NOTICE OF EXTENSION

THE FINAL DAY OF THE COMMENT PERIOD FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) CASE NO. ENV-2016-2906 (SCH NO. 2016091010) HAS BEEN EXTENDED FROM SEPTEMBER 26, 2022 TO **OCTOBER 11, 2022**

NOTICE OF AVAILABILITY OF
DRAFT ENVIRONMENTAL IMPACT REPORT
Boyle Heights Community Plan Update
City EIR No. ENV-2016-2906-EIR
CPC -2016-2905-CPU
State Clearinghouse No. 2016091010

TO: Affected Agencies, Organizations and Other Interested Parties **DATE**: July 28, 2022

PROJECT NAME: Boyle Heights Community Plan Update (Proposed Plan)

COMMENT REVIEW PERIOD: July 28, 2022 to ~~September 26, 2022~~ **October 11, 2022**

PROJECT LOCATION:

The Boyle Heights Community Plan Area (CPA) is located immediately east of Downtown and the Los Angeles River and rail corridor and flanks the eastern boundary of the City of Los Angeles. Its boundaries are approximately defined by the San Bernardino Freeway/Interstate 10 (10 Freeway) and Marengo Street on the north, the Union Pacific and Santa Fe Railroad tracks on the south, Indiana Street on the east, and the Union Pacific and Santa Fe Railroad tracks and the Los Angeles River on the west. The southern and eastern borders of the CPA align with the city limits of Los Angeles; the City of Vernon is located to the south and the unincorporated community of East Los Angeles is located to the east of the CPA respectively, while the Los Angeles communities of Lincoln Heights and El

Sereno are located to the north, and the industrial districts of Downtown are located to the west. The CPA is approximately 6.67 square miles.

COUNCIL DISTRICT: 14 (De León)

PROJECT DESCRIPTION:

The Proposed Plan includes amending both the text of the Boyle Heights Community Plan and the General Plan Land Use Map of the Boyle Heights Community Plan. The Proposed Plan would also adopt several zoning ordinances to implement the updates to the Community Plan, including rezoning all parcels in the CPA to regulate specific uses and apply development standards (including height of structures, Floor Area Ratios, site configuration) using the New Zoning Code. Additional zoning ordinances include a Community Plan Implementation Overlay (CPIO) District. The Proposed Plan will accommodate forecasted housing, population, and employment growth in the CPA for the next 20 years. The Proposed Plan directs future growth to already urbanized areas of the CPA. The proposed changes largely follow the current pattern of land use development reflecting City policies to direct growth where it can be supported by existing transportation infrastructure. The Proposed Plan promotes a balance of housing units and jobs near transit where different types of land uses (e.g., commercial and residential) can be provided to reduce the length and number of vehicle trips.

The table below identifies the reasonably anticipated population, housing, and employment of the Proposed Plan and compares this to the 2016 Baseline, Existing Plan, and Southern California Association of Governments (SCAG) 2040 projections.

2040 REASONABLY ANTICIPATED DEVELOPMENT OF THE BOYLE HEIGHTS COMMUNITY PLAN

	2016 Baseline/a/	Existing Plan Reasonably Anticipated Development/b/	Proposed Plan Reasonably Anticipated Development/b/	SCAG 2040 Growth Forecast/c/
Housing	22,000	28,000	33,000	27,000
Population	86,000	98,000	115,000	93,000
Employment	26,000	32,000	39,000	35,000

/a/ 2016 Baseline – SCAG 2016-2020 RTP/SCS
/b/ LADCP - 2018
/c/ SCAG 2016-2020 RTP/SCS
Note: Numbers are rounded to the nearest thousand.

Project Objectives:

The primary objectives of the Proposed Plan are to:

- Accommodate projected population, housing, and employment growth and focus growth into Framework identified centers and corridors located near transit, through a diverse housing typologies and income levels to discourage the displacement of existing residents and communities;
- Reduce greenhouse gas emissions and promote enhanced multi-modal transportation opportunities for bicyclists, pedestrians and transit users. Reduce vehicle miles traveled to meet the requirements of Senate Bill 375, Senate Bill 743, and California Assembly Bill 32;
- Maintain existing affordable housing units and promote the creation of more affordable housing units for residents with incomes below the Area Median Income (AMI);
- Strengthen vibrant mixed-use areas near transit that encourage a strong jobs/housing balance and support increased ridership, and walkability; and
- Preserve community character and neighborhood identity by strengthening and maintaining traditional character of notable residential and commercial neighborhoods and preserving stable low density neighborhoods.
- Promote a mix of compatible land uses that foster sustainability, equity, and healthy living.
- Support sustainable urban design strategies that positively contribute to an urban tree canopy across the entire plan area, and supports publicly accessible open space as the area evolves.

Elements of the Proposed Plan to implement these objectives include the following:

- Amendments to the General Plan, consisting of the Boyle Heights Community Plan text and land use maps (including changes to the footnotes and map symbols);
- Code amendments to the LAMC to include relevant portions of the New Zoning Code (Municipal Code Chapter 1A) to implement the Boyle Heights Community Plan;
- Amendment of the Zoning Map to rezone the Boyle Heights CPA with zone classifications from the New Zoning Code;
- Adoption of the Boyle Heights Community Plan Implementation Overlay (Boyle Heights CPIO) District;
- Minor amendments to the Clean Up/Green Up (CUGU) Overlay and the Los Angeles River Improvement Overlay (RIO) to address consistency with the New Zoning Code;
- Amendments to the Adelante-Eastside Redevelopment Plan to clarify its relationship to the Boyle Heights Community Plan and its implementing provisions and ordinances;

- Amendments to the General Plan Framework, Circulation Map, Mobility Plan and other Citywide General Plan Elements, and ordinances, as necessary;
- Amendments to all other relevant ordinances and actions as necessary to ensure consistency of regulations and implementation of the Community Plan amendments.

ANTICIPATED SIGNIFICANT IMPACTS

Based on the analysis in the DEIR, the Proposed Plan would result in significant impacts (project and cumulative) in the following categories:

- Air Quality (**construction NOx, operational VOC, sensitive receptors**)
- Cultural Resources (**historical resources**, archeological resources)
- Geology and Soils (paleontological resources)
- Hazards and Hazardous Materials (transport, use or disposal; upset and accident conditions; hazardous materials within one-quarter mile of a school; be located on a hazardous materials site)
- Noise (**temporary noise increases during construction, construction vibration**)
- Recreation (**deterioration of neighborhood parks**)
- Transportation and Traffic (**off ramp queuing on State highway facilities**)
- Tribal Cultural Resources (adverse change in a tribal cultural resources)

Many of these impacts can be reduced to less than significant levels with the incorporation of mitigation measures identified in the DEIR. However, those impacts listed in **bold** were found to be significant and unavoidable even with mitigation incorporated or because no feasible mitigation was identified.

Government Code Section 65962.5 Notice: The Project area includes sites listed under Government Code Section 65952.5. These are described in Section 4.8 of the Draft EIR, Hazards, Existing Setting.

COMMENT PERIOD: **START DATE AND TIME: July 28, 2022, at 9:00 A.M.**

END DATE AND TIME: ~~September 26, 2022~~ October 11, 2022, at 5:00 P.M.

The Draft EIR and all documents referenced in the EIR are available for public review and a **75** ~~60~~-day comment period. At this time, there are no scheduled public hearings on the Proposed Plan. Future

hearings by the City Planning Commission and the City Council will be held before the Proposed Plan can be approved.

DOCUMENT AVAILABILITY

If you wish to review a copy of the Draft EIR or the documents referenced in the Draft EIR, you may do so at the City of Los Angeles Department of City Planning at 200 N. Spring Street Room 667, Los Angeles. Appointments must be made in advance by emailing boyleheightsplan@lacity.org or calling (213) 978-1304.

Copies are also available at the following library branches:

1) Los Angeles Central Library, 630 West 5th Street, Los Angeles, CA 90071

2) Robert Louis Stevenson Branch Library, 803 Spence Street, Los Angeles, CA 90023

3) Malabar Branch Library, 2801 Wabash Avenue, Los Angeles, CA 90033

For an electronic copy, the Draft EIR can be downloaded or reviewed at the Department of City Planning's website at: https://planning.lacity.org/development-services/eir.

The DEIR is available on the City of Los Angeles website at:

Project Website: https://planning.lacity.org/plans-policies/community-plan-update/boyle-heights-community-plan-update

Sitio Web del Proyecto: https://planning.lacity.org/plans-policies/community-plan-update/boyle-heights-community-plan-update-es

SUBMITTAL OF WRITTEN COMMENTS

If you wish to submit comments on the Draft EIR, please submit written comments (including a name, telephone number, and contact information and the following file number ENV-2016-2906-EIR) during the Comment Period, July 28, 2022, to ~~September 26, 2022~~ **October 11, 2022**, via mail or e-mail to the following addresses:

Mail:

City of Los Angeles Department of City Planning
ATTN: Ernesto Gonzalez
Case Numbers: CPC-2016-2905-CPU and ENV-2016-2906-EIR

DRAFT
ENVIRONMENTAL IMPACT REPORT

Boyle Heights Community Plan Update

Environmental Case: ENV-2016-2906-EIR
State Clearinghouse No.: 2016091010

Project Location: The Boyle Heights Community Plan Area (CPA) is located immediately east of Downtown and the Los Angeles River and rail corridor and flanks the eastern boundary of the City of Los Angeles. Its boundaries are approximately defined by the San Bernardino Freeway/Interstate 10 (10 Freeway) and Marengo Street on the north, the Union Pacific and Santa Fe Railroad tracks on the south, Indiana Street on the east, and the Union Pacific and Santa Fe Railroad tracks and the Los Angeles River on the west. The southern and eastern borders of the CPA align with the city limits of Los Angeles; the City of Vernon is located to the south and the unincorporated community of East Los Angeles is located to the east of the CPA respectively, while the Los Angeles communities of Lincoln Heights and El Sereno are located to the north, and the industrial districts of Downtown are located to the west. The CPA is approximately 6.67 square miles.

Council District: 14 (De León)

Project Description: The Proposed Plan includes amending both the text of the Boyle Heights Community Plan and the General Plan Land Use Map of the Boyle Heights Community Plan. The Proposed Plan would also adopt several zoning ordinances to implement the updates to the Community Plan, including rezoning all parcels in the CPA to regulate specific uses and apply development standards (including height of structures, Floor Area Ratios, site configuration) using the New Zoning Code. Additional zoning ordinances include a Community Plan Implementation Overlay (CPIO) District. The Proposed Plan will accommodate forecasted housing, population, and employment growth in the CPA for the next 20 years. The Proposed Plan directs future growth to already urbanized areas of the CPA. The proposed changes largely follow the current pattern of land use development reflecting City policies to direct growth where it can be supported by existing transportation infrastructure. The Proposed Plan promotes a balance of housing units and jobs near transit where different types of land uses (e.g., commercial and residential) can be provided to reduce the length and number of vehicle trips.

1.0 INTRODUCTION

This chapter provides a brief introduction to the Boyle Heights Community Plan Update (referred to as the 'Proposed Plan'), an overview of the purpose and focus of the Draft Environmental Impact Report ('Draft EIR' or 'DEIR'), a discussion of the intended use of the Draft EIR, a description of the organization of the Draft EIR, and a discussion of the public review process and potential areas of controversy.

1.1 PROPOSED PLAN

This Draft EIR analyzes the potential environmental effects of the Proposed Plan. The Proposed Plan involves a long-term planning effort, including implementing the New Zoning Code (Chapter 1A), in the Boyle Heights Community Plan Area (CPA), as described below.

1. **Boyle Heights Community Plan Update (Proposed Plan).** There are 35 community plans plus two district plans that make up the Land Use Element of the City of Los Angeles's (City) General Plan. The Update to the Boyle Heights Community Plan is the principal component of the Proposed Plan. A Community Plan Update requires: (i) amending the text of the community plan, including the goals, policies, and programs; (ii) amending the designations on the community plan land use maps, which express a range of development intensities, distribution of land uses, and provide zoning consistency tables; (iii) adopting implementing zoning ordinances, including adopting zone changes to amend the Zoning Map; and (iv) any other necessary and related actions to implement the community plan amendments, including adopting amendments to other elements of the City's General Plan (e.g., the Framework or Mobility Elements) to ensure consistency, or adopting other land use related ordinances (such as amendments to housing regulations). The component of the Proposed Plan to update the Boyle Heights Community Plan, including adopting changes to re-designate property in the Boyle Heights CPA utilizing the zone classifications in the New Zoning Code, as discussed below, as well as the other required actions to update the community plan, is referred to in this EIR as the 'Boyle Heights Community Plan Update' or 'Proposed Plan.' The property regulated by the Boyle Heights Community Plan is the project area for this EIR and is referred to collectively in this EIR as "Community Plan Area" or "CPA."

2. **Implementing the Zoning Code in the Boyle Heights Community Plan Area**. As discussed above, the Proposed Plan implements the New Zoning Code in the CPA. The New Zoning Code is a citywide program (the re:code LA program[1]) to comprehensively update the City's zoning ordinances through amendments to the Los Angeles Municipal Code (LAMC). The LAMC amendments will add a new

[1] City of Los Angeles Planning Department, New Code. URL: https://planning.lacity.org/zoning/new-code Accessed: October 2021.

Chapter 1A to the LAMC, which will establish a new zoning code for the City; this action is not part of the Boyle Heights Proposed Plan or analyzed in this EIR. The existing Zoning Code is found in Chapter 1 of the LAMC. Adoption of the full text of the New Zoning Code is expected to occur over multiple future community plan updates and code amendments and is beyond the scope of the Proposed Plan. Implementation of the New Zoning Code is expected to occur through the community plan update process or through other planning and zoning efforts to re-designate land utilizing the zoning designations from the new Chapter 1A.

As part of the Proposed Plan, the City intends to adopt new zones and zoning regulations from Chapter 1A that implement the New Zoning Code within the Boyle Heights CPA. The Proposed Plan will adopt amendments to Chapter 1A that include at a minimum the new zoning modules[2] to be used in the Boyle Heights CPA, including substantive requirements for those zoning modules. The component of the Proposed Plan to adopt or amend the new Chapter 1A to the LAMC in the Boyle Heights CPA is referred to in this EIR as the "New Zoning Code."

A detailed description of the components of the Proposed Plan is provided in **Chapter 3.0, Project Description**

1.2 PURPOSE OF THE ENVIRONMENTAL IMPACT REPORT

The purpose of this EIR is to assess the environmental effects of implementing the Proposed Plan, as described above. All projects within the State of California are required to undergo an environmental review to determine the environmental impacts associated with implementation of the project in accordance with CEQA. CEQA was enacted in 1970 by the California legislature to disclose to decision makers and the public, the significant environmental effects of proposed activities, as well as ways to avoid or reduce the environmental effects by requiring implementation of feasible alternatives or mitigation measures. CEQA applies to all California governmental agencies at all levels, including local agencies, regional agencies, state agencies, boards, commissions, and special districts.

The EIR is ultimately intended as an informational document and by itself does not determine whether the Proposed Plan will be approved. The EIR aids in the decision-making process by disclosing the potential significant and adverse impacts. In conformance with CEQA, California Public Resources Code, Section

---

2 For clarity, throughout this document, "zoning modules" refer to the proposed zoning structure that consists of five key parts or districts: 1. Form District (determine how large buildings can be); 2. Frontage Districts (influence how buildings appear from the street); 3. Development Standards Districts (regulate certain design elements around the building, including those relating to access, parking, and signs); 4. Use Districts (determine what kinds of activities are allowed on a property—ranging from residential to commercial or a mix of uses); and 5. Density Districts (determine the number of housing units or guest rooms permitted).

21000, this EIR provides objective information addressing the environmental consequences of the Proposed Plan and identifies the means of reducing or avoiding its significant impacts where feasible.

The *CEQA Guidelines* help define the role and expectations of this EIR as follows:

- **Information Document**. An EIR is an informational document that will inform decision-makers as well as members of the public of the significant environmental effects of a project, identify feasible ways to minimize or avoid these effects, and describe a set of reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information contained in the administrative record (Section 15121(a)).

- **Degree of Specificity**. An EIR on an individual development project will be more detailed in the specific effects of the project than will an EIR on the adoption of a community plan or zoning ordinance because the effects of the individual development can be predicted with greater accuracy. An EIR on a project such as the adoption of a community plan and/or zoning ordinance should focus on the secondary effects that can be expected to follow from the adoption but need not be as detailed as the analysis on the specific construction project that might follow (Section 15146).

- **Standards of Adequacy**. An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information that enables them to make a decision that intelligently takes account of environmental consequences. An evaluation of the environmental effects of a Proposed Plan need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure (Section 15151).

The *CEQA Guidelines*, Section 15382, defines a significant effect on the environment as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant."

1.3 LEAD, RESPONSIBLE, AND TRUSTEE AGENCY

The lead agency for the Proposed Plan is the City of Los Angeles. The Department of City Planning is responsible for preparing the EIR for the review and consideration of the City Council, as the final decision-maker for the Proposed Plan. The address for the Department of City Planning is the following:

City of Los Angeles
Department of City Planning
200 North Spring Street, Room 667
Los Angeles, California 90012

The determination that the City of Los Angeles is the "lead agency" is made in accordance with *CEQA Guidelines* sections 15051 and 15367, which define the lead agency as the public agency that has the principal responsibility for carrying out or approving a project. This Draft EIR reflects the independent judgment of the City regarding the potential environmental impacts and the level of significance of the impacts both before and after the mitigation measures proposed to reduce the impacts.

Responsible agencies are other agencies responsible for carrying out/implementing a specific component of the proposed project or for approving a project that implements the goals and policies of a general plan. Section 15381 of the *CEQA Guidelines* defines a "responsible agency" as: "A public agency which proposes to carry out or approve a project, for which a lead agency is preparing or has prepared an EIR or Negative Declaration. For purposes of CEQA, responsible agencies include all public agencies other than the lead agency that have discretionary approval authority over the project."

There are no responsible agencies for the Proposed Plan. However, several other agencies may have approval authority over individual developments that could be facilitated by the Boyle Heights Community Plan. These agencies include, but are not limited to, California Department of Transportation, California Department of Fish and Wildlife (CDFW), the South Coast Air Quality Management District, and the Los Angeles Regional Water Quality Control Board.

Trustee agencies have jurisdiction over certain resources held in trust for the people of California, but do not have legal authority to approve or carry out the project. *CEQA Guidelines* Section 15386 designates four agencies as trustee agencies: CDFW with regards to fish and wildlife, native plants designated as rare or endangered, game refuges, and ecological reserves; the State Lands Commission with regard to state owned "sovereign" lands, such as the beds of navigable waters and state school lands; the California Department of Parks and Recreation with regard to units of the state park system; and, the University of California with regard to sites within the Natural Land and Water Reserves System. There are no trustee agencies for the Proposed Plan.

1.4 AUTHORIZATION AND FOCUS

The City determined that an EIR is needed to evaluate potentially significant effects that could result from the implementation of the Proposed Plan. An Initial Study was not prepared for the Proposed Plan since it was determined from the outset that an EIR would be required (*CEQA Guidelines* Section 15060(d)).

The City is required to consider the information in the Draft EIR, along with any other relevant information, in making its decision on the Proposed Plan. Although the Draft EIR does not determine the ultimate decision that will be made regarding implementation of the project, CEQA requires the City to consider the information in the Draft EIR and make findings regarding each significant effect in the Draft EIR. Once certified, the Final EIR will serve as the environmental document for the Proposed Plan and will be used as a basis for decisions related to future development in the CPA. Other agencies may also use the certified Final EIR in their review and approval process.

1.5 TYPE OF ENVIRONMENTAL REVIEW

The Boyle Heights Community Plan will guide development for the CPA through 2040. This EIR considers broad community plan level issues and evaluates the effects of the Boyle Heights Community Plan as well as the effects of implementation of portions of the New Zoning Code (Chapter 1A) within the Boyle Heights CPA. This EIR addresses environmental impacts from the Proposed Plan to the level that can be assessed without undue speculation, considering the scope of the Proposed Plan components.

Consistent with the requirements of CEQA, the EIR compares the reasonably anticipated development from the Proposed Plan against the existing environment and not to the existing plans and regulations. The No Project Alternative considers the effects of the existing community plans and zoning ordinances relative to the impacts of the Proposed Plan.

Future Use of the EIR and Subsequent Projects

Approval of the Proposed Plan does not constitute a commitment to any specific development project. It is contemplated that future site-specific approvals in the CPA may be evaluated with consideration of the EIR under CEQA rules for subsequent approvals, where applicable, including but not limited to the following:

- **Program EIR/Subsequent Approvals** (*CEQA Guidelines* Section 15168.) Projects within the scope of a Program EIR are eligible for streamlined review. For purposes of identifying projects within the scope of the Program EIR, subsequent approvals that were analyzed in this EIR would be any residential, commercial, industrial, open space or public facility development consistent with the allowed use, intensity, density, development, and design standards of the Proposed Plan.

- **Addendums** (*CEQA Guidelines* Sections 15162 and 15164). Addendums may be used when a subsequent approval is consistent with the Proposed Plan and no major revisions to the EIR are required based on a change to the Proposed Plan, a change in circumstances, or new information, as a result of a new significant impact or an identified significant impact being more severe.

- **Tiering** (Public Resources Code Section 21094 and *CEQA Guidelines* Section 15152). Tiering refers to using the analysis of general matters contained in a broader EIR with later EIRs and negative declarations on narrower projects; incorporating by reference the general discussion from the broader EIR; and concentrating the later EIR or negative declaration solely on the issues specific to the later project.

- **Projects Consistent with a Community Plan, General Plan, or Zoning** (*CEQA Guidelines* Section 15183). Streamlined environmental review is available for a project consistent with community plan adopted with an EIR (Public Resources Code Section 21083).

- **Streamlining for Infill Projects** (SB 226; PRC Section 21094.5; *CEQA Guidelines* Section 15183.3). Eligible infill projects may qualify for streamlined environmental review at the project level where the effects of infill development have been addressed in a planning level decision or by uniformly applicable development policies.

- **Transit Priority Projects** (SB 375; PRC Section 21155-21155.2). Transit Priority Projects consistent with the SCAG RTP/SCS near transit that have imposed all or all applicable mitigation measures from a prior EIR may be exempt from CEQA or be subject to streamlined review.

1.6 ENVIRONMENTAL REVIEW PROCESS

The environmental review process, as required under CEQA, is summarized below. The steps are presented in sequential order.

1. **Notice of Preparation (NOP) Distributed**. Immediately after deciding that an EIR is required, the lead agency files an NOP soliciting input on the EIR scope to "responsible," "trustee," and involved federal agencies; to the State Clearinghouse, if one or more state agencies is a responsible or trustee agency; and to parties previously requesting notice in writing. A scoping meeting to solicit public input on the issues to be assessed in the EIR, while not always required, may be conducted by the lead agency.

2. **Draft Environmental Impact Report (Draft EIR) Prepared**. Following the distribution of the NOP and the scoping meeting, a Draft EIR is prepared. The Draft EIR must contain a (1) table of contents or index, (2) summary, (3) project description, (4) environmental setting, (5) environmental impacts (direct, indirect, cumulative, growth-inducing, and unavoidable impacts), (6) alternatives, (7) mitigation measures, (8) irreversible changes, and (9) organizations and persons consulted.

3. **Public Notice and Review**. The lead agency must prepare a Notice of Availability (NOA) of an EIR. The Notice must be placed in the County Clerk's office for 30 days (Public Resources Code Section

21092.3) and sent to anyone requesting it. Additionally, public notice of Draft EIR availability must be given through at least one of the following procedures: (1) publication in a newspaper of general circulation, (2) posting on and off the project site, and (3) direct mailing to owners and occupants of contiguous properties. The lead agency must consult with and request comments on the Draft EIR from responsible and trustee agencies, and adjacent cities and counties. The minimum public review period for a Draft EIR is 30 days. When a Draft EIR is sent to the State Clearinghouse for review, the public review period must be 45 days, unless a shorter period is approved by the State Clearinghouse (Public Resources Code 21091). Distribution of the Draft EIR may be required through the State Clearinghouse.

4. **Notice of Completion.** The lead agency must file a Notice of Completion (NOC) with the State Clearinghouse as soon as it completes a Draft EIR.

5. **Final EIR.** A Final EIR must include (1) the Draft EIR or a revision thereof, (2) copies of comments received during public review, (3) list of persons and entities commenting, and (4) responses to comments.

6. **Certification of Final EIR.** Prior to approving a project, the lead agency shall certify that (1) the Final EIR has been completed in compliance with CEQA, (2) the Final EIR was presented to the decision-making body of the lead agency, and (3) the decision-making body reviewed and considered the information in the Final EIR.

7. **Lead Agency Project Decision.** The lead agency may (1) disapprove a project because of its significant environmental effects; (2) require changes to a project to reduce or avoid significant environmental effects; or (3) approve a project despite its significant environmental effects, if the proper findings and statement of overriding considerations are adopted.

8. **Findings/Statement of Overriding Considerations.** For each significant impact of the project identified in the EIR, the lead or responsible agency must find, based on substantial evidence, that either (1) the project has been changed to avoid or substantially reduce the magnitude of the impact; (2) changes to the project are within another agency's jurisdiction and such changes have or should be adopted; or (3) specific economic, social, or other considerations make the mitigation measures or project alternatives infeasible. If an agency approves a project with unavoidable significant environmental effects, it must prepare a written Statement of Overriding Considerations that sets forth the specific social, economic, or other reasons supporting the agency's decision.

9. **Mitigation Monitoring and Reporting Program.** When an agency makes findings on significant effects identified in the EIR, it must adopt a reporting or monitoring program for mitigation measures that were adopted or made conditions of project approval to mitigate significant effects.

10. **Notice of Determination.** An agency must file a Notice of Determination (NOD) after deciding to approve a project for which an EIR is prepared. A local agency must file the Notice with the County Clerk. The Notice must be posted for 30 days and sent to anyone previously requesting notice. Posting of the Notice starts a 30-day statute of limitations on CEQA challenges.

Notice of Preparation

In compliance with CEQA, the City of Los Angeles completed a multi-step process to determine the appropriate scope of issues to be examined in this Draft EIR. Pursuant to *CEQA Guidelines* Section 15082, a NOP was prepared by the City and distributed on September 2, 2016, to the State Clearinghouse in the Office of Planning and Research, notifying the general public, responsible and trustee agencies, as well as interested parties that an EIR will be prepared for the Proposed Plan. The NOP was circulated for a 35-day review period that began on September 2, 2016 and ended on October 7, 2016. A Scoping Meeting was held on September 13, 2016. Written comments were received from agencies and from interested parties during the review period. Refer to **Appendix A, NOP and Responses,** to this EIR for a copy of the NOP and comments submitted to the City in response to the NOP. The NOP was available for review on the City's website. The City received a total of 46 written and 14 verbal comments to the NOP. Information, data, and observations addressing comments from these comments are included throughout this Draft EIR where relevant.

Public Participation in Review of Draft EIR

CEQA encourages public participation in the planning and environmental review process. The City will provide opportunities for the public to present comments and concerns regarding the CEQA processes. The public is invited to provide comments and concerns regarding the accuracy of the Draft EIR and the CEQA process. Community members are encouraged to participate in the environmental review process, request to be notified of meetings and release of documents, monitor newspapers for formal announcements, and submit substantive comments at every possible opportunity afforded by the lead agency. The environmental review process provides various opportunities for the public to participate through scoping, public review of CEQA documents, and public hearings.

The public is invited to provide comments and concerns regarding the accuracy of this Draft EIR and the CEQA process. The 60-day comment period will begin on July 28, 2022, and end on September 26, 2022. The Draft EIR will be circulated for review and comment by the public and other interested parties, agencies, and organizations for 60 calendar days. The Draft EIR is available on the City of Los Angeles Department of City Planning website at: Published Documents | Los Angeles City Planning (lacity.org).

Written comments may be submitted via:

1. **Mail:**

   City of Los Angeles Department of City Planning
   Attn: Ernesto Gonzalez
   Case Numbers: CPC 2016-2905-CPU and ENV-2016-2906-EIR
   200 N. Spring Street, Room 667
   Los Angeles, CA 90012

2. **E-mail:** boyleheightsplan@lacity.org

Pursuant to *CEQA Guidelines* Section 15088, the City will prepare written responses to any comments that raise significant environmental issues received during the noticed comment period and include those responses in the Final EIR. The public will also be provided opportunities to present oral and written comments at future hearings and meetings on the Proposed Plan to City Planning Commission and the City Council. The City may but is not required to provide written responses to comments submitted after the circulation period for the Draft EIR.

1.7 AREAS OF CONTROVERSY / ISSUES TO BE RESOLVED

Potential areas of controversy and issues to be resolved by the City's decision-makers may include those environmental issue areas where the potential for an unavoidable and significant impact has been identified. Based on the NOP comment letters (provided in **Appendix A, NOP and Responses,** of this Draft EIR), issues known to be of concern in the community and therefore, potential areas of controversy, include: green space, housing access and affordability, heavy freight traffic, hazardous materials, land use incompatibilities, historic preservation, and development adjacent to the LA River.

1.8 FINAL EIR AND EIR CERTIFICATION

Following the close of the public review period on the Draft EIR, the City will prepare and publish a Final EIR, which will contain a summary of all written and recorded oral comments on this EIR received during the public review period for the Draft EIR and written responses to those comments that raise environmental concerns, along with copies of the letters received, and any necessary revisions to the EIR. The Draft EIR, comments on the EIR and a list of persons, organizations, and public agencies that commented on the Draft EIR, response to comments, and any revisions to the Draft EIR will constitute the Final EIR. The Final EIR will be available for public review prior to consideration of certification of the document by the decision-makers. The City Council, in an advertised public meeting(s), will consider the documents and then, if found adequate, certify the Final EIR as completed in compliance with CEQA and the *CEQA Guidelines*.

1.9 ORGANIZATION OF THE EIR

The EIR is organized into the following chapters so the reader can easily obtain information about the Proposed Plan and its specific issues:

- **Chapter 1.0, Introduction**: This chapter contains an overview of the purpose and focus of the Draft EIR, a discussion of the intended use of this Draft EIR, a description of the organization of the Draft EIR, and a discussion of the public review process and potential areas of controversy.

- **Chapter 2.0, Executive Summary**: This section provides a summary of the Proposed Plan's potential environmental impacts that would result from implementation of the Proposed Plan, proposed mitigation measures where applicable, and the level of significance of the impact before and after mitigation.

- **Chapter 3.0, Project Description**: This chapter describes the Proposed Plan, including project location, project background, project objectives and components, and a description of the proposed changes to existing plans and zoning under the project.

- **Chapter 4.0, Environmental Impact Analysis**: This chapter is the primary focus of this Draft EIR. Each environmental issue is considered in a separate section, which contains a discussion of the environmental settings, the regulatory setting, the methodology and the thresholds of significance. Each section also includes the analyses of environmental impacts of the project, mitigation measures, conclusions regarding the level of significance after mitigation, and cumulative impacts for each of the following environmental topics and environmental issues:

  - **Section 4.1, Aesthetics:** Potential conflicts with applicable zoning and other regulations governing scenic quality, changes to views, scenic resources, and visual quality

  - **Section 4.2, Air Quality:** Changes in pollutants affecting air quality

  - **Section 4.3, Biological Resources:** Impacts on any sensitive wildlife habitats or special species

  - **Section 4.4, Cultural Resources:** Changes to historic resources and impacts to archaeological or paleontological resource and human remains

  - **Section 4.5, Energy:** Wasteful or inefficient use of energy resources

  - **Section 4.6, Geology and Soils:** Risk from geologic and seismic hazards

- **Section 4.7, Greenhouse Gas Emissions:** Changes to greenhouse gas emissions and conformance to applicable greenhouse has plans, policy, and regulations
- **Section 4.8, Hazards and Hazardous Materials:** Changes in the risk of exposure to hazardous materials, or proximity to wildland fire hazards
- **Section 4.9, Hydrology and Water Quality:** Changes in water quality, drainage patterns and the amount of stormwater runoff
- **Section 4.10, Land Use and Planning:** Impacts due to a conflict with any land use plan, policy, or regulation
- **Section 4.11, Noise and Vibration:** Changes in noise and vibration levels due to construction, traffic, and proposed uses
- **Section 4.12, Population and Housing:** Impacts related to unplanned population growth and the displacement of people or housing
- **Section 4.13, Public Services and Recreation:** Impacts related to the construction of new or expanded public facilities (i.e., fire protection and schools), and impacts related to the construction, expansion, or deterioration of recreational facilities.
- **Section 4.14, Transportation and Traffic:** Changes in transportation conditions and vehicles miles travelled, review of emergency access, potential hazardous design features, and potential conflict with alternative transportation (e.g., bicycles and public transportation)
- **Section 4.15, Tribal Cultural Resources:** Impacts to cultural resources potentially related to one of more Native American tribes
- **Section 4.16, Utilities and Service Systems:** Impacts related to the increased need for utilities and infrastructure improvements and the construction of new or expanded facilities

- **Chapter 5.0, Alternatives:** This chapter provides analysis of a range of reasonable alternatives to the Proposed Plan in accordance with *CEQA Guidelines* Section 15126(f). The range of alternatives considered is based on their ability to feasibly attain most of the project objectives and avoid or substantially lessen any of the significant effects of the Proposed Plan:
  - **Alternative 1:** Low Transit Oriented Development Potential
  - **Alternative 2:** High Transit Oriented Development Potential

- **Alternative 3:** Land Use Mix Alternative
- **Alternative 4:** No Project

- **Chapter 6.0, Other CEQA Considerations:** This chapter provides a summary of significant and unavoidable impacts of the Proposed Plan and a discussion of potential growth inducing effects of the Proposed Plan.

- **Chapter 7.0, Effects Not Found to be Significant:** This chapter summarizes those impact categories that were determined to be less than significant and did not need further analysis in the EIR.

- **Chapter 8.0, List of Preparers**: This chapter lists the individuals involved in preparing the EIR and organizations and persons consulted.

1.10 CEQA FINDINGS FOR PROJECT APPROVAL

Where a certified EIR identifies significant environmental effects, *CEQA Guidelines* Sections 15091 and 15092 require the adoption of findings prior to approval of a project. Prior to approval of a project, one of three findings must be made, as required by PRC Section 21081 and *CEQA Guidelines* Section 15091:

- Changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect as identified in the Final EIR.

- Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

- Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

If the City approves the Proposed Plan, despite significant impacts identified in the Final EIR that cannot be feasibly mitigated, the City must state in writing the reasons for its actions, under *CEQA Guidelines* Section 15093. Those findings, called a Statement of Overriding Considerations, must be prepared to substantiate the City's decision to accept the unavoidable significant environmental effects of the Proposed Plan when balanced against the benefits afforded by the Proposed Plan, and must be supported by substantial evidence in the record.

1.11 MITIGATION MONITORING OR REPORTING PROGRAM

At the time of project approval, CEQA and the *CEQA Guidelines* require lead agencies to adopt a mitigation monitoring or reporting program for monitoring the revisions it has required in the project and the measures it has imposed to mitigate or avoid significant effects on the environment (*CEQA Guidelines* Section 21081.6; *CEQA Guidelines* Section 15097). This Draft EIR contains mitigation measures that if found feasible will be included in the Mitigation Monitoring or Reporting Program for the Proposed Plan.

2.0 EXECUTIVE SUMMARY

In accordance with Section 15123 of the *California Environmental Quality Act (CEQA) Guidelines*,[1] this section of the Environmental Impact Report (EIR) provides an overview of the proposed updates to the City of Los Angeles' Boyle Heights Community Plan (Boyle Heights Community Plan or Proposed Plan), its potential environmental impacts and mitigation measures, and a summary of the alternatives to the proposed project evaluated in this EIR. The summary is also required to identify areas of controversy known to the Lead Agency, including issues raised by agencies and the public, and issues to be resolved.

2.1 SUMMARY OF THE PROPOSED PROJECT

Lead Agency Name and Address

City of Los Angeles
Department of City Planning
200 North Spring Street, Room 667
Los Angeles, CA 90012

Lead Agency Contact Person

Ernesto Gonzalez, Planning Assistant
Email: boyleheightsplan@lacity.org
Los Angeles City Planning
200 N. Spring Street, Room 667
Los Angeles, CA 90012

2.1.1 Project Location

The Boyle Heights Community Plan Area (CPA) is bordered by the Central City North CPA to the west and the Northeast Los Angeles CPA to the north. Major east-west corridors include (from north to south) Marengo Street, Wabash Avenue, Cesar E Chavez Avenue, 1st Street, 4th Street, Whittier Boulevard, and Olympic Boulevard. Major north-south corridors include (from west to east) Mission Road, Soto Street, Lorena Street, and Indiana Street.

Four freeways traverse the Boyle Heights CPA, with the San Bernardino Freeway (I-10 Freeway) and Hollywood Freeway (US 101) traversing through the northern portion of the Boyle Heights CPA and Interstate 5 (I-5) and the Pomona Freeway (SR-60) traversing through the southern portion of the CPA. All four freeways converge over much of the western portion of the Boyle Heights CPA to form the East Los

1 *State CEQA Guidelines*, Section 15123.

Angeles Interchange. The location of the CPA is shown in **Figure 3.0-1, Regional Location,** in **Chapter 3.0, Project Description**.

The Boyle Heights CPA is located immediately east of Downtown Los Angeles and the Los Angeles River and rail corridor and encompasses an area of approximately 4,271 acres (approximately 6.67 square miles). The Boyle Heights CPA is roughly bounded by the San Bernardino Freeway (I-10 Freeway) and Marengo Street to the north, the Union Pacific and Santa Fe Railroad lines to the south, Indiana Street to the east, and the rail lines adjacent to the Los Angeles River to the west. The southern and eastern borders of the CPA align with the city limits of Los Angeles with the City of Vernon located to the south and the unincorporated community of East Los Angeles located to the east of the CPA, with a small area of the southeast corner of the CPA aligning with the City of Commerce. Located to the north are the Los Angeles communities of Lincoln Heights, El Sereno, and Ramona Gardens, and located to the west are the industrial districts and public facilities of Downtown, including the Arts District and Little Tokyo.

Topography in the Boyle Heights CPA includes mild variations with lower elevations along the Los Angeles River alluvial plain which then builds up to a system of bluffs that form the western edge of the plateau that constitutes most of the land area in the CPA. Other topographical features include several minor hills located in the northeast corner of the CPA and a ravine located to the west of Lorena Street.

The Los Angeles River is an important ecological feature located adjacent to the western edge of the Boyle Heights CPA. The Los Angeles River was once a free-flowing waterway but was encased in concrete in the 1930s as part of a flood control project undertaken by the U.S. Army Corps of Engineers. Efforts being led by the Army Corps of Engineer and the City of Los Angeles are now underway to restore some of the river's natural qualities over the coming decades. The Los Angeles River is separated from the CPA by an active rail line.

As of 2016, Boyle Heights has a residential population of approximately 86,000 and a population of approximately 13,000 people per square mile making it one of the most densely populated communities in Los Angeles.

2.1.2 Project Description

This EIR has been prepared to examine the potential environmental effects of the Proposed Plan. The following is a summary of the full project description, which can be found in **Chapter 3.0, Project Description**.

Boyle Heights Community Plan Update

The Proposed Plan includes amending both the text of the Boyle Heights Community Plan and the General Plan Land Use Map of the Boyle Heights Community Plan. The Proposed Plan would also adopt several zoning ordinances to implement the updates to the Community Plan, including rezoning all parcels in the Community Plan Area (CPA) to regulate specific uses and apply development standards (including height of structures, Floor Area Ratios, site configuration) using the New Zoning Code. Additional zoning ordinances include a Community Plan Implementation Overlay (CPIO) District. See **Chapter 3.0, Section 3.9, Discretionary Actions and Approvals,** for a list of all approvals that are part of the Proposed Plan.

The amendments to the community plan text and the General Plan Land Use Map for the Boyle Heights Community Plan are intended to guide development through the year 2040 by establishing the City's broad planning goals, policies, and objectives, the arrangement of land uses and intensities, as well as specific development standards for the Community Plan Area (CPA). The Boyle Heights Community Plan is intended to improve the link between land use and transportation in a manner that is consistent with the City's adopted General Plan Framework Element, Mobility Element, SB 375, and state law.

No new development would be entitled or built as a direct result of adopting the Proposed Plan. Future development projects would require additional discretionary and/or administrative approvals. These development projects are expected to occur over the next two decades. The exact type, place, and intensity of each new development cannot be assured through the adoption of the Proposed Plan, as the level of activity will be determined largely by private investment in Boyle Heights and the condition of the local economy.

New Zoning Code

Realizing the objectives of the Boyle Heights Community Plan Update as envisioned requires the application of New Zoning Code regulations, developed through re:code LA, the comprehensive revision of the City's zoning code. The New Zoning Code regulations include provisions for the new zone modules,[2] (a range of Form Districts, Frontage Districts, Use Districts, Development Standards Districts, and Density Districts). Please also refer to **Chapter 1.0, Introduction, Section 1.1**, **Proposed Plan**, regarding the implementation of the New Zoning Code in the Boyle Heights CPA.

---

2 For clarity, throughout this document, "zone module type" refers to the structural or organizational components of the new zone string: Form Districts, Frontages, Use Districts, Development Standards, and Density limitations. "Zone modules" refer to specific Form Districts, Frontages, Use Districts, Development Standard Sets, or Density Limit Indicators that can be applied to a property. For example, a 'Very-Low Rise 1' is a zone module within the Form District zone module type.

Even when adopted into the LAMC, the New Zoning Code districts are not effective until they are implemented through zone changes that apply the New Zoning Code districts to specific properties through amendments to the City's Zoning Map. The expectation is that the New Zoning Code will be adopted in large part prior to the adoption of the Proposed Plan, through the adoption of the Process & Procedures Ordinance and the adoption of the Downtown Community Plan Update, the first community plan update to use the New Zoning Code zoning modules.

The timing of the re:code LA initiative in relation to the Boyle Heights Community Plan Update provides an opportunity to use the proposed New Zoning Code structure as part of the Boyle Heights Community Plan Update and implement the New Zoning Code in the CPA. This Proposed Plan will apply the New Zoning Code solely within the Boyle Heights CPA. The application of the New Zoning Code outside of the Boyle Heights CPA will be an incremental process over time. Ultimately, the New Zoning Code is intended to apply to the entire City of Los Angeles when all community plans and other applicable planning and regulatory documents are amended and adopted through Community Plan Updates or other legislative planning processes. Even when adopted into the LAMC, the New Zoning Code is not effective in a geographic area until it is implemented through zone changes that apply the New Zoning Code zoning designations, through a Community Plan Update process or separate planning process. Therefore, it is speculative to determine where else in the City the zones implemented through the Boyle Heights Community Plan Update may be applied through future planning processes. See **Chapter 3.0, Project Description,** for more details about the New Zoning Code.

2.1.3 Project Objectives

The underlying purpose of the Boyle Heights Community Plan is to plan for and accommodate foreseeable growth in the City, including the CPA, consistent with the growth strategies of the City as provided in the Framework Elements, as well as the policies of SB 375, and the Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

The **Primary Objectives** of the Proposed Plan are as follows:

- Accommodate projected population, housing, and employment growth and focus growth into Framework identified centers and corridors located near transit, through a diverse range of housing typologies and income levels to discourage the displacement of existing residents and communities;

- Reduce greenhouse gas emissions and promote enhanced multi-modal transportation opportunities for bicyclists, pedestrians and transit users. Reduce vehicle miles traveled to meet the requirements of Senate Bill 375, Senate Bill 743, and California Assembly Bill 32;

- Maintain existing affordable housing units and promote the creation of more affordable housing units for residents with incomes below the Area Median Income (AMI);
- Strengthen vibrant mixed-use areas near transit that encourage a strong jobs/housing balance and support increased ridership, and walkability; and
- Preserve community character and neighborhood identity by strengthening and maintaining traditional character of notable residential and commercial neighborhoods and preserving stable low density neighborhoods.
- Promote a mix of compatible land uses that foster sustainability, equity, and healthy living.
- Support sustainable urban design strategies that positively contribute to an urban tree canopy across the entire plan area and supports publicly accessible open space as the area evolves.

The **Secondary Objectives** of the Proposed Plan are as follows:

- Foster a safe, healthy, and environmentally sustainable region that increases access to healthy foods and healthcare services and promotes recreational open space and linkages with safe routes to schools and other routes that link people to public facilities and recreational open spaces;
- Support jobs-producing uses by maintaining industrially planned lands for employment generating uses and increase the opportunity for small business and jobs located in transit station areas and along connecting corridors;
- Improve the function and design of neighborhoods throughout the CPA by promoting a diversity of neighborhood serving uses near residential areas, discouraging a proliferation of auto related uses along pedestrian corridors, and enhancing pedestrian oriented design along corridors;
- Provide a variety of mobility options and optimize bus transit, while enhancing cyclist and pedestrian access on identified corridors and facilitating the shared use of streets and alleys in residential areas;
- Improve consistency between land use and zoning regulations where needed
- Implement the new zoning code districts and rules as applicable to this geography, through the adoption of the Boyle Heights Community Plan.
- Support public infrastructure improvements consistent with other City department and public agencies.

2.1.4 Reasonably Anticipated Development

Reasonably anticipated development that is anticipated to occur through 2040 as a result of the Proposed Plan is shown in **Table 2.0-1, 2040 Reasonably Anticipated Development of the Boyle Heights Community Plan Compared to SCAG Forecast**. The Boyle Heights Community Plan would increase reasonably expected housing, population and employment compared to the Existing Plan and compared to SCAG forecasts.

Reasonably anticipated development for the Boyle Heights CPA was determined based on land use designations included in the City's General Plan, the allowable development capacity in each designation, anticipated levels of development in the life of the Proposed Plan, and development constraints such as topography. See **Appendix B, Methodology**, for a more extensive discussion of how the City forecasts the reasonably anticipated development. The development anticipated under the Boyle Heights Community Plan would accommodate SCAG's 2040 population, housing, and employment projections. Reasonably anticipated development and reasonably expected housing, population and employment growth are further discussed in **Section 4.12, Population, Housing, and Employment**.

Table 2.0-1
2040 Reasonably Anticipated Development of The Boyle Heights Community Plan Compared To SCAG Forecast

	2016 Baseline/a/	Existing Plan Reasonably Anticipated Development/b/	Proposed Plan Reasonably Anticipated Development/b/	SCAG 2040 Growth Forecast/c/
Housing	22,000	28,000	33,000	27,000
Population	86,000	98,000	115,000	93,000
Employment	26,000	32,000	39,000	35,000

/a/ The 2016 estimated population and the 2040 projected population are based on SCAG's 2016-2040 RTP/SCS. Due to rounding, percentages may not add up to 100 percent

Note: Numbers are rounded to the nearest thousand.

2.2 AREAS OF CONTROVERSY / ISSUES TO BE RESOLVED

Potential areas of controversy and issues to be resolved by the City's decision-makers may include those environmental issue areas where the potential for an unavoidable and significant impact has been identified.

Based on the NOP comment letters (provided in **Appendix A, NOP and Reponses,** of this Draft EIR), issues known to be of concern in the community and therefore, potential areas of controversy, include identification of historic resources and the Proposed Plan's potential impacts on those resources, analyzing impacts that heavy industry zoned areas have on local elementary schools, population and housing issues including residential displacement, and transportation and traffic.

The primary issue to be resolved through the planning and environmental review process for the Proposed Plan is whether the City should adopt the updated Boyle Heights Community Plan and the New Zoning Code to replace the existing community plan and zoning. Options include adopting the New Plan or some variation of it (such as one of the alternatives considered in this EIR) or continuing to have the existing community plan and zoning code guide developments in the Boyle Heights Community Plan Area.

2.3 CLASSIFICATION OF ENVIRONMENTAL IMPACTS

The following environmental impact categories are analyzed in this EIR:

- **Aesthetics**. Potential conflicts with applicable zoning and other regulations governing scenic quality, changes to scenic vistas, scenic highways, and light/glare.
- **Air Quality**. Consistency with applicable air quality plan and changes in cumulative pollutant emissions, sensitive receptor exposure, and odors.
- **Biological Resources**. Consistency with applicable habitat conservation plan and policy and impacts to special status species and special species habitat, riparian habitat, wetlands, and migratory wildlife.
- **Cultural Resources**. Impacts to historical resources, archaeological resources, and human remains.
- **Energy**. Consistency with applicable renewable energy plans and changes in energy consumption.
- **Geology and Soils**. Risk from geological and seismic hazards and impacts to paleontological resources.
- **Greenhouse Gas Emissions**. Generation of greenhouse gases and consistency with applicable plans, policies, and regulations related to climate change and greenhouse gas emissions.
- **Hazards and Hazardous Materials**. Changes in risk or exposure to hazardous materials, and consistency with applicable airport and emergency response plans.
- **Hydrology and Water Quality**. Consistency with applicable water quality plans and policy, and changes in water quality, groundwater supplies, drainage, and release in pollutants.

- **Land Use Planning**. Impacts due to a conflict with any land use plan, policy, or regulation.
- **Noise**. Changes in noise and vibration levels due to construction, traffic, and operation of future development, and consistency with applicable airport plans.
- **Population and Housing**. Impacts related to unplanned population growth and the displacement of people or housing.
- **Public Services**. Impacts related to the construction of expansion of public facilities (i.e., police protection, fire protection, schools, and libraries), and impacts related to the construction, expansion, or deterioration of recreational facilities.
- **Transportation**. Consistency with applicable plans and policy related to circulation, impacts related to vehicle miles travelled metric, hazards, and emergency access.
- **Tribal Cultural Resources**. Impacts to tribal cultural resources.
- **Utilities and Services Systems**. Consistency with applicable regulations and goals, and impacts related to the construction of new or expanded facilities (i.e., wastewater treatment, drainage, water, solid waste, electric power, natural gas, telecommunications, police, fire, libraries, and schools).

2.4 SUMMARY OF ALTERNATIVES

As required by Section 15126.6 of the *CEQA Guidelines*, a range of reasonable alternatives to the proposed project that would attain most of the basic project objectives but would avoid or substantially lessen any of its significant environmental effects must be examined. Project alternatives aim to identify and disclose ways to mitigate or avoid significant environmental effects that may result from the proposed project. Impacts found to be significant and unavoidable in **Section 4.0, Environmental Impact Analysis**, are the project and cumulative impacts from exceedance of criteria air pollutant emission standards including construction related NOx, operation-related VOC, sensitive receptors from TACs associated with operations of distribution facilities, the loss of historical resources, temporary construction-related noise and construction-related vibration impacts, deterioration of existing parks, and traffic safety impacts related to highway off-ramp queuing. Impacts found to be potentially significant but able to be reduced to less than significant level with the imposition of proposed mitigation include impacts to sensitive receptors from construction-related activities, impacts from ground-disturbing activities to archaeological, tribal, and paleontological resources or hazardous contamination or materials resulting from contaminated soils.

The alternatives considered are summarized below. Project alternatives are further discussed in **Chapter 5.0, Alternatives**.

The Low Transit Oriented Development Alternative (Alternative 1) assumes that future planned growth and mixed-use development is focused along the corridors instead of in the transit nodes near the L Line stations. In comparison to the Proposed Plan, Alternative 1 would reduce the development potential near the Soto Street and Indiana L Line stations by maintaining the FAR and density permitted by the existing zoning. In the blocks surrounding the Indiana Street Station, the zoning would be proposed with a 2L density, in lieu of the proposed 1/800 density under the Proposed Plan. In the blocks surrounding the Soto Street Station, primarily from Cesar Chavez to 4th Street, St. Louis to Mott Street, proposed zoning would reflect existing zoning regulations, currently allowing a combination of 1/1500, 1/800, and 1/400 densities in lieu of the proposed 1/600 density under the Proposed Plan. This Alternative would also maintain the existing land use designation and zoning around the Pico/Aliso transit node (1.5:1 FAR and Light Industrial land use designation) in lieu of the proposed 1.5:1 Base and 4:0:1 Bonus FAR, 1/400 density, and Commercial Mixed-Use zoning. Bonus FAR and density accessed through the Community Benefits Program would continue to be available, and changes from Residential to Commercial Mixed Use would still occur along certain corridors throughout the CPA. The decreases in intensity of the transit nodes reduces the expected development in all areas of the plan, reducing the overall reasonably expected development. Alternative 1 is expected to incrementally reduce impacts of the Proposed Plan with regard to historical resources, air impacts, construction noise, construction vibration and deterioration of existing parks as well as the Proposed Plan's significant, but mitigatable impacts related to archaeological and paleontological resources, and hazardous materials. Despite accommodating less development capacity as compared to the Proposed Plan, Alternative 1 would still result in significant and unavoidable impacts to historical resources, air quality, construction noise and vibration, recreational facilities and transportation (off-ramp queuing). Additionally, Alternative 1 would result in a new significant impact to VMT.

The High Transit Oriented Development Alternative (Alternative 2) would modify the Proposed Plan by allowing greater development potential around the following L Line transit stations: Soto, Pico/Aliso, and Indiana. Alterative 2 would allow a higher base FAR than the Proposed Plan (3:1 instead of 1.5:1 FAR) and the bonus FAR would increase to 4.5:1 as compared to 4:1 FAR. Additional density would be permitted in the blocks surrounding the Soto Street Metro Station, primarily from Cesar Chavez to 4th Street, St. Louis to Mott Street, where 1/400 density would be permitted in lieu of the proposed 1/600. Additional density incentives within the TOD areas would increase development potential, and redevelopment would be more likely as a result of the delta from existing regulations to proposed bonus regulations.

Under Alternative 2, the Boyle Heights CPA would experience increased development capacity, as compared to the Proposed Plan. Therefore, it may result in incrementally greater impacts in the Boyle Heights CPA, including the significant unavoidable impacts of the Proposed Plan with regard to historical resources, air quality (construction NOx, Operational VOC and sensitive receptors), construction noise,

construction vibration, deterioration of existing parks, and traffic safety to highway off-ramp queuing as well as the Proposed Plan's significant, but mitigable impacts related to air quality (construction sensitive receptors), archaeological and paleontological resources, hazardous materials, and tribal cultural resources. Specifically, this alternative may help reduce overall regional VMT and associated air pollutant and GHG emissions compared to the Proposed Plan by further increasing future development in areas with good transit access and where housing, jobs, and amenities are near one another.

The "Land Use Mix" Alternative (Alternative 3**)** was included based on public input on the Proposed Plan to consider mixed-use development along the western portion of the CPA near the Los Angeles River. Generally, this alternative would make the same recommendations as the Proposed Plan but would change the land use designations near the Los Angeles River-adjacent 'riverside areas' to Light Industrial, Hybrid Industrial, and Community Center. This alternative would permit mixed-use development in an area that the Proposed Plan designates and zones for light industrial uses. From 3rd Street to 6th Street and Mission Road to Clarence Street, the proposed land use designation would change to Hybrid Industrial, and this area would be zoned with a 1.5:1 Base FAR and 3.0:1 Bonus FAR, with a density of 1/800. New residential construction would be permitted in this area, but 1.0:1 FAR would be required to be used as jobs-producing space. Between 6th Street and 7th Street, Mission Road to Highway 101, the land use designation would be changed to Community Center, and the zoning would allow a 1.0:1 Base FAR with a 4.0:1 Bonus, and 1/400 density. These blocks would be zoned with a traditional mixed-use zone that permits residential and commercial uses but does not permit industrial uses. Alternative 3 was included to inform decision makers and foster public participation on an alternative that could result in higher community benefits by allowing greater residential and commercial development in the Boyle Heights CPA. Under Alternative 3, the Boyle Heights CPA would have increased residential and commercial development potential as compared to the Proposed Plan. Further concentrating development in the CPA may limit development elsewhere in the City, with reductions in environmental impacts regionally. Specifically, this alternative would help reduce overall regional VMT and associated air pollutant and GHG emissions compared to the Proposed Plan by further increasing future development in areas with good transit access and where housing, jobs, and amenities are in close proximity to one another. Alternative 3 would allow new housing opportunities in the area of the CPA closest to Downtown Los Angeles, which is a major employment center and transit hub for the wider region. Due to the proximity to Downtown Los Angeles and new infrastructure investments in the riverside area, specifically the new 6th Street Viaduct Replacement Project and the 6th Street PARC Project, if Alternative 3 were to be adopted it is reasonably foreseeable that new housing development within the CPA would likely occur in the riverside area, which could lessen overall impacts related to temporary construction (air quality and noise) in other areas of the CPA. Since Alternative 3 would have greater overall development than the Proposed Plan, it would result in greater impacts to public services and utilities (except for solid waste which would be less than the Proposed Plan) as these topic areas are

largely driven by population and Alternative 3 would increase the number of housing units and population compared to the Proposed Plan, and is also expected to have greater impacts on archeological and paleontological resources though, similar to the Proposed Plan, the impact would also be less than significant. Alternative 3 would still result in significant and unavoidable impacts to historical resources, air quality, construction noise and vibration, recreational facilities and transportation. However, alternative 3 would result in incrementally lesser impacts to VMT, air quality (TAC emissions.

The "No Project Alternative," Alternative 4, involves continued implementation of the existing Boyle Heights Community Plan. This alternative assumes that the City's existing plans and policies would continue to accommodate development in accordance with existing General Plan designations. The "no project" alternative, required by CEQA, would meet some of the project objectives. Alternative 4 would include less development capacity overall and thus less growth in the Boyle Heights Community Plan Area. Alternative 4 would result in significant impacts to: cumulatively considerable net increase of criteria pollutant (construction NOx and operational/long-term VOC emissions), historic resources, ambient and ground-borne noise levels, deterioration of parks and recreational facilities, and safety impacts related to off-ramp queuing. As with the Proposed Plan, Alternative 4 would result in significant impacts to: cumulatively considerable net increase of criteria pollutant (construction NOx and operational/long-term VOC emissions), sensitive receptors from TACs related to distribution facilities, historic resources, ambient and ground-borne noise levels related to construction, deterioration of parks and recreational facilities, and safety impacts related to off-ramp queuing. Because this alternative would not be subject to mitigation measures proposed in the Proposed Plan, including the CPIO's review procedures for projects that involve properties that have been identified as an eligible historical resource, the level of impact would be greater than under the Proposed Plan despite the lower overall intensity of development in the Boyle Heights CPA under this alternative and would have additional significant and unavoidable impacts to archaeological, paleontological, conformance with state climate action goals, hazardous (contaminated sites), transportation (VMT) and tribal resources. In addition, limiting development potential in Boyle Heights may induce higher levels of growth in other areas of the City and region that have fewer transit options and longer distances between housing, jobs, and services. As such, Alternative 4 may incrementally increase related air pollutant and GHG emissions.

2.4.1 Environmentally Superior Alternative

CEQA requires identification of the environmentally superior alternative among the options studied. In general, the environmentally superior alternative is the alternative that would be expected to generate the fewest adverse impacts. If the No Project Alternative (Alternative 4) is identified as environmentally superior, then another environmentally superior alternative shall be identified among the other alternatives.

As shown in **Table 2.0-2**, Alternatives 1 and 4 would incrementally reduce impacts for multiple issue areas compared to the Proposed Plan. This is because Alternative 1 and 4 would both reduce overall development levels in the CPA. However, none of these alternatives would avoid any of the significant and unavoidable impacts of the Proposed Plan and in fact, Alternatives 1 and 4 would result in a new significant impact (VMT). Alternative 4 would involve the lowest overall level of growth and development in the CPA. However, because Alternative 4 would not be subject to the mitigation measures proposed in the Proposed Plan, it may result in higher greater overall impacts than the Proposed Plan for certain issues. In addition, by limiting growth in the CPA, Alternative 4 could cause more forecasted growth and associated development to occur in other areas of the City or region that have less access to transit and longer distances between housing, jobs, and services. In this way, Alternative 4 may also result in greater in overall regional VMT and associated air pollutant and GHG emissions.

