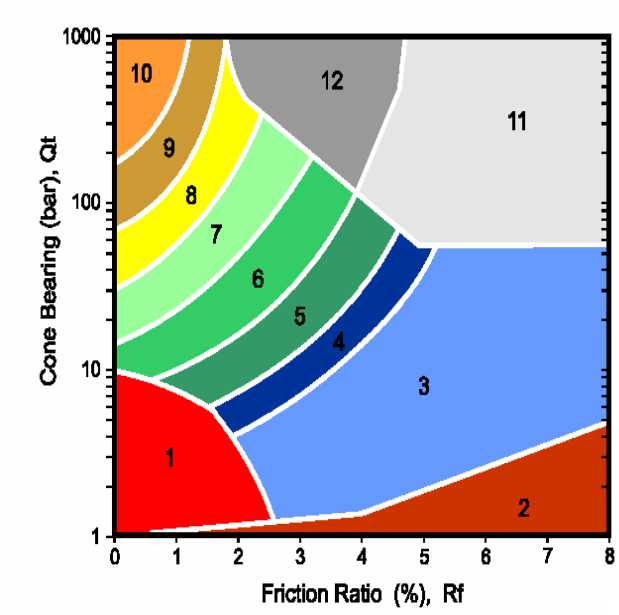
The cone has the following accuracy:
1 tsf for q_c, 0.02 tsf for f_s and 0.5 psi for u_2. In soft clays, a lower capacity cone should be used for improved accuracy.

When the soundings are complete, the test holes are grouted. The grouting procedures generally consist of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.



Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected from your site are presented in graphical form in the attached report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings extending greater than 50 feet, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. do not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and do not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

Figure SBT

Cone Penetration Test (CPT) Interpretation

Gregg has recently updated their CPT interpretation and plotting software (2007). The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, pa = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results,(ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve friction, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data, if collected, e.g. electrical resistivity or UVIF
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1\text{-}a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \gamma z$
12	Insitu pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u – u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with Ic)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT Lunne et al. (1997) listed below

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 – \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c – 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} (based on Normalized SBT_n)
(Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_{N,}$
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go
a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For SBT_n 5, 6, 7*
b. $G_o = C_G\, q_t$ *For SBT_n 1, 2, 3& 4*
Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR $OCR = k_{ocr}\, Q_{t1}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$
3	$1x\ 10^{-9}$	$3x\ 10^{-10}$
4	$3x\ 10^{-8}$	$1x\ 10^{-8}$
5	$3x\ 10^{-6}$	$1x\ 10^{-6}$
6	$3x\ 10^{-4}$	$1x\ 10^{-4}$
7	$3x\ 10^{-2}$	$1x\ 10^{-2}$
8	$3x\ 10^{-6}$	$1x\ 10^{-6}$
9	$1x\ 10^{-8}$	$3x\ 10^{-9}$

Estimated Unit Weight (see Lunne et al., 1997)

SBT	Approximate Unit Weight (lb/ft^3)	(kN/m^3)
1	111.4	17.5
2	79.6	12.5
3	111.4	17.5
4	114.6	18.0
5	114.6	18.0
6	114.6	18.0
7	117.8	18.5
8	120.9	19.0
9	124.1	19.5
10	127.3	20.0
11	130.5	20.5
12	120.9	19.0

GREGG DRILLING & TESTING, INC.
GEOTECHNICAL AND ENVIRONMENTAL INVESTIGATION SERVICES

November 12, 2012

HFA
Attn: Mark Fahan

Subject: CPT Site Investigation
1022-1054 S. La Cienega
Los Angeles, California
GREGG Project Number: 12-812SH

Dear Mr. Fahan:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☒
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (925) 313-5800.

Sincerely,
GREGG Drilling & Testing, Inc.

Peter Robertson
Technical Director, Gregg Drilling & Testing, Inc.

APPENDIX 5.

LOG OF EXPLORATORY BORINGS AND WELL CONSTRUCTION DETAILS

LITHOLOGY
(UNIFIED SOIL CLASSIFICATION SYSTEM)

MAJOR DIVISIONS			GROUP SYMBOLS	TYPICAL NAMES
COARSE-GRAINED SOILS MORE THAN HALF IS LARGER THAN No. 200 SIEVE	GRAVEL MORE THAN HALF COARSE FRACTION IS LARGER THAN No. 4 SIEVE SIZE	GRAVELS WITH LITTLE OR NO FINES	GW	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES, LITTLE OR NO FINES
			GP	POORLY-GRADED GRAVELS OR GRAVEL-SAND MIXTURES, LITTLE OR NO FINES
		GRAVELS WITH OVER 12% FINES	GM	SILTY GRAVELS, GRAVEL-SAND-SILT MIXTURES
			GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES
	SAND MORE THAN HALF COARSE FRACTION IS SMALLER THAN No. 4 SIEVE SIZE	SANDS WITH LITTLE OR NO FINES	SW	WELL-GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
			SP	POORLY-GRADED SANDS OR GRAVELLY SANDS, LITTLE OR NO FINES
		SANDS WITH OVER 12% FINES	SM	SILTY SANDS, SAND-SILT MIXTURES
			SC	CLAYEY SANDS, SAND-CLAY MIXTURES
FINE-GRAINED SOILS MORE THAN HALF IS SMALLER THAN No. 200 SIEVE	SILT AND CLAY		ML	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY
			CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
			OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILT AND CLAY		MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDY OR SILTY SOILS, ELASTIC SILTS
			CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
			OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS
HIGHLY ORGANIC SOIL			Pt	PEAT AND OTHER HIGHLY ORGANIC SOILS

SYMBOLS AND ACRONYMS

- SOIL SAMPLE COLLECTED
- GROUNDWATER SAMPLE COLLECTED (HYDROPUNCH® OR SIMILAR)
- SAMPLE NOT RECOVERED
- GROUNDWATER ENCOUNTERED DURING DRILLING

- WELL BOX WITH LOCKING CAP
- BLANK SCHEDULE 40 PVC CASING
- MICROPOROUS BUBBLER
- SLOTTED SCHEDULE 40 PVC CASING
- BOTTOM PLUG

- 0.25-INCH NYLON TUBING WITH GAS-TIGHT CAP
- STEEL PROBE

BOREHOLE COMPLETION

- ASPHALT/CONCRETE SURFACE PATCH
- CONCRETE
- BENTONITE CHIPS OR PELLETS
- BENTONITE/CEMENT GROUT
- FILTER PACK

PID = PHOTOIONIZATION DETECTOR
ppmv = PARTS PER MILLION BY VOLUME
fbg = FEET BELOW GRADE
USCS = UNIFIED SOIL CLASSIFICATION SYSTEM
PVC = POLYVINYLCHLORIDE

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 11/26/2012 4:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4° C.

GC/MS VOA
Method(s) 8260B: Due to the high concentration of 2-Methyl-2-Propanol, the matrix spike / matrix spike duplicate (MS/MSD) for batch 70374 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No other analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

Subcontract non-Sister
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Subcontract Work
Methods API RP40-Porosity, Air,Water,Total, ASTM Method D2937 Bulk Density, Grain Size ASTM D422: These methods were subcontracted to PTS Laboratories, Inc. The subcontract certifications are different from those listed on the TestAmerica cover page of this final report.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Physical Properties Data
1022-1056 South La Cienega Blvd., Los An; 440-30669-1

Dear Mr. Sanelle:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your 1022-1056 South La Cienega Blvd., Los An; 440-30669-1 project. All analyses were performed by applicable ASTM, EPA, or API methodologies. An electronic version of the report has previously been sent to your attention via the internet. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact Morgan Richards at (562) 347-2509.

Sincerely,
PTS Laboratories

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Nick Pryor (HFA)
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Physical Properties Data
1022-1056 South La Cienega Blvd., Los An; 440-30766-1

Dear Mr. Sanelle:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your 1022-1056 South La Cienega Blvd., Los An; 440-30766-1 project. All analyses were performed by applicable ASTM, EPA, or API methodologies. An electronic version of the report has previously been sent to your attention via the internet. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact Morgan Richards at (562) 347-2509.

Sincerely,
PTS Laboratories

for Rachel

Michael Mark Brady, P.G.

Laboratory Test Program Notes

Contaminant identification: _____

Standard TAT for basic analysis is 10 business days.

ASTM D422: Dry Sieve only, Hydrometer analysis must be requested prior to initiating tests. Additional costs would apply.

Substitute API RP40 for ASTM D2937 per P. Sanelle/TestAmerica 20121129

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Nick Pryor
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 11/28/2012 5:20 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.7° C.

GC/MS VOA
Method(s) 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 70701 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

GC VOA
Method(s) 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 70681 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Subcontract non-Sister
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Holguin, Fahan & Associates, Inc.
Project/Site: 1022-1056 South La Cienega Blvd., Los An

TestAmerica Job ID: 440-30890-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-13
Arizona	State Program	9	AZ0671	10-13-13

Re: PTS File No: 42879
Physical Properties Data
1022-1056 South La Cienega Blvd., Los An; 440-30890-1

Dear Mr. Sanelle:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your 1022-1056 South La Cienega Blvd., Los An; 440-30890-1 project. All analyses were performed by applicable ASTM, EPA, or API methodologies. An electronic version of the report has previously been sent to your attention via the internet. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact Morgan Richards at (562) 347-2509.

Sincerely,
PTS Laboratories

for Rachel S

Michael Mark Brady, P.G.
District Manager

Laboratory Test Program Notes

Contaminant identification: _____

Standard TAT for basic analysis is 10 business days.

ASTM D422: Dry Sieve only, Hydrometer analysis must be requested prior to initiating tests. Additional costs would apply.

Substitute API RP40 for ASTM D2937 per P. Sanelle/TestAmerica 20121129

PTS Laboratories

Login Sample Receipt Checklist

Client: Holguin, Fahan & Associates, Inc.

Job Number: 440-30890-1

Login Number: 30890

List Source: TestAmerica Irvine

List Number: 1

Creator: Robb, Kathleen

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Nick Pryor
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 11/29/2012 6:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4º C.

GC/MS VOA
Method(s) 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 70701 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

GC VOA
Method(s) 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 70681 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (LCS 440-71183/2). The BFB surrogate coeluted with the TPH standard. Data not impacted.

Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (440-31170-19 MS), (440-31170-19 MSD). The BFB surrogate coeluted with the TPH standard. Data not impacted.

Method(s) 8015B: Surrogate recovery for the following sample(s) was outside control limits: W-1-15 (440-31037-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (LCS 440-71183/30), (LCSD 440-71183/31). The BFB surrogate coeluted with the TPH standard. Data not impacted.

Method(s) 8015B: Surrogate recovery for the following sample(s) was outside control limits: W-1-15 (440-31037-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8015B: The 5g run was above the calibration range.

Method(s) 8015B: The following sample(s) was diluted due to the nature of the sample matrix: W-1-15 (440-31037-4). Elevated reporting limits (RLs) are provided. The 5g run was above the calibration range. Both results were reported.

No other analytical or quality issues were noted.

Subcontract non-Sister
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits

GC VOA

Qualifier	Qualifier Description
E	Result exceeded calibration range.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Physical Properties Data
1022-1056 South La Cienega Blvd., Los An; 440-31037-1

Dear Mr. Sanelle:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your 1022-1056 South La Cienega Blvd., Los An; 440-31037-1 project. All analyses were performed by applicable ASTM, EPA, or API methodologies. An electronic version of the report has previously been sent to your attention via the internet. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact Morgan Richards at (562) 347-2509.

Sincerely,
PTS Laboratories

for Rachel S

Michael Mark Brady, P.G.

List Number: 1

Creator: Kim, Will

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Nick Pryor
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 11/30/2012 7:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was -0.1° C.

GC/MS VOA
Method(s) 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 71244 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

GC VOA
Method(s) 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 70681 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 8015B: Surrogate recovery for the following sample(s) was outside control limits: W-2-15 (440-31177-1). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (LCS 440-70731/14), (LCSD 440-70731/15). The surrogate BFB coeluted with the TPH standard. Data not impacted.

No other analytical or quality issues were noted.

Subcontract non-Sister
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Physical Properties Data
1022-1056 South La Cienega Blvd., Los An; 440-31177-1

Dear Mr. Sanelle:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your 1022-1056 South La Cienega Blvd., Los An; 440-31177-1 project. All analyses were performed by applicable ASTM, EPA, or API methodologies. An electronic version of the report has previously been sent to your attention via the internet. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please contact Morgan Richards at (562) 347-2509.

Sincerely,
PTS Laboratories

for Rachel S

Michael Mark Brady, P.G.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Jeff Nogriga
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 12/10/2012 6:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.3º C.

GC/MS VOA
Method(s) 8260B: The continuing calibration verification (CCV) for acetone associated with batch 74553 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8260B: The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 74553 was outside control limits. The individual analyte recovery was within acceptance criteria. The associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) precision met acceptance criteria.

No other analytical or quality issues were noted.

GC/MS Semi VOA
Method(s) 8270C, 8270C LL: The grand mean exception, as outlined in EPA Method 8000B, was applied to the initial calibration (ICAL) analyzed in batch 69453. This rule states that when one or more compounds in the ICAL fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %RSD (the grand mean) of all the compounds in the ICAL is less than or equal to 15% RSD. The following compounds are affected: benzidine; 1,4-naphthoquinone; dimethoate; methyl parathion; and 4-nitroquinoline-1-oxide.

Method(s) 8270C: Surrogate recovery for the following sample(s) was outside control limits: W-1 (440-32164-1), W-2 (440-32164-3), W-3 (440-32164-4), W-5 (440-32164-6). Matrix interference is suspected.

Method(s) 8270C: Insufficient sample volume was available to perform batch matrix spike/matrix spike duplicate (MS/MSD) associated with batch 73281. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

Method(s) 8270C: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 73281 exceeded control limits for the following analytes: 2,4-dichlorophenol and hexachloroethane. The individual recoveries met acceptance criteria.

Method(s) 8270C: The grand mean exception, as outlined in EPA Method 8000B, was applied to the initial calibration (ICAL) analyzed in batch 74307. This rule states that when one or more compounds in the ICAL fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %RSD (the grand mean) of all the compounds in the ICAL is less than or equal to 15%RSD. The following compounds are affected: benzidine.

No other analytical or quality issues were noted.

HPLC
Method(s) 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for chloride in batch 72504 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 300.0: Due to the high concentration of chloride, the matrix spike / matrix spike duplicate (MS/MSD) for batch 72504 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No other analytical or quality issues were noted.

GC VOA
Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (440-32164-1 MS), (440-32164-1 MSD). The

Job ID: 440-32164-1 (Continued)

Laboratory: TestAmerica Irvine (Continued)

BFB surrogate coeluted with the TPH standard. Data not impacted.

No other analytical or quality issues were noted.

Metals
Method(s) 6020: The initial calibration verification (ICV) for analytical batch 440-73512 exceeded control criteria for Ag. The data have been qualified and reported. commamerge

No other analytical or quality issues were noted.

General Chemistry
Method(s) 1664A: Insufficient sample volume was available to perform batch matrix spike/matrix spike duplicate (MS/MSD) associated with batch 74049. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

Method(s) 1664A: Insufficient sample volume was available to perform batch matrix spike/matrix spike duplicate (MS/MSD) associated with batch 74416. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

Method(s) SM 4500 CN G: Total cyanide analysis were performed for samples and the result obtained were non-detect. As such, these amenable cyanides analysis were not performed, and the result for these analytes were reported as non-detect.

Method(s) SM 4500 CN G: Total cyanide analysis was performed for sample W-1 (440-32164-1), W-1 DUP (440-32164-2), W-2 (440-32164-3), W-3 (440-32164-4), W-4 (440-32164-5), W-5 (440-32164-6), and the result obtained was a non-detect. As such, the amenable cyanide analysis was not performed, and the result for this analyte was reported as non-detect.

Method(s) SM 4500 S2 D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 72992 were outside control limits for dissolved sulfide. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Definitions/Glossary

Client: Holguin, Fahan & Associates, Inc.
Project/Site: 1022-1056 South La Cienega Blvd., Los An

TestAmerica Job ID: 440-32164-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F	RPD of the MS and MSD exceeds the control limits

GC/MS Semi VOA

Qualifier	Qualifier Description
*	RPD of the LCS and LCSD exceeds the control limits
*	LCS or LCSD exceeds the control limits
X	Surrogate is outside control limits

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

HPLC/IC

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits

Metals

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.

General Chemistry

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits
HF	Field parameter with a holding time of 15 minutes

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Holguin, Fahan & Associates, Inc.
Project/Site: 1022-1056 South La Cienega Blvd., Los An

TestAmerica Job ID: 440-32164-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-13
Arizona	State Program	9	AZ0671	10-13-13
California	LA Cty Sanitation Districts	9	10256	01-31-13
California	NELAP	9	1108CA	01-31-13
California	State Program	9	2706	06-30-14
Guam	State Program	9	Cert. No. 12.002r	01-23-13
Hawaii	State Program	9	N/A	01-31-13
Nevada	State Program	9	CA015312007A	07-31-13
New Mexico	State Program	6	N/A	01-31-13
Northern Mariana Islands	State Program	9	MP0002	01-31-13
Oregon	NELAP	10	4005	09-12-13
USDA	Federal		P330-09-00080	06-06-14
USEPA UCMR	Federal	1	CA01531	01-31-13

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Mobile Geochemistry Inc.

H&P Project: HFA121312-11 Rev
Client Project: Steptoe / 1022-1054 S. La Cienega

Dear Mr. Jeff Nobriga:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 12-Dec-12 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody

Unless otherwise noted, all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Janis Villarreal
Laboratory Director

H&P Mobile Geochemistry, Inc. operates under CA Environmental Lab Accreditation Program Numbers 2579, 2740, 2741, 2742, 2743, 2745 and 2754. National Environmental Laboratory Accreditation Conference (NELAC) Standards Lab #11845

NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the Environmental Laboratory Accreditation Program (CA) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste for the following methods:

Certificate# 2741, 2743, 2579, 2754 & 2740 approved for EPA 8260 and LUFT GC/MS
Certificate# 2742, 2745, & 2741 approved for LUFT
Certificate# 2745 & 2742 approved for EPA 418.1

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the National Environmental Accreditation Conference Standards for the category Environmental Analysis Air and Emissions for the following analytes and methods:

1,2,4-Trichlorobenzene by EPA TO-15 & TO-14A
Hexachlorobutadiene by EPA TO-15 & TO-14A
1,2,4-Trimethylbenzene by EPA TO -14A
1,2-Dichlorobenzene by EPA TO-15 & TO-14A
1,3,5-Trimethylbenzene by EPA TO -14A
1,4-Dichlorobenzene by EPA TO-15 & TO-14A
Benzene by EPA TO-15 & TO-14A
Chlorobenzene by EPA TO-15 & TO-14A
Ethyl benzene by EPA TO-15 & TO-14A
Styrene by EPA TO-15 & TO-14A
Toluene by EPA TO-15 & TO-14A
Total Xylenes by EPA TO-15 & TO-14A
1,1,1-Trichloroethane by EPA TO-15 & TO-14A
1,1,2,2-Tetrachloroethane by EPA TO-15 & TO-14A
1,1,2-Trichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethene by EPA TO-15 & TO-14A
1,2-Dichloroethane by EPA TO-15 & TO-14A
1,2-Dichloropropane by EPA TO-15 & TO-14A
Benzyl Chloride by EPA TO-15 & TO-14A
Bromoform by EPA TO-15
Bromomethane by EPA TO-15 & TO-14A
Carbon tetrachloride by EPA TO-15 & TO-14A
Chloroethane by EPA TO-15
Chloroform by EPA TO-15 & TO-14A
Chloromethane by EPA TO-15 & TO-14A
cis-1,2-Dichloroethene by EPA TO-15
cis-1,2-Dichloropropene by EPA TO-15 & TO-14A
Methylene chloride by EPA TO -15 & TO-14A
Tetrachloroethane by EPA TO-15 & TO-14A
trans-1,2-Dichloroethene by EPA TO-15
trans-1,2-Dichloropropene by EPA TO-15 & TO-14A
Trichloroethene by EPA TO-15 & TO-14A
Vinyl chloride by EPA TO -15 & TO-14A
2-Butanone by EPA TO-15
4-Methyl-2-Pentanone by EPA TO-15
Hexane by EPA TO-15
Methyl tert-butyl ether by EPA TO-15
Vinyl acetate by EPA TO-15
Dibromochloromethane by EPA TO-15
Dichlorodifluoromethane by EPA TO-15 & TO-14A
Trichlorofluoromethane by EPA TO-15 & TO-14A
Naphthalene by EPA TO-15 & TO-14A
m&p Xylenes by EPA TO-15
o-Xylene by EPA TO-15
1,3-Butadiene by EPA TO-15
1,1,2-Trichlorotrifluoroethane by EPA TO-15 & TO-14A
Carbon disulfide by EPA TO-15
1,4-Dioxane by EPA TO-15
Cyclohexane by EPA TO-15
tert-Butyl Alcohol by EPA TO-15
1,3-Dichlorobenzene by EPA TO-15 & TO-14A
Heptane by EPA TO-15
Bromodichloromethane by EPA TO-15 & TO-14A

This certification applies to samples analyzed in summa canisters.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

APPENDIX 7.