Among the other alternatives, Alternative 3, the Land Use Mix Alternative would include the same high level of TOD development as the Proposed Plan with the added benefit of increased housing for the region and reducing VMT. Since Alternative 3 would have greater overall development than the Proposed Plan, it would result in greater impacts to public services and utilities as these topic areas are largely driven by population and Alternative 3 would increase the number of housing units and population compared to the Proposed Plan. Although this alternative would not reduce any of the significant impacts of the Proposed Plan, it would meet the project objectives, even if to a lesser degree for some, it has more environmental benefits related to greenhouse gases and energy use and sustainable development patterns than the other alternatives. Alternative 3 would allow new housing opportunities in the area of the CPA closest to Downtown Los Angeles, which is a major employment center and transit hub for the wider region. Due to the proximity to Downtown Los Angeles and new infrastructure investments in the riverside area, specifically the new 6th Street Viaduct Replacement Project and 6th Street PARC Project, if Alternative 3 were to be adopted it is reasonably foreseeable that new housing development within the CPA would likely occur in the riverside area, which could lessen overall impacts to temporary construction (air quality and noise) in other areas of the CPA. Based on the ability to result in incrementally reduced environmental impacts and meet project objectives, the Land Use Mix Alternative (Alternative 3) is the Environmentally Superior Alternative.

Table 2.0-2
Impact Comparison of Alternatives

Resource Area	Alternatives			
	Low TOD	High TOD	Land Use Mix	No Project
Aesthetics	-	+	=	-
Air Quality	-	+	-/=	+
Biological Resources	=	+	=	-
Cultural Resources	-	+	+	+
Energy	=	-	-	+
Geology and Soils	-	+	=	+
Greenhouse Gas Emissions	+	-	-	+
Hazards/Hazardous Materials	=	=	=	+
Hydrology/Water Quality	=	=	=	=
Land Use/Planning	+	=	=	+
Noise/Vibration	-	+	-/=	+
Population/Housing	-	+	=	=
Public Services/Recreation	-	+	+	-
Transportation/Traffic	+	-	-	+
Tribal Cultural Resources	-	+	+	+
Utilities/Service Systems	+	+	-/+	-

+ Increased level of impact to the Proposed Plan
- Decreased level of impact to the Proposed Plan
= Similar level of impact to the Proposed Plan
Significant and unavoidable impacts are bolded and red. Note that impacts are identified as "significant and unavoidable" if the physical effect associated with the alternative would be equivalent to a "significant impact" only if the alternative involved a new discretionary action.

2.5 SUMMARY OF PLAN IMPACTS AND MITIGATION MEASURES

A summary of the environmental impacts associated with the Proposed Plan is included in **Table 2.0-3, Summary of Plan Impacts and Mitigation Measures**. If necessary, mitigation measures are included to avoid or decrease the severity of significant impacts. The level of significance before and after mitigation measures is also identified.

Table 2.0-3
Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Aesthetics				
Scenic Vista	**Impact 4.1-1:** Would implementation of the Proposed Plan have a substantial adverse effect on a scenic vista?	Less than significant	No mitigation required.	Less than significant
Scenic Resources Within a State Scenic Highway.	**Impact 4.1-2:** Would implementation of the Proposed Plan substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	No impact	No mitigation required.	No impact
Visual Quality Zoning and Regulations	**Impact 4.1-3**: Would implementation of the Proposed Plan conflict with applicable zoning and other regulations governing scenic quality or where it proposes to change the applicable zoning and other regulations governing scenic quality would it degrade the visual character of the CPA and its surrounding area?	Less than significant	No mitigation required.	Less than significant
Light and Glare	**Impact 4.1-4:** Would implementation of the Proposed Plan create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Air Quality				
Air Quality Plan	**Impact 4.2-1:** Would implementation of the Proposed Plan conflict with or obstruct implementation of the applicable air quality plan?	Less than significant	No mitigation required.	Less than significant
Cumulative Increase	**Impact 4.2-2:** Would implementation of the Proposed Plan result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	*Construction* – Significant (for NOx) *Operation* – Significant (for regional VOC emissions)	**MM AQ-1: Dust Control Compliance with SCAQMD Rule 403** a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS. b. Standard: Consistent with SCAQMD Rule 403, best available dust control measures shall be implemented during Ground Disturbance Activities and active construction operations capable of generating dust. **MM AQ-2: Equipment Maintenance** a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS. b. Standard: Maintain construction equipment in good, properly tuned operating condition, as specified by the manufacturer, to minimize exhaust emissions. Documentation demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications shall be maintained per the proof of compliance requirements for a minimum of five years after the Certificate of Occupancy is issued. All construction equipment shall achieve emissions reductions that are no less than what could be achieved by a Tier 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations. **MM AQ-3: Vehicle Idling Limit and Notification Signs** a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS.	Construction – Significant and unavoidable (for NOx) Operation – Significant and unavoidable (for VOC emissions)

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			b. Standard: Vehicle idling during construction activities shall be limited to five minutes as set forth in the California Code of Regulations, Title 13, Section 2449. Signs shall be posted in areas where they will be seen by vehicle operators stating idling time limits. **MM AQ-4: Non-Diesel Fueled Electrical Power** a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS. b. Standard: Electricity from power poles rather than temporary gasoline or diesel-powered generators shall be used To the Extent Available and Feasible. **MM AQ-5: Emissions Standards for Off-Road Construction Equipment Greater than 50 Horsepower** a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day. b. Standard: All off-road diesel-powered construction equipment equal to or greater than 50 horsepower shall meet the U.S. Environmental Protection Agency's (U.S. EPA) Tier 4 emission standards during construction. Operators shall maintain records of all off-road equipment associated with Project construction to document that each piece of equipment used meets these emission standards per the proof of compliance requirement for a minimum of five years after the Certificate of Occupancy is issued. In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.	

MM AQ-6: Use of Low Polluting Fuels

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.

b. Standard: Construction equipment less than 50 horsepower shall use low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, and unleaded gasoline).

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

MM AQ-7: Emission Standards for On-Road Haul Trucks

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve more than 90 round-trip haul truck trips on any given day for demolition debris and import/export of soil.

b. Standard: Construction haul truck operators for demolition debris and import/export of soil shall use trucks that meet the California Air Resources Board's (CARB) 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of nitrogen oxides (NOX) emissions. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards per the proof of compliance requirements in Subsection I.D.6.

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

MM AQ-8: Routes for On-Road Haul Trucks

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS. b. Standard: Construction contractors shall reroute construction trucks away from congested streets or Sensitive Uses, as feasible. The burden of proving that compliance is infeasible shall be upon the Applicant or Owner. Where avoiding Sensitive Uses and congested streets altogether is infeasible, routing away from Sensitive Uses shall be prioritized over routing away from congested streets.	
Sensitive Receptors	**Impact 4.2-3:** Would implementation of the Proposed Plan expose sensitive receptors to substantial pollutant concentrations?	*Construction* – Significant *Operation* – Significant (for TAC-related impacts associated with distribution centers)	Refer to Mitigation Measures **AQ-1** through **AQ-8**. Also, the following is required for distribution centers. **MM AQ-9: Distribution Facility Health Risk Assessment** a. Applicability Threshold: Applicants for distribution centers in the Boyle Heights Plan Area within 1,000 feet of sensitive uses that require discretionary permits and/or would accommodate more than 100 truck trips or 40 TRUs per day. shall b. Standard: Prepare health risk assessments (HRAs) in accordance with SCAQMD and OEHHA guidance to identify the potential for cancer and non-cancer health risks. If cancer risks exceeding SCAQMD standards are identified, the Applicant shall identify opportunities to reduce emissions and associated risks. Methods may include, but are not limited to, limiting the number of trucks/TRUs accessing the site on a daily basis, locating distribution center entry and exist points as far as possible from sensitive land uses, and routing truck traffic away from sensitive land uses.	*Construction* –Less than significant *Operation* – Significant and unavoidable (for TAC-related impacts associated with distribution centers)
Odors	**Impact 4.2-4:** Would implementation of the Proposed Plan result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	*Construction* –Less than significant *Operation* –Less than significant	No mitigation required.	*Construction* –Less than significant *Operation* –Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Biological Resources				
Special Status Species Habitat	**Impact 4.3-1:** Would implementation of the Proposed Plan have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Less than significant	Although the impact conclusion related to nesting birds is found to be less than significant, the City adopts the following additional mitigation measure to add additional protections to ensure compliance with the existing federal and state regulations. **MM BIO-1:** For all projects, if any active bird nest is found during a pre-construction nesting bird survey or is discovered inadvertently during earthwork or construction-related activities, a Qualified Biologist shall be retained by the Applicant or Owner to determine an appropriate avoidance buffer which shall be no less than is necessary to protect the nest, eggs and/or fledglings, from damage or disturbance in consideration of the following factors: the bird species, the availability of suitable habitat within the immediate area, the proposed work activity, and existing disturbances associated with surrounding land uses. The buffer shall be demarcated using bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary of the buffer. All construction personnel shall be notified of the buffer zone and shall avoid entering the protected area. No Ground Disturbing Activities or vegetation removal shall occur within this buffer area until the Qualified Biologist has confirmed that breeding/nesting is complete and the young have fledged the nest and/or that the nest is no longer an Active Nest. The Qualified Biologist shall prepare a report prior to the issuance of any building permit detailing the results of the nesting bird survey and subsequent monitoring, which shall be maintained for a minimum of five years after the Certificate of Occupancy is issued. **MM BIO-2:** All project applicants for grading, excavation, or building permits will be notified of and shall include on their plans an acknowledgement of the requirement to comply with the federal MBTA and CFGC to not destroy active bird nests and of best practices recommended by qualified biologist to avoid impacts to active nests, including checking for nests prior to construction activities during February 1-August 31 and what to do if an active nest is found during grading or construction activities, including the need to comply with the measures in **MM BIO-1.**	Less than significant without mitigation. Mitigation is added as an additional measure to provide additional protections to impacts that are less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Riparian Habitat	**Impact 4.3-2:** Would implementation of the Proposed Plan have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	Less than significant	No mitigation required.	Less than significant
Wetlands	**Impact 4.3-3:** Would implementation of the Proposed Plan have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Less than significant	No mitigation required.	Less than significant
Migratory Wildlife, Biological Resources Plan	**Impact 4.3-4:** Would implementation of the Proposed Plan interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less than significant	No mitigation required.	Less than significant
Local Policies and Ordinances	**Impact 4.3-5:** Would implementation of the Proposed Plan conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Less than significant	No mitigation required.	Less than significant
Habitat Conservation Plan	**Impact 4.3-6:** Would implementation of the Proposed Plan conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No impact	No mitigation required.	No impact

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Cultural Resources				
Historical Resources	**Impact 4.4-1:** Would implementation of the Proposed Plan cause a substantial adverse change in the significance of a historical resource as pursuant to § 15064.5?	**S**ignificant	No feasible mitigation measures have been identified.	Significant and unavoidable
Archaeological Resources	**Impact 4.4-2:** Would implementation of the Proposed Plan cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	Significant	**MM CR-1**: For any project that requires a permit for grading or excavation; if a possible archaeological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Archaeologist has been retained to evaluate the find in accordance with National Register of Historic Places and California Register of Historical Resources criteria. The Qualified Archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius. Any potential archaeological resource or associated materials that are uncovered shall not be moved or collected by anyone other than an Archaeological Monitor or Qualified Archaeologist unless the materials have been determined to be non-unique archaeological resources, as defined in Public Resources Code Section 21083.1(h), by the Qualified Archaeologist. The Qualified Archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g). Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows: • The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			• When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a Qualified Archaeologist. Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a Qualified Archaeologist. A report that describes the resource(s) and its disposition, as well as the assessment methodology, shall be prepared by the Qualified Archaeologist according to current professional standards and maintained for a minimum of five years after the Certificate of Occupancy is issued. If appropriate, the report should also contain the Qualified Archaeologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply. **MM CR-2:** Prior to issuance of a permit for grading or excavation all project applicants will receive notice and acknowledge receipt of the following notice: Several laws regulate the treatment of archaeological, paleontological, and tribal cultural resources and make it a criminal violation to destroy those resources. These regulations include, but are not limited to: • California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor." • Public Resources Code Section 5097.5(a) states: "A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands." • California Code of Regulations, Title 14, Section 4307 states: "No person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces…Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave. The following best practices are recognized by archaeologists and environmental consultants to ensure archaeological resources are not damaged during grading, excavation, or other Ground Disturbance Activities: • Records Search. A cultural resources records search should be requested from and conducted by the California Historical Resources Information System's (CHRIS) South Central Coastal Information Center (SCCIC) located at California State University, Fullerton to determine whether any cultural resources have been previously identified on or within a 0.5-mile radius of the Project site. The results of this records search shall be used as an indicator of the archaeological sensitivity of the Project site. • A Qualified Archaeologist shall be retained and use all reasonable methods, consistent with professional standards and best practices, to determine the potential for archaeological resources to be present on the Project site. • If the Qualified Archaeologist determines there is a medium to high potential that archaeological resources may be located on the Project site and it is possible that such resources will be	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			impacted by the Project, the Qualified Archaeologist shall advise the Applicant and Owner to retain an Archaeological Monitor to observe all Ground Disturbance Activities within those areas identified as having a medium to high potential in order to identify any resources and avoid potential impacts to such resources. • Monitoring. An Archaeological Monitor should monitor excavation and grading activities in soils that have not been previously disturbed in order to identify and record any potential archaeological finds and avoid potential impacts to such resources. In the event of a possible archaeological discovery, the Archaeological Monitor shall notify a Qualified Archaeologist. The Archaeological Monitor has the authority to temporarily halt earthwork activities. • Handling, Evaluation, and Preservation. Any archaeological resource materials or associated materials that are uncovered shall not be moved or collected by anyone other than an Archaeological Monitor or Qualified Archaeologist unless they have been determined to be nonunique archaeological resources, as defined in Public Resources Code Section 21083.1(h) by a Qualified Archaeologist. A Qualified Archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g). • Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows: o The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource. o When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			the resource, and this determination is documented by a Qualified Archaeologist. • If recommended by the Qualified Archaeologist, the resource(s) shall be curated by a public, non-profit institution with a research interest in the material, such as the Natural History Museum of Los Angeles County or another appropriate curatorial facility for educational purposes. • Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a Qualified Archaeologist. **MM CR-3:** Projects within 500 feet of the currently mapped known segments of the Zanja system have increased likelihood of encountering segments of the Zanja system during construction. If possible segments of the Zanja system are uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Archaeologist has been retained to inspect and evaluate the find. The Qualified Archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius. At a minimum, and even if avoided, should the find be determined to be related to the Zanja system, the Qualified Archaeologist shall prepare a memo and complete all relevant State of California Department of Parks and Recreation (DPR) DPR 523 forms documenting the find. If the Qualified Archaeologist, having evaluated the find, determines that the find retains integrity, documentation consistent with the standards and guidelines established the Historic American Engineering Record (HAER) shall be undertaken and transmitted to the Library of Congress before any alteration, demolition, construction, or removal activity may occur within the determined avoidance area. Documentation shall include narrative	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			records, measured drawings, and photographs in conformance with HAER Guidelines. The found segments shall also be mapped using Geographic Information Systems (GIS) or 3D mapping technology in order to contribute to the existing record of the location and extent of the Zanja system as a whole. At minimum, GIS data shall include the geographic coordinates and depth of all portions of the find. All records, including geographic data, georeferenced photographs, and information about the depth of the find shall be submitted to City Planning. Report documentation and GIS files shall additionally be provided to the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton. In addition to HAER documentation, if determined appropriate by the Qualified Archaeologist, one or more of the following specific treatments shall be developed and implemented based on potential California Register eligibility criteria or the significance of the find as a unique archaeological resource: • Treatment Under Criterion 1: Treatment shall include interpretation of the Zanja Madre System for the public. The interpretive materials may include, but are not limited to, interpretive displays of photographs and drawings produced during the HAER documentation, signage at the Zanja Madre alignment, relocating preserved segments in a publicly accessible display, or other visual representations of Zanja alignments through appropriate means such as a dedicated internet website other online-based materials. At a minimum, the interpretive materials shall include photographs and drawings produced during the HAER documentation, and signage. These interpretive materials shall be employed as part of Project public outreach efforts that may include various forms of public exhibition and historic image reproduction. Additionally, the results of the historical and archaeological studies conducted for the Project shall be made available to the public through repositories such as the local main library branch or with identified non-profit historic groups interested in the subject matter. The interpretive materials shall be prepared at the expense of the Project applicant, by professionals meeting the Secretary of the	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			Interior standards in history or historical archaeology. The development of the interpretive materials shall consider any such materials already available to the public so that the development of new materials would add to the existing body of work on the historical Los Angeles water system, and to this end, shall be coordinated, to the extent feasible and to the satisfaction of the Department of City Planning, in consultation with the Office of Historic Resources. The interpretive materials shall include a consideration of the Zanja Madre segment located on the Project Site in relation to the entire Zanja system. The details of the interpretive materials, including the content and format, and the timing of their preparation, shall be completed to the satisfaction and subject to the approval of the Department of City Planning, in consultation with the Office of Historic Resources. • Treatment Under Criterion 2: No additional work; archival research about important persons directly associated with the construction and use of Zanja Madre would be addressed as part of HAER documentation. • Treatment Under Criterion 3: No additional work; HAER documentation is sufficient. • Treatment Under Criterion 4: No additional work; archaeological data recovery and HAER documentation are sufficient. • Treatment as a unique archaeological resource, as defined by PRC Section 21083.2(g): Same as Criterion 1 treatment.	
Human Remains	**Impact 4.4-3:** Would implementation of the Proposed Plan disturb any human remains, including those interred outside of dedicated cemeteries?	Less than significant	No mitigation required.	Less than significant
Energy				
Inefficient Energy Consumption	**Impact 4.5-1:** Would implementation of the Proposed Plan result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
	consumption of energy resources, during project construction or operation?			
Renewable Energy/Energy Efficiency Plans	**Impact 4.5-2:** Would implementation of the Proposed Plan conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	Less than significant	No mitigation required.	Less than significant
Geology And Soils				
Earthquake Fault, Seismicity	**Impact 4.6-1:** Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	Less than significant	No mitigation required.	Less than significant
Seismic Ground Shaking	**Impact 4.6-2:** Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?	Less than significant	No mitigation required.	Less than significant
Seismic-Related Ground Failure, Liquefaction, Landslides	**Impact 4.6-3:** Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and/or landslides?	Less than significant	No mitigation required.	Less than significant
Soil Erosion, Loss of Topsoil	**Impact 4.6-4:** Would implementation of the Proposed Plan result in substantial soil erosion or the loss of topsoil?	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Unstable Soil	**Impact 4.6-5:** Would implementation of the Proposed Plan be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, or collapse?	Less than significant	No mitigation required.	Less than significant
Expansive Soils	**Impact 4.6-6:** Would implementation of the Proposed Plan be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	Less than significant	No mitigation required.	Less than significant
Septic Tanks	**Impact 4.6-7:** Would implementation of the Proposed Plan have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No impact	No mitigation required.	No impact
Paleontological Resources	**Impact 4.6-8:** Would implementation of the Proposed Plan directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Significant	**MM GEO-1: Paleontological Resources.** For all discretionary projects that are excavating earth for two or more subterranean levels within previously undisturbed land or below previously excavated depths within native soils, a determination shall be made using all reasonable methods to determine the potential that paleontological resources are present on the project site, including through searches of databases and records, and surveys. If there is a medium to high potential that paleontological resources are located on the project site and it is possible that these resources will be impacted, monitoring will be conducted for all excavation, grading or other ground disturbance activities to identify any resources and avoid potential impacts to such resources as follows: • **Paleontological Worker Environmental Awareness Program (WEAP).** Prior to the start of construction, the paleontological monitor shall conduct training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			construction staff. In the event of a fossil discovery by construction personnel, all work in the immediate vicinity of the find shall cease and a qualified paleontologist shall be contacted to evaluate the find before restarting work in the area. If it is determined that the fossil(s) is(are) scientifically significant, the paleontological monitor shall complete the next two steps. • **Fossil Salvage**. The Qualified Paleontologist or designated paleontological monitor shall recover intact fossils. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case the paleontologist shall have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner. Any fossils shall be handled and deposited consistent with a mitigation plan prepared by the paleontological monitor. • **Paleontological Resource Construction Monitoring**. Additional ground disturbing construction activities (including grading, trenching, foundation work and other excavations) in undisturbed sediments, below five feet, with high paleontological sensitivity shall be monitored on a full-time basis by a Qualified Paleontologist or designated paleontological monitor during initial ground disturbance. If the paleontological monitor determines that full-time monitoring is no longer warranted, he or she may recommend that monitoring be reduced to periodic spot-checking or cease entirely. Monitoring shall be reinstated if any new or unforeseen deeper ground disturbances are required. **MM GEO-2: Treatment of Paleontological Resources.** If a probable paleontological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Paleontologist has been retained to evaluate the find in accordance with the Society of Vertebrate Paleontology's Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources.	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			Temporary flagging shall be installed around the find in order to avoid any disturbance from construction equipment. Any paleontological materials that are uncovered shall not be moved or collected by anyone other than a Qualified Paleontologist or his/her designated representative such as a Paleontological Monitor. If cleared by the Qualified Paleontologist, Ground Disturbance Activities may continue unimpeded on other portions of the site. The found deposit(s) shall be treated in accordance with the Society of Vertebrate Paleontology's Standard Procedures. Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by Qualified Paleontologist. A report that describes the resource and its disposition, as well as the assessment methodology, shall be prepared by the Qualified Paleontologist according to current professional standards and maintained pursuant to the proof of compliance requirements in Subsection I.D.6. If appropriate, the report should also contain the Qualified Paleontologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply. **MM GEO-3: Notification of Intent to Excavate Language.** For all projects not subject to **MM-GEO-1** that are seeking excavation or grading permits, the Department of Building and Safety shall issue the following notice and obtain an acknowledgement of receipt of the notice from applicants: • California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor." • PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that: "No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints,	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands." • California Code of Regulations, Title 14, Section 4307 states that "no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces…every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave." • Best practices to ensure unique geological and paleontological resources are not damaged include compliance with **MM GEO-2**.	
Greenhouse Gas Emissions				
Plans, Policies or Regulations	**Impact 4.7-1:** Whether the Proposed Plan is consistent with AB 32, SB 32 (and Executive Order B-30-15 through demonstration of conformance with 2017 Scoping Plan), SB 375 (through demonstration of conformance with Connect SoCal 2020-2045 RTP/SCS), the Sustainable City pLAn, and GreenLA?	Less than significant	No mitigation required.	Less than significant
Hazards and Hazardous Material				
Hazardous Materials Transport, Use, Disposal	**Impact 4.8-1:** Would implementation of the Proposed Plan create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	*Construction* – Significant *Operation* –Less than significant	**MM HAZ-1**: Any project that requires a grading, excavation, or building permit from LADBS and which is: • Located on or within 500 feet of a Hazardous Materials site listed in any of the following databases:	*Construction* – Less than significant *Operation* –Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			○ State Water Resources Control Board GeoTracker (refer to https://geotracker.waterboards.ca.gov); ○ DTSC EnviroStor (refer to https://www.envirostor.dtsc.ca.gov/public); ○ DTSC Hazardous Waste Tracking System (refer to https://hwts.dtsc.ca.gov); ○ LAFD Certified Unified Program Agency (refer to the active, inactive, and historical inventory lists at https://www.lafd.org/fire-prevention/cupa/public-records); ○ Los Angeles County Fire Department Health Hazardous Materials Division (refer to the active and inactive facilities, site mitigation, and California Accidental Release Prevention inventory lists at https://fire.lacounty.gov/public-records-requests); ○ SCAQMD Facility Information Detail (refer to https://xappprod.aqmd.gov/find); or • Located on or within 500 feet of a Hazardous Materials site designated as a Resource Conservation and Recovery Act (RCRA) Small Quantity Generator or Large Quantity Generator (refer to the USEPA Envirofacts database at https://enviro.epa.gov/index.html); or • Located in an Oil Drilling District (O) or located on or within 50 feet of a property identified as having an oil well or an oil field (active or inactive) by the California Geologic Energy Management Division (refer to https://www.conservation.ca.gov/calgem/Pages/WellFinder.aspx); or • Located on land currently or previously designated with an industrial use class or industrial zoning, in whole or in part; or • Located on land currently or previously used for a gas station or dry cleaning facility. Or:	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			• The Applicant or Owner are aware or have reason to be aware that the Project site was previously used for an industrial use, gas station or dry cleaner. And: • The site has not been previously remediated to the satisfaction of the relevant regulatory agency/agencies for any contamination associated with the above uses or site conditions. Then a Phase I Environmental Site Assessment shall be prepared by a Qualified Environmental Professional in accordance with State standards/guidelines and current professional standards, including the American Society for Testing and Materials' (ASTM) Standard Practice for Environmental Site Assessments, to evaluate whether the site, or the surrounding area, is contaminated with hazardous substances from any past or current land uses, including contamination related to the storage, transport, generation, or disposal of toxic or Hazardous Waste or materials. If the Phase I identifies a Recognized Environmental Condition (REC) and/or if recommended in the Phase I, a Phase II Environmental Site Assessment shall also be prepared by a Qualified Environmental Professional. The Phase I and/or Phase II Environmental Site Assessment(s) shall be maintained pursuant to appropriate proof of compliance for a minimum of five years after the Certificate of Occupancy is issued and made available for review and inclusion in the case file by the appropriate regulatory agency, such as the State Water Resources Control Board, the State Department of Toxic Substances Control, or the LAFD Hazard Mitigation Program. Any remediation plan recommended in the Phase II Environmental Site Assessment or by the appropriate regulatory agency shall be implemented and, if required, a No Further Action letter shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, the Qualified Environmental Professional shall provide written verification of compliance with and completion of the remediation	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			plan, such that the site meets the applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements. **MM HAZ-2**: For discretionary projects that do not meet the criteria in **MM HAZ-1** and are not within the Exide PIA, and involve any ground and/or soil disturbance, soil samples shall be collected and tested to determine the presence of lead or arsenic and the extent of contamination, if any. Any remediation plan recommended by the appropriate regulatory agency shall be implemented and, if required, a No Further Action letter shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, a Qualified Environmental Professional shall provide written verification of compliance with and completion of the remediation plan, such that the site meets the applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements. **MM HAZ-3**: Any project that requires a grading, excavation, or building permit from LADBS and which suspected Hazardous Materials, contamination, debris, or other features or materials that could present a threat to human health or the environment are discovered during earthwork or construction, such activities shall cease immediately until the affected area is evaluated by a Qualified Environmental Professional. If the Qualified Environmental Professional determines that a hazard exists, a remediation plan shall be developed by the Qualified Environmental Professional in consultation with the appropriate regulatory agency, and the remediation identified shall be completed. Work shall not resume in the affected area until appropriate actions have been implemented in accordance with the remediation plan, to the satisfaction of the regulatory agency. A report that describes the Hazardous Materials, contamination or debris and its disposition, shall be prepared by the Qualified Environmental Professional, according to current professional

			standards and maintained pursuant to appropriate proof of compliance requirements.	
Hazardous Materials Upset or Accident	**Impact 4.8-2:** Would implementation of the Proposed Plan create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Significant	Refer to **MM HAZ-1** through **MM HAZ-3**	Less than significant
Hazards within ¼ Mile of School	**Impact 4.8-3:** Would implementation of the Proposed Plan emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter of an existing or proposed school?	Significant	Refer to **MM HAZ-1** through **MM HAZ-3**	Less than significant
Hazardous Materials Sites	**Impact 4.8-4:** Would the Proposed Plan be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	Significant	Refer to **MM HAZ-1** through **MM HAZ-3**	Less than significant
Airport Plan	**Impact 4.8-5:** For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the area?	No impact	No mitigation required.	No impact
Emergency Response Plans	**Impact 4.8-6:** Would implementation of the Proposed Plan impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Wildland Fires	**Impact 4.8-7:** Would implementation of the Proposed Plan expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	Less than significant	No mitigation required.	Less than significant
Hydrology and Water Quality				
Groundwater Quality / Discharge Requirements	**Impact 4.9-1:** Would implementation of the Proposed Plan violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	Less than significant	No mitigation required.	Less than significant
Groundwater	**Impact 4.9-2:** Would implementation of the Proposed Plan substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	Less than significant	No mitigation required.	Less than significant
Drainage – Erosion, Runoff, Flooding	**Impact 4.9-3:** Would the Proposed Plan substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river through the addition of impervious surfaces, in a manner which would: (i) Result in substantial erosion or siltation on- or off-site; (ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-or off-site (iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
	drainage systems or provide substantial additional sources of polluted runoff; or (iv) Impede or redirect flood flows?			
Pollutants	**Impact 4.9-4:** In flood hazard, tsunami, or seiche zones, would the Proposed Plan risk release of pollutants due to project inundation?	Less than significant	No mitigation required.	Less than significant
Water Quality Plans and Policy Consistency	**Impact 4.9-5:** Would the Proposed Plan conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	Less than significant	No mitigation required.	Less than significant
Land Use and Planning				
Physically Divide a Community	**Impact 4.10-1:** Would implementation of the Proposed Plan physically divide an established community?	No impact	No mitigation required.	No impact
Land Use Plans and Policy Consistency	**Impact 4.10-2:** Would implementation of the Proposed Plan cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	Less than significant	No mitigation required.	Less than significant
Noise and Vibration				
Noise Levels	**Impact 4.11-1:** Would implementation of the Proposed Plan generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	*Construction* – Significant *Operation* –Less than significant	**Construction (Temporary) Noise** **MM NOI-1:** The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. Power construction equipment (including combustion engines), fixed or mobile, shall be equipped with noise shielding and muffling devices consistent with manufacturers' standards or the Best Available Control Technology. All equipment shall be properly maintained, and the applicant or owner shall require any construction contractor to	*Construction* – Significant and unavoidable *Operation* –Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			keep documentation on-site during any earthwork or construction activities demonstrating that the equipment has been maintained in accordance with manufacturer's specifications. **MM NOI-2:** The following is required for any project whose earthwork and construction activities involve the use of construction equipment and require a permit from LADBS. Driven (impact) pile systems shall not be used, except in locations where the underlying geology renders drilled piles, sonic, or vibratory pile drivers infeasible, as determined by a soils or geotechnical engineer and documented in a soils report. **MM NOI-3:** The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. All outdoor mechanical equipment (e.g., generators, compressors) shall be enclosed or visually screened. The equipment enclosure or screen shall be impermeable (i.e., solid material with minimum weight of 2 pounds per square feet) and break the line of sight between the equipment and any off-site Noise-Sensitive Uses. **MM NOI-4:** The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. Construction staging areas shall be located as far from Noise-Sensitive Uses as reasonably possible and technically feasible in consideration of site boundaries, topography, intervening roads and uses, and operational constraints. The burden of proving what constitutes 'as far as possible' shall be upon the Applicant or Owner, in consideration of the above factors. **MM NOI-5**: The following is required for any project whose earthwork and construction activities involve the use of construction equipment and require a permit from LADBS; and whose construction activities are located within a line of sight to and within 500 feet of Noise-Sensitive Uses, with the exception of projects limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses. Noise barriers, such as temporary walls (minimum ½-inch thick plywood) or sound blankets (minimum STC 25 rating), that are a minimum of eight feet tall, shall be erected between construction activities and Noise-	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			Sensitive Uses as reasonably possible and technically feasible in consideration of site boundaries, topography, intervening roads and uses, and operational constraints. The burden of proving that compliance is technically infeasible shall be upon the applicant or owner. Technical infeasibility shall mean that noise barriers cannot be located between construction activities and Noise-Sensitive Uses due to site boundaries, topography, intervening roads and uses, and/or operational constraints. **MM NOI-6**: The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS; are located within 500 feet of Noise-Sensitive Uses; and have one or more of the following characteristics: • Two or more subterranean levels • 20,000 cubic yards or more of excavated material; • Simultaneous use of five or more pieces of construction equipment; or • Construction duration (excluding architectural coatings) of 18 months or more; or • Any project whose construction activities involve pile driving or the use of 300 horsepower equipment A Noise Study, prepared by a qualified noise expert shall be required and prepared prior to obtaining any permit by LADBS. The Noise Study shall characterize expected sources of earthwork and construction noise that may affect identified noise-sensitive uses, quantify expected noise levels at these noise-sensitive uses, and recommend measures to reduce noise exposure to the extent noise reduction measures are available and feasible, and to demonstrate compliance with any noise requirements in the Los Angeles Municipal Code. Specifically, the Noise Study shall identify noise reduction devices or techniques to reduce noise levels in accordance with accepted industry practices and in compliance with LAMC standards. Noise reduction devices or techniques shall include but not be limited to mufflers, shields, sound barriers, and time and place restrictions on equipment and activities. The Noise Study shall identify anticipated noise	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			reductions at Noise-Sensitive Uses associated with the noise reduction measures. Applicants and owners shall be required to implement and comply with all measures identified and recommended in the Noise Study. The Noise Study and copies of any contractor agreements shall be maintained pursuant to the proof of compliance requirements and a copy of all records documenting compliance shall be maintained for a minimum of five years after the Certificate of Occupancy is issued.	
Groundborne Vibration	**Impact 4.11-2:** Would implementation of the Proposed Plan generate excessive groundborne vibration or groundborne noise levels?	*Construction* – Significant *Operation* –Less than significant	**Construction** **MM NOI-7:** The following is required for any project, with the exception of project limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses, whose earthwork or construction activities: (1) involve the use of construction equipment, including Heavy Construction Equipment, that produces 0.12 PPV or more of vibration at a distance of 25 feet; (2) require a permit from LADBS; and (3) which occur: • Within 25 feet of any building extremely susceptible to vibration damage, including unreinforced masonry buildings, tilt-up concrete wall buildings, wood-frame multi-story buildings with soft, weak or open front walls, and non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources Survey; or • Within 15 feet of non-engineered timber and masonry buildings. Or any project whose construction activities involve the use of pile drivers within 135 feet of any building extremely susceptible to vibration damage, including existing unreinforced masonry buildings, existing tilt-up concrete wall buildings, existing wood-frame multi-story buildings with soft, weak or open front walls, and existing non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources Survey.	*Construction* – Significant and unavoidable *Operation* –Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			Required standard: Prior to demolition, grading/excavation, or construction, a Qualified Structural Engineer shall prepare a survey establishing baseline structural conditions of potentially affected structures and a Vibration Control Plan, which shall include methods to minimize vibration, including, but not limited to: • A visual inspection of the potentially affected structures to document (by video and/or photography) the apparent physical condition of the building (e.g., cracks, broken panes, etc.). • A shoring design to protect the identified structures from potential damage; • Use of drilled piles or a sonic vibratory pile driver rather than impact pile driving, when the use of vibrating equipment is unavoidable; • Use of rubber-tired equipment rather than metal-tracked equipment; and • Avoiding the use of vibrating equipment when allowed by best engineering practice. **MM NOI-8:** The following is required for any project, with the exception of projects limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses, whose earthwork or construction activities: (1) involve the use of construction equipment, including Heavy Construction Equipment, that produces 0.12 PPV or more of vibration at a distance of 25 feet; (2) require a permit from LADBS; and (3) which occur: • Within 25 feet of any building extremely susceptible to vibration damage, including unreinforced masonry buildings, tilt-up concrete wall buildings, wood-frame multi-story buildings with soft, weak or open front walls, and non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources survey; or	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			• Within 15 feet of non-engineered timber and masonry buildings. Or any project whose construction activities involve the use of pile drivers within 135 feet of any building extremely susceptible to vibration damage, including existing unreinforced masonry buildings, existing tilt-up concrete wall buildings, existing wood-frame multi-story buildings with soft, weak or open front walls, and existing non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic resources Survey. Required standard: In the event of damage to any non-historic building due to construction vibration, as verified by the Qualified Structural Engineer, a letter describing the damage to the impacted building(s) and recommendations for repair shall be prepared by the Qualified Structural Engineer within 60 days of the time when damage occurred. Repairs shall be undertaken and completed, at the owner's or applicant's expense, in conformance with all applicable codes. In the event of vibration damage to any building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources survey, a letter describing the damage to the impact building(s) and recommendations for repair shall be prepared by the Qualified Historian within 60 days of the time when damage occurred. Repairs shall be undertaken and completed, at the owner's or applicant's expense, in conformance with the California Historical Building Code (Title 24, Part 8) as well as the Secretary of the Interior's Standards for the Treatment of Historic Properties and associated guidelines, as applicable and as determined by the Qualified Historian.	
Private Airstrip / Airport Plan	**Impact 4.11-3:** For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Proposed	No impact	No mitigation required.	No impact

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
	Plan expose people residing or working in the project area to excessive noise levels?			
Population, Housing and Employment				
Induce Substantial Population Growth	**Impact 4.12-1:** Would implementation of the Proposed Plan induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?	Less than significant	No mitigation required.	Less than significant
Displacement of Existing People or Housing	**Impact 4.12-2:** Would implementation of the Proposed Plan displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	Less than significant.	No mitigation required.	Less than significant.
Public Services and Recreation				
Fire Protection	**Impact 4.13-1:** Would the Proposed Plan result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?	Less than significant	No mitigation required.	Less than significant
Police Protection	**Impact 4.13-2:** Would the Proposed Plan result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the	Less than significant	No mitigation required.	Less than significant

	construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?			
Public Schools	**Impact 4.13-3:** Would the Proposed Plan result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service or other performance objectives for public schools?	Less than significant	No mitigation required.	Less than significant
Libraries	**Impact 4.13-4:** Would the Proposed Plan result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for libraries?	Less than significant	No mitigation required.	Less than significant
Existing Regional Parks or Recreation Facilities	**Impact 4.13-5:** Would the Proposed Plan increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Significant	No feasible mitigation measures have been identified.	Significant and unavoidable

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Recreational and Governmental Facilities	**Impact 4.13-6:** Does the Proposed Plan include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	Less than significant.	No mitigation required.	Less than significant.
Transportation and Traffic				
Circulation System Programs and Policy	**Impact 4.14-1:** Would implementation of the Proposed Plan conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadways, bicycle and pedestrian facilities?	Less than significant	No mitigation required.	Less than significant
CEQA Guidelines	**Impact 4.14-2:** Would implementation of the Proposed Plan conflict or be inconsistent with *CEQA Guidelines* section 15064.3, subdivision (b)?	Less than significant	No mitigation required.	Less than significant
Design Feature Hazards	**Impact 4.14-3:** Would implementation of the Proposed Plan substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Less than significant, except significant and unavoidable for safety impacts related to queuing at freeway off-ramps	No mitigation required, and no feasible mitigation measures have been identified for queuing at freeway off-ramps.	Less than significant, except significant and unavoidable for safety impacts related to queuing at freeway off-ramps
Emergency Access	**Impact 4.14-4:** Would implementation of the Proposed Plan result in inadequate emergency access?	Less than significant	No mitigation required.	Less than significant
Tribal Cultural Resources				
Historical and Tribal Resources	**Impact 4.15-1:** Would implementation of the Proposed Plan cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural	Significant	Refer to mitigation measures CR-1, CR-2, and CR-3. **MM TC-1: Native American Consultation and Monitoring for Discretionary Projects** For all projects that require a permit for grading or excavation, if a possible tribal cultural resource is uncovered during earthwork or	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
	landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: • Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or • A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?		construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Tribal Monitor or Archaeological Monitor has been retained to evaluate the find. Following discovery, the Applicant or Owner shall immediately contact all Native American tribes that have informed the City of Los Angeles they are traditionally and culturally affiliated with the geographic area of the Project, as well as the Department of City Planning, Office of Historic Resources (OHR). If a Qualified Tribal Monitor or Archaeological Monitor determines, pursuant to Public Resources Code Section 21074(a)(2), that the object or artifact appears to be a potential tribal cultural resource, in its discretion and supported by substantial evidence, the Applicant and Owner shall provide any affected tribe a reasonable period of time, not less than five business days, to conduct a site visit and make recommendations to the Applicant or Owner and OHR regarding the monitoring of future Ground Disturbance Activities and the treatment and disposition of any discovered tribal cultural resources. The Applicant or Owner shall implement the tribe's recommendations if the Qualified Tribal Monitor or Archaeological Monitor reasonably concludes such recommendations are reasonable and feasible. Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of tribal cultural resources should occur as follows: • The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource. • When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a Qualified Tribal Monitor or Qualified Archaeologist. All collected artifacts and fieldwork notes, if not human remains or other mortuary objects, shall be curated at the Natural History Museum of Los Angeles County or another appropriate curatorial facility for educational purposes. If cleared by the Qualified Tribal

			Monitor or Archaeological Monitor, Ground Disturbance Activities may continue unimpeded on other portions of the site. Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed. A report that describes the resource and its disposition, as well as the assessment methodology shall be prepared by the Qualified Tribal Monitor or Archaeological Monitor, according to current professional standards. A copy of the report shall be submitted to OHR, the South Central Coastal Information Center at California State University, Fullerton and to the Native American Heritage Commission for inclusion in its Sacred Lands File. If requested by the City, OHR may review and approve any monitoring or mitigation plan prior to implementation. **MM TC-2: Notices for Non-Discretionary Projects** All projects that are seeking excavation or grading permits, prior to issuance of a permit for grading or excavation, the Department of Building and Safety shall issue the following notice and obtain a signed acknowledgement that the notice was received and read by the applicant and owner. • Several federal and state laws regulate the treatment of tribal resources and make it criminal violation to destroy those resources. These include, but are not limited to: – California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor." – Public Resources Code Section 5097.5(a) states, in part, that: – No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art,	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			or any other archaeological, paleontological or historical feature, situated on public lands, except with the express written permission of the public agency having jurisdiction over the lands. – California Code of Regulations, Title 14, Section 4307 states: "No person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces…Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave." • Best practices to ensure that tribal cultural resources are not damaged include but are not limited to the following steps: – A Sacred Lands File (SLF) records search shall be requested from and conducted by the California Native American Heritage Commission (NAHC) to determine whether cultural resources associated with any Native American tribe(s) with traditional lands or cultural places located within or near the Project site have been previously identified or whether the Project area is considered sensitive for the presence of tribal cultural resources. – All tribes listed on the NAHC's Native American Contact List included with the SLF records search shall be contacted, informed of the Project, and given an opportunity to provide input. If the tribe provides substantial evidence of a potential for discovery of tribal cultural resources within the Project site and requests monitoring of Project excavation, grading or other Ground Disturbance Activities, a Qualified Tribal Monitor or an Archaeological Monitor shall be retained.	

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			– A qualified tribal monitor or archaeological monitor shall observe all ground disturbance activities within those areas identified in the records search as sensitive for the presence of tribal cultural resources in order to identify any resources and avoid potential impacts to such resources. In the event of a possible discovery of a tribal cultural resource, the qualified tribal monitor or archaeological monitor shall have the authority to temporarily halt earthwork activities within an appropriate radius of the find, as determined by the qualified tribal monitor or qualified archaeologist to ensure the find is not damaged or any other potential tribal cultural resources on or near the project site. – If tribal resources are uncovered (in either a previously disturbed or undisturbed area), all work should cease in the appropriate radius determined by the qualified tribal monitor and in accordance with federal, state, and local guidelines. – Any find shall be treated with appropriate dignity and protected and preserved as appropriate with the agreement of the qualified tribal monitor and in accordance with federal, state, and local guidelines. – The location of the tribal cultural resources find and the type and nature of the find should not be published beyond providing it to public agencies with jurisdiction or responsibilities related to the resources any affected tribal representatives. – Following discovery, the applicant or owner shall immediately contact all Native American tribes that have informed the City of Los Angeles they are traditionally and culturally affiliated with the geographic area of the Project, as well as the Department of City Planning, Office of Historic Resources (OHR). – The applicant and owner shall provide any affected tribe a reasonable period of time, not less than five business days, to conduct a site visit and make recommendations to the applicant or owner regarding the monitoring of

Water Facilities and Supply	**Impact 4.16-1:** Would implementation of the Proposed Plan require or result in the relocation or construction of new or expanded waster facilities, the construction or relocation of which could cause significant environmental effects? **Impact 4.16-2:** Would implementation of the Proposed Plan have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years	Less than significant	No mitigation required.	Less than significant
Wastewater and Stormwater Drainage	**Impact 4.16-3:** Would implementation of the Proposed Plan require or result in the relocation or construction of new or expanded wastewater treatment facilities the construction of which could cause significant environmental effects? **Impact 4.16-4:** Would implementation of the Proposed Plan result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments? **Impact 4.16-5:** Would implementation of the Proposed Plan require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	Less than significant	No mitigation required.	Less than significant

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Solid Waste	**Impact 4.16-6:** Would implementation of the Proposed Plan generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? **Impact 4.16-7:** Would implementation of the Proposed Plan comply with federal, state, and local statutes and regulations related to solid waste?	Less than significant	No mitigation required.	Less than significant
Electricity, Natural Gas, and Telecommunications	**Impact 4.16-8:** Would implementation of the Proposed Plan require or result in the relocation or construction of new or expanded electricity, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.	Less than significant	No mitigation required.	Less than significant

3.0 PROJECT DESCRIPTION

Consistent with the provisions of the *California Environmental Quality Act (CEQA) Guidelines* Section 15124, this chapter provides information regarding the Proposed Plan, including the Boyle Heights Community Plan updated and related adoption of the New Zoning Code.

This chapter is required to include the following information: the location of the Proposed Plan; a statement of project objectives; a general description of the Plan's technical, economic, and environmental characteristics; and a statement briefly describing the intended uses of the EIR. The *CEQA Guidelines* state a project description need not be exhaustive but should provide the level of detail needed for the evaluation and review of potential environmental impacts.

The Project Description is the starting point for all environmental analysis required by the *CEQA Guidelines*. Section 15146 of the *CEQA Guidelines* states that the degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity, which is described in the EIR.

3.1 PROJECT OVERVIEW

There are 35 community plans [1] that make up the land use element of the City's General Plan. The Update to the Boyle Heights Community Plan is the principal component of the Proposed Plan. A Community Plan Update will require: (i) amending the text of the community plan, including the goals, policies, and programs; (ii) amending the designations on the General Plan land use maps for the community plan area, which express a range of development intensities, distribution of land uses, and provide zoning consistency tables; (iii) adopting implementing zoning ordinances, including adopting zone changes to amend the Zoning Map, as well as amendments to the City's zoning regulations and adoption of overlays; and (iv) any other necessary and related actions to implement the community plan amendments, including adopting amendments to other elements of the City's General Plan (e.g., the Framework or Mobility Elements) to ensure consistency, or adopting other land use related ordinances (such as amendments to housing regulations).

A community plan, as a portion of the Land Use Element of the General Plan, is a vision statement for the City's desired growth and development of a particular area of the City. As a very general matter, that vision is implemented through zoning ordinances that specifically regulate allowed land uses and standards for development and design for properties throughout the community plan area. In the case of the Boyle

[1] A pending proposal to adopt the Downtown Community Plan would merge two community plans—the Central City Community Plan and the Central City North Community Plan. If adopted, the City will have 34 community plans.

Heights Community Plan Update, the City will utilize the "New Zoning Code" established in Chapter 1A of the Los Angeles Municipal Code (LAMC), discussed further below.

The proposed project to update the Boyle Heights Community Plan, including adopting changes to re-designate property in the Boyle Heights Plan area utilizing the zone classifications in the New Zoning Code, as well as the other required actions to update the community plan, is referred to in this EIR as the 'Boyle Heights Community Plan' or 'Proposed Plan.'

This chapter provides an overview of the Proposed Plan, its location, the background for the Proposed Plan, the Project objectives, a broad description of the existing environment, and a description of the Project components, including how they respond to growth trends, and the proposed land use and zone changes.

Boyle Heights Community Plan Update

The Proposed Plan includes amending both the text of the Boyle Heights Community Plan and the General Plan Land Use Map, for the Boyle Heights Community Plan. The Proposed Plan would also adopt several zoning ordinances to implement the updates to the Community Plan, including rezoning all parcels in the Community Plan Area (CPA) to regulate specific uses and apply development standards (including height of structures, Floor Area Ratios, site configuration) using the New Zoning Code. Additional zoning ordinances include a Community Plan Implementation Overlay District; removing existing building lines by rescinding building line ordinances; amendments to the River Improvement Overlay (RIO) District to remove properties within the Boyle Heights CPA from the RIO District; and amendments to the Clean Up Green Up (CUGU) Overlay to remove properties within the Boyle Heights CPA from the CUGU District.

The Boyle Heights Community Plan Update includes zone changes to implement the policies, objectives, and goals of the Plan. The New Zoning Code includes a range of new zones that regulate building standards, use allowances and limitations, development standards, and allowable densities; Citywide Development Standards (such as landscaping requirements, grading haul route standards, minimum pedestrian walkways, and others); zoning incentive system(s) tied to public benefits; incorporation of overlay district standards and regulations; and updated minimum parking requirements.

The amendments to the community plan text and the General Plan Land Use Map for the Boyle Heights Community Plan are intended to guide development through the year 2040 by establishing the City's broad planning goals, policies, and objectives, the arrangement of land uses and intensities, as well as specific development standards for the Plan area. The Boyle Heights Community Plan is intended to improve the link between land use and transportation in a manner that is consistent with the City's adopted General Plan Framework Element, Mobility Element, SB 375 and state law.

No new development would be entitled or built as a direct result of adopting the Proposed Plan. Future development projects would require additional discretionary and/or administrative approvals. These development projects are expected to occur over the next several decades. The exact type, place, and intensity of each new development cannot be assured through the adoption of the Proposed Plan, as the level of activity will be determined largely by private investment in Boyle Heights and the condition of the local economy.

New Zoning Code

Realizing the objectives of the Boyle Heights Community Plan Update as envisioned requires the application of New Zoning Code regulations, developed through re:code LA, the comprehensive revision of the City's zoning code. The New Zoning Code regulations include provisions for the new zone modules,[2] (a range of Form Districts, Frontage Districts, Use Districts, Development Standards Districts, and Density Districts

Even when adopted into the LAMC, the New Zoning Code districts are not effective until they are implemented through zone changes that apply the New Zoning Code districts to specific properties through amendments to the City's Zoning Map. The expectation is that the New Zoning Code will be adopted in large part prior to the adoption of the Proposed Plan, through the adoption of the Process & Procedures Ordinance and the adoption of the Downtown Community Plan Update, the first community plan update to use the New Zoning Code zoning modules.

The timing of the re:code LA initiative in relation to the Boyle Heights Community Plan Update provides an opportunity to use the proposed New Zoning Code structure as part of the Boyle Heights Community Plan Update and implement the New Zoning Code in the Proposed Plan Area. This Proposed Plan will apply the New Zoning Code solely within the Boyle Heights CPA. The application of the New Zoning Code outside of the Boyle Heights CPA will be an incremental process over time through subsequent community plan updates or other policy projects.

While the majority of the New Zoning Code is anticipated to be adopted prior to the adoption of the Boyle Heights Community Plan, the Proposed Plan will likely include adding one or more new zoning modules or types to the New Zoning Code. These New Zoning Code regulations adopted with the Proposed Plan could be applied or implemented elsewhere in the City as other community plans are updated or amended

---

2 For clarity, throughout this document, "zone module type" refers to the structural or organizational components of the new zone string: Form Districts, Frontages, Use Districts, Development Standards, and Density limitations. "Zone modules" refer to specific Form Districts, Frontages, Use Districts, Development Standard Sets, or Density Limit Indicators that can be applied to a property. For example, a 'Very-Low Rise 1' is a zone module within the Form District zone module type.

to utilize the new zoning. This would require future legislative action to adopt plan amendments and zoning changes, as well as environmental review. Thus, any amendments to the New Zoning Code regulations could affect other areas within the City's jurisdictional boundaries, as other community plans are updated or amended to utilize the new zoning. Ultimately, the New Zoning Code is intended to apply to the entire City of Los Angeles when all community plans and other applicable planning and regulatory documents are amended and adopted through the New Community Plan program (now referred to as Community Plan Updates). However, even when adopted into the LAMC, the New Zoning Code is not effective in a geographic area until it is implemented through zone changes that apply the New Zoning Code zoning designations, through a Community Plan Update process or separate planning process. Therefore, it is speculative to determine where else in the City the zones implemented through the Boyle Heights Community Plan Update may be applied through future planning processes. Based on the speculative nature of the use of any zone in a future planning effort, implementation of any new zone from amendments to Chapter 1A by the Proposed Plan outside of the CPA is not a part of this project and will not be analyzed in this EIR. See **Section 3.2, the Project Background**, and **Section 3.7, Project Components,** for more details about the New Zoning Code.

3.2 PROJECT BACKGROUND

City of Los Angeles General Plan

California state law (Government Code Section 65300) requires that cities prepare and adopt a comprehensive, integrated, long-term General Plan to direct future growth and development and accommodate projected increases in population and employment. Local and regional long-range plans must be consistent. The General Plan is a fundamental policy document that the California Supreme Court has described as a city's "constitution for future development." It defines how the city should use and manage its physical and economic resources over time. State Law requires eight General Plan Elements: land use, circulation, housing, conservation, open space, noise, safety, and environmental justice. Government Code Section 65302(a) requires the general plan to include a land use element described as follows:

> *(a) A land use element that designates the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, open space, including agriculture, natural resources, recreation, and enjoyment of scenic beauty, education, public buildings and grounds, solid and liquid waste disposal facilities, and other categories of public and private uses of land. The location and designation of the extent of the uses of the land for public and private uses shall consider the identification of land and natural resources pursuant to paragraph (3) of subdivision (d). The land use element shall include a statement of the standards of population density and building intensity recommended for the various districts and other territory covered by the plan. …*

The State requires that the General Plan be periodically revised to reflect new conditions, community input, and technological advances.

The Los Angeles Charter also requires that the City adopt a General Plan:

> *Sec. 554. General Plan – Purpose and Contents*
>
> *The General Plan shall be a comprehensive declaration of goals, objectives, policies and programs for the development of the City and shall include, where applicable, diagrams, maps and text setting forth those and other features.*
>
> *a) Purposes. The general Plan shall serve as a guide for:*
>
> *1) The physical development of the City;*
>
> *2) The development, correlation and coordination of official regulations, controls, programs and services; and*
>
> *3) The coordination of planning and administration by all agencies of the City government, other governmental bodies and private organization and individuals involved in the development of the City.*
>
> *b) Content. The General Plan shall include those elements required by state law and any other elements determined to be appropriate by the Council, by resolution, after consideration the recommendation of the City Planning Commission.*

The General Plan's guiding document for the City of Los Angeles is the Framework Element, which provides a strategy for long-range growth and development focused around the following objectives:

- grow strategically;
- balance the distribution of land uses;
- revitalize economically depressed areas;
- conserve existing residential neighborhoods;
- enhance neighborhood character through better development standards;
- create more small parks, pedestrian districts, and public plazas;
- improve mobility and access;
- identify a hierarchy of mixed-use districts and centers; and
- focus growth around transit stations.

The Framework Element, adopted in 1996, establishes a long-range land use strategy to support the City's viability and to accommodate projected growth. Framework Element policies reflect that where growth occurs, it is accommodated in a sustainable manner that protects residential neighborhoods and commercial districts, while guiding growth to higher-intensity commercial and mixed use centers that are served by transportation infrastructure. The city's Long-Range Land Use Diagram depicts this growth strategy with land use categories, including Neighborhood District, Community Center, Regional Center, Downtown Center, and Mixed-Use Boulevard, which reflect a conceptual relationship between land use patterns and transportation. The big-picture goals established in the Framework Element are then further refined in other planning documents such as the community plans and the zoning code. In the City of Los Angeles, the Land Use Element is composed of 35 community plans. The 35 community plans guide the physical development of neighborhoods by establishing goals and policies for land use within each CPA. The community plans implement, at a community level, the citywide goals and policies established in the overarching Framework Element and all other elements of the General Plan.

Existing Boyle Heights Community Plan

The last comprehensive update of the Boyle Heights Community Plan was completed in 1998 and was written to guide development through the year 2010. This plan encouraged the conservation and improvement of viable housing, while providing a variety of housing opportunities through compatible new housing, improvement of the function, design and economic vitality of the commercial corridors, maximizing development opportunities along a once proposed rail transit line along Cesar E. Chavez Avenue, and planning the remaining commercial and industrial development opportunity sites for job-producing uses. Since the creation of the 1998 Community Plan a number of important changes have occurred in Boyle Heights:

- The L (Gold) Line Extension along 1st Street was completed in 2009, bringing a major transit investment to Boyle Heights in the form of light rail rather than a subway beneath Cesar E Chavez Boulevard as the 1998 Community Plan anticipated. This same year, the Los Angeles County+USC Medical Center Station opened at the El Monte Busway located off Marengo towards the upper northern boundary of the CPA.

- Two comprehensive zoning ordinances that updated zoning and land use regulations in the Boyle Heights CPA.

  – In 2014 the River Improvement Overlay District (RIO) was adopted, establishing design standards and development regulations for properties located within designated areas around the Los Angeles River.

  - In 2016 the Clean-Up Green-Up (CUGU) Supplemental Use District was adopted in order to address health hazards cause by incompatibilities between land uses by establishing design, distancing and performance standards for potentially hazardous uses and sensitive uses that locate near each other.

- In 2011 the state legislature approved the dissolution of Redevelopment Agencies. Thereafter, implementation of the land use authority over the Adelante Eastside Redevelopment Area Plan, which encompasses all of the CPA's industrial land and commercial corridors, transitioned to the Designated Local Authority (DLA). In 2019 transition, pursuant to AB 1484 and City Council resolution, authority of the land use related plans and functions transferred to the City. The Plan is set to expire in 2030. (Also see page 3.0-15 "California Redevelopment Project Area".)

- In 2014, SurveyLA, which is a citywide project managed by the Department of City Planning's Office of Historic Resources (OHR), completed a historic resources survey of the Boyle Heights CPA. See **Section 4.4, Cultural Resources,** for additional discussion.

- The Bureau of Engineering (BOE) is currently managing the construction of the replacement of the Sixth Street Viaduct. BOE published the DEIR in May 2021 for the creation of the Sixth Street Park, Arts, River & Connectivity Improvements (PARC) Project, which includes a 12 acre public recreational space in areas underneath and adjacent to the Sixth Street Viaduct within Downtown's Arts District and Boyle Heights.

- In November 2016, voters in the City of Los Angeles City approved Measure JJJ, which led to the adoption of the Transit Oriented Communities (TOC) Guidelines by the City Planning Commission in September 2017. As further discussed in **Section 4.10, Land Use and Planning,** the guidelines provide incentives for projects planned around public transit, within one-half mile of significant public transit stops that include units set aside for affordable housing within the development project. The CPA includes four Metro L (Gold) Line Stations and a network of Metro buses as well as other routes operated by providers other than Metro (i.e., Montebello transit).

- In early 2021, updates to state laws for Accessory Dwelling Units (ADUs) became effective.

Further, the following issues have substantially evolved or been prioritized since the last Plan Update: ***sustainability*** (including through the 2006 California Global Warming Solutions Act, or Assembly Bill [AB] 32, and 2008 Sustainable Communities Act, or Senate Bill [SB] 375); ***mobility*** (the 2008 Complete Streets Act, or AB 1358, and the City's revised Mobility Element known as Mobility Plan 2035); ***housing*** (the City's updated Housing Element and Assembly Bill [AB] 2299 and SB [SB] 1069 for accessory dwelling units; SB 8 and 330 that streamline housing approval processes and strengthen rules for protected units; and SB 9

and 10 for infill housing development); ***health and wellness*** (the City's Plan for a Healthy Los Angeles); and ***historic preservation***.