SOIL GAS SAMPLING PROCEDURES

SOIL GAS AND AIR SAMPLING PROCEDURES

SCOPE

These procedures have been prepared to ensure that sampling of soil gas and ambient air use methodologies in general conformance with the Department of Toxic Substances Control (DTSC's), Los Angeles Regional Water Quality Control Board's (LARWQCB's), and San Francisco Bay Regional Water Quality Control Board's "Advisory – Active Soil Gas Investigation" (DTSC et al., 2012) and the DTSC's "Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)" (DTSC, 2011).

PERMITTING AND NOTIFICATION

Prior to field activities, necessary permits, site access agreements, and/or encroachment permits are obtained. At least 2 weeks in advance of field activities, notifications are made to the property owner, client representative, on-site facility manager, regulatory agency, and/or other appropriate parties.

SOIL PARAMETERS FOR MODELING

If the soil gas data will be used for modeling, site-specific soil parameters may be required to meet project objectives. Soil samples are collected in stainless steel sleeves using procedures described elsewhere. Soil matrix parameters are obtained from a minimum of three sample locations, at depths where VOCs are present, for each soil type. Soil parameters that may be used in vapor intrusion studies include bulk density, organic carbon content of the soil, soil moisture, effective permeability, porosity, and grain size distribution.

SOIL GAS SAMPLING PROBE INSTALLATION

Soil gas samples may be collected from temporary or permanent soil gas sampling probes, or from beneath the slab of a building.

Subsurface Clearance Protocol

Site Utility Survey

At least 48 hours prior to drilling, Underground Service Alert of Southern California, Arizona Blue Stake, or an equivalent utility locating service is notified. A geophysical survey may be conducted to locate subsurface utilities. Site plans and/or as-built drawings are compared to actual conditions observed at the site. The property owner or site manager is interviewed to gain information about locations of former UST systems (including dispensers, product lines, and vent lines) and other subsurface structures. A visual inspection is made of the locations of the existing UST system, and scars and patches in pavement are noted.

Hole Clearance

To determine the natural subsurface conditions, better recognize fill conditions, and prevent cross-contamination, the first sampling location is generally located the furthest from any suspected underground improvement. When drilling a soil boring in asphalt or concrete, a minimum 10-inch-diameter round cut is made. When advancing a direct-push location, a minimum 3.5-inch-diameter round cut is made. There are three hole clearance scenarios, as follows.

- Permanent probes. Air excavation, air knifing, or another soft dig technique is used to clear an area larger than the diameter of the largest tool to be advanced. The air excavation is continued to a minimum depth of 8 feet, or deeper if nearby subsurface improvements are suspected of being present at greater depths.

- Temporary probes, hole clearance required. If hole clearance is required for installation of a temporary probe, hole clearance is performed at least 1 month prior to sampling. Air excavation, air knifing, or another soft dig technique is used to clear an area larger than the diameter of the largest tool to be advanced. The air excavation is continued to a minimum depth of 8 feet, or deeper if nearby subsurface improvements are suspected of being present at greater depths. The cleared hole is backfilled with sand, the surface is patched with asphalt or concrete if needed, and the subsurface is allowed to re-equilibrate for at least 1 month before sampling. Subsequent sampling must be 1 foot or greater below the bottom of the soft dug hole.

- Temporary probes, hole clearance not required. If hole clearance is not required for installation of a temporary probe, written client approval is obtained, a private geophysical survey is performed, and probe locations are at least 5 feet from any identified or suspected subsurface structures.

If subsurface conditions prevent adequate subsurface clearance, the field activities cease until the client gives written approval of a procedure for continuation. When pea gravel, fill sand, or other nonindigenous material is encountered, the sampling location is abandoned unless the absence of subsurface facilities can be demonstrated and client approval to proceed is obtained. If hole clearance activities are conducted prior to the actual day of drilling, the holes are covered with plates and/or backfilled.

If any portion of the UST system is encountered, or if there is any possibility that it has been encountered, the work ceases, and the client is notified immediately. If there is reason to believe that the product system has been damaged, the emergency shut-off switch is

activated. The client decides if additional uncovering by hand is required. If it is confirmed that the UST system has been encountered, tightness tests are recommended. The hole is backfilled only with client approval.

Permanent Soil Gas Sampling Probes

Direct-Push Installation of Permanent Probes

Permanent sampling probes are installed with a direct-push rig utilizing Geoprobe's Post Run Tubing (PRT) system or soil gas implants. Multilevel direct-push probe installation consists of a cluster of single-level probes.

Tubing is marked at the surface to identify the probe depth. The ends of the tubes are secured in a traffic-rated wellbox or other well cover appropriate for the surface conditions, which is set into a cement surface cap. The construction of the soil gas sampling probe is documented on a well construction diagram on the log of exploratory boring.

Hollow-Stem Auger and Hand-Auger Installation of Permanent Probes

Procedures for drilling, logging, and collecting soil samples from hollow-stem and hand-auger borings are described separately. Soil samples may be collected for lithologic characterization, compound analysis, and/or physical property testing; procedures for soil sampling are described elsewhere.

After the borehole is drilled to its maximum depth, the deepest soil gas sampling probe is installed. Each sampling probe consists of a 3/8-inch-diameter by 6-inch-long stainless steel screen with stainless steel end caps. The probe is connected to 1/4-inch-outside-diameter nylon (NylaFlow or equivalent) tubing. To position the assembled probe and tubing in the borehole, the probe and tubing are inserted temporarily into a small-diameter (1 inch) pipe to place the probe and tubing at the appropriate position and depth of the borehole. The temporary pipe is then slowly removed as the annular filter pack and seal are placed in the borehole. For multilevel probes, additional probes are installed in a similar manner. The piping is not left in the ground. Each of the nylon tubing lines is clearly and permanently marked at the land surface to denote its corresponding screened interval.

Backfill materials are poured into the augers or open hole and measured with a weighted downhole tape measure. The sand pack is #3 Monterey sand or equivalent, and is placed such that each 6-inch-long screen is vertically centered in a 1-foot or greater interval containing sand pack, resulting in at least 3 inches of sand above and below each screen. Each sand pack is covered with 1 foot of dry granular bentonite, which is then covered with at least 2 feet of hydrated granular bentonite to the bottom of the next sand pack (for multilevel probes).

Following the emplacement of dry granular bentonite above the uppermost sand pack, the remainder of the borehole is filled with hydrated granular bentonite and, at the top, a cement surface cap is installed. The ends of the tubes are secured in a traffic-rated wellbox or other wellcover appropriate for the surface conditions, which is set into the cement cap. The construction of the soil gas sampling probe is documented on a well construction diagram on the log of exploratory boring.

Temporary Soil Gas Sampling Probes Using Direct Push

Direct-push soil gas probes are constructed of either 1.25-or 1.5-inch-outside-diameter steel equipped with a hardened drop-off steel tip. The probe length is normally 4 feet long and is threaded together to reach multiple depths. The probe is driven into the subsurface with H&P's Strataprobe or equivalent direct-push system. Once inserted to the desired depth, the probe is retracted to expose the vapor sampling port. Then, 1/4-inch-outside-diameter nylon (NylaFlow or equivalent) tubing is inserted through the center of the rod and threaded into a gas-tight fitting just above the tip. The probe rod is sealed at the surface with granular and hydrated bentonite for a minimum of 20 minutes before sampling.

After a sample is obtained, the tubing is removed and the probe rod is advanced to the next sampling depth or removed. This design prevents clogging of the sampling port and cross-contamination from soil during insertion.

Sub-Slab Soil Gas Sampling Probes

Sub-slab soil gas sampling involves collecting soil gas from immediately beneath the concrete slab of a building. An outer hole is drilled that partially penetrates the slab, then a smaller-diameter inner hole is drilled through the center of the outer hole through the remaining slab and into the sub-slab material.

The soil gas probe for sub-slab sampling is a 1/4-inch-outside-diameter stainless steel or brass tube that fits within the inner hole. The top of the tubing contains stainless steel or brass compression thread fittings (Swagelok or NPT female thread connectors) to connect to the soil gas sampling equipment. The probe is inserted into the inner hole such that the open bottom of the probe is completely beneath the slab. The larger diameter out hole in the slab is filled with quick-drying Portland cement that expands as it dries to ensure a tight seal with the probe and completed flush with the slab. The cement cures for at least 24 hours prior to sampling.

SOIL GAS SAMPLING

Equilibration Time

To allow for subsurface conditions to equilibrate after soil gas probe installation, the following equilibration times must pass prior to sampling.

- For probes installed with the direct-push method where the drive rod remains in the ground, the purge volume test, leak test, and soil gas sampling are not conducted for at least 20 minutes following soil gas probe installation.

- For probes installed with the direct-push method where the drive rod does not remain in the ground, the purge volume test, leak test, and soil gas sampling are not conducted for at least 30 minutes following soil gas probe installation.

- For probes installed with hollow-stem drilling methods, the purge volume test, leak test, and soil gas sampling are conducted at least 48 hours after the soil gas probe installation.

- For sub-slab probes installed, the leak test and soil gas sampling are conducted at least 24 hours after the soil gas probe installation.

Purge Volume Test

If required, a site-specific purge volume test is conducted at the beginning of the soil gas survey to determine the optimum purge volume. One casing volume is the volume of the sampling equipment and of the tubing or casing down to the probe. The casing volume does not include the volume of the probe, the sand pack, or the Summa canister (if used). During purging of a selected probe, soil gas samples are collected after 1, 3, and 7 casing volumes have been removed. The samples are analyzed immediately to determine the purge volume that yields the highest concentration. This purge volume is used for purging the remaining probes. If all concentrations are below detection limits during the purge test or a site-specific purge volume test is not required, 3 casing volumes are selected as the optimal purge volume for the remaining probes.

Leak Test

A tracer compound, either difluoroethane or helium, is used to test for leaks around the probe barrel at the ground surface and in the sampling system. When using difluoroethane, the tracer is placed around the base of the probe barrel and at the top of the probe barrel during sample collection. Paper towels or rags are soaked with the tracer and placed in plastic bags. The plastic bags are placed around the aboveground sampling system connections such that the bags are open to the connections but closed to the atmosphere.

When using helium as a tracer, a shroud is constructed to cover the entire sampling train (from the probe to the Summa canister) in order to detect leaks in the fittings and tubing of the system. The shroud includes an inlet port for adding helium and a second port for monitoring helium concentrations inside of the shroud. A third port can be added for passage of nylon tubing if the vacuum pump is located outside of the shroud. The shroud is filled with helium prior to purging the sampling point. The pressure in the shroud should be close to atmospheric pressure so normal sampling conditions exist. A portable helium detector is used to monitor and maintain a relatively stable helium concentration.

Soil gas samples are analyzed for difluoroethane or helium (based on the tracer used), in addition to the other analyses. If the difluoroethane or helium tracer is detected in the sample, then the sample may contain atmospheric air, the sample is not valid, and another sample may be collected.

Purge/Sample Flow Rate

Purging and sample collection is timed so that the flow rate does not exceed 200-ml per minute. The sample collection flow rate is accomplished by withdrawing the plunger on the 60-cc syringe at a constant rate for 20 seconds. The collector notes the collection time on a log sheet, and also records any resistance to sample flow that is felt on the syringe during collection.

Purging and Sample Collection

The probe tip and sampling tubing is purged of 3 to 5 casing volumes, or a pre-determined purge volume based upon a purge volume test described above. Following purging, soil gas is withdrawn from the end of the nylon tubing that runs from the sampling probe to the surface by one of two methods.

- For field analysis, a 20- to 60-cc syringe is used to withdraw a soil gas sample, which is immediately transferred to a mobile laboratory for analysis.

- For analysis by a fixed-base laboratory, a gas-tight Summa canister is used to withdraw a soil gas sample. The Summa canister has a choke valve that is used to ensure that the flow rate is less than 200 ml per minute. Summa canisters are stored at ambient temperatures away from direct sunlight; canisters are not chilled.

INDOOR AIR AND OUTDOOR AMBIENT AIR SAMPLING

When indoor air sampling is performed, outdoor air samples are also collected to measure background concentrations of constituents. The samples are collected in 6-liter, 100%

laboratory-certified clean Summa canisters. The sample duration for commercial/industrial buildings is 8 hours and 24 hours for residential buildings.

Indoor and outdoor air sampling are conducted at the same time by commencing and ending the sampling of each within one-half hour of each other. In order to minimize contamination of the sample with VOCs generated within the building, the building is inspected at least 24 hours prior to sampling and obvious sources of contamination such as stored fuels and paints are removed. Potential VOC sources that cannot be removed, such as newly painted walls, new carpets, and heavy smoke odors are noted. Samples are collected from the center of the lowest floor at 3 to 5 feet above floor level. The outdoor air sample is collected at 3 to 5 feet abovegrade and upwind from the location and protected from the elements.

FIELD DATA COLLECTION

The following data are collected and recorded in the field:

- sample identification,
- probe location,
- date and time of sample collection,
- sampling depth,
- identity of samplers,
- weather conditions,
- sampling methods and devices,
- soil gas purge volumes,
- volume of soil gas extracted,
- observation of soil or subsurface characteristics (any condition that affects sample integrity),
- apparent moisture content (dry, moist, or saturated) of the sampling zone, and
- chain of custody.

SAMPLING QA/QC

Method Blanks

Prior to sampling each day, all components of the sampling system are checked for contamination by drawing ambient air from aboveground through the sampling equipment, and injecting a sample into a gas chromatograph. The results are compared to that of the ambient air and recorded in the data tables as blanks.

Sample Quality Control

Each sample is given a unique identification number specifying location and depth. Purge and sample volumes are monitored closely using small, calibrated syringes to ensure a proper flow of

soil gas. This procedure ensures that a representative sample is obtained from the sample zone without excessive pumping, which could result in sampling of surface air.

Decontamination Procedures

To minimize the potential for cross-contamination between sites, all external soil gas probe parts are wiped or washed cleaned of excess dirt and moisture with solvents or de-ionized water as appropriate. The probe's internal NylaFlow tubing is purged with clean air between sampling locations or replaced as necessary. Sampling syringes are flushed with clean air after each use or replaced.

ANALYSIS OF SOIL GAS SAMPLES

Soil gas samples are collected and analyzed by a laboratory certified by the state for which the analyses are being performed. Procedures comply with requirements of DTSC (2011) and DTSC et al. (2012).

APPENDIX 8.

GROUNDWATER MONITORING PROCEDURES

GROUNDWATER MONITORING, SAMPLING, AND SAMPLE MANAGEMENT PROCEDURES

NOTIFICATIONS

Prior to performing any field work, the client, regulatory agency, and property owner/manager with jurisdiction over the subject site are notified. Notifications are made a minimum of 48 hours prior to sampling, or as required by the client or regulator. E-mail notifications are used whenever possible.

WATER LEVEL MEASUREMENTS

Prior to performing purge or no-purge sampling, water level measurements are collected according to the following procedures.

- Wells are checked for phase-separated hydrocarbons (PSH), as required, with a clear plastic or Teflon bailer or oil/water interface meter.

- To avoid cross contamination, water levels are measured starting with the historically "cleanest" wells and proceeding to the historically "dirtiest."

- Water levels within each well are measured to an accuracy of ±0.01 foot using an electronic measuring device and are referenced to the surveyed datum. The surveyed datum is a notched (or otherwise marked) point on the top of the casing or, if no marking is visible, the northern side of the top of the casing. Measurements include the depth to groundwater, depth to PSH if applicable, and depth to bottom of well.

- As a best practice, water levels in wells should be measured within a 24-hour period. For multi-day monitoring events, water level measurements should be made on consecutive days. In order to ensure that purging does not effect water level measurements at cluster or nested wells located less than 5 feet from one another, all wells in a cluster/nest are measured before they are purged.

PHASE-SEPARATED HYDROCARBONS

If PSH is encountered, its thickness and depth are measured using one of the following methods.

- an electronic oil/water interface meter is used to measure the depths to the top of the PSH and to the top of the water; and/or

- an electronic water level meter is used to measure the depth to the top of the water and a clear bailer is used to measure the PSH thickness.

The potentiometric surface elevation is calculated as:

TOC – DTW + 0.74PT

Where TOC = top-of-casing elevation, DTW = depth to water (interface), and PT = PSH thickness.

If PSH thickness is less than 0.02 foot, and purging of the well is planned prior to sample collection, the well is purged and sampled in accordance with the sample collection section of this standard operating procedure (SOP). If the PSH thickness is 0.02 foot or greater, either no sample is collected for analysis, or a groundwater sample is collected (to meet technical or regulatory objectives for the project) from the bottom of a disposable bailer lowered below the PSH-water interface. Wells containing PSH are not purged, even if the other wells are purged.

NO-PURGE SAMPLING

Well purging is not conducted prior to sampling if purging is not needed to meet technical and/or regulatory project requirements. Following collection of water level measurements, the wells are sampled according to the protocol in the sample collection section of this document.

PURGING PROCEDURES

Well purging is conducted prior to sampling if purging is needed to meet technical and/or regulatory project requirements. The goal of purging wells is to remove stagnant water from the well and allow formation water to enter the well to be collected for analysis. If the wells are completed in low-yielding formations and are pumped dry, the purging may be discontinued.

Dedicated Pump Purging

If permanent pumps are in the wells for groundwater remediation, the pumps are operated for at least 24 hours prior to sampling. If a dedicated sampling port is in place to collect samples of the pumped water from an individual well, then the port is used to collect the sample. VOA vials are filled completely so that no headspace or air bubbles are present within the vial. Care is taken to minimize air exposure and turbulence. The vials are not overfilled, which could cause preservative to be lost. If no sampling port is in place, the pump is turned off and the wells are sampled according to the protocol in the sample collection section of this document.

Purging Methods

If dedicated pumps are not present at the site, then purging is accomplished by either standard purging or low-flow purging (also known as "micropurging").

Standard Purging

Standard purging methods involve removal of a set number of casing volumes of water and/or removal of sufficient water to stabilize indicator parameters such as temperature, pH, and conductivity (see below for measurement procedures). The water is removed using a vacuum or peristaltic pump, submersible electric pump, bailer, hand pump, or bladder pump, as appropriate for the site conditions. The specific purging method and equipment are recorded in the field log. A surge block may be used if the well screen becomes bridged with sediment or the produced groundwater is overly turbid.

Low-Flow Purging

Low-flow purging involves purging at sufficiently low rates of withdrawal that drawdown, aeration, and turbulence are minimal. Groundwater is removed using a submersible pump, bladder pump, or centrifugal pump. Water is purged from the well at flow rates that are generally in the range of 0.05 to 0.5 gallons per minute, but this may be lower or higher in wells of lower or higher productivity.

The pump intake is positioned in the mid-point of the saturated screened interval, but a different position may be used based on hydrogeologic conditions and/or analyte properties. For petroleum hydrocarbon and oxygenate sample analysis, the pump intake is placed in the upper third of the saturated screened interval. The type of pump, flow rate, total volume of water removed, and depth of the pump intake are noted on the field log. Low-flow purging continues until temperature, pH, and conductivity stabilize (see below for measurement procedures). Then, a water sample is collected from the purge water effluent stream or from a bailer. VOA vials are filled completely so that no headspace or air bubbles are present within the vial. Care is taken to minimize air exposure and turbulence. The vials are not overfilled, which could cause preservative to be lost.

Monitoring During Purging

During the purging process, groundwater is monitored for temperature, pH, and conductivity using a standard field meter. These water quality parameters are recorded on a field log. Purging continues until a minimum number of well volumes (3) are removed and/or temperature, pH, and conductivity stabilize. For standard purging, water quality parameters are measured in bailer samples or from the pump effluent. For low-flow purging, water quality parameters are continuously monitored during purging using a water quality meter housed

within a Solinst flow-through cell, and stabilization generally occurs after about one casing volume is purged from a well.

Purge Water Storage and Disposal

If active groundwater treatment is occurring at the site, purge water may be disposed of through the treatment system. Otherwise, purge water is either stored on-site in Department of Transportation-approved 55-gallon drums, or transported offsite as non-hazardous waste for disposal or recycling at an approved facility.

SAMPLE COLLECTION PROCEDURES

For dedicated pumps with sampling ports and for low-flow purging, samples are collected directly from the purge water stream, as described above. For standard purging and dedicated pumps without a sampling port, sampling is performed after the water level in the well recharges to 80 percent of hydrostatic in productive wells, or after one hour has elapsed in low-yielding wells. Then, groundwater samples are collected using the following procedures.

- A clean Teflon or stainless steel bailer is lowered and partially submerged into the well water to collect a groundwater sample.