In order to keep the Boyle Heights Community Plan up-to-date, the existing Community Plan is being revised to guide development through the year 2040. The update process for this Community Plan involves determining anticipated residential and employment growth and where new growth or infill should occur in a manner that improves the quality of life of existing and future residents of Boyle Heights and the City of Los Angeles. In arriving at these determinations many factors are accounted for, including a variety of community preferences, housing demand, leveraging investment in infrastructure, opportunities for economic development, and the potential for environmental impacts.

Department of City of Planning (DCP) New Community Plan Program

In 2006, DCP established the New Community Plan (NCP) Program. The intent of the NCP Program is to update the community plans regularly in order to encourage smart growth, identify appropriate locations for new development, minimize lengthy discretionary approvals, and provide certainty and predictability for developers, homeowners and anyone else concerned with future development in the City. One of the goals of the NCP Program is to accommodate projected growth consistent with the Framework Element (Framework Element, Page 1). The NCP Program also establishes an ongoing method to revise community plans with civic engagement and other participatory efforts in order to address prevailing neighborhood and community issues. Recommended changes to community plans and their policies and programs are based on public input, as well as collaboration with other City departments and governmental agencies.

3.3 LOCATION, CURRENT LAND USE, AND REGULATORY SETTING

The Boyle Heights CPA is bordered by the Central City North CPA[3] to the west and the Northeast Los Angeles CPA to the north. Major east-west corridors include (from north to south) Marengo Street, Wabash Avenue, Cesar E Chavez Avenue, 1st Street, 4th Street, Whittier Boulevard, and Olympic Boulevard. Major north-south corridors include (from west to east) Mission Road, Soto Street, Lorena Street, and Indiana Street.

Four freeways traverse the Boyle Heights CPA, with the San Bernardino Freeway (I-10 Freeway) and Hollywood Freeway (US 101) traversing through the northern portion of the Boyle Heights CPA and Interstate 5 (I-5) and the Pomona Freeway (SR-60) traversing through the southern portion of the CPA. All

[3] Proposed to be combined with the Central City CP and renamed the Downtown CP.

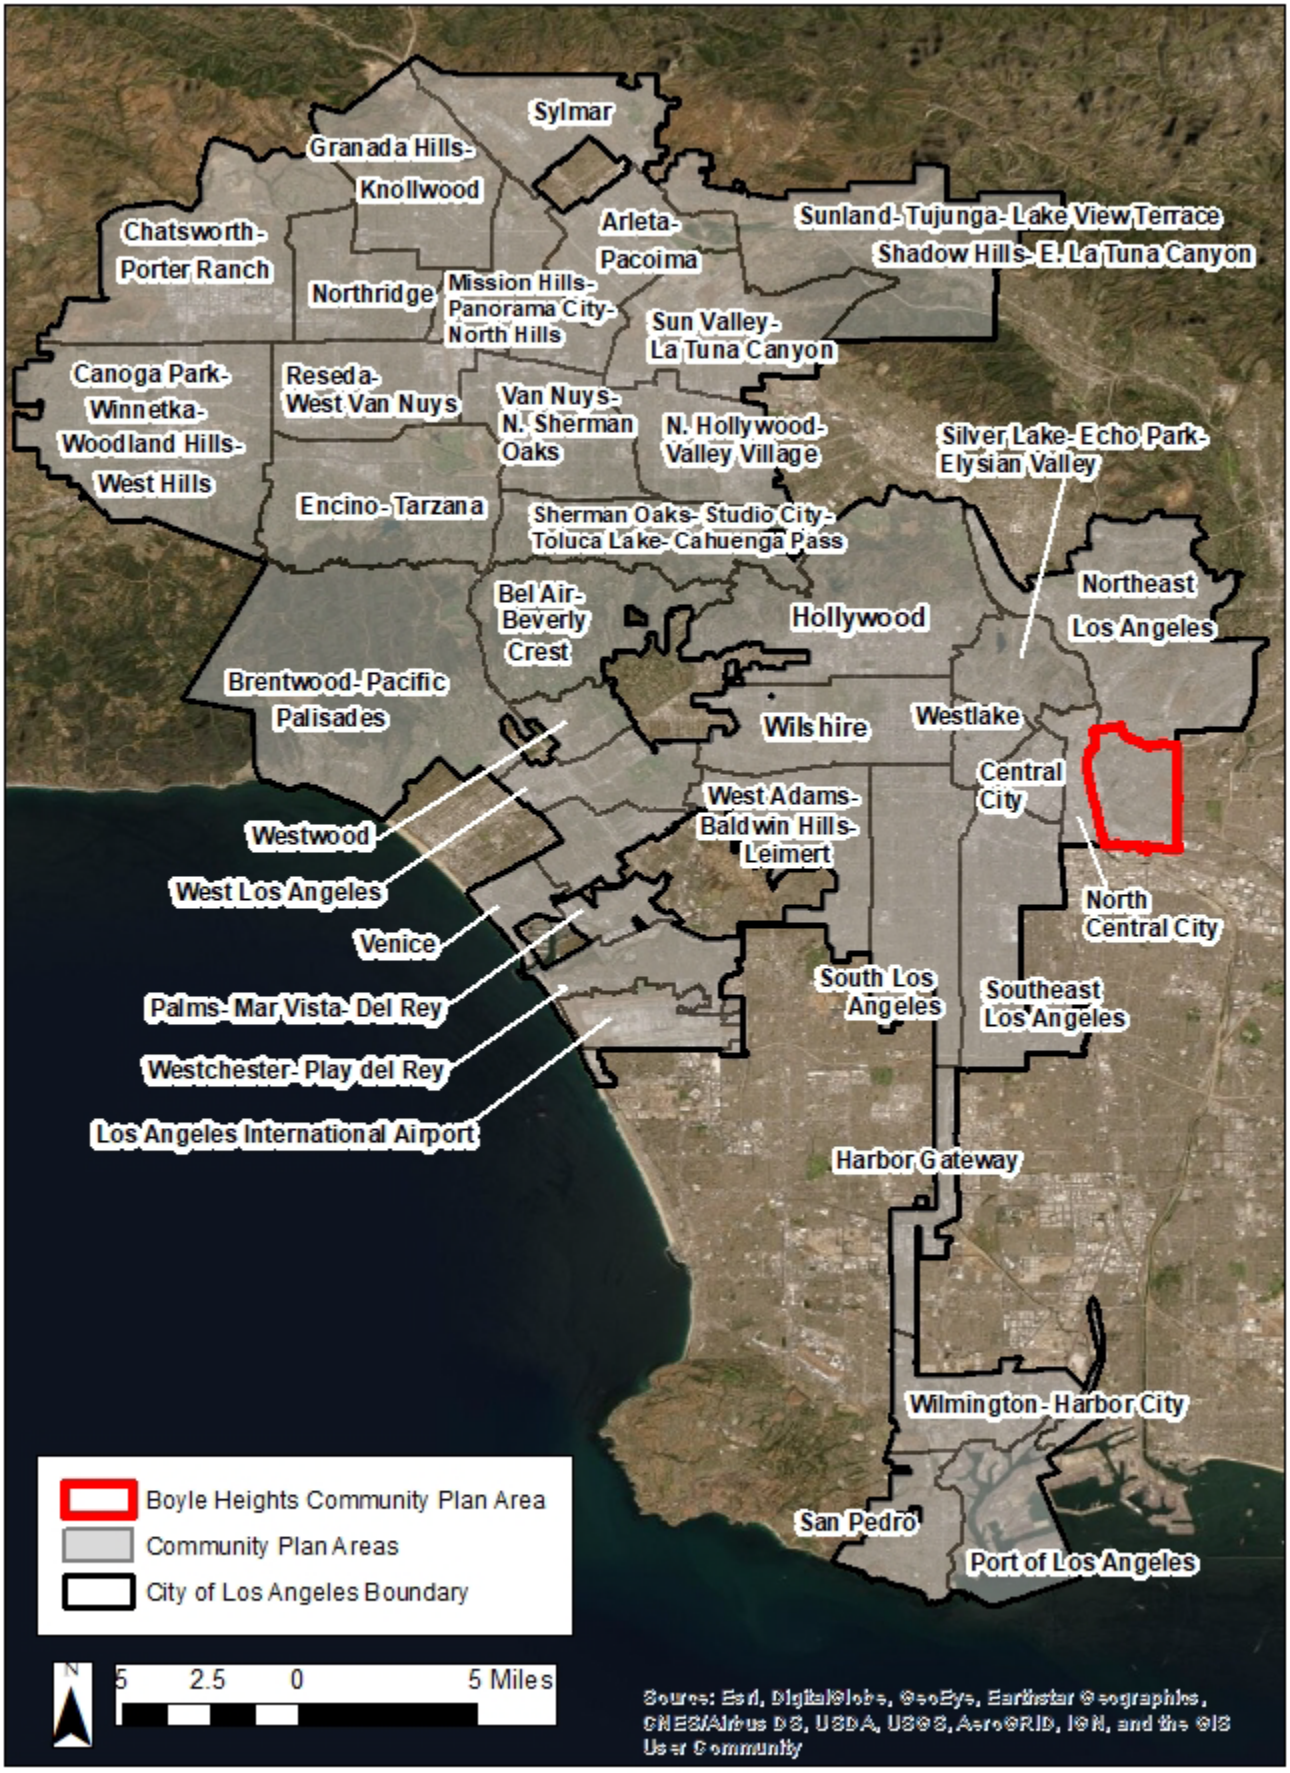
four freeways converge over much of the western portion of the Boyle Heights CPA to form the East Los Angeles Interchange.

The Boyle Heights CPA is located immediately east of Downtown Los Angeles and the Los Angeles River and rail corridor and encompasses an area of approximately 4,271 acres (approximately 6.67 square miles). The Boyle Heights CPA is roughly bounded by the San Bernardino Freeway (I-10 Freeway) and Marengo Street to the north, the Union Pacific and Santa Fe Railroad lines to the south, Indiana Street to the east, and the Los Angeles River to the west. The southern and eastern borders of the CPA align with the city limits of Los Angeles with the City of Vernon located to the south and the unincorporated community of East Los Angeles located to the east of the CPA, with a small area of the Southeast corner of the CPA aligning with the City of Commerce. Located to the north are the Los Angeles communities of Lincoln Heights, El Sereno, and Ramona Gardens, and located to the west are the industrial districts and public facilities of Downtown, which includes the Arts District.

Topography in the Boyle Heights CPA includes mild variations with lower elevations along the Los Angeles River alluvial plain which then builds up to a system of bluffs that form the western edge of the plateau that constitutes most of the land area in the CPA. Other topographical features include several minor hills located in the northeast corner of the CPA and a ravine located to the west of Lorena Street.

The Los Angeles River is an important ecological feature located on the western edge of the Boyle Heights CPA. The Los Angeles River was once a free-flowing waterway but was encased in concrete in the 1930s as part of a flood control project undertaken by the U.S. Army Corps of Engineers. Efforts being led by the Army Corps of Engineer and the City of Los Angeles are now underway to restore some of the river's natural qualities over the coming decades.

Boyle Heights has a residential population of approximately 86,000 and a population density of approximately 13,000 people per square mile making it one of the most densely populated communities in Los Angeles.



Existing Residential. The predominant land use in the Boyle Heights CPA is residential. Approximately 43 percent (1,278 acres) of the Boyle Heights CPA is zoned residential. Existing residential areas within the Boyle Heights CPA are primarily designated for multi-family, with multi-family land use designations covering 98 percent of all residential areas within the CPA. The remaining two percent of residential land is designated for low density and single-family use. Low density areas only exist in three small clusters near the edges of the CPA: south of Los Angeles County/USC Medical Center; tucked within the northeast corner of the CPA south of the I-10 and west of the City Terrace boundary; and just south of SR-60 and west of Indiana Street along the city limits boundary.

FIGURE **3.0-2**

IMPACT SCIENCES

City of Los Angeles Community Plan Areas

Existing Commercial. Commercial land uses consist of approximately 8 percent (244 acres) of the total land area of the CPA. The four major east-west commercial corridors of Cesar Chavez Avenue, First Street, Fourth Street, and Whittier Boulevard contain the majority of the CPA's commercial land use designations. Smaller concentrations are located along Marengo Street, Wabash Avenue, and Olympic, and on north-south corridors such as Soto Street and Lorena Street. Commercial uses in the CPA are locally-oriented, containing a mix of retail, restaurants, offices, and services primarily established to serve the immediate residential community.

There are currently two designated Regional Centers in Boyle Heights, including a six block section of Cesar Chavez Avenue, and the area surrounding the intersection of Olympic Boulevard and Soto Street, in proximity to the historic Sears building. Both Regional Centers were designated as such with future aspirations in mind. While it was anticipated that a subway line would extend beneath Cesar Chavez Avenue during the previous Community Plan update process which took place during the 1990s, a transit line was instead built along First Street, removing the possibility that Cesar Chavez Avenue would develop into a major transit corridor on a regional scale.

Existing Industrial. Industrial land uses make up 26 percent (783 acres) of the total land area in the CPA. A continuous belt of industrial land runs from the northwest corner of the CPA and extends south along the Los Angeles River and adjacent rail lines, continuing southeast and occupying the southern portion of the CPA. Industrial land contains a variety of uses including goods processing and distribution, which contribute to much of the areas' business activity. As a result, the area attracts heavy goods movement traffic along the corridors that pass through the industrial areas, with Mission Road, Fourth Street, Olympic Boulevard and Soto Street experiencing large amounts of truck traffic.

Existing Open Space. Boyle Heights is mostly built out and contains few natural features and no significant areas of natural open space. Land designated Open Space consists of approximately 5 percent (149 acres) of the total area in the CPA, with the most significant civic open space being Hollenbeck Park. Other smaller civic parks include Lou Costello Jr Recreational Center, Evergreen Recreational Center, Ramon Garcia Recreational Center, Prospect Park, and State Street Recreation Center. Other large portions of land designated as Open Space consist of cemetery land within Evergreen Cemetery and Odd Fellows Cemetery.

Existing Public Facilities. The Boyle Heights CPA contains a number of public facilities including three libraries, one police station, and two fire stations; yet by far the largest portion of land designated for public facilities consists of land dedicated to the freeways, which all together consume about 15 percent of the total CPA land area. Public facilities other than freeways comprise (7) percent and (190) acres of land in the CPA. A total of 27 LAUSD public schools and 7 charter schools are located in the CPA, including 6 primary/early education centers.

Existing Transportation System. The Project Area's transportation system includes a public transit system; bicycle routes; a circulation network of freeways, highways and surface roadways; and a pedestrian circulation system of sidewalks and crosswalks.

- Public Transportation options include:
  - Metro L Line (Light Rail)
  - Metro Bus lines
  - LADOT Boyle Heights DASH bus
  - Montebello Bus Lines
  - El Sol Shuttle
  - Commerce Municipal Bus Lines
- Bicycle networks include:
  - Class II Bicycle Lanes
  - Class III Bicycle Lanes
- Freeways include:
  - Interstate 5 (I-5, Golden State Freeway)
  - US- 101 (101, Hollywood Freeway)
  - Interstate 10 (I-10, San Bernardino Freeway)
  - California State Route 60 (SR 60, Pomona Freeway)
- Street designations include:
  - Boulevard II
  - Avenue I
  - Avenue II
  - Avenue II Modified
  - Collector
  - Collector Modified
  - Industrial Collector

– Local

Regulatory Setting: Planning Overlays

Planning and zoning overlays allow zoning regulations to be tailored to local areas, and include various types of regulatory limitations. Examples of these limitations include land use restrictions, maximum heights, building form and massing requirements, intensity limits, etc. Where these plans establish regulations that are different from, more restrictive, or more permissive than the base zoning, these overlays supersede.

Below is a description of the existing overlays within the Boyle Heights CPA.

Planning Overlays

- River Improvement Overlay (RIO) District (Ordinance 183144) established design standards and development regulations for properties located within designated areas around the Los Angeles River.
- Clean-Up Green-Up (CUGU) Supplemental Use District (Ordinance 184245) addresses health hazards caused by incompatibilities between land uses by establishing design, distancing and performance standards for potentially hazardous uses and sensitive uses that locate near each other.

As part of the Proposed Plan, the above overlays will be amended and will become integrated into the New Zoning Code. See Section 3.7.3 for a discussion of how these overlays will be addressed in the Proposed Plan.

California Redevelopment Project Area

Community Redevelopment Areas (CRA) are areas, pursuant to California Redevelopment Law, that were identified for revitalization through the building of new housing and commercial projects. Prior to 2012, the Community Redevelopment Agency of Los Angeles (CRA/LA) was the agency in charge of developing, implementing, and overseeing CRA projects in the City (Urban Land Institute, Los Angeles 2012). The passage of AB1x-26 and the California Supreme Court's decision in *California Redevelopment Association v. Matosantos* in 2012 effectively dissolved redevelopment agencies in the State. Since the dissolution of the CRA/LA, activities in the redevelopment project areas have been administered through the Designated Local Authority (DLA). In 2019, pursuant to AB 1484 and City Council resolution, all "land use related plans and functions" of the DLA transferred to the City.

The Boyle Heights CPA includes one CRA Redevelopment Project Area, the Adelante Eastside Redevelopment Plan, which expires in 2031. The main goal of the Adelante-Eastside Redevelopment Plan

is to remove blight and preserve and increase employment, job training, and business and investment opportunities through redevelopment programs. The Redevelopment Plan identifies, now defunct, redevelopment funding sources for rehabilitation of existing residential, commercial, and industrial buildings. The Redevelopment Plan also includes policies for land uses permitted in the Project Area. These policies include policies for commercial, residential, and industrial uses; commercial uses within residential areas and industrial areas; residential uses within commercial areas; as well as open space and other public uses.

3.4 GROWTH TRENDS

The Proposed Plan plans for and guides anticipated growth and development. This section discusses how the City identifies forecasted growth in population, housing, and employment, and it discusses why the Southern California Association of Governments (SCAG) is the City's primary source for current and forecasted population, housing and employment numbers. It also describes the growth trends for the City of Los Angeles and the Project Area.

As discussed above and in **Section 4.12, Population and Housing**, the Proposed Plan is growth accommodating and not growth inducing. Therefore, while the Proposed Plan directs where anticipated growth will go, the Proposed Plan is not expected to result in or cause growth. However, for the purposes of conservative environmental impact analysis, this EIR will analyze impacts from foreseeable growth in the CPA, including to the extent feasible, how it is anticipated to be directed by the Proposed Plan policies.

The following discussion will identify the baseline and forecasted socioeconomic data (population, households, and employment) used in the EIR to analyze the impacts of growth. However, the reader should be cautioned about an overreliance on quantitative data in the context of analyzing impacts on a long-term plan. While this quantitative data is necessary to model a handful of impacts (i.e., transportation, GHG, air quality, some utilities) and discuss population, it is important to realize the large majority of the impact sections in the EIR do not rely on socioeconomic data. Additionally, as is discussed below and in **Appendix B, Methodology**, determining baseline and forecasted population, employment, and household numbers is not an exact science. It requires reliance on professional demographers and best available methodologies and data. Different sources, including the top sources can provide numbers that are several percentage points apart. Even the U.S. Census, which is considered the best source of data and is intended to capture existing population numbers cannot be relied on to capture in its survey every person living in a census tract, and can be subject to collection errors. Additionally, existing population, employment, and number of households, as one would expect, is an ever-fluctuating condition. Major events, such as, recessions or pandemics, or unforeseen trends, can have significant impacts to these numbers. Based on

this, as discussed in **Appendix B, Methodology**, the City is using the socioeconomic data it has determined is most reasonably and feasibly available to the City.

2040 Regional Transportation Plan (RTP) Southern California Association of Governments (SCAG) Growth Projections

SCAG is designated as a Metropolitan Planning Organization (MPO) responsible for carrying out federal and state statutory duties within its region, which encompasses six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities in an area covering more than 38,000 square miles with over 18 million residents.

Federal and state laws require SCAG to develop regional plans for transportation, growth management, hazardous waste management and air quality.[4] SCAG is responsible for producing socio-economic estimates and projections at multiple geographic levels. The socio-economic estimates and projections are used for federal and state mandated long-range planning efforts, such as the Regional Transportation Plan (RTP). The RTP is a 20-year transportation plan for the region that addresses regional growth, air quality and other issues, based on an analysis of past and future regional trends. Federal and state requirements direct local plans, such as land use community plans, to be prepared in accordance with the RTP and use demographic projections provided by SCAG. SCAG develops RTPs on a four-year cycle.[5]

Federal laws require that land use allocation in an RTP reflect development patterns most likely to be built in the region. While federal and state laws do not mandate consistency with the RTP, state law does require SCAG to identify and quantify housing needs for the region, prepare the Regional Housing Needs Assessment (RHNA), and for local agencies to update their Housing Elements to plan and zone to accommodate the agency's RHNA. SB 375 coordinates land use and transportation planning to reduce greenhouse gas (GHG) emissions and, to that end, requires SCAG to prepare a Sustainable Communities Strategy (SCS) as an integral part of the RTP. SB 375 also requires the RHNA process to be consistent with an SCS, and that RHNA must be coordinated every eight years (RTP is updated every four years[6]).

A function of SCAG, in preparing the RTP, is to forecast or prepare population, housing and employment projections in consultation with cities in the region. These projections are derived from a combination of sources and consider factors such as birth rates; migration rates; historical trends; household size; market and economic projections; existing and planned land uses; and consistency with relevant adopted local,

4 Government Code Section 65080(b)(2)(B): Part 450 of Title 23 of, and Part 93 of title 40 of, the Code of Federal Regulations.

5 Southern California Association of Governments, The RTP/SCS Development Process http://scagrtpscs.net/Pages/DevProcess.aspx accessed June 2018

6 Government Code Section 65080(b)(2)(B).

regional and state land use policies and growth strategies. The development of the growth forecast is driven by collaboration between SCAG and local jurisdictions. The integration of the regional and local forecasts is achieved through joint efforts and collaboration among the various contributors.[7]

Many government agencies (including public service providers and other City departments) rely on the same source, i.e., the most current SCAG RTP data, for purposes of planning, both for estimates of current population, housing and employment, as well as for projections of future population, housing, and employment. Use of such data is a consistent and best practice for local governments. It is also the Department of City Planning's practice to use SCAG RTP data as a benchmark or as a reference point for estimates and projections locally. For more information about SCAG, see **Appendix B, Methodology**.

While the 2020-2045 RTP (adopted in September 2020) is the most recently adopted RTP, this document relies on the 2016-2040 RTP/SCS, the most recent RTP/SCS at the time of the NOP publication and scoping. This is in part necessary because the most up to date and validated Los Angeles Transportation Demand Forecasting (TDF) model contains data and information from the 2016-2040 RTP/SCS; this model and its outputs are used in various sections of this Draft EIR and therefore, the 2016 RTP/SCS is utilized as the analysis baseline throughout this document.[8] Utilization of the 2016-2040 RTP/SCS for baseline socio-economic data was determined by the City to be reasonable because the adopted 2020 RTP shows similar growth patterns within the Boyle Heights CPA as the 2016 RTP. The 2020-2045 RTP/SCS used a baseline year of 2016. For the Boyle Heights CPA, SCAG utilized a 2016 estimated population of 83,000 persons. This difference is approximately 3 percent from the 86,000 persons in the Proposed Plan's EIR baseline. Further, in comparing baseline conditions for households and employment, the difference between the 2016 RTP and 2020 RTP is less than 4 percent and 2 percent, respectively. Since 2016, there has not been a substantial increase in either dwelling units or jobs within the CPA that would necessitate a different baseline value.[9] As the differences between the socio-economic data for baseline conditions between the 2016-2040 RTP/SCS and the 2020-2045 RTP/SCS are all less than five percent, they are within the margin of error for the modeling that relies on such data and therefore, use of the 2016-2040 RTP/SCS data was determined to be reasonable.

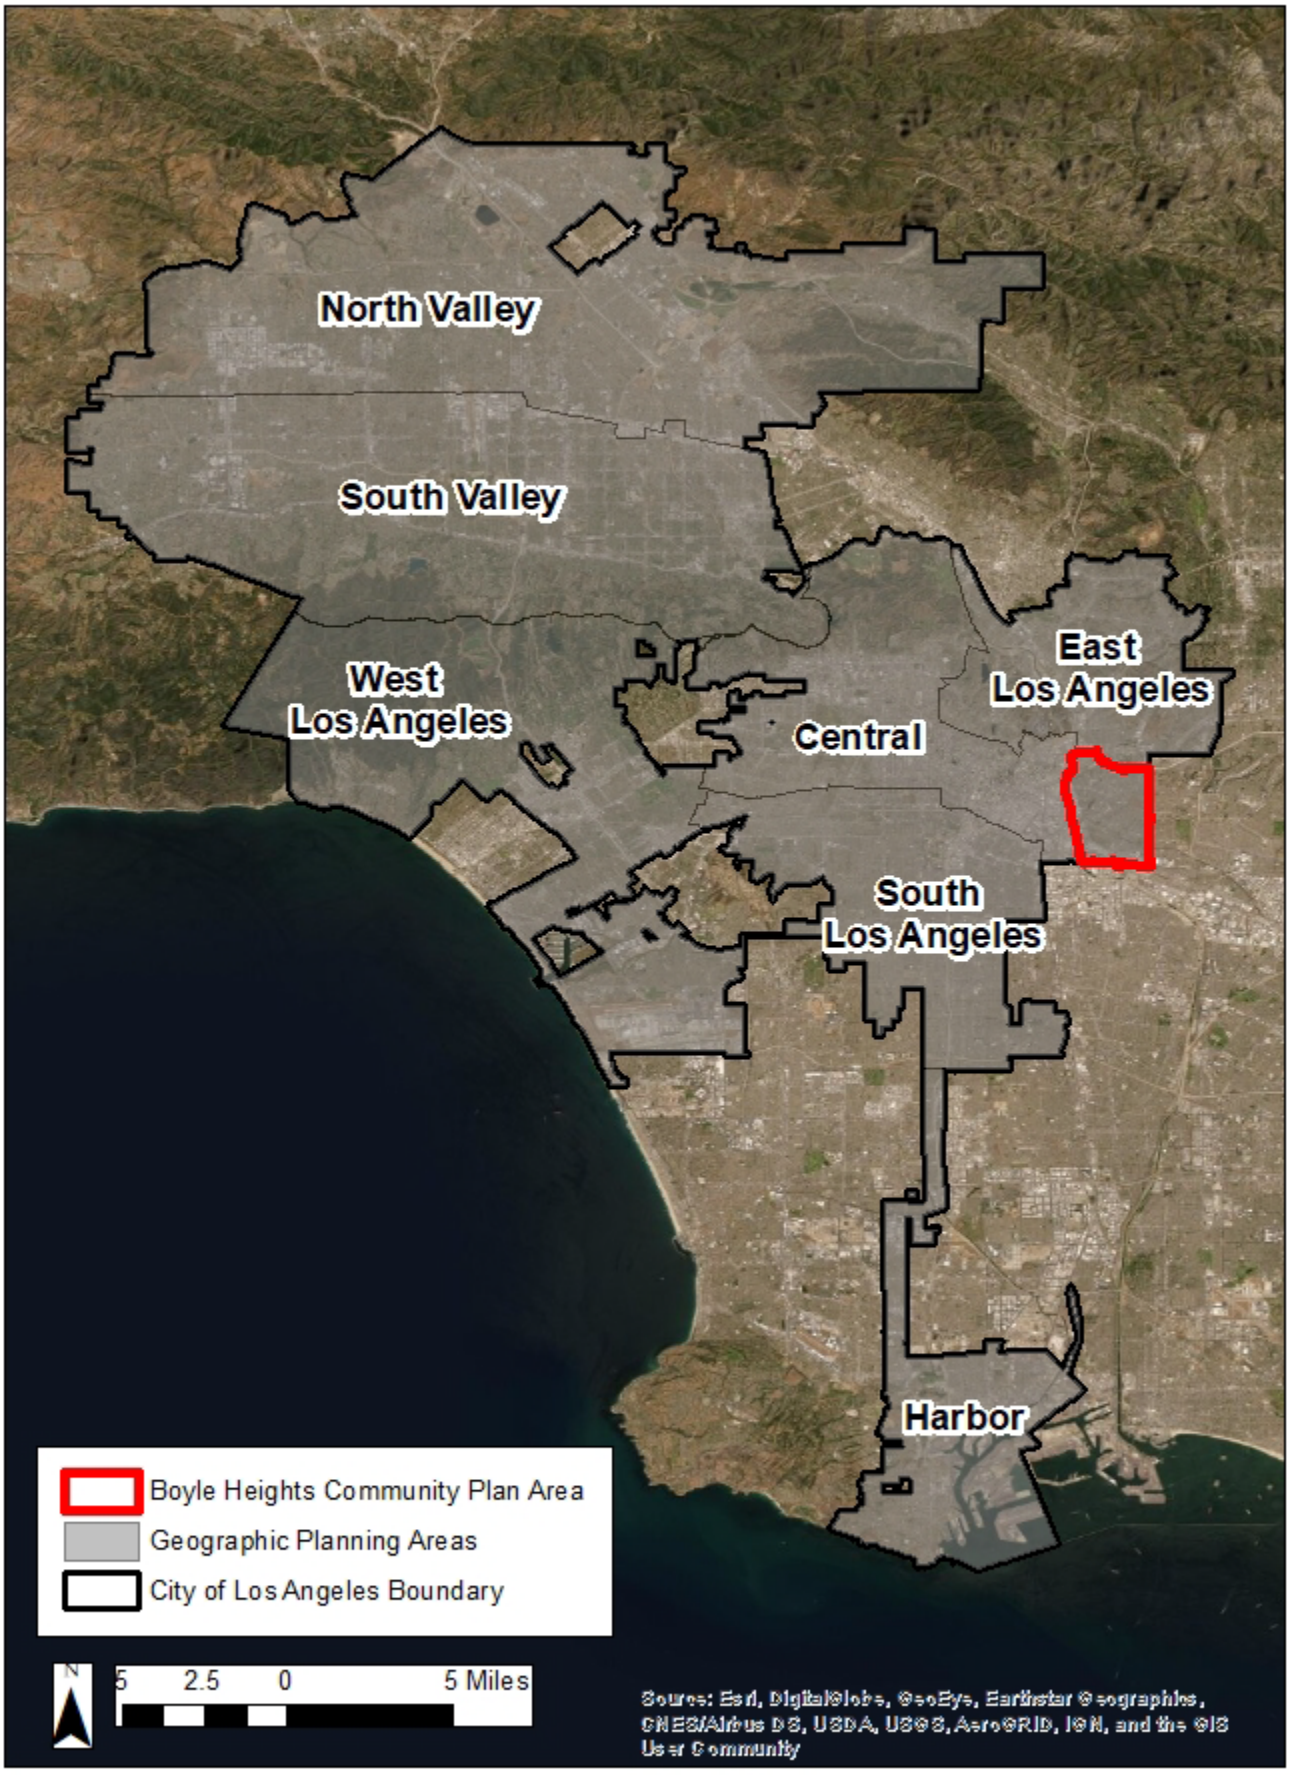
---

7 For more information on SCAG's forecasting methodology and assumptions, see the Demographics & Growth Forecast Appendix of the 2016-2040 RTP/SCS website, http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_DemographicsGrowthForecast.pdf .

8 As of the drafting of this EIR, the Department of Transportation was working on obtaining the necessary grant funds to update the TDF Model with the latest 2020-2045 RTP/SCS data. Based on the significant costs, it was not found feasible to update the TDF Model for this EIR.

9 See also, **Appendix B, Methodology,** for a discussion of the results of the 2020 Census.

Citywide Population Projections



The City of Los Angeles is 469 square miles and had a 2016 population of approximately 3.9 million. The population is anticipated to increase by 17 percent to approximately 4.6 million persons by the year 2040, according to the SCAG 2016-2040 RTP/SCS (**Table 3.0-1, Projected Population Growth for the City**). Every four years, SCAG produces socioeconomic projections that are used by various City departments and agencies for their long-range planning efforts. The growth projection for the City of Los Angeles is based on several factors, including historical development trends, land values, and development costs, as well as smart growth strategies to direct development to areas in proximity to rail and major bus stations, community centers, regional centers, and downtown Los Angeles.

Table 3.0-1
Projected Population Growth for the City

Geographic Planning Area	2016 Population /a/	2040 Projected Population /a/	Projected Population Growth (2016 – 2040) /a/
City of Los Angeles	3,931,000	4,609,000	678,000
South Valley	751,000	876,000	125,000
South Los Angeles	751,000	874,000	123,000
North Valley	716,000	795,000	79,000
Central	684,000	904,000	220,000
West Los Angeles	428,000	497,000	69,000
East Los Angeles	402,000	449,000	47,000
Harbor	200,000	214,000	14,000

Note: /a/ The 2016 estimated population and the 2040 projected population are based on SCAG's 2016-2040 RTP/SCS. Numbers are rounded to the nearest one thousand and aggregated to the Area Planning Commission Boundaries.

The City's 35 CPAs are divided into seven larger geographic areas for planning administration (**Figure 3.0-3, City of Los Angeles Geographic Planning Area**). Each of these geographic planning areas has an Area Planning Commission that reviews certain cases located within their planning area. The Project Area is located within the East Los Angeles geography. According to the 2016-2040 RTP/SCS, the population in the East Los Angeles geography is anticipated to increase by approximately 47,000 by 2040. The East Los Angeles geography represents approximately seven percent of the anticipated population growth for the entire City (**Table 3.0-2, Percentage of Citywide Population and Projected Growth**). The following tables summarize projected population growth for the City of Los Angeles.

SOURCE: City of Los Angeles, 2020

FIGURE **3.0-3**

IMPACT SCIENCES

City of Los Angeles Geographic Planning Areas

Table 3.0-2
Percentage of Citywide Population and Projected Growth

Geographic Planning Area	% of Citywide 2016 Population /a/	% of Citywide 2040 Projected Population /a/	% of Citywide Projected Population Growth (2016 – 2040) /a/
City of Los Angeles	100	100	100
South Valley	19	19	18
South Los Angeles	19	19	19
North Valley	18	17	12
Central	17	20	32
West Los Angeles	11	11	10
East Los Angeles	10	10	7
Harbor	5	5	2

The purpose of forecasting future population is to describe the likely future population based on current trends and to be able to plan for and accommodate change. In general, projections help City departments to understand where current policies might lead and to determine whether those are leading the City towards its stated objectives consistent with federal, state, and local policies. They are also used by each City department in preparing long-range plans, such as community plan updates and infrastructure plans. DCP uses anticipated population growth or population projections as a benchmark, to determine the level of development that is needed to accommodate this future growth. Population growth is a fundamental consideration in making long-range land use planning decisions. However, as discussed above, it is important to note that these projections are calculations based in part on a number of assumptions and, as with any data reliant on assumptions, projections have limitations. For example, projections are often based on recent trends that may or may not continue as conditions change.

Boyle Heights CPA Growth Projections

The State of California requires that cities plan for changes in demographics, including housing demand, population, and employment. If growth is anticipated, each city must accommodate a share of the region's projected growth. The Project Area represents approximately 1.4 percent of the City of Los Angeles land area (nearly 6.6 square miles out of 469 square miles) and 2.19 percent of the City's population. Over the next few decades, population within the CPA is anticipated to increase by approximately eight percent by year 2040, as identified by SCAG projections in 2016 (see **Table 3.0-3, Projected Population Growth for the Project Area**). The CPA is projected to continue growing but at a slower rate than the City of Los Angeles as a whole.

Table 3.0-3
Projected Population Growth for the Project Area

Area	Existing Population (2016)	% of Citywide Existing Population	2040 Projected Population	Projected Population Growth (2016-2040)	% of Citywide 2040 Projected Population	% Change in Projected Population Growth (2016-2040)
City of Los Angeles	3,931,000	100%	4,609,000	678,000	100%	17%
Project Area	86,000	2 %	93,000	7,000	2%	8%

Note: Numbers are rounded to the nearest thousand.

3.5 BASELINE CONDITIONS

CEQA requires an EIR to compare existing physical conditions ("baseline") to the physical conditions after implementation of a project. For the Proposed Plan, which plans for growth and development, there is no expected direct effect from the Proposed Plan (such as for a construction project), but there are expected indirect effects from the reasonably anticipated development that will occur. To assess the impacts of the Proposed Plan requires determining reasonably expected development and identifying the current conditions. Both of these determinations rely in part on estimates of the current population, housing and employment, and the forecasted growth in population, housing and employment (see Growth Trends, above for a discussion of the Project Area's forecasted growth).

CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a proposed project, as they exist at the time the NOP is published. This environmental setting normally constitutes the baseline physical conditions to which the lead agency compares the impacts from the project and determines the significance of impacts. The NOP for this EIR was published on September 2, 2016 (see **Appendix B, Methodology**). Thus, the Draft EIR uses 2016 as the baseline existing conditions. Where baseline conditions for population, housing, and employment are used, the Project assumes 2016 baseline numbers from SCAG, published in the adopted 2016-2020 RTP/SCS. Numbers from the RTP for population, housing, and employment have been cross-referenced with other readily available data sources such as Census Data, American Communities Survey Data, Department of Finance Data, and Assessor Data. Where baseline conditions rely on existing or post-2016 built or developed conditions where necessary to provide the most accurate picture practicably possible of the Proposed Plan's impacts, the most current and readily available information has been used.

CEQA generally requires an analysis of the foreseeable impacts from a project against the existing environment or baseline conditions. However, there are some exceptions to this rule where that analysis would be misleading or would not provide useful information for purposes of CEQA. In certain cases, where impacts from the project would be better demonstrated with the use of an alternate (e.g., future) baseline it may be used when justification for a different baseline (*Neighbors for Smart Rail v. Exposition Metro Line Const. Auth.*) is provided by the lead agency. In accordance with this direction, when this EIR does not analyze the impacts of the Proposed Plan against the existing environment, (such as is the case in the GHG analysis) the alternate baseline is identified and a justification is provided for the use of the alternative baseline. A description of the methodology for analysis of impacts, including the use of an alternative baseline, is included in **Chapter 4.0, Environmental Analysis** (also see **Appendix B, Methodology**). It may also be noted that baseline is not always established by population and housing information The subject of the baseline is related to the particular impact area under consideration. For example, a baseline for purposes of agricultural and aesthetic impacts is related to current legal status or the current built conditions in the project area (e.g., land that is designated prime farmland, a designated state scenic highway, or the existence of a valued scenic vista).

3.6 PROJECT OBJECTIVES

CEQA requires an EIR to include a statement of the objectives sought by a Proposed Plan, and the statement of objectives should include the underlying purpose of the Proposed Plan.

Underlying Purpose of Proposed Plan

The underlying purpose of the Proposed Plan is to plan for and accommodate foreseeable growth in the City, including the Project Area, consistent with the growth strategies of the City as provided in the Framework Element, as well as the policies of SB 375 and the Southern California Association of Governments (SCAG) Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS).

Project Objectives

In accordance with *CEQA Guidelines* Section 15124, the specific project objectives identified below support the underlying purpose of the Proposed Plan, assist the City as Lead Agency in developing a reasonable range of alternatives to evaluate in this EIR, and will ultimately aid the decision maker in preparing findings and overriding considerations, if necessary.

The **Primary Objectives** of the Proposed Plan are as follows:

- Accommodate projected population, housing, and employment growth and focus growth into Framework identified centers and corridors located near transit, through a diverse range of housing typologies and income levels to discourage the displacement of existing residents and communities;
- Reduce greenhouse gas emissions and promote enhanced multi-modal transportation opportunities for bicyclists, pedestrians and transit users. Reduce vehicle miles traveled to meet the requirements of Senate Bill 375, Senate Bill 743, and California Assembly Bill 32;
- Maintain existing affordable housing units and promote the creation of more affordable housing units for residents with incomes below the Area Median Income (AMI);
- Strengthen vibrant mixed-use areas near transit that encourage a strong jobs/housing balance and support increased ridership, and walkability;
- Preserve community character and neighborhood identity by strengthening and maintaining traditional character of notable residential and commercial neighborhoods and preserving stable low density neighborhoods;
- Promote a mix of compatible land uses that foster sustainability, equity, and healthy living; and
- Support sustainable urban design strategies that positively contribute to an urban tree canopy across the entire plan area and that support publicly accessible open space as the area evolves.

The **Secondary Objectives** of the Proposed Plan are as follows:

- Foster a safe, healthy, and environmentally sustainable region that increases access to healthy foods and healthcare services and promotes recreational open space and linkages with safe routes to schools and other routes that link people to public facilities and recreational open spaces;
- Support jobs-producing uses by maintaining industrially planned lands for employment generating uses and increase the opportunity for small business and jobs located in transit station areas and along connecting corridors;
- Improve the function and design of neighborhoods throughout the CPA by promoting a diversity of neighborhood serving uses near residential areas, discouraging a proliferation of auto related uses along pedestrian corridors, and enhancing pedestrian oriented design along corridors;

- Provide a variety of mobility options and optimize bus transit, while enhancing cyclist and pedestrian access on identified corridors and facilitating the shared use of streets and alleys in residential areas;
- Improve consistency between land use and zoning regulations, where needed;
- Implement the new zoning code districts and rules as applicable to this geography, through the adoption of the Boyle Heights Community Plan; and
- Support public infrastructure improvements consistent with other City department and public agencies.

3.7 PROJECT COMPONENTS

Proposed Project Land Use Strategy

The Proposed Project includes updates to the Boyle Heights Community Plan, including both the text (**Appendix C, Boyle Heights Community Plan**) and the land use map and adoption of implementing zoning ordinances in order to strategically accommodate future growth. This includes zoning tools and programs that would lead to development of affordable housing.

The Proposed Plan incorporates principles set forth in the General Plan Framework, which are based on informed theories of planning and regional development over several decades, including sustainable development and smart growth, and, more currently, equitable transit-oriented development. The General Plan Framework policies encourage compact development in proximity to transit infrastructure and activity centers. A vision of concentrated, mixed-use development adjacent to central transit "nodes" and along corridors is promoted in order to conserve resources, protect existing residential neighborhoods and improve air quality by reducing the use of cars. The Proposed Plan's vision of major corridors as livable mixed-use environments supported by transit embodies the General Plan Framework principles.

The Proposed Plan envisions the evolution of the Project Area's major corridors and areas around transit stations into livable mixed-use environments with housing for a range of household types, sizes, and income levels with high concentrations of pedestrian and retail activity, including neighborhood serving uses. Beyond the mixed-use corridors, residential neighborhoods within the CPA are broadly distinguished as either suitable for limited change where some levels of additional development and density can occur, or as areas where maintaining the existing character and density is the goal. Under the Proposed Plan the potential for additional job growth could occur along the corridors where there is potential for new commercial uses generated by new mixed-use developments. Employment growth is targeted for the currently industrial land located at the western edge of the CPA along the Los Angeles River as well as the

southern portion of the CPA, bordering Vernon. Facilitating job growth and lighter industrial and commercial amenities along the river is intended to coincide with efforts to establish the riverside as a public destination and create better compatibility with the forthcoming Sixth Street Viaduct and Sixth Street Park, Arts, River and Connectivity Improvements Project (Sixth Street PARC), as well as improve compatibility between the industrial land and existing residential uses in close proximity. The Proposed Plan includes updates to land use designations and zones that are intended to accommodate the growth anticipated in the SCAG 2040 forecast in a manner that enhances the quality of life of existing and future residents within the CPA. New growth and housing is to be directed along identified corridors and mixed-use transit nodes where future residents would live within walking distance of transit and commercial amenities. Due to the proximity to major cultural and employment centers such as Downtown Los Angeles and the regional industrial center of Vernon, as well as the infrastructure investment of the Gold Line, the Project Area is well-suited for equitable transit-oriented development.

During the public scoping process stakeholders expressed an interest in permitting residential uses adjacent to the LA River between the Pico/Aliso Metro station to the new 6th Street Bridge and the Park, Arts, River and Connectivity (PARC) Improvements Project. Therefore, **Chapter 5.0, Alternatives**, of this DEIR considers the future possibility of residential uses in this portion of the CPA as a Project Alternative. During the life of the Proposed Plan, the new 6th Street Bridge and PARC will be constructed, and it is therefore reasonably foreseeable that development projects in this part of the CPA could include a mix of land uses that include residential uses.

SCAG has adopted RTPs since 1976 but the Sustainable Communities and Climate Protection Act of 2008, also known as SB 375, began requiring SCAG to prepare an SCS as an integral part of its RTP. The SCS enables cities and counties of Southern California to achieve target levels of reduction in GHG emissions by 2035 and 2040. The overarching strategy for both the 2016-2040 and the 2020-2045 RTP/SCS envisions growing more compact communities in existing urban areas with efficient public transit and safe mobility opportunities and preserving open space and natural lands. Major themes include integrating transportation investments and future land use patterns, striving for sustainability, providing more transportation choices, responding to demographic and housing market demand for smaller housing and a more walkable lifestyle, supporting economic growth with infrastructure, and improving public health. The 2020-2045 RTP/SCS builds upon these strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern.

The Proposed Plan follows the policies of infill development contained in the General Plan Framework and SCAG's RTP/SCS, which would facilitate mobility and housing choices that would reduce the use of cars and help the Southern California region reach GHG emission reduction targets established by SB 375.

Proposed Plan "Reasonably Anticipated Development"

The underlying purpose and one of the primary objectives of the Proposed Plan is to accommodate future growth in the Project Area. With the implementation of the Proposed Plan, the land use designations/intensities of the Project Area would be revised to accommodate population growth and housing and employment demand projected by SCAG through the year 2040 through land use patterns that meet the objectives of the SCS. The Proposed Project would also meet the other project objectives, including locating growth in transit centers and corridors.

To assess potential environmental impacts of the Proposed Plan, the reasonably anticipated development that is expected to occur by 2040 as a result of the Proposed Plan was determined. The reasonably anticipated development of the Project Area was determined based on assumptions about the level of development that can be reasonably anticipated to occur during the life of the Proposed Plan (through the Plan horizon year of 2040, or approximately 20 years into the future, coincident with the 2016 RTP/SCS). A key factor in determining reasonably anticipated development is the allocation of land and the distribution of uses to reflect development patterns most likely to be built, or that are reasonably expected to occur, including through implementation of the City's growth strategies that are consistent with the Framework Element and SCAG's Sustainable Communities Strategy (SCS) (e.g., locating density near transit and centers). This approach is consistent with the approach used by SCAG to comply with federal laws that require RTPs to reflect development patterns most likely to be built in the region. As SCAG is a guiding precept, it is the City's policy for Community Plans to meet or exceed the expected projections.

The development growth assumptions for the Proposed Plan are based on the acreage of land use designations and the allowable densities and intensities of each zone within the land use designation; anticipated levels of development in the life of the Proposed Plan; and development constraints, such as topography, land acquisition and construction costs, and historic preservation regulations. During the Boyle Heights Community Plan Update process, new projects have been filed and development activity has continued in the CPA. As the Project was being analyzed, potential projects and development activity have continued in Boyle Heights. The City's methodology for determining the reasonably anticipated development and associated reasonably foreseeable growth in population, housing and employment is further discussed in **Appendix B, Methodology**.

Table 3.0-4
2040 Reasonably Anticipated Development of the Boyle Heights Community Plan Compared to SCAG Forecast

	2016 Baseline/a/	Existing Plan Reasonably Anticipated Development/b/	Proposed Plan Reasonably Anticipated Development/b/	SCAG 2040 Growth Forecast/c/
Housing	22,000	28,000	33,000	27,000
Population	86,000	98,000	115,000	93,000
Employment	26,000	32,000	39,000	35,000

/a/ 2016 Baseline – SCAG 2016-2020 RTP/SCS
/b/ LADCP - 2018
/c/ SCAG 2016-2020 RTP/SCS
Note: Numbers are rounded to the nearest thousand

Existing Plan and Proposed Plan

CEQA requires the EIR to compare Proposed Plan to existing conditions. Other than analyzing the No Impact alternative in the Alternative Analysis, comparing the Proposed Plan to current plans is not required and it is not appropriate for impact analysis under CEQA. To the extent this comparison is provided in a few places in the EIR, it is provided for informational purposes only, not for impact analysis, to highlight how the Proposed Plan updates the population, housing and employment in the context of reasonably anticipated development in the Project Area and to inform decision makers and the public regarding different potential impacts if the Current 1998 Plan were to continue compared to the impacts of the Proposed Plan. **Table 3.0-4, 2040 Reasonably Anticipated Development of the Boyle Heights Community Plan Compared to SCAG Forecast,** compares the current and Proposed Plan's reasonably expected growth potential (see **Appendix B, Methodology**). The Proposed Plan would increase reasonably anticipated housing, population, and employment as compared to the Current Plan. The Proposed Plan would accommodate SCAG's population, housing and employment projections based on the amount of growth that can reasonably be anticipated to occur during the life of the Proposed Plan, given the Proposed Plan's land use designations and policies.

Boyle Heights Designations, Zoning, and Other Plan Components

Overview

The Proposed Plan, which includes implementing the New Zoning Code in the Plan Area, will include updated zones and General Plan Designations for every parcel within the CPA. However, not all changes will result in changes to allowable density or intensity. General Plan Amendments and Zone Changes are

described in more detail below. In general, zone changes resulting in increased development rights such as height, floor area ratio or density are proposed near the Pico Aliso, Soto, and Indiana Metro Stations, and along major corridors such as Soto Street, Whittier, First Street, and Fourth Street. The goal for these areas is to allow for pedestrian oriented, mixed-use development with multifamily housing in proximity to transit. While Zone Changes and General Plan Amendments will occur throughout the plan area, conservation of the existing residential density is proposed for the majority of the Project Area's current Low Density and Multiple Family designated areas. Conservation of industrial zoned land for jobs-focused uses is also proposed as a means to protect industrial areas from conversion to residential use. In addition to changes to building form regulations, uses will be revised to create more comprehensive, healthy neighborhoods throughout the CPA by introducing limited neighborhood serving commercial amenities into residential neighborhoods, and distancing noxious uses from sensitive uses along commercial corridors and in industrial areas.

Height limits that exist in residential zoning standards today will be included as part of the Form District applied through the proposed zoning in Boyle Heights, and new height limits will be introduced along neighborhood-serving corridors that are developed with primarily 1-2 story buildings today.

The following general categories of changes are proposed for the CPA in the Proposed Plan:

1. **Minimal Change & Nomenclature Changes.** These changes rely on new zones created through the New Zoning Code applied to parcels to reflect existing development patterns, built conditions, or uses permitted. They do not substantially change residential density or increase height or FAR regulations. In many instances, the zone change or General Plan Amendment is the result of a nomenclature change and will not substantially change development regulations. Areas experiencing this level of change include:

    a. **Low Density Residential Land Use Designations:** This applies to areas near 5th St. and Indiana St., and southeast of Marengo St. and Evergreen Ave. that are designated Low Residential, with corresponding zone of R1 today. These areas will be zoned with Form Districts that mirror existing regulations and conditions, such as height and floor area, with a reduced rear yard setback. This reduced rear yard setback reflects existing development patterns in the majority of neighborhoods in Boyle Heights due to the era of development for the neighborhood. These areas will continue to be zoned to allow one dwelling unit per lot, except for ADUs, JADUs, and additional development permissions pursuant to SB9 and other state regulations.

    b. **Neighborhood Corridors:** Wabash Avenue, Lorena Street, portions of 1st Street and 4th Street, and sections of Cesar Chavez Avenue designated as Neighborhood Office Commercial and Highway

Oriented and Limited Commercial are proposed to be designated as Neighborhood Center. This change encourages mixed-use development, promotes small business tenant spaces, and creates a correspondence with the updated zoning regulations. The zone change maintains the zoning regulations of an FAR of 1.5:1 but introduces a 2-story height limit, with projects providing affordable housing able to reach a 2.5:1 FAR and a 4-story height limit. These corridors continue to allow similar uses as existing zoning regulations, including residential and commercial uses. These areas are currently developed with a mix of uses and built forms. Please see 2d (Historic Brooklyn Corridor) below for more details on Cesar E Chavez Ave.

c. **Community Corridors**: Whittier Boulevard, Marengo Avenue, western portions of Cesar E Chavez, and blocks surrounding Olympic Boulevard and Soto Street are proposed to be designated as Community Centers. Today these areas are developed with a mix of uses, including residential and commercial, and are zoned for C2 which allows a 1.5:1 FAR and 1/400 Density, with projects providing affordable housing able to reach a 3:1 FAR. Proposed zoning for these areas maintains the 1.5:1 base FAR as well as 1/400 Density and allowable mix of uses. Primary changes to this area include prohibition of new auto-related uses; for more detail, see "Revision to Allowable Uses" below.

d. **Heavy Industrial:** Areas south of Pico Boulevard between Soto and Grande Vista, south of Union Pacific Avenue between Grande Vista and Indiana, and the Northwest corner of the CPA, the area known as "Piggyback Yard", are proposed to remain as Heavy Industrial uses with flexible building regulations and a 1.5:1 FAR.

2. **Changes to Development Potential**. This subsection describes changes to development potential as a result of zoning and plan designation changes. Increased development potential occurs when the zoning regulations on a property are changed to allow for greater intensity, through residential density, FAR, or height increases, for example, or when a General Plan Designation is changed to a designation that allows for a wider range of uses, more intense uses, or a range of zones that allow for greater residential density, FAR, or height. Decreased development potential occurs when the zoning regulations on a property are changed to decrease the allowable intensity, through residential density, FAR, or height reductions, for example, or when a General Plan Designation is changed to a designation that restricts or reduces the allowable range of uses, or a range of zones that further restrict residential density, FAR, or height. Typically, change to development potential results from changes to both the zoning and Plan Designation on a lot, in order to achieve goals established through the Community Plan.

a. **Transit Nodes (Figure 3.0-4)**: Areas of the CPA that are located in proximity to transit, particularly fixed L Line rail stations, will undergo zone changes and plan amendments to accommodate additional housing near transit. These nodes include the area surrounding the Pico/Aliso station, First/Soto station, and Indiana Street station. The area surrounding the Pico/Aliso Station is generally bounded by First Street and Third Street to the north and south, Mission Road on the west, and Utah Street on the east. The First and Soto Transit Node contains the parcels fronting Soto Street immediately south of Cesar Chavez Avenue's Historic Brooklyn Corridor, south to Fourth Street, and the parcels fronting First Street from St. Louis Street on the west to Mott Street on the east. The Indiana Station transit node includes the blocks located between the Cinco Puntos Intersection of Cesar Chavez Avenue and Indiana Street, south to Fourth Street, and from Velasco Street south of First Street and Lorena Street north of First Street on the west, to the CPA Boundary at Indiana Street on the east. These transit nodes are envisioned to function as mixed-use dense centers to facilitate walkability and transit access. Parking requirements will be reduced in these areas. Currently, these areas are a mix of R2, RD1.5,R3, R4, R5, C1.5, C1, and C2. These areas are primarily proposed to become designated as Community Center, with development regulations ranging from 1.5:1 FAR with no height limit and a 1/400 density for buildings along the main corridors, up to a 4.0:1 Bonus FAR for projects that include affordable housing.

   In the residential area surrounding the First/Soto Street station, from St. Louis St. to Mott St., Cesar E Chavez Avenue to 4th Street, residential density will be increased from the existing mix of 1/400, 1/800, and 1/1,500 to 1/600. Zoning will permit a 1.5:1 Base FAR with a 3-story height limit, and allow up to a 3.0:1 FAR with a 6-story height limit for projects that provide affordable housing. These properties will be designated as Medium Neighborhood Residential. In the residential area surrounding the Indiana Street station, residential density will be increased from 1/1,500 and a 2 unit per lot restriction to 1/800.

b. **Corridors (Figure 3.0-5, Corridors)**: Certain corridors in the CPA currently have inconsistencies between land use and zoning correspondence, with Q conditions limiting uses or development regulations to create a consistency. For example, the south side of First Street between Julien and Lorena street is primarily designated Low Medium II with a zoning of [Q]C2-1-CUGU. This particular [Q] condition states that the properties are "Limited to existing uses, thereafter must conform to the RD1.5-1 Zone." The Proposed Plan will change these properties and other similar instances to Community Center or Neighborhood Center General Plan Designations with mixed-use zones that are similar to today's C2 zoning in order to establish consistency between Plan Designations and zoning, as well as to achieve the Objectives of the Proposed Plan to increase

housing opportunities along corridors. This will result in an increase to the development potential in regards to the increased intensity of allowable uses and increased allowable residential density.

On parcels where the designation is changing to Community Center, existing height limitations would be removed; as discussed above, this would primarily be close to Metro L Line rail stations where new housing and growth is planned. In areas that would be changed to Neighborhood Center, a height limit of 2 stories would be introduced with an option to reach 4 stories through provision of affordable housing. See "Neighborhood Corridors" above for more detail. Other corridors where this type of change will occur include 4th Street between Cummings and Chicago, as well as between Fresno and Velasco; Wabash, between Stone Street and Indiana. In addition to increased development potential in order to correct inconsistencies, Soto Street from Wabash Ave to 4th Street is proposed to change from existing Low Medium II and Medium Residential land uses, with RD1.5 and R3 zoning, to a Community Center designation with mixed-use zoning with a 1.5.0 FAR and 1/400 Residential Density (equivalent of R4 today).

c. **Low Density Residential:** The area of the Plan bounded by Pomeroy on the South, Lord Street on the West and State Street on the East, South of Marengo and currently zoned for single family residential uses (R1) will be changed to permit low density multi-family developments. These properties are typically under 5,000 square feet and are currently developed with both single-family and multi-family uses. Proposed zoning will maintain similar height limits as the R1 zone permits but would allow for an equivalent of today's R2 density, at two dwellings per lot.

d. **Cesar E Chavez "Brooklyn Avenue Neighborhood Corridor" (Figure 3.0-6, Historic Brooklyn Avenue Neighborhood Corridor)**: Properties located along Cesar E Chavez Avenue between Mott and Cummings, currently designated as Regional Center Commercial and Community Commercial, are proposed to be designated as Neighborhood Center to prevent large scale development from disrupting the historic character and community oriented businesses that exists. These properties will be permitted a 1.5:1 FAR, like today, but will be restricted to two stories. Additionally, properties along this stretch of Cesar E Chavez will be held to specific design standards through creation of a unique "Frontage" through the implementation of the New Zoning Code. These standards will require new construction or substantial renovations to create buildings that reflect prominent design features and site planning found in this historic street frontage.

e. **Soto Street and Olympic Boulevard Regional Center (Figure 3.0-7, Soto & Olympic Regional Center and Sears Site):** Properties located to the north of the intersection of Soto Street and Olympic Boulevard designated as Regional Center are proposed to be designated as Community

Center in order to apply a land use designation that more closely reflects the scale of the intersection.

f. **Sears Site (Figure 3.0-7, Soto & Olympic Regional Center and Sears Site):** The Sears site, the location of the historic Sears building on the southwest corner of Olympic and Soto, is currently designated Light Manufacturing and Regional Center, and is proposed as Community Center. The change is proposed to create consistency in zoning and land use across the entire site.

g. **Low Medium I, II and Medium Land Use Designations (Figure 3.0-8 Proposed Multi-Unit Land Use Designations):** This primarily applies to areas of the plan designated for Low Medium I and Low Medium II Residential land uses, with corresponding zones of R2, RD1.5, RD2, RD3, and R3. These areas will be zoned with Form Districts that mirror existing regulations and conditions, such as height and floor area, with a reduced rear yard setback. This reduced rear yard setback reflects existing development patterns in the majority of neighborhoods in Boyle Heights due to the era of development for the neighborhood. Many properties are currently developed with an additional dwelling unit, granny flat, garage, or other structure nearly abutting the rear property line, which would not be permitted under the existing R3, RD1.5, RD2, RD3, or R2 zoning. Existing buildings vary from single-story to three and four story properties, ranging from single homes to duplexes, fourplexes, and apartment complexes. In some instances, properties are not built to the allowable height or FAR, and in others, properties exceed the allowable height and FAR as permitted under today's zoning as a result of past zoning regulations that were in place during development. The majority of areas currently zoned as RD1.5 will maintain the 1/1500 density and 45 foot height limit, and the FAR will be decreased from a 3.0:1 allowed today to a 1.0:1 with a1.5:1 Bonus FAR. Areas currently zoned as RD2, RD3, and R2 will be zoned to allow 2 units per lot with a 2L density and a 33 foot height limit, with an FAR reduction from 3.0:1 to a 0.6:1. Areas currently zoned R3 will primarily be zoned to maintain the 1/800 density and 45 foot height limit, and the FAR will be decreased from a 3.0:1 allowed today to a 1.0:1 with a 1.5:1 Bonus FAR.

h. **General Plan Footnotes.** While footnote #1 under the current Boyle Heights Community Plan restricts all properties to Height District 1, limited Height District 2 zoned properties exist. These properties will be downzoned from a currently permitted 6:1 FAR for consistency.