- If PSH is present in the sample bailer with a thickness greater than 0.02 foot, PSH thickness is recorded on the field log, and no sample is collected.

- For volatile organic analyses, groundwater samples are collected in 40-milliliter, VOA vials with Teflon-lined caps. A pre-measured quantity of hydrochloric acid preservative is added to all vials by the laboratory prior to receipt by HFA. Samples are held at 4°C or less while in the field and in transit to the laboratory. Other appropriate containers, preservatives, and holding protocols are used for non-volatile analyses.

- VOA vials are filled completely so that no headspace or air bubbles are present within the vial. Care is taken so that the vials are not overfilled, and the preservative is not lost.

- Sample containers are immediately labeled and sealed after collection. For VOA vials, the label is placed to overlap the edge of the cap as a custody seal, unless a separate custody seal is used.

- Samples are stored in a cooler while on-site and in transport to the laboratory or office. The cooler has sufficient ice to maintain appropriate temperature prior to collecting

samples. The VOA vials are kept chilled both prior to and after filling. Warm containers are not used when volatile compounds are the target analytes.

DECONTAMINATION PROCEDURES

Decontamination of monitoring and sampling equipment is performed prior to all monitoring and sampling activities. Decontamination procedures consist of a four-step process. The initial decontamination is performed using a non-phosphate soap, such as Simple Green or Alconox, in tap water in a bucket. A bottlebrush is used to thoroughly clean the inside and outside of the equipment. The brush is used in the first bucket only; it does not travel from bucket to bucket with the equipment. This procedure minimizes any transport of the contaminants, which should stay in the first bucket. The equipment is then rinsed in a bucket of tap water, followed by a second and third bucket of tap water as a final rinse. The decontamination water is disposed of using the same procedures as the purge water. The last rinse may be de-ionized or distilled to meet technical or regulatory project requirements. For rinsing small equipment such as the water level meter, clean rags moistened with clean water (tap, de-ionized or distilled) or spray bottles with clean water may be used.

WELL CONDITION

The condition of the well is checked during the monitoring event. The well lid and cap are secured, and any debris present in the well box is removed. If the threads of the well lid bolt holes are stripped, then they should be re-tapped, to the next appropriate size, using a tap and die kit. The bolts for the well lid should be replaced with the corresponding re-tapped thread size. Any other deficiencies with the well box and pad that cannot be fixed during the monitoring event are noted. The log is given to the project manager for correction of the deficiencies at a future date.

CHAIN OF CUSTODY

A chain of custody form is completed for each group of samples delivered to the laboratory, as follows.

- A separate COC is completed for each day of sampling. If samples are collected on separate days for the same site, a separate COC is completed for each sampling day, and the COC is always kept with the samples. If samples are shipped off-site for laboratory analysis, individual coolers with separate COCs are sent for each day/cooler shipped.

- The COC is filled out completely, and all persons having control of the samples sign the COC to show transfer of sample control between individuals. At times when the field sampler is not delivering samples directly to the laboratory, the samples are relinquished to a sample

manager or other HFA employee for shipping. In this instance, the sample manager takes custody of the samples, and both the sampler and sample manager sign and date the COC to show custody transfer.

- The COC is placed inside the cooler, and a custody seal is placed on the outside of the cooler prior to shipping.

- If samples are sent to the laboratory via UPS, FEDEX, etc., this fact is indicated on the COC, and the sample manager also indicates the date and time the custody seal is placed on cooler for delivery to the shipping agent (the shipping agent does not sign the COC).

- For trip blanks, the COC indicates the date the trip blank was taken to the field for sampling, not the date the trip blank was prepared by the laboratory (the latter date may appear on the VOA label).

- Electronic deliverable format (EDF) requirements of California AB2886 mandate that COCs and laboratory reports maintain consistent and unique names between sites (Global ID) and sample location/well names (Field Point ID). This information must be consistent with the initial information supplied to GeoTracker, and for each subsequent sampling event.

SAMPLE HANDLING

Refrigerator Storage

Samples may be stored in a refrigerator prior to transport to the laboratory. Refrigerator storage is maintained under the following conditions.

- Refrigerators used for sample storage are dedicated for that usage only (no food or other materials are stored in sample refrigerators).

- Refrigerators are maintained at a temperature of 4°C or less.

- Each refrigerator contains a dedicated, reliable thermometer. The thermometer is designed for use in a refrigerator and is fixed or secured to the inside of the unit. The thermometer range is specific for measuring temperatures less than 4°C.

Cooler Storage

The sample coolers are packed as directed by the receiving laboratory. The following cooler packing procedures are used.

- The cooler contains enough ice so the ice will not completely melt while samples are stored in the cooler.

- Water ice (not dry ice or ice packs) is used for shipping.

- The COC is placed in the cooler in a sealed plastic bag, and the cooler lid is taped closed to secure it for transport and to minimize loss of temperature. A custody seal is placed vertically across the seam of the cooler lid.

QUALITY CONTROL

The following table summarizes each type of measurement described in this document. For each measurement, the table shows the method of measurement, data quality objectives, potential sources of bias, and quality control testing. Any quality control testing result that falls outside the data quality objective is discussed in the reporting of the data.

QUALITY CONTROL MATRIX - GROUNDWATER MONITORING

DATA TYPE	MEASUREMENT METHOD	POTENTIAL SOURCES OF BIAS	QUALITY CONTROL TESTING		STANDARD DATA QUALITY OBJECTIVES	
			BIAS	PRECISION	BIAS	PRECISION
Water level and/or depth of well measurement	Solinst 101-P4 water level meter or equivalent; measured to datum on casing	Tape length changes due to stretching or damage	Visual inspection of tape	Measure water levels twice	No visible tearing or deformation of tape	± 0.01 foot
		Erroneous probe signal due to dirt or damage	Visually inspect probe, and test probe in clean water or a well		Probe appears clean and yields consistent signal	
PSH level measurement	Electronic interface meter; measured to datum on casing	Tape length changes due to stretching or damage	Visual inspection of tape	Measure PSH level twice	No visible tearing or deformation of tape	± 0.01 foot
PSH thickness measurement	Measure PSH in clear bailer using a tape measure or ruler	Thickness in bailer not the same as thickness in well due to displacement by bailer insertion or leakage from bailer	No bias test	Measure PSH thickness in bailer twice using tape measure or ruler	--	± 0.01 foot
Temperature	Hydac conductivity-temperature-pH meter or equivalent	Calibration drift	Factory calibrated; no bias measurement	Measure temperature of water in a beaker twice	--	± 1°C or 2°F
pH	Hydac conductivity-temperature-pH meter or equivalent	Calibration drift	Calibration check using 7.0 standard	Measure pH of water in a beaker twice	± 0.5 pH units	± 0.2 pH units
Conductivity	Hydac conductivity-temperature-pH meter or equivalent	Calibration drift	Factory calibrated; no bias measurement	Measure conductivity of water in a beaker twice	--	± 0.5 ms/cm
Sample storage temperature - refrigerator	Commercially available thermometer	Calibration drift	Factory calibrated; no bias measurement	Measure temperature of refrigerator twice or with 2 thermometers	--	± 1°C or 2°F
Purge water volume - bailer	Fill container of known volume (examples: 5 gallon bucket, 55-gallon drum)	Container leaks or is deformed	Visual inspection of tape	No precision test; equal volumes will produce same result if container does not deform	No visible leakage or deformation of container	--
Purge water volume - peristaltic pump truck	Great Plains Industries flow meter or equivalent	Calibration drift	Discharge flow to container of known volume	Duplicate bias test; compare flow meter readings for equal volumes	± 10%	± 10%
Groundwater sample collection for VOC analysis	Collect samples in VOAs and deliver to laboratory	Additional analyte in sample from sampling equipment	Equipment blank sample analysis	Duplicate sample analysis	ND	± 20%
		Analyte enters VOA prior to analysis	Trip blank sample analysis			

-- Not applicable

APPENDIX 10.

LEAK TEST PROCEDURES

Soil Vapor Sampling using Shroud Method of Leak Detection
Sample Collection into Summas for Off-site Analysis

Placing a plastic shroud over a soil vapor sampling probe and introducing a gaseous compound, such as helium, into the shroud can be implemented to ensure the probe seal integrity. It may also be used to assess the potential for leaks in the sample train.

A plastic shroud is placed over the soil vapor probe location with the tubing of the probe exiting the shroud through a small hole. The valve on the probe termination is connected to the sampling apparatus that is to be used. Smaller purge volumes may only require a syringe to purge, while larger purge volumes may require a sample pump with flow meter and vacuum gauge.

A "shut in" test is performed to check for leaks in all sample fittings and connections not contained within shroud. This is achieved by shutting the valve at the probe termination to the off position, then applying a vacuum to all connections between the valve and the sample container (i.e. syringe or summa canister). An in-line vacuum gauge is used to observe any loss in vacuum over a period of time (i.e. 60 seconds), which would indicate a leak in the system.

Helium (or other compound) is released into the shroud and a hand held helium detector is used to monitor and maintain a reasonably steady concentration of approximately 50% helium in the shroud. Once the concentration is reached, the soil vapor probe is purged at the recommended flow rate and any probe vacuum is recorded. The soil vapor sample is then collected in the appropriate sample container (i.e. tedlar or summa canister). Once the sample is taken, a final reading of the shroud concentration is measured with the meter and recorded.

The sample can then be analyzed for the tracer gas (i.e. Helium) to determine if a leak was present during sample collection.

Los Angeles, California 90013
(VIA INTERNET UPLOAD)

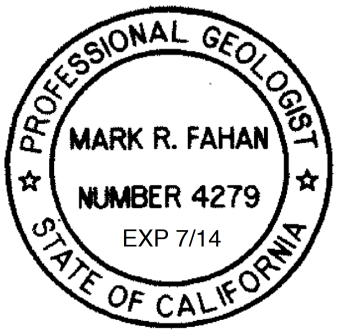
Subject: **SECOND QUARTER 2013 SEMIANNUAL GROUNDWATER MONITORING REPORT**
76 SERVICE STATION #0981 (351697)
1004 SOUTH LA CIENEGA BOULEVARD, LOS ANGELES, CALIFORNIA
(CRWQCB-LAR/EAOP FILE #900350016)

Dear Mr. Pirotton:

On behalf of Chevron Environmental Management Company, for itself and as Attorney-in-Fact for Union Oil Company of California (hereinafter "EMC"), Holguin, Fahan & Associates, Inc. (HFA) is pleased to submit the enclosed Second Quarter 2013 Semiannual Groundwater Monitoring Report for the subject location. The contents of this report include:

Progress Report Summary Sheet
List of Acronyms/Abbreviations
Exhibit 1 - Current and Historic Summary Tables
Exhibit 2 - Figures
Exhibit 3 - Graphs
Exhibit 4 - Laboratory Analytical Reports and Chain of Custody Records
Exhibit 5 - Groundwater Monitoring Field Procedures and Data

On April 15, 2013, HFA performed the second quarter 2013 groundwater monitoring event at the above-referenced site. HFA calculated the groundwater flow to be toward the southeast, which is consistent with previous data. Dissolved-phase TPH as gasoline, benzene, MTBE, and TBA concentrations are adequately defined. The site data indicate overall stable to declining trends in the residual dissolved-phase hydrocarbon concentrations.



A soil vapor extraction/groundwater pump and treat system operated during the first half of 2013. The remediation system progress reporting is submitted under separate cover.

Beginning May 1, 2013, EMC has transferred site management responsibilities and all associated reporting requirements to:

AECOM
901 Via Piemonte, 5th Floor
Ontario, California 91764
Attention: Todd McFarland
Todd.McFarland@aecom.com

PROGRESS REPORT SUMMARY SHEET
SECOND QUARTER 2013

SITE INFORMATION:	
Responsible Party / Contact :	Union Oil Company Of California / Roya Kambin
Responsible Party Address :	6101 Bollinger Canyon Road, Room 5310, San Ramon, CA, 94583
Station / Site ID:	0981 (351697)
Current Site Use :	Active Service Station
Global ID :	T0603700871
Lead Regulatory Agency/Case#/Case Worker :	CRWQCB-LAR/900350016/Daniel Pirotton
Date of Most Recent Regulatory Letter :	6/15/2009
Primary Consultant / Project Manager :	Holguin, Fahan & Associates, Inc. /Mark Fahan
Well Monitoring Contractor :	Holguin, Fahan & Associates, Inc.
Site Monitoring Frequency :	Semi-Annual
Well(s) and/or Surface Water Within 1,000 ft.:	none
Number of Groundwater Wells On Site:	9
Number of Groundwater Wells Off Site:	5
Phase of Vadose Zone Investigation:	Remediation
Phase of Groundwater Investigation:	Remediation
Nature of Contamination:	Gasoline

SITE HYDROLOGY IN "AQUIFER 1":	
Number of Water Zones:	1
Groundwater Depth Range (ft):	14.23 - 17.40
Potentiometric Surface Elevation Range (ft-MSL):	107.66 - 110.80
Quarterly Change in Average GW Elevation (ft):	-0.16
Flow Direction/Hydraulic Gradient (ft/ft)	southeast/0.006

FIELD ACTIVITY (CURRENT QUARTER):		**Well With PSH : Wells**	**Feet**
Groundwater Monitoring Date :	April 15, 2013		
Groundwater Wells Gauged:	7		
Groundwater Wells Sampled:	12		
Purging Method:	Submersible pump		
Gallons of Groundwater Purged:	155		
Treatment Method/Disposal Facility:	On-site GWTS		

GROUNDWATER CONDITIONS :			
No. of Wells with Detectable TPH - Gas:	11	TPH - Gas Range (μg/l):	<7.2 - 85,000
No. of Wells with Detectable Benzene:	9	Benzene Range (μg/l):	<0.083 - 1,300
No. of Wells with Detectable MTBE:	7	MTBE Range (μg/l):	<0.11 - 170
No. of Wells with Detectable TBA:	2	TBA Range (μg/l):	<9.4 - 640

ADDITIONAL INFORMATION:

PROGRESS REPORT SUMMARY SHEET (Continued)
SECOND QUARTER 2013

76 Service Station #0981 (351697)

WORK PERFORMED THIS REPORTING PERIOD:

- Groundwater monitoring and sampling by HFA.
- Operation and maintenance of SVE and GWPT systems by HFA.

TREND ANALYSIS:

- The lateral extents of dissolved-phase TPH as gasoline, benzene, MTBE, and TBA are defined.
- Dissolved-phase hydrocarbon concentrations show an overall stable to declining trend.

PROPOSED FUTURE WORK:

- Groundwater monitoring and sampling on a semiannual basis during the second and fourth quarters.
- Operation and maintenance of the SVE and GWPT systems by AECOM.
- Remedial progress reports will be submitted on a quarterly basis.

SITE WORK PERFORMED TO DATE:

- Assessment
- Remedial excavation
- Groundwater monitoring
- Remediation well installation and vapor extraction testing
- Dual-phase extraction test
- Remediation – Operation of dual-phase extraction (SVE) and GWPT systems

CONSTRUCTION/EXCAVATION ACTIVITIES THIS QUARTER:

- Construction: None.
- Excavation (cubic yards): none.
- Soil Disposal (cubic yards): none.

CUMULATIVE VOLUME OF SOIL EXCAVATED TO DATE:

- Total volume unknown.
- In 2003, 8,174 tons of soil was excavated and disposed of off-site in association with the development of the Ships Center (Matrix Automotive) to the south.

LIST OF STANDARD ACRONYMS / ABBREVIATIONS

Avg.	average
C	Celsius or Centigrade
cond.	conductivity
CRWQCB	California Regional Water Quality Control Board
DIPE	di-isopropyl ether
DO	dissolved oxygen
dup	duplicate sample
EDB	ethylene dibromide
EDC	ethylene dichloride or 1,2-dichloroethane
EPA	Environmental Protection Agency
ETBE	ethyl tertiary butyl ether
F	Fahrenheit
fbg	feet below grade
FP	free product
ft	feet
ft-MSL	feet above mean sea level
ft-TOC	feet from top of casing
GW	groundwater
GWTS	groundwater treatment system
HB	hand bailer
HP	hand pump
J	value between the method detection limit and the reporting limit
mg/l	milligrams/liter
ms/cm	millisiemens/centimeter
MSL	mean sea level
MTBE	methyl tertiary butyl ether
mV	millivolts
NA	not assessable
N/A	not applicable
ND	not detected at concentrations above reporting limits
NM	not measured
No.	number
OCHCA	Orange County Health Care Agency
ORP	oxidation-reduction potential
pH	acidity
ppb	parts per billion
PSH	phase-separated hydrocarbons
Q1,Q2, Q3, Q4	first quarter, second quarter, third quarter, fourth quarter
QB	Quik-E-Bailer
Qtrly	quarterly
SBCPSD	Santa Barbara County Protection Services Division
TAME	tertiary amyl methyl ether
TBA	tertiary butyl alcohol
Temp.	temperature
TOC	top of casing
TPH	total petroleum hydrocarbons
Vac	vacuum truck
VCEHD	Ventura County Environmental Health Division
VES	vapor extraction system
VOA	volatile organic analysis
VOC's	volatile organic compounds
μg/l	micrograms/liter

Project Manager: Mark Fahan

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
S09	The surrogate recovery on the sample for this compound was not within the control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

MW-18	4-15-13	20gal	Treatment tank
DE CON	4-15-13	15 gal	Treatment tank
	TOTAL WATER TRANSPORTED:	155 gallons	all generated water pumped into on-site GWTS

I hereby certify that the information on this form is true and correct. The above-listed non-hazardous wastewater is/was transported to Holguin, Fahan & Associates, Inc.'s stationary groundwater treatment system located at 2255 Ventura Avenue, Unit B, Ventura, California. HFA transports non-hazardous wastewater using lidded poly tanks mounted to a vehicle or trailer assembly. Additional information is provided on HFA's JSA for Groundwater Monitoring. Upon arrival at HFA's Ventura facility, wastewater is/was immediately transferred to the groundwater treatment system and entered into the system log.

HFA Representative Signature

April 15, 2013
Date

HFA treats and discharges water under City of Ventura Non-Domestic Wastewater Discharge Permit No. 45.

1.1 Monitoring Well Installation and Development – 1022 La Cienega Boulevard

Up to three monitoring wells will be installed during this investigation. Actual number of wells will depend on whether one or two groundwater bearing units are detected while drilling the boreholes. If two groundwater bearing units are observe, a shallow well will be installed to a depth of approximately 19 feet below ground surface (bgs) and a second well to a depth of 25 feet below existing grade (beg).

Shallow wells will be constructed with approximately 19 feet of 2-inch diameter PVC casing that will include:

- 10 feet of solid PVC casing from ground surface to 10 feet bgs.
- 5 feet of 010 slotted screen with #2/12 Lone Star sand
- 4 feet of solid PVC casing (sump) below the screened interval.

Deeper wells will be constructed with approximately 25 feet of 2-inch diameter PVC casing that will include:

- 15 feet of solid PVC casing from ground surface to 15 feet bgs.
- 10 feet of 010 slotted screen with #2/12 Lone Star sand from 15 feet to 25 feet bgs.

If only one water bearing unit is observed during drilling, one 25-foot deep well will be installed. The well will be constructed with approximately 25 feet of 2-inch diameter PVC casing that will include:

- 10 feet of solid PVC casing from ground surface to 10 feet bgs.
- 15 feet of 010 slotted screen with #2/12 Lone Star sand from 10 feet to 25 feet bgs.

A sand filter pack will be constructed around the screened portion of all slotted casing and will extend approximately two feet above the top of the screen. A bentonite seal at least 2 feet thick will be installed above the filter pack, and the remainder of the boring will be filled with cement/bentonite grout or neat cement. Each well will be housed within a flush mounted traffic-rated well cover.

After well construction, the well will be developed by surging to draw removable fine sediments into the well casing, and bailing to remove solids from within the well casing. The wells will then be pumped with a submersible pump, or bailed to clear residual fines from the well and filter pack. Groundwater parameters (such as temperature, pH, specific conductivity, and turbidity) will be recorded during the well development activities.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 13-01-0096

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

6 Chain of Custody/Sample Receipt Form. 25

Calscience Environmental Laboratories, Inc.

Work Order Narrative

Work Order: 13-08-1788 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain of Custody (COC) on 08/27/13. They were assigned to Work Order 13-08-1788.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Additional Comments:

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Glossary of Terms and Qualifiers

Work Order: 13-08-1788 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

LABEL INSTRUCTIONS:

Do not copy or reprint this label for additional shipments - each package must have a unique barcode.

STEP 1 - Use the "Send Label to Printer" button on this page to print the shipping label on a laser or inkjet printer.
STEP 2 - Fold this page in half.
STEP 3 - Securely attach this label to your package, do not cover the barcode.
STEP 4 - Request an on-call pickup for your package, if you do not have scheduled daily pickup service or Drop-off your package at the nearest GSO drop box. Locate nearest GSO dropbox locations using this link.