3. **Revision to Allowable Uses**. Revised zones are proposed throughout the CPA to address comments heard throughout the outreach process and to create better adjacency of uses and further the environmental justice goals of the plan.

a. **"Residential Mixed" Use Districts (Figure 3.0-9, "Residential-Mixed" Use Districts)**: In many residential areas of the CPA, limited commercial uses and neighborhood amenities will be allowed, such as a corner market, known as a "tiendita", or personal services. This is reflective of today's development patterns, where there are often existing non-conforming corner markets or businesses interspersed throughout the residential neighborhoods. The Proposed Plan would make many of these establishments conforming and allow new ones to open with certain standards and conditions, such as a limited size, location restricted to a corner lot, hours of operation limitations, and operational standards to ensure these businesses do not disrupt the predominant residential uses in the neighborhoods. This Use District is not being applied in residential areas of the CPA that have been identified as potentially historic. Along Soto Street between 4th Street and Inez Street, a Residential Mixed Use District will be applied that also allows small restaurants in addition to corner markets and personal services.

b. **Commercial Establishment Size Restrictions (Figure 3.0-10):** In areas of the plan designated Neighborhood Center there will be restrictions on commercial establishment sizes to encourage small business operations and to limit big-box operators from opening on the neighborhood scaled corridors. These restrictions mirror much of the development pattern that exists along the corridors of Boyle Heights today. Along major corridors a commercial establishment size limit will be applied, but at a scale that would allow for grocery stores and other mid-sized retailers to open.

c. **Auto Related Uses (Figure 3.0-11)**: Revised zones are proposed along mixed-use corridors to prohibit noxious and disruptive uses near residential areas and to address the overconcentration of auto-related uses along corridors in the Project Area. The Proposed Plan includes concentrating auto-related uses such as auto-repair shops and gas stations near freeway on and off ramps or in industrial areas, and prohibiting these uses along pedestrian-oriented corridors, to improve walkability, safety, and enhance the pedestrian experience along major corridors, as well as improve adjacency for residences that abut these corridors. This also furthers the objectives of the Clean Up Green Up (CUGU) Ordinance by creating distance between new auto-related uses and existing residential uses.

d. **Industrial "Buffer Zone" (**see **Figure 3.0-12)**: Under the proposed zoning, a "buffer zone" will be implemented in the industrial area immediately south of Olympic Boulevard to Pico Boulevard, between Soto Street and Grande Vista. This buffer zone will allow for heavy commercial uses, light industrial uses, office, and commercial, The Plan implements a "buffer zone" that creates greater distance between traditional heavy industrial uses and nearby residential uses.

e. **Light Industrial (Figure 3.0-13):** The area adjacent to the Los Angeles River and rail corridor will be designated as Light Industrial under the Proposed Plan. As a follow up to Clean Up Green Up's policy goals, this designation is intended to facilitate cleaner industrial uses and discourage new hazardous or toxic heavy industrial uses from locating near existing housing, railroads, and the Los Angeles River, as well as the upcoming Sixth Street PARC. Further, limited commercial uses will be allowed to provide neighborhood serving amenities to existing residents of this River-adjacent industrial area, and future visitors to the Sixth Street PARC and the Los Angeles River. Building forms in the Light Industrial area immediately adjacent to the railroad tracks (located east of the LA River) will be required to be oriented to pedestrians as well as the Los Angeles River/ rail corridor by providing building breaks, active frontages, and outdoor amenity space, such as walkways, plazas and landscaped areas in order to contribute to efforts increase access and open space along the adjacent rail/river corridor.

4. **Proposed Community Benefits Program System and a Community Plan Implementation Overlay (CPIO) District:** In addition to applying new zones throughout the CPA the Boyle Heights Community Plan will implement a Community Benefits Program to incentivize development of Affordable Housing throughout the Plan Area. These incentives will include optional increases to residential density and FAR, parking reductions throughout the CPA, and height increases in some zones, in exchange for including restricted affordable units in the development project. This benefits system will require levels of affordability that are tailored to the current socioeconomic makeup and median income levels of Boyle Heights. While the entirety of the plan area will include incentives for parking reductions, FAR increases, and residential density increases, height incentives will be directed only to major transit nodes such as Pico/Aliso, First/Soto, and Indiana Station, and away from residential neighborhoods. The proposed Boyle Heights Community Benefits system will comply with requirements of Measure JJJ, passed in November 2016 by City of LA Voters. The Boyle Heights Community Benefits System will apply to the entirety of the CPA and the Citywide TOC guidelines released in September 2017 will no longer apply to properties located within Boyle Heights CPA boundaries. The Community Benefits Program will be adopted through the proposed CPIO District and will rely on regulations and procedures outlined in Article 9 of the New Zoning Code. Please see **Appendix D, Boyle Heights Community Plan Implementation Overlay (CPIO),** for the proposed CPIO.

   In addition to implementing the Community Benefits Program for Affordable Housing, the CPIO includes a review process for projects that involve certain eligible and designated historic resources, as well as regulatory protections from demolitions and alterations for certain eligible historic resources that have been identified in surveys prepared or accepted by the City.

5. **Revisions to General Plan Land Use Designations**. The Plan Map (proposed land use map for the Boyle Heights Community Plan) includes the proposed general plan land use designations in the Plan Area, as well as a corresponding zone table to identify the zoning types that are allowed for each type of land use designation (**Figure 3.0-15, Proposed General Plan Land Use**). The Proposed Plan also includes amendments to the General Plan Framework Element to introduce new general plan land use designations of the Boyle Heights Community Plan. These designations are designed to reflect the intent of the Plan's land use strategy and the proposed amendments will allow for their limited applicability to the Boyle Heights Community Plan area. General plan land use designations help guide development by establishing the general location and intensity of different uses of land, in addition to the allowable scale of development. Each land use designation expresses a variety of goals and policies and corresponds to a set of implementing zones that regulate development, including uses, floor area ratios, densities, and height. The Plan Map shows the locations of the proposed land use designations in the Community Plan Area. The proposed land use designations, along with implementing zoning actions, would reinforce a pattern of development that directs future growth to already urbanized and transit-served areas.

6. **Updates to Planning Overlays**. As part of the Proposed Plan, a selection of planning overlays and redevelopment plans will be amended and/or will become integrated into the New Zoning Code. See **Section 4.10, Land Use and Planning, Regulatory Framework** for a description of the existing planning overlays and redevelopment plans in the Boyle Heights Community Plan Area.

   Below is a discussion of the updates to the overlays as part of the Proposed Plan.

   Planning Overlays

   - **Clean Up Green Up Ordinance (CUGU).** The CUGU overlay will be incorporated into the new zoning code and will no longer be an overlay within the Boyle Heights CPA. Some distancing requirements have been implemented into the Proposed Plan through zoning application, restricting where new noxious uses can locate in proximity to residential or other sensitive uses. Other distancing and operational standards have been incorporated into the Use District regulations for Industrial Use Districts. Additional design regulations have been implemented through the Development Standards Districts, including enclosure and wall standards, and landscaping and planting standards. Other regulations still have been incorporated as Citywide best practice, such as lighting and glare requirements.

   - **The Los Angeles River Implementation Overlay (RIO).** Applicable development regulations and measures to protect sensitive biological resources in the existing The Los Angeles River

Implementation Overlay (RIO) will be incorporated into Frontage Districts and development standard rules of the New Zoning Code. In addition, the RIO will be amended to remove portions that are currently in the Boyle Heights CPA to avoid redundancy with the New Zoning Code provisions.

California Redevelopment Plan

As discussed earlier in the Regulatory Setting of this Chapter, the Boyle Heights CPA includes one redevelopment area, the Adelante-Eastside Redevelopment Project Area. The Proposed Plan seeks to preserve industrial land for jobs, while also improving the compatibility between industrial land and residential neighborhoods. The Proposed Plan also includes policies to preserve existing housing stock while providing opportunities for gentle infill, directing future housing growth to transit served areas and provides tools to create more affordable housing. As such, the Proposed Plan would be generally consistent with the Adelante Eastside Redevelopment Plan in terms of its broad goals and policies related to land use. Although the broad goals and policies between the Redevelopment Plan and the Proposed Plan are similar, certain regulations in the Redevelopment Plan are inconsistent or conflict with the goals, objectives, and policies of the Proposed Plan. While the Redevelopment Plan does not include regulations or numerical caps for floor area ratio, height, or residential density, it does include design standards for new signs and billboards, and for new wireless telecommunication facilities. The Proposed Plan does not support carrying forward these requirements in the Redevelopment Plan, which are in conflict with the Proposed Plan. For a detailed discussion of regulations and procedures in the Adelante-Eastside Redevelopment Plan that are not entirely consistent with the goals, objectives, and policies of the Proposed Plan, and how those will be addressed, please see **Section 4.10, Land Use and Planning**, of this EIR.

7. **Other Plan Components**. In addition to the general plan land use map amendments, community plan text amendments, zoning changes, and updates to planning overlays described above, the proposed plan will redesignate certain streets in the CPA, which will require amendments to the Mobility Plan 2035, including at minimum to the circulation plan.

Areas in pink show properties proposed as Community Center that are not currently zoned C2-1; areas in Orange show areas proposed as Medium Neighborhood Residential with a 1/600 density.

Summary of Proposed Changes to Chapter 1A of the LAMC (Proposed New Zoning Regulations)

To implement the Proposed Plan, the entire Boyle Heights CPA will be assigned a set of new General Plan Land Use designations and new zones tailored to meet the varying needs of Boyle Heights. These zones are being created as part of the New Zoning Code that will be included in Chapter 1A of the LAMC and are anticipated to be adopted with the Downtown Community Plan Update (CPC-2017-432-CPU) prior to the adoption of the Proposed Plan. As discussed above, the New Zoning Code will be adopted prior to the adoption of the Proposed Plan. The Proposed Plan will introduce some additional zones to Chapter 1A of the LAMC as necessary to implement the policies and goals of the Boyle Heights Community Plan Update. The following is to provide an overview of the New Zoning Code and discuss the zones proposed to be used in the Proposed Plan.

The new zoning system is comprised of a modular zoning system that requires the bundling of multiple segments to compose a complete zone string. The individual modules that establish a zone will include: Form District, Frontage District, Development Standards District, followed by Use District, and Density District. The first three components of the zone string address the built environment, and the second two components address the activity within the structure. There are many potential module combinations that can be applied to properties to make a zone.

Proposed Form Districts

There are 10 Form Districts proposed for use in the Boyle Heights CPA. The proposed Form Districts for Boyle Heights are:

- Very Low-Rise Narrow 1 (VN1)
- Very Low-Rise Narrow 2 (VN2)
- Very Low-Rise Medium 1 (VM1)
- Very Low-Rise Medium 2 (VM2)
- Very Low-Rise Full 2 (VF2)
- Low-Rise Narrow 1 (LN1)
- Low-Rise Medium 3 (LM3)
- Low-Rise Medium 4 (LM4)
- Low-Rise Medium 5 (LM5)
- Low-Rise Medium 6 (LM6)

Proposed Frontages

There are 7 Frontages being applied throughout the Boyle Heights Community Plan area (see **Appendix C, Boyle Heights Community Plan**). Their application is tailored to meet a range of objectives, such as high pedestrian walkability, flexibility of function over time, and consistency with existing structures and architectural features.

Frontage Districts are applied to properties throughout the CPA based on a number of factors, including existing uses and development patterns, transit accessibility, neighborhood walkability, and anticipated future uses and development patterns. Much of the CPA is served by bus or other forms of transit, and Frontage types that encourage and reinforce walkability and pedestrian orientation are applied throughout the CPA. In addition, certain Frontage Districts are being applied to areas with unique character or existing development patterns to ensure future development is compatible.

Character Frontages will be applied to areas that were identified through Survey LA as eligible historic resources. These Frontages will mandate specific building elements and features – for example, a porch, a roof pitch, vertical or horizontal expressions, or entrance spacing. A unique Residential Character Frontage will be applied in the residential areas South of I-10, east of 101, and west of 1-5, and in a select block to the

east of Hollenbeck Park. A unique Commercial Character Frontage will be applied to the "Historic Brooklyn Avenue Neighborhood Corridor" (HCM 590), along Cesar E Chavez between Mott Street and Cummings Street.

Proposed Development Standard Sets

Two Development Standard Sets are being applied within the Project Area.

Development Standard Set 4 is being applied to the areas of the CPA near fixed transit stations, such as the Pico/Aliso Station, First/Soto Station and Indiana Street Station. It is designed to account for walking, biking, and transit as the primary modes of transportation, accounts for a high mix of uses which encourage walkability, and has a reduced minimum parking requirement from current LAMC requirements.

Development Standard Set 3 is being applied to the remainder of the Plan Area beyond the transit nodes. It is designed to account for areas that may have less access to high frequency transit, but are still walkable with a number or local bus lines, and have a high mix of uses in proximity. This set has a reduced requirement for parking, with parking primarily provided to the rear of buildings.

Proposed Use Districts

There are 12 Use Districts proposed in the Boyle Heights CPA, as well as one Special District (Freeway). The proposed Use Districts for Boyle Heights are:

- Open Space 1 (OS1)
- Residential 2 (RG2)
- Residential-Mixed 1 (RX1)
- Residential-Mixed 2 (RX2)
- Commercial-Mixed 2 (CX2)
- Commercial-Mixed 3 (CX3)
- Commercial-Mixed 5 (CX5)
- Industrial-Mixed 5 (IX5)
- Industrial 2 (I2)
- Industrial 3 (I3)
- Public 1 (P1)

- Public 2 (P2)
- Freeway Special District (FWY)

Table 3.0-5, Proposed General Plan Land Use Designations and Zoning, provides a general summary of proposed designations and corresponding zones, frontages, use districts, and density

Table 3.0-5

3.8 CONSTRUCTION SCHEDULE AND PHASING

The Proposed Plan is an update to an existing Community Plan that would guide development in the Project Area through 2040. No development is proposed as part of the Proposed Plan. Therefore, the Proposed Plan has no construction schedule or phasing. The Boyle Heights Community Plan Update is anticipated to be adopted in 2022 with implementation starting after adoption and continuing through 2040.

3.9 DISCRETIONARY ACTIONS AND APPROVALS

The following actions will be required in order to implement the Proposed Plan:

- Certification of the proposed Boyle Heights Community Plan Update EIR, and
- Adoption of the proposed Boyle Heights Community Plan Update and all related documents including:
  - Amendment to the General Plan, consisting of the Boyle Heights Community Plan text and land use maps (including changes to the footnotes and map symbols)
  - Code amendments to the LAMC to include relevant portions of the New Zoning Code (Municipal Code Chapter 1A) to implement the Boyle Heights Community Plan
  - Amend the Zoning Map to rezone Boyle Heights with zone classifications from the New Zoning Code
  - Adoption of the Boyle Heights Community Plan Implementation Overlay (Boyle Heights CPIO)
  - Minor amendments to the Clean Up/Green Up (CUGU) Overlay and the Los Angeles River Improvement Overlay (RIO) to address consistency with the New Zoning Code
  - Amendments to the Adelante-Eastside Redevelopment Plan to clarify its relationship to the Boyle Heights Community Plan and its implementing provisions and ordinances.
  - Amend the General Plan Framework, Circulation Map, Mobility Plan and other Citywide General Plan Elements, as necessary
- Amendments to all other relevant ordinances and actions as necessary to ensure consistency of regulations and implementation of the Community Plan amendments.

Approval of the Proposed Project would not require action by any agency other than the City of Los Angeles.

4.0 ENVIRONMENTAL IMPACT ANALYSIS

4.0.1 INTRODUCTION

This chapter evaluates the reasonably foreseeable significant environmental impacts that could result from the implementation of the Proposed Plan. These potential impacts are analyzed for the following environmental issues: aesthetics, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise and vibration, population and housing, public services and recreation, transportation and traffic, utilities and service systems, and tribal cultural resources. Discussion is focused on the identification of changes that may be considered to be environmentally significant (a substantial, or potentially substantial, adverse change in the environment) relative to the existing environmental conditions.

4.0.2 FORMAT OF SECTIONS

The analysis of each environmental impact category is organized to include the following subsections:

Introduction

This subsection provides an overview of the section and summarizes topics to be analyzed.

Existing Environmental Setting

This subsection includes a description of existing conditions that precede implementation of the Proposed Plan. As a general rule, *CEQA Guidelines* Section 15125(a) calls for the baseline to be the physical conditions that exist in the area affected by the project at the time the EIR process begins. This requirement is intended to provide the public with "the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." The City may reference historical or expected future conditions for conditions that fluctuate over time if the City determines it is reasonably necessary to provide the most accurate and understandable picture practically possible of the project's impacts, as supported with substantial evidence. The Notice of Preparation (NOP) for this project was filed in September of 2016 and so for purposes of this EIR, the existing setting is usually 2016. In some cases, updated information is provided, where appropriate, to provide additional context to the discussion of the setting. However, the determination of significance remains a comparison to the 2016 existing conditions, unless otherwise indicated.

Regulatory Framework

This subsection includes an identification of federal, state, and local laws, regulations, policies, plans, and in some instances, regulating agencies, that regulate, plan or have jurisdictions over the environmental area of concern.

Thresholds of Significance

This subsection identifies the criteria by which the components of the Proposed Plan are measured to determine if the project would cause a substantial or potentially substantial adverse change in the existing environmental (baseline) conditions.

This EIR relies upon *CEQA Guidelines* Appendix G thresholds as the threshold of significance unless another is specifically identified in the EIR. The City may rely on thresholds of significance adopted by regulatory agencies, such as SCAQMD, or any others deemed appropriate by the City, which are supported by substantial evidence.

The court in California Building Industry Association v. Bay Area Air Quality Management District (*CBIA v. BAAQMD*), confirmed the general principle that CEQA only requires analysis of a project's effect on the environment and not the reverse (i.e., the impact of existing environmental conditions on a project), except in limited circumstances including instances where the project might worsen or exacerbate existing environmental hazards. To the extent that any thresholds used in this EIR suggest analyzing impacts from the existing environment on the proposed project, the analysis is limited to whether the project would exacerbate existing conditions, consistent with CBIA v. BAAQMD, unless otherwise expressly indicated.

Discussion in both thresholds and methodology subsections found in the sections associated with each individual impact area provide further explanation of which thresholds are used. As to each environmental topic, the City has selected the thresholds that ensure as comprehensive an analysis of the Proposed Plan's potential environmental impacts as possible, given the constraints of attempting to analyze a policy document that will be implemented over the course of a twenty-year period.

Finally, all impact questions, except as indicated below, are interpreted to take into account the following mandatory findings of significance from *CEQA Guidelines* Section 15065(a):

> *(1) The project has the potential to substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened*

species; or eliminate important examples of the major periods of California history or prehistory.[1]

(2) *The project has the potential to achieve short-term environmental goals to the disadvantage of long-term environmental goals.*[2]

(3) *The project has possible environmental effects that are individually limited but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.* [3]

(4) *The environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly.*[4]

Methodology

This subsection summarizes the methods, procedures, and techniques used to estimate the impacts of the Proposed Plan. As is described in the "Thresholds of Significance" discussion above, the methodology subsection also further clarifies which thresholds are used when describing the methods, procedures, and techniques used to estimate the Proposed Plan's impacts. The methodology subsection of the chapters associated with each individual impact area will provide further explanation of what geographic area is used for the purposes of the impact analysis.

Impacts

For each impact category, this subsection identifies the reasonably foreseeable indirect impact of the Proposed Plan, compares that impact to baseline conditions, and determines in consideration of the applicable threshold of significance whether the change, if any, caused by the Proposed Plan to existing conditions will result in a significant or potentially significant impact. As discussed above, the baseline, unless expressly provided otherwise in this EIR, is the existing conditions at the time the NOP was published.

For each significant impact identified, this subsection also recommends appropriate and reasonable mitigation measures to avoid or minimize impacts to the extent feasible. In addition, this subsection includes a discussion of whether a significant and unavoidable impact would be reduced to a less-than-

---

1 Considered in **Section 4.3, Biological Resources,** and **Section 4.4, Cultural Resources.**

2 .Considered in impact analysis in **Section 4.1** through **Section 4.17.**

3 Considered in the cumulative analysis in each impact **Section 4.1** through **Section 4.17.**

4 Considered in all impact analysis **Section 4.1** through **Section 4.17.**

significant level after imposition of any identified mitigation measures or would remain significant and unavoidable.

The following terms are used to describe the level of significance of impacts identified in the analysis:

- **No Impact** – No Impact applies where an environmental issue is evaluated and it is determined that the project would have no effect or impact in that category. No Impact answers need to be adequately supported by information that shows the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone).

- **Less-Than-Significant Impact** – Less-Than-Significant Impact applies where the project creates only less-than-significant impacts that do not exceed the defined threshold of significance. CEQA does not require mitigation of less-than-significant impacts.

- **Potentially Significant Impact** – Potentially Significant Impact applies to an impact that may potentially exceed the defined threshold of significance. Potentially significant impacts can sometimes be reduced to a less than significant level through the implementation of feasible mitigation measures. If feasible mitigation measures are not available or would not reduce the magnitude of the impact below the threshold of significance, the impact would be deemed significant and unavoidable.

- **Less-Than-Significant Impact with Mitigation-Incorporated Impact.** Less-Than-Significant with Mitigation Incorporated Impact applies to an impact that exceeds the defined threshold of significance, but for which mitigation is identified to reduce the impact to a less-than- significant level.

- **Significant and Unavoidable Impact** – Significant and Unavoidable applies to an impact that exceeds the defined threshold of significance and cannot be eliminated or reduced to a less-than-significant level through implementation of feasible mitigation measures.

Cumulative Impacts

This subsection includes an analysis of the cumulative impacts associated with the Proposed Plan. Pursuant to *CEQA Guidelines* Section 15130, an EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of the project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. A finding of No Impact would also mean that the effect is not cumulatively considerable.

CEQA Guidelines Section 15130 allows the discussion of cumulative impacts shall reflect the severity of the impacts and the likelihood of occurrence, but the discussion need not provide as much detail as is provided for the effects attributable to the project alone.

CEQA Guidelines Section 15130 allows for two approaches to study cumulative impacts: using a list of past, current, and probable future projects or relying on a summary of projections (growth forecasts) from adopted local, regional or statewide plans, As the Proposed Plan is a community plan update covering a large are of the City over a twenty year planning period, the cumulative impacts analysis in this EIR, unless otherwise indicated, relies on a summary of projections method, utilizing the SCAG projections.

Cumulative Projects Setting

Pursuant to *CEQA Guidelines* Section 15130, an EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of the project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. A finding of No Impact would also mean that the effect is not cumulatively considerable.

Cumulative impacts are the changes in the environment that result from the incremental impact of development of the Proposed Plan and other projects with related impacts. For example, traffic impacts of two nearby projects may be insignificant when analyzed separately but could have a significant impact when analyzed together.

CEQA Guidelines Section 15130 allows that the discussion of cumulative impacts shall reflect the severity of the impacts and the likelihood of occurrence, but the discussion need not provide as much detail as is provided for the effects attributable to the project alone.

Section 15130 allows for two approaches to study cumulative impacts: using a list of past, current, and probable future projects or relying on a summary of projections (growth forecasts) from adopted local, regional, or statewide plans. As the Proposed Plan is a community plan update covering a large area of the City over a twenty plus year planning period, the cumulative impacts analysis in the EIR relies on the summary of projections method, relying on City of Los Angeles and SCAG projections as discussed below and throughout this EIR.

Under Section 15130, an EIR is also supposed to define the geographic scope of the area affected by cumulative effect with a reasonable explanation of that area. The impact analysis in this EIR considers different geographies as appropriate to each impact. Many cumulative impacts (such as aesthetics and noise), occur within the immediate vicinity of a project (adjacent to or within 0.5 mile); some impacts (such

as impact on local utility lines) affect infrastructure further away (one to two miles); some impacts are at the City level (such as the impact to the City's sewer treatment facilities); some impacts are regional (such as air quality criteria pollutants), and one impact is global (greenhouse gas emissions).

For each impact analysis listed in **Chapter 4.0, Sections 4.1 through 4.16,** the potential environmental impacts related to the Boyle Heights Community Plan update will be analyzed in conjunction with other Community Plan updates that could affect the Boyle Heights CPA, such as updates to the Central City and Central City North Community Plans (Downtown Community Plan Update). In addition, major projects within a two-mile radius from the Boyle Heights CPA will be considered as cumulative to the Proposed Plan.

References

This subsection identifies the sources and technical studies utilized in the preparation of this Draft EIR. These reports are referenced throughout the document where appropriate.

4.1 AESTHETICS

4.1.1 INTRODUCTION

This section provides an overview of the potential visual changes that could occur within the Boyle Heights CPA and evaluates the aesthetic impacts associated with the Proposed Plan. Topics addressed include scenic views and vistas, visual character, scenic resources, and light and glare.

4.1.2 EXISTING ENVIRONMENTAL SETTING

Scenic Views and Vistas

The term "view" generally refers to visual access to, or the visibility of, a particular sight from a given vantage point or corridor. Focal views focus on a particular object, scene, setting, or feature of visual interest. Examples of focal views include natural landforms, public art/signs, individual buildings, and specific, important trees. Panoramic views, or vistas, provide visual access to a large geographic area, for which the field of view can be wide and extend into the distance. Panoramic views are usually associated with vantage points looking out over a section of urban or natural areas that provide a geographic orientation not commonly available. Examples of panoramic views might include an urban skyline, a valley, a mountain range, the ocean, or other water bodies. The City's General Plan Conservation Element defines scenic views or vistas as the panoramic public view access to natural features, including views of the ocean, striking or unusual natural terrain, or unique urban or historic features. Public access to these views is from park lands, public rights-of-way, and other publicly owned sites held open to the general public.

Scenic views or vistas in the CPA include limited views of the downtown Los Angeles skyline, the San Gabriel Mountains, Hollenbeck Park, and various historic bridges. Due to the density and relative heights of buildings and urban development throughout a majority of the CPA, views are largely obstructed at the ground level. Intervening buildings, street bridges, freeway overpasses, and street trees block most views to natural features or views of the downtown Los Angeles skyline. Within the CPA there are four primary views that the City has identified as scenic, or long-range, vistas:

- View of the downtown Los Angeles skyline from Mariachi Plaza;
- General views of the downtown Los Angeles skyline from various points in the CPA;
- Views to and from the historic bridges spanning the Los Angeles River; and
- Views of the San Gabriel Mountains to the north of the CPA.

These vistas are shown in **Figures 4.1-1** through **4.1-3**.

Scenic Highways

The California State Scenic Highway System is a list of scenic highways (mainly state highways) or scenic parkways which have been designated or proposed by the state of California. The scenic highway designation serves to protect California's scenic beauty as well as its scenic resources. There are no state-designated scenic highways (or proposed state scenic highways or parkways) within the CPA. The only officially designated state scenic highway that crosses through the City is a small portion of a 3.5-mile segment of Topanga Canyon Boulevard (State Route 27), which is not within the Boyle Heights CPA. Several eligible state scenic highways pass through portions of Los Angeles, including Interstate 5 from Interstate 210 to the northern City limit, U.S. Route 101 from Topanga Canyon Boulevard to the western City limit, State Route 118 from De Soto Avenue to the western City limit, Interstate 210 from Interstate 5 to the eastern City limit, State Route 1 from Venice Boulevard to the City boundary adjacent to Santa Monica, and State Route 1 north of Interstate 10. The Arroyo Seco Parkway is a National Civil Engineering Landmark, a National Scenic Byway, and one of two California Historic Parkways, and is located north of the Boyle Heights CPA.

The City's Mobility Plan designates scenic highways that traverse an urban area of cultural, historic, or aesthetic value within the City. City-designated scenic highways consist of land that is visible from the highway right-of-way and is comprised primarily of scenic and/or natural features. There are no City-designated scenic highways within the Boyle Heights CPA.

Visual Character

The concept of visual character is not explicitly defined in the *CEQA Guidelines*. Visual character refers to the character of the landscape, which generally gives visual value to a setting. Visual character can be defined in terms of the overall impression formed by the relationship between perceived visual elements of the existing built, urban environment. Visual character is the features or elements that contribute to the valued image of a neighborhood, community, or localized area. Features that contribute to visual character may include, but are not limited to:

- Height and mass of-buildings;
- Structures of architectural or historical significance, or visual prominence;
- Public plazas, art, or gardens;
- The quality of the public realm, including roadways, sidewalks, plazas, parks, and street furniture;
- The nature and quality of the landscaping that is visible to the general public; and
- Relationship between the built and unbuilt space or building coverage.

The Boyle Heights CPA includes commercial corridors in close vicinity to densely populated residential neighborhoods and intensely developed industrial land, and they each have a distinct visual character. Industrial land uses are generally concentrated in the western and southern portions of the CPA, following long established industrial freight corridors that run north and south along the Los Angeles River and southeast into the industrial cities of Vernon and Commerce.

Boyle Heights CPA

For the purposes of describing the scenic resources (including scenic views), within, and visual character of, the CPA and to evaluate the Proposed Plan's related impacts, the CPA has been divided into five sub-areas for a broad description. A more detailed description of specific areas of the CPA is provided where the Proposed Plan proposes to change the development potential through amendments to the land use designation and zoning.

North

The northern area of the CPA is bounded by Cesar E. Chavez Avenue on the south and the I-10 Freeway and Marengo Street to the north. This area contains the hilliest parts of the CPA located to the north of Ganahl Street and east of Evergreen Avenue and is primarily multi-family residential. Scenic views in this area include both the San Gabriel Mountains to the north and the Downtown Los Angeles skyline to the west. This area also includes heavy industrial land uses in the northwestern corner of the CPA, as well as portions of the commercial corridor intended for the northern end of Soto Street.

South

The southern portion of the CPA abuts the city limits of the City of Los Angeles up to the Whittier Boulevard commercial corridor. This area is a mix of multi-family housing and industrial land uses, primarily south of Olympic Boulevard. The San Gabriel Mountains can be seen from this portion of the CPA as well as the Downtown Los Angeles skyline. The Sears building at the southwest corner of Olympic Boulevard and Soto Street dominates views within this portion of the CPA.

East

The eastern portion of the CPA, generally east of Evergreen Avenue and Euclid Avenue, abuts unincorporated East Los Angeles. Like much of the rest of the CPA, the eastern portion of Boyle Heights is primarily multi-family residential with associated commercial activities. Evergreen Memorial Cemetery is the largest open space in Boyle Heights and is found in this area. Scenic views include both the San Gabriel

Mountains to the north and the downtown Los Angeles skyline to the west. The most prominent view in this area is the panoramic view from the 4th Street bridge at Lorena Street.

Central

The central portion of the CPA is generally bounded by Cesar E. Chavez Avenue to the north, Whittier Boulevard to the South, the I-5 Freeway on the west, and Evergreen/Euclid Avenue on the east. This area is a mix of multi-unit housing as well as public facilities uses such as Roosevelt High School and Hollenbeck Middle School. The 4th Street corridor runs northwest to southwest within the central portion of the CPA. As with other areas of the CPA, the San Gabriel Mountains can be seen from this portion of the CPA as well as the Downtown Los Angeles skyline. Hollenbeck Park, which lies adjacent to the I-5 Freeway, is one of the most prominent scenic resources within this area.

West

The western portion of the CPA is bordered by the Los Angeles River. Scenic views in this area consist of the historic bridges spanning the river, the San Gabriel Mountains, and the downtown Los Angeles skyline, particularly from Mariachi Plaza. Scenic resources also include the historic Boyle Hotel and Mariachi Plaza itself. The western edge of the CPA is heavily industrial, particularly along the river, with areas east of Clarence Street devoted to primarily multi-family housing and commercial uses.

The interior of the CPA is comprised of residential neighborhoods in proximity to commercial corridors, schools, hospitals, and transit. These predominantly residential neighborhoods and commercial corridors have a very different visual character from the industrial edges of the CPA; therefore, the visual character of each area will be described separately in greater detail.

Residential Neighborhoods and Commercial Corridors. Boyle Heights is predominantly a residential community and is served by commercial corridors of varying intensity that reflect the needs of the surrounding neighborhoods. A clear distinction cannot easily be drawn between Boyle Heights' commercial and residential districts because while several areas have an established commercial character for several blocks or at a particular intersection, they are within a residential context. For example, the commercial activity that characterizes Cesar Chavez Avenue peaks at the intersection with Soto Street but takes on a more residential character just east of the intersection of Evergreen Avenue. First Street, Fourth Street, and Whittier Boulevard can be described in much the same way.

This mix of residential and commercial uses along the CPA's major corridors is reflected by a diverse building typology. This includes small storefronts and larger institutional buildings located alongside residential buildings, including large multi-story apartment blocks, and detached single story homes with pitched roofs. Many small storefronts are additions to the front of detached residential homes located along

a corridor. Commercial uses are typically located within small storefronts built to the sidewalk in a pedestrian oriented format or set far back from the street behind a parking lot, often within a corner shopping center. Both formats are common in Boyle Heights, therefore the visual character differs significantly from block to block. Buildings along the major corridors are generally between one and two stories, except for several recently constructed apartment buildings which are between three and five stories. Contributing to the varied character of each corridor is a variety of commercial signage, which can be found affixed to or painted on building facades or as pole signage. Beyond the major corridors, commercial uses can be found within Boyle Heights' residential neighborhoods in the form of small one story corner stores. Many of corner stores were built between the 1920s and 1940s and have continued to serve as a feature of neighborhood life in Boyle Heights.

The predominantly residential areas of the CPA have a wide variety of architectural styles and residential typologies that reflect more than a century of development. Residential architectural styles from the late nineteenth and early twentieth centuries are heavily represented, and in many cases, significantly modified and altered. It is generally common for a single block to have a mix of homes with pitched roofs and generous setbacks alongside larger multi-storied apartment buildings with parapet roofs, often built up to or near the sidewalk. Streets rarely present a uniformity of building styles, scales or setbacks. This variety of scales and styles is further augmented by past and ongoing modification of homes and properties in the form of second story and rear yard additions. While building forms are highly varied, most homes are built with a front porch or portico. Additionally, front yards are often enclosed with short walls and fencing. Building features allowing activity beyond the private domain are an important part of the visual and social character of Boyle Heights.

Industrial Areas. The western and southern edges of the CPA include industrial uses that are both part of a larger industrial region that includes the western portion of Downtown LA, the entire City of Vernon, and most of the City of Commerce. Heavy trucking and rail operations significantly contribute to the visual character of the CPA's industrial areas. The western industrial edge of the CPA runs along the Los Angeles River/Rail corridor with the north/south streets of Clarence Street, Anderson Street, and Mission Road shaping the layout of the district. The southern industrial edge of the CPA is located to the south of Olympic Boulevard and extends to the industrial City of Vernon. This area is primarily comprised of streets running east/west. While these areas are geographically separate, the visual character of each is generally similar. Both areas generally consist of one and two story brick and concrete buildings on streets that generally lack curb and gutters. Windows, entrances and loading bay doors along building facades are typically closed off and therefore do not provide indication of the types of uses or activities inside the buildings. The Sears Mail Order Building is located at the intersection of Soto Street and Olympic Boulevard, near the western edge of Boyle Heights' southern industrial district. The building includes a 10-story (130-feet) warehouse

complex on a large lot (4.6 acres), and features a 230-foot tall Art Deco style tower. As the building is located near low-rise buildings, the tower defines the visual character in this area and the building is in clear view within the southern industrial district looking west along either 11th Street or Olympic Boulevard.

Description of the Visual Character of Areas with Proposed Changes to Development Potential

- **Pico/Aliso Station Area:** The Pico/Aliso Metro Station is an elevated platform located in the center of First Street between Anderson Street and Utah Street. The station is located at the boundary between Boyle Heights' western industrial district and the residential neighborhoods of Pueblo del Sol (formerly Aliso Village) and Pico Gardens. The area where change is being proposed by the plan is generally bounded by First Street to the north, Mission Road to the west, Third Street to the south, and Utah Street to the east. The area generally consists of low scale warehouses that are one to two stories in height. Several small residential buildings are mixed in amongst the warehouses, each maintaining a residential appearance with a front yard and porch. The warehouse buildings that make up much of the area are built out along or near the edges of their respective lots, and any areas that remain are used as surface parking or vehicle storage screened behind security fencing. Building facades generally include long blank walls interrupted by the occasional loading bay, while windows and doors are typically shuttered. Mono Street is a small side street that bisects the area, south of which the area's sidewalks recede into generally unmaintained level surface, the majority of which is used for street parking.

- **Mariachi Plaza Station Area:** The area described in the following section includes Mariachi Plaza, First Street between Boyle Avenue and the I-5 Freeway overpass, and the White Memorial Medical Center site and its immediate surroundings. Mariachi Plaza is public plaza located along First Street between Boyle Avenue and Bailey Street. The plaza was designed to serve as the entrance to the subterranean Mariachi Plaza / Boyle Heights Metro L Line Station, as well as a public gathering space. The plaza is surfaced with decorative paving and landscaping and features an outdoor stage and a masonry bandstand. The Boyle Hotel, which is across the street from Mariachi Plaza, is a three story brick building designed in the Queen Anne architectural style and is a significant feature of the visual character of Mariachi Plaza and the surrounding neighborhood. A row of small one-story shop fronts directly abut the plaza along its northern edge, several of which have painted murals on the building facades. First Street is lined with rows of small stores and restaurants for several blocks until the I-5 Freeway overpass. The First Street and Boyle Avenue intersection includes a recently completed four story apartment building at the southwest corner, and a large vacant lot at the southeast corner.

  Located directly to the north of Mariachi Plaza and First Street is the White Memorial Medical Center, which is a cluster of large hospital and medical office buildings on an approximately 18-acre site. The

largest building within the complex serves as the primary hospital facility and was built in 2004 near the center of the site at height of 130-feet. The building can be seen from most vantage points in the area, including from Mariachi Plaza. Other large buildings on the site are between around 45 and 85 feet and date from the 1960s, 70s and 80s, and a large portion of the site includes surface parking lots. The White Memorial Medical Center site is surrounded by residential neighborhoods of primarily one and two-story detached homes, most of which were built between the 1890s and 1920s in a variety of Late Victorian and Arts and Craft styles. Many of the homes in this neighborhood are included in the Mount Pleasant Residential Historic District, which has been identified through SurveyLA.

- **Soto Station Area:** The area described in the following section is centered on Soto Station Plaza located at the intersection of First Street and Soto Street, and bounded by St. Louis Street to the west, Fourth Street to the south, Mott Street to the east, and just south of the parcels fronting Cesar Chavez Avenue.

  Soto Station is located at the southwest corner of the intersection of First Street and Soto Street where the Metro Rail L Line runs beneath First Street. The station entrance is in the middle of a public plaza that contains seating and landscaping along its southern edge. The First Street corridor that passes between St. Louis Street and Mott Street includes a varied mix of small storefronts, civic facilities, and residential uses.

  The intersection of First Street and Chicago Street is often referred to as the Boyle Heights Civic Center because it has three of the community's main civic facilities, as well as a small public park. Civic uses include the Boyle Height City Hall, a two-story Mediterranean Revival brick building built in 1924, Benjamin Franklin Library, a single story building constructed in 1974, and Hollenbeck Community Police Station, which is a two-story building built in 2009. A small triangle shaped park, Ross Valencia Community Plan, is located on the corner of First Street and Chicago Street and provides a grassy lawn and park benches under a grove of shade trees.

  Beyond the civic uses at the intersection of First Street and Chicago Street, the First Street corridor includes one and two-story commercial buildings with small storefronts for retail, restaurants, and personal services. Breaking from the pattern of small storefronts is an auto body repair shop on First Street and Breed Street which includes an outdoor repair and storage lot fronted by repair bays. Near the corner of First Street and Soto Street is a five-story mixed use building completed in 2018 that is larger than the surrounding one and two story structures.

  First Street between Mathews Street and Mott Street has a mix of small storefronts built up to the sidewalk and one and two-story detached homes set back behind modest sized front yards. Most of

the homes on this stretch of First Street were built between the 1890s and 1920s in a variety of Late Victorian and Arts and Craft styles.

The residential neighborhood blocks to the north and south of First Street have a varied mix of building scales and architectural styles with heights ranging between one and three stories. While the visual character is varied, there is a higher concentration of apartment blocks, bungalow courts, and homes built to the sidewalk north of First Street. The neighborhood blocks located to the south of First Street are predominantly one and two story homes built with pitched roofs and setback from the sidewalk ten to twenty feet with a landscaped front yard. A number of religious buildings built between the 1890s and 1920s are dispersed throughout the neighborhood blocks to the north and south of First Street.

The intersection of Fourth Street and Soto Street is predominately made up of auto-related uses, including a gas station, an auto sales lot, several auto repair shops, and large surface parking areas for retail uses. Pole signs are located on each street corner at the intersection. Beyond the Soto Street intersection, Fourth Street between St. Louis Street and Mott Street includes a mix of residential buildings set back behind front yards, small storefronts, and two public school campuses.

- **Indiana Station Area:** The Indiana Metro L Line Station is located on the east side of Indiana Street midblock between First Street and Third Street. This section focuses on the neighborhood blocks located to the west of Indiana Station, which is an area bound by Lorena Street to the west, Fourth Street to the south, Indiana Street to the east, and the five points intersection (Los Cinco Puntos) of Lorena Street, Cesar Chavez Avenue, and Indiana Street to the north. Bisecting the area is First Street, along which the Metro L Line travels before veering south on Indiana Street. The one block stretch of First Street between Lorena Street and Indiana Street includes a mix of commercial and residential buildings on sloping terrain. The most significant building on this stretch of First Street is the two story stucco Mission Revival building housing El Mercado, which is an indoor marketplace and restaurants. Two large surface parking areas located behind the site. The blocks to the north of the market building and parking lots are generally developed with one and two story detached residential buildings. The intersection of Cesar Chavez Avenue and Lorena Street and Indiana Street is referred to by many as Los Cinco Puntos in reference to the five point intersection. There are two small public parks located between the intersecting roadways, and they both include a small, landscaped seating area and a plot for a separate veteran's memorials. Between Lorena Street and Indiana Street at the southern corner of the intersection is a small single story restaurant with outdoor dining along the street. Evergreen Cemetery is located west of Lorena Street between Cesar Chavez Avenue and First Street. Views toward the cemetery from Lorena Street consist mainly of a long retaining wall that supports the sloping cemetery grounds at a higher elevation. The neighborhood blocks located south of First Street,

between Lorena Street and Indiana Street, mainly include one and two-story detached homes with pitched roofs and setback from the sidewalk with a landscaped front yard. The rear yards of most properties are heavily built-out with multiple buildings and structural additions.

- **Soto Street Corridor:** Soto Street functions as the primary north/south corridor connecting Boyle Heights to the communities of Lincoln Heights and El Sereno to the north, and the City of Vernon to the south. While Soto Street extends through the entire CPA, the area described in this section focuses on the 1.6 mile stretch of Soto Street between Wabash Avenue and Seventh Street. This area includes Soto Street's major intersections with Cesar Chavez Avenue, First Street, Fourth Street, and Whittier Boulevard. Each of these major intersections support commercial uses and transit connections, however beyond these intersections Soto Street is mainly residential with a residential character at varying intensities. The visual character of Soto Street can be generalized by describing the corridor north of First Street and south of First Street. Soto Street north of First Street is developed with two and three story apartment buildings built predominantly in the 1920s. These apartment buildings are typically built to or near the sidewalk and provide a strong street presence with entrances located directly along the street and Spanish and Mission Revival style building facades. Mixed in among the apartment building along the northern stretch of Soto Street are one and two story detached homes with pitched roofs, typically setback from the sidewalk with a landscaped or paved front yard. This mix in range in building setbacks results in the Soto Street corridor lacking a defined streetwall. Soto Street's visual character south of First Street is generally lower scale, containing predominantly one and two story homes. Setbacks along this southern section of Soto Street vary from around twenty feet to building set up along the edge of the sidewalk. Front yards are typically enclosed with chain link or wrought iron fencing while providing a street facing entrance.

- **Cesar Chavez Avenue:** The main commercial district in the CPA is located along Cesar Chavez Avenue, with a nearly continuous row of active storefronts lining the street between Cummings Street and Mott Street. This district was designated as a Los Angeles Historic Cultural Monument in 1994 as contributors to the Brooklyn Avenue Neighborhood Corridor. This area includes mostly one and two story commercial buildings built between the early 1900s and the 1930s and are characterized by their minimal decorative brickwork. Building heights range between one and two stories while views above the first story from the street are often obstructed by the thick canopy of street trees. The dense and compact arrangement of commercial buildings along the corridor present a unified visual character defined by continuous rows of small storefronts.

Scenic Resources

Scenic resources contribute to the visual character of a given area. It includes natural or urban features. Natural features can include open space, native or ornamental vegetation/landscaping, topographic or geologic features, and natural water sources. Urban or built features include structures of architectural/historical significance or visual prominence, public plazas, public art or gardens, heritage oaks and other trees or landscaping protected by the City, consistent design elements along a street or within a district, pedestrian amenities, and landscaped medians or park areas. Scenic resources contribute to the aesthetic character or image of a given area.

Landforms and Geology

There are very few natural geological features of note in the CPA. The area is mostly flat, densely populated, and heavily developed. The northeastern portion of the CPA includes a small-terraced hillside area developed with several winding streets and residential uses. This hillside area, along with the adjacent community of City Terrace, constitutes the southern extent of the San Rafael Hills, which define the topography of Northeast Los Angeles, Pasadena, and Glendale. The San Gabriel Mountains are visible from much of the CPA and are a significant visual resource in the area. The Los Angeles River runs along the western boundary of the CPA; however, the river is channelized and concrete-lined and is not considered a scenic resource. The only surface water feature of note in within the CPA boundaries is the artificial lake in Hollenbeck Park.

Open Space and Parks

Boyle Heights is mostly built out and contains few natural features and no significant areas of natural open space. Land designated Open Space consists of approximately 5 percent (149.3 acres) of the total area in the CPA, with the most significant civic open space being Hollenbeck Park. Other smaller civic parks include Lou Costello Jr Recreational Center, Evergreen Recreational Center, Ramon Garcia Recreational Center, Prospect Park, Pecan Recreation Center, Aliso Pico Recreation Center, Wabash Recreation Center, Boyle Heights Sports Center and Park, and State Street Recreation Center. Other large portions of land designated as Open Space consist of cemetery land within Evergreen Memorial Park and Crematory and Odd Fellows Cemetery.

Prominent Structures/Scenic Resources

Prominent structures and/or other scenic resources identified within the CPA include the following:

- Hollenbeck Park

- Prospect Park
- Boyle Hotel
- Sears Building
- Los Angeles River bridges
- 4th Street Bridge
- Evergreen Cemetery

Prominent Structures

The Project Area contains many structures of architectural/historical significance or visual prominence. Many of these structures were identified in SurveyLA as potentially eligible for historic designation. As discussed in Section 4.4, Cultural Resources, a Historic Resources Survey Report (Survey Report) undertaken from December 2013 to December 2014 of the Boyle Heights CPA was completed by the Los Angeles City Planning's Office of Historic Resources (OHR) as part of SurveyLA.

SurveyLA identified numerous potentially eligible properties in the CPA that fall under one or more of the resource types, as noted below. Properties in the CPA identified by SurveyLA as eligible for historic designation include single-family homes, multi-family buildings, commercial buildings, institutional properties, and industrial buildings. Many single-family and multi-family buildings are identified as appearing to be individually eligible for historic designation because they contribute to the history of Boyle Heights; are representative of a particular architectural style; embody distinctive characteristics of a period in history; represent the work of a master architect; and/or are associated with an important person in history. Similarly, eligible institutional, industrial, and commercial facilities are eligible for historic designation because they contribute to the history of Boyle Heights, are representative of a particular architectural style, and/or represent a period of development. Many corridors in Boyle Heights are examples of streetcar-related development in the earlier history of the City. A total of 153 parcels in the CPA are identified as eligible historic properties either individually or as contributors in a historic district. A total of 131 properties are identified as individually eligible and 22 properties are identified solely as contributors to an historic district. SurveyLA identified a total of four potentially eligible historic districts, including two industrial districts (Hostetter and 500-600 South Anderson), one medical and institutional district (County/USC Medical Center), and one commercial district (Cesar E. Chavez).

Light and Glare

Light

Nighttime illumination of varying intensities is characteristic of most urban and suburban land uses including those in the CPA. Nighttime lighting is necessary to provide and maintain safe, secure, and attractive environments. However, these lights have the potential to produce spill light and glare, and if designed incorrectly, could be considered unattractive or obtrusive to neighboring residences. Light that falls beyond the intended area is referred to as nighttime spillover light or light trespass. Nighttime spillover light can adversely affect light sensitive uses at nighttime, especially residences.

Given the nature of high-density urban development, most of the CPA is characterized by moderate to high intensities of nighttime illumination. Light and glare may be caused by street and parking lot lighting, building or landscape lighting, illuminated signs, recreational facilities, and to some extent interior lighting of residential and nonresidential buildings. Materials such as glass, metal, and polished surfaces can contribute to glare. Nighttime lighting sources include street, security, and way finding outdoor lighting, vehicle headlights, and interior building illumination. Street lights, particularly at intersections, illuminate a majority of the streets in the CPA. The bulk of the existing street lights within the CPA is on approximately 40-foot-tall street light poles. Ornamental pedestrian-level lighting is provided on some corridors, such as portions of 1st Street. Ambient light levels or illumination is measured in foot-candles (fc). **Table 4.1-1** describes the foot-candle (fc) range of various types of light.

Table 4.1-1
Foot-Candle Values of Common Light Sources

Illumination Source	Foot-Candles (LUX/FX)
Full Daylight	1,000
Full Moon	0.1
Office Lighting	70 - 150
Street Lighting	0.6-1.6

Source: City of Los Angeles, Department of Public Works Bureau of Street Lighting Design Standards and Guidelines, 2007.

In general, the CPA is an urban area with many sources of ambient illumination, including light emitted from industrial and commercial properties and streetlights lining the streets, as well as from the headlights of vehicles traveling through the CPA. Nighttime lighting is lowest in the residential areas of the CPA. Within the CPA, illumination levels due to street lights between intersections are lower than those at intersections, regardless of light spilling from lighting within adjacent buildings.

Glare

Glare is a common phenomenon in the southern California area primarily due to the occurrence of a high number of days per year with direct sunlight and the highly urbanized nature of the region resulting in a large concentration of potentially reflective surfaces. The majority of existing structures within the CPA are comprised of non-reflective materials, such as concrete, wood, and plaster, and to a limited extent, brick. However, glare can result from sunlight reflecting off of windows or the plastic signage, awnings or other structural components affixed to buildings located adjacent to streets in the CPA. During the daytime, parked vehicles can also produce a large source of glare from sunlight being reflected off windshields and other surfaces. Nighttime glare can occur from a variety of light sources including street lights and commercial and residential structures.

Shade and Shadows

Shading refers to the effect of shadows cast upon adjacent areas. The consequences of shadows upon land uses may be positive, including cooling effects during warm weather, or negative such as the loss of natural light necessary for solar energy purposes or the loss of warming influences during cool weather. Shadows are cast in a clockwise direction from west/northwest to east/northeast from approximately 7:00 a.m. to 3:00 p.m. or later depending on the time of the year: Summer Solstice (June 21), Spring/Fall Equinoxes (March 20 and September 22), and Winter Solstice (December 21). Generally, the shortest shadows are cast during the Summer Solstice and then grow increasingly longer until the Winter Solstice. During the Winter Solstice, the sun appears lower in the sky and shadows are at their maximum coverage lengths. Shadows cast during the Winter Solstice represent the greatest potential shade and shadow impacts.

Shadow effects depend on several factors, including local topography, the height and massing of buildings, and existing uses. Due to the relatively dense arrangement of existing commercial, industrial, and residential buildings within the developed portions of the CPA, shadow effects already exist in the CPA. Mid-rise buildings cast longer shadows than low-rise buildings. Within the Project Area, most buildings are considered low-rise, except for a few buildings such as the Sears building and buildings associated with the White Memorial Medical Center. As such, the effects of shadows affecting public spaces where people gather for long periods are minimal.

4.1.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Aesthetics at the state and local levels. As described below, these plans, guidelines, and laws include the following:

- Caltrans State Scenic Highways
- Senate Bill 743
- City of Los Angeles General Plan Framework, Mobility Plan 2035, and Conservation Element
- City of Los Angeles Planning and Zoning Code and Building Regulations
- City of Los Angeles Baseline Hillside Ordinance
- Los Angeles Administrative Code (LAAC) Cultural Heritage Ordinance
- City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance
- City of Los Angeles Tree and Shrub Preservation Ordinance
- City of Los Angeles Citywide Design Guidelines
- Clean Up Green Up Supplemental Use District

State

California Department of Transportation (Caltrans) State Scenic Highways

California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment. State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Sections 260 through 263. A highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. Caltrans defines a State Scenic Highway as any freeway, highway, road, or other public right-of-way that traverses an area of exceptional scenic quality. Eligibility for designation as a State Scenic Highway is based on vividness, intactness, and unity of the roadway. The status of a proposed State Scenic Highway changes from eligible to officially-designated when the local governing body applies to Caltrans for scenic highway approval, adopts a Corridor Protection Program, and receives notification from Caltrans that the highway has been officially designated a State Scenic Highway. There are no designated state scenic highways in the City of Los Angeles, including the Boyle Heights Community Plan Area.

Senate Bill 743.

On September 2013, Governor Brown signed into law SB 743, which instituted changes to the California Environmental Quality Act (CEQA) when evaluating environmental impacts of projects in areas served by transit. While the focus of SB 743 is to address how transportation impacts are evaluated, it also limits the

extent to which aesthetic impacts are evaluated under CEQA. SB 743 (Public Resources Code [PRC] Section 21099 (d)(1)) exempts development projects located in Transit Priority Areas (TPAs), from review of aesthetic impacts under CEQA. Specifically, this bill states that aesthetic impacts of a residential, mixed-use residential, or employment center project on an infill site within a TPA shall not be considered significant impacts on the environment. Therefore, aesthetic impacts within a TPA are considered less than significant in environmental analyses. A TPA is defined as an area within one-half mile of a major transit stop that is existing or planned.

Local

City of Los Angeles General Plan Framework, Mobility Plan 2035 and Conservation Element

The Framework Element planning policies regarding urban form, neighborhood design and the conservation of open space and other scenic resources, described in Framework Element Section 1.1 of Chapter 1, Introduction and Community Profile, are intended to improve community and neighborhood livability in the City of Los Angeles. The Framework Element's policies on Open Space and Conservation seek to conserve resources and use open space to enhance community and neighborhood character in the City.

The Conservation Element (adopted in 2001) includes a discussion of the existing landforms and scenic vistas in the City of Los Angeles. Objectives, policies, and programs included in this element are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects.

The Mobility Plan 2035 (adopted in 2016) provides an inventory of City-designated scenic highways. Scenic highways depicted in the City have special controls for protection and enhancement of scenic resources. The Mobility Plan 2035 also includes Scenic Highway Guidelines for those designated scenic highways for which there is no adopted scenic corridor plan. (Los Angeles 2016a)

Objectives, policies, and programs included in the General Plan Framework, Conservation Element and Mobility Plan 2035 are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects. Applicable goals, objectives, and policies of these General Plan elements are shown in **Table 4.1-2.**

Table 4.1-2
Relevant General Plan Aesthetics Goals, Objectives, and Policies

Goal/Objective/ Policy	Goal/Objective/Policy Description
Framework Element-Chapter 5 Urban Form and Neighborhood Design	
Goal 5A	A livable City for existing and future residents and one that is attractive to future investment. A City of interconnected, diverse neighborhoods that builds on the strengths of those neighborhoods and functions at both the neighborhood and Citywide scales.
Objective 5.1	Translate the Framework Element's intent with respect to Citywide urban form and neighborhood design to the community and neighborhood levels through locally prepared plans that build on each neighborhood's attributes, emphasize quality of development, and provide or advocate "proactive" implementation programs.
Policy 5.1.1	Use the Community Plan Update process and related efforts to define the character of communities and neighborhoods at a finer grain than the Framework Element permits.
Objective 5.2	Encourage future development in centers and in nodes along corridors that are served by transit and are already functioning as centers for the surrounding neighborhoods, the community or the region.
Policy 5.2.1	Designate centers and districts in locations where activity is already concentrated and/or where good transit service is, or will be, provided.
Policy 5.2.2	Encourage the development of centers, districts, and selected corridor/boulevard nodes such that the land uses, scale, and built form allowed and/or encouraged within these areas allow them to function as centers and support transit use, both in daytime and nighttime (see Chapter 3: Land Use). Additionally, develop these areas so that they are compatible with surrounding neighborhoods, as defined generally by the following building characteristics. • Buildings in neighborhood districts generally should be low rise (one- to two-stories), compatible with adjacent housing, and incorporate the pedestrian-oriented design elements defined in Policies 5.8.1 and 3.16.1 - 3.16.3. They should also be located along sidewalks with appropriate continuous storefronts. • Buildings in community centers generally should be two to six stories in height, with the first several stories located along the sidewalk. They should also incorporate the pedestrian-oriented elements defined in policy 5.8.1. Either housing or office space may be located above the ground floor storefronts. • Buildings located at activity nodes along mixed-use boulevards generally shall have the same characteristics as either neighborhood districts or community centers, depending on permitted land use intensities. Housing over ground floor storefronts or in place of commercial development shall be encouraged along mixed-use boulevards
Objective 5.5	Enhance the livability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.
Policy 5.5.3	Formulate and adopt building and site design standards and guidelines to raise the quality of design Citywide.
Policy 5.5.4	Determine the appropriate urban design elements at the neighborhood level, such as sidewalk width and materials, street lights and trees, bus shelters and benches, and other street furniture.
Policy 5.5.6	Identify building and site design elements for commercial or mixed-use streets in centers that may include: the height above which buildings must step back; the location of the building base horizontal articulation; and other design elements.
Policy 5.5.7	Promote the undergrounding of utilities throughout the City's neighborhoods, districts, and centers.
Objective 5.6	Conserve and reinforce the community character of neighborhoods and commercial districts not designated as growth areas.
Policy 5.6.1	Revise community plan designations as necessary to conserve the existing urban form and community character of areas not designated as centers, districts, or mixed-use boulevards.
Objective 5.7	Provide a transition between conservation neighborhoods and their centers.
Policy 5.7.1	Establish standards for transitions in building height and for on-site landscape buffers.