ADDITIONAL OPTIONS:

Send Label Via Email | Create Return Label

TERMS AND CONDITIONS:

By giving us your shipment to deliver, you agree to all the service terms and conditions described in this section.
Our liability for loss or damage to any package is limited to your actual damages or $100 whichever is less, unless you pay for and declare a higher authorized value. If you declare a higher value and pay the additional charge, our liability will be the lesser of your declared value or the actual value of your loss or damage. In any event, we will not be liable for any damage, whether direct, incidental, special or consequential, in excess of the declared value of a shipment whether or not we had knowledge that such damage might be incurred including but not limited to loss of income or profit. We will not be liable for your acts or omissions, including but not limited to improper or insufficient packaging, securing, marking or addressing. Also, we will not be liable if you or the recipient violates any of the terms of our agreement. We will not be liable for loss, damage or delay caused by events we cannot control, including but not limited to acts of God, perils of the air, weather conditions, act of public enemies, war, strikes, or civil commotion. The highest declared value for our GSO Priority Letter or GSO Priority Package is $500. For other shipments the highest declared value is $10,000 unless your package contains items of "extraordinary value", in which case the highest declared value we allow is $500. Items of "extraordinary value" include, but or not limited to, artwork, jewelry, furs, precious metals, tickets, negotiable instruments and other items with intrinsic value.

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Calscience Environmental Laboratories, Inc.

Work Order Narrative

Work Order: 13-08-2042 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain of Custody (COC) on 08/29/13. They were assigned to Work Order 13-08-2042.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Additional Comments:

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Glossary of Terms and Qualifiers

Work Order: 13-08-2042 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

ACCREDITED IN ACCORDANCE WITH nelac

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Calscience Environmental Laboratories, Inc.

Work Order Narrative

Work Order: 13-08-2190 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain of Custody (COC) on 08/30/13. They were assigned to Work Order 13-08-2190.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Additional Comments:

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Glossary of Terms and Qualifiers

Work Order: 13-08-2190 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
	Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.
	A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

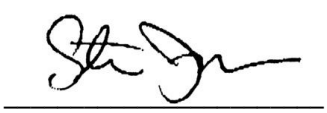
LABORATORY RESULTS

Client:	Leighton Consulting, Inc.	**Report date:**	1/30/2013
Client Address:	26074 Avenue Hall, Suite 23 Santa Clarita, CA 91355	**JEL Ref. No.:** **Client Ref. No.:**	D-0533 10096.001
Attn:	Bob Lorton	**Date Sampled:** **Date Received:** **Date Analyzed:**	1/23/2013 1/23/2013 1/23-24&28/2013
Project Address:	1022-1024 La Cienaga Blvd Los Angeles, CA	**Physical State:**	Soil Gas

ANALYSES REQUESTED

1. EPA TO-15 - Volatile Organics by GC/MS in Air/Summa Canister



Sampling – Soil Gas samples were collected in 1-Liter SUMMA Canisters. Tubing placed in the ground for soil gas sampling was purged three different times as recommended by DTSC/RWQCB regulations. This purge test determined how many purges of the soil gas tubing were needed throughout the project. One, three and ten purge volumes were analyzed to make this determination.

A tracer gas mixture of n-propanol and n-pentane was placed at the tubing-surface interface before sampling. These compounds were analyzed during the TO-15 analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No n-propanol or n-pentane were found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record. 1&3 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for some length of time. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

Analytical – Soil Gas samples were analyzed using EPA Method TO-15. Instrument Continuing Calibration Verification, QC Reference Standards, and Instrument Blanks were analyzed every 24 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) were analyzed with each batch of Soil Gas samples. A duplicate sample was analyzed each day of the sampling activity.

Approval: 

Steve Jones, Ph.D.
Laboratory Manager

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 12-12-1675

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 12-12-1753

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

WORK ORDER #: 12-12-1753

SAMPLE RECEIPT FORM

Cooler 1 of 1

CLIENT: LEIGHTON DATE: 12/18/12

TEMPERATURE: Thermometer ID: SC4 (Criteria: 0.0 °C – 6.0 °C, not frozen except sediment/tissue)

Temperature 3.1 °C - 0.3 °C (CF) = 2.8 °C ☑ Blank ☐ Sample

☐ Sample(s) outside temperature criteria (PM/APM contacted by: _____).

☐ Sample(s) outside temperature criteria but received on ice/chilled on same day of sampling.

☐ **Received at ambient temperature, placed on ice for transport by Courier.**

Ambient Temperature: ☐ Air ☐ Filter Initial: AM

CUSTODY SEALS INTACT:

☐ Cooler ☐_____ ☐ No (Not Intact) ☑ Not Present ☐ N/A Initial: _____

☐ Sample ☐_____ ☐ No (Not Intact) ☑ Not Present Initial: _____

SAMPLE CONDITION:	Yes	No	N/A
Chain-Of-Custody (COC) document(s) received with samples	☑	☐	☐
COC document(s) received complete	☑	☐	☐
☐ Collection date/time, matrix, and/or # of containers logged in based on sample labels.			
☐ No analysis requested. ☐ Not relinquished. ☐ No date/time relinquished.			
Sampler's name indicated on COC	☑	☐	☐
Sample container label(s) consistent with COC	☑	☐	☐
Sample container(s) intact and good condition	☑	☐	☐
Proper containers and sufficient volume for analyses requested	☑	☐	☐
Analyses received within holding time	☑	☐	☐
pH / Res. Chlorine / Diss. Sulfide / Diss. Oxygen received within 24 hours	☐	☐	☑
Proper preservation noted on COC or sample container	☑	☐	☑ WR 12/18/12
☐ Unpreserved vials received for Volatiles analysis			
Volatile analysis container(s) free of headspace	☐	☐	☑
Tedlar bag(s) free of condensation	☐	☐	☑

CONTAINER TYPE:

Solid: ☐4ozCGJ ☐8ozCGJ ☐16ozCGJ ☑Sleeve (S) ☐EnCores® ☑3TerraCores® ☐_____

Water: ☐VOA ☐VOA**h** ☐VOA**na$_2$** ☐125AGB ☐125AGB**h** ☐125AGB**p** ☐1AGB ☐1AGB**na$_2$** ☐1AGB**s** ☐500AGB ☐500AGJ ☐500AGJ**s** ☐250AGB ☐250CGB ☐250CGB**s** ☐1PB ☐1PB**na** ☐500PB ☐250PB ☐250PB**n** ☐125PB ☐125PB**znna** ☐100PJ ☐100PJ**na$_2$** ☐_____ ☐_____ ☐_____

Air: ☐Tedlar® ☐Canister **Other:** ☐_____ **Trip Blank Lot#:**_____ **Labeled/Checked by:** AM

Container: **C:** Clear **A:** Amber **P:** Plastic **G:** Glass **J:** Jar **B:** Bottle **Z:** Ziploc/Resealable Bag **E:** Envelope **Reviewed by:** _____

Preservative: **h:** HCL **n:** HNO_3 **na$_2$:**$Na_2S_2O_3$ **na:** NaOH **p:** H_3PO_4 **s:** H_2SO_4 **u:** Ultra-pure **znna:** $ZnAc_2$+NaOH **f:** Filtered **Scanned by:** _____

ACCREDITED IN ACCORDANCE WITH nelac

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

Work Order: 13-08-1316 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

EXECUTIVE SUMMARY

Previous Environmental Assessment Work:
Two previous Site Investigations have been conducted on the property. The first one in 2010 found two gravelly sand lenses that had gasoline concentrations that exceeded current regulatory Action Levels. The second investigation was conducted in 2013. This investigation did not discover the same areas of environmental impact, and it is possible the pollutants trapped in the sand lenses escaped or degraded or both between 2010 and 2013.

Site Location and Description:
The property is located in a mixed residential, commercial, and industrial area of Los Angeles, CA. The site is vacant land that is being used temporarily by the auto body repair shop to the north for vehicle parking.

Since there are no structures on the property, friable asbestos containing materials, Polychlorinated Biphenyl's (PCB's), lead in paint, and mold cultures are not issues at this time. The infiltration of Radon gas is minimal.

Geology and Hydrogeology:
The site elevation is 125 feet. It is underlain by 150-200 feet of Holocene and late Pleistocene age alluvium. The depth to groundwater is approximately 17 feet, with a regional flow direction to the south. The property is 3 miles northeast of the active Newport-Inglewood Fault Zone. The property is in FEMA Zone X, not a 100 or 500 year flood zone. The property is located in the abandoned Beverly Hills Oil field, and is in a LA City methane gas study area. The closest oil well is 500 feet to the south. It was closed and abandoned in 1965. No landfilling or mining has been done within 1/2 mile of the property. The property is not in wetlands

Site Land-Use History:
From the mid 1800's to 1920's, the property was used for livestock grazing. From the 1920's to the 1954 the property was a vacant lot. From 1954 to 2006, the property was developed with an office building. From 2006 to the present day, the property has been a vacant lot. The planned future use is for the property to be developed with retirement community including a skilled care nursing facility.

Site Reconnaissance:
Hazardous materials were not stored, utilized, or generated in the past, and will not be in the future. There are 6-7 steel, 55 gallon drums in the northwest corner of the property. These drums contain non-hazardous soil cuttings from the previous investigations. No evidence of illegal disposal to the land was observed and there are no permit or fire code violations on record.

Regulatory Agency Listings and Area Reconnaissance:
The property address is not listed on government documents as a hazardous waste site or a generator of hazardous waste. There are 5 sites within the ASTM distances of the property known or suspected to have caused environmental degradation. Three are up-gradient from the property. One of these has tainted the ground water migrating under the property with gasoline and its additives. The other two up-gradient sites are located too far away to have adversely impacted the ground water migrating under the property. No on-site or off-site soil vapor intrusion threats were found.

Neighboring and Adjacent Properties:
There is an auto body shop to the north. There is vacant land to the south. There is a residence to the east. There is a parking lot for a Temple and private school facility to the west. None of the neighboring or adjacent property addresses are listed on government documents as hazardous sites or as generators of hazardous waste. There is no documented or observed threat to the subject property from the adjacent operations.

Environmental Compliance Program:
An environmental compliance program is not necessary at this time, since there are no structures on the property. The soil cuttings in the 55 gallon drums may be emptied and disposed of.

Conclusions, Recommendations:
We conclude environmental impact requiring a government mandated investigation has not occurred on the subject property. There is no threat the human health or the environment at this time.

We recommend no additional environmental investigation be required at this time.

Opinion:
It is our opinion to proceed with the development of the property and have Chevron clean up any soil or ground water that is found to be impacted with hydrocarbons, above Action Levels, that are encountered during excavation and grading.

BACKGROUND

A summary from the US EPA concerning the All Appropriate Inquires Rule, commonly referred to as a Phase I, is located as the last four pages of this report for your review. The official title of a Phase I is an “All Appropriate Inquiries” It was instituted in 2006 by the United States, Environmental Protection Agency (US EPA). It originated out of the innocent purchaser clause of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), commonly known as Superfund. The “All Appropriate Inquiries” is the premier and preferred document by the US EPA to protect innocent landowners from the expenses related to investigation and clean-up of polluted property.

There are 11 primary components to the “All Appropriate Inquiries” that must be addressed by a qualified environmental professional. The collected information can be presented in any format the environmental professional prefers. There is no mandatory format, and demanding a specific format may be considered discrimination. Maintaining a list of consultants may be considered discrimination, and an attempt to manipulate the market. This practice was observed to lead to collusion, price fixing, and fraud. The “All Appropriate Inquiries” has a Federal suggested format for its preparation.

The American Society for Testing Materials (A STM) has established a set of standards to conduct the “All Appropriate Inquiries”. These are intended to be guidelines for the collection of the data used in preparing the report. ASTM has presented a suggested format for the presentation of the data. The ASTM format is accepted by the US EPA as a secondary format that may be used as a substitute for the Federal rep ort guidelines. The ASTM form at is the most common; however, it is not an “All Appropriate Inquiries” on its own.

What you need to be aware of, is the secondary ASTM form at, accepted by the US EPA, is not the official format. If any of the 11 primary information components is missing, the ASTM formatted report may not be recognized as an “All Appropriate Inquiries”, and you will not be protected under Federal CERCLA regulations. To insure you qualify for protection under this Federal law, National Environmental, Inc. (NEI) prepares an “All Appropriate Inquiries”, in full compliance with current Federal CERCLA regulation, utilizing the Federal suggested guidelines for report preparation.

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by 1022 South La Cienega, LLC to conduct an "All Appropriate Inquiries" (Phase I) on the property located at 1022 South La Cienega Blvd., Los Angeles, CA 90035 and report the results.

“We have the specific qualifications based on education, training, and experience, to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 Code of Federal Regulations, Part 312”.

This investigation is being conducted to determine the environmental condition and hazardous waste liability of the subject proper ty. "We have performed a Phase I All Appropriate Inquiries in conformance with the scope and limitations of American Society for Testing Materials (ASTM) Standards E 1527-13, any exceptions to or deletions from this practice are described in the Scope of Services of this report. This assessment has not revealed evidence of significant adverse environmental conditions to exist on the subject property".

SCOPE OF SERVICES

The investigation consisted of: a review of previous environmental assessment work; a visual site inspection; interviews with primary parties; a geologic and hydrogeologic summary; a review of property history; a hazardous materials site reconnaissance; a regulatory agency review; a soil vapor intrusion review; a review of the existing environmental compliance program; and this written report on the results stating our opinion.

Previous environmental assessment work, presented for review or discovered, consisted of two site investigations on the property related to a leaking underground storage tank site that is 0.2 miles to the north.

The visual site inspection was conducted on the morning of December 5, 2015. At that time, the property was photographed, mapped, and inspected for evidence of environmental impact. The immediately adjacent an d neighboring properties were also inspected for evidence of environ mental impact and photographed. The occupants, of the current adjacent properties, were interviewed for local current or historical information whenever possible.

The primary party interviewed was Mr. Dean Isaacson. Mr. Isaacson is a representative of the property owner, 1022 South La Cienega Partnership. He provided information on previous and planned future land uses of the property. An attempt was made to contact the former property owner, Monty Ferdowsi. His phone number had been changed and he could not be reached for an interview.

The geologic/hydrogeologic summary was compiled from various publications of: the United States Environmental Protection Agency (EPA); United States Geological Survey (USGS); Federal Emergency Management Agency (FEMA); Federal Department of Fish and Game; California Geological Survey; California Division of Water Resources; California Environmental Protection Agency (Cal EPA); and the Los Angeles County, Department of Building and Safety. This summary is intended to identify the uppermost geologic formation, depth and flow direction of groundwater, and any pertinent geologic hazards.

Historic aerial photographs were provided by Geosearch. Sanborn Fire Insurance maps were provided by Environmental Data Resources. Current and historic topographic maps were obtained from the USGS. Agencies providing information were the City of Los Angeles, Department of Building and Safety, and the Los Angeles County Tax Assessor. The City of Los Angeles, Dept. of Building and Safety provided reference to old permits, land zoning, and building codes. The Tax Assessors office provided information on land values and construction dates. This information assisted us in determining previous ownership, occupancies, and land uses.

A site reconnaissance was conducted on the property to determine: what hazardous materials are, were, and will be stored, utilized, and generated; permit compliance and violation history; hazardous materials housekeeping; and emergency response protocols. A visual inspection of the storage and usage areas, with emphasis on illegal releases and compliance, was conducted. This audit researched the presence of storage tanks and clarifiers, pools of liquids, drums and substance containers, PCB's, stained pavement, stressed vegetation, and waste water and sewage disposal systems.

The regulatory agency review consisted of a computer search of the ASTM determined Federal, State, and local public documents relating to sites that have been identified as causing environmental degradation. The computer service maintains a continually updated database of public records. With this information, NEI highlights sites that pose a potential off-site environmental threat, including potential soil vapor migration onto the subject property. The computer search was performed by Geosearch.

FINDINGS

Site Location and Description:

The Los Angeles County Tax Assessor has assigned Parcel ID number 5087-001-021. This parcel has two addresses associated with it 1022 and 1024 S. La Cienega Blvd. The land is valued at $2,243,956.00. The property is being utilized by the occupants of the property to the north, Matrix Collision Repair Facility, for vehicle parking (photos 1-4).

The address utilized for this purpose is 1022 S. La Cienega Blvd., LA, CA 90035 (maps 1 & 2). The property is zoned C2-1-0 for highway oriented, general commercial by the City of Los Angeles. This zoning allows for a wide range of commercial businesses. For more detailed information concerning specific land uses, contact the City of Los Ange les, Dept. of Building and Planning. A land zoning map and explanation is included in the Appendix.

Since the property is vacant land: asbestos; lead in paint; Polychlorinated Biphenyls (PCB's), and mold are not issues at this time. The threat from Radon and Methane gas is minimal.

The property is served by: the City of Los Angeles for (fresh) potable water and power. A document displaying the results of on-going water sample testing is available from this agency. Los Angeles County provides sewage disposal; and the Southern California Gas Company provides natural gas.

Previous Environmental Assessment Work:

A "Report on Site Investigation" was conducted by NEI on 12/8/2010 for Beverly Hills Adjacent Senior Assisted Living (BHASAL). This investigation discovered two sand lenses that had elevated concentrations of gasoline and benzene. The pollutants originated from a leaking tank on the gas station on the southeast corner of Olympic and La Cienega. A second gas station on the northeast corner of Olympic and La Cienega was found to have impacted soils only and has been closed.

A "Soil, Soil Gas, and Ground Water Sampling Report" was conducted by Holguin, Fahan & Associates (HFA) on 1/25/13 for Chevron. This investigation involved more de tailed investigation, since the previous investigation discovered elevated concentrations of pollutants. The investigation was conducted on behalf of the owners of the gas station where the leak had occurred and is now part of the public record.

The excessive concentrations of gasoline and benzene discovered by NEI in 2010 were not found a second time in 2013 by HFA. There are numerous possible explanations, but the two most likely are that the pollutants breached the clay containment and were swept away by the fast moving ground water or they degraded naturally. A combination of the two is most likely to have occurred. Relatively low concentrations of residual hydrocarbons are present, however, it was determined there is no longer an imminent threat to the general public or any future occupants of the property. This parcel has been indemnified by Chevron. The property will be restored to environmentally acceptable conditions if adverse conditions are encountered during construction.

Pertinent excerpts from both reports are presented in the closure report section of the Appendix.

Geology/Hydrogeology:

Definitions of selected geologic terms are included at the end of the text for your reference.

The property is located on the northern Coastal Plain at an elevation of 125 feet above mean sea level. It is underlain by 150 to 200 feet of Holocene and late Pleistocene age alluvium (map 5).

The property is located in the Central Basin Pressure Area of the Central Basin (map 6). The depth to the closest ground water was measured at approximately 17 feet in 2013 by HFA. Ground water was measured at roughly 16 feet deep in 2010.

The property is located 3 miles northeast of the Newport-Inglewood fault zone. The property is not located in a 100 or 500 year flood zone (Zone X). The property is located in the now abandoned Beverly Hills Oil Field. No oil or gas wells have been drilled on the proper ty. An exploratory well was drilled 500 feet south of the property (map 4c). This well was plugged and abandoned in 1965. The property is located in a City of Los Angeles Methane Zone. This City code requires property be investigated for methane gas prior to new construction. The HFA report sampled for methane gas, with no elevated concentrations reported. The property is not located in wetlands (maps 7-10).

The Coastal Plain (map 6a) is 50 miles long and 12 to 20 miles wide. During the Holocene and late Pleistocene geologic epochs, the rivers that drain the interior built up the shallow sea floor with fluvial deposits, to form an alluvial plain.

Review of the historic topographic m aps (map 4) indicates the presence of a Holocene age stream channel in the vicinity of the subject property. It is the nature of the stream channel to migrate relative to the amount of water flowing through it. As the amount of surface water decreased, the stream channel infilled with sediment leaving behind the sand and gravel lenses left from stream migration. This depositional process was documented in the 2010 investigation using Ground Penetrating Radar, and again in the 2013 using a Cone Penetrometer.

Holocene age alluvium is described as poorly sorted, unconsolidated, interbedded, sand, gravel, silt, and clay. The Holocene geologic epoch represent the sediments that have accumulated during the previous 11,000 years. Late Pleistocene alluvium is similar to Holocene alluvium except it m ay be semi-consolidated. The late Pleistocene geo logic epoch represents the sediments deposited from 700,000 to 11,000 years ago.

The Central Basin of the Coastal Plain is bordered by the Hollywood Basin on the north. The southern boundary is an arbitrary line, along the Coyote Creek, dividing it from the Lower S anta Ana Basin (Orange County portion of the basin). The Newport-Inglewood Uplift is the western boundary, and the east boundary is made up by the Repetto Hills and the Santa Fe Springs-Coyote Uplift. The Central Basin has been adjudicated since 1965 due to over-pumping of the ground water. The basin has been managed by the California Division of Water Resources since then.