Goal/Objective/ Policy	Goal/Objective/Policy Description
Objective 5.8	Reinforce or encourage the establishment of a strong pedestrian orientation in designated neighborhood districts, community centers, and pedestrian-oriented subareas within regional centers, so that these districts and centers can serve as a focus of activity for the surrounding community and a focus for investment in the community.
Policy 5.8.1	Buildings in pedestrian-oriented districts and centers should have the following general characteristics: a. An exterior building wall high enough to define the street, create a sense of enclosure, and typically located along the sidewalk; b. A building wall more-or-less continuous along the street frontage; c. Ground floor building frontage designed to accommodate commercial uses, community facilities, or display cases; d. Shops with entrances directly accessible from the sidewalk and located at frequent intervals; e. Well-lit exteriors fronting on the sidewalk that provide safety and comfort commensurate with the intended nighttime use, when appropriate; f. Ground floor building walls devoted to display windows or display cases; g. Parking located behind the commercial frontage and screened from view and driveways located on side streets where feasible; h. Inclusion of bicycle parking areas and facilities to reduce the need for vehicular use; and i. The area within 15 feet of the sidewalk may be an arcade that is substantially open to the sidewalk to accommodate outdoor dining or other activities.
Policy 5.8.2	The primary commercial streets within pedestrian-oriented districts and centers should have the following characteristics: a. Sidewalks: 15-17 feet wide (see illustrative street cross-sections). b. Mid-block medians (between intersections): landscaped where feasible. c. Shade trees, pruned above business signs, to provide a continuous canopy along the sidewalk and/or palm trees to provide visibility from a distance. d. Pedestrian amenities (e.g. benches, pedestrian-scale lighting, special paving, window boxes, and planters).
Policy 5.8.4	Encourage that signage be designed to be integrated with the architectural character of the buildings and convey a visually attractive character.
Conservation Element	
Land Form & Scenic Vista Objective	Protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.
Land Form & Scenic Vista Policy	Continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.
Mobility Plan 2035	
Objective 11	Preserve and enhance access to scenic resources and regional open space.
Policy 11.1	Designate scenic highways and scenic byways which merit special consideration for protection and enhancement of scenic resources.
Policy 11.2	Provide for protection and enhancement of views of scenic resources along or visible from designated scenic highways through implementation of guidelines set forth in this 2035 Mobility Plan.
Policy 11.3	Consider aesthetics and scenic preservation in the design and maintenance of designated scenic highways and of those scenic byways designated in Community Plans.
Policy 11.4	Establish Scenic Corridor Plans, where appropriate, which set forth corridor boundaries and development controls in harmony with each corridor's specific scenic character.
Plan for a Healthy LA	
Policy 2.2	Promote a healthy built environment by encouraging the design and rehabilitation of buildings and sites for healthy living and working conditions, including promoting enhanced pedestrian-oriented circulation, lighting, attractive and open stairs, healthy building materials and universal accessibility using existing tools, practices, and programs.

Goal/Objective/ Policy	Goal/Objective/Policy Description
Policy 3.3	Continue to support the implementation of the Los Angeles River Revitalization Master Plan to create a continuous greenway of interconnected parks and amenities to extend open space and recreational opportunities.
Policy 3.4	Promote opportunities for physical activity for users of all ages and abilities by continuing to improve the quality of existing park and open space facilities and creating recreation programs that reflect the city's rich diversity and local community needs.

City of Los Angeles Planning and Zoning Code and Building Regulations

LAMC Chapter 1 contains the Planning and Zoning Code, and Chapter 9 contains Building Regulations. The purpose of the Planning and Zoning Code is to designate and regulate the location, use, height and size of buildings. The Planning and Zoning Code regulates the aesthetics and visual quality of development projects. It includes development regulations specific to each zone and also addresses parking, landscaping, landform protection, lighting, and a number of other topics that influence the aesthetics of a development project. The Planning and Zoning Code also includes design regulations that seek to affect the physical alteration of streets, intersections, alleys, pedestrian walkways, and landscaping.

The following LAMC Sections regulate issue areas pertaining to the aesthetics of development in the City of Los Angeles. Those sections from Chapter 1 of the LAMC referenced below will be carried over to Chapter 1A of the LAMC (the New Zoning Code); although the regulations may be modified to meet the structure of the New Zoning Code, they would meet the intent of these existing regulations.

Lighting

Chapter 1, Article 2, Sec. 12.21 A5(k). All lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any streets and any adjacent premises.

Chapter 1, Article 7, Sec. 17.08C. Plans for street lighting system shall be submitted to and approved by the Bureau of Street Lighting.

Chapter 9, Article 3, Sec. 93.0117. No exterior light source may cause more than two foot-candles (21.5 lux) of lighting intensity or generate direct glare onto exterior glazed windows or glass doors; elevated habitable porch, deck, or balcony; or any ground surface intended for uses such as recreation, barbecue or lawn areas or any other property containing a residential unit or units.

Chapter 9, Article 1, Section 91.6205 (K)4. Signs are prohibited if they contain flashing, mechanical and strobe lights in conflict with the provisions of Section 80.08.4 and 93.6215 of this code.

Chapter 9, Article 1, Section 91.6205M. No sign shall be arranged and illuminated in such a manner as to produce a light intensity of greater than three foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property

Land Form Preservation

Chapter 1, Article 7, Section 17.50-E. Establishes slope-density regulations which restrict density on the basis of the calculated average of the ungraded slopes at selected contours within a parcel that is proposed for divisions of land

Chapter 1, Article 2, Section 12.21-A.17. Establishes the hillside overlay zone within which restricted densities and other requirements for neighborhood and environmental compatibility apply.

City of Los Angeles Baseline Hillside Ordinance.

The Baseline Hillside Ordinance is part of the City's Planning and Zoning Code and applies to all properties zoned R1, RS, RE (9, 11, 15, 20, and 40), and RA and are designated as Hillside Area in the Department of City Planning Hillside Area Map, as defined in LAMC Section 12.03. It designates and regulates the setback, height, and size of residential buildings in the Hillside Area. Its purpose is to limit the scale of development within the residential zoned parcels within the hillside.

Los Angeles Administrative Code (LAAC) Cultural Heritage Ordinance (Section 22.171)

The provisions of the Cultural Heritage Ordinance are codified in Division 22, Chapter 9, Article 1 of the LAAC, commencing with Section 22.171. The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCM). HCMs, along with all other historically significant resources, are considered scenic resources. The designation of a historic building as an HCM requires that the resource be considered when analyzing the aesthetic impacts of a project and delays demolition by up to a year. See **Section 4.4, Cultural Resources** for a discussion of this Ordinance.

City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance

In addition to the designation of individual sites as HCMs, the City of Los Angeles also has a separate ordinance and procedure for the designation of historic districts, or HPOZ. This Ordinance, which is found in LAMC Chapter I, Article 2, Section 12.20.3, is intended to recognize, preserve, and enhance buildings, structures, landscaping, natural features, and areas within the City having historic, architectural, cultural, or aesthetic significance in the interest of the health, economic prosperity, cultural enrichment, and general welfare of the people. See **Section 4.4, Cultural Resources,** for a discussion of this Ordinance.

City of Los Angeles Tree and Shrub Preservation Ordinance

Protected trees are considered aesthetic resources. The City of Los Angeles adopted an ordinance for the Preservation of Protected Trees (Ordinance No. 177,404; LAMC Chapter IV, Article 6) which became law on April 23, 2006. The ordinance protects the following tree species:

- All native Oak tree species (*Quercus spp*), but excluding the Scrub Oak (*Quercus dumosa*)
- Western Sycamore (Platanus racemosa)
- California Bay (*Umbellularia californica*)
- California Black Walnut (*Juglans californica*)

The ordinance applies to trees that are four inches or greater in diameter at 4.5 feet above ground, and on any lot size. Protected tree removal requires a removal permit by the City of Los Angeles Department of Public Works (LADPW). Ordinance-projected trees on private property and streets rights-of-way are protected by the City's Tree Preservation Ordinance; therefore, any act that may cause the failure or death of a protected tree requires inspection by the LADPW Urban Forestry Division. In the event that the LADPW approves a tree removal, replacement of the tree is required with at least two trees of a protected variety. See Section 4.3, Biological Resources, for a discussion of protected trees.

On December 11, 2020, the City adopted Ordinance No. 186,873, extending protection status to include two native shrub species, the Mexican Elderberry (*Sambucus mexicana*) and Toyon (*Heteromeles arbutifolia*) shrubs and amending provisions of Sections 12.21, 17.02, 17.05, 17.06, 17.51, 46.00, 46.01, 46.02, 46.03, 46.04, and 46.06 of the Los Angeles Municipal Code (LAMC).

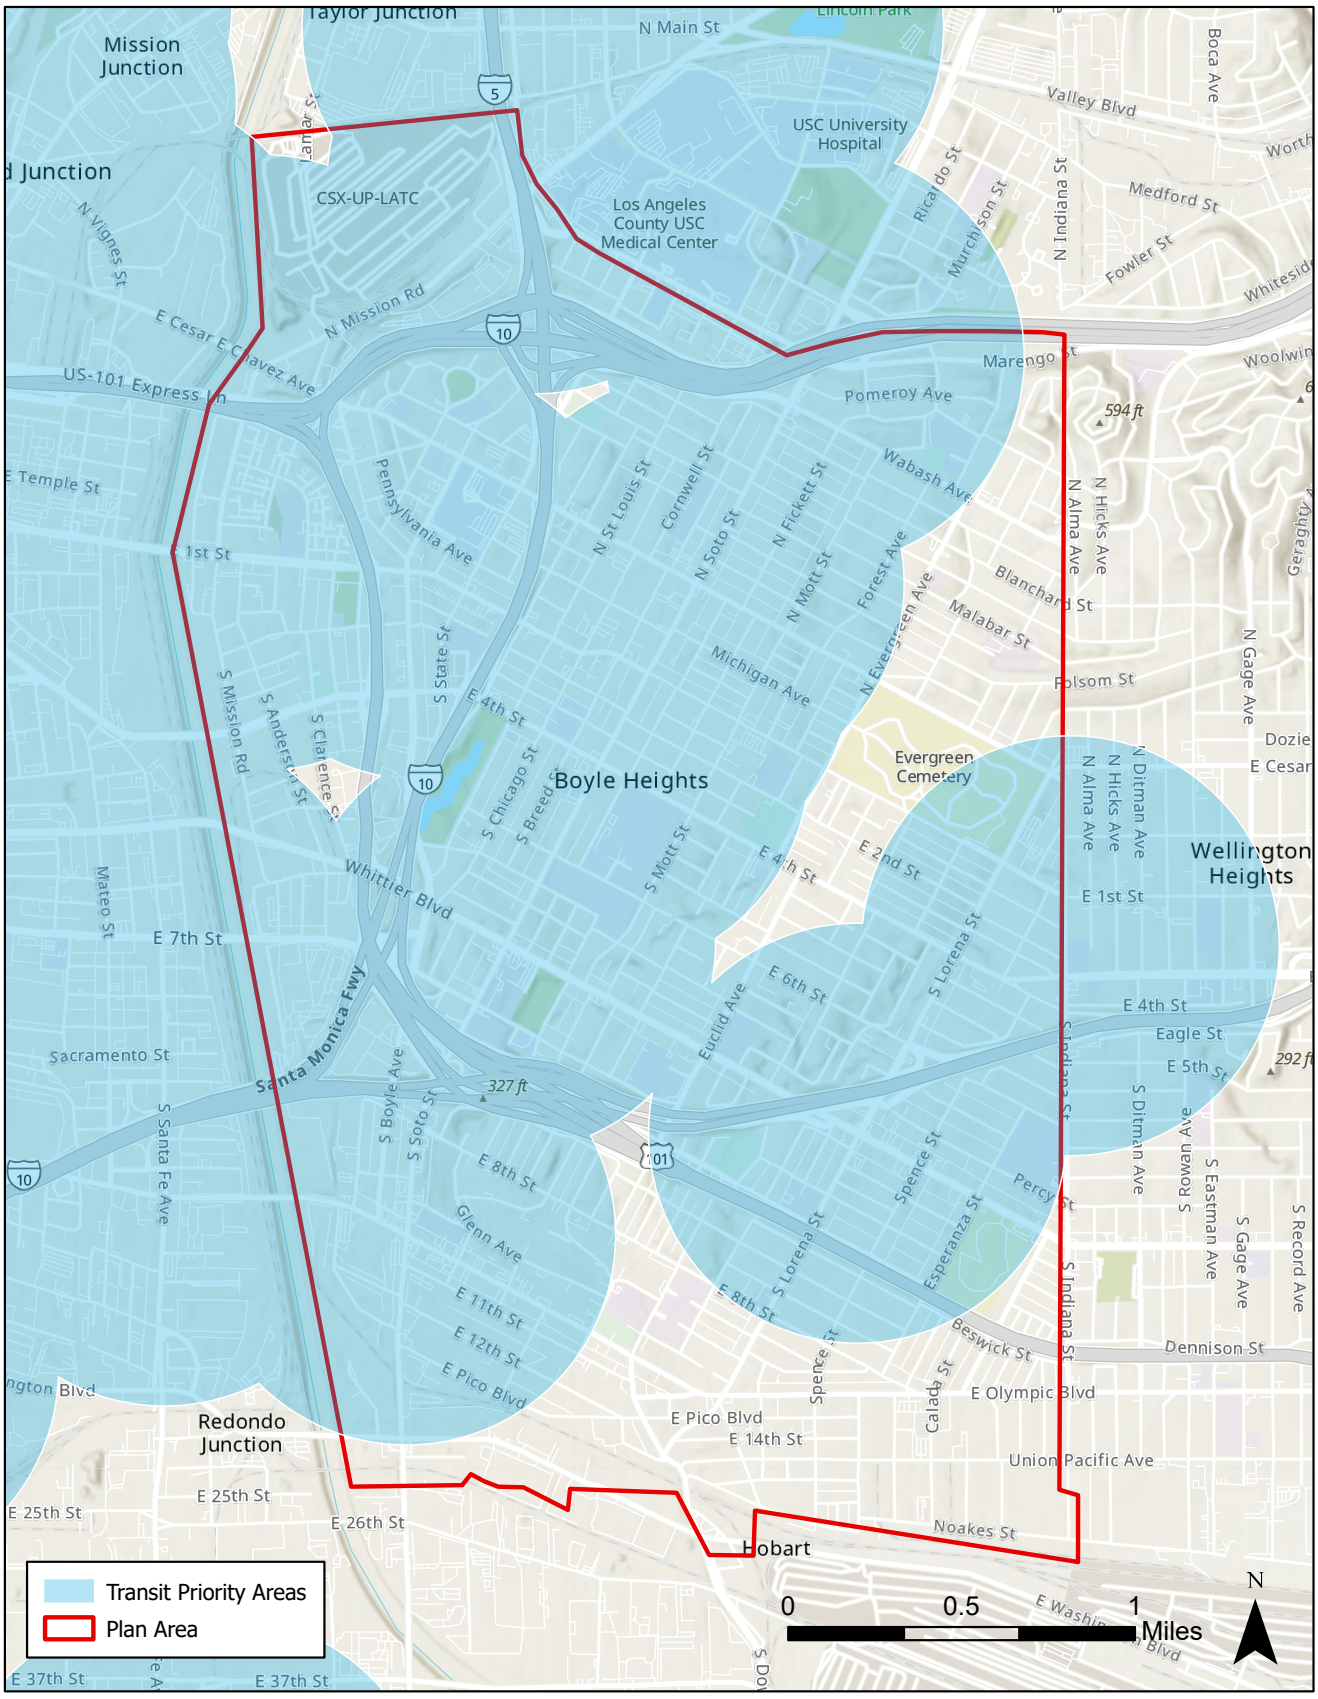
City of Los Angeles Citywide Design Guidelines

The City of Los Angeles has created Citywide Design Guidelines to carry out the common design objectives that maintain neighborhood form and character for residential, commercial, and industrial uses. The guidelines are intended for developers, architects, and advisory and decision-making bodies when evaluating development projects. Specific design regulations relating to individual communities can be found in the Community Plan Urban Design Chapter of each of the City's 35 Community Plans or special zoning designations, such as Specific Plans, Community Design Overlay Districts, designated historic properties, and historic districts. The Citywide Design Guidelines applies to all areas of the City, but it is particularly applicable to those areas within the city that do not currently have adopted design guidelines. In cases where the Citywide Design Guidelines conflict with a provision in a Community Plan Urban Design Chapter or a special zoning designation, the community's specific requirements would prevail. The

previous sentence is stated verbatim in each of the three Citywide Design Guidelines (Residential, Commercial, and Industrial) in a section called "Relationship Between the General Plan, Zoning Code, Citywide Guidelines, and Community-Specific Design Guidelines."

Clean Up Green Up Supplemental Use District

In 2016, the City Council approved Ordinance #184246 to establish a Clean Up Green Up Supplemental Use District within Boyle Heights, as well as other areas of the City. The Clean Up Green Up Ordinance establishes "green zones" to reduce cumulative health impacts resulting from incompatible land uses, establish a citywide Conditional Use for asphalt manufacturing and refinery facilities, and increase the notification requirement for projects within a surface mining district. The Clean Up Green Up Ordinance also includes provisions that impact aesthetics such as applicable standards regarding lighting, building heights, and landscaping.



4.1.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to visual/aesthetic resources if it would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from a publicly accessible vantage point.) If the project is in an urbanized area, would the Proposed Plan conflict with applicable zoning and other regulations governing scenic quality; and/or
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

4.1.5 METHODOLOGY

This impact discussion evaluates impacts from inside and outside the CPA where the visual resources identified in the existing setting may be affected by the Proposed Plan. This impact section analyzes impacts from reasonably anticipated development of the Proposed Plan. As shown in **Figure 4.1-14, Boyle Heights TPA Map**, a significant portion of the Boyle Heights CPA is located within Transit Priority Areas (TPAs).

SOURCE: SCAG, 2016; Esri, 2022

FIGURE **4.1-14**

IMPACT SCIENCES

Boyle Heights Transit Priority Areas

1264.03•05/22

A portion in the southern part of the CPA is located outside of the 0.5-mile transit buffer of the TPA boundary and lies in the predominantly industrially zoned area and partially multi-unit zoned area that is generally south of 8th Street and east of Grand Vista Avenue. There is another small portion of the CPA that is outside of a TPA boundary that is located generally west of Evergreen between Lanfranco Street and Marengo Street that include mostly low density multi-unit zoned areas as well as Evergreen Cemetery. TPAs are defined as areas within 0.5-mile of a major transit stop. TPAs are defined as areas within a half mile of a major transit stop. The Metro L Line runs through Boyle Heights along 1st Street with stops at Pico/Aliso Station, Mariachi Plaza, Indiana Station, and Soto Station.[1]

As discussed previously, under SB 743, residential, mixed-use, and employment center projects in a TPA are exempt from aesthetic impacts analysis. Most development that is reasonably foreseeable in the TPAs of the Proposed Plan would be residential, mixed use, or an employment center and would, therefore, as a matter of law, not have aesthetic impacts under CEQA. Notwithstanding, the relevant language of SB 743, codified at PRC Section 21099(d) does not expressly apply to planning projects and therefore as a conservative measure, this EIR will consider aesthetic impacts from the implementation of the Proposed Plan in all of the CPA, including TPAs and including from development that would qualify for SB 743 exemption.

The evaluation of aesthetic impacts is a subjective exercise, both in identifying valued aesthetic resources and identifying impacts to valued aesthetic resources. Considerations for determining impacts under the various categories of aesthetic resources and impact thresholds are discussed below.

Scenic Vistas / Obstruction of Views

This aesthetics analysis takes into account public scenic views of the Boyle Heights CPA from varying vantage points, as well as public scenic views from the CPA of visual features such as open spaces, mountain ranges, etc. For the purposes of the CEQA analysis, significant impacts to views typically consist of the loss or obstruction of a valued public view (e.g., scenic vista, particularly a panoramic view of areas that have visual interest views), or changes in the character of the view that detract from a valued viewshed. The assessment evaluates whether such viewpoints exist within the CPA and whether the content of the view would be adversely affected by the Proposed Plan. Diminishment of a scenic vista would occur if the Proposed Plan would introduce buildings or development that contrast enough with a visually interesting view, so that the content and quality of the view is permanently affected. The loss of a private view would not be an impact for purposes of this analysis. The City does not protect private views. Changes to and loss

1 Mariachi Plaza Stations. Metro Los Angeles. Available online at: http://media.metro.net/riding_metro/maps/images/gold_mariachi.pdf.

of private views from development are expected in an urban environment over time as buildings are changed or added to a particular area.

Visual Character

The concept of visual character is not explicitly defined in the *CEQA Guidelines* or the City's Thresholds Guide. *Visual character* can be defined in terms of the overall impression formed by the relationship between perceived visual elements of the built, urban environment existing in the CPA. Elements contributing to the impression of the character of an area include the following:

- Height and mass of proposed buildings compared to existing development;
- The compatibility between uses and activities with the built environment;
- The quality of the public realm, including roadways, sidewalks, plazas, parks, and street furniture;
- The nature and quality of landscaping that is visible to the general public;
- The relationship between built and unbuilt space, or building "coverage;" and
- The presence of shade and shadows.

Evaluation of significant impacts to the visual character of an area is generally based on the removal of features with aesthetic value, the introduction of contrasting urban features into a local area, and the degree to which the elements of the Proposed Plan detract from the visual character of an area. Analysis of impacts to visual character is subjective in its very nature. The qualities that create aesthetic value will vary from person to person. Some observers may see a benefit in change to the visual character, while other observers would find them discordant.

Although the threshold of significance in Appendix G focuses on whether the Proposed Plan conflicts with the applicable zoning in an urban environment, as the City is changing the applicable zoning with the Proposed Plan, the analysis in this impact area will analyze whether the Proposed Plan would be expected to degrade the existing visual character or quality of public views of the Boyle Heights CPA and its surrounding area for the Proposed Plan, notwithstanding the CPA is an urbanized area.

Light and Glare

Light and glare impacts are typically associated with outdoor artificial light during the evening and nighttime hours. Glare may also be a daytime occurrence caused by the reflection of sunlight or artificial light from highly polished surfaces, such as window glass and reflective building cladding materials, and

may interfere with the safe operation of a motor vehicle on adjacent streets. In this aesthetics discussion, light and glare impacts are assessed qualitatively based on anticipated future development as well as applicable City regulations pertaining to acceptable levels and sources of light and glare.

4.1.6 IMPACTS

Threshold 4.1-1 Would implementation of the Proposed Plan have a substantial adverse effect on a scenic vista?

This impact would be less than significant.

In general, the potential to impact panoramic view and landscapes (both natural and man-made) varies by the location and scale of development. Although panoramic views are often associated with open space areas, they can also be present in developed urban areas such as Boyle Heights. Implementation of the Proposed Plan and its associated land use and zoning changes could result in visual impacts by blocking or impeding views of significant landscape features, however views of these features from the public right-of-way would remain.

Within the CPA there are four primary views that the City has identified as scenic vistas:

- View of the downtown Los Angeles skyline from Mariachi Plaza;
- General views of the downtown Los Angeles skyline from various publicly accessible points in the CPA;
- Views to and from the historic bridges spanning the Los Angeles River; and
- Views of the San Gabriel Mountains to the north of the CPA.

A substantial adverse effect on scenic vistas would occur if implementation of the Proposed Plan would result in the loss and/or significant obstruction of scenic views or change the character of the view that detracts from the view value. Loss or significant obstruction would occur if the Proposed Plan introduced development that contrasts enough with the existing view so that it is permanently affected or if public access to the viewpoint is lost. The City does not consider impacts to views from private property and impacts to private views would not be an impact for the purposes of this analysis.[2]

The Proposed Plan would not result in a loss of scenic vistas. Most views from within Boyle Heights are framed by the existing street grid pattern, flat terrain, and urbanized built environment. The views from

2 CEQA case law has established that, in general, protection of public views is emphasized. For example: *Association for Protection etc. Values v. City of Ukiah* (1991) 2 Cal. App. 4th 720, 734.

public areas and public streets are from a distance, generally align with the street grid, and may be framed by buildings and street trees. Much of the future development that would occur under the Proposed Plan would occur in designated nodes and corridors within existing built areas, not creating new obstructions but instead reinforcing existing view corridors. Some new buildings could impinge on existing views, but such impacts are expected within an urban environment and existing public vistas are anticipated to be substantially maintained.

The Proposed Plan would not cause any changes to the subjects of the scenic, or long-range, vistas. The Plan would not directly alter views from or of Mariachi Plaza, the existing Los Angeles skyline, the historic bridges spanning the Los Angeles River, nor the San Gabriel Mountains to the north of the CPA.

The following sections describe how the Proposed Plan would affect the scenic, or long-range, vistas identified above. The sections below are organized according to major categories of zone changes and General Plan amendments that would be enacted as part of the Proposed Plan.

Changes to Development Potential

Re-designation of properties located to the south and west of the Sears site from Light Manufacturing and Heavy Manufacturing to Light Industrial

The Proposed Plan would re-designate Light and Heavy Manufacturing properties located to the south and west of the Sears site as Light Industrial. The changes to the land use designation and associated zoning would allow FAR up to 1.5:1, which would result in buildings generally up to 4 stories in an area that is currently developed with a mix of one story industrial uses and surface parking lots. Future development on these parcels would not obstruct prominent views of the downtown Los Angeles skyline, San Gabriel Mountains, or Los Angeles River bridges. The Sears building itself is a large visual feature in the built environment, and new development in these surrounding parcels would be constructed to a compatible massing and scale.

Re-designation of major corridors from Neighborhood Commercial to Community Center

The Proposed Plan would increase the development potential along some corridors within the CPA. Increased development potential means that the zoning or the designations of a parcel change such that higher intensity use is allowed; for instance, a wider range of uses, higher residential densities, higher FAR, or taller height limitations represent increased development potential. A redesignation does not mean that the higher intensity will occur, just that it would be allowable.

The Proposed Plan would increase the development potential in areas of the CPA surrounding the Metro L Line stations and along major transit corridors. These areas would be changed to permit additional housing to be constructed at a higher FAR and residential density. These areas include the blocks surrounding the Pico/Aliso L Line station, the Soto L Line station, and the Indiana Street L Line station. These areas are currently under a wide range of residential and commercial zoning and are proposed to be designated as Community Center with development regulations ranging from 1.5.0 FAR with no height limit along the main corridors to 3.0 FAR with a 45-foot height limit for residential buildings surrounding the Soto and Indiana Street stations.

The view of the Downtown Los Angeles skyline from Mariachi Plaza follows the First Street alignment; the Pico/Aliso L Line station is located on First Street between Downtown Los Angeles and Mariachi Plaza. However, in general, increases in building height would not obstruct public views of scenic resources or vistas because structures would not block existing views along public rights-of-way and views of urban streetscapes would not be substantially altered. Furthermore, the Proposed Plan would not alter existing street alignments such that existing views would become blocked.

The Proposed Plan would also increase the development potential along certain corridors in the CPA by changing the General Plan Designations to Community Center or Neighborhood Center. This change would generally resolve some existing inconsistencies between land use and zoning regulations that currently rely on Q conditions to limit uses or development to create consistency. For example, parcels on the south side of First Street between Julien and Lorena Streets are designated Low Medium II and zoned [Q]C2-1-CUGU, and the Q Condition further limits the density and uses to what is permitted in the RD1.5 zone. The Proposed Plan would change portions of corridors to mixed-use zones with zoning consistent with C2 zoning, resulting in an increased intensity of allowable uses, increased allowable residential density, and introduction of no height limit. The changes to the land use designation and associated zoning would allow FAR up to 2.5: and building height up to 4 stories in an area that is currently built with mostly one- to two-story buildings. This change would affect various corridor sections, where the current Low Medium II land use designation is inconsistent with the existing C2 zoning.

Changes to massing, form, and height are expected to be incremental and gradual as it takes time for development projects to be proposed, approved, and financed. Development would not be anticipated to cause new obstructions to prominent public views of the Downtown Los Angeles skyline, San Gabriel Mountains, or Los Angeles River bridges.

Re-designation of Soto Street from Low Medium II Residential and Medium Residential to Community Center and Medium Neighborhood Residential

Soto Street is primarily a residential corridor that intersects with major east-west commercial corridors in the central part of its path through Boyle Heights, containing a mix of commercial and residential uses near these intersections. The primary development pattern along these residential stretches are detached homes that have been sub-divided. The Proposed Plan would designate the majority of Soto Street in the CPA as Community Center to concentrate future growth in corridors with access to transit.

Physical changes in the area, particularly the residential areas, would occur, including development of residential properties, multi-family housing, commercial buildings, or mixed-use buildings, and the Proposed Plan will foreseeably increase building height and/or density in certain areas. North of Cesar Chavez Ave and south of 4th Street, the proposed zoning would allow a maximum FAR of up to 3:1 , which would result in buildings up to 6 stories in height. This portion of Soto Street is currently mainly developed with one and two-story residential buildings set back from the sidewalk with front yards. Between Cesar Chavez Ave and 4th Street, the proposed zoning would allow a maximum FAR of up to 4:1, which would result in buildings of up to 7 stories in height. Changes to massing, form, and height are expected to be incremental and gradual as it takes time for development projects to be proposed, approved, and financed. Views of the San Gabriel Mountains, which occur only intermittently along the Soto Street alignment would not be substantially affected. Existing partial views of the Downtown Los Angeles skyline and Los Angeles River bridges where Soto Street intersects other streets would also not be substantially affected.

Re-designation of blocks located between Lorena Street, First Street, Indiana Street, and Cesar Chavez Avenue from Low Medium II Residential to Community Center

Consistent with one of the Proposed Plan's objective to increase the development potential in areas of the CPA along major corridors that are located around Metro L Line stations, the Proposed Plan would change the designation for properties in a residential area near the Indiana L Line Station to Community Center. The designation change and associated changes to the zoning would allow FAR up to 1.5:1 and no height limit, which could result in buildings generally up to 3 stories in height. These blocks are currently mainly developed with one and two-story detached residential buildings that are setback from the sidewalk with a front yard. Physical changes in the area would occur, including development of residential properties, multi-family housing, or mixed-use buildings. Such development would occur along existing street alignments. Views of Downtown and the San Gabriel Mountains from the public-right-of-way would remain. Views of the San Gabriel Mountains from the 4th Street bridge located at Lorena Street, south of this area, would not be obstructed.

Re-designation of properties located around Soto Street and Olympic Boulevard from Regional Center to Community Center

Some properties located to the north of the intersection of Soto Street and Olympic Boulevard are currently designated as Regional Center; the Proposed Plan would designate these properties as Community Center to better accommodate the roadway intersection scale, and to be consistent with other intersections of similar size and scale elsewhere in the City. The proposed zoning regulations for this area would allow up to 4:1 FAR, which could generally result in buildings of up to 7 stories in height. This area is currently developed with one to two-story commercial buildings, so future development could impinge on private views of the Art Deco tower on the Sears site or views of the San Gabriel Mountains, but views from the public-right-of-way would remain.

Re-designation of Cesar Chavez Avenue from Regional Center to Neighborhood Center

The Proposed Plan would change the designation of sections of Cesar Chavez Avenue so that the designation reflects existing development patterns, built conditions, and permitted uses. In the sections of Cesar Chavez Avenue changing from Regional Center to Neighborhood Center, which is generally the portion between Cummings Street and Mott Street, the changes to the land use designation and associated zoning would allow up to 2.5:1 FAR and a building height of up to 4 stories. In the re-designated area, views of the Downtown Los Angeles skyline are typically obstructed by existing buildings and street trees. Views of the San Gabriel Mountains are generally available from public street intersections looking north, framed by buildings on either side. These views may be partially or fully obstructed by street trees or buildings depending on the immediate context. There are no proposed changes to the street alignment, and physical changes to the area would occur in a manner consistent with existing land use development patterns. Existing views would generally remain unaffected as new development would occur within existing parcels and would not further obstruct views along the street corridors.

Revision of Allowable Uses and Other Changes

These types of changes would result in changes to the zones within the CPA to revise allowable uses. These changes were developed and proposed based on input from the CPA residents throughout the outreach process, to create better use adjacency, and further environmental justice goals of the Plan.

Riverside Industrial

The Proposed Plan would re-designate the industrial area along the Los Angeles River from Light and Heavy Manufacturing to Light Industrial. This designation is intended to facilitate cleaner industrial uses and prohibit new heavy industrial uses from locating near the Los Angeles River, the proposed 6th Street

PARC, and existing housing developments in the area. The change would not affect building development on existing parcels and would not impede views along the existing street grid. The change would not impede views of the San Gabriel Mountains, the Downtown Los Angeles skyline, or the Los Angeles River Bridges.

Although physical change would likely occur and could change views in some areas of the CPA, development that would occur in the CPA under the Proposed Plan would be limited to specific nodes and transit corridors and the plan would preserve existing vistas into and out of the CPA at a reasonable level. In addition, many of the vistas are from existing public streets which would be largely unaffected by the land use and zoning changes associated with the Proposed Plan. The implementation of the Proposed Plan would be consistent with current City policy regarding the preservation of views from private property. Impacts to scenic vistas would be less than significant.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.1-2 **Would the Proposed Plan substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?**

No impact would occur.

A portion of State Route 27 through the western portion of the City within the Palisades Highlands community outside of the CPA is the only State designated highway in the City. A portion of the Arroyo Seco Parkway through the northeastern portion of the City is a National Civil Engineering Landmark, a National Scenic Byway, and one of two California Historic Parkways. However, only the portion of the Parkway north of the Interstate 5 Freeway outside of the CPA is designated as a state scenic and historic parkway. Views from the Parkway to the CPA are primarily not available due to its distance from the CPA.[3] Therefore, no impact would occur.

[3] Caltrans State Scenic Highway System Map. https://caltrans.maps.arcgis.com/apps/webappviewer/index.html?id=465dfd3d807c46cc8e8057116f1aacaa, accessed April 27, 2021.

Mitigation Measures

No mitigation measures are required.

Summary of Impacts After Mitigation

No impact.

Threshold 4.1-3 **If the Proposed Plan is in an urbanized area, would the Proposed Plan conflict with applicable zoning and other regulations governing scenic quality, or where it proposes to change the applicable zoning and other regulations governing scenic quality would it degrade the visual character of the CPA and its surrounding area?**

This impact would be less than significant.

Reasonably anticipated development from the Proposed Plan would involve increased building heights, FAR, and development intensities in combination with design standards (i.e, form and frontage) and would provide a greater mix of uses in the CPA through new General Plan designations and associated zoning regulations that are intended to foster a greater mix of uses in the CPA. Where the Proposed Plan proposes no changes in zoning regulations and standards, no impact is foreseeable as anticipated development in those areas would occur in an urbanized area and be required to comply with the zoning standards. In areas where the Proposed Plan proposes changes in zoning regulations or standards, an impact could occur if the changes will result in development that degrades the visual character. However, while the proposed General Plan designations and associated zoning may allow for a change in the existing visual character, development patterns would focus future development around employment centers and transit and transit served areas. The sections below are organized by broad land use categories and then by areas where the Proposed Plan is changing the development potential through land used designation and zoning changes. An overview of the foreseeable visual character of the CPA under the Proposed Plan is provided.

As discussed previously, there are very few natural features of note in the CPA. The area is mostly flat, densely populated, and heavily developed. The largest natural resources in the CPA include Hollenbeck Park (and the manmade lake), Evergreen and Odd Fellows Cemeteries, and the Los Angeles River which is channelized through this portion of the City. There are other smaller public parks in the CPA, and (although not located within the CPA) the San Gabriel Mountains feature prominently as a scenic view to the north of the CPA.

The Proposed Plan does not seek to increase development potential within or near the natural features in the CPA and would not include changes that would alter areas with an Open Space land use designation. During the lifetime of the Proposed Plan, new or expansion of recreational uses could occur in public parks. Additionally, the Los Angeles River could be improved with public or recreational facilities or revitalized with natural features, such as native vegetation and landscaping and the emphasis on creating access to the River through the proposed frontages. Thus, development that could occur during the lifetime of the Proposed Plan would not substantially degrade the existing visual character of natural features within or near the CPA.

The existing visual character of urban or built features in the CPA is varied in terms of building ages, uses, heights, and massing. Infill development projects have been built or are planned near prominent structures in the CPA, some of which are historic, and are changing the visual setting. Under the Proposed Plan, more infill projects with a variety of architectural styles, massing and heights would be expected to be built over time. As a result, it is expected that new infill projects would occur in selected areas of the areas identified for increased development potential under the Proposed Plan.

Although structures in the CPA that have been designated Historic-Cultural Monuments would remain protected per State and local statutes, development could increase and the visual character of residential and commercial neighborhoods could change as density of land use will increase around transit stations and along corridors. As the Proposed Plan seeks to accommodate new housing and commercial in particular nodes and along commercial corridors and near transit stations, these areas could experience a change in visual character. The proposed land use and zoning changes in areas surrounding Metro L Line stations and along transit corridors would result in buildings that are taller and denser in terms of the number of residential units.

Residential Neighborhoods and Commercial Corridors

Reasonably anticipated development from the Proposed Plan would involve increased building height, intensity or density near the Metro L Line stations and along major commercial corridors. Anticipated future development would be up to 5-7 stories near the L Line stations. The residential neighborhoods that include areas designated as Low Neighborhood Residential and Low Medium Residential will be zoned with Form Districts that mirror existing regulations and conditions, such as height and floor area, with a reduced rear yard setback. This reduced rear yard setback reflects existing development patterns in most of the residential neighborhoods in Boyle Heights that are characterized by an additional dwelling unit, granny flat, garage, or other structure nearly abutting the rear property line. Existing buildings vary from single-story to three and four story properties, ranging from single homes to duplexes, fourplexes, and

apartment buildings. The Proposed Plan would permit buildings with a maximum height of 33 feet to 45 feet, which would be between 2 to 4 stories.

The Proposed Plan would re-designate some corridors such as Whittier Boulevard, Marengo Avenue, western portions of Cesar Chavez, and blocks surrounding Olympic Boulevard and Soto Street to Community Center, and other corridors such as Wabash Avenue, Lorena Street, portions of 1st Street and 4th Street, and sections of Cesar Chavez Avenue to Neighborhood Center. These corridors have varied visual characters that are mostly developed, with a wide range of various uses, building massing, and building age. These areas primarily include commercial development, residential uses, public transportation, public facilities, and have low-rise buildings and a few mid-rise buildings. Under the Proposed Plan, areas that are designated Neighborhood Center would allow a maximum 2.5:1 FAR and a 4-story height limit. In areas that are designated as Community Center, a maximum 3:1 FAR or 4:1 FAR would be allowed, which would generally result in buildings up to 6 and 7 stories in height. The re-designation is largely intended to focus new development into these key nodes and corridors within the CPA. Higher intensity development would be allowed in key nodes and along sections of major corridors near transit. Certain areas would have a higher FAR and could see new development with higher buildings and mixed-use development. The general physical changes that could occur under the Proposed Plan has the potential to change the visual character of portions of the CPA where development potential is increased to have taller buildings and a more urban character, primarily along the nodes and corridors where land use and zoning changes would permit such development.

Industrial Designated Areas

Future permitted development in the Light Industrial designated areas would facilitate cleaner industrial uses and discourage new heavy industrial areas from locating near existing housing, railroads, and the Los Angeles River, as well as the upcoming Sixth Street PARC. Limited commercial uses will be allowed to provide neighborhood serving amenities to existing residents of this River-adjacent industrial area, and future visitors to the Sixth Street PARC and the Los Angeles River. Form and frontage requirements for this area adjacent to the Los Angeles River and rail corridor would require buildings to be oriented to pedestrians as well as the Los Angeles River/rail corridor by providing building breaks, active frontages, and outdoor amenity space, such as walkways, plazas and landscaped areas in order to contribute to efforts increase access and open space along the adjacent rail/river corridor. The proposed change from Heavy Industrial to Light Industrial is also anticipated to discourage new hazardous or toxic heavy industrial uses from locating next to the Los Angeles River, the proposed 6th Street PARC, and existing housing developments in the area. The area is predominantly industrial in visual and aesthetic character, with warehouses and minimal or non-existent landscaping. This change is not anticipated to have a significant effect on the visual character or quality of the industrial properties in this area but may indirectly protect

the visual character and quality of the surrounding environment and the Los Angeles River by discouraging heavy industrial uses from locating within the area.

The Heavy Industrial designated areas, including the area south of Pico Boulevard between Soto and Grande Vista, south of Union Pacific Avenue between Grande Vista and Indiana, and the northwest corner of the CPA, the area known as "Piggyback Yard" are proposed to remain as Heavy Industrial uses with flexible building regulations. The proposed zoning for these industrial areas would be maintained at an FAR of 1.5:1, which would result in building heights generally up to 45 feet or 3 to 4 stories. It is anticipated that the general visual character of areas with these land use designations would be improved by reasonably anticipated development from the Proposed Plan due to the addition of design standards to improve visual quality such as visual connections to the river and requirements for more public green space.

Visual Quality

The prevailing visual quality of the CPA is similar to what is typically found in highly-urbanized areas. Multi-family housing, as mentioned above, accounts for virtually all of the residential land uses with other areas designated industrial and a smaller commercial presence. There are several open spaces, but these are not of a significant size and therefore do not affect the overall urbanized visual quality of the area. As discussed above, the Proposed Plan directs future growth to areas that are well served by public transit to support housing where residents would have the greatest access to mobility options and amenities. For this reason, the Proposed Plan accommodates higher densities and more infill development in areas surrounding each of the four Metro Rail L Line stations. The Proposed Plan also accommodates future development along Soto Street, which serves as Boyle Heights' primary north/south transit corridor. One notable area of the plan area that has been prioritized for preservation for cultural and historic reasons is the portion of Cesar Chavez Avenue known as the "Brooklyn Avenue Neighborhood Corridor."

The following analysis is organized by the areas that have proposed changes to development potential through changes to the land use designation and zoning, as described in the Existing Setting and describe the potential changes to visual character in greater detail.

- **Pico/Aliso Station Area –** The area is bounded by First Street to the north, Mission Road to the west, Third Street to the south, and Utah Street to the east. The area generally consists of low scale warehouses that are one to two stories in height. Under the Proposed Plan, buildings would have a maximum permitted 4:1 FAR, which would generally result in building heights of up to 7 stories. Development would also be subject to zoning requirements regarding articulation, entrances, entry - features and transparencies. The average building heights would increase in this area due to the higher

permitted FAR. This would result in a more intense urban visual character that would be a change from the existing conditions. However, it is anticipated that the visual character of this area would generally be improved by reasonably anticipated development from the Proposed Plan due to the addition of active pedestrian amenities and a mix of residential and commercial uses. Future development is anticipated to have a cohesive development pattern and active ground floor uses that would improve views of urban streetscapes and unify the urban character of this area.

- **Mariachi Plaza Station Area:** Mariachi Plaza is located along First Street between Boyle Avenue and Bailey Street. The historic Boyle Hotel, a three-story brick building designed in the Queen Anne architectural style, is across the street from Mariachi Plaza, A row of small one-story shop fronts directly abut the plaza along its northern edge. The stretch of First Street is lined with rows one story buildings built to the street until the I-5 Freeway overpass. Under the Proposed Plan, buildings on the northside of 1st Street between Boyle Avenue and State Street would have a maximum permitted 4:1 FAR, which would generally result in building heights of up to 7 stories. Development would also be subject to zoning requirements regarding articulation, entrances, entry-features, and transparencies. The average building heights would increase in this area due to the higher permitted FAR. Under the Proposed Plan other properties on 1st Street between Pecan Street and the I-5 Freeway overpass would have a maximum permitted 3:1 FAR, which would generally result in building heights up to 6 stories. This would result in a more intense urban visual character that would be a change from the existing conditions.

  White Memorial Medical Center is located north of Mariachi Plaza and First Street and includes a range of buildings that range from approximately 45 to 130 feet. Adjacent residential neighborhoods are comprised of primarily one and two-story detached home that were built between the 1890s and 1920s. Under the Proposed Plan, buildings would have a maximum permitted 4;1 FAR, which would generally result in building heights of up to 7 stories. Development would also be subject to zoning requirements regarding building articulation, entrances, entry-features, and transparencies. Future development would have average building heights similar to many of the existing buildings in this area.

- **Soto Station Area:** The 1st Street corridor between St. Louis Street and Mott Street includes a varied mix of small storefronts, civic facilities, and residential uses, that include mainly one and two-story commercial buildings built to the property line. This stretch of 1st Street also includes a five-story mixed use building near the corner of 1st Street and Soto Street, built in 2018, and some auto related uses. Under the Proposed Plan, buildings on 1st Street between St. Louis St. and Mott Street would have a maximum permitted 4:1 FAR, which would generally result in building heights of up to 7 stories. This would result in a more intense urban visual character that would be a change from the existing

conditions, and average building heights would increase in this area due to the higher permitted FAR. Development would also be subject to zoning requirements regarding articulation, entrances, entry-features and transparencies. Future development is anticipated to have a cohesive development pattern and active ground floor uses with a mix of residential and commercial uses, and active pedestrian amenities that would improve views of urban streetscapes and unify the urban character of this area.

The residential neighborhood blocks to the north and south of First Street have a varied mix of building scales and architectural styles with heights ranging between one and three stories and have varied front yard setbacks. In some areas buildings are built to the sidewalk, whereas in other areas buildings are setback from the sidewalk with landscaped front yards. Under the Proposed Plan, buildings in this residential area would have a maximum permitted 3;1 FAR and maximum building height of up to 6 stories. The average building heights would increase in this area due to the higher permitted FAR. Development would also be subject to zoning requirements regarding front yard setbacks, landscaping, building entrances and transparency to ensure a cohesive development pattern in this area.

- **Indiana Station Area:** This area includes the blocks located between the Cinco Puntos Intersection of Cesar Chavez Avenue and Indiana Street, south to Fourth Street, and from Lorena on the west to the CPA Boundary at Indiana Street on the east. Under the Proposed Plan, buildings near the Indiana Station in an area bounded by Velasco Street, 4th Street/3rd Pl, 1st Street, and Indiana Street would have a maximum permitted 4;1 FAR, which would generally result in building heights of up to 7 stories. This would also apply to buildings on 1st Street west of Lorena Street and the northeast side of 4th Street west of Lorena Street. This would result in a more intense urban visual character that would be a change from the existing conditions, which are characterized by one and two-story residential buildings are setback from the sidewalk. In addition, average building heights would increase in this area due to the higher permitted FAR. West of the station in the area generally bounded by Lorena Steet, Gleason Street, Velasco Street, and 3rd Street, the Proposed Plan would allow for buildings up to 1.5:1 FAR and building heights up to 45 feet. This area is currently developed with mostly one to two-story residential buildings with narrow front yard landscaped setbacks. This area is envisioned to function as mixed-use dense centers and future development would be subject to zoning requirements regarding front yard setbacks, landscaping, building entrances and transparency that will help facilitate walkability and transit access.

- **Soto Street Corridor:** Soto Street's major intersections with Cesar Chavez Avenue, First Street, Fourth Street, and Whittier Boulevard support commercial uses and transit connections. Beyond these intersections Soto Street is predominantly residential uses and maintains a residential character at varying intensities. Under the Proposed Plan, buildings on Soto Street generally between 4th Street and

Cesar Chavez Avenue would have a maximum permitted 4;1 FAR, which would generally result in building heights of up to 7 stories. This would result in a more intense urban visual character that would be a change from the existing conditions, which is characterized by two and three-story apartment buildings built up to or near the sidewalks north of First Street and one and two-story residential with front yards south of First Street. The average building heights would increase in this area due to the higher permitted FAR. Development would also be subject to zoning requirements regarding articulation, entrances, entry-features and transparencies. Future development is anticipated to have a cohesive development pattern and active ground floor uses with a mix of residential and commercial uses, and active pedestrian amenities that would improve views of urban streetscapes and unify the urban character of this area.

Under the Proposed Plan, portions of Soto Street north of Cesar Chavez Avenue and south of 4th Street would have a maximum permitted 3:1 FAR, which would generally result in building heights of up to 6 stories. This portion of Soto Street is currently zoned to allow up 3:1 FAR but also has a height limit of 45 feet. The Proposed Plan maintains the currently permitted FAR but would remove the 45-foot height limit. Therefore, the Proposed Plan would result in a more intense urban visual character that would change the existing conditions, which is characterized by one to two-story apartment buildings north of Cesar Chavez Avenue and a combination of one and two-story apartment buildings and one-story commercial buildings with surface parking lots on Soto Street south of 4th Street. The average building heights would increase in this area due to the zoning permitted under the Proposed Plan. Development would also be subject to zoning requirements regarding maximum front yard setbacks, landscaping, entry features, and transparencies.

- **Cesar Chavez Avenue:** The main commercial district along Cesar Chavez Avenue includes a nearly continuous row of mostly one and two story commercial buildings with active storefronts between Cummings Street and Mott Street. This district is a designated Los Angeles Historic Cultural Monument, and the storefronts are characterized by their minimal decorative brickwork. Under the Proposed Plan, buildings would have a maximum permitted 2.5:1 FAR and building height of up to 4 stories. Development would be subject to zoning requirements regarding articulation, entrances, transparencies and building materials that would be consistent and reinforce the existing decorative brickwork of this district.

In general, the Proposed Plan would include building design regulations to address factors that influence the visual character in the CPA including building orientation, building scale, height and massing, parking, building façade/frontage, and landscaping. Specifically, form and frontage districts would set limits for building height, step-backs, and massing, across the land use designations to help provide cohesive height

and bulk transitions across future structures within the CPA. This would be particularly emphasized in historically sensitive areas to minimize potential adverse effects to the existing scale and built character.

The Proposed Plan would change land use and zoning in the portion of CPA that is adjacent to the LA River. Scenic vistas of the historic bridges and the Los Angeles skyline are available at some locations in the river adjacent industrial area. Frontage requirements would be implemented along the river which would require that buildings have frequent breaks between them to promote visual connections and maintain scenic views.

Individual Buildings and Resources

The following landmarks have been identified as visually important scenic resources in the CPA:

- Hollenbeck Park
- Prospect Park
- Boyle Hotel
- Sears Building
- Bridges across the LA River
- 4th Street Bridge over Lorena
- Evergreen Cemetery

The two parks and cemetery would not be significantly affected by the implementation of the Proposed Plan. The development nodes and corridors would not substantially impede views into or out of these areas at a level that would substantially diminish their aesthetic value in the CPA. Although the Proposed Plan would aim to preserve the existing historic and visual character adjacent to or near, Prospect Park, Hollenbeck Park, the Boyle Hotel, the Sears building, and Los Angeles River bridges, these urban/built features would have the potential to change. In general, foreground views and the visual character near some iconic structures could change under the Proposed Plan and particular views from public sidewalks and streets could be affected. However, any changes to existing views would be incremental and would be consistent with the eclectic urban environment of the CPA. Further, the Proposed Plan's form and frontage requirements will govern the height and bulk of new development and will preserve existing neighborhood character and visual resources.

Conclusion

Reasonably anticipated development from the Proposed Plan, as directed by the proposed General Plan designation and zoning changes, would increase the height, scale, and density of buildings and other structures in the Boyle Heights CPA. Such changes would represent a change in the visual character of some areas, especially areas near the Pico/Aliso, Soto, and Indiana Metro L Line Stations, and along major corridors such as Soto Street, Whittier Boulevard, First Street, and Fourth Street. However, future development would likely benefit and improve the visual character and quality in some of these areas, as new development would be designed with contextual form and frontage regulations to be compatible with existing visual character. While the Proposed Plan would result in increases in density in some locations, these areas are where the State, region and City are encouraging growth and where such development is desirable. While these changes would change the visual character of these areas, such changes are consistent with the overall urban character of the CPA and City; therefore, impacts would be ***less than significant*** and no mitigation is required.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.1-4 Would the Proposed Plan create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

This impact would be less than significant.

Lighting

A high level of ambient nighttime light is common to urbanized areas of the City of Los Angles. In the residential areas of the CPA, nighttime artificial lighting sources include pedestrian-scaled streetlights, security and decorative wall lighting at residential homes, vehicle headlights, and interior building illumination. Existing sources of nighttime lighting along commercial corridors and industrial areas of the CPA include street, security, and wayfinding outdoor lighting, vehicle headlights, and interior building illumination. This relatively high level of ambient light currently reduces the visibility of the nighttime sky. Reasonably anticipated development from the Proposed Plan would allow for increased development density, intensity, and building heights in targeted areas of the Plan Area, such as corridors that are envisioned as mixed-use corridors. While increased illumination is anticipated from sidewalk lighting, and

from commercial, residential, and industrial windows in mixed-use and single-use stand-alone projects, these effects would be incremental.

The LAMC contains specific regulations with respect to lighting. LAMC Section 12.21 A.5(k) (amended by Ordinance No. 171,858), which will be incorporated as part of the New Zoning Code, states that all lights used to illuminate parking areas shall be designed, located and arranged so as to reflect the light away from any street and any adjacent premises. Additionally, any new lighting would be designed to conform to applicable standards including LAMC Sections 93.0117 and 12.21 A.5(k), which pertains to outdoor lighting affecting residential property (no more than two foot-candles of lighting intensity from a light source is allowed on adjacent residential property). All new development would be required to be consistent with these LAMC regulations to reduce impacts from light. In addition, General Plan Framework Policies 5.5.3, 5.5.4, and 5.8.1 call for the formulation of building and site design standards, determination of appropriate urban design elements, and lighting commensurate with intended nighttime use. In addition, the Proposed Plan includes application of the new Development Standards (Article 4 of the New Zoning Code), which includes regulations pertaining to site lighting that would regulate the amount of illumination for different uses to minimize light trespass and to ensure that the appropriate type and amount of lighting is used. Compliance with these standards would ensure that light impacts of future development occurring under the Proposed Plan would be ***less than significant***.

Glare

Glare is a common phenomenon in the City of Los Angeles including the Boyle Heights CPA primarily due to the occurrence of a high number of days per year with direct sunlight and the highly urbanized nature of the region. Most existing structures within the CPA are composed of non-reflective materials such as concrete, wood, stucco and plaster. Few structures have mostly glass facades. Reasonably anticipated development from the Proposed Plan would be generally consistent with the level of reflective surfaces on existing development and would comply with LAMC Chapter 9, Article 3, Section 93.0117 of the LAMC and Chapter 9, Article 1, Section 91.6205M, for light and glare affecting residential uses. These standards prohibit the use of highly reflective or deeply tinted glass. In addition, the new Development Standards (Article 4 of the New Zoning Code) includes standards to reduce glare by prohibiting the use of materials that typically create high levels of glare and generate excessive heat. Adherence to applicable standards on all new development under the Proposed Plan would reduce glare impacts to ***less than significant***.

Shadow. Shadow effects already exist in the Plan Area, especially in areas with taller buildings. The average building heights and associated shadows would increase in the Plan Area due to the higher permitted FAR. This increased building height and intensity would increase the number and length of shadows generated by buildings; however, this would not adversely affect the existing visual character of

the area because shade effects are typical in an urban environment. The increased shade effects may also be considered beneficial, particularly during warmer seasons and sunny days, by providing cover and cooling effects during high heat days. Additionally, shade effects could make an urban environment more pedestrian friendly. Thus, the potential increase in shade and shadows are not expected to substantially degrade the existing visual character or quality of the CPA and impacts would be *less than significant*.

Mitigation Measure

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.1.7 CUMULATIVE IMPACTS

The geographic context for cumulative analysis of aesthetic impacts is generally localized to the immediate vicinity of the CPA. For this analysis, the geographic context for cumulative impacts on scenic views and vistas in the CPA includes the geographic area within and outside the CPA that would have views of and across the CPA. The geographic context for cumulative impacts on visual character, scenic resources, lighting, and glare would be within the geographic context of the CPA. The cumulative analysis accounts for reasonably foreseeable cumulative growth within these geographic areas, including growth from approved projects that are not yet built, other community plans, the Los Angeles County General Plan and the 2020 RTP/SCS.

Scenic Vistas

The Boyle Heights CPA is bordered by the Central City North CPA to the west and the Northeast Los Angeles CPA to the north. Major east-west corridors include (from north to south) Marengo Street, Wabash Avenue, Cesar E Chavez Avenue, 1st Street, 4th Street, Whittier Boulevard, and Olympic Boulevard. Major north-south corridors include (from west to east) Mission Road, Soto Street, Lorena Street, and Indiana Street. Within the CPA there are four primary views that the City has identified as scenic vistas:

- View of the downtown Los Angeles skyline from Mariachi Plaza;
- General views of the downtown Los Angeles skyline from various points in the CPA;
- Views to and from the historic bridges spanning the Los Angeles River;
- Views of the San Gabriel Mountains to the north of the CPA.

These public vantage points provide views of the CPA, San Gabriel Mountains, and the downtown Los Angeles skyline. Future developments along commercial corridors in adjacent communities and cities outside of the CPA, whether they are mid-rise or high-rise developments, could change the views from these public vantage points. The Proposed Plan is not anticipated to have a cumulative impact on short-range views from these public vantage points. While the Proposed Plan would allow greater building heights than what currently exist in certain areas, the scenic vistas available from these public vantage points generally align with the existing street grid and while these views may be impinged upon, they would not be substantially obstructed or significantly changed by taller structures within the CPA. Therefore, the Proposed Plan's cumulative impact on scenic vistas would be less than significant and would not be cumulatively considerable.

Visual Character

The existing visual character of the geographic area is urban. Impacts on visual character would be generally limited to the community in which the new development would be located and immediately adjacent areas. Within the CPA, a number of projects were approved in recent years and are expected to be built, in combination with future development under the Proposed Plan during the lifetime of the Proposed Plan. Impacts from such development are generally described above as impacts of the Plan. In addition to the Boyle Heights CPA, development in the adjacent Downtown CPA is expected to change the visual character of that area. However, Boyle Heights is geographically and visually separated from Downtown by the Los Angeles River therefore the potential for overlapping impacts is limited and the impact of the proposed Plan is not anticipated to result in a considerable contribution to cumulative impacts.

Future development associated with the Proposed Plan would primarily affect the visual character within the CPA. New development in adjacent communities that are located in the immediate vicinity of the CPA boundaries could potentially change the visual character of that area. However, the effects would be localized, and the Proposed Plan does not propose changes that would cause new development along the CPA boundaries to significantly vary in height, massing, and scale when compared to the existing uses in these areas. Thus, new development along and near the Boyle Heights CPA boundaries is expected to be consistent with the visual character of the surrounding area.

The CPA has no state- or City- designated scenic highways in the CPA or vicinity; the Proposed Plan would have no impact on state- or City-designated scenic highways.

As discussed in **Section 4.4, Cultural Resources**, it is possible that future development within the CPA could result in demolition and/or significant alteration to some of the historical resources that are found within the CPA. Implementation of the Proposed Plan in combination with other projects (other

community plans leading to redevelopment) located throughout the City of Los Angeles could contribute to the loss of historical resources in the City. The existing visual character of the CPA and its adjacent communities is varied in terms of building ages, uses, heights, and massing. While individual buildings may be impacted, future development is not expected to substantially degrade this varied visual character. Due to the existing dense arrangement of development, future development is not expected to add additional shadow effects to public spaces.

In summary, the Proposed Plan's impact on visual character would be less than significant and would not be cumulatively considerable.

Light and Glare

Development of cumulative projects in the CPA, adjacent CPAs, and adjacent areas (City of Los Angeles, City of Commerce, City of Vernon, and unincorporated Los Angeles County), and could incrementally increase ambient nighttime lighting in this cumulative geographic area. The LAMC contains specific regulations with respect to light and glare. LAMC Section 12.21 A.5(k) states that all lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any street and any adjacent premises. Additionally, the City of Vernon and City of Commerce zoning codes, and the Los Angeles County code or ordinances require lighting of development to be directed away from surrounding properties and public rights-of-way. Any new lighting within the CPA, adjacent CPAs, and adjacent cities would be designed to conform to applicable lighting standards contained within the respective jurisdictional codes.

With respect to glare, new development outside of the CPA is likely to use building materials that are consistent with the building materials that are commonly used in that community or city.

In summary, the Proposed Plan's impact on light and glare would be less than significant and would not be cumulatively considerable.

4.2 AIR QUALITY

4.2.1 INTRODUCTION

This section examines the degree to which the Proposed Plan may result in significant adverse changes to air quality. Both short-term construction emissions occurring from activities, such as grading and haul truck trips, and long-term effects related to the ongoing operation of individual development projects are discussed in this section. The analysis focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. "Emissions" refer to the actual quantity of pollutant measured in pounds per day (ppd or lbs./day). "Concentrations" refer to the amount of pollutant material per volumetric unit of air and are measured in parts per million (ppm), parts per billion (ppb), or micrograms per cubic meter ($\mu g/m^3$).

The potential for the Proposed Plan to conflict with or obstruct implementation of the applicable air quality plan, to violate an air quality standard or contribute substantially to an existing or projected air quality violation, to result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment, or to expose sensitive receptors to substantial pollutant concentrations are also discussed. Air quality data utilized in the preparation of this section is included in **Appendix 4.2** of this EIR.

Fundamentals of Air Quality

Regulated Air Pollutants

Both the federal and state governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect public health and welfare. These pollutants are referred to as "criteria air pollutants" as a result of the specific standards or criteria that have been adopted for them. Federal and state ambient air quality standards have been set at levels considered safe to protect public health, including the health of "sensitive" populations, such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. The criteria pollutants include ground-level ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), particulate matter (respirable particulate matter [PM10] and fine particulate matter [PM2.5]) sulfur dioxide (SO_2), and lead (Pb). Toxic air contaminants (TACs) are also a concern in the South Coast Air Basin (SCAB), which is where the Boyle Heights Community Plan Area (CPA) is located.

Ozone (O_3). O_3 is a highly reactive and unstable gas that is formed when reactive organic gases (ROG), sometimes referred to as volatile organic compounds (VOC), and nitrogen oxides (NO_X), byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O_3

concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant. Short-term exposure (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue and some immunological changes.

Carbon Monoxide (CO). CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. In urban areas, such as the CPA, automobile exhaust accounts for the majority of CO emissions. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike O_3, motor vehicles operating at slow speeds are the primary source of CO in the SCAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.

Nitrogen Dioxide (NO_2). NO_2 is a nitrogen oxide compound that is produced by the combustion of fossil fuels, such as in internal combustion engines (both gasoline and diesel powered), as well as point sources, especially power plants. Of the seven types of NO_X compounds, NO_2 is the most abundant in the atmosphere. As ambient concentrations of NO_2 are related to traffic density, commuters in heavy traffic areas, such as urban areas like the CPA, may be exposed to higher concentrations of NO_2 than those indicated by regional monitors.

Particulate Matter (PM10 and PM2.5). PM10 and PM2.5 consist of extremely small, suspended particles or droplets 10 microns and 2.5 microns or smaller in diameter, respectively. Some sources of particulate matter, like pollen and windstorms, are naturally occurring. However, in populated areas like the CPA, most particulate matter is caused by road dust, diesel soot, combustion products, abrasion of tires and brakes, and construction activities.

Sulfur Dioxide (SO_2). SO_2 is a colorless, pungent gas formed primarily by the combustion of high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO_2 oxidizes in the atmosphere, it forms sulfates (SO_4). Collectively, these pollutants are referred to as sulfur oxides (SO_X). Generally, the highest levels of SO_2 are found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

Lead (Pb). Pb occurs in the atmosphere as particulate matter. The combustion of leaded gasoline is the primary source of airborne Pb in the SCAB. The use of leaded gasoline is no longer permitted for on road motor vehicles, so the majority of such combustion emissions are associated with off-road vehicles.

However, because leaded gasoline was emitted in large amounts from vehicles when leaded gasoline was used for on-road motor vehicles, Pb is present in many urban soils and can be re-suspended in the air. Other sources of Pb include the manufacturing and recycling of batteries, paint, ink, ceramics, ammunition, and the use of secondary lead smelters.

Pb is also found in lead-based paint, which is considered to be a health hazard for people, especially children. From the turn of the century through the 1940s, paint manufacturers used lead as a primary ingredient in many oil-based paints. Use of lead in paint decreased but was still used until 1978, when it was banned from residential use. Remodeling, renovations, or demolition activities in older buildings could disturb lead-based paint surfaces.

Toxic Air Contaminants. TACs refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long duration) and acute (i.e., severe but of short duration) adverse effects on human health. TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. TACs are different from criteria pollutants in that ambient air quality standards have not been established for them, largely because there are hundreds of TACs and their effects on health tend to be felt on a local scale rather than on a regional basis. Because chronic exposure can result in adverse health effects, TACs are regulated at the regional, state, and federal level.

TACs are found in ambient air, especially in urban areas, and are emitted by industry, agriculture, fuel combustion, and commercial operations (e.g., dry cleaners). TACs are typically found in low concentrations, even near their source (e.g., benzene near a freeway). Diesel exhaust is the predominant TAC in urban air. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by the California Air Resources Board (CARB), and are listed as carcinogens either under the state's Proposition 65 or under the federal Hazardous Air Pollutants programs. The U.S. Environmental Protection Agency (U.S. EPA) has adopted Ultra Low Sulfur Diesel (ULSD) fuel standards that went into effect in June 2006 in an effort to reduce diesel particulate matter substantially. As of June 1, 2006, refiners and importers nation-wide have been required by the U.S. EPA to ensure that at least 80 percent of the volume of the highway diesel fuel they produce, or import would be ULSD-compliant. As of December 10, 2010, only ULSD fuel was available for highway use nation-wide. In California, which was an early adopter of ULSD fuel and engine technologies, 100 percent of the diesel fuel sold—downstream from refineries, up to and including fuel terminals that store diesel fuel—was ULSD fuel since July 15, 2006. Since September 1, 2006, all diesel fuel offered for sale at retail outlets in California has been ULSD fuel.

Health Effects of Regulated Pollutants

The health effects of criteria pollutants (i.e., O_3, CO, NO_2, PM10 and PM2.5, SO_2, and Pb) are described below. The harmful effects of each criteria pollutant are summarized in **Table 4.2-1** and are further discussed in the *Air Quality and Health Effects* White Paper related to the *Sierra Club v. County of Fresno* judiciary ruling that is included in **Appendix 4.2**.[1] As mentioned above, federal air quality standards were set at a level that protects public health with an adequate margin of safety to prevent the types of health outcomes summarized below.

Table 4.2-1
Summary of Health Effects of Criteria Pollutants

Pollutant	General Description
Ozone (O_3)	• Aggravation of respiratory and cardiovascular diseases • Reduced lung function • Increased cough and chest discomfort
Carbon Monoxide (CO)	• Aggravation of some heart disease (angina) • Reduced tolerance for exercise • Impairment of mental function • Impairment of fetal development • Death at high levels of exposure
Nitrogen Dioxide (NO_2)	• Aggravation of respiratory illness
Respirable Particulate Matter (PM10) and Fine Particulate Matter (PM2.5)	• Reduced lung function • Aggravation of respiratory and cardio-respiratory diseases • Increases in mortality rate • Reduced lung function growth in children
Sulfur Dioxide (SO_2)	• Aggravation of respiratory diseases (asthma, emphysema) • Reduced lung function
Lead (Pb)	• Behavioral and hearing disabilities in children • Nervous system impairment

Source: SCAQMD, Guidance Document for Air Quality Issues in General Plans and Local Planning, 2005. Available at: https://www.aqmd.gov/home/research/guidelines/planning-guidance/guidance-document, accessed November 2021.

Ozone (O_3). Individuals exercising outdoors, children and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub-groups for O_3 effects. Short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated ozone levels are

1 City of Los Angeles, *Air Quality and Health Effects – Sierra Club v. County of Fresno*, October 2019.

associated with increased school absences. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and/or live in high O_3 communities. O_3 exposure under exercising conditions is known to increase the severity of the observed responses mentioned above. Animal studies suggest that exposure to a combination of pollutants that include O_3 may be more toxic than exposure to O_3 alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

Carbon Monoxide (CO). Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin. Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses, and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

Reduction in birth weight and impaired neurobehavioral development has been observed in animals chronically exposed to CO resulting in carboxyhemoglobin levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include pre-term births and heart abnormalities. Additional research is needed to confirm these results.

Nitrogen Dioxide (NO_2). Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO_2 at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy individuals. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups.

In animals, exposures to levels of NO_2 considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune response. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of O_3 and NO_2.

Particulate Matter (PM10 and PM2.5). A consistent correlation between elevated ambient respirable and fine particulate matter (PM10 and PM2.5) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in various parts of the United States and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in life span, and increased mortality from lung cancer.

Daily fluctuations in fine particulate matter concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children and to increased medication use in children and adults with asthma. Studies show that lung function growth in children is reduced with long-term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease, and children appear to be more susceptible to the effects of PM10 and PM2.5.

Sulfur Dioxide (SO_2). A few minutes exposure to low levels of SO_2 can result in airway constriction in some asthmatics. Increased resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed in asthmatics after acute exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2.

Animal studies suggest that despite SO_2 being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels. In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or if one pollutant alone is the predominant factor.

Lead (Pb). Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence levels. In adults, increased lead levels are associated with increased blood pressure. Lead poisoning can cause anemia, lethargy, seizures and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to the breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue).

Toxic Air Contaminants. TACs are a broad class of compounds known to cause or contribute to cancer or non-cancer health effects such as birth defects, genetic damage, and other adverse health effects. As discussed previously, effects from TACs may be both chronic and acute on human health. Acute health effects are attributable to sudden exposure to high quantities of air toxics. These effects include nausea, skin irritation, respiratory illness, and, in some cases, death. Chronic health effects result from low-dose, long-term exposure associated with the routine releases of air toxics. The effect of major concern for this type of exposure is cancer, which requires a period of 10 to 30 years after exposure to develop.

Diesel exhaust is estimated to represent about two-thirds of the cancer risk from TACs (based on the state-wide average). According to CARB, diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue.

4.2.2 EXISTING ENVIRONMENTAL SETTING

This subsection provides a discussion of the environmental setting and existing air quality conditions in the CPA. All future land use development that would occur with implementation of the Proposed Plan would be located in the City of Los Angeles, which is situated entirely within the South Coast Air Basin (SCAB). The SCAB is the geographic region over which the South Coast Air Quality Management District (SCAQMD) has regulatory jurisdiction and encompasses 6,745 square miles covering all of Orange County and the non-desert portions of Los Angeles (including the CPA), Riverside, and San Bernardino Counties. The SCAB is bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino and San Jacinto Mountains to the north and east; and the San Diego County line to the south.

Regional Topography and Climate

The SCAB is in an area of high air pollution potential due to its climate and topography. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific Ocean, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The SCAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the west and high mountains around the rest of its perimeter.

The SCAB experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high air masses in the lower atmosphere that effectively trap pollutants near the Earth's surface by limiting vertical mixing, especially in the summer. Atmospheric temperature typically decreases with altitude. However, under inversion conditions, temperature increases as altitude increases, thereby preventing air close to the ground from mixing with the air above it. As a result, air pollutants are

trapped near the ground. During the summer, air quality problems are created due to the interaction between the ocean surface and the lower layer of the atmosphere. This interaction creates a moist marine layer in the lower atmosphere, over which an upper layer of warm air mass forms, preventing air pollutants from dispersing upward. Additionally, hydrocarbons and NO_2 react under strong sunlight, creating smog. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed in mid to late afternoons on hot summer days. Winter inversions frequently break by mid-morning.

The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations and worst air quality. Conversely, on days of no inversion or high speed winds, ambient air pollutant concentrations are lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized aeras are transported predominantly inland toward the mountains and into Riverside and San Bernardino Counties. In the winter, the greatest pollution problem is the accumulation of CO and NO_x emissions due to low inversion and air stagnations during the night and early morning hours. CO concentrations are generally worse in the morning and late evening (around 10:00 p.m.). In the morning, CO levels are relatively high due to cold temperatures and the large number of cars traveling. High CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO emissions are produced almost entirely from automobiles, the highest CO concentrations in the SCAB are associated with heavy traffic. NO_2 concentrations are also generally higher during fall and winter days due to lower temperatures and increased home heating.

The mountains and hills within the SCAB contribute to the variation of rainfall, temperature, and winds throughout the region. The average wind speed, as recorded at the Central Los Angeles Meteorological Station, is approximately 5.3 miles per hour with calm winds occurring approximately 25 percent of the time. Wind in the vicinity of the CPA predominately blows from the west-southwest.[2] The annual average temperature recorded in the CPA is 65.4°F.[3] Total precipitation averages approximately 15 inches annually. Precipitation occurs mostly during the winter and relatively infrequently during the summer.[4]

4 *Ibid*.

Regional Air Quality

Air pollutant emissions in the SCAB are generated by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point sources and area sources. Point sources occur at an identified location and are usually associated with manufacturing and industry. Examples of point sources are boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products, such as barbeque lighter fluid and hair spray. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, race cars, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

Ambient air quality is determined primarily by the type and amount of pollutants emitted into the atmosphere, as well as the size, topography, and meteorological conditions of a geographic area. The SCAB has low mixing heights and light winds, which help to accumulate air pollutants. Exhaust emissions from mobile sources generate the majority of ROG, CO, NO_X, and SO_X both in the SCAB generally and specifically the Los Angeles County portion of the SCAB. Area-wide sources generate the most airborne particulates (i.e., PM10 and PM2.5) in both the SCAB and Los Angeles County. The determination of whether a region's air quality is healthful or unhealthful is made by comparing contaminant levels in ambient air samples to national and state standards. Measurements of ambient concentrations of criteria pollutants are used by the U.S. EPA and the CARB to assess and classify the air quality of each air basin, county, or, in some cases, a specific urbanized area.

The federal Clean Air Act (CAA) requires U.S. EPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant (O_3, NO_2, CO, SO_2, PM10, PM2.5, and Pb) based on whether the National Ambient Air Quality Standards (NAAQS) have been achieved. The NAAQS are summarized in **Table 4.2-2**. The classification is determined by comparing actual monitoring data with national standards. If a pollutant concentration measured over time in a particular area consistently remains below the standard level, the area is classified as being in "attainment" of the air quality standard. If the pollutant concentration exceeds the standard, the area is classified as a "nonattainment" area. If the agencies are unable to gather sufficient data to determine whether the standard is met in an area, the area is typically designated as "unclassified." The U.S. EPA has classified the Los Angeles County portion of the SCAB as a nonattainment area for O_3, PM2.5, and Pb, as presented in **Table 4.2-3**, below.

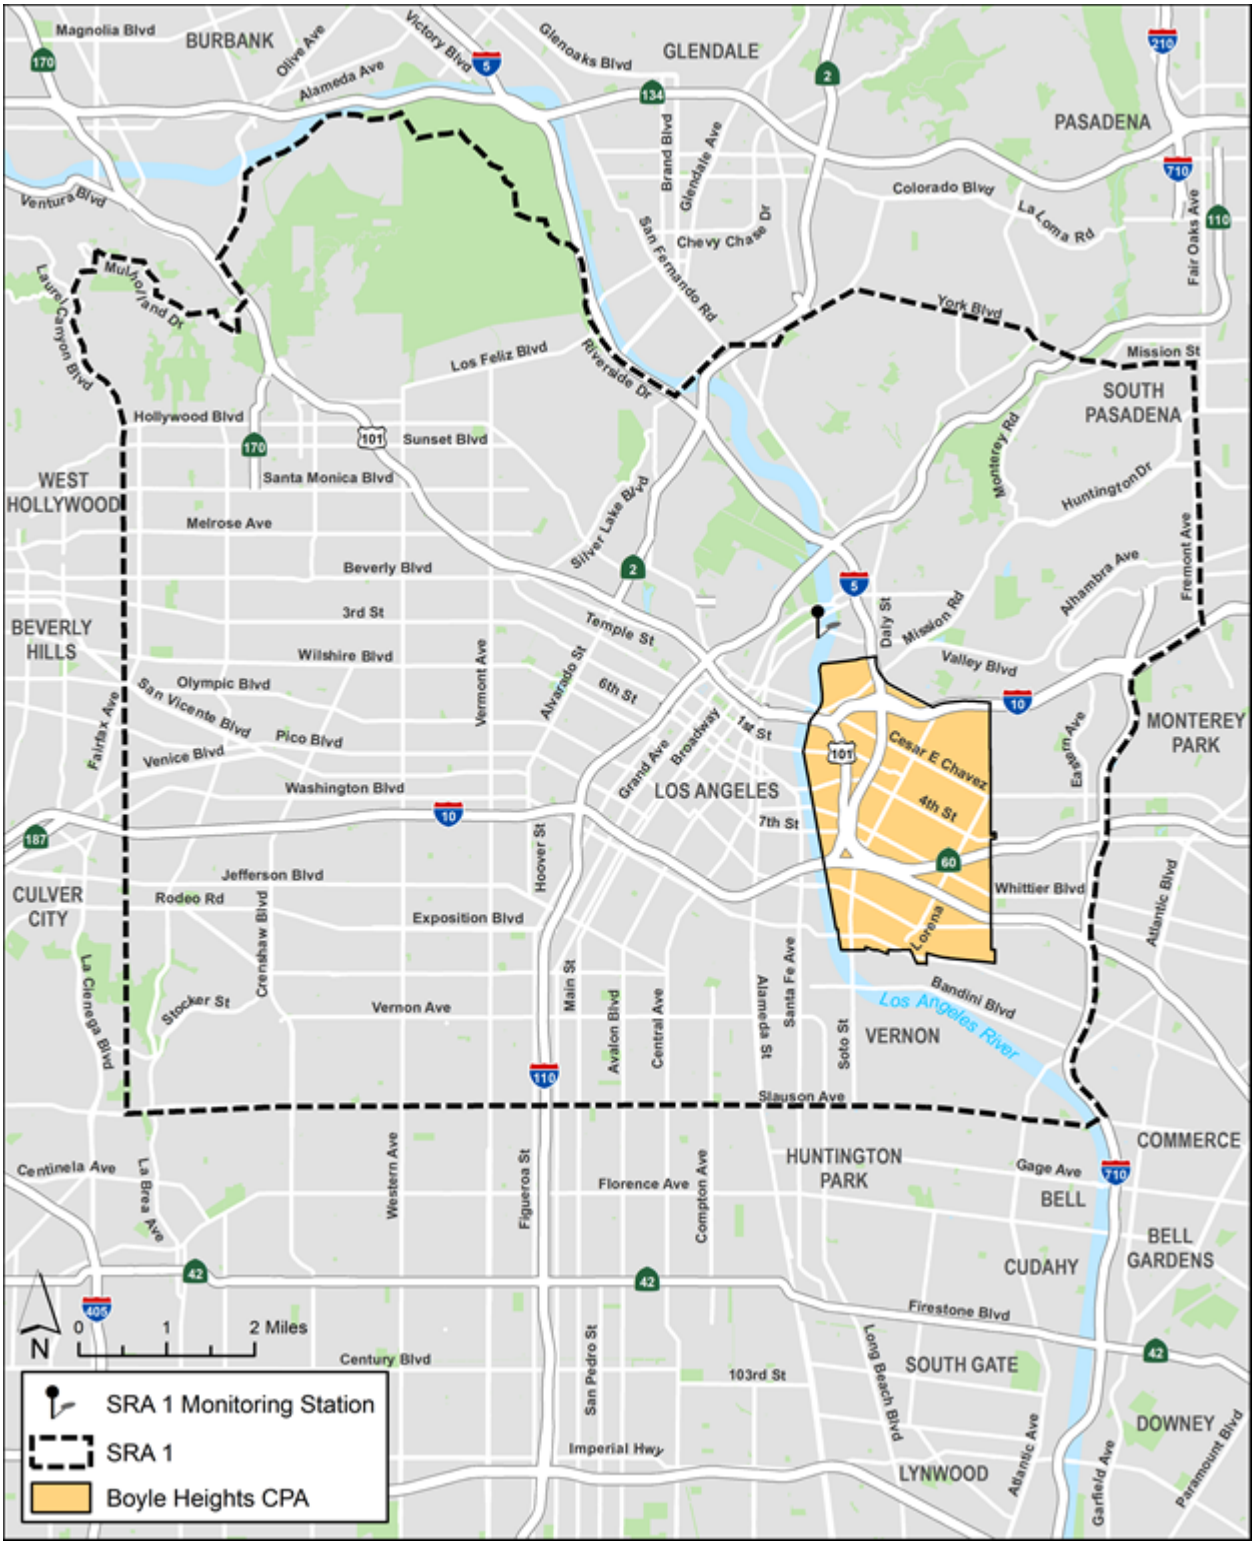
Table 4.2-2
Ambient Air Quality Standards

Air Pollutant	Averaging Time	State Standard	Federal Standard
Ozone (O_3)	1-Hour	0.09 ppm	-
	8-Hour	0.07 ppm	0.07 ppm
Carbon Monoxide (CO)	1-Hour	20.0 ppm	35 ppm
	8-Hour	9.0 ppm	9 ppm
Nitrogen Dioxide (NO_2)	1-Hour	180 ppb	100 ppb
Sulfur Dioxide (SO_2)	1-Hour	250 ppb	75 ppb
	24-Hour	40 ppb	140 ppb
Sulfates (SO_4)	24-Hour	25 μg/m^3	-
Fine Particulate Matter (PM2.5)	24-Hour	-	35 μg/m^3
	Annual Arithmetic Mean	12 μg/m^3	12 μg/m^3 (Primary) 15 μg/m^3 (Secondary)
Respirable Particulate Matter (PM10)	24-Hour	50 μg/m^3	150 μg/m^3
Lead (PB)	30-Day Average	1.5 μg/m^3	-
	Calendar Quarter	-	1.5 μg/m^3 (for certain areas)
	Rolling 3-Month Average	-	0.15 μg/m^3

Source: CARB, Ambient Air Quality Standards, 2016. Available at: https://ww2.arb.ca.gov/sites/default/files/2020-07/aaqs2.pdf, accessed November 2021.
Notes: ppm = parts per million; ppb = parts per billion; μg/m^3 = microgram per cubic meter.

The California Clean Air Act (CCAA) requires the CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the California Ambient Air Quality Standards (CAAQS) have been achieved. As shown in **Table 4.2-2**, the CAAQS are generally more stringent than the NAAQS; and additional state standards are specified for sulfates, hydrogen sulfide (H_2S), vinyl chloride, and visibility-reducing particles. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the non-desert Los Angeles County portion of the Basin is designated as a nonattainment area for O_3, PM2.5, and PM10 as shown in **Table 4.2-3**.

Table 4.2-3
Air Quality Standard Attainment Statuses for the Los Angeles County Portion of SCAB



Pollutant	California Ambient Air Quality Standards	National Ambient Air Quality Standards
Ozone (O_3) (1-Hour)	Nonattainment	Nonattainment (Extreme)
Ozone (O_3) (8-Hour)	Nonattainment	Nonattainment (Extreme)
Carbon Monoxide (CO) (1-Hour and 8-Hour)	Attainment	Attainment (Maintenance)
Nitrogen Dioxide (NO_2) (1-Hour)	Attainment	Unclassified/Attainment
Nitrogen Dioxide (NO_2) (8-Hour)	Attainment	Attainment (Maintenance)
Sulfur Dioxide (SO_2) (1-Hour)	Attainment	Pending – Expect Unclassified/Attainment
Sulfur Dioxide (SO_2) (24-Hour)	Attainment	Unclassified/Attainment
Fine Particulate Matter (PM2.5) (24-Hour)	Nonattainment	Attainment (Maintenance)
Fine Particulate Matter (PM2.5) (Annual)	Nonattainment	Not Applicable
Respirable Particulate Matter (PM10) (24-Hour)	Not Applicable	Nonattainment (Serious)
Respirable Particulate Matter (PM10) (Annual)	Nonattainment	Nonattainment (Moderate)
Lead (Pb)	Attainment	Nonattainment (Partial)

Local Air Quality

The SCAQMD jurisdiction is divided geographically into 38 source receptor areas (SRAs), wherein 37 monitoring stations operate—one station in each SRA excluding SRA 7—to measure and record concentrations of the regulated pollutants that provide representative air quality conditions in the region. The 38 SRAs are divided based on proximity to air monitoring stations and local meteorological patterns. The CPA is situated entirely within SRA 1, described as Central Los Angeles County. Air quality conditions in the CPA are characterized by concentrations of air pollutants measured at the SRA 1 monitoring station, SCAQMD Station No. 087 Los Angeles – North Main Street, which is located approximately 0.6 miles northeast of the CPA boundary (**Figure 4.2-1**). This station records concentrations of O_3, CO, NO_2, SO_2, PM10, and PM2.5 at timescales that match the corresponding ambient air quality standards. **Table 4.2-4** presents the monitored air quality data at the North Main Street Monitoring Station from 2018 to 2020.[5]

5 While the NOP was published in 2016 and is the baseline year for the EIR CEQA analyses, data has been updated as appropriate to reflect the most current information available to characterize ambient air quality.

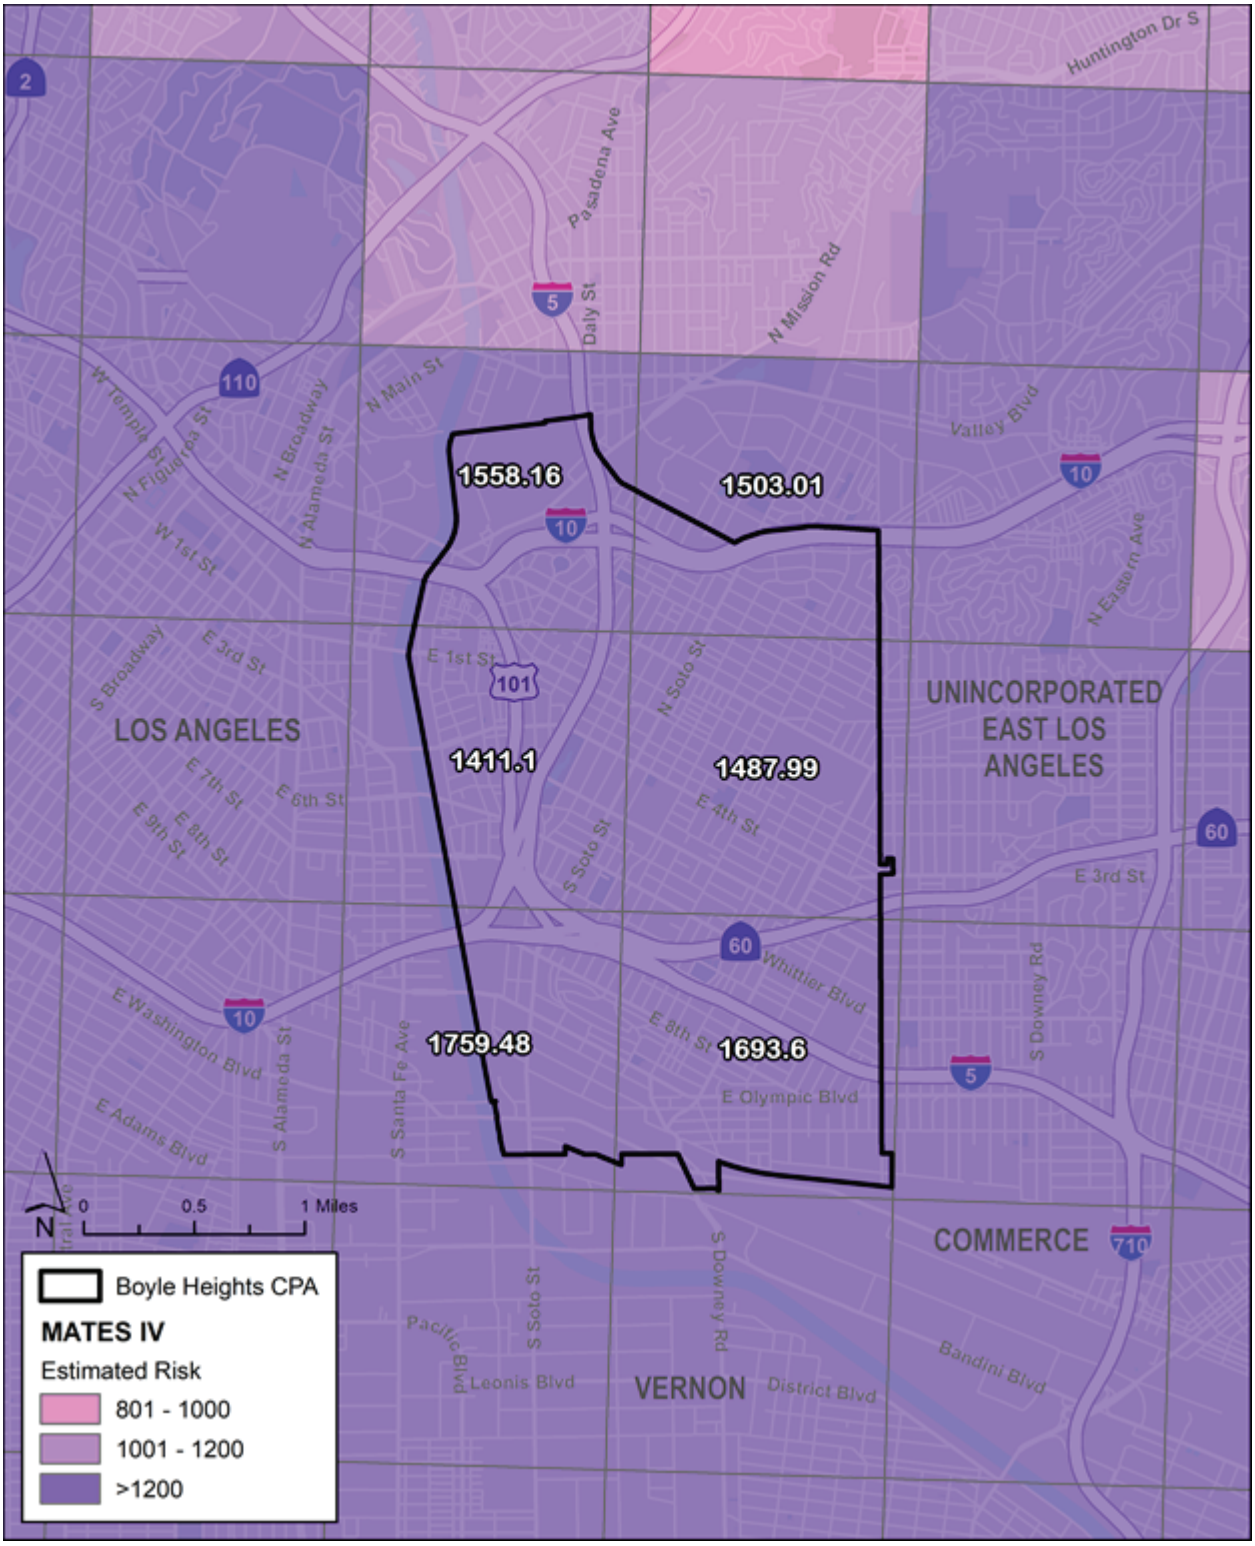
Source: SCAQMD, Historical Data by Year – Air Quality Data Tables 2018–2020.
Available at: https://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year, Accessed November 2021.
U.S. EPA, Annual Summary Data – Concentration by Monitor, 2018–2020.
Available at: https://aqs.epa.gov/aqsweb/airdata/download_files.html#Annual, Accessed November 2021.



According to air quality data from SCAQMD Station No. 087 shown in **Table 4.2-4**, concentrations of O_3 exceeded the State 1-hour standard at least once in each of the three years presented. Levels of O_3 also exceeded the national and State 8-hour standards on 28 occasions between 2018–2020. PM10 concentrations did not exceed the 24-hour NAAQS during the three year period; however, concentrations exceeded the applicable State 24-hour PM10 standard at least four times between 2018–2020, and a maximum of 31 times in 2018. Additionally, annual average PM10 concentrations exceeded the State standard in all three years. PM2.5 concentrations exceeded the federal 24-hour standard a total of 19 times between 2018–2020, and annual average concentrations exceeded the State and federal standard in 2018 and 2020. There were no instances of concentrations of CO, NO_2, or SO_2 exceeding applicable air quality standards in any of the three years. The data demonstrate consistency with the nonattainment designations in **Table 4.2-3**, above.

SCAQMD also operates and maintains an air monitoring network for TACs as part of its Multiple Air Toxics Exposure Study (MATES) program. Originally developed in 1986 and now in its fifth iteration, the MATES V program relied on concentrations of more than 30 TACs—including both gases and particulates—measured at 10 fixed sites throughout the SCAB during the 2018–2019 period in conjunction with a basin-wide TAC emissions inventory and a regional modeling effort to characterize ambient excess carcinogenic risks across the SCAB.[6] MATES V also included an exploratory analysis of chronic non-cancer health impacts (e.g., cardiovascular, respiratory, neurological health outcomes, etc.) based on the measured concentrations and modeled emissions. The results of MATES V determined that the carcinogenic risk estimated from data collected at the 10 monitoring sites was approximately 40 percent lower on average than the risk that was estimated in MATES IV using monitoring data from the 2012–2013 time period. The estimated SCAB-wide population-weighted cancer risk calculated from the modeling data estimated that the reduction relative to MATES IV was approximately 54 percent, similar to the decrease demonstrated in monitored data. Based on the inhalation exposure pathway only, MATES-V found that the average population-weighted carcinogenic risk in the SCAB declined from 897 per million in 2012–2013 to 424 in a million in 2018–2019.

At the county level, Los Angeles County ambient average inhalation-pathway population-weighted cancer risk decreased from approximately 1,015 per million in MATES IV to 462 per million in MATES V, a reduction of 54 percent, which is similar to the modeled reduction across the SCAB. Accounting for multiple exposure pathways, the highest carcinogenic risk in MATES V was estimated near the Ports of Los Angeles and Long Beach to be approximately 960 per million, and the countywide average for Los Angeles County was approximately 497 per million (approximately 57 percent lower than MATES IV results). The Boyle Heights CPA warrants special consideration as part of the SB 535 East Los Angeles/Boyle Heights/West Commerce (ELABHWC) Environmental Justice (EJ) Community, which was designated for the AB 617 Community Air Program in 2018.[7] The MATES V report concluded that that the average carcinogenic risk within the ELABHWC EJ community was approximately 653 per million, which represented a reduction of approximately 60 percent relative to the MATES IV analysis from six years prior. However, the ELABHWC EJ community and the Boyle Heights CPA still experience some of the highest levels of TAC pollution in the City due to the heavily trafficked roadways, freeways, and nearby railyards. **Figure 4.2-2** displays the Boyle Heights CPA boundary overlain on the MATES V estimated carcinogenic risk map. The MATES V ambient carcinogenic risk in the Boyle Heights CPA ranges between approximately 670 and 800 per million. According to the MATES V data visualizer, approximately 70 percent of the ambient excess cancer risk is attributed to diesel PM concentrations.

IMPACT SCIENCES

1264.003•05/2022

Sensitive Receptors and Locations

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. There is a strong correlation between the likelihood of being exposed to unhealthy concentrations of air pollution and the proximity to the source of air pollutant emissions. Some individuals are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. CARB has identified the following population groups who are most likely to be affected by air pollution: children less than 14 years of age, adults over 65 years of age, athletes, and people with cardiovascular and chronic respiratory diseases. Land uses where these population groups are likely to spend a substantial amount of time are considered sensitive receptors. According to SCAQMD, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers and retirement homes.

The Boyle Heights CPA currently contains numerous land uses that are considered sensitive receptors in the CPA, including residential uses, parks and playgrounds, institutional facilities such as schools (including the Los Angeles City College), and long-term medical care facilities. Residential land uses comprise the plurality of the area within the Boyle Heights CPA, accounting for approximately 1,278 acres or 43 percent of the CPA. As described in **Section 4.14, Public Services and Recreation**, there are 27 Los Angeles Unified School District public schools, 7 charter schools, and approximately 18 parks and recreational facilities within the CPA. There are also various medical uses located in the CPA that could accommodate individuals who would be especially susceptible to adverse health effects from air pollution exposure. In addition, there are sensitive receptors outside but in close proximity to the boundaries of the CPA which may be impacted by air pollutant emissions that would be generated by construction and operation of land use developments with implementation of the Proposed Plan.

Sensitive land uses that are in close proximity to major sources of emissions (i.e., freeways and railyards) are commonly subjected to higher levels of pollution. The CARB recommends that new sensitive land uses should not be developed within 500 feet of a freeway or within 1,000 feet of a railyard due to the magnitude of emissions generated by these sources.[8] Major freeway sources within the CPA include I-5, I-10, SR-60, and US-101, and there are several freeway interchanges within the CPA that are often congested, which exacerbates potential localized concentrations. Additionally, the LA Metro Division 20 railyard is located adjacent to the CPA on the western side of the Los Angeles River between East 1st Street and 6th Street, and

8 CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005.

the Union Pacific Los Angeles Transportation Center railyard is located in the northwest corner of the CPA. There are many existing sensitive land uses within the CPA that are located within 500 feet of a freeway.

4.2.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Air Quality at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Clean Air Act
- California Clean Air Act
- California Code of Regulations
- State Programs for Toxic Air Contaminants
- Diesel Risk Reduction Program
- South Coast Air Quality Management District (SCAQMD)'s Air Quality Management Plan (AQMP) and Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)
- SCAQMD's Air Quality Guidance Documents
- SCAQMD's Rules and Regulations
- City of Los Angeles Air Quality Element
- City of Los Angeles Plan for a Healthy LA

Federal Regulations

Federal Clean Air Act. The Federal Clean Air Act (CAA) was enacted in 1970 and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990.[9] The CAA is the comprehensive federal law that regulates air emissions in order to protect public health and welfare.[10] The U.S. EPA is responsible for the implementation and enforcement of the CAA, which establishes federal

9 42 United States Code §7401 et seq. (1970).

10 United States Environmental Protection Agency, Summary of the Clean Air Act, https://www.epa.gov/laws-regulations/summary-clean-air-act. Accessed February 2022.

National Ambient Air Quality Standards (NAAQS), specifies future dates for achieving compliance, and requires the U.S. EPA to designate areas as attainment, nonattainment, or maintenance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for each criteria pollutant for which the state has not achieved the applicable NAAQS. The SIP includes pollution control measures that demonstrate how the standards for those pollutants will be met. The sections of the CAA most applicable to land use development projects include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions).[11]

Title I requirements are implemented for the purpose of attaining NAAQS for criteria air pollutants. **Table 4.2-2, Ambient Air Quality Standards**, shows the NAAQS currently in effect for each criteria pollutant. The Air Basin fails to meet national standards for O_3 and PM2.5 and, therefore, is considered a federal "non-attainment" area for these pollutants, as shown in **Table 4.2-3.** Therefore, the Air Basin is subject to the requirements of demonstrating a path towards attaining the NAAQS as part of the SIP. The NAAQS and the CAAQS, which are generally more stringent, have been set at levels considered safe to protect public health, including the health of sensitive populations and to protect public welfare.

Title II pertains to mobile sources, which includes on-road vehicles (e.g., cars, buses, motorcycles) and non-road vehicles (e.g., aircraft, trains, construction equipment). Reformulated gasoline and automobile pollution control devices are examples of the mechanisms the U.S. EPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for NO_X emissions have been lowered substantially and the specification requirements for cleaner burning gasoline are more stringent.

State Regulations

California Clean Air Act. The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the state to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practicable date. The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both state and federal air pollution control programs within California. In this capacity, CARB conducts research, sets the CAAQS, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products, and various types of commercial equipment. It also sets fuel specifications to further reduce

11 United States Environmental Protection Agency, Clean Air Act Overview, Clean Air Act Table of Contents by Title, Last Updated January 3, 2017, https://www.epa.gov/clean-air-act-overview/clean-air-act-text. Accessed February 2022. As shown therein, Title I addresses nonattainment areas and Title II addresses mobile sources.

vehicular emissions. **Table 4.2-2** includes the CAAQS currently in effect for each of the criteria pollutants, as well as other pollutants recognized by the state. As shown in **Table 4.2-2,** the CAAQS include more stringent standards than the NAAQS. The Air Basin fails to meet state standards for O_3, PM10, and PM2.5 and, therefore, is considered "non-attainment" for these pollutants.

California Code of Regulations. The California Code of Regulations (CCR) is the official compilation and publication of regulations adopted, amended or repealed by state agencies pursuant to the Administrative Procedure Act. The CCR includes regulations that pertain to air quality emissions. Specifically, Section 2485 in Title 13 of the CCR states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location. In addition, Section 93115 in Title 17 of the CCR states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

State Programs for Toxic Air Contaminants. The California Air Toxics Program is an established two-step process of risk identification and risk management to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and OEHHA determine if a substance should be formally identified, or "listed," as a TAC in California. In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on results of that review, CARB has promulgated a number of Airborne Toxic Control Measures (ATCMs), both for stationary and mobile sources, including On-Road and Off-Road Vehicle Rules. These ATCMs include measures such as limits on heavy-duty diesel motor vehicle idling and emission standards for off-road diesel construction equipment in order to reduce public exposure to DPM and other TACs. These actions are also supplemented by the AB 2588 Air Toxics "Hot Spots" program and SB 1731, which require facilities to report their air toxics emissions, assess health risks, notify nearby residents and workers of significant risks if present, and reduce their risk through implementation of a risk management plan. SCAQMD has further adopted two rules to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating. Rule 1402 incorporates requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities.

Diesel Risk Reduction Program. CARB identified particulate emissions from diesel-fueled engines as TACs in August 1998. Following the identification process, the ARB was required by law to determine if there is a need for further control, which moved us into the risk management phase of the program. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines* and the *Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines*. The Diesel Advisory Committee approved these documents on September 28, 2000, paving the way for the next

step in the regulatory process: the control measure phase. During the control measure phase, specific statewide regulations designed to further reduce DPM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce DPM emissions.

Regional Regulations

South Coast Air Quality Management District (SCAQMD). The SCAQMD is primarily responsible for planning, implementing, and enforcing air quality standards for the South Coast Air Basin. The Air Basin is a subregion within the western portion of the SCAQMD jurisdiction, as the SCAQMD also regulates portions of the Salton Sea Air Basin and Mojave Desert Air Basin within Riverside County.

Air Quality Management Plan and RTP/SCS. To meet the NAAQS and CAAQS, the SCAQMD has adopted a series of AQMPs, which serve as a regional blueprint to develop and implement an emission reduction strategy that will bring the area into attainment with the standards in a timely manner. The 2016 AQMP includes strategies to ensure that rapidly approaching attainment deadlines for O_3 and PM2.5 are met, and that public health is protected to the maximum extent feasible. The most significant air quality challenge in the Air Basin is to reduce NO_X emissions[12] sufficiently to meet the upcoming O_3 standard deadlines, as NO_X plays a critical role in the creation of O_3. The AQMP's strategy to meet the 8-hour O_3 standard in 2023 should lead to sufficient NO_X emission reductions to attain the 1-hour O_3 standard by 2022. Since NO_X emissions also lead to the formation of PM2.5, the NO_X reductions needed to meet the O_3 standards will likewise lead to improvement of PM2.5 levels and attainment of PM2.5 standards.[13] [14]

The AQMP also incorporates the transportation strategy and transportation control measures from SCAG's adopted 2016-2040 RTP/SCS (2016-2040 RTP/SCS)[15] Plan. SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG coordinates with various air quality and transportation stakeholders in Southern California to ensure compliance with the federal and state air quality requirements. Pursuant to California Health and Safety Code Section 40460, SCAG has the responsibility of preparing and approving the portions of the AQMP relating to the regional

---

12 NO_X emissions are a precursor to the formation of both O_3 and secondary PM2.5.

13 Estimates are based on the inventory and modeling results and are relative to the baseline emission levels for each attainment year (see Final 2016 AQMP for detailed discussion).

14 SCAQMD, *Final 2016 AQMP*, 2017. Page ES-2. http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp. Accessed February 2022.

15 SCAG, *Final 2016 RTP/SCP*, 2016 http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. Accessed February 2022.

demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. SCAG is required by law to ensure that transportation activities "conform" to, and are supportive of, the goals of regional and state air quality plans to attain the NAAQS. The RTP/SCS includes transportation programs, measures, and strategies generally designed to reduce vehicle miles traveled (VMT), which are contained in the AQMP. The SCAQMD combines its portion of the AQMP with those prepared by SCAG.[16] The RTP/SCS and Transportation Control Measures, included as Appendix IV-C of the 2016 AQMP for the Air Basin, are based on SCAG's 2016-2040 RTP/SCS.

The 2016 AQMP forecasts the 2031 emissions inventories ''with growth'' based on SCAG's 2016-2040 RTP/SCS. The region is projected to see a 12 percent growth in population, 16 percent growth in housing units, 23 percent growth in employment, and 8 percent growth in vehicle miles traveled between 2012 and 2031. Despite regional growth in the past, air quality has improved substantially over the years, primarily due to the effects of air quality control programs at the local, state and federal levels.[17]

On September 3, 2020, SCAG's Regional Council adopted the 2020-2045 RTP/SCS. The 2020-2045 RTP/SCS was determined to conform to the federally-mandated state implementation plan (SIP), for the attainment and maintenance of NAAQS standards. On October 30, 2020, CARB also accepted SCAG's determination that the SCS met the applicable state greenhouse gas emissions targets. The 2020-2045 RTP/SCS will be incorporated into the forthcoming 2022 AQMP.

SCAQMD Air Quality Guidance Documents. The SCAQMD published the *CEQA Air Quality Handbook* (approved by the AQMD Governing Board in 1993) to provide local governments with guidance for analyzing and mitigating project-specific air quality impacts.[18] The *CEQA Air Quality Handbook* provides standards, methodologies, and procedures for conducting air quality analyses. However, the SCAQMD is currently in the process of replacing the *CEQA Air Quality Handbook* with the *Air Quality Analysis Guidance Handbook*. While this process is underway, the SCAQMD has provided supplemental guidance on the SCAQMD website.[19]

The SCAQMD has also adopted land use planning guidelines in its *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*, which considers impacts to sensitive receptors from

19 SCAQMD, *Air Quality Analysis Guidance*, http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook#. Accessed February 2022.

facilities that emit TAC emissions.[20] SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for sensitive land uses proposed in proximity to freeways and high-traffic roads, and the same siting criteria for distribution centers and dry cleaning facilities). The SCAQMD's document introduces land use-related policies that rely on design and distance parameters to minimize emissions and lower potential health risk. SCAQMD's guidelines are voluntary initiatives recommended for consideration by local planning agencies.

The SCAQMD has published a guidance document called the *Final Localized Significance Threshold Methodology* for CEQA evaluations that is intended to provide guidance when evaluating the localized effects from mass emissions during construction or operation of a project.[21] The SCAQMD adopted additional guidance regarding PM2.5 emissions in a document called *Final Methodology to Calculate Particulate Matter (PM)2.5 and PM2.5 Significance Thresholds*.[22] The latter document has been incorporated by the SCAQMD into its CEQA significance thresholds and *Final Localized Significance Threshold Methodology*.

SCAQMD Rules and Regulations. The SCAQMD has adopted several rules and regulations to regulate sources of air pollution in the Air Basin and to help achieve air quality standards for land use development projects, which include, but are not limited to the following:

Regulation IV – Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events. The following is a list of rules which apply to the reasonably anticipated development of the Proposed Plan:

- **Rule 401 – Visible Emissions:** This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

21 South Coast Air Quality Management District, Final Localized Significance Threshold Methodology, 2008, http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds. Accessed November 2021.

22 South Coast Air Quality Management District, Final Methodology to Calculate Particulate Matter (PM)2.5 and PM2.5 Significance Thresholds, 2006, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-(pm)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf?sfvrsn=2. Accessed November 2021.

- **Rule 402 – Nuisance:** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

- **Rule 403 – Fugitive Dust:** This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM10 emissions to less than 50 micrograms per cubic meter (μg/m3) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Mitigation measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the U.S. EPA.

Regulation XI – Source Specific Standards: Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to reasonably anticipated development of the Proposed Plan:

- **Rule 1113 – Architectural Coatings:** This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

- **Rule 1138 – Control of Emissions from Restaurant Operations:** This rule specifies PM and VOC emissions and odor control requirements for commercial cooking operations that use chain-driven charbroilers to cook meat.

- **Rule 1146.2 – Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters:** This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.

- **Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations:** This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIII – New Source Review (NSR): Regulation XIII sets requirements for preconstruction review required under both federal and state statutes for new and modified sources located in areas that do not meet the Clean Air Act standards ("non-attainment" areas). NSR applies to both individual permits and entire facilities. Any permit that has a net increase in emissions is required to apply Best Available Control Technology (BACT). Facilities with a net increase in emissions are required to offset the emission increase by use of Emission Reduction Credits (ERCs). The regulation provides for the application, eligibility, registration, use and transfer of ERCs. For low emitting facilities, the SCAQMD maintains an internal bank that can be used to provide the required offsets. In addition, certain facilities are subject to provisions that require public notice and modeling analysis to determine the downwind impact prior to permit issuance.

Regulation XIV – Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following is a list of rules which may apply to the Proposed Plan:

- **Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:** This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

- **Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines:** This rule applies to stationary compression ignition (CI) engines greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Rule 2305 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program: The WAIRE Program has compliance and reporting requirements for warehouse owners and operators to reduce nitrogen oxide and diesel emissions from the goods movement industry, help meet federal air quality standards and improve public health. It applies to warehouses that have at least 100,000 square feet of indoor floor space in single building.[23] WAIRE was adopted May 7, 2021, by

[23] South Coast Air Quality Management District. WAIRE Program Overview Factsheet, http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/waire-program-overview-factsheet.pdf?sfvrsn=8. Accessed November 23, 2021.

the South Coast Air Quality Management District.[24] Under WAIRE, owners are required to submit information about their buildings and tenants. Warehouse operators are required to earn a specific number of points every year through a menu-based point system, based on the number of truck trips made to and from the warehouse. Mitigation fees may be paid as an option. The compliance program is being phased in based on the size of a warehouse, starting in 2022 with warehouses that are larger than 250,000 square feet; 2023 for warehouses between 150,000 square feet and 250,000 square feet; and 2024 for warehouses between 100,000 square feet and 150,000 square feet.[25]

Local Regulations

City of Los Angeles General Plan

Air Quality Element. Local jurisdictions, such as the City, have the authority and responsibility to reduce air pollution through their land use decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. In general, the City of Los Angeles' General Plan (including the Framework, Air Quality, Mobility 2035, and Health and Wellness Elements) and the City of Los Angeles' Green New Deal (Sustainable pLAn 2019) contain policies and programs for the protection of the environment and health through improved air quality. These serve to provide additional critical guidance for the betterment of public health for the region and City.

The most directly-related of those plans, the City's General Plan Air Quality Element, was adopted on November 24, 1992, and sets forth the goals, objectives, and policies which guide the City in its implementation of its air quality improvement programs and strategies. A number of these goals, objectives, and policies are relevant to land use development, and relate to traffic mobility, minimizing particulate emissions from construction activities, discouraging single-occupancy vehicle trips, managing traffic congestion during peak hours, and increasing energy efficiency in City facilities and private developments.

The Air Quality Element establishes six goals:

- Good air quality in an environment of continued population growth and healthy economic structure;
- Less reliance on single-occupant vehicles with fewer commute and non-work trips;

25 South Coast Air Quality Management District. WAIRE Program Overview Factsheet, http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/waire-program-overview-factsheet.pdf?sfvrsn=8. Accessed November 23, 2021.

- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimal impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels and the implementation of conservation measures including passive measures such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution

The City is also responsible for the implementation of transportation control measures as outlined in the AQMP. Through capital improvement programs, the City can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation measures.

Plan for a Healthy Los Angeles. The Plan for a Healthy Los Angeles, first adopted by the City Council on March 31, 2015, lays the foundation to create healthier communities for all residents in the City. The City Council subsequently adopted targeted amendments in the Plan For a Healthy Los Angeles on November 24, 2021. The updated Plan satisfies the State requirements (SB 1000) to address environmental justice in the General Plan. As the Health, Wellness, and Equity element of the General Plan, it provides high-level policy vision, along with measurable objectives and implementation programs, to elevate health as a priority for the City's future growth and development. With a focus on public health and safety and environmental justice, the Plan for a Healthy Los Angeles provides a roadmap for addressing the most basic and essential quality-of-life issues: safe neighborhoods, a clean environment (i.e., improved ambient and indoor air quality), the opportunity to thrive, and access to health services, affordable housing, and healthy and sustainably produced food.

Safety Element. The updated Safety Element, adopted by the City Council on November 24, 2021, includes an objective and policies to address climate change, including air quality.

Table 4.2-5
City of Los Angeles Safety Element

Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Policy 1.2.1	**Environmental Justice.** In keeping with the Plan for a Healthy LA, build a fair, just and prosperous city where everyone experiences the benefits of a sustainable future by correcting the long running disproportionate impact of environmental burdens faced by low income families and communities of color.
Policy 1.2.2	**Renewable Energy.** Aggressively pursue renewable energy sources, transitioning away from fossil based sources of energy and toward 100% renewable energy sources.
Policy 1.2.6	**Mobility.** In keeping with the Mobility Plan, build a comprehensive and integrated transportation network that changes how Angelenos get around and reduces car dependency.
Policy 1.2.7	**Zero Emissions Vehicles.** In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increases zero emissions infrastructure including charging.
Policy 1.2.8	**Industrial Emissions and Air Quality Monitoring**. In keeping with the Air Quality Element, ensure that every Angeleno can breathe clean, healthy air by addressing air pollution from all sources, with a particular emphasis on prioritizing the health and wellbeing of overburdened families and delivering environmental justice.
Policy 1.2.11	**Urban Ecosystem and Resilience.** In keeping with the Conservation and Open Space Elements, create a more temperate biodiverse city with more green space for people and habitat.
Policy 1.2.13	**Lead by Example.** Leverage government owned properties and publicly-driven investments to realize broader climate change goals.

Los Angeles Green Plan. The City seeks to address the issue of global climate change with the *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan). This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. According to the LA Green Plan, the City is committed to the goal of reducing emissions of CO_2 to 35 percent below 1990 levels. To achieve this, the City will:

- Increase the generation of renewable energy;
- Improve energy conservation and efficiency; and
- Change transportation and land use patterns to reduce dependence on automobiles.

The LA Green Plan is discussed in greater detail in **Section 4.7, Greenhouse Gas Emissions**.

City of Los Angeles Green Building Code. In December 2010, the Los Angeles City Council adopted various provisions of the CalGreen Code as part of Ordinance No. 181,480, thus codifying certain provisions of the CalGreen Code as the new Los Angeles Green Building Code (LA Green Building Code). As a result of continuing updates to the CalGreen Code, the City adopted the pertinent provisions of the 2016 CalGreen standards through Ordinance No. 184,691, approved December 19, 2016. The LA Green

Building Code applies to the construction of every new building, every new building alteration with a permit valuation of over $200,000, and every building addition unless otherwise noted. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) non-residential and high-rise residential buildings; and (3) additions and alterations to non-residential and high-rise residential buildings.

City of Los Angeles Clean Up Green Up Ordinance. The City of Los Angeles adopted a Clean Up Green Up Ordinance (Ordinance Number 184,245) on April 13, 2016, which among other provisions, includes provisions related to ventilation system filter efficiency in mechanically ventilated buildings.[26] This Ordinance added Sections 95.314.3 and 99.04.504.6 to the Los Angeles Municipal Code (LAMC) and amended Section 99.05.504.5.3 to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns. Section 99.04.504.6, which became effective June 4, 2016, mandates that regularly occupied areas in mechanically ventilated buildings within 1,000 feet of a freeway be provided with air filtration media for outside and return air that meet a Minimum Efficiency Report Value (MERV) of 13. This Ordinance requires that these filters be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual. The only exception to Section 99.04.504.3 applies to existing mechanical equipment. Additionally, Section 99.05.504.3 states that regularly occupied areas in all mechanically ventilated buildings shall be provided with air filtration media for outside and return air that meets a MERV of 8. An exception is provided for existing mechanical equipment and for new ventilation units meeting certain 2013 California Energy Code requirements. These additions to the LAMC are designed to address cumulative health impacts in highly polluted areas resulting from incompatible land use patterns within the City of Los Angeles.

4.2.4 THRESHOLDS OF SIGNIFICANCE

State CEQA Guidelines

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to air quality if it would:

a) Conflict with or obstruct implementation of the applicable air quality plan (Threshold AQ-1);

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard (Threshold AQ-2);

---

26 City of Los Angeles Department of City Planning, Ordinance Number 184,245 Clean Up Green Up, Council File No. 15-1026, adopted April 13, 2016.

c) Expose sensitive receptors to substantial pollutant concentrations (Threshold AQ-3); and/or

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people (Threshold AQ-4).

Specific quantitative thresholds used to address these general CEQA impact criteria are discussed below.

SCAQMD Thresholds

The SCAQMD has developed specific CEQA regional and localized significance thresholds (LSTs) to assess air quality impacts associated with individual development projects. Separate thresholds have been established for the temporary construction phase and permanent operational phase of proposed projects within the SCAQMD jurisdiction. The regional mass daily thresholds applicable to construction activities were based on quarterly emissions thresholds originally established by the SCAQMD in its 1993 CEQA Air Quality Handbook.[27] The regional operational phase thresholds explicitly apply to long-term emissions that occur following the completion of construction activities, and the operational thresholds for emissions of volatile organic compounds (VOCs) and nitrogen oxides (NO_X) were derived by scaling annual U.S. EPA thresholds applicable to stationary sources in "extreme" O_3 nonattainment areas from Section 182(e) of the federal CAA down to a daily mass quantity.[28] Importantly, the SCAQMD has no thresholds for a project like the Proposed Plan, an areawide planning project. As the SCAQMD LSTs are not applicable to areawide planning documents but to individual development projects and as the details of new uses and locations are not known,[29] this EIR provides a qualitative, programmatic level discussion of localized emissions.

The regional and localized construction significance thresholds that are applicable to emissions from individual land use development projects in the Boyle Heights CPA are shown in **Table 4.2-6**. The regional mass daily threshold values apply to land use development projects throughout the City (and the SCAB), while LST values vary depending on the air monitoring areas—or source receptor areas (SRAs)—in which a development project is located. The CPA is located entirely within SRA 1, Central Los Angeles County, and therefore each infill development project subject to CEQA would need to address the applicable LST values. Due to the density of development within the CPA, the LST values for SRA 1 are some of the most protective in the Basin for regulating localized emissions and preventing exposure of sensitive receptors to substantial pollutant concentrations.

SCAQMD Daily Construction Emissions Thresholds

Pollutant[1]	Regional Threshold (Pounds Per Day)	Community Plan Area Localized Thresholds (Pounds Per Day)[2]		
		1 Acre	2 Acre	5 Acre
Volatile Organic Compounds (VOC)	75	--	--	--
Nitrogen Oxides (NO_x)	100	74	108	161
Carbon Monoxide (CO)	550	680	1,048	1,861
Sulfur Oxides (SO_x)	150	--	--	--
Respirable Particulates (PM10)	150	5	8	16
Fine Particulates (PM2.5)	55	3	5	8

Source: SCAQMD, Air Quality Significance Thresholds, 2019. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2, Accessed November 2021;
SCAQMD, Final Localized Significance Threshold Methodology, Appendix C – Mass Rate LST Look-Up Tables, revised October 21, 2009. Available at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/localized-significance-thresholds, Accessed November 2021.
[1] SCAQMD has adopted a significance threshold of three pounds per day for lead. The construction projects under the Proposed Plan do not include sources of lead emissions, and a discussion of air quality impacts from lead emissions is excluded from the air quality analyses.
[2] Localized significance thresholds are based on a 25 meter receptor distance because most of the CPA is densely developed.