The Central Basin is a single structural unit with no obstructions to the flow of ground water. It is comprised of the alluvial cones of the three major rivers that discharge onto the Coastal Plain, forming a compound alluvial cone. The four subdivisions of the basin are the Los Angeles Forebay Area, the Montebello Forebay Area, the Whittier Forebay Area, and the Central Basin Pressure Area (map 6a). Additional information on the Central Basin is presented in the ground water section of the Appendix in Bulletin 118.

The forebay areas of the Central Basin are characterized as unconfined aquifers, which allow ground water to rise and fall freely. The Central Bas in Pressure A rea is characterized by having confined aquifers. Confined aquifers are under pressure due to clay and silt layers containing and building pressure between the sand and gravel aquifers. We have tentatively identified an ancient stream channel along the east end of the subject property, with the water flowing south. The base of the channel is approximately 30 feet deep. The depth to ground water in this area is generally less than 20 feet (map 6c).

The current depth to water, to be classified as a liquefaction threat in CA, is 45 feet. The property is in an area subject to liquefaction (map 7c). The surface expression of liquefaction is commonly referred to as "sand

blows". Liquefaction may be described as the resettling of the underlying alluvium in the saturated (water filled) zone, resulting in unstable sediments and a jet of water and sand being emitted on the surface. Damage to the foundation of structures may result if they overlie this geologic activity.

The property is considered to be in an area subject to liquefaction potential. Liquefaction threat is based on the historic highest depth to the ground water table in areas underlain by unconsolidated alluvium.

The classification is presented for reference:

depth to ground water	liquefaction potential
0-30 feet	high
30-50 feet	moderate
50-80 feet	low
> 80 feet	no threat

Active faults are defined as faults displaying evidence of movement within the previous 11,000 years (map 7a). Potentially active faults are faults that display evidence of movement within the previous 700,000 years. The time of faulting is color coded on the Legend to map 7a. A strike-slip fault is defined as one side moving parallel relative to the other side. A thrust fault is defined as one side moving up or down relative to the other side.

The property is 3 miles northeast of the active Newport-Inglewood fault zone. The Newport- Inglewood fault zone is approximately 40 miles long and extends from the Newport Mesa to Beverly Hills. It is capable of producing a magnitude 7 earthquake and last ruptured in the Signal Hill area in 1933. The Newport-Inglewood fault is a thrust fault with evidence of movement in both directions.

Regional Land Use History:

This land was first occupied by Tongva (people of the earth) Indians. They lived in villages made up of small, reed, huts along the Los Angeles and San Gabriel river banks. Four settlements were noted in the early 1500's by Spanish explorer Juan Cabrillo. He named the area "Bahia de los Fumos" (bay of smokes). The Indians lived sim ply off the land, sustained by acorns, sage seeds and small animals. Tongva were well known as basket weavers and canoe makers. Their primary trading partners were the Chumash Indians living along the coast and on the Channel Islands. They traded canoes and baskets for fish and shells.

First contact in Southern California was made by Spanish explorers and missionaries in 1769 and declared Spanish Territory. Father Junipero Serra built a series of 21 missions along the "Camino Real". The task of the Mission was to convert the Indians to Christianity, teach them to plant crops, raise cattle, and make products. Many Indians died from imported disease. Some Indians eventually owned their own land.

The land was declared Mexican Territory when they gained independence from Spain in 1821. Mexico ceased to fund the Missions and they were gradually phased out. The land was subdivided into Rancho's, which were awarded to veterans of war, old war heroes, and others in favor with the Mexican Government. The land became US Territory, after the Mexican-American War (1846-1848), and the State of California in 1850. High taxes caused many of the Rancho's to be further subdivided.

The property is located in the "Rancho de las Aguas" (Ranch of the Gathering Waters) which was awarded to Luis Quintero. His daughter Maria Rita and son in law Vicente Villa, who was a soldier for the Mexican Army, acquired the Rancho when the Mexican/Spanish Land Grants were returned to the original owners in 1852 by the United States. They sold the Rancho to Benjamin Wilson and Major Henry Hancock in 1854 for sheep grazing. A portion of the land was sold in 1868 to Edward Preuss, who started a town called Santa Maria. Drought caused the town to fail and the land reverted to sheep ranching.

Next the owners of the United States Hotel in downtown Los Angeles, Henry Hammel and Andrew Denker, purchased the land and grew vast fields of lima beans for their hotel. In 1900, the land was purchased by Amalgated Oil Company. They explored for oil and gas, but came up with dry wells. They converted the land to Rodeo Land and Water Company, and residential and commercial development of the area began. Historic photos, maps, and permits display the land from this point in time.

Southern California was opened up to the rest of the country when the Santa Barbara Line of the Southern Pacific Railroad was constructed in 1876. It completed the final rail link between Los Angeles and San Francisco. The City of Los Angeles was first started as San Gabriel in 1771. In 1781, the Spanish Governor, Felipe De Neve, sent 44 people to colonize “El Pueblo de la Reina de Los Angeles (The City of the Queen of the Angeles). The pueblo was originally founded to grow food for the soldiers guarding this far off territory for Spain.

Historic primary thoroughfares were Wilshire and Pico, east and west, and La Cienega and Doheny, north and south. From the 1920’s to the 1950’s, the Pacific Electric operated the “Red Car” along Santa Monica

Blvd. to connect downtown LA with the Pacific Ocean. The property is located south of historic Sherman (West Hollywood). This is where the train was serviced and the employees housed, primarily due to fresh water being close to the surface (historic photos, maps 3& 4).

The area today is a residential area of Los Ange les, with commercial development along the primary thoroughfares.

The ownership and land use of the property has been summarized from available sources as:

1800 - 1852, Luis Quintero /sheep grazing;

1852 - 1854, Benjamin Wilson, Henry Hancock, William Workman/sheep grazing;

18? - 1900, Henry Hammel, Andrew Denker/farming;

1906 – 1954, Rodeo Land and Water Company/property development;

1954 - 2000; Unidentified owners/office building;

2000 - 2006; Nextel/communications company offices;

2006 - 2015; Beverly Hills Adjacent Senior Assisted Living, LLC./vacant land;

2015-present; 1022 S. La Cienega Partnership/ (photos1-4).

The planned future use is for the property to be developed with a senior citizen residential community (map 11).

Local Land Use History:

Sanborn fire insurance maps date 1927, 1950, and 1969. Historic aerial photographs date 1922, 1928, 1947, 1952, 1965, 1976, 1989, and 1994. Historical topographic maps date 1897, 1921, 1924, 1950, 1966, and 1972. Building permits date back to 1954.

Historical topographic maps from 1897, 1921 and 1924 show the property as vacant land, and indicate it is in the vicinity of a stream. Topographic maps after this simply indicate the property is located in a developed area. The Sanborn map from 1927 indicates the property is vacant land. The Sanborn map from 1950 indicates the property is vacant. The Sanborn map from 1969 displays the single story, wood, office building constructed in 1954.

The historic aerial photo from 1922 shows the land as vacant. The photo from 1928 shows trees or bushes on the property. The 1947 photo shows the subject property as vacant land. The photo from 1952 shows what appears to be a billboard on the property. The photos from 1965, 1976, 1989, and 1994 show the single story, wood frame, office building on the property. The site photograph on map 1 shows the property since the demolition of the wood frame office building in 2006.

The careful review of historic photos, historic topographic maps, building permits, and Sanborn fire insurance maps all display the same evidence that the property was vacant unimproved land until its development with a single story office building in 1954. Building permits indicate the office building was demolished in 2006. Interviews with the property owner determined the vacant lot has been utilized for wrecked vehicle parking since mid-2015.

Site Reconnaissance:

Prior to development in 1954 the property was grazing land and a vacant lot. This type of land use is very rarely found to be impacted with herbicides and pesticides . These soil additives are generally found where the materials are stored or the excess disposed of. Routine application of these chemicals to the land do not pose a threat to the environment, and eventually break down to harmless compounds of nitrogen and phosphorous over 30 to 50 years. Since the last possible grazing land use was 94 years ago, environmental impact from this potential source is not suspected.

From 1954 to 2006 the property was an office building. The occupants were not identified from 1954 to 2000. From 2000 to 2006 the office building was occupied by Nextel Communications. From 2006 to 2015 the property was owned by BHASAL. The 1954 office building was demolished with plans for new development proceeding (building perm its). The property was sold to 1022 South La Cienega Partnership in 2015.

The planned future use is for a retirement home and a skilled nursing care facility to be constructed (map 11). There is no environmental threat from the planned future land use.

There are 6 -7, steel, 55 gallon drum s, filled with non-hazardous soil cuttings from the previous investigations. This material may be emptied and the drums discarded.

Regulatory Agency Listings and Area Reconnaissance:

The Geosearch report is 132 pages in its entirety and presented in the Appendix. The subject property is not listed on government documents as a hazardous site or as a generator of hazardous waste.

Review of the existing agency publications, documenting proper ties know to have caused environmental degradation, has found 5 sites of concern within current ASTM distances of the subject property. The location of the identified site relative to the subject property is presented in the Appendix as Radius Maps 1 & 2. The location, case type, and case status are presented for reference. Detailed information may be found in the Geosearch Radius Report. The page number where the site is located is presented for reference.

3) Geosearch page 30 — 0. 04 miles north
Tosco Arco station — LUST/RWQCB
1004 S. La Cienega Blvd. — clean-up is in progress
Los Angeles, CA 90035
This site is up-gradient and the ground water is impacted with hydrocarbons.

6) Geosearch page 60
Paulie Auto Body Shop — 0.15 mi. south
1135 S. La Cienega Blvd. — LUST/RWQCB
Los Angeles, CA 90035 — clean-up is in progress
This site is down-gradient and the ground water is impacted with solvents.

7) Geosearch page 67
Mobil station — 0.4 miles south
6162 W. Pico Blvd. — LUST/RWQCB
Los Angeles, CA 90035 — under investigation

This site is down-gradient, the full impact from a leaking waste oil tank is unknown.

17) Geosearch page 105
Horrace Mann School — 0.6 miles northwest
8701 Charlieville Blvd. — Envirostore/DTSC
Beverly Hills, CA 90211 — under investigation

This site is up-gradient and the ground water is impacted with gasoline,

20) Geosearch, page 109
Beverly Hills Plating Works — 0.9 miles northwest
243 N. Robertson Blvd. — Envirostor/DTSC
Beverly Hills, CA 90211 — clean-up is in progress
This site is up-gradient, pollutants are not reported.

Of the 5 sites identified as causing environmental degradation, 3 are located up-gradient from the subject property. All 3 are known to have impacted the ground water and 1 has impacted the ground water migrating under the subject property in the past. The other 2 up-gradient sites are not close enough to the

subject property to have an adverse impact on the ground water migrating under the subject property.

Soil Vapor Intrusion:

None of the open or closed sites known to have discharged volatile organic com pounds (VOC's) are located within 100 feet of the subject property. No solvent or gasoline additive vapor will migrate in concentrations that pose a threat to the occupants of any structures on the subject property. Any vapor from these long closed sites would have dissipated to harmless concentrations.

Adjacent Properties:

The primary sources of information for the neighboring and adjacent properties were obtained from the careful review of Los Angeles, Department of Building and Planning perm its, historical aerial photographs, topographic maps, and Sanborn Fire Insurance maps.

The adjacent property to the north, 1116-1120 S. La Cienega has been occupied by Matrix Auto Body since 2005 (photos 5-8). This company is involved in the repair of wrecked vehicles. Prior to this: 1941-1973 it was a car wash and car detailing company; 1973- 2005 it was a tennis shop with a tennis court.

The property to the south, 1026 S. La Cienega, has been vacant land owned by a land development company since 2006 (photos 9-11). It was developed on vacant land in 1954 and utilized as a bar and a restaurant until 2006 when the structure was demolished.

The property to the east is a residence, 1021 and 1023 S. Alfred St, (photo 12). The single family home was constructed in 1935 and apparently subdivided into 2 units in 1942.

The property to the west, 1023 S. La Cienega, has been occupied by the parking lot for the Temple Beth Am (photo 13). The construction of the first building was in 1956, since then 3 additional structures have been constructed and the Temple facility has added a private school.

None of the neighboring or adjacent property addresses are listed on government documents as hazardous waste sites or generators of hazardous waste.

Environmental Compliance Program:

Since there are no structures on the property there is no need for an environmental compliance program at this time.

Data Gaps:

The occupants of the office building from 1954 to 2000 were not identified. Since office buildings very rarely store, utilize, or generate reportable quantities of hazardous materials, this data gap is insignificant and has no bearing on the conclusions, recommendations or opinions on this report.

CONCLUSIONS and RECOMMENDATIONS

Our review of public and private records, occupancy and land use history, and inspection of the property has not found evidence of environmental impact that could result in a government mandated investigation or restoration.

The ground water migrating under the property was found to have been tainted from the leaking underground storage tanks at the service station ½ block to the north. Two investigations have been conducted; both indicate that an environmental issue that threatens human health or the environment is not present.

The property is indemnified by Chevron against any gasoline impacted soil or ground water encountered during the planned future construction Since there are no structures on the property, friable asbestos containing materials, polychlorinated byphenols (PCB's), lead in paint, or mold are not issues at this time. The property is located in Radon Zone 2 (2 to 4 pico curies/liter) by the US EPA. A map depicting this is presented in the Radon gas section of the Appendix. The potential for infiltration with Radon gas is minimal.

The property is at an elevation of 125 feet. It is underlain by 150-200 feet of Holocene and late Pleistocene age alluvium. The depth to ground water is currently estimated at 17 feet, with a flow direction to the south.

The property is located 3 miles northeast of the Newport-Inglewood fault zone. The property is not in an Alquist-Priolo Special Studies Zone. Ground water in general is less than 20 feet deep and the property is located in a liquefaction hazard zone.

The property is located in the abandoned Beverly Hills Oil Field, and is included within a City of Los Angeles m ethane zone. The site investigation conducted in 2013 analyzed form ethane with none detected. The nearest oil well drilled in the area is 500 feet to the south. The property is located in FEMA Flood Zone X (not a 100 or 500 year flood zone). The property is not in wetlands. No evidence of willful industrial abuse,

mining, legal or illegal landfilling, or oil and gas exploration was discovered.

There are 5 sites within current ASTM distances known to have caused environmental impact. 3 of the sites are located up-gradient from the subject property. One site is currently active and undergoing clean-up. The edge of the gasoline ground water plume has tainted the ground water migrating under the subject property. The levels are below current regulatory Action Levels and considered insignificant at this time.

Neither of the other two up-gradient sites is close enough to impact the g round water under the subject property. The remaining two sites are either down or off gradient and pose no environmental, legal, or financial threat to the subject property. There is no potential for vapor intrusion from off-site sources at this time.

We recommend no additional environmental assessment work be required on the property at this time.

OPINION

It is our opinion to proceed with the planned construction and have Chevron clean-up any hydrocarbon impacted soil or ground water if it is encountered during excavation and grading.

LIMITATIONS

This report has been prepared to impart information of the obvious environmental condition and hazardous waste liability of the subject property. The statements in this report are based upon observations of the apparent conditions of the premises, systematic investigation of public information, and the interviews with the primary parties, as stated in the Scope of Services. No representation, warranties, or guaranties are given with respect to concealed or latent problems outside the boundaries of the documented investigation.

CONFIDENTIALITY AGREEMENT

National Environmental, Inc. hereby agrees not to release this report, any portion of this report, or the results of the investigation to any party, except as required by law, without written or verbal consent from 1022 South La Cienega, LLC.

Definitions of Selected Geologic Terms

Acre-foot – The volume of liquid or solid to cover one acre to a depth of one foot.

Alluvium – A general term for all sedimentary deposits resulting from the operations of modern rivers. Including sediments deposited in river beds, flood plains, lakes, fans at the foot of mountain slopes, and estuaries

Anticline - Inclined toward each other, as the ridge tiles of the roof of a house.

Aquiclude – A formation which, although porous and capable of absorbing water slowly, will not transmit it fast enough to furnish an appreciable supply for a well or spring.

Aquifer – a formation, group of formations, or part of a formation that transmits water in sufficient quantity to supply pumping wells or springs.

Basin – An extensive depressed area into which the adjacent land drains, and having no surface outlet.

Bedding – Planes dividing sedimentary rocks of the same or different lithology.

Cemented – The process of chemically precipitating a bonding material around grains or minerals in rocks.

Consolidated – Any or all of the processes whereby loose, soft, or liquid earth materials become firm and coherent.

Dome – A roughly symmetrical upfold, the beds dipping in all directions, more or less equally around a point.

En echelon – Separate faults having parallel but steplike trends.

Epoch – a division of geologic time that corresponds to a series of rock and is a subdivision of a period.

Formation – A geological mappable unit, the primary unit of formal mapping of distinction. Most formations possess certain distinctive or combinations of distinctive lithic features. Formations may be combined into groups or subdivided into members.

Fault – A fracture or fracture zone along which there has been displacement of the sides relative to one another.

Hydrologic – Pertaining to the occurrence, circulation, distribution, and properties of the water of the earth and the earths atmosphere.

Interbedded – A bed of sedimentary rock that lies between two other sedimentary beds or formations.

Lithic- Referring to rocks and the minerals that makes up the rocks.

Marine – Of, belonging to, or caused by the sea.

Perched – Water that lies above an impermeable bed that prevents it from migrating downward into an aquifer.

Permeable – Having a texture that allows a fluid to move through it.

Plate – One of many large segments of the earths crust, varying in thickness in 50 to 250 km.

Saturated Zone – The zone in which the voids in the rock or soil are filled with water at a pressure greater than atmospheric in an unconfined aquifer.

Syncline – A fold in rocks in which the strata (formations) dip inward from both sides toward the axis.

Uplift – Elevation of any extensive part of the earths surface relative to some other parts.

Vadose Zone - The zone between the water table (saturated zone) and the atmosphere where the spaces between the grains or minerals contain water at less than atmospheric pressure.

Personnel

Mr. Hector G. Estrella – California (CA) Professional Geologist # 9019. Mr. Estrella received his BS Degree in Oceanography from Universidad Autonoma the Baja California, School of Oceanography with a concentration in Geology. He has over 25 years of experience in geotechnical, geology, and environmental applications. He has extensive experience, and has coordinated hundreds of reports in these areas.

Mr. Alex T. Feucht – CA Professional Geologist #4433. Mr. Feucht received his BS degree in geology from the University of Wisconsin at Madison, and his MS degree in geology from the University of Montana, Missoula. He spent 17 years working as a petroleum exploration geologist for Texaco, and has over 25 years experience as an environmental consultant.

Mr. Carl M. Hulick – Geologist and Licensed Hazardous Waste Contractor. Mr. Hulick received his Bachelors of Science Degree in Geology and Master of Business Administration (MBA) from the California State University at Bakersfield in 1991. He has over 25 years of experience in all aspects of environmental consulting, specialty engineering, water treatment systems, demolition and grading, and real estate transactions. Mr. Hulick is a voting member of the American Society of Testing Materials (ASTM), and has assisted the California State Licensing Board in exam preparation.

Barry Keller, Ph.D. - CA Certified Hydrogeologist #370, CA Professional Geologist #4460. Dr. Keller received his Ph.D. in geophysics from the University of California Santa Barbara in 1984, his MS degree in geology from the California Institute of Technology in 1969. Dr. Keller has over 25 years experience applying geophysics and hydrogeology to all aspects of environmental protection. His work briefly includes petroleum and mineral exploration, US Military base clean-ups, development of environmental regulation for the World Bank in South America, hazardous waste management, fresh water delivery systems, and computer modeling. Dr. Keller has numerous publications in all of these fields.

Mr. Craig A. Kitchen – National Registry of Environmental Professionals, REPA #456935 Mr. Kitchen studied at California State University at Los Angeles and is an environmental scientist by trade. He is 40 hour OSHA certified, and the director of safety and environmental affairs at a large manufacturing concern. He has over 25 years of experience in the storage, utilization, and disposal of hazardous materials and waste streams.

Mrs. Mercedes Q. Maikisch – Environmental Assessor. Mrs. Maikisch received her Bachelor of Science Degree in Mathematics from Saint Peter College of Toril Davao City Philippines. She has 1 year of experience conducting and editing “All Appropriate Inquiries” (Phase I’s).

Mr. Robert J. Maikisch - CA Professional Geologist #8963. Mr. Maikisch received his BS degree in geology from Bradley University, Illinois in 1982. He has completed graduate studies in hydrogeology and stratigraphy at the Colorado School of Mines in Golden, CO. He spent 6 years working for Noranda Exploration as a technician and geologist, and has US EPA level training in Radon gas detection and mitigation. He is one of NEI’s founders, with over 25 years experience as an environmental consultant.

Mr. Gary M. Mann - CA Professional Geologist #6589. Mr. Mann received his MS degree in geology from the California State University at Hayward, and his BS degree in geology from the California State University at Long Beach. He spent 12 years as a geologist for the United States Geological Survey, involved in remote sensing and seismic reflection, and has written several publications. He is currently specialized in the application of Ground Penetrating Radar and Electrical Resistivity Tomography for subsurface imaging.

Ms. Dawn McGuire, Ph.D, - CA Certified Engineering Geologist #2280, CA Certified Hydrogeologist #905, CA Professional Geologist #7181. Dr. McGuire received her Ph.D. in geology/geochemistry from the Colorado School of Mines, Golden CO, in 1983; her MA degree in geology from the University of California at Santa Barbara (UCSB) in 1976; and her BA degree in geology from UCSB in 1972. She has more than 36 years of experience in geosciences, including research with the USGS (>75 publications); the National Park Service; California Geological Survey; CA Department of Fish and Game; and roadway-engineering geology with the CA Department of Transportation (Caltrans).

Ms. Mya L. Raggio - United States Code Qualified Environmental Assessor and Project Manager, Ms. Raggio studied at Saddleback University. She has over ten years of experience in the environmental industry, and is currently focused on studies in Industrial Hygiene.

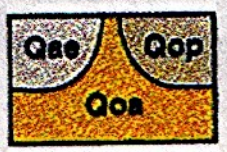
BEVERLY HILLS—VAN NUYS (South 1/2) QUADRANGLES

LEGEND



SURFICIAL SEDIMENTS

unconsolidated detrital sediments; generally undissected

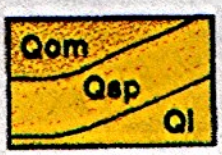
af *artificial cut and fill* **Qls** *landslide debris*

Qs *beach sand*

Qa *alluvial gravel, sand, and silt-clay, derived mostly from Santa Monica Mountains; includes gravel and sand of stream channels*

OLDER SURFICIAL SEDIMENTS

unconsolidated to weakly consolidated alluvial sediments, dissected where elevated; late Pleistocene age



Qae *alluvial fan sediments of granitic sand at West Hollywood, derived from adjacent Santa Monica Mountains*

Qop *paleosoil in Baldwin Hills (Fox Hills residual paleosoil of Weber et al.1982), gray to rusty brown, sandy, locally pebbly, moderately indurated "hardpan" on* **Qoa**

Qoa *older alluvium of gray to light brown pebble-gravel, sand and silt-clay derived from Santa Monica Mountains; slightly consolidated; in Baldwin Hills designated as Baldwin Hills sandy gravel by Weber et al.1982, where it is much dissected and eroded*

—UNCONFORMITY—

in mountain areas

SHALLOW MARINE SEDIMENTS

shallow marine and some alluvial detrital sediments, weakly consolidated, dissected where elevated; Pleistocene age

Qom *marine deposits of Hoots 1931: light gray to light brown sand, pebbly sand gravel and silt; probably in part non-marine alluvium*

Qsp *San Pedro Sand (of Wright 1987; Culver Sand of Weber et al.1982, in Baldwin Hills): light gray to light brown sand, fine to coarse grained or pebbly, locally contains shell fragments*

Ql *Inglewood Formation (of Wright 1987; Weber et al.1982, in Baldwin Hills): light gray, friable fine grained sandstone and interbedded soft gray siltstone; base not exposed*

UNNAMED SHALE

(upper member of Modelo Formation of Hoots 1931; Upper Modelo Formation of Durrell 1954; equivalent to Sisquoc Formation of Dibblee 1989, in Ventura Basin)

marine clastic and biogenic; late Miocene age ("Delmontian" and late Mohnian Stages)

Tud *soft, white-weathering diatomaceous shale to diatomite, bedded, soft, semi-punky, porous; grades laterally westward into* **Tush**

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Recency of Movement	DESCRIPTION
Quaternary	Late Quaternary	Historic				Displacement during historic time (e.g. San Andreas fault 1857). Includes areas of known fault creep.
			200			
		Holocene				Displacement during Holocene.[1]
			10,000			
		Pleistocene				Faults showing evidence of displacement during late Quaternary time.[2, 3]
			700,000			
	Early Quaternary					Quaternary (undifferentiated) faults-most faults in this category show evidence of displacement during the last 2,000,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.
			2,000,000			
Pre-Quaternary		Pliocene				Faults showing evidence of no displacement during Quaternary time or faults without recognized Quaternary displacement.
			5,000,000			
		Miocene

Raymond	Active	22	14	6.7
San Andreas	Active	>120	>74	8
San Antonio	Active	18	11	6.2
San Fernando	Active–potentially active	17	11	6.5
San Gabriel	Active–potentially active	130	81	>7.0
San Jose	Active	14	9	6.7
San Pedro basin	Potentially active	70	43	>7.0
Santa Felicia	Potentially active	8	5	6.1
Santa Monica	Active	>40	>25	6.7
Santa Susana	Active	28–38	17–24	6.9
Sierra Madre	Active	62	38	>7.0
Verdugo	Active	21	13	6.7
Whittier	Active	>40	>25	>7.0

[1]The term potentially active is used here to classify those faults for which there is evidence for Pleistocene age offsets but for which evidenc for or against Holocene activity has not (yet) been developed. The term active is used here to indicate a fault for which there is geologic o geomorphic evidence to infer Holocene offset or for which there is current seismic activity on the fault structure.

EQ = earthquake; M = magnitude.

FEMA LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.

ZONE AE Base Flood Elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

ZONE AR Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D Areas in which flood hazards are undetermined, but possible.

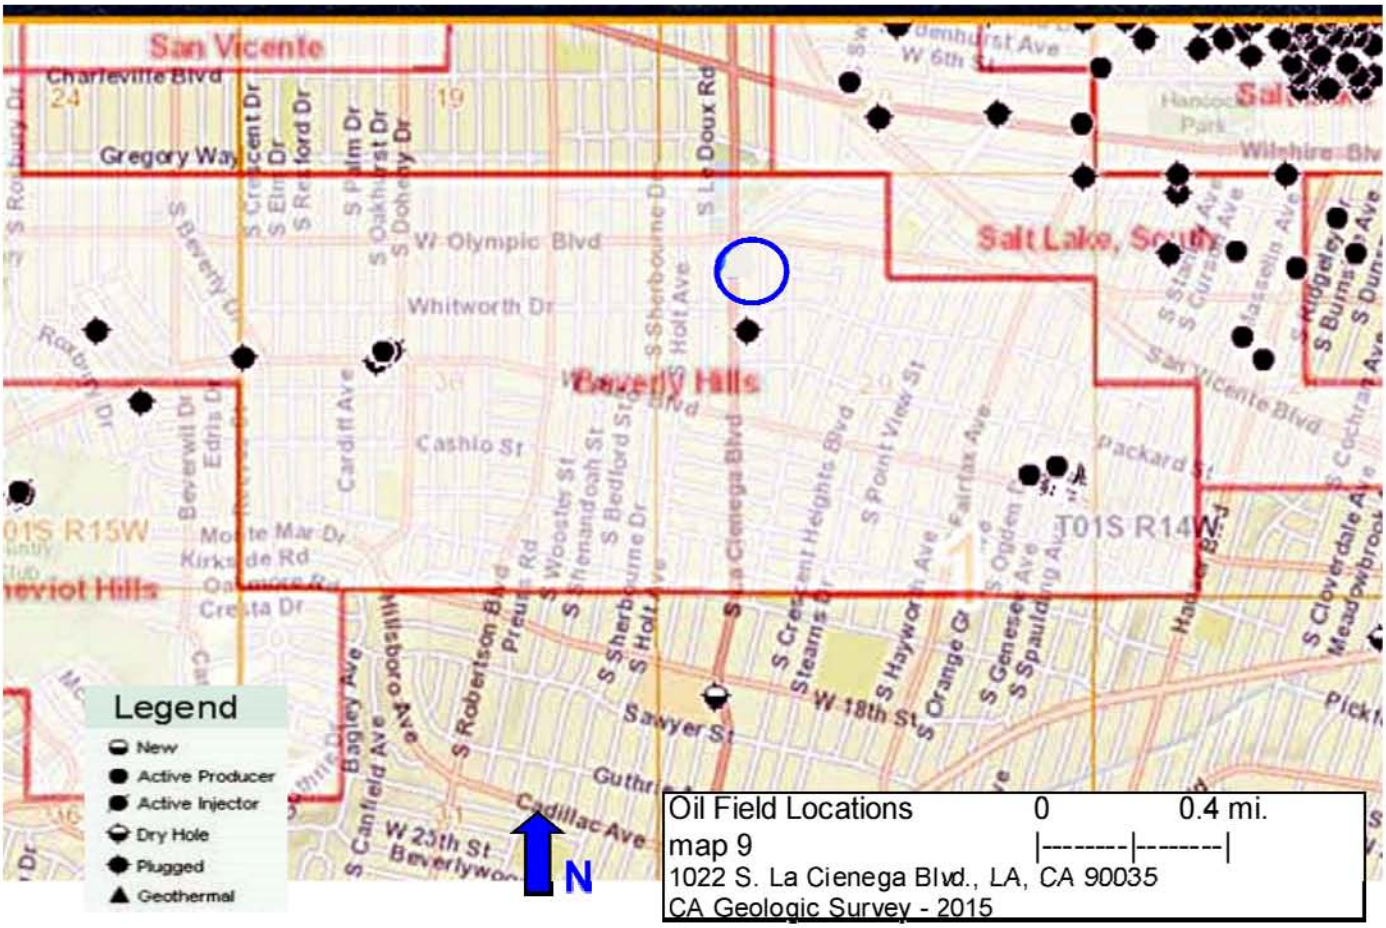
COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% annual chance floodplain boundary

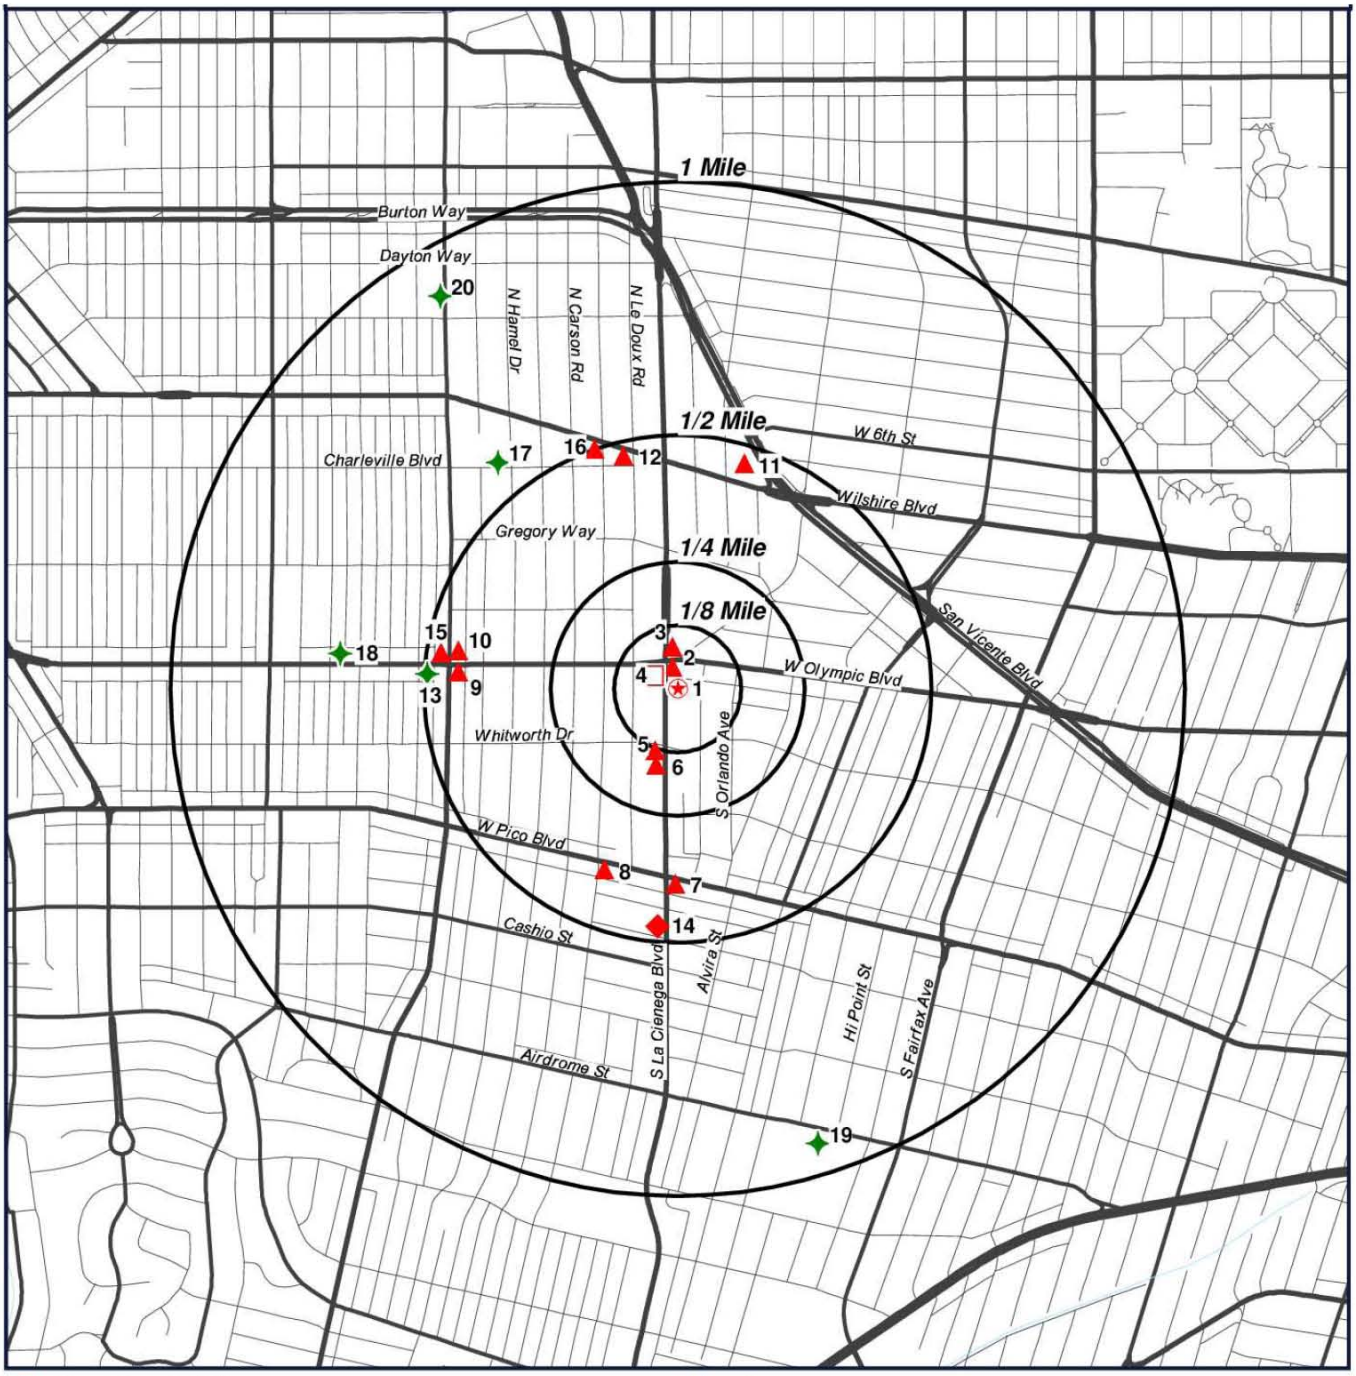
0.2% annual chance floodplain boundary



Floodway boundary

Zone D boundary

CBRS and OPA boundary



Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

14. APPLICATION COMMENTS

In the event that any box (i.e. 1-16) is filled to capacity, it is possible that additional information has been captured electronically and could not be printed due to space restrictions. Nevertheless, the information printed exceeds that required by Section 19825 of the Health and Safety Code of the State of California.

15. Building Relocated From:

16. CONTRACTOR, ARCHITECT, & ENGINEER NAME	ADDRESS	CLASS	LICENSE#	PHONE #
(O) , Owner-Builder	, ,		0	

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951).

17. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the following reason (Section 7031.5, Business and Professions Code:
Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

( ) I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale).

OR

(✓) I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

( ) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

( ) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier:_____ Policy Number:_____

(✓) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Owner-Builder Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale).

OR

(__) I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(__) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(__) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier:_____ Policy Number:_____

(__) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Owner-Builder Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

INTRODUCTION

National Environmental, Inc. (NEI) has been retained by the Beverly Hills Adjacent Senior Assisted Living, LLC. (BHASAL) to conduct a Site Investigation (Phase II) on the property located at 1022-1054 S. La Cienega Blvd., LA, CA 90035 and report the findings (maps 1-2).

Briefly, the property was developed in the 1950's and 1960's with a retail store (1022), a restaurant (1026), an auto repair shop (1032), and the current 2 story apartment building (1042-1056). The purpose of this investigation was to determine if the property has been impacted from a nearby gasoline station (76 Station) that had leaking underground storage tanks (UST), and is currently undergoing clean-up (photo 1, maps 1 & 2).

The primary contaminants of concern are gasoline and its associated additives.

SCOPE OF INVESTIGATION

This investigation was conducted without the direct oversight of a Government agency, but in accordance with the "Interim Site Assessment & Cleanup Guidebook", as published by the California Regional Water Quality Control Board – Los Angeles Region (RWQCB) in May. 1996. This guidebook provides standards and protocols for subsurface investigations of this type. It is intended to assess the chemical contamination of property and potential impact to ground water resources.

A review of previous environmental assessment work was conducted on the subject property, and the site where the UST leak had occurred. Pertinent excerpts from the previous studies are included in this report for reference. Complete copies of the previous reports are available from NEI or BHASAL.

A Ground Penetrating Radar (GPR) survey was conducted to obtain information on the sub-surface conditions of historic and ancient stream channels that are known to have once migrated through this area. Ground Penetrating Radar sends pulses of radio waves into the ground and receives the information as it bounces off the different things underground. The Ground Penetrating Radar allows us to determine the difference between coarse sand and

CONCLUSIONS

We conclude the sand and gravel "pockets" of the migratory stream are interconnected when groundwater is at a higher elevation. Simply, the groundwater fills up until it spills over into the next down-gradient sand and gravel "pocket". At lower groundwater elevations the groundwater remains isolated in the individual "pockets", by the surrounding clay deposits. We ascertain this is the case between the deeper channels, at the 25 to 35 foot depth on the central and eastern side of the property, and the release point at the 76 station. This explains why the groundwater plume apparently ends at the center of the 35 foot deep channel. Map 5b is the best depiction of this scenario.

The concentrations of gasoline in soil borings B30, B32, and B34 appear to be related to groundwater that is currently trapped in sand and gravel "pockets". Minor overflow or seepage through the surrounding clay, is allowing gasoline to escape into the deeper underlying channels, as suggested by the gasoline present in soil borings B11 and B15. These down-gradient points correspond to the path of the stream channel, at the 25 foot depth, identified during the Ground Penetrating Radar survey.

When comparing the data from May, 2008 to the current data, the groundwater samples from B7 and B8 (map 2d) were both non-detectable for gasoline. The groundwater sample from soil boring B11 (map 2a), this investigation, is in nearly the same location as B7 and B8 and reports a concentration of 220 parts per billion. This demonstrates downward migration along the proven stream channel, along the entire length of the property.

The concentrations of gasoline in B15 (2010) also correspond to the findings of soil boring B5 that was drilled in nearly the same location, in May, 2008. Gasoline is also present in the groundwater sample collected from B4 in 2008. This is in the 35 foot deep channel that runs along the east side of the property. Gasoline was not detected in this area in 2010, suggesting groundwater is relatively fast moving in this subsurface channel.

The highest concentrations of contaminants are in soil boring B37. This correlates to the southernmost extent of the original plume when it was investigated in 2000. Map 5c displays the southernmost extent of the mapped plume in 2000 as 1,000 ppm. Map 5a displays the

contaminant level in the B37 area as 1,000 ppm in 2010. We conclude this is fairly clear evidence of the sand and gravel "pockets" isolating the released gasoline long after the occurrence of the initial release.

The post release down-gradient migration, likely due to seepage through the clay, is evident in soil boring B29.

We ascertain the geology underlying the subject property continues on the surrounding properties to the north and west, and it is possible there are other sand and gravel "pockets", surrounding the original release point, that contain highly contaminated groundwater that were not discovered during the 2000-2005 investigation of the 76 Station. This possibility poses a continuous threat to any future occupants of the planned Skilled Nursing Facility, and retirement community.

Based on these data we conclude the downward migration of contaminants will continue under the property as either seepage or over flow during times of higher ground water elevation.

We conclude the planned excavation of a two story underground parking structure will only hasten the down-gradient migration of pollutants into areas of the property that are currently not impacted.