The SCAQMD developed the LST screening values in response to the Governing Board's Environmental Justice Enhancement Initiative (1-4), which was prepared to update the *CEQA Air Quality Handbook* (1993). The LST screening values were adopted in response to concerns regarding exposure of individuals to criteria pollutants in local communities that were not adequately protected by the regional mass daily thresholds, and have been developed for NO_x, CO, PM10, and PM2.5 based on local air quality conditions. The LST screening values represent the maximum daily emissions from sources located on a project site that will not cause or contribute to an air quality exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest sensitive receptor, taking into consideration ambient concentrations in each SRA, the proximity of sensitive land uses, and maximum daily ground disturbance area during construction activities.

LSTs have been developed for emissions from sources located on-site within construction areas up to five acres in size. Using air dispersion modeling in conjunction with measured ambient air quality conditions, the SCAQMD determined LST screening values to prevent the occurrence of substantial pollutant concentrations at locations near land use development sites. Each of the 38 SRAs in the SCAQMD jurisdiction have their own corresponding LST screening values. The LST values for SRA 1 shown in **Table 4.2-6** correspond to individual sites for land use developments within 25 meters (approximately 83 feet) of sensitive receptors, which are the most conservative thresholds. The receptor distances are provided in

meters based on results of air dispersion modeling performed by the SCAQMD to derive the LST screening values.

The regional operational significance thresholds for individual projects within the CPA are shown in **Table 4.2-7**. These quantitative thresholds are considered when making a significance determination using the *CEQA Guidelines* Appendix G thresholds, above, as appropriate. Localized analyses of on-site operational emissions associated with individual projects are typically limited to industrial and commercial land uses that involve considerable on-site heavy-duty vehicle traffic or involve stationary sources of substantial air pollutant emissions.

Table 4.2-7

SCAQMD, Final Localized Significance Threshold Methodology, Appendix C – Mass Rate LST Look-Up Tables, revised October 21, 2009. Available at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/localized-significance-thresholds, Accessed November 2021.
[1] SCAQMD has adopted a significance threshold of three pounds per day for lead. The construction projects under the Proposed Plan do not include sources of lead emissions, and a discussion of air quality impacts from lead emissions is excluded from the air quality impact analyses.
[2] Localized significance thresholds are based on a 25 meter receptor distance because most of the CPA is densely developed.

Furthermore, SCAQMD is tasked with managing exposure of sensitive receptors to air toxics and associated public health concerns. According to SCAQMD methodology, health effects from carcinogenic air toxics are described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person continuously exposed to concentrations of TACs over a 70-year lifetime will contract cancer based on the use of standard risk assessment methodology. SCAQMD has stated that the incremental cancer risk should not exceed 10 persons in one million, and the chronic and acute risks should not exceed a calculated Hazard Index value of 1.0. The SCAQMD quantitative thresholds are considered when making a significance determination using the *CEQA Guidelines* Appendix G thresholds, above, as appropriate.

4.2.5 METHODOLOGY

The terminology and methodology used to evaluate the significance of potential impacts to air quality are described below. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation. The City uses SCAQMD's *CEQA Air Quality Handbook* as the guidance document for the environmental review of plans and development proposals within its jurisdiction. The City does not, however, have the specific technical expertise to develop plans, programs, procedures, and methodologies to ensure that air quality within the county and region will meet federal and state standards. Instead, the City relies upon the expertise of the SCAQMD, uses the *CEQA Air Quality Handbook*, and SCAQMD recommended thresholds of significance as the guidance for the environmental review of plans and development proposals. For purposes of this analysis, the *CEQA Guidelines* Appendix G criteria are used, supplemented by the thresholds identified in current SCAQMD guidance.

Air quality impacts resulting from implementation of the Proposed Plan are assessed at a programmatic level because information on specific development projects is not known for the Boyle Heights CPA as a whole. The SCAQMD *CEQA Air Quality Handbook* states that the air quality assessment should be as comprehensive as possible at a programmatic level. In the absence of SCAQMD programmatic thresholds, the EIR evaluates broad air quality impacts and examines the Proposed Plan's consistency with the 2016 AQMP. Consistency with this plan would ensure compliance with regional and local air quality goals. The analysis also broadly examines temporary construction emissions, long-term operational emissions, localized pollutant concentrations, TACs, and odors. Common sources of construction emissions include heavy-duty off-road construction equipment exhaust, fugitive dust, and architectural coatings. Sources of operational emissions include the use of consumer products, motor vehicle trips attracted to or generated by a land use, and on-site combustion of natural gas. A best-effort approach to disclose all reasonably foreseeable impacts based on available information is used consistent with the requirements of CEQA. To this end, the analysis of construction impacts is based on estimated generalized construction scenarios, as described below.

Construction

Construction emissions were estimated for equipment exhaust emissions and truck trips for a number of example individual construction projects using SCAQMD's California Emissions Estimator Model (CalEEMod, Version 2016.3.2).[30] Equipment emission factors in CalEEMod are based on CARB data.

[30] The CalEEMod program was updated since the release of version 2016.3.2. The analyses presented utilized CalEEMod 2016.3.2 as it was the most recently released version at the time of commencement of EIR preparation.

Equipment was assumed to operate for eight hours per day. Truck emission factors in CalEEMod are from EMFAC2014 and trucks were assumed to travel 40 miles per day, with a one-way distance of 20 miles to the disposal site. Fugitive dust and architectural coating emissions are qualitatively discussed because it would be speculative to quantify lot acreage and the size of buildings to be coated. These example projects account for four scales of intensity with respect to equipment usage and truck trips, as itemized below:

- Example 1: crew of 10 workers, two pieces of heavy-duty equipment, and 25 truck trips per day
- Example 2: crew of 20 workers, four pieces of heavy-duty equipment, and 50 truck trips per day
- Example 3: crew of 50 workers, eight pieces of heavy-duty equipment, and 100 truck trips per day
- Example 4: crew of 100 workers, 10 pieces of heavy-duty equipment, and 150 truck trips per day

These crew sizes, equipment inventories, and truck volumes are representative of a reasonable range of construction activity intensity for individual projects based on previous development in the City of Los Angeles including the Boyle Heights CPA. Maximum daily regional and localized emissions were quantified for these construction scenarios and assessed in the context of SCAQMD thresholds of significance. It is not practicable to estimate the incremental change in daily off-road equipment activity or daily VMT associated with construction projects within the CPA resulting from implementation of the Proposed Plan with any reasonable degree of accuracy. Construction of individual projects within the CPA is happening under existing conditions, and future infill development would continue occurring in the absence of the Proposed Plan. There is no substantive evidence as to whether implementation of the Proposed Plan would accelerate the turnover and redevelopment of land uses within the CPA and attempting to quantify additional daily construction activity spurred by adoption of the Proposed Plan would be entirely speculative. Therefore, the analysis of emissions from reasonably expected construction projects under implementation of the Proposed Plan assumes a baseline of zero for daily criteria pollutants emissions, which is extremely conservative given that there are generally multiple large and small construction projects going on in the City and Boyle Heights CPA at any given time.

CalEEMod incorporates the CARB OFFROAD and EMFAC emission inventory models to estimate emissions from off-road equipment and on-road mobile vehicles, respectively.[31] The OFFROAD and EMFAC models contain emission factors for specific categories of equipment and vehicles corresponding to the year of project analysis. The CARB and SCAQMD recognize that fleet average emission rates for off-road equipment and on-road mobile vehicles will decrease in future years as emission controls, engine technologies, and fuel efficiency improve, and older equipment and vehicles are phased out of use. The

[31] The CARB EMFAC model is updated more frequently than the CalEEMod program; the version of CalEEMod used to complete the analysis (Version 2016.3.2) contains emission factors from EMFAC2014.

horizon year of the Proposed Plan (2040) is 24 years later than the existing conditions baseline year of 2016, and construction activities would be occurring during each year within the timeframe. To demonstrate how emissions from construction projects within the CPA would change over time based on the anticipated fleet turnover that CARB modeling staff predict, the analysis of emissions that would be generated by construction activities addressed the inventory scenarios described above in both 2016 and 2040. Refer to **Appendix 4.2** for detailed construction emissions modeling calculation files.

Operations

Regarding future operational conditions, reasonably anticipated development from the Proposed Plan would generate air pollutant emissions from regional on-road vehicle travel (mobile sources), consumer products and landscaping (area sources), and natural gas combustion within the CPA land uses (energy source). Mobile source emissions were estimated using regional VMT data provided in the transportation model prepared for the Proposed Plan and vehicle emission rates from the EMFAC2021 model. The EMFAC application contains emission factors that correspond to vehicle speeds in five mile per hour (mph) increments and VMT data were produced in matching speed bins, which allowed the analysis to account for changes in traffic flow under the build scenarios. Additional sources of air pollutant emissions associated with land use development include VOCs from consumer products and cleaning supplies, exhaust emissions from landscaping equipment, and emissions from natural gas combustion from building facilities and appliances. These emissions were estimated using emission factors and calculation methodologies described within the CalEEMod technical documentation. Detailed operations emissions modeling calculation files can be found in **Appendix 4.2**.

Concurrent Construction and Operations

There is no comprehensive timeline for the construction of individual projects within the CPA through the horizon year of 2040, and it is not possible to estimate the rate of redevelopment over such a long timeframe. Similar to what is already occurring within the CPA under existing and ongoing conditions, sources of air pollutant emissions involved in the construction of individual projects would be active while operational emissions are continuously occurring. The City cannot reasonably anticipate if growth would be linear or sporadic between 2016 and 2040. Given the uncertainty of year-to-year growth, interim year emissions analyses are unlikely to yield reasonably accurate portrayal of emissions prior to 2040. It would also be inappropriate to consider construction emissions in combination with ongoing operational emissions, as the SCAQMD air quality significance thresholds were derived separately and the SCAQMD handbook explicitly states that operational emissions begin when construction is completed. It would not serve the goal of providing an informational document to combine hypothetical construction projects with operational emissions in an interim emissions scenario, nor is this approach standard practice for air quality

impacts assessments under CEQA. Without a robust understanding of project details including the schedules under which individual projects would be constructed, the exercise of combining construction and operational emissions would not bolster the disclosure of air quality impacts.

4.2.6 IMPACTS

Threshold 4.2-1 Would the Proposed Plan conflict with or obstruct implementation of the applicable air quality plan?

This impact would be less than significant.

The air quality plans applicable to CEQA projects within the City are the SCAQMD 2016 AQMP, SCAG's RTP/SCS and the City of Los Angeles General Plan. The 2016 AQMP was adopted in March 2017 and represents the most updated regional blueprint for achieving the federal air quality standards and minimizing public health concerns related to air quality. As discussed in the Regulatory Framework, the overall strategy for the 2016 AQMP was designed to meet applicable federal and state requirements, including attainment of the ambient air quality standards. The primary focus of the 2016 AQMP was demonstrating attainment of the 2006 24-hour PM2.5 NAAQS by the 2019 attainment date, and also to update control measures and implementation timeframes for the 8-hour O_3 NAAQS. The AQMP provides base year emissions (2012) and emission projections that forecast future air quality conditions, including the effects from adopted rules and regulations as well as other emission reduction strategies. In doing so, the 2016 AQMP relied upon the most recent planning assumptions and the best available information, including CARB's mobile source emission factors for the on-road mobile source emissions inventory; CARB's in-use fleet inventory for the off-road mobile source emission inventory; the latest point source inventory; updated area source inventories; SCAG's forecast growth assumptions developed for the 2016–2040 RTP/SCS and SCAG's mobile source emissions estimates developed for the 2016–2040 RTP/SCS.

In accordance with the procedures established in SCAQMD's *CEQA Air Quality Handbook*, the impact discussion considers the following criteria to determine whether the Project is consistent with applicable SCAQMD and SCAG planning objectives:

- Would the project create any impacts related to air quality violations, such as:
  - An increase in the frequency or severity of existing air quality violations;
  - Causing or contributing to new air quality violations; or,
  - Delaying timely attainment of air quality standards or the interim emission reductions specified in the AQMP.

- Would the project exceed the assumptions utilized in preparing the AQMP:
  - Is the Project consistent with the population and employment growth projections upon which AQMP forecasted emission levels are based;
  - Does the Project incorporate mitigation measures to reduce potentially significant impacts; and/or
  - To what extent is Project development consistent with the AQMP land use policies and control measures?

Regarding the first criterion, air quality violations refer to instances of the ambient air quality standards being exceeded. Projects that emit enough pollutants to create additional air quality violations could delay attainment of an air quality standard beyond the timeline specified in the AQMP. The SCAQMD established the regional and localized air quality significance thresholds as a screening tool to avoid the potential occurrence and exacerbation of air quality violations resulting from construction and operation of individual CEQA projects. However, attainment of the ambient air quality standards is focused on achieving a particular concentration region-wide, and available modeling programs that simulate pollutant concentrations are better suited for these regional scale assessments.

The standard CEQA practice for assessing air quality impacts is based on quantifying, disclosing, and analyzing project mass daily emissions for criteria pollutants and—when project specific details are available—pollutant concentrations for TACs. For CEQA purposes, concentrations of criteria pollutants for which the SCAQMD has established quantitative mass daily thresholds generally cannot be reasonably calculated.[32] More detail on modeling criteria pollutant and TAC concentrations is provided in **Appendix 4.2**. As an example, due to the complexity of ozone formation in the atmosphere, a specific mass amount of NO_X or VOCs emitted in a particular area does not equate to a particular concentration of O_3 in that area. Based on the nature of pollutant fate and transport in the atmosphere, the limitations of available scientific models to simulate concentrations, and lack of available information on future sources of emissions, for those projects where regional construction and/or operational emissions are anticipated to exceed the SCAQMD's daily significance thresholds, it is not possible to determine with any accuracy the concentration of O_3 that will be created at or near a project site or area or the frequency or severity of air quality violations.

In addition, there is no correlation between individual instances of exceeding SCAQMD thresholds and potential air quality violations. The potential for violations of air quality concentrations is determined at the project level by complex dispersion modeling based on site specific information and characteristics, and

32 City of Los Angeles, Air Quality and Health Effects – *Sierra Club v. County of Fresno*, October 2019.

at the regional level by even more complicated modeling that takes into account numerous factors that are unknown at this time. The City evaluated the feasibility of correlating instances of SCAQMD mass daily thresholds being exceeded by individual CEQA projects to exacerbations of air quality violations, and offered the following considerations:

> *"[Once a project's emissions enter the environment, these emissions are subject to a number of complex factors and variables, including chemical changes, dispersal, and weather variation, and ultimately combine with other existing conditions to result in the regional ambient air quality and concentrations of pollutants.*
>
> *"… The SCAQMD conducts regional-scale modeling in order to evaluate regional-scale air pollution, including modeling for the AQMP, modeling attainment demonstrations, and the Multiple Air Toxics Exposure Studies (MATES). This involves a regional scale photochemical model such as CAMx and CMAQ, which have a modeling domain on the order of hundreds of kilometers. The effort, resources, and availability of necessary input data required to perform this type of analysis is complex and extensive, and infeasible for smaller projects...*
>
> *"The computer models (e.g., CMAQ modeling platform) used to simulate and predict an attainment date for ozone are based on regional inventories of precursor pollutants and meteorology within an air basin. At a very basic level, based on gross assumptions appropriate for regional-scale analysis, the models simulate future ozone levels based on predicted changes in precursor emissions basin wide. It should be noted that it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. The computer models are not designed to determine whether the emissions generated by an individual development project, or even emissions from most relatively small-scale areas such as specific plan areas or community plan areas, will affect the date that the air basin attains the ambient air quality standards."*[33]

It is noted that in evaluating the AQMP itself, the Program EIR for the 2016 AQMP determined that construction activities associated with the AQMP were consistent with the AQMP despite identifying daily air pollutant emissions during construction activities that would exceed the SCAQMD mass daily thresholds for NOx. Implementation of the Proposed Plan would not substantially change the types of land uses that are allowed within the CPA and would not accommodate new large-scale facilities that could be the culprit of future air quality violations.

The second indicator of AQMP consistency is assessed by determining potential effects of permanent project operations on population, housing, and employment policy assumptions that were used in the development of the AQMP and the RTP/SCS. The AQMP emissions inventory is based in part on forecasted growth projections developed at the local jurisdiction level and aggregated by SCAG for the RTP/SCS. The City determines AQMP consistency at the project and local plan level through consistency with regional growth projections developed by SCAG; these growth projections are used in the AQMP to demonstrate

---

33 City of Los Angeles, *Air Quality and Health Effects – Sierra Club v. County of Fresno*, October 2019.

the attainment timeline for the NAAQS and CAAQS (and are also used to document consistency with applicable state and regional GHG emissions targets). These growth projections were developed based on local input and a regional policy aimed at reducing per capita VMT, the SCS. Therefore, the assessment of impacts under this threshold focuses on assumptions incorporated into the AQMP related to regional growth forecasts.

Estimated regional growth contributes to both area and mobile source emissions that are included in the AQMP. If implementation of the Proposed Plan would render the underlying AQMP assumptions invalid by introducing growth within the SCAQMD jurisdiction that exceeds projections incorporated into the AQMP, a significant air quality impact may occur as those emissions have not been accounted for in the attainment demonstration. As mentioned in the Regulatory Framework, the primary land use policy directives of the 2016–2040 RTP/SCS—which was used to formulate the basis of the 2016 AQMP—that are aimed at reducing air pollution focus on augmenting density in proximity to transit stations and encouraging mixed-use development and active transportation. The crux of the rationale behind concentrating new growth near transit hubs involves the shortening and displacement of passenger vehicle trips via increased transit ridership and accessibility of community destinations. Detailed evaluation of the Proposed Plan's consistency with the applicable RTP/SCS is provided in **Section 4.7, Greenhouse Gas Emissions; Section 4.10, Land Use and Planning; Section 4.12, Population and Housing;** and **Section 4.14, Transportation and Traffic**. As discussed in these sections, the Proposed Plan is consistent with goals and policies of the RTP/SCS and the 2016 AQMP.

While the RTP/SCS makes specific assumptions regarding population, housing and employment down to the TAZ level, these assumptions represent only one way to interpret RTP/SCS polices. In the development of regional growth projections, SCAG adopts population, housing, and employment forecasts at the jurisdictional level (i.e., at the City level), which allows each jurisdiction flexibility in interpreting RTP/SCS policies as deemed appropriate at the local level to optimally achieve the identified goals. Reasonably anticipated growth from the Proposed Plan would not exceed the SCAG population, housing, or employment projections for the City as a whole and would further RTP/SCS goals by concentrating growth in proximity to transit and existing employment centers thereby reducing per capita VMT in the future. As discussed in **Section 4.12, Population and Housing**, the Proposed Plan would not induce significant population and employment growth, but rather would serve to accommodate predicted growth in preferred locations near existing and planned transportation infrastructure and existing employment, as encouraged in the RTP/SCS. Because the Proposed Plan would not increase reasonably anticipated development in the Boyle Heights CPA in a way that would be inconsistent with citywide growth forecasts, it would be consistent with the assumptions in the 2016 AQMP.

As discussed in **Section 4.7, Greenhouse Gas Emissions,** and **Section 4.10, Land Use and Planning**, the Proposed Plan would be consistent with the applicable goals of the RTP/SCS. Specifically, the Proposed Plan would incentivize new development opportunities around existing and planned transit systems; would direct growth to transit hubs and job centers; would encourage mixed-use development; and would encourage a variety of mobility options, such as making streets more walkable to promote pedestrian-friendly corridors. These growth strategies are consistent with the RTP/SCS and the 2016 AQMP. It is also noted that these strategies would also be consistent the Air Quality Element and the Framework Element of the City of Los Angeles General Plan.

In addition, the Proposed Plan would not conflict with 2016 AQMP assumptions regarding development projects including strategies to reduce emissions generated during construction and operation in accordance with SCAQMD and local jurisdiction regulations that are designed to address air quality impacts and required pollution control measures.

Therefore, impacts related to conflicting with—or obstructing implementation of—the applicable air quality plans would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.2-2 **Would the Proposed Plan result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?**

This impact would be significant and unavoidable for regional NO_x emissions during construction activities and regional VOC emissions during future operations.

The SCAQMD *CEQA Air Quality Handbook* advises that for both construction and operational activities, if a project exceeds the identified project-level significance thresholds, its emissions would be cumulatively considerable, resulting in potentially significant adverse air quality impacts to the region's existing air quality conditions. In Appendix D to its *White Paper on Control Strategies to Address Cumulative Impacts from Air Pollution*, the SCAQMD asserts that project-specific and cumulative significance thresholds are the same based on this reasoning, and projects that do not exceed project-specific thresholds are generally not

considered to be cumulatively significant. The following analyses were developed using the framing of cumulatively considerable impacts established by the SCAQMD in promulgating its thresholds.

Construction – Regional Emissions

Construction activity associated with reasonably anticipated development from the Proposed Plan has the potential to create air quality impacts through emissions produced by the use of heavy-duty construction equipment and by vehicle trips generated by construction worker commuting, construction vendor material deliveries, and haul truck trips to and from individual development sites within the CPA. Fugitive dust (PM10 and PM2.5) emissions would primarily result from demolition and site preparation (e.g., grading) activities. NO_x emissions, a precursor emission to ozone for which the SCAB is also designated nonattainment, would primarily result from the use of construction equipment. During the finishing phase, paving operations and the application of architectural coatings (e.g., paints) and other building materials would release VOCs, the other precursor emission to O_3. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation and, for dust, the prevailing weather conditions.

SCAQMD's Rule 403, Fugitive Dust, is a control requirement for preventing, mitigating and controlling the release of airborne particulate matter emissions from earth moving activities. It is mandatory for all construction projects in the SCAB to comply with Rule 403 or face violations that would incur fines. Specific Rule 403 control requirements include, but are not limited to, applying water in sufficient quantities to prevent the generation of visible dust plumes, applying soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the project site, and maintaining effective cover over exposed areas. Compliance with Rule 403 would reduce PM2.5 and PM10 emissions associated with construction activities by approximately 61 percent.[34] New construction would also be subject to VOC emission limits for architectural coatings, adhesives and sealants in the LA Green Building Code. In addition, SCAQMD Rules 1113 and 1168 establish VOC limits to control emissions from the application of architectural coatings, adhesives, and sealants.

As described in the Methodology, the construction equipment and vehicle activity scenarios were analyzed in the Proposed Plan using a baseline year of 2016 and the horizon year of 2040. **Table 4.2-8** shows the estimated average daily construction emissions associated with the four sample construction activity scenarios in 2016, and **Table 4.2-9** presents the same activity emissions from sources in 2040 as generated using the regulatory emissions models. These scenarios are representative of reasonable construction

34 SCAQMD, *Overview – Fugitive Dust Mitigation Measure Tables*, 2007.

activity intensities for individual future development projects in the CPA, although it would be less common for equipment inventories of eight to 10 pieces operating continuously throughout the day. Results of the emissions modeling demonstrate that daily emissions of NO_x from heavy-duty diesel equipment and trucks during construction activities could exceed the SCAQMD regional thresholds under reasonably anticipated circumstances for individual large projects in 2016 although a similar individual large project in 2040 (**Table 4.2-9**) would not exceed the thresholds. Emission controls ramp up considerably prior to 2030, but the year that emissions of such an illustrative individual large project would be less than the thresholds has not been determined. In addition, it is anticipated that development under the Proposed Plan could result in several projects (small, medium, and the occasional large project) being constructed within the CPA at any given time.

The City of Los Angeles Department of Building and Safety has established VOC content limits for architectural coatings, adhesives, and sealants as part of the 2017 Los Angeles Green Building Code (including a flat coating limit of 50 grams VOC per Liter and a non-flat coating limit of 100 grams VOC per Liter). Compliance with the Los Angeles Green Building Code is mandatory for new development projects within the City of Los Angeles. Implementation of the VOC content limits for architectural coatings under the 2017 Los Angeles Green Building Code would substantially reduce the likelihood that off-gassing emissions from painting, finishing, and paving activities would exceed SCAQMD air quality significance threshold for VOC. The SCAQMD has also published Rules 1113 and 1168 that limit VOC content in architectural coating applications, from which the City derived its Green Building Code limits. The use of architectural coatings with low VOC content would also eliminate the potential for daily VOC emissions to exceed the applicable SCAQMD threshold.

As noted above, existing construction emissions are occurring in the CPA; it is unknown the number and location of individual construction projects that could occur under the Proposed Plan. Therefore, it is not possible to determine the change in construction emissions in the CPA. Therefore, in the interests of presenting a conservative analysis impacts from reasonably anticipated construction from the Proposed Plan (i.e., construction of individual projects in the CPA) could result in a ***potentially significant*** impact related to regional emissions of NO_x.

Table 4.2-8
Estimated Maximum Daily Construction Emissions – 2016

Example Scenarios - Daily Activity[1]	Pounds per Day					
	VOC	NOx	CO	SOx	PM10	PM2.5
2 Pc. Heavy-Duty Equipment, 25 Truckloads	2.1	28.9	11.2	<0.1	4.4	2.0
4 Pc. Heavy-Duty Equipment, 50 Truckloads	4.1	57.8	22.3	0.1	8.9	4.1
8 Pc. Heavy-Duty Equipment, 100 Truckloads	8.2	**115.6**	44.6	0.2	17.7	8.2

Exceed Threshold?	**No**	**Yes**	**No**	**No**	**No**	**No**

Source: TAHA, 2021.
[1] Equipment exhaust was estimated conservatively assuming eight hour per day of operation. Truck emissions were estimated assuming a round trip length of 40 miles.

Table 4.2-9 presents the emissions that would be generated by the same construction activity sources in the 2040 analytical year. The regulatory models account for mandatory improvements in engine technologies, control measures, and fuel efficiencies that are adopted at the state level, as well as the phase-out of older equipment and vehicles over time. Therefore, the aggregate fleet average emission factors in 2040 are considerably lower than in 2016, exhibiting a NOx reduction of approximately 75 percent. As shown in **Table 4.2-9**, construction of even individual large projects within the CPA in 2040 would not generate criteria pollutant or ozone precursor emissions in excess of any applicable SCAQMD regional threshold. Therefore, the magnitude of construction-related emissions under the Proposed Plan would gradually decrease throughout the Proposed Plan horizon.

Table 4.2-9
Estimated Maximum Daily Construction Emissions – 2040

Example Scenarios - Daily Activity[1]	Pounds per Day					
	VOC	NOx	CO	SOx	PM10	PM2.5
2 Pc. Heavy-Duty Equipment, 25 Truckloads	0.6	7.6	8.0	<0.1	3.1	0.6

[1] Equipment exhaust was estimated conservatively assuming eight hour per day of operation. Truck emissions were estimated assuming a round trip length of 40 miles.

Operations

Reasonably anticipated future development from the Proposed Plan would generate long-term regional air pollutant emissions, which would result from mobile sources (motor vehicle exhaust) and area sources, such as consumer products and natural gas combustion. Emissions from motor vehicle exhaust were estimated using VMT data for existing (2016) conditions, the future without project conditions (i.e., 2040 without the Proposed Plan), and future with project conditions (i.e., 2040 with the Proposed Plan). **Table 4.2-10** shows the estimated regional daily VMT associated with all vehicle trips having origins or destinations in the CPA for the aforementioned conditions that were used in the mobile source emissions analysis.

While total daily VMT would increase from existing conditions to 2040 with Proposed Plan conditions, per capita VMT for the service population (residents and employees) would decrease by approximately 18 percent from 26.3 to 21.6 (see **Section 4.14, Transportation**). The increase in total VMT can be attributed to ambient regional growth, as well as the increases in households and employment in the CPA resulting from implementation of the Proposed Plan, which are described in **Section 4.12, Population, Housing, and Employment**. The daily VMT estimates were utilized in conjunction with stationary source utility demand to assess regional operational air pollutant emissions generated under the Proposed Plan.

Table 4.2-10
Daily VMT for the Boyle Heights Community Plan Area

Scenario	Community Plan Area Trips Daily VMT
Existing Conditions (2016)	2,968,948
2040 Without Proposed Plan	3,301,969
2040 With Proposed Plan	3,334,101

Source: Camsys, 2020.
Note: The 2040 Without Proposed Plan scenario is included for informational purposes and not for impact analysis or conclusions.

Additional sources of air pollutant emissions associated with land use development include natural gas consumption and landscaping, as well as VOC emissions from consumer products (i.e., cleaning supplies and solvents). Area source emissions in the CPA are attributed to the use of consumer products and landscaping equipment, and energy source emissions are attributed to natural gas combustion in both residential and non-residential land uses. Regional survey data was utilized to estimate operational emissions from stationary sources in the CPA under existing, 2040 without Proposed Plan, and 2040 with Proposed Plan conditions based on reasonably anticipated land use developments. The 2040 without

Proposed Plan condition was included for informational purposes and was not relied on for the air quality impact analysis or conclusions.

Table 4.2-11 presents estimates of the existing and reasonably anticipated number of residential units and existing and reasonably anticipated square footage of non-residential development within the CPA. Estimates of daily regional operational emissions were calculated using the values presented in **Table 4.2-11** and emissions factors obtained from survey data contained in CalEEMod and the Los Angeles Department of Water and Power Urban Water Management Plan.[35,36]

Table 4.2-11
Community Plan Area Land Use Summary

Land Use Statistics	2016 Existing Conditions	2040 No Project	2040 Proposed Plan
Total Residential Dwelling Units	22,766	28,162	33,117
Commercial Land Use Square Footage	7,370,546	13,498,883	19,844,665
Industrial Land Use Square Footage	14,814,079	51,306,720	47,682,097
Public Facilities Land Use Square Footage	297,596	10,488,145	10,791,956

Source: City of Los Angeles, Department of City Planning, 2021.
Note: The 2040 No Project scenario is included for informational purposes, and not used in the impact analysis or determination of significance

Estimates of daily VMT from CPA land uses and reasonably anticipated development within the CPA presented in **Table 4.2-10** and **Table 4.2-11** were used to generate estimates of daily regional emissions for existing, 2040 without Proposed Plan and 2040 with Proposed Plan conditions. The operational emissions assessment focuses on regional emissions since the Proposed Plan would not result in the development of industrial uses that could introduce substantial permitted stationary sources to the CPA that would have the potential to exceed localized significance thresholds in proximity to sensitive receptors.

Table 4.2-12 presents estimated regional daily emissions under each scenario. Relative to existing conditions, daily emissions of NO_x, CO, and SO_x would be lower under the Proposed Plan condition in 2040. Daily PM10 and PM2.5 emissions would be higher than those estimated under existing conditions predominantly due to brake wear, tire wear, and road dust emissions that increase with additional VMT; however, the incremental increase in daily emissions would remain below the SCAQMD regional air

35 California Air Pollution Control Officers Association, *California Emissions Estimator Model (Version 2016.3.2) User's Guide*, 2017.

36 Los Angeles Department of Water and Power, *Urban Water Management Plan*, 2015.

quality significance thresholds for PM10 and PM2.5. The difference in daily CPA VOC emissions between existing conditions and the Proposed Plan in 2040 would exceed the applicable SCAQMD mass daily threshold. The increase in VOC emissions from area sources is predominately attributed to the use of consumer products (such as deodorants, hair sprays, cleaning products, spray paint, solvents, and insecticides) that are estimated uniformly based on the square footage of residential and nonresidential development using an emission factor from CalEEMod that is specific to the SCAQMD jurisdiction (1.98 x 10^{-5} lb. VOC per square foot per day).[37] This factor value represents a regional average emission factor that was derived from CARB consumer product Emission Inventory, and does not reflect future VOC content reductions that will occur.

Table 4.2-12

37 California Air Pollution Control Officers Association, *California Emissions Estimator Model (Version 2020.4.0) User's Guide*, 2021.

The VOC content of consumer products is regulated by CARB at the state level. CARB reviews product databases and identifies opportunities to achieve maximum feasible VOC reductions from consumer products that are technologically and commercially viable. CARB acknowledges that improvements in consumer products control strategies are essential to eventually meeting the federal air quality standards statewide. CARB is committed to reducing VOC emissions in the SCAQMD jurisdiction by between one to two tons per day by 2023 and by between four to five tons per day by 2031 through the SIP and has proposed new VOC content regulations for manual aerosol air fresheners, crawling bug insecticides, hair care products, and personal fragrance products.[38] As an example, to achieve the South Coast Air Basin VOC reductions that were committed to in the AQMP, by 2031 CARB is proposing to reduce VOC content limits on manual aerosol air fresheners from an existing VOC content standard of 20–30 percent down to five percent (approximately 80 percent reduction), a limit on personal fragrance products from an existing VOC content standard of 75 percent down to 50 percent (approximately one-third reduction), and limits on aerosol crawling bug insecticide from an existing VOC content standard of 15 percent down to six percent (approximately 60 percent reduction).[39] However, emissions modeling conservatively employed the CalEEMod consumer products emission factor, and VOC emissions from area sources would be ***potentially significant***.

With respect to mobile sources, as shown in **Table 4.2-12**, future daily regional emissions under implementation of the Proposed Plan are generally expected to decrease relative to existing emissions, with the exception of particulate matter emissions attributed to brake and tire wear and road dust. This is largely a result of improvements in vehicular engine efficiency technologies and fuel pollutant concentrations that are projected to occur between existing conditions and 2040 resulting from more stringent statewide regulations. Future emissions are calculated based on implementation of known and approved regulations that are accounted for the in CARB EMFAC application.

While emissions from mobile sources are generally expected to decrease over time as a result of statewide emissions reductions measures, the anticipated ambient growth in residential housing and non-residential reasonably anticipated development under the Proposed Plan would result in increased use of consumer products and natural gas. When compared to existing conditions, future development in the CPA, as detailed in **Table 4.2-12**, could result in daily emissions of VOC from these sources that would exceed the SCAQMD regional significance threshold. Reasonably anticipated development in the CPA would increase the use of consumer products, which is the predominant contributor to operational VOC emissions. Available emission factors for consumer products VOC emissions used in the analysis represent SCAQMD regional

38 SCAQMD, *Final 2016 Air Quality Management Plan – Table 4-5*, March 2017.

39 CARB, *Public Webinar for Proposed Amendments to the Consumer Products Regulations*, November 2020.

averages derived from the 2008 CARB consumer product emission inventory, when the statewide inventory was approximately 239.6 lbs./day.[40] CARB continually applies increasingly stringent regulations on consumer products, and the emissions presented in this document represent highly conservative estimates of VOC emissions from area sources within reasonably anticipated development in the operational year of 2040. Additionally, area and energy-related increases in emissions of NO_x and CO would be offset by the decrease in mobile source emissions of NO_x and CO. Emissions of SO_x would generally remain the same as existing conditions for area and energy sources and would decrease substantially for mobile sources.

Nevertheless, for purposes of this analysis, impacts related to regional operational emissions associated with the Proposed Plan for operational VOC emissions are considered ***potentially significant***.

Mitigation Measures

Construction

Air Quality Standard (AQ1) – Operation of Construction Equipment

AQ-1 Dust Control Compliance with SCAQMD Rule 403

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard: Consistent with SCAQMD Rule 403, best available dust control measures shall be implemented during Ground Disturbance Activities and active construction operations capable of generating dust.

AQ-2 Equipment Maintenance

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard: Maintain construction equipment in good, properly tuned operating condition, as specified by the manufacturer, to minimize exhaust emissions. Documentation demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications shall be maintained per the proof of compliance requirements for a minimum of five years after the Certificate of Occupancy is issued.

40 CAPCOA, *California Emissions Estimator Model Appendix E Technical Source Documentation*, October 2017.

All construction equipment shall achieve emissions reductions that are no less than what could be achieved by a Tier 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

AQ-3 Vehicle Idling Limit and Notification Signs

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard: Vehicle idling during construction activities shall be limited to five minutes as set forth in the California Code of Regulations, Title 13, Section 2449. Signs shall be posted in areas where they will be seen by vehicle operators stating idling time limits.

AQ-4 Non-Diesel Fueled Electrical Power

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard: Electricity from power poles rather than temporary gasoline or diesel-powered generators shall be used To the Extent Available and Feasible.

AQ-5 Emissions Standards for Off-Road Construction Equipment Greater than 50 Horsepower

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.

b. b. Standard: All off-road diesel-powered construction equipment equal to or greater than 50 horsepower shall meet the U.S. Environmental Protection Agency's (U.S. EPA) Tier 4 emission standards during construction. Operators shall maintain records of all off-road equipment associated with Project construction to document that each piece of equipment used meets these emission standards per the proof of compliance requirement for a minimum of five years after the Certificate of Occupancy is issued.

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ-6 Use of Low Polluting Fuels

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.

b. Standard: Construction equipment less than 50 horsepower shall use low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, and unleaded gasoline).

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ-7 Emission Standards for On-Road Haul Trucks

a. Applicability Threshold: Any project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve more than 90 round-trip haul truck trips on any given day for demolition debris and import/export of soil.

b. Standard: Construction haul truck operators for demolition debris and import/export of soil shall use trucks that meet the California Air Resources Board's (CARB) 2010 engine emissions standards at 0.01 g/bhp-hr. of particulate matter (PM) and 0.20 g/bhp-hr. of nitrogen oxides (NOX) emissions. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards per the proof of compliance requirements in Subsection I.D.6.

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ-8 Routes for On-Road Haul Trucks

a. Applicability Threshold: Any pAroject whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard: Construction contractors shall reroute construction trucks away from congested streets or Sensitive Uses, as feasible. The burden of proving that compliance

is infeasible shall be upon the Applicant or Owner. Where avoiding Sensitive Uses and congested streets altogether is infeasible, routing away from Sensitive Uses shall be prioritized over routing away from congested streets.

Significance After Mitigation

Construction

As indicated above, individual construction projects with eight or more heavy duty pieces of equipment on-site and operating eight hours per day and over 100 daily truckloads of hauling could exceed SCAQMD regional significance thresholds and there may be several construction projects underway in the Boyle Heights CPA at any one time. As noted above, projects that would require this level of equipment use/truck trips would be expected to be larger than the threshold for site plan review and would require discretionary review. **Mitigation Measures AQ-1** through **AQ-8** would reduce regional and localized emissions generated by various construction activities, including equipment operation, truck trips, and painting. For construction impacts, the use of Tier 4 equipment would result in a 50 to 90 percent reduction in NO_x and particulate matter emissions from diesel-powered off-road construction equipment relative to Tier 3 engines, which are typically used as the industry standard. Requiring engines to meet Tier 4 emissions standards is becoming more common as the equipment is more widely available and would reduce emissions for some construction projects that would otherwise have significant impacts based on SCAQMD thresholds to a less than significant level. Los Angeles County Metropolitan Transportation Authority already requires the use of Tier 4 engines in all their construction projects. However, on-road heavy-duty haul trucks are not regulated under the same off-road emissions standards and the City cannot feasibly require all construction-related on-road trucks operating within City limits to adhere to more stringent engine emissions standards.

Furthermore, as shown in **Table 4.2-8**, by the horizon year of 2040 even the largest of individual construction projects within the CPA would be unlikely to generate daily emissions of criteria pollutants and O_3 precursors in excess of the SCAQMD regional mass daily thresholds due to improvements in engine technologies, control measures, and fuel efficiency. As noted above, multiple construction projects may be underway at any given time, and those emissions should be considered cumulatively as occurring under the Proposed Plan. However, the material effect of the Proposed Plan related to construction emissions would be attributed to the incremental change in total off-road equipment and on-road vehicle activity within the CPA on a daily basis relative to activities occurring under Existing Conditions. This incremental impact is not possible to determine in the absence of a comprehensive project inventory programmed through the Proposed Plan horizon year of 2040. Although the Proposed Plan would involve revisions to the existing zoning designations, it is not feasible to determine if its implementation would spur an increase

in daily construction equipment or heavy-duty vehicle use throughout the entire CPA. While some zoning changes would increase allowable land use density on particular parcels, implementation of the Proposed Plan would not necessarily accommodate larger project sites than under Existing Conditions, which might reduce logistical constraints on the number of equipment and vehicles that could access a given construction site on a daily basis, thereby increasing the average project's daily hours of activity. It is also impossible to verify whether Proposed Plan implementation would accelerate the rate of redevelopment within the CPA, which could affect the number of active construction sites that may be under development simultaneously.

Substantial reductions in average equipment and vehicle emissions are anticipated to result from enforcement of mandatory regulatory actions. Based on adopted regulations, daily emissions of NO_X from the modeled construction activities at individual sites would be reduced by approximately 75 percent between the existing conditions (2016) and the 2040 horizon year. Specific reduction in emissions below the SCAQMD significance thresholds cannot be demonstrated in the absence of individual project details to assess. It is reasonable to assume that construction activities for an individual large development project in the CPA or multiple medium and smaller projects could generate emissions that would exceed the SCAQMD regional significance threshold for NO_X despite emission reductions even with implementation of **Mitigation Measures AQ-1** through **AQ-8**. Therefore, the Proposed Plan is considered to result in a ***significant and unavoidable*** impact related to criteria pollutants for which the region is nonattainment under the NAAQS or CAAQS.

Operations

The VOC content of consumer products manufactured, distributed, sold, and used within the CPA is regulated at the state level, and there is no jurisdictional authority to enforce consumer products VOC content within the CPA. No feasible mitigation measures are available to reduce long-term VOC emissions associated with implementation of the Proposed Plan to below SCAQMD thresholds. As VOCs are ozone precursors and the SCAB is designated nonattainment of the 8-hour O_3 NAAQS and CAAQS, impacts related to cumulatively considerable emissions of nonattainment pollutants would remain potentially ***significant and unavoidable.***

Associated Health Effects (Sierra Club v. County of Fresno)

The Court in *Sierra Club v. County of Fresno* held that projects with significant air quality impacts need to "relate the expected adverse air quality impacts to likely health consequences or explain why it is not feasible at the time of drafting to provide such an analysis, so that the public may make informed decisions regarding the costs and benefits of the project." Based on the above analysis and conclusions, the Proposed

Plan could result in significant unavoidable impacts from construction emissions for regional emissions of NO_X and significant and unavoidable impacts from operational emissions of VOC predominately associated with consumer products use. As discussed below, while additional information is provided about health effects of these pollutants, **Appendix 4.2** explains why it is not feasible to provide analysis to relate these significant impacts to likely health consequences.

There is no established pathway to accurately quantify ozone-related health impacts caused by NO_X or VOC emissions from individual construction projects or localized area plans such as the Proposed Plan (see **Appendix 4.2**). SCAQMD indicates that it may be feasible to analyze air quality related health impacts for projects on a regional scale with very high emissions of NO_X and VOCs, where impacts are regional. The example SCAQMD provided in its amicus brief in the *Sierra Club* decision was for proposed Rule 1315, which authorized various newly-permitted sources to use offsets from the District's "internal bank" of emission reductions. The CEQA analysis accounted for essentially all of the increases in emissions due to new or modified sources in the SCAQMD between 2010 and 2030, or approximately 6,620 pounds per day of NO_X and 89,947 pounds per day of VOC, to expected health outcomes from O_3 and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to zone).

Accordingly, for the Proposed Plan, it is not feasible to directly correlate emissions of VOC and/or NO_X in the CPA with specific health impacts from O_3. Further, SCAQMD's amicus brief notes that O_3 formation is not linearly related to emissions. Therefore, O_3 impacts vary depending on the location of the emissions, the location of other precursor emissions, meteorology, and seasonal impacts, and because O_3 is formed later and downwind from the actual emission. Lead agencies that use SCAQMD's thresholds of significance may determine that a project would have a significant air quality impact and must apply all feasible mitigation measures; however, it would not be able to precisely correlate the project to quantifiable health impacts, unless the emissions are sufficiently high to use a regional modeling program, which is not the case for the Proposed Plan.

As detailed in **Appendix 4.2,** while a number of models and tools are available to quantify emissions, these models are limited by a number of factors in determining health impacts of individual development and infrastructure projects as well as local plan-level projects. The U.S. EPA currently performs health impact assessments (HIAs) using the Community Multiscale Air Quality (CMAQ) model for pollutant transport modeling and Environmental Benefits Mapping and Analysis Program - Community Edition (BENMAP-CE) for health impact calculations. However, these models are designed to estimate health impacts over a large-scale area (e.g., city-wide, state-wide). In addition, the CMAQ model requires inputs such as regional sources of pollutants and global meteorological data, which are not readily accessible. Other general limitations of the current suite of models include not being able to model concentrations or dispersion of

pollutants, the unsuitability of regional models in providing accurate results for local-level plans or individual projects, and limitations on being able to correlate concentrations to related health effects.

As noted in **Appendix 4.2**, "[f]or local plans or projects that exceed any identified SCAQMD air quality threshold, City EIR documents are able to identify and disclose generalized health effects of certain air pollutants but are currently limited and are unable to establish an accurate connection between any local plan or project and a particular health effect." At this time, it is infeasible for City EIRs to directly link a plan or project's significant air quality impacts with a specific health effect. A number of factors contribute to this uncertainty, including the regional scope of air quality monitoring and planning, technological limitations for accurate modeling at a local plan- or project-level, and the intrinsically complex nature between air pollutants and health effects in conjunction with local environmental variables.

Threshold 4.2-3 Would the Project expose sensitive receptors to substantial pollutant concentrations?

This impact would be less than significant with mitigation incorporated for construction; significant and unavoidable for operational TAC-related impacts associated with distribution centers and warehouses.

Regarding health risks from existing emissions sources, the California Supreme Court ruling in *California Building Industry Association vs. Bay Area Air Quality Management District* (December 17, 2015) held that, "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. But when a proposed project's risks exacerbate those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's impact on the environment – and not the environment's impact on the project – that compels an evaluation of how future residents or users could be affected by exacerbated conditions." Assessing health risks from existing land uses equates to assessing the environment's impact on the project. The California Supreme Court ruled that this analysis would not be consistent with CEQA.

Construction – Localized Emissions

The analysis of localized pollutant concentrations and possible exposures of nearby sensitive receptor that would result from construction activities under the Proposed Plan evaluated emissions of O_3 precursors and criteria pollutants in the context of the air quality standards, and also considered TAC emissions and associated receptor exposures and health risks.

Criteria Pollutants and Ozone Precursors. As discussed under Significance Thresholds, the SCAQMD developed area-specific LST screening values for mass daily emissions of NO_x, CO, PM10, and PM2.5 to assess the possibility of elevated criteria pollutant concentrations occurring at sensitive receptors during construction and operation of individual development projects. The LST values are specific to the SRA in which an individual project is located and are based on historical air quality conditions and proximity to the nearest sensitive receptor(s). The CPA is situated entirely within SRA 1 – Central Los Angeles County, and it is reasonable to assume that some individual projects in the CPA would involve construction activity adjacent to existing and future sensitive receptors (e.g., residences and schools). However, the SCAQMD established in the PEIR for the 2016 AQMP that the LST screening methodology is not applicable to regional projects such as local general plans, specific plans, or air quality plans under the rationale that the details of the individual projects to implement these types of plans and their locations are not known at the time of plan adoption.[41,42] A localized construction analysis would therefore be speculative for individual projects within the CPA given the lack of a comprehensive redevelopment schedule that would need to include programmatic construction locations and construction activities under the Proposed Plan. However, a qualitative evaluation of possible localized impacts was prepared for informational disclosure as a conservative approach.

Notwithstanding that potential pollutant emissions cannot be quantified at this stage of the planning process, the possibility exists that adjacent construction projects could collectively generate emissions of PM10 and/or PM2.5 in excess of the LST screening values presented in **Table 4.2-6** and create elevated particulate concentrations at nearby receptors remains. Pollutant concentrations are typically highest near sources of emissions (within a few hundred feet) and dissipate with distance. Thus, sensitive receptors in and adjacent to the CPA would be the most susceptible to emissions and concentrations of air pollutants resulting from construction activities that would occur with implementation of the Proposed Plan. Based on recent air quality data and SCAQMD research, particulate matter (PM10 and PM2.5) is the pollutant most likely to present possible public health concerns during construction within the CPA. Sources of particulate matter involved in construction activities would include exhaust from diesel-fueled equipment and trucks as well as fugitive dust generated by earth-moving and ground-disturbing activities. Fugitive dust emissions would be reduced through compliance with SCAQMD Rule 403 for activities requiring earthwork and material movement, such as demolition and grading, which would decrease the likelihood of PM10 and PM2.5 concentrations exceeding the CAAQS at sensitive receptor locations in and adjacent to the CPA. Compliance with and enforcement of regulatory measures to control emissions will reduce average emissions from off-road equipment and heavy-duty trucks over time as older units are phased out

42 SCAQMD, *Final Program Environmental Impact Report for the 2016 Air Quality Management Plan*, January 2017.

of the regional fleet inventory and newer equipment is introduced with engines meeting more stringent emissions standards.

The CARB maintains a statewide database of registered off-road equipment that has been tested and verified to comply with the tiers of emission control standards. The CARB 2020 in-use off-road equipment inventory analysis determined that off-road equipment with Tier 4 engines already represent the plurality of available units statewide,[43] with Tier 0–2 equipment promulgated to be phased out entirely by 2033 under the CARB 2020 Mobile Source Strategy.[44,45] Furthermore, beginning in January 2023, heavy-duty on-road trucks involved in Proposed Plan construction activities will be required to meet 2010 U.S. EPA emissions standards in accordance with the CARB Truck and Bus Regulation. The CARB EMFAC mobile source emissions inventory estimates that regional fleet average running exhaust emissions would decrease by over 60 percent for NO_x and would decrease by over 80 percent for particulate matter between 2016 and 2028 on a per-mile basis. Because off-road equipment and heavy-duty truck use during construction generate diesel exhaust—which constitutes approximately 70 percent of the total ambient cancer risk from air pollution in the greater Los Angeles region—nearby sensitive receptors could be affected by criteria pollutant and TAC emissions during construction of individual projects.[46] Although localized emissions of NO_x and particulate matter during construction would be controlled through regulatory compliance, impacts related to localized criteria pollutant (PM10 and $PM2.5_)$ emissions would be *potentially significant* before mitigation.

Toxic Air Contaminants. Some large individual projects may be subject to a requirement of preparing a Health Risk Assessment (HRA) to analyze potential carcinogenic risks and non-carcinogenic hazards resulting from concentrations of diesel PM at sensitive receptor locations generated by heavy-duty off-road construction equipment. OEHHA published a guidance manual in 2015 to assist the preparation of HRA for carcinogenic and non-carcinogenic exposures to air toxics in accordance with the Air Toxics "Hot Spots" Information and Assessment Act. The 2015 OEHHA HRA guidelines provide methodologies for assessing various types of environmental exposures to toxic contaminants, including inhalation exposures. The 2015 OEHHA HRA guidance relied upon a comprehensive review of the most up-to-date scientific literature to formulate the recommended exposure estimation methodologies. The OEHHA guidance acknowledges that children are especially susceptible to the effects of TAC exposure, and incorporated age sensitivity factors (ASFs) and age-specific daily breathing rates (DBRs) to account for the differences in sensitivity to

carcinogens during early life exposure. OEHHA recommends a default ASF of 10 for the age range between the third trimester of pregnancy through two years, and an ASF of three for ages two through 15 years.

As a conservative measure to characterize maximum potential exposures of sensitive receptors to carcinogenic risks, residential exposures are assumed to begin at birth and exposures of children at schools are anticipated to begin at the lowest educational grade level. The OEHHA guidance provides recommended DBR values that are specific to the age of the receptor and the type of activity in which the receptor would be engaged during exposure, which are evaluated on a case-by-case basis. SCAQMD has not adopted guidelines to implement the 2015 OEHHA HRA guidelines for construction and indicated it is currently considering how to implement the guidelines. The City has only found one Air District, the San Joaquin Valley Air Pollution Control District, which has adopted guidelines to implement the 2015 OEHHA HRA guidelines. The Bay Area Air Quality Management District is undergoing a process to implement the guidelines as well.

The specific locations of future construction activity in the CPA are not currently known. The construction health risk analysis is speculative given the lack of a construction location and construction activities. However, a review of several published EIRs for the largest development projects recently analyzed in the City, did not show any significant impacts resulting from construction related to TACs. For example, none of the following recently reviewed projects had significant impacts from construction related TACs:

- Olympia Project: 1.84 million new square feet, occupying a whole city block, and 284,000 cubic yards of soil export;[47]
- 2134 Violet Street Project: 569,448 square feet, involving a whole City block, with 239,000 cubic yards of soil export;[48]
- Crossroads Project: 1.4 million square feet in Hollywood Plan Area, 647,753 cubic yards of soil export;[49]
- Times Mirror Project: 1.5 million square feet on 3.6-acre city block, involving 37-story tower and a 53-story tower, and export of 364,000 cubic yards of soil;[50] and
- 5th and Hill Project: 260,689 square feet on 0.38-acre site, involving 53-story building, with 25,092 cubic yards of soil export.[51]

50 City of Los Angeles, *Times Mirror Square Project*, 2019.

51 City of Los Angeles, *5th and Hill Project*, 2018.

The only City EIR that was identified that found a potential impact related to TACs under a conservative worst-case scenario was the 6220 Yucca Project, which involved demolition of an existing structure and construction of 210 multi-family residential units, 136 hotel rooms and approximately 12,570 square feet of commercial/restaurant uses on a 1.16-acre site, with export 120,000 cubic yards of soil. The EIR found that impacts would be less than significant with mitigation.[52] The 6220 Yucca Project is the only recent development project identified with potentially significant impacts. The air quality analysis for this development project relied on a conservative measurement but found that application of standard mitigation reduced impacts to a less than significant level. The mitigation identified for the 6220 Yucca project is substantially similar to mitigation identified above, as it relates to using Tier 4 equipment. Therefore, the Proposed Plan could result in substantial pollutant concentrations at sensitive receptors during construction activities before mitigation. As a result, this impact is considered ***potentially significant***.

Operations

The primarily residential and commercial land uses reasonably anticipated from the Proposed Plan typically do not generate TAC emissions that would expose people to substantial pollutant concentrations. The use of toxic compounds would be strictly regulated through the SCAQMD permitting process, which requires detailed HRAs, when applicable. New sources of TAC emissions (i.e., gas stations) are subject to SCAQMD Rule 1401, New Source Review of Toxic Air Contaminants. This rule specifies limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic hazard index (HI) from new permit units, relocations, or modifications to existing permit units that emit TACs. Compliance with the SCAQMD permitting process and Regulation XIV would ensure that new land uses would not generate TAC emissions exceeding the SCAQMD standards or adversely affect sensitive land uses.

An important element to consider regarding potential future exposures of residents within the Boyle Heights CPA to air pollution from nearby freeway traffic is that regional air quality is improving over time, and mandated advancements in fuel efficiency and alternative fueled vehicles will reduce aggregate fleet average pollutant emissions from mobile sources in the future. The trend of decreasing pollutant concentrations in the Los Angeles area has been documented for some time, especially as evidenced in the SCAQMD Multiple Air MATES reports. Using the regional toxic air contaminants emissions inventory and monitored concentrations at 10 locations throughout its jurisdiction, the SCAQMD determined that the population-weighted average carcinogenic risk within the South Coast Air Basin decreased by approximately 57 percent (from 853 per million to 367 per million) between the 2002–2004 monitoring

52 City of Los Angeles, *6220 Yucca Project*, 2020.

period (MATES III) and the 2012–2013 monitoring period (MATES IV).[53] As the regional vehicle fleet turns over and older vehicles are replaced with newer ones, improvements to fuel efficiency and engine technologies will continue to result in decreases in ambient carcinogenic risk throughout the South Coast Air Basin and the City of Los Angeles.

Regarding exposures of sensitive receptors to pollutant concentrations near heavily-trafficked roadways, the Air Quality analyses within the SCAG Program Environmental Impact Reports (PEIRs) for the 2016–2040 RTP/SCS and the 2020–2045 RTP/SCS addressed the forecasted regional reduction in carcinogenic risk at residential receptors near heavily-trafficked freeway segments in the SCAG region.[54,55] The 2016–2040 RTP/SCS has the same horizon year as the analysis prepared for the Proposed Plan and examined how concentrations and consequent exposures to mobile-source TACs would be projected to decrease in the future as vehicles with enhanced emission control and fuel efficiency technologies replace older vehicles in the regional fleet. The fleet turnover produces an effect of aggregate average per-vehicle emission rates being lower in future years compared to existing conditions, and air quality trends in the CPA reflect this cause-and-effect. For example, the 2016–2040 RTP/SCS PEIR estimated that the 30-year residential carcinogenic risk from mobile source emissions along selected freeway segments would decrease by an average of 92 percent over the corresponding planning horizon.

The two freeway segments closest to the CPA that were analyzed in the 2016–2040 RTP/SCS PEIR were a 1.5-mile segment of State Route (SR) 60 in El Monte and Interstate 710 in Compton. The HRA concluded that the modeled ambient 30-year residential cancer risk near SR 60 in El Monte would decrease from approximately 763 per million in the base year of 2012 to approximately 44 per million in 2040 with implementation of the 2016–2040 RTP/SCS, representing a reduction of over 94 percent. The HRA also concluded that the modeled 30-year ambient cancer risk near the I-710 in Compton would decrease from approximately 807 million in 2012 to 55 per million in 2040, representing a 93 percent reduction in ambient risk. Based on this analysis and the SCAQMD MATES research, ambient carcinogenic risks near busy freeways in the vicinity of the CPA are anticipated to decrease by over 90 percent by the Proposed Plan horizon year of 2040, which would reduce the likelihood of adverse health effects in the surrounding communities.

Similarly, the Program EIR for the 2020 RTP/SCS (Connect SoCal PEIR, certified May 13, 2020) included a long-term forecast HRA for representative high-truck-volume freeway segments throughout the region—Interstate 110 (I-110), I-710 and I-60 were included for LA County—that assessed cancer risks for 30-year

53 SCAQMD, *MATES IV Final Report – Multiple Air Toxics Exposure Study in the South Coast Air Basin*, May 2015.

54 SCAG, *Draft Program Environmental Impact Report for the 2016–2040 RTP/SCS*, December 2015.

55 SCAG, *Draft Program Environmental Impact Report for the Connect SoCal 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy of the Southern California Association of Governments*, December 2019.

residential exposure adjacent to freeways comparing 2019 conditions to 2045 conditions.[56] The conclusions of the Connect SoCal PEIR with respect to health risk adjacent to freeways are relevant as updates to the forecasts in the near-freeway HRA in the 2016–2040 RTP/SCS PEIR. The maximum cancer risks for receptors adjacent to the three freeway segments in LA County were shown to be reduced by 51 percent to 73 percent (66 percent on average) in 2045 compared to existing 2019 conditions as a result of expected federal and state regulations pertaining to fuel efficiency and engine technologies. The Connect SoCal PEIR concluded that, "[d]ue to the significant reduction in DPM emissions and associated health risk, overall risk is reduced and therefore, impacts are considered less than significant" (at page 3.3-77 through 3.3-78). Reducing community exposures to pollution from high-volume roadways is a subject that has garnered substantial regulatory attention from CARB and the regional air quality districts, and considerable research has been conducted to evaluate methods to reduce exposures of sensitive receptors to mobile source pollution.[57]

One of the methods that CARB recommends to reduce indoor exposures to roadway source air pollution is the installation of high-efficiency filtration units in controlled air ventilation systems. To address this public health concern, the City adopted the Clean Up Green Up Ordinance (Ordinance Number 184,245) on April 13, 2016, which among other provisions, includes provisions related to ventilation system filter efficiency in mechanically ventilated buildings.[58] The Ordinance requires that all new mechanically ventilated buildings within 1,000 feet of a freeway have ventilation systems outfitted with filtration devices achieving at a Minimum Efficiency Reporting Value (MERV) of 13 (City Ordinance No. 184245 – Municipal Code § 99.04.504.6). CARB research indicates that ventilation systems with MERV 13 rated filters are capable of removing up to 90 percent of particulate matter less than 2.5 microns in diameter (PM2.5) relative to ambient outdoor concentrations.[59] This Ordinance requires that these filters be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual. Design of new residential units permitted within 1,000 feet of the local freeways would be required to comply with the ordinance, as well as other provisions of the Los Angeles Green Building Code related to air ventilation and outdoor air infiltration though the building envelope.