RECOMMENDATIONS

We recommend the polluted groundwater trapped in the sand and gravel "pockets" on the north portion of the property be pumped to and processed in the groundwater treatment unit at the 76 Station.

During excavation for the underground parking structure, any soils above the Action Level should be separated out and disposed of off-site in accordance with current regulations.

There are several options for the long term protection of the occupants of the planned skilled nursing care facility and retirement community. The consideration of these options is beyond the scope of this investigation.

NEI compilation from soil borings - 2010

MAP 2: Location of 250 MHz ground-penetrating radar (GPR) profiles acquired at 1042 South La Cienega Boulevard, Los Angeles, California on November 7, 2009, by Earth Imaging Geologic Services, superimposed on previous site map 2A. GPR profiles 10 through 16 (15 omitted) are shown in red line as indicated. The location of a GPR-imaged, gravelly sand channel, extending to a depth of 30 feet, is shown outlined (at approximate 25 foot depth) in thin red dashed lines and annotated "channel deposits". Scale is 1 inch = 27.5 feet. North is to the top of the page.

ENVIRONMENTAL MANAGEMENT CONSULTANTS

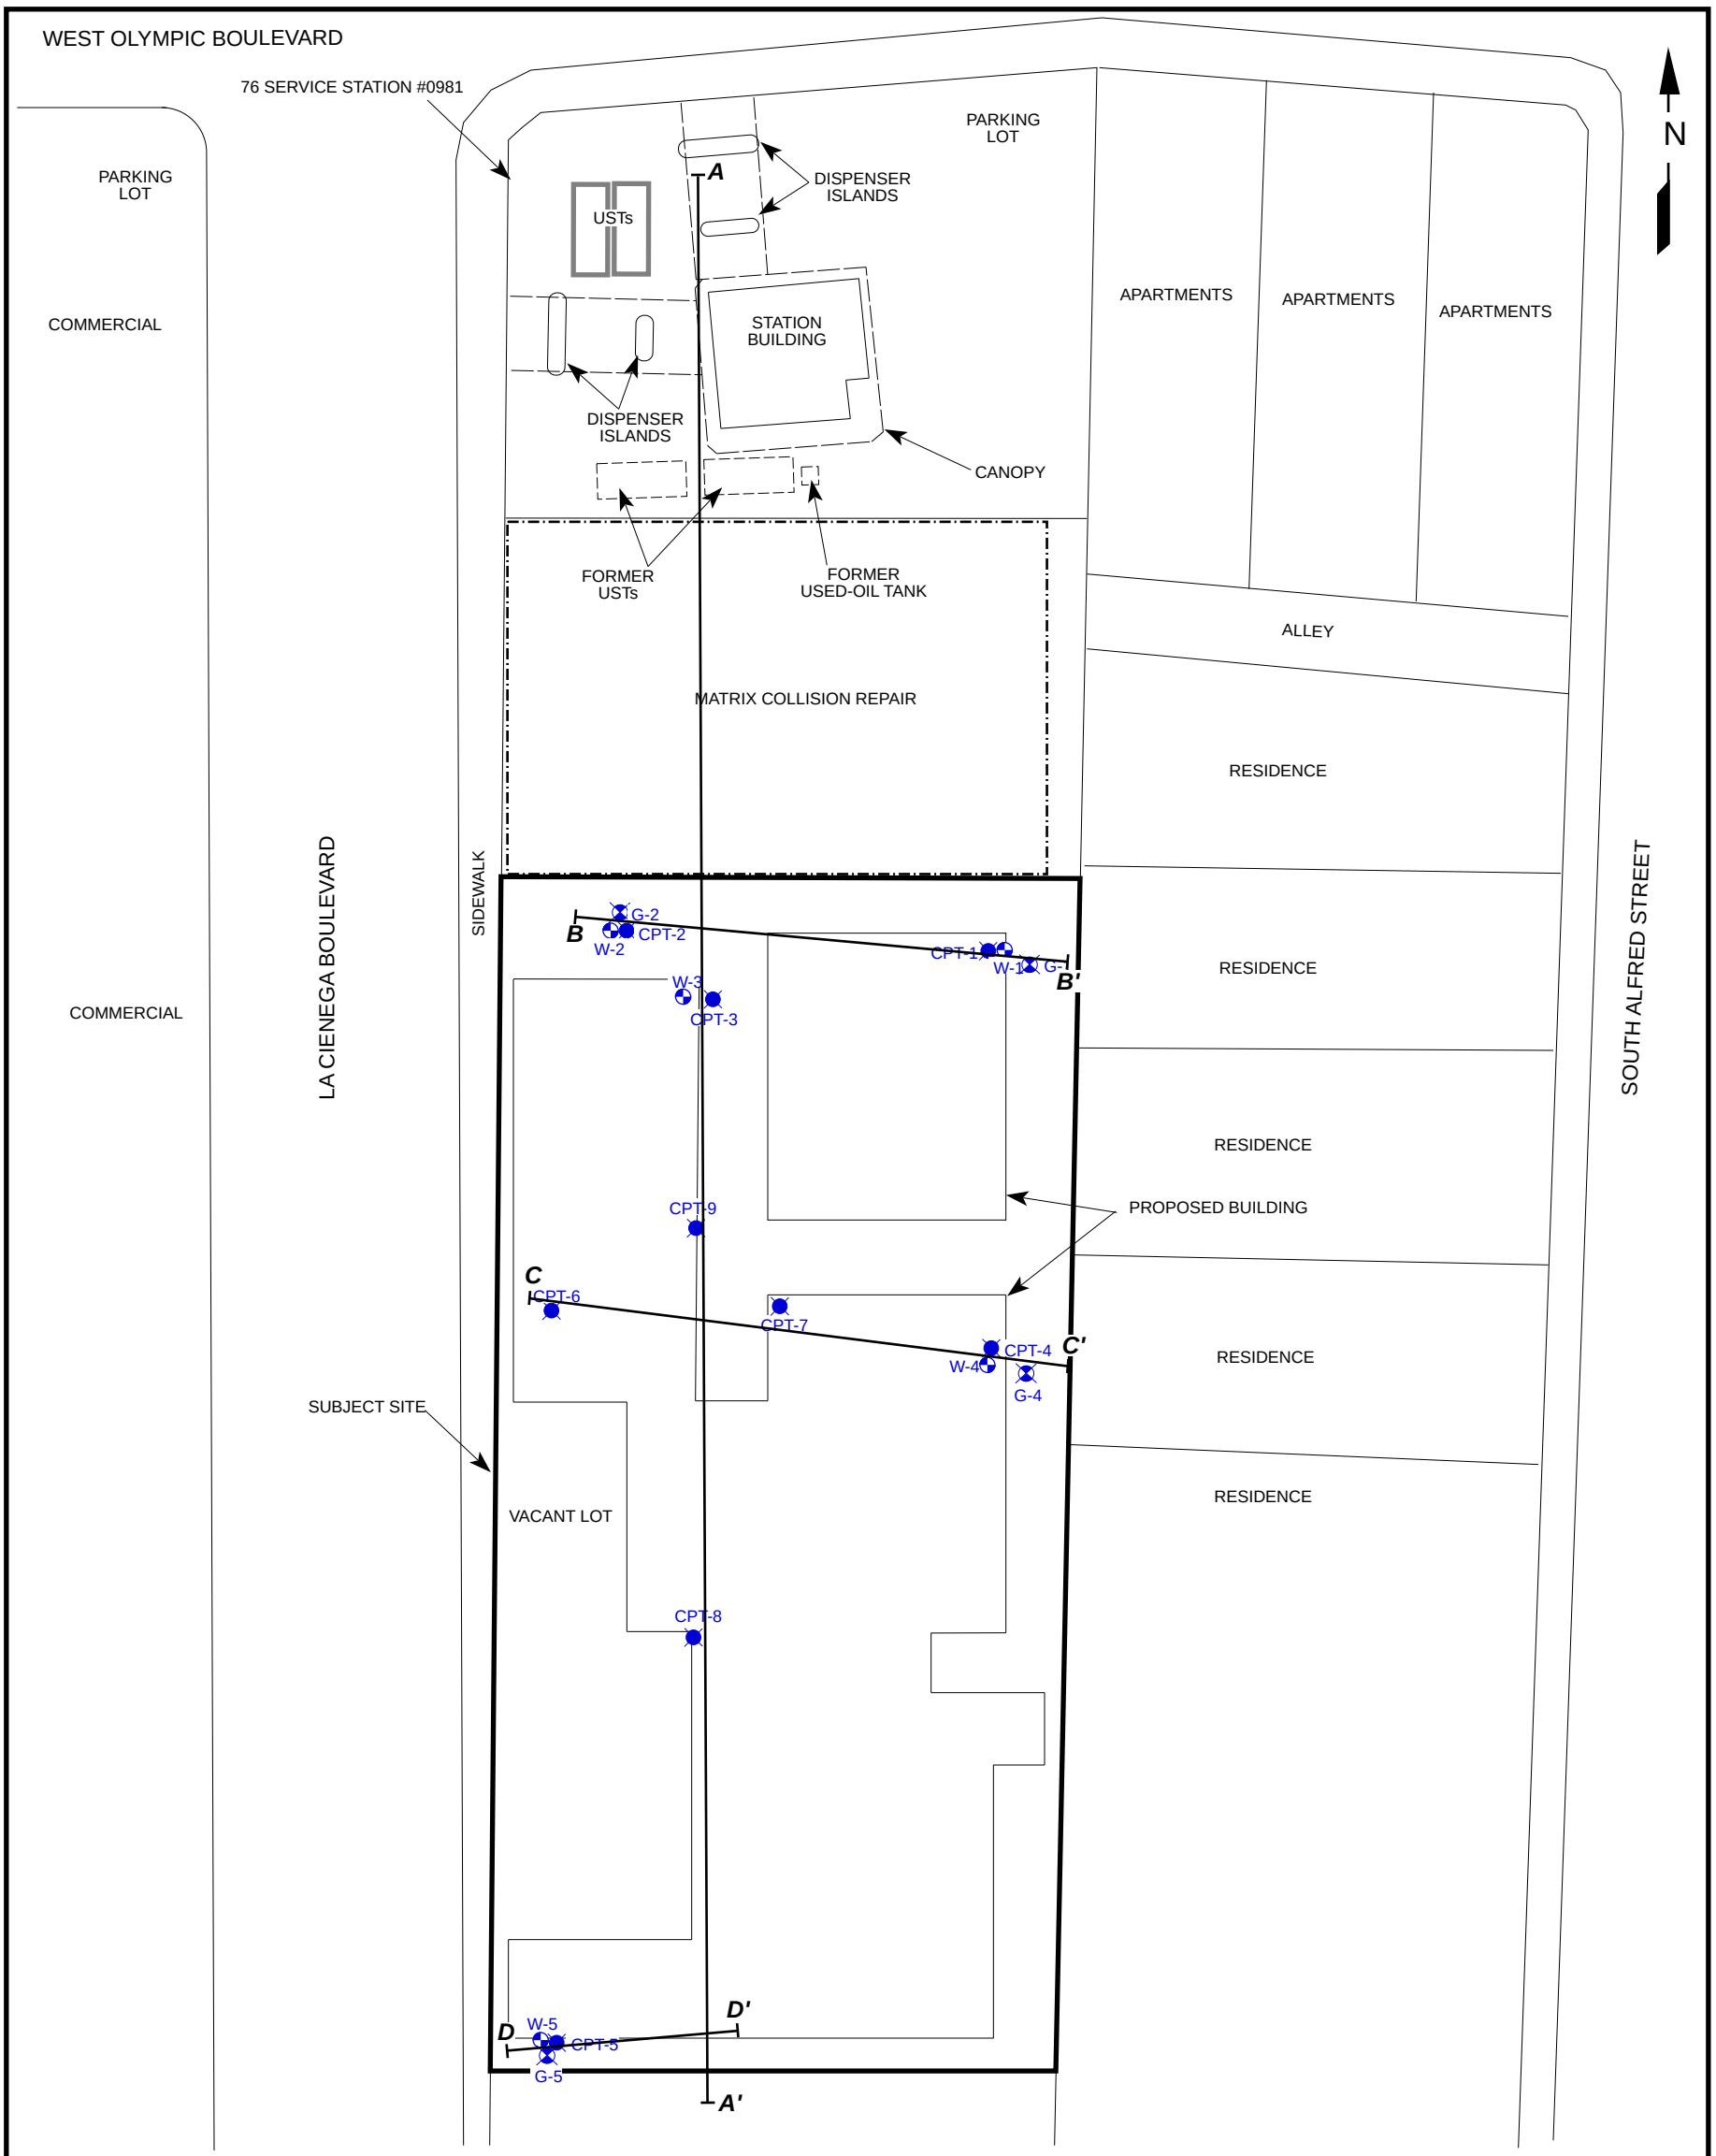
INTRODUCTION



Steptoe & Johnson, LLP, contracted Holguin, Fahan & Associates, Inc. (HFA) to prepare this soil, soil gas, and groundwater sampling report for the contiguous four parcels located at 1022, 1026, 1032, and 1042–1054 South La Cienega Boulevard, Los Angeles, California (see Figure 1 - Site Location Map and Figure 2 - Plot Plan). The four parcels are owned by Beverly Hills Adjacent Senior Assisted Living LLC (BHASAL) and by SRC.SCH LLC. Site access for performing the subject sampling was provided by site access agreements between Chevron Environmental Management Company (EMC) and the above-referenced property owners. The work was performed in accordance with HFA's soil gas and groundwater sampling plan dated August 15, 2012 (HFA, 2012), as modified by subsequent emailed communications and field decisions. The four parcels were unpaved, vacant lots at the time of the sampling activities. Mr. Matt Houser of Blaine Tech Services, Inc. provided access to the four parcels and observed all site work on behalf of the property owners.

SUMMARY

Between November 9 and November 30, 2012, HFA advanced nine CPTu borings and installed five groundwater monitoring wells and four soil gas probes. Soil encountered during the CPTu borings and drilling of the well and probe locations consisted of sand, silt, clay, and mixtures of these soil types.

On December 10, 2012, HFA gauged, purged, and sampled the groundwater monitoring wells and gauged several of the off-site groundwater monitoring wells associated with the nearby 76 service station. No PSH was detected. Depth to groundwater ranged from 15.20 (76 service station well BC-6) to 17.49 ft-TOC (well W-21). Laboratory analytical results for groundwater samples indicated maximum benzene and MTBE concentrations at 7.5 and 2.4 μg/l, respectively.

On December 12, 2012, HFA sampled the soil gas probes. Laboratory analytical results of soil gas samples indicated maximum benzene, ethylbenzene, and naphthalene concentrations of 3.7, 4.6, and 10 $\mu g/m^3$, respectively.

THE COMMERCIAL PROPERTY OWNER'S GUIDE TO EARTHQUAKE SAFETY

Written and adopted by the

California Seismic Safety Commission
1900 K Street, Suite 100
Sacramento, CA 95814-4186

January 1993

SSC 93-01

© 1992 California Seismic Safety Commission. All rights reserved.

Legal Requirements for Selling Your California Commercial Property

- If you are planning to sell a commercial building constructed before 1975, and it has precast (tiltup) concrete or reinforced masonry walls and wood-frame floors or roof, or if it has unreinforced masonry walls, state law requires you to give a copy of this booklet, *The Commercial Property Owner's Guide to Earthquake Safety*, to the buyer.

- You are not required to hire anyone to evaluate your property, although you may find it in your best interests to do so. The state does not require you to strengthen your property to resist earthquakes, but you should check to see whether your local government requires it.

Taking precautions such as strengthening your commercial property can reduce the risk of earthquake damage. There are no guarantees of safety during earthquakes, but precautions can help. The Seismic Safety Commission hopes that you will act on the suggestions outlined in this booklet and make yourself, your business, and your commercial property safer before the next damaging earthquake.

Why You Should Read This Guide

Anywhere in California, your commercial property can be shaken by damaging earthquakes. Although modern California commercial properties are among the safest buildings in the world during earthquakes, some of the older buildings contain serious *earthquake weaknesses*—problems such as unreinforced masonry walls or walls inadequately anchored to floors and roofs—that buyers frequently overlook .

- **If you plan to buy a commercial property, this guide will tell you how to spot its earthquake weaknesses and other potential earthquake-related concerns, and help you get them fixed.**

  There is no law that requires sellers of commercial properties to disclose earthquake weaknesses like the disclosure laws for residential properties. So it is up to you to find out about them and decide if the property is a good investment. You can ask the seller to complete a disclosure form, like the one opposite, to help you decide. While the earthquake weaknesses listed on the form are those most likely to cause deaths and injuries in an earthquake, you should look for *all* the earthquake weaknesses and concerns mentioned in this booklet. You should consider the possibility that the property could be seriously damaged or could be subject to earthquake strengthening ordinances, or that you could be liable for earthquake damage to tenants and passersby.

- **If you own a commercial property, this guide will help you assess and manage your earthquake risk so that your property will survive damaging earthquakes.**

  You can strengthen your building to help reduce or prevent earthquake damage. It may be expensive to fix these weaknesses before an earthquake, but it could cost much more to repair the damage afterward.

- **If you lease space in a commercial building, this booklet can help you decide whether it is safe enough in earthquakes, and help you protect your business.**

It makes good financial and personal sense to make sure that you, your family, and your property or business are ready when the next quake hits.

How to Use This Guide

Use this guide to help you:

- Identify the earthquake weaknesses and concerns that may threaten your property and get them fixed (pages 6-19).
- Understand the geologic hazards of earthquakes (pages 20-22).
- Evaluate the financial implications of strengthening (pages 23-24).
- Prepare yourself, your property, and your business for earthquakes (pages 25-27).

COMMERCIAL PROPERTY EARTHQUAKE WEAKNESS DISCLOSURE REPORT

Refer to Section 8893 *et seq.*, California Government Code and Section 10147, Business and Professions Code

Owner's Name	Assessor's Parcel No.
Street Address	Year Built
City and County	Zip Code

Answer these questions to the best of your knowledge. If you do not have actual knowledge as to whether the weakness exists or not, answer "Don't Know." If you know that a weakness exists or has been corrected, or the building has been seismically retrofitted, explain on a separate sheet. If your property does not have the feature, answer "Doesn't Apply." The page numbers in the right-hand column indicate where in this guide you can find information on each of these features.

		Yes	No	Don't Know	Doesn't Apply	See Page
1.	If the building has precast (tiltup) concrete or reinforced masonry walls with wood-frame floors or roof, are the exterior walls adequately anchored to the floors and the roof in accordance with Sections 2310, 2336, and 2337 of the 1991 Uniform Building Code?	☐	☐	☐	☐	6
2.	If the exterior walls, or part of them, are made of unreinforced masonry, have they been strengthened?	☐	☐	☐	☐	8
3.	If the building has unreinforced masonry bearing walls and is located in Seismic Zone 4, has it been posted as potentially unsafe?	☐	☐	☐	☐	9
4.	If the building has concrete columns, were they adequately reinforced to resist earthquakes or have they been strengthened?	☐	☐	☐	☐	10

☐ Separate pages describing earthquake weaknesses or seismic retrofit work done to this building are attached.

As Seller of the property described herein, I have answered the questions above to the best of my knowledge. Other earthquake concerns may be present but are not disclosed.

EXECUTED BY

(Seller) (Seller) Date

I acknowledge receipt of this form, completed and signed by the Seller. I understand that if the Seller has answered "No" to one or more questions, or if Seller has indicated a lack of knowledge, or if the building was constructed prior to 1975, there may be one or more earthquake weaknesses in this building.

(Buyer) (Buyer) Date

This earthquake weakness disclosure report is made in addition to other real estate transfer disclosures.

Keep your copy of this form for future reference.

If You Are Selling Your Commercial Property

- You must give prospective buyers a copy of this guide if the building was built before January 1, 1975 and it has precast (tiltup) concrete or reinforced masonry walls and wood-frame floors or roof, or if it has unreinforced masonry walls.
- You are not required to hire someone to identify earthquake weaknesses. You may, however, want to get assistance from a qualified engineer or architect with experience in evaluating earthquake hazards, who can prepare a written report for you that describes the earthquake weaknesses in more detail.
- You are not required to remove siding, drywall, or plaster to identify earthquake weaknesses.
- You are not required to strengthen earthquake weaknesses before you sell, but you may get a better price for your property if you do.
- If you list your property for sale by a real estate broker or agent, it is strongly recommended that you give the agent a report, like the one on page 3, that describes earthquake weaknesses when you sign the listing agreement. Your agent can give a copy of this guide and the report on the building to the buyer.
- You should keep a copy of your report, signed by the buyer, as evidence that you have disclosed the earthquake weaknesses.

If You Own or Are Buying A Commercial Property

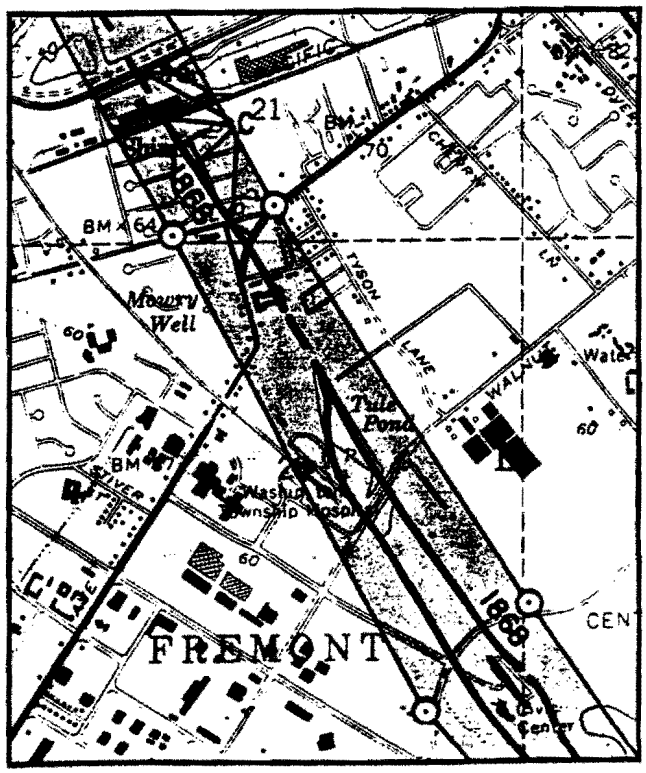
- Before you buy a property, read this guide and review all information disclosed by the seller. Pay special attention to any items that indicate earthquake weaknesses.
- Consider how well the building's design would withstand earthquakes. You may wish to have a qualified architect or engineer with experience in evaluating earthquake weaknesses give you an opinion regarding any earthquake weaknesses and the cost to strengthen them.
- Consider the property's location: Is it in or near a fault rupture zone or an area where it might be damaged by a landslide, liquefaction, or a tsunami?
- You may wish to negotiate the cost of strengthening with the seller. If these weaknesses are not fixed you may find that your repair costs after an earthquake could exceed your equity in your property, or force you to sell at a loss. You could also be liable for deaths, injuries, or property losses.
- Develop emergency plans to deal with earthquake damage repairs and business recovery.
- Check whether the community has earthquake strengthening ordinances that would affect the property.

State Laws Regarding Earthquake Hazard Disclosure

- California's modern earthquake codes are among the strongest in the world, and its buildings are among the safest. However, since many older buildings were not built to these codes, sellers of commercial property built before 1975 that has precast (tiltup) concrete or reinforced masonry walls and wood-frame floors or roof must deliver to the buyer, "as soon as practicable before the transfer," a copy of *The Commercial Property Owner's Guide to Earthquake Safety* (this booklet) to warn the buyer of earthquake weaknesses that the property might have (Government Code Sections 8893 *et seq.*).
- Local governments in Seismic Zone 4, where a damaging earthquake is most likely (see map, page 20), must inventory their unreinforced masonry buildings and establish a seismic risk mitigation program for these buildings that includes the disclosure of the risk to the building owner (Government Code Section 8875 *et seq.*). Owners of buildings in Seismic Zone 4 who have received notice that their buildings have load-bearing unreinforced masonry walls must post their buildings with signs warning that they may be unsafe in an earthquake (Government Code Section 8875.8).
- Sellers of real estate and their agents or brokers must disclose whether the property is located in an "Alquist-Priolo Special Studies Zone," where earthquake faults have ruptured the ground (Public Resources Code Section 2621 *et seq.*).
- The Seismic Safety Commission is required to develop, adopt, publish, and update *The Commercial Property Owner's Guide to Earthquake Safety* containing information on geologic and seismic hazards, explanations of structural and nonstructural earthquake weaknesses, and recommendations for mitigating the weaknesses (Business and Professions Code Section 10147). This guide is to be distributed to buyers of commercial property (Civil Code Section 2079.9) and also made available to the general public.

ALQUIST—PRIOLO EARTHQUAKE FAULT ZONING ACT

The Alquist–Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the hazard of surface faulting to structures for human occupancy. This state law was a direct result of the 1971 San Fernando earthquake, which was associated with extensive fault ruptures that damaged numerous homes, commercial buildings and other structures. Surface rupture is the most easily avoided seismic hazard.



What is the Alquist–Priolo Act?

The Alquist–Priolo Earthquake Fault Zoning Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The Act only addresses the hazard of surface fault rupture and is not directed toward other earthquake hazards. The Seismic Hazards Mapping Act, passed in 1990, addresses non-surface fault rupture earthquake hazards, including liquefaction and seismically induced landslides. For further information on Seismic Hazards maps and the Seismic Hazards Mapping Act refer to the DMG website: www.consrv.ca.gov/dmg/shezp/index.htm

How does the law work?

The law requires the State Geologist to establish regulatory zones (known as Earthquake Fault Zones*) around the surface traces of active faults and issue appropriate official Earthquake Fault Zones maps. The maps are distributed to all affected cities, counties and state agencies for their use in planning and controlling new or renewed construction. Local agencies must regulate most development projects within the zones. Projects include all land divisions and most structures for human occupancy. Single family wood-frame and steel-frame dwellings up to two stories not part of a development of four units or more are exempt. However, local agencies can be more restrictive than state law requires.

Before a project can be permitted, cities and counties require a geologic investigation to demonstrate a proposed building will not be constructed across active faults. An evaluation and written report of a specific site must be prepared by a registered geologist. If an active fault is found, a structure for human occupancy cannot be placed over the trace of an active fault and must be set back from the fault (generally 50 feet).

A portion of a map showing Earthquake Fault Zone (shaded) and traces of the Hayward Fault that were active in 1868 and where fault creep (c) occurs.

What is an Earthquake Fault Zone?

Earthquake Fault Zones (EFZs) are regulatory zones around active faults. The zones are defined by turning points connected by straight lines. Most of the turning points are identified by roads, drainages, and other features on the ground. EFZs are plotted on topographic maps at a scale of 1 inch equals 2,000 feet. The zones vary in width, but average about one-quarter mile wide.

What is a fault?

A fault is a fracture in the crust of the earth along which rocks on one side have moved relative to those on the other side. Most faults are a result of repeated displacements. A fault trace is the line on the earth's surface defining the fault. For the purpo
is one that has ruptured in the las
11,000 years.

What is "surface rupture" in an earthquake?

Surface rupture occurs when movement on a fault deep within the earth breaks through to the surface. Surface ruptures associated with the 1992 Landers earthquake, in San Bernardino County, extended for 50 miles with displacements from a fraction of an inch to 20 feet. Not all earthquakes result in surface rupture. The Loma Prieta earthquake of 1989 caused major shaking in the San Francisco Bay Area but the movement deep in the earth did not break through the surface.

* Earthquake Fault Zones were called Special Studies Zones prior to January 1, 1994.

Fault rupture almost always follows preexisting faults, which are zones of weakness. Rupture may occur suddenly during an earthquake or slowly in the form of fault creep. Sudden displacements are more damaging to structures because they are accompanied by shaking.

Fault creep is the slow rupture of the earth's crust. Examples of creep are well known along the Hayward Fault where it crosses highly developed areas in Contra Costa and Alameda counties. Although the Hayward Fault ruptured suddenly in the 1868 earthquake, it also exhibits slow surface creep which offsets and deforms curbs, streets, buildings and other structures that lie on top of the fault.

How can I tell if a property is in an Earthquake Fault Zone?

EFZ maps can be studied at local planning departments or at the DMG offices listed on the back of this brochure. These maps show most streets, drainages, and other features. Local government may have already transferred Earthquake Fault Zone boundaries to parcel maps, so the relationship of the zone to each parcel can easily be determined.

Does the law require that all real estate within an Earthquake Fault Zone be disclosed as such before it is sold?

The fact that a property is located in an Earthquake Fault Zone must be disclosed to a potential buyer before the sales process is complete. The real estate agent is legally bound to present this information to the buyer. When no realtor is involved, the seller must inform the buyer directly. This is usually done at the time an offer is made or accepted.

Effective June 1, 1998, the Natural Hazards Disclosure Act requires that sellers of real property and their agents provide prospective buyers with a "Natural Hazard Disclosure Statement" when the property being sold lies within one or more state-mapped hazard areas, including Earthquake Fault Zones. Additional information on Earthquake Fault Zones and disclosure can be found at the DMG website: www.consrv.ca.gov/dmg/rghm/disclose.htm

What does an Earthquake Fault Zone mean to me?

It means an active fault is present near or within the land parcel and may pose a risk of surface fault rupture to existing or future structures.

If the property is not developed, a fault study may be required before the parcel can be subdivided or structures permitted. See the definition of "proje

under "How does the law work?" Check with your local permitting agency for specific requirements.

If property is developed, you will not need a geologic study unless you plan to extensively add onto or remodel an existing structure. See the definition of a project above and check with your local permitting agency.

You can learn more about the potential fault rupture hazard by:

- Asking the property owner or real estate agent to see any geologic report prepared for the site.
- Checking the files of local government for consulting geologic reports for nearby sites. Also, most fault investigations required by the Alquist-Priolo Act are on file at the DMG office in San Francisco.
- Researching maps and data on active faults at technical libraries at DMG, U.S. Geological Survey, and universities.
- Hiring a consulting geologist to provide a preliminary assessment of the fault rupture hazard for a specific site (see the Yellow Pages).

Where can I go to get more information on Earthquake Fault Zones?

A detailed description of the Alquist-Priolo program, an index of Earthquake Fault Zone maps, and the Act and its regulations are presented in Special Publication 42, *Fault-Rupture Hazard Zones in California*. It can purchased at the DMG offices listed below for $5.00, including tax and postage.

For additional information, visit the DMG website at www.consrv.ca.gov/dmg/

How can I tell whether the map that I have is a Seismic Hazard Zone Map?

The following text appears on all Seismic Hazard Zone Maps for which real estate disclosure is required by California Public Resources Code Section 2694:

STATE OF CALIFORNIA
SEISMIC HAZARD ZONES

Delineated in compliance with Chapter 7.8. Division 2 of the California Public Resources Code (Seismic Hazards Mapping Act)

[NAME OF] QUADRANGLE
OFFICIAL MAP/REVISED OFFICIAL MAP

Effective: [Date]

[Signature of State Geologist releasing map]
STATE GEOLOGIST

California Is [redacted] Country

Most people in California live within 30 miles of an earthquake fault. More than 200 faults in California could produce a damaging earthquake.

Earthquake damage most often occurs in locations that we know about. The areas most likely to suffer damage include soils that are susceptible to liquefaction, steep slopes prone to landslides, and areas near faults. When these sites are identified, they can be avoided or structures can be designed to resist collapse and damage. Such measures could save tens of thousands of dollars per home when the next earthquake occurs.

Liquefaction

If a layer of sandy soil near the ground surface is saturated with water and shaken by an earthquake, the soil can flow like a liquid. If the ground fails above the liquefied zone, it can cause severe damage to structures, roads, and utilities. Seismic hazard zone maps published by the Department of Conservation show areas where site investigations are required because of the potential for liquefaction.

Landslides

Steep, unstable hill slopes may slide when an earthquake occurs and boulders may roll down slope. The seismic hazard zone maps published by the Department of Conservation show areas where site investigations are required because of the potential for landsliding.

Faults

Faults can cause the ground to break as they move during an earthquake. The Department of Conservation's Alquist-Priolo earthquake fault zone maps show surface traces of known active faults. Today it is illegal to build new structures for human occupancy over the surface trace of an active fault.

Department scientists also collect information about faults that do not break the surface but that can cause earthquakes. Although those faults are not shown on Alquist-Priolo maps, engineers use the information to design schools, hospitals and other important structures.

What Is Radon?

Radon is a naturally occurring, cancer-causing, radioactive gas.

It is produced by the normal decay of uranium, an element that is found in nearly all soils.

Impossible to detect without a test, radon gas is colorless, odorless, and tasteless.

Radon gas levels in California.

To date, surveys indicate that elevated radon levels can be found in any part of the state. The estimated number of California homes exceeding the recommended **U.S. Environmental Protection Agency's (EPA's)** action level of 4 picoCuries is roughly one percent, or approximately 100,000 homes. The **California Department of Health Services (DHS)**, along with the **U.S. Geological Survey (USGS)** and EPA, have identified several areas with a higher-than-statewide-average of homes with high radon levels. These areas include sections of Santa Barbara, Ventura and Los Angeles counties. Ongoing testing by DHS in these and other counties continues to identify areas of high radon potential.

In addition to geographic location, other factors can affect radon levels, such as house structure, soil/house pressures, climatic conditions, and soil permeability. If you are concerned about radon gas, DHS recommends testing. Testing is the **only** way to determine the radon level in your home.

What are the health risks of radon?

The U.S. Surgeon General has warned that radon is the second leading cause of lung cancer in the United States -- after smoking. A known human carcinogen, radon is estimated to cause approximately 1,100 lung cancer deaths per year in California. DHS and EPA believe that any radon exposure carries some risk -- no level of radon is safe.

How can radon affect you and your family?

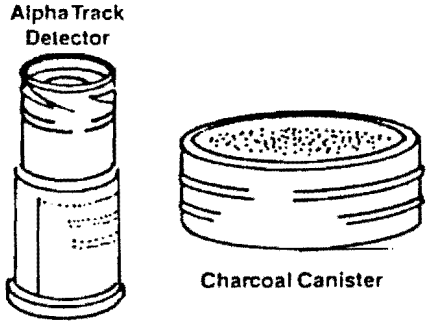
Everyone who breathes is at risk from radon. As radon decays, it changes into other radioactive elements. These elements can become trapped in the lungs as the radon decay process releases energy in the form of particles. Over the course of a lifetime, this process can damage lung tissue and increase the risk of lung cancer.

Your risk of developing lung cancer from radon gas depends on:

- How much radon is in the home.
- The amount of time spent at home.
- Whether you are a smoker (or if you have ever smoked – smoking combined with radon is an especially serious lung cancer risk).

How does radon enter the home?

Typically, radon gas moves up through the soil into your home through cracks in the foundation and walls, pores in hollow-block walls, and gaps in suspended floors and around service pipes.



Homes often draw in radon because of differences in pressure caused by a variety of factors. Your home can trap radon inside, where it can build up to elevated levels.

Radon can also be present in well water, which then is released into the air by showering or other water usage. In most cases, radon in water is a small risk compared to radon gas entering the home from the soil.

How is radon gas detected?

Since you can't see, smell, feel or taste radon gas, you need specialized equipment to test for it. The types of commercially available detectors that can be purchased by home owners are:

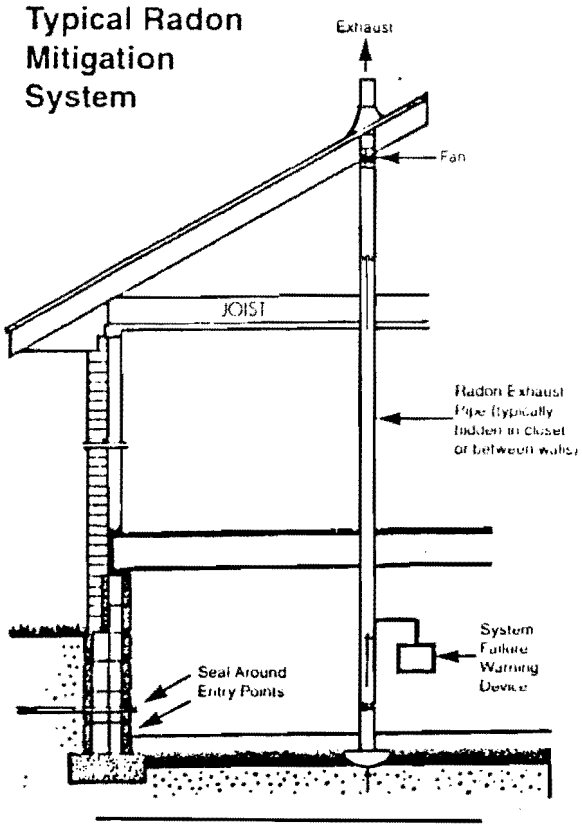
- Charcoal canister (or liquid scintillation device) designed for short-term screening (two to seven days).

- Filtered or unfiltered alpha track detector for longer-term measurement (generally three months to one year).

These detectors usually cost less than $20, which includes postage and the test report.

All types of detectors are acceptable, but since the amount of radon gas escaping from the ground varies from day-to-day and season-to-season, the longer-term test will give you a more representative assessment of your actual radon gas exposure.

Test kits are available in some hardware stores and home improvement centers. Whether using a short- or long-term test, use a device that is state-certified by DHS. A list of mail-order companies handling certified detectors is available from DHS. If you wish to hire a company to conduct testing for you, make sure it is also certified by DHS.



What do test results mean?

Radon gas is measured in picoCuries per liter (pCi/L). Average radon concentrations range from about 0.4 pCi/L outdoors to around 1.3 pCi/L indoors. If short-term tests register levels of 4 pCi/L or higher, DHS and EPA recommend testing with a long-term test (for a better understanding of your year-round average). If you need results right away, verify the first test with a second short-term test. If results are still above 4 pCi/L, you should correct the problem. Radon levels below 4 pCi/L still pose some risk, therefore you may wish to consider further reductions. The higher the radon level, the greater the risk of lung cancer.

What if the test results are high?

There are several methods of lowering radon levels in your home. Some techniques prevent radon from infiltrating, while others reduce the radon gas after it has already entered the home. Usually, DHS and EPA recommend those methods that **prevent** the entry of radon.

Lowering high radon levels requires technical knowledge and special skills; therefore a trained contractor should be used. DHS can provide a list of state-certified contractors. The cost of making repairs to reduce radon gas depends on a variety of factors, but for most homes such repairs will range from approximately $500 to $2,500.

Radon tests and contractors must be certified.

To ensure consumer protection, DHS regulates the radon service industry through a state certification program. Any company providing radon services to the public must be certified and provide its certification number to clients.

Also, California has a real estate disclosure law that requires the disclosure of known environmental hazards, including radon, by the seller to the buyer.❑

WHAT IS THE PROPER WAY TO DISPOSE OF ASBESTOS?

Cal-EPA is responsible for hazardous waste control. They define asbestos waste as having more than 1% asbestos and being friable. Call them for a ruling if you are disposing of asbestos containing material. Asbestos waste must be placed in landfill sites approved for hazardous waste. The California Water Resources Control Board licenses hazardous waste sites. The contractor will normally handle the transport and disposal of asbestos waste. The homeowner is the owner of the waste and if it is over a certain amount must sign an EPA form documenting the waste and where it will be deposited. The contractor will help obtain this form but you must sign it. Cal-EPA can give you advice on how to transport and dispose of small amounts of asbestos. They have special policies for homeowners with only small amounts of asbestos waste.

Any hazardous waste that is transported to a disposal site must be accompanied by a properly completed Uniform Hazardous Waste Manifest. To properly complete the manifest, the generator must obtain an EPA Identification number. Permanent ID numbers are issued to generators who routinely generate hazardous waste. Provisional ID numbers and emergency ID numbers are issued for one-time only situations and are valid for 90 days. A special provisional number is issued for asbestos containing wastes generated in the course of residential removals. For further information and to obtain an application, call the Department of Health Services (DHS) at (916) 324-1781.

Asbestos wastes must be contained and transported in one of the following ways:

1. In sealed, leak-tight, and non-returnable containers (e.g. plastic bags of 6mm thickness, cartons, drums, or cans) from which fibers cannot escape. Wastes within the container must be adequately wetted to prevent blowing of fibers in case the container is broken.

2. For bulk wastes that will not fit into containers without additional breaking, place wastes into sealed and leak-tight wrapping after wetting. If the wastes are to be placed directly in trailer or drop-boxes, the trailer or drop-box should be lined with plastic sheeting. The wastes should be wetted to prevent blowing of fibers in case the wrapping is broken. The wrapping should be sealed (e.g. with duct tape), and the trailer or drop-box should be covered with a tarp.

In California, asbestos wastes totaling more than 50 lbs., must be transported by a registered hazardous waste hauler to an approved treatment, storage, or disposal facility. Persons generating and transporting less than 50 lbs. of a hazardous waste to a permitted hazardous waste facility are exempt from this requirement and the requirements concerning possession of the manifest while transporting hazardous waste upon meeting all of the following conditions:

3. The hazardous wastes are transported in closed containers and packed in a manner that prevents the containers from tipping, spilling, or breaking during the transporting.

4. Different hazardous waste materials are not mixed within a container during the transporting.

5. The person transporting the hazardous waste is the producer of that hazardous waste, the person produces no more than 100 kg of hazardous waste in any month, and accumulates no more than 1000 kg at any one time.

Warning labels are required on each container or wrapping and should state:

DANGER

Contains Asbestos Fibers

Avoid Creating Dust
Cancer and Lung Disease Hazard

HAZARDOUS WASTE