Another pollutant for which land development, and in particular increased traffic congestion, can potentially create impacts is CO. Elevated CO levels can occur at roadway intersections that experience

high traffic volumes and high levels of engine idling. Historically, mobile source-related CO concentrations at high-volume (e.g., congested) intersections have been linked to health concerns according to U.S. EPA and SCAQMD. According to the *2004 Revision to the California State Implementation Plan for Carbon Monoxide*, requirements for cleaner vehicles, equipment, and fuels have cut peak CO levels in half since 1980 despite growth (CARB 2004).[60] However, with cleaner technologies, automobile emissions of CO have steadily declined over the years and in 2001, the SCAB met both the federal and state 8-hour CO standards at all monitoring stations for the first time. CO attainment was also demonstrated in the 2003 AQMP and the region has remained in attainment of CO standards ever since.

Within the City of Los Angeles, the busiest intersection evaluated in 2003 was that at Wilshire Boulevard and Veteran Avenue (located outside the CPA), which had a daily traffic volume of approximately 100,000 vehicles per day. The 2003 1-hour concentration for this intersection was 4.6 ppm, which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day.[61] With implementation of the Proposed Plan, no intersection in the CPA would experience daily trip volumes exceeding 400,000 vehicles per day. Therefore, the Proposed Plan has no potential to generate localized CO concentrations at intersections that exceed state CO standards. Impacts related to CO standards would, therefore, be *less than significant*.

The CPA land use composition includes a substantial amount of industrial uses, and future development under the Proposed Plan would more than triple the accommodated industrial use within the CPA. The primarily residential, commercial, and light industrial land uses reasonably expected from the Proposed Plan typically do not generate TAC emissions that would expose people to substantial pollutant concentrations. However, new heavy industrial development within the CPA is allowed. Regarding potential warehouse or distribution center operations, new industrial sources of emissions are subject to SCAQMD Regulation XIII (New Source Review. Under this rule, hazardous facilities are legally subject to provisions that require public notice and modeling analysis to determine and, if necessary, mitigate the downwind impact prior to permit issuance. Permit issuance for these hazardous facilities under the Proposed Plan would be handled on a case-by-case basis, and the emissions modeling analysis would be project-specific. Each individual future industrial project would be responsible for demonstrating compliance with the air quality thresholds of significance devised by the SCAQMD that are designed to protect public health and prevent exposures to substantial pollutant concentrations. In addition, new discretionary development in the CPA would be required to comply with PRC Section 21151.8, which requires assessment of hazardous pollutants within 0.25 miles of a new elementary or secondary school.

60 CARB, *2004 Revision to the California State Implementation Plan for Carbon Monoxide*, 2004.

61 City of Los Angeles, *South Los Angeles and Southeast Los Angeles Community Plans Draft EIR*, 2016.

This legal requirement within the PRC protects staff and students at new schools from significant health risks from exposure to TACs.

The operation of distribution centers with large truck fleets could also generate TAC emissions from diesel-fueled sources that could impact sensitive receptors. Because there are existing historical residential uses (i.e., pre-1950) in some parts of the Boyle Heights CPA including areas designated as Production, Markets, and Hybrid Industrial that allow for industrial uses—new distribution facilities could potentially be located adjacent or near sensitive uses. Based on various health studies, air quality modeling, and monitoring studies, the CARB recommends avoiding the siting of new sensitive land uses (e.g., residences, schools, and medical facilities) within 1,000 feet of a distribution center that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units (TRUs) per day, or where TRU operations exceed 300 hours per week in order to preclude substantial health risks from diesel emissions. The CARB also recommends avoiding locating residences and other new sensitive land uses near distribution center entry and exit points. Based on these recommendations, the location of a new distribution center that accommodates more than 100 trucks or 40 TRUs per day and is located within 1,000 feet of an existing residence or other sensitive land use could result in significant health risks.

The actual level of risk would depend on a variety of factors that can only be determined once the specifics of a project (i.e., the type, location, and size of the facility, any permitted on-site sources, and the daily truck volumes) are known. In many cases, the preparation of a detailed HRA for a specific project may reveal that significant cancer risks would not occur or identify ways in which elevated cancer and other health risks can be avoided. Health risks, particularly for especially susceptible populations (i.e., children and the elderly), may include aggravated asthma, chronic bronchitis, increased hospitalizations from respiratory and cardiovascular complications, decreased lung function in children, lung cancer, and premature deaths for people with heart or lung disease (refer to **Appendix 4.2** for further discussion). However, absent project-level details, preparation of a meaningful HRA is not possible at the plan level and it cannot be determined with any certainty that health risks would remain below SCAQMD thresholds. Based on the above, Proposed Plan operations would result in a *potentially significant* impact related to sensitive receptor exposure to substantial pollutant concentrations for heavy industrial use operations involving high volumes of trucking activities.

Mitigation Measures

Construction

AQ-1 through **AQ-8**.

Operations

AQ-9 Distribution Facility Health Risk Assessment

a. Applicability Threshold: Applicants for distribution centers in the Boyle Heights Plan Area within 1,000 feet of sensitive uses that require discretionary permits and/or would accommodate more than 100 truck trips or 40 TRUs per day. shall

b. Standard: Prepare HRAs in accordance with SCAQMD and OEHHA guidance to identify the potential for cancer and non-cancer health risks. If cancer risks exceeding SCAQMD standards are identified, the Applicant shall identify opportunities to reduce emissions and associated risks. Methods may include, but are not limited to, limiting the number of trucks/TRUs accessing the site on a daily basis, locating distribution center entry and exist points as far as possible from sensitive land uses, and routing truck traffic away from sensitive land uses.

Significance After Mitigation

Construction

Application of Air Quality mitigation measures would reduce criteria pollutant and TAC emissions generated by construction activities, including equipment operation. For example, as discussed in the City of Los Angeles South and Southeast Los Angeles Community Plans DEIR and the 6220 Yucca Project DEIR, Tier 4 engines with horsepower ratings between 175 and 750 generate 90 percent less exhaust emissions, including diesel particulate matter, than Tier 2 or 3 engines. A thorough review of recent projects approved within the City did not identify any significant and unavoidable air quality impacts related to localized emissions of NO_x, PM10, or PM2.5. Impacts would be ***less than significant with mitigation***.

Operations

Application of **Mitigation Measure AQ-9** would reduce impacts associated with distribution centers and warehouses with high volumes of trucking activity to the degree feasible. Nevertheless, although the health risk impact associated with possible future distribution centers is speculative and the recommendations from the CARB upon which the determination of a potentially significant impact are by their nature "conservative," it cannot be determined that distribution centers or large warehouses with high trucking volumes in the Boyle Heights Plan Area would not result in health risks exceeding the SCAQMD thresholds. Therefore, TAC-related impacts associated with distribution centers and warehouses are conservatively identified as ***significant and unavoidable***.

Associated Health Effects. Regarding emissions and resulting concentrations of TACs that could occur during operation of distribution centers and warehouses with substantial trucking activities, the greatest potential for exposure to substantial TAC concentrations adjacent to distribution centers and warehouses operations with implementation of the Proposed Plan would be diesel particulate emissions associated with heavy duty truck traffic. Distribution centers and/or warehouses are facilities that serve as a distribution point for the transfer of goods. Depending on the size and type, a warehouse/distribution center may have hundreds of diesel trucks that deliver, load, and/or unload goods, often operating seven days a week. To the extent that these trucks are transporting perishable goods, they are commonly equipped with diesel-powered transport refrigeration units (TRUs). In addition, cargo handling equipment such as forklifts and yard tractors are used to move goods at warehouses, which are also often powered by diesel engines. These are the primary diesel particulate emissions sources involved in distribution center and warehouse operations.

In 1998, following an exhaustive 10-year scientific assessment process, the CARB identified particulate matter from diesel-fueled engines as a TAC. Diesel exhaust causes health effects from both short-term—or "acute"—exposures, and long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Acute exposure to diesel exhaust may cause irritation to eyes, nose, throat and lungs, and some neurological effects, such as lightheadedness. Acute exposure may also elicit a cough or nausea, as well as exacerbated asthma. Chronic exposure to diesel exhaust in experimental animal inhalation studies has shown a range of dose-dependent lung inflammation and cellular changes in the lung and immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.

Adverse health risks—particularly to children whose lungs are still developing and the elderly who may have other serious health conditions or comorbidities—associated with exposures to diesel particulates and other TAC emissions from warehouses and distribution centers may include: (i) aggravated asthma; (ii) chronic bronchitis; (iii) increased respiratory and cardiovascular hospitalizations; (iv) decreased lung function in children; (v) lung cancer; and (vi) premature deaths for people with heart or lung disease. The actual level of risk would depend on a variety of factors that can only be determined once the specifics of a project (i.e., the land use development type and scale, proximity to sensitive receptors, locations of permitted sources of TAC emissions, and projected volume of daily trucking activities) are determined. In many cases, the preparation of a detailed HRA for a specific project may reveal that significant cancer risks to sensitive receptors would not occur or may identify other ways in which elevated cancer risks and other health hazards can be avoided. However, absent project-level details, preparation of a meaningful HRA

that would provide informational value towards protecting public health is not feasible for all possible future warehouse and distribution center uses located within industrial zones of the CPA.

Although the Proposed Plan would accommodate considerable expansion of industrial land uses within the CPA, attempting to quantify the possibility of diesel particulate or other TAC emissions from future warehouses and distribution centers contributing to significant TAC exposures of sensitive receptors would not provide any informational value at this stage of the planning process and is not feasible to any degree of accuracy. New industrial sources of emissions are subject to the SCAQMD Rule XIII (New Source Review). Under this rule, hazardous facilities are legally subject to provisions that require public notice and modeling analyses to determine and, if necessary, mitigate the downwind impact prior to permit issuance. Permit issuance for these hazardous facilities under the Proposed Plan would be handled on a case-by-case basis, and the emission modeling analysis would be project-specific by accounting for identified stationary sources and forecasted diesel trucking activity. Each individual future project would be responsible for demonstrating compliance with the SCAQMD air quality significance thresholds, including those for carcinogenic risk and noncarcinogenic hazards. **Mitigation Measure AQ-9** would reduce exposures of sensitive receptors to TAC concentrations associated with distribution centers and warehouses to the maximal degree feasible.

Threshold 4.2-4 Would the Proposed Plan result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

This impact would be less than significant.

Construction

Potential sources that could emit odors during construction activities include equipment exhaust and paving and painting activities. Such odors are localized, generally confined to the immediate area surrounding a construction site and transitory in nature. In addition, odors associated with construction activities are not those typically associated with odor complaints. Construction activities in the CPA would utilize typical construction techniques, and the odors would be typical of most construction sites and temporary in duration. Construction activity would not cause a significant odor nuisance. Reasonably anticipated development for the Proposed Plan would not result in any other emissions during construction that could adversely affect a substantial number of people. Therefore, impacts related to construction odors under the Proposed Plan would be ***less than significant***.

Operations

According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. As shown in **Table 4.2-11**, the Boyle Heights CPA contains primarily commercial and residential uses. Although some industrial-related uses exist within the CPA, implementation of the Proposed Plan would be unlikely to accommodate any of the uses identified by the SCAQMD to generate nuisance odors. The Proposed Plan would not generally promote the development of land uses inconsistent with those already existing in the CPA.

On-site trash receptacles would have the potential to create adverse odors. Consistent with the Mayor's Clean Streets LA Program, trash receptacles would be located and maintained in a manner that promotes odor control and would not result in substantially adverse odor impacts. Restaurant uses that may generate odors would be similar to existing uses within the CPA and would be subject to the provisions of SCAQMD Rule 402 related to the prevention of public nuisance odors affecting a substantial number of people. Therefore, impacts related to operational odors under the Proposed Plan would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant impact.

4.2.7 CUMULATIVE IMPACTS

As discussed in **Section 4.2.2, Existing Environmental Setting**, the geographical formation of SCAB is that of a basin, with the surrounding mountains trapping the air and its pollutants in the valleys below. The SCAB includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties. Cumulative projects would include any reasonably anticipated development in the SCAB for regional air quality impacts, as well as reasonably anticipated development in and within 1,500 feet of the CPA for localized air quality impacts. Air pollutant emissions in the SCAB are primarily generated by stationary and mobile sources.

AQMP Consistency. As discussed in *Regulatory Framework*, the SCAQMD is responsible for developing programs to reduce emissions from stationary, mobile, and indirect sources to meet the NAAQS and CAAQS. The most recent of these programs is the 2016 AQMP. The 2016 AQMP represents a thorough

analysis of existing and potential regulatory control options, includes available, proven, and cost-effective strategies, and seeks to achieve multiple goals in partnership with other entities promoting reductions in GHG emissions and toxic risk, as well as efficiencies in energy use, transportation, and goods movement.

AQMP consistency is discussed under **Threshold 4.2-1.** As discussed therein, the Proposed Plan would not conflict with the 2016 AQMP, the 2016-2040 RTP/SCS, or the Connect SoCal 2020 – 2045 RTP/SCS. The AQMP was prepared to accommodate growth, to reduce the high levels of pollutants within areas under the SCAQMD jurisdiction, and to minimize the impact on the economy. Consistency with the AQMP is assessed by determining how a project accommodates increases in population or employment consistent with the applicable assumptions in the AQMP. The population and employment assumptions used by the SCAQMD to estimate regional emissions in the AQMP are obtained from SCAG projections for cities and unincorporated areas in the SCAQMD's jurisdiction. The Proposed Plan would not facilitate population or employment growth exceeding the SCAG population or employment forecasts for the City as a whole. Therefore, implementation of the Proposed Plan would not conflict with the AQMP. Impacts related to AQMP consistency would be less than significant and would not be cumulatively considerable.

Criteria Pollutant Emissions for which the Region is Non-Attainment. In order to assess cumulative impacts of emissions, the SCAQMD recommends that projects be evaluated to determine whether they would be consistent with AQMP performance standards and project-specific emissions thresholds. In the case of the Proposed Plan, air pollutant emissions would be considered to be cumulatively considerable if the new sources of emissions exceed SCAQMD project-specific emissions thresholds. The cumulative context for consideration of most air quality impacts is the SCAB. The context for localized significance thresholds is within 1,500 feet of the project site per SCAQMD LST guidance, as health risks generally decrease by about 90 percent at 1,500 feet from the emission source.[62]

As discussed under **Threshold 4.2-2** and **Threshold 4.2-3**, construction activities could result in significant impacts related to regional and localized emissions, respectively. Attempting to develop a comprehensive construction schedule for individual projects throughout the entire CPA would not provide any substantive informational value at the plan levels, and specific timing and equipment and vehicle activities from simultaneous construction projects both within and outside the CPA cannot be reasonably estimated. Therefore, reasonably anticipated construction from the Proposed Plan has the potential to be cumulatively considerable with construction in other areas of the City. Implementation of **Mitigation Measures AQ-1** through **AQ-8** would reduce regional and local emissions generated by various construction activities, including equipment operation, truck trips, and painting. However, it is likely that construction activities associated with individual development projects citywide would generate emissions that would exceed the

62 SCAQMD, *Final 2016 Air Quality Management Plan*, 2017.

significance thresholds despite incorporation of the Air Quality mitigation measures. The nature of a Plan analysis is cumulative in itself since it evaluates the potential for numerous individual projects to occur. SCAQMD indicates that projects that have significant impacts at a project level must also be determined to be significant at a cumulative level, this would result in a significant and unavoidable cumulative impact related to regional emissions of NO_X. Furthermore, operational emissions of VOC would potentially exceed SCAQMD thresholds and substantially contribute to cumulative long-term air quality impacts related to emission of O_3 precursors and attainment of the O_3 ambient air quality standards. Thus, the incremental effect of the Proposed Plan related to nonattainment pollutants would be significant and unavoidable and would be cumulatively considerable.

Sensitive Receptors and Substantial Pollutant Concentrations. As indicated under **Threshold 4.2-3**, the residential, commercial, and industrial land uses that are reasonably anticipated to occur from the Proposed Plan typically do not generate TAC emissions that would expose people to substantial pollutant concentrations. The use of toxic compounds would be strictly regulated through the SCAQMD permitting process—which requires detailed HRAs—when applicable. New potential sources of substantial TAC emissions (i.e., gasoline dispensing facilities) are subject to SCAQMD Rule 1401, New Source Review of Toxic Air Contaminants. Compliance with the SCAQMD permitting process and Regulation XIV would ensure that new land uses would not generate TAC emissions exceeding the SCAQMD standards or adversely affect sensitive land uses. In addition, as discussed above, the Proposed Plan together with cumulative development would not result in localized CO concentrations that exceed SCAQMD CO significance thresholds. However, operational impacts related to potential TAC exposures cannot be definitively determined to be less than significant, and therefore are conservatively identified as ***significant and unavoidable*** at both the project and cumulative levels**.**

Odor. The Proposed Plan is not anticipated to facilitate the development of uses typically associated with odor complaints. While construction activity can emit odors, construction activity has not been identified as a source of odor complaints. Accordingly, future development occurring under the Proposed Plan would not cause a construction-related odor nuisance. With regards to operational activities, on-site trash receptacles would have the potential to create adverse odors. Consistent with the Mayors Clean Streets LA Program, trash receptacles would be located and maintained in a manner that promotes odor control. Impacts from Proposed Plan related to odors would be ***less than significant*** and would not be cumulatively considerable.

4.3 BIOLOGICAL RESOURCES

4.3.1 INTRODUCTION

This section provides an overview of biological resources within the areas that could potentially be affected by the Proposed Plan and evaluates impacts associated with the Proposed Plan. Topics addressed in this section include habitats and sensitive species; Significant Ecological Areas (SEAs); wetlands, streams, and riparian habitat; wildlife movement; Habitat Conservation Plans (HCPs); and other applicable plans, policies, and ordinances related to biological resources.

4.3.2 EXISTING ENVIRONMENTAL SETTING

Regional Setting

Boyle Heights is located in a fully developed urban area east of downtown Los Angeles. Biologically, the general area is within the Southern California Coast ecoregion despite the 14-mile distance to the Pacific Ocean. The Boyle Heights Community Plan Area (CPA) lies in the California Floristic Province, within the Mediterranean biome characterized by a mild climate with dry summers and usually cool, damp winters. Native vegetation communities historically found in undeveloped areas of the California Floristic Province were dominated by chaparral, oak-sycamore riparian, oak woodland, walnut woodland, annual grasslands, or mixed scrub.

Local Setting

The CPA is highly urban -- both containing and surrounded by developed areas. Over 90 percent of the CPA land use is zoned for development. Land uses include residential, industrial, commercial, public facilities, open space, and commercial. The channelized Los Angeles River is not located within the boundaries of the CPA and is separated from the western boundary by multiple active rail lines.

With a population of approximately 86,000 people in six square miles, the density of Boyle Heights is about 13,000 people per square mile; Boyle Heights is one of the most densely populated communities in Los Angeles.[1] Consequently, there are few natural features and only approximately five percent of the CPA is zoned for parks that occur as isolated islands of green spaces supporting primarily lawns and ornamental (non-native) plant species.

1 Southern California Association of Governments (SCAG). 2016. 2016-2040 Regional Transportation Plan/ Sustainable Communities Strategy.

The main ecological feature located just west of the CPA is the Los Angeles River, even with its concrete channelization. Plans are underway to restore and revitalize the river.[2] The CPA also contains five passive parks (i.e., without developed sports facilities) identified below and two cemeteries, all which contain large, mature trees and irrigated lawn.

Significant Ecological Areas (SEAs)

The County of Los Angeles has designated Significant Ecological Areas (SEAs) that are ecologically important land and water systems that support valuable habitat for plants and animals, often including rare, threatened, or endangered species and/or special status communities. The City's General Plan Conservation Element recognizes SEAs identified by Los Angeles County as important for the preservation and maintenance of biodiversity as well as of special status species and communities. No SEAs occur within the Boyle Heights CPA. The closest designated SEA is the Puente Hills SEA, located approximately five miles east of the CPA.

Sensitive Natural Communities and Special Status Species

Sensitive Natural Communities are those that are listed to the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) due to the rarity of the community in the state or throughout its entire range (globally). A special status species is a plant or animal species listed as designated (rare, threatened, or endangered) and candidate species or as some other special status, by federal, state, or local agencies, or by one or more special interest groups, such as the California Native Plant Society (CNPS), the CDFW, and the CNDDB. CDFW and CNDDB were consulted to determine whether any sensitive species could occur in the Boyle Heights CPA**.**

The CNDDB is an online database maintained by CDFW to compile details on special status species' occurrences that scientists and knowledgeable citizens collect during field surveys. These data are not exhaustive of what may/did occur, older records do not always have accurate geographic references, and data available depend upon surveyors gathering and submitting the necessary information. The CNDDB is useful to examine historical occurrences of plants, animals, and plant communities of special concern that were documented in an area to assess natural habitats that were present before disturbance and that have potential for restoration.

One special status plant community, the California Walnut Woodland, is listed in the CNDDB as being historically identified to occur within the CPA vicinity. This community is identified by the dominance of

---

2 City of Los Angeles, *Los Angeles River Revitalization Master Plan*. 2007. Available online at: https://www.lariver.org/master-plan, accessed on May 17, 2022.

California black walnut (*Juglans californica*). It is no longer present in the CPA, according to the CNPS *Inventory of Rare and Endangered Plants* on-line database.[3]

Table 4.3-1 lists the federally- and state-designated special status species located within the Boyle Heights CPA. As summarized in **Table 4.3-1**, suitable habitats for many of the special status species historically (i.e., prior to urbanization) found in the CPA have changed dramatically over the years. Therefore, many of these species are not expected to occur today; indeed, many are believed by CDFW to be extirpated. This table demonstrates what species occurred under more natural conditions in the CPA. A total of nine special status animal species and nine special status plant species are listed in the CNDDB as being present or historically identified in the CPA.

Table 4.3-1
Special Status Species Within the Boyle Heights CPA

Scientific Name	Common Name	Habitat	Federal Status /a/	State Status /b/	CDFW /c/	CNPS /d/
Animals						
Vireo bellii pusillus	least Bell's vireo	Summer resident of limited areas of Southern California in low riparian areas; not recorded in vicinity since 1914.	Endangered	Endangered	--	--
Athene cunicularia	burrowing owl	Open, dry annual or perennial grasslands, deserts & scrublands with low-growing vegetation; last recorded in vicinity in 1921.	--	--	SSC	--
Empidonax traillii extimus	southwestern willow flycatcher	Healthy riparian woodlands in Southern California; last recorded in vicinity in 1906.	Endangered	Endangered	--	--
Riparia riparia	bank swallow	Requires vertical banks/cliffs with fine textured/sandy soils along rivers, lakes, ocean for colonial nests; last recorded in vicinity in 1894.	--	Threatened	--	--
Phrynosoma blainvillii	coast horned lizard	Relatively open grasslands, scrublands, and woodlands with fine, loose soil where ants occur; last recorded in vicinity in 1974.	--	--	SSC	--
Arizona elegans occidentalis	California glossy snake	Open sandy areas with scattered brush, but also found in rocky areas; last recorded in vicinity in 1889.	--	--	SSC	--

SSC = species of special concern.
/d/ CNPS = California Native Plant Society rare plant rank status applies to plants only.
1A = plants presumed extirpated in California and either rare or extinct elsewhere.
1B.1 = rare, threatened or endangered in California and elsewhere; seriously threatened in California.
1B.2 = rare, threatened or endangered in California and elsewhere; fairly threatened in California.
1B.3= rare, threatened or endangered in California and elsewhere; not very threatened in California.
2B.1 = rare, threatened or endangered in California but more common elsewhere; seriously threatened in California.
2B.2 = rare, threatened or endangered in California but more common elsewhere; moderately threatened in California.
3.1 = seriously threatened in California.
4.2 = plants of limited distribution; moderately threatened in California.
4.3 = plants of limited distribution; not very threatened in California.

Wildlife Habitats

Boyle Heights is mostly built out and contains few natural features and no significant areas of natural open space. The largest open space in the CPA is the 67-acre Evergreen Memorial Park & Crematory in the east, with the Odd Fellows Cemetery in the southeastern area the second largest at approximately 24 acres. The most significant civic open space is Hollenbeck Park. Hollenbeck Park has a lake with year-round water (Hollenbeck Lake). As shown on **Figure 4.3-1, Open Space and Recreation Areas within the Boyle Heights CPA**, other smaller civic parks include Lou Costello Jr Recreational Center, Evergreen Recreational Center, Ramon Garcia Recreational Center, Prospect Park, Pecan Recreation Center, and State Street Recreation Center.

As discussed above, the largest park within the CPA is Hollenbeck Park with about 21 acres of passive recreation area, including a 4.37-acre lake excavated in a ravine in 1892 during development of the park. This lake, which is called Hollenbeck Lake, offers important and unique aquatic habitat for wildlife in the CPA and habitat for a range of common species that rely on permanent water sources. Hollenbeck Lake supports various species of ducks, American coot (*Fulica americana*), egrets and herons, and non-native red-eared slider turtles (*Trachemys scripta elegans*). The CDFW stocks the pond with hatchery-raised rainbow trout (*Oncorhynchus sp.*) from winter through early spring and catfish during the summer months. In addition, bluegill (*Lepomis macrochirus*), largemouth bass (*Micropterus salmoides*), crappie (*Pomoxis sp.*), and

carp are known to live in the lake.[4] More information on Hollenbeck Lake is provided under Wetlands, Streams, and Riparian Habitat below.

These areas of open space are anticipated to be used by urban-adapted species, especially birds such as American crow (*Corvus brachyrhynchos*), northern mockingbird (*Mimus polyglottos*), white-crowned sparrow (*Zonotrichia leucophrys*), California towhee (*Melozone crissalis*), dark-eyed junco (*Junco hyemalis*), house finch (*Haemorhous mexicanus*), house sparrow (*Passer domesticus*), rock pigeon (*Columba livia*), and Anna's hummingbird (*Calypte anna*). Birds of prey, such as red-shouldered hawk (*Buteo lineatus*), red-tailed hawk (*Buteo jamaicensis*), and Cooper's hawk (*Accipiter cooperii*) and owls are likely to use these areas and may even nest. Additional birds would be probable during the spring and fall migration, when large trees are of particular importance to weary migrants. Small mammals such as raccoon (*Procyon lotor*), opossum (*Didelphis virginiana*), California [Beechy] ground squirrel (*Spermophilus beecheyi*), Botta's pocket gopher (*Thomomys bottae*), mice, and voles would be expected, along with Great Basin fence (*Sceloporus occidentalis longipes*) and western side-blotched (*Uta stansburiana elegans*) lizards.

The Los Angeles River channel, being a continuous corridor through the CPA, may provide a travel route for coyotes (*Canis latrans*), raccoons, and opossums, but due to the lack of vegetation present most mammals would not find protective cover in the concrete channel. Bats and swallows may forage for insects over the water and find cover or even breeding areas in human-made structures and ornamental trees nearby. The Los Angeles River is discussed in more detail below in Wetlands, Streams, and Riparian Habitat and in Wildlife Corridors.

Wetlands, Streams, and Riparian Habitat

A wetland is an area of land that is partially or fully submerged all year or for varying periods of time during the year. Riparian areas are those plant communities adjacent to and dependent upon surface or groundwater, usually adjacent to rivers, streams, lakes, ponds, or other drainages. Wetlands and riparian vegetation provide many valuable functions, such as water quality maintenance, flood control, bank stabilization, groundwater replenishment, and food, cover, and water sources for a diversity of wildlife, for both residents and migratory species.

Figure 4.3-2, Wetlands, Streams, and Riparian Areas within Boyle Heights CPA, shows Hollenbeck Lake, which is defined as a "permanently flooded freshwater pond" by the USFWS National Wetlands

4 Fishing Network, *Hollenbeck Park Lane*, 2020. Available online at: http://fishingnetwork.net/index.php?pageid=hollenbeck, accessed on May 17, 2022.

Inventory.[5] Even with the addition of the Interstate 5 freeway over the western portion of the lake and park, it functions as a wetland and water source for the urban-adapted resident wildlife and for those that stopover during migration.

The Los Angeles River adjacent to the western boundary of the CPA is defined as a "permanently flowing lower perennial river," human-excavated and channelized (concrete lined).

Wildlife Corridors

A wildlife corridor is a linear landscape element that serves as a linkage between historically connected habitats or landscapes that are otherwise separated. Such corridors play an important role in countering habitat fragmentation as a result of urbanization. Wildlife use corridors to travel; migrate; access food, cover, and water resources; and find mates. Corridors facilitate plant seed dispersal and propagation, genetic interchange for plants and animals essential for population health, species movements in response to environmental changes and natural disasters, and re-colonization to habitats from which populations have been locally extirpated. Corridors can consist of a sequence of discontinuous areas of habitat such as isolated wetlands and roadside vegetation that act as stepping-stones across the landscape. However, they usually consist of continuous linear strips of vegetation and habitat (e.g., riparian corridors, ridgelines, powerline right-of-ways), or may be parts of larger habitat areas selected for their known or likely importance to local wildlife.

Wildlife dispersal, movement, and migration opportunities in the CPA have been substantially altered due to habitat fragmentation through urbanization. Roads even when narrow may have a surface that smaller and less mobile wildlife species are reluctant to cross. When fragmentation results in species being unable to access necessary habitat types and resources, it affects wildlife foraging activity, reproductive patterns, immigration/emigration, and/or dispersal capabilities, and therefore, survivability.

The Los Angeles River channel provides a continuous corridor that sometimes contains water in a semi-arid, urban region, and may provide movement opportunities and habitat for wildlife. The river is not located within the boundaries of the Boyle Heights CPA, but it is adjacent to its western border. Despite being concrete lined, the Los Angeles River channel may be the only way for some species to cross under busy roads and highways to disperse, find mates, and seek essential resources.

IMPACT SCIENCES

Wetlands within the Boyle Heights CPA

Habitat Conservation Plan

Habitat Conservation Plans **(**HCPs), designated under the Endangered Species Act Section 10(a)(1)(B), are federal planning documents designed to conserve the ecosystems upon which listed species depend, ultimately contributing to their recovery. HCPs require a "take permit" when a project will affect a species identified as listed, non-listed, or eligible under the act and detail how those impacts will be minimized or mitigated and how the HCP is to be funded. There are no HCPs within the Boyle Heights CPA.

Heritage Trees

The City of Los Angeles has identified a collection of trees as heritage trees that are individual trees of any size or species specially designated as "heritage" because of their historical, commemorative, or horticultural significance. The nomination and determination of heritage trees is an internal process within City of Los Angeles Department of Recreation and Parks (RAP); nominations are generally made by RAP staff members or community members. The list of heritage trees remains open for new designations and provides information to RAP staff regarding the importance of their actions while planning activities near heritage trees. Heritage trees are not protected by any regulation unless they are one of the protected tree types covered by the Tree Preservation Ordinance. The list of heritage trees is maintained by RAP and can be viewed on NavigateLA.[6]

As heritage trees are located on City parks and recreational facilities, as well as public rights-of-way, RAP is responsible for the maintenance and protection of these trees from injury. According to NavigateLA, which provides an inventory of all heritage trees within City parks and recreation center properties, there are approximately 295 heritage trees located throughout the Boyle Heights CPA with the vast majority within Hollenbeck Park. Within the Boyle Heights CPA, heritage trees are primarily located within public parks, recreational facilities, parkways, and roadway medians.

Ordinance-Protected Trees and Shrubs

An "ordinance-protected tree" in the City of Los Angeles includes any of the following Southern California indigenous tree species or Southern California indigenous shrub species which measures four inches or more in cumulative diameter, 4 1/2 feet above the ground level at the base of the tree or shrub. These trees and shrubs are subject to the provisions that regulate relocation, removal, and replacement:

6 City of Los Angeles, Bureau of Engineering Department of Public Works, *NavigateLA*, 2016. http://navigatela.lacity.org/navigatela/, accessed on May 17, 2022.

Protected Trees

(a) Oak tree including Valley Oak (*Quercus lobata*) and California Live Oak (*Quercus agrifolía*), or any other tree of the oak genus indigenous to California but excluding the Scrub Oak (*Quercus dumos*a);

(b) Southern California Black Walnut (*Juglans californica var. californica*);

(c) Western Sycamore (*Platanus racemosa*); and

(d) California Bay (*Umbellularia californica*).

Protected Shrubs

(a) Mexican Elderberry (*Sambucus Mexicana*)

(b) Toyon (*Herteromeles arbutifolia*)

There are likely ordinance-protected trees and shrubs located in public and private areas of the Boyle Heights CPA. Ordinance-protected trees and shrubs on private property and street rights-of-way are protected by the City of Los Angeles Tree Preservation Ordinance, which makes it illegal to remove or fatally harm the trees or shrubs without the issuance of a permit.

4.3.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Biological Resources at the federal, state, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Endangered Species Act
- Migratory Bird Treaty Act
- California Endangered Species Act
- California Migratory Bird Protection Act
- California Native Plant Protection Act
- Porter-Cologne Water Quality Control Act
- California Fish and Wildlife Code - Fully Protected Species and Species of Special Concern

- Fish and Wildlife Code Sections 3503 & 3513
- City of Los Angeles Municipal Code – Protected Trees and Shrubs
- City of Los Angeles Framework Element
- City of Los Angeles Conservation Element
- Los Angeles River Revitalization Master Plan
- River Implementation Overlay
- City of Los Angeles Stormwater Pollution Control Measures for Development Planning and Construction Activities Ordinance
- City of Los Angeles General Plan Open Space Element
- Heritage Trees

Federal

National Environmental Protection Act. The National Environmental Policy Act (NEPA) was signed into law on January 1, 1970 and was one of the first laws written that established the broad national framework for protecting our environment. NEPA's basic policy is to assure that all branches of the federal government give proper consideration to the environment prior to undertaking any major federal action that significantly affects the environment. NEPA requirements are invoked when airports, buildings, military complexes, highways, parkland purchases, and other federal activities are proposed, including activities by state or local governments using federal monies. Environmental Assessments (EAs) and Environmental Impact Statements (EISs), which are assessments of the likelihood of impacts from alternative courses of action, are required from all Federal agencies and are the most visible NEPA requirements.[7]

NEPA requires federal agencies to assess the environmental effects of their proposed actions prior to making decisions. Regulations are codified annually in the *U.S. Code of Federal Regulations* (CFR). Title 40: Protection of Environment is the section of the CFR that deals with EPA's mission of protecting human health and the environment.[8] Title I of NEPA contains a Declaration of National Environmental Policy.

---

7 U.S. Environmental Protection Agency, *Summary of the National Environmental Policy Act*, 2021. Available online at: https://www.epa.gov/laws-regulations/summary-national-environmental-policy-act, accessed on May 17, 2022.

8 U.S. Environmental Protection Agency, *Laws and Regulations*, 2022. Available online at: https://www.epa.gov/laws-regulations/regulations, accessed on May 17, 2022.

This policy requires the federal government to use all practicable means to create and maintain conditions under which man and nature can exist in productive harmony.

Section 102 in Title I of the Act requires federal agencies to incorporate environmental considerations in their planning and decision-making through a systematic interdisciplinary approach. Specifically, all federal agencies are to prepare detailed statements assessing the environmental impact of and alternatives to major federal actions significantly affecting the environment. These statements are commonly referred to as Environmental Impact Statements (EIS) and Environmental Assessments (EA). The role of a federal agency in the NEPA process depends on the agency's expertise and relationship to the proposed action. The agency carrying out the federal action is responsible for complying with the requirements of NEPA. In some cases, there may be more than one federal agency involved in the proposed action. In this situation, a lead agency is designated to supervise the preparation of the environmental analysis. Federal agencies, together with state, tribal or local agencies, may act as joint lead agencies.[9]

Clean Water Act Section 404 and 401. Pursuant to Section 404 of the Clean Water Act, the Army Corps Of Engineers (ACOE) and the United States Environmental Protection Agency (EPA) regulate the discharge of dredged and/or fill material into "waters of the United States" Navigable waters means waters of the United States, including the territorial seas. Waters of the United States means: (1) Jurisdictional waters. For purposes of the Clean Water Act, 33 U.S.C. 1251 et seq. and its implementing regulations, subject to the exclusions in paragraph (2) of this section, the term ''waters of the United States'' means: (i) The territorial seas, and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide; (ii) Tributaries; (iii) Lakes and ponds, and impoundments of jurisdictional waters; and (iv) Adjacent wetlands.[10] The term "wetlands" (a subset of waters of the United States) is defined in 33 Code of Federal Regulations (CFR) 328.3(b) as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

Section 401 of the Clean Water Act requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a certification that the discharge will comply with applicable effluent limitations and water quality standards. The

9 U.S. Environmental Protection Agency, *What is the National Environmental Policy Act?*, 2021. Available online at: https://www.epa.gov/nepa/what-national-environmental-policy-act, accessed on May 17, 2022.

10 Federal Register, Volume 85, Number 77, 2020. Available online at: https://www.epa.gov/sites/production/files/2020-01/documents/navigable_waters_protection_rule_prepbulication.pdf, accessed on May 10, 2022.

certification must be obtained from the state in which the discharge originates or would originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the affected waters at the point where the discharge originates or would originate. A certification obtained for the construction of any facility must also pertain to the subsequent operation of the facility. Responsibility for the protection of water quality in California rests with the State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCBs). The agency with jurisdiction over projects in the City of Los Angeles is the Los Angeles Regional Water Quality Control Board.

U.S. Army Corps of Engineers. The U.S. Army Corps of Engineers (USACE) has primary federal responsibility for administering regulations that concern waters and wetlands in the project area. In this regard, USACE acts under two statutory authorities, the Rivers and Harbors Act (33 U.S.C., Sections 9 and 10), which governs specified activities in navigable waters, and the Clean Water Act (Section 404), which governs specified activities in waters of the United States, including wetlands and special aquatic sites. Wetlands and non-wetland waters (e.g., rivers, streams, and natural ponds) are a subset of waters of the United States and receive protection under Section 404 of the Clean Water Act. USACE has primary federal responsibility for administering regulations that concern waters and wetlands in the project area under statutory authority of the Clean Water Act (Section 404). In addition, the regulations and policies of various federal agencies mandate that the filling of wetlands be avoided to the maximum extent feasible. USACE requires obtaining a permit if a project proposes placing structures within navigable waters and/or alteration of waters of the United States.

Fish and Wildlife Coordination Act. The Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.) requires that federal agencies consult with the U.S. Fish and Wildlife Service, the National Marine Fisheries Service and State wildlife agencies for activities that affect, control or modify waters of any stream or bodies of water, in order to minimize the adverse impacts of such actions on fish and wildlife resources and habitat. This consultation is generally incorporated into the process of complying with Section 404 of the Clean Water Act, NEPA or other federal permit, license or review requirements.

Marine Mammal Protection Act. The Marine Mammal Protection Act of 1972, and as amended, establishes federal responsibility for the protection and conservation of marine mammal species by prohibiting the harassment, hunting, capture, or killing of any marine mammal. The primary authority for implementing the act belongs to the United States Fish and Wildlife Service and National Marine Fisheries Service.[11]

[11] U.S. Fish & Wildlife Service, *Marine Mammal Protection Act*, 16 U.S.C. 1361-1407. Available online at: https://www.fws.gov/international/laws-treaties-agreements/us-conservation-laws/marine-mammal-protection-act.html, accessed on May 10, 2022.

Federal Noxious Weed Act. Federal Noxious Weed Act - Public Law 93-629 (7 U.S.C. 2801 et seq.; 88 Stat. 2148), enacted January 3, 1975, established a Federal program to control the spread of noxious weeds. The Secretary of Agriculture was given the authority to designate plants as noxious weeds by regulation, and the movement of all such weeds in interstate or foreign commerce was prohibited except under permit. The Secretary was also given authority to inspect, seize and destroy products, and to quarantine areas if necessary to prevent the spread of such weeds. The Secretary was also authorized to cooperate with other Federal, State and local agencies, farmers associations and private individuals in measures to control, eradicate, or prevent or retard the spread of such weeds.[12]

Federal Endangered Species Act. The Federal Endangered Species Act (FESA) of 1973, as amended (16 U.S.C. 1531 et seq.), provides the regulatory framework for the protection of plant and animal species (and their associated critical habitats), which are formally listed, proposed for listing, or candidates for listing as endangered or threatened under the FESA. The FESA has four major components: (1) provisions for listing species; (2) requirements for consultation with the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service; (3) prohibitions against "taking" of listed species; and (4) provisions for permits that allow an incidental "take."[13] The FESA also discusses recovery plans and the designation of critical habitat for listed species. Both the USFWS and the National Marine Fisheries Service share the responsibility for administration of the FESA. During the CEQA review process, each agency is given the opportunity to comment on the potential of a project to affect listed plants and animals.

FESA (16 United States Code [U.S.C.] 1531 et seq.) is implemented by USFWS through a program that identifies and provides for protection of various species of fish, wildlife, and plants deemed to be in danger of or threatened with extinction. As part of this regulatory act, FESA provides for designation of critical habitat, defined in FESA Section 3(5)(A) as specific areas within the geographical range occupied by a species where physical or biological features "essential to the conservation of the species" are found and that "may require special management considerations or protection." Critical habitat may also include areas outside the current geographical area occupied by the species that are nonetheless "essential for the conservation of the species."

---

12 U.S. Fish & Wildlife Service, *Federal Noxious Weed Act*, P.L. 93-629. Available online at: https://fws.gov/law/federal-noxious-weed-act, accessed on May 17, 2022.

13 The California Endangered Species Act defined the term "take" as follows: "to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill, *Fish & Game Code, §86."* California Department of Fish & Wildlife, *Threatened and Endangered Species,* available online at: https://wildlife.ca.gov/Conservation/CESA, accessed on May 17, 2022. *Federal* Endangered Species Act defines a "take" as follows: "Harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." *16 U.S.C., §1532 (19).* U.S. Fish & Wildlife Service, *Endangered Species Act*, 16 U.S.C. 1531-1544. Available online at: https://www.fws.gov/law/endangered-species-act, accessed on May 17, 2022.

The FESA also discusses recovery plans and the designation of critical habitat for listed species. Both the USFWS and the National Marine Fisheries Service share the responsibility for administration of the FESA. During the CEQA review process, each agency is given the opportunity to comment on the potential of a project's impacts to listed plants and animals and to ensure adequate protection of listed species that may be affected by the project.

Migratory Bird Treaty Act. All migratory bird species that are native to the United States or its territories are protected under the federal Migratory Bird Treaty Act (MBTA). The federal Migratory Bird Treaty Act (MBTA) prohibits any person unless permitted by regulations, to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of this Convention…for the protection of migratory birds…or any part, nest, or egg of any such bird" (16 U.S. Code 703).

The list of migratory birds protected by the MBTA includes nearly all bird species native to the United States. The statute was extended in 1974 to include parts of birds, as well as eggs and nests. Thus, it is illegal under the MBTA to take (including killing, capturing, selling, trading, and transport) protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service.[14] Activities that result in removal or destruction of an active nest (a nest with eggs or young being attended by one or more adults) would violate the MBTA. While destruction of a nest by itself is not prohibited under the MBTA, nest destruction that results in the unpermitted take of migratory birds or their eggs, is illegal and fully prosecutable under the MBTA.

With respect to nesting birds, although the MBTA does not itself provide specific take avoidance measures, the United States Fish and Wildlife Service and California Department of Fish and Wildlife, over time, have developed a set of measures sufficient to demonstrate take avoidance, included during construction activities, which include conducting brush removal, tree trimming, building demolition and/or construction, or grading activities outside of the nesting season. California Department of Fish and Wildlife biologists have defined the nesting season is February 15 through August 31 (January 15 to August 31 for raptors). If other timing restrictions make it impossible to avoid the nesting season, prior to issuance of a grading, construction or building permit including demolition permit, the following measures are required as described below:

---

14 U.S. Fish & Wildlife Service, *Migratory Bird Treaty Act of 1918*. Available online at: https://www.fws.gov/birds/policies-and-regulations/laws-legislations/migratory-bird-treaty-act.php, accessed on May 17, 2022.

1. Vegetation removal activities shall be scheduled outside the nesting season (September 1 to February 14 for songbirds; September 1 to January 14 for raptors) to avoid potential impacts to nesting birds. This includes vegetation removal associated with on-going fuel modification activities.

2. Any construction activities or fuel modification activities that occur during the nesting season (February 15 to August 31 for songbirds; January 15 to August 31 for raptors) shall require that all suitable habitat be thoroughly surveyed for the presence or absence of nesting birds by a qualified biologist monitor (i.e., a professional biologist with a minimum of two years of avian survey experience or equivalent) before the commencement of clearing. If any active nests are detected, a buffer of at least 300 feet (500 feet for raptors), or as determined appropriate by the qualified biologist monitor, shall be delineated, flagged, and avoided until the nesting cycle is complete as determined by the qualified biologist monitor.

State

California Department of Fish and Wildlife.

Stream and Riparian Habitat.

Pursuant to California Fish and Game Code Section 1600, CDFW has authority over all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state, and requires any person, state or local governmental agency, or public utility to notify the CDFW before beginning any activity that would "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake" that supports fish or wildlife resources.

A stream is defined as a "body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation" (California Code of Regulations, Title 14 §1.72). A Lake or Streambed Alteration Agreement may be required for any Proposed Project that would result in an adverse impact to a river, stream, or lake. CDFW jurisdiction typically extends to the top of the bank and out to the outer edge of adjacent riparian vegetation if present. However, CDFW can take jurisdiction over a body of flowing water and the landform that conveys it, including water sources

and adjoining landscape elements that are byproducts of and affected by interactions with flowing water without regard to size, duration, or the timing of flow.[15]

Special-Status Wildlife Protection

Special Animal

Special-status wildlife species are those species included on the CDFW "Special Animals" list.[16] "Special Animal" is a general term that refers to all of the taxa the CNDDB is interested in tracking, regardless of their legal or protection status. The CDFW considers the taxa on this list to be those of greatest conservation need. The species on this list generally fall into one or more of the following categories:

- Officially listed or proposed for listing under the State and/or Federal Endangered Species Acts.
- State or Federal candidate for possible listing.
- Taxa that meet the criteria for listing, even if not currently included on any list, as described in
- Section 15380 of the California Environmental Quality Act Guidelines.
- Taxa considered by the Department to be a Species of Special Concern.
- Taxa that are biologically rare, very restricted in distribution, declining throughout their range, or have a critical vulnerable stage in their life cycle that warrants monitoring.
- Populations in California that may be on the periphery of a taxon's range but are threatened with extirpation in California.

CDFW Species of Special-Concern

A Species of Special Concern (SSC) is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- Is extirpated from the State or, in the case of birds, is extirpated in its primary season or breeding role;

---

15 California Department of Fish & Wildlife, *Water Rights*, 2022. Available online at: https://wildlife.ca.gov/Conservation/Watersheds/Water-Rights, accessed on May 18, 2022.

16 California Natural Diversity Database (CNDDB). . California Department of Fish and Wildlife. *Special Animals List* 2021. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406&inline, accessed 11/22/2021.

- Is listed as Federally-, but not State-, threatened or endangered; meets the State definition of threatened or endangered but has not formally been listed;

- Is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for State threatened or endangered status;

- Has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for State threatened or endangered status.

It is the goal and responsibility of CDFW to maintain viable populations of all native species. To this end, CDFW has designated certain vertebrate species as SSC because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. The goal of designating SSCs is to halt or reverse their decline by calling attention to their plight and addressing the issues of concern early enough to secure their long-term viability. Not all SSCs have declined equally; some species may be just starting to decline, while others may have already reached the point where they meet the criteria for listing as a threatened or endangered under state and/or federal endangered species acts.

Special-Status Plant Protection

Special Plant

"Special Plants" is a broad term used to refer to all the plant taxa inventoried by the CDFW's CNDDB, regardless of their legal or protection status. Special Plants include vascular plants as well as high priority bryophytes (mosses, liverworts, and hornworts) and lichens. Special Plant taxa are species, subspecies, or varieties that fall into one or more of the following categories. Not all plants within each category are necessarily tracked as Special Plants but these categories are often used as a starting point when determining which plants are tracked by the CNDDB:

- Officially listed by California or the Federal Government as Endangered, Threatened, or Rare;

- A candidate for state or federal listing as Endangered, Threatened, or Rare;

- Taxa listed in the California Native Plant Society's Inventory of Rare and Endangered Plants of California;

- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the *CEQA Guidelines*; these taxa may indicate "None" under listing status, but note that all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA;

- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- A Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service Sensitive Species/Species of Conservation Concern;
- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California; and
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g. wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.).

California Fish and Game Code Section 1600. Under sections 1600 et. seq. of California Fish and Game Code, CDFW regulates activities that would divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake that supports fish or wildlife and requires a Streambed Alteration Agreement for such activities. The CDFW issues a Streambed Alteration Agreement with any necessary mitigation to ensure protection of the State's fish and wildlife resources. The CDFW has jurisdiction over riparian habitats associated with watercourses.

California State Water Resources Control Board/Regional Water Quality Control Board. The California State Water Resources Control Board (SWRCB) and the RWQCB maintain regulatory responsibility for management of wetlands and waterbodies in California and may review wetland delineations in concert with the USACE under Section 401 of the Clean Water Act.

Together the SWRCB and Los Angeles RWQCB have jurisdiction over "waters of the State," (WOS) which are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The SWRCB or local RWQCB have not established regulations for field determinations of waters of the state except for wetlands currently. The RWQCB are affected by or shares USACE jurisdiction unless isolated conditions or ephemeral waters are present. Each local RWQCB may delineate their jurisdictions of waters of the state differently based on current interpretations of jurisdiction.

Procedures for defining RWQCB jurisdiction pursuant to the SWRCB's *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* went into effect May 28, 2020. The SWRCB defines an area as wetland if, under normal circumstances:

(i) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both;

(ii) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and

(iii) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

The SWRCB's Implementation Guidance for the Wetland Definition and Procedures for Discharges of Dredge and Fill Material to Waters of the State (2020), states that waters of the U.S. and waters of the State should be delineated using the standard USACE delineation procedures, taking into consideration that the methods shall be modified only to allow for the fact that a lack of vegetation does not preclude an area from meeting the definition of a wetland.

NatureServe Element Ranking for Plants. The CNDDB uses a ranking methodology maintained and periodically revised by NatureServe. It includes a Global rank (G rank), describing the rank for a given taxon over its entire distribution and a State rank (S rank), describing the rank for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the subspecies or variety. The next section of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank, as described below:

- G1 - Critically imperiled; at very high risk of extinction or elimination due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.
- G2 - Imperiled; at high risk of extinction or elimination due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- G3 - Vulnerable; at moderate risk of extinction or elimination due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- G4 - Apparently secure; at fairly low risk of extinction or elimination due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- G5 - Secure; at very low risk of extinction or elimination due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats
- S1 - Critically imperiled; at very high risk of extirpation in the jurisdiction due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2 - Imperiled; at high risk of extirpation in the jurisdiction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.

- S3 - Vulnerable; at moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- S4 - Apparently secure; at a fairly low risk of extirpation in the jurisdiction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- S5 - Secure; at very low or no risk of extirpation in the jurisdiction due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

California Rare Plant Ranks. The California Rare Plant Rank (CRPR) status applies to plants only. The CRPRs are a ranking system originally developed by the CNPS to better define and categorize rarity in California's flora. All plants tracked by the CNDDB are assigned to a CRPR category. These categories are:

- 1A Presumed extirpated in California and either rare or extinct elsewhere
- 1B Rare or Endangered in California and elsewhere
- 2A Presumed extirpated in California, but more common elsewhere
- 2B Rare or Endangered in California, but more common elsewhere
- 3 Plants for which we need more information – Review list
- 4 Plants of limited distribution – Watch list

In addition, the CRPR use a decimal-style threat rank. The threat rank is an extension added onto the CRPR and designates the level of threats by a 1 to 3 ranking with 1 being the most threatened and 3 being the least threatened. Most CRPRs read as 1B.1, 1B.2, 1B.3, etc. Note that some Rank 3 plants do not have a threat code extension due to difficulty in ascertaining threats for these species. Rank 1A and 2A plants also do not have threat code extensions since there are no known extant populations of the plants in California.

Natural Community Conservation Act. The Natural Community Conservation Act (NCCA) (CFGC Chapter 10, Division 3, Sections 2800 et seq.) was enacted in 1991. NCCA is administered by CDFW. The goal of this Act is to identify and secure habitat areas for protection of biodiversity. Habitat areas are identified by CDFW, and plans are prepared for habitat protection. When a development project is proposed, a determination is made concerning the potential impacts of the project on biodiversity and the best means of avoiding or mitigating them. NCCA allows local, state or federal agencies to enter into agreements with public and private entities to implement a "natural community conservation plan"

(NCCP), (e.g., habitat and species protection within a specified geographic area). Participation in an NCCP does not exempt a development project from CEQA. Mitigation measures pursuant to CEQA may, as an alternative, include participation in an NCCP in order to reduce the burden for on-site mitigation.

Sensitive Vegetation Communities. Sensitive vegetation communities are natural communities and habitats that are either unique, of relatively limited distribution in the region, or of particularly high wildlife value. These resources have been defined by federal, state, and local conservation plans, policies or regulations. The CDFW ranks such vegetation communities as "threatened" or "very threatened" and keeps records of their occurrences in the California Natural Diversity Database (CNDDB). Sensitive vegetation communities are also identified by the CDFW on its List of California Natural Communities Recognized by the CNDDB. Impacts to these vegetation communities and habitats identified in local or regional plans, policies, regulations, or by federal or state agencies must be considered and evaluated under CEQA.[17]

Habitat Conservation Plans. HCPs, designated under the Federal Endangered Species Act Section 10(a)(1)(B), are federal planning documents designed to conserve the ecosystems upon which listed species depend, ultimately contributing to their recovery. HCPs require a "take permit" when a project will affect a species identified as listed, non-listed or eligible under the act and detail how those impacts will be minimized or mitigated; and how the HCP is to be funded.[18] No HCPs are located in the Boyle Heights Community Plan Area.

California Endangered Species Act. Under the California Endangered Species Act, the California Department of Fish and Wildlife (CDFW) is responsible for maintaining a list of threatened and endangered species (California Department of Fish and Game Code Section 2070).[19] The CDFW also maintains a list of candidate species, which are species formally under review for addition to either the list of endangered species or the list of threatened species.

---

18 U.S. Fish and Wildlife Service, *Habitat Conservation Plans: Overview*. Available online at: http://www.fws.gov/endangered/what-we-do/hcp-overview.html, accessed May 13, 2022.

19 The commission shall establish a list of endangered species and a list of threatened species. The commission shall add or remove species from either list if it finds, upon the receipt of sufficient scientific information pursuant to this article, and based solely upon the best available scientific information, that the action is warranted. *(Amended by Stats. 2018, Ch. 329, Sec. 4. (SB 473) Effective January 1, 2019.)* State of California, *Senate Bill No. 473 – Chapter 329*, September 2018. Available online at: https://leginfo.legislature.ca.gov/faces/billPdf.xhtml?bill_id=201720180SB473&version=20170SB47391CHP, accessed on May 18, 2022.

The California Endangered Species Act prohibits the take of plant and animal species that the California Fish and Game Commission has designated as either threatened, rare, or endangered in California. "Take" in the context of this regulation means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill a listed species (California Fish and Game Code Sections 86 and 2080). The take prohibitions also apply to candidates for listing under the California Endangered Species Act. However, Section 2081 of the act allows the department to issue permits for the minor and incidental take of species by an individual or permitted activity listed under the act.

In accordance with the requirements of the California Endangered Species Act, an agency reviewing a project within its jurisdiction must determine if any state-listed endangered, rare, threatened or candidate species could be present in the project area. The agency also must determine if the project could have a potentially significant impact on such species. In addition, the CDFW encourages informal consultation on any project that could affect any state-listed endangered, rare, threatened or candidate species.

California Migratory Bird Protection Act. Assembly Bill 454 (AB 454), the California Migratory Bird Protection Act, which expires on January 20, 2025, makes it unlawful the taking or possession of any migratory nongame bird designated in the federal act before January 1, 2017, any additional migratory nongame bird that may be designated in the federal act after that date, or any part of those migratory nongame birds, except as provided by rules and regulations adopted by the United States Secretary of the Interior under the federal act before January 1, 2017, or subsequent rules or regulations adopted pursuant to the federal act, unless those rules or regulations are inconsistent with the Fish and Game Code.

AB 454, also reenacted, operative January 20, 2025, the existing provisions of law regarding the taking or possession of any migratory nongame bird as designated in the federal act, or any part of such migratory nongame bird, except as specified.

California Native Plant Protection Act. The California Native Plant Society (CNPS) maintains a list of special status plant species based on collected scientific information. Designation of these species by CNPS has no legal status or protection under federal or state endangered species legislation. CNPS designations are defined as List 1A (plants presumed extinct); List 1B (plants rare, threatened, or endangered in California and elsewhere); List 2 (plants rare, threatened, or endangered in California, but more numerous elsewhere); List 3 (plants about which more information is needed – a review list); and List 4 (plants of limited distribution - a watch list). In general, plants appearing on CNPS List 1A, 1B, or 2 meet the criteria of Section 15380 of the *CEQA Guidelines*; thus, substantial adverse effects to these species would be considered significant. Additionally, plants constituting CNPS List 1A, 1B, or 2 meet the definitions of California Department Fish and Game Code Section 1901 (Native Plant Protection Act) or Sections 2062 and 2067 (California Endangered Species Act).

Porter-Cologne Water Quality Control Act. Waters of the State are defined by the Porter-Cologne Water Quality Control Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The RWQCB protects all waters in its regulatory scope but has special responsibility for isolated wetlands and headwaters. These water bodies have high resource value, are vulnerable to filling, and may not be regulated by other programs, such as Section 404 of the Clean Water Act. Waters of the State are regulated by the RWQCB under the State Water Quality Certification Program, which regulates discharges of dredged and fill material under Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Projects that require a Corps permit, or fall under other federal jurisdiction, and have the potential to impact waters of the State are required to comply with the terms of the State Water Quality Certification Program. If a proposed project does not require a federal license or permit, but does involve activities that may result in a discharge of harmful substances to waters of the State, the RWQCB has the option to regulate such activities under its State authority in the form of Waste Discharge Requirements or Certification of Waste Discharge Requirements.

California Fish and Wildlife Code – Fully Protected Species and Species of Special Concern. The classification of "fully protected species" was the CDFW's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under CESA and/or FESA. The California Fish and Wildlife Code Sections (fish at Section 5515, amphibians and reptiles at Section 5050, birds at Section 3511(b), and mammals at Section 4700) dealing with "fully protected" species state that these species "may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected species," although take may be authorized for necessary scientific research. This language makes the "fully protected" designation the strongest and most restrictive regarding the "take" of these species. In 2003, the California Fish and Wildlife Code sections dealing with fully protected species were amended to allow the CDFW to authorize takings resulting from recovery activities for state-listed species.

Species of "special concern" are broadly defined as animals not listed under the FESA or CESA, but that are nonetheless of concern to the CDFW because they are declining at a rate that could result in listing or because they historically occurred in low numbers and known threats to their persistence currently exist.[20] This designation is intended to result in special consideration for these animals by the CDFW, land managers, consulting biologists, and others, and is intended to focus attention on the species to help avert the need for listing under FESA and CESA, and recovery efforts that might ultimately be required. This

20 California Department of Fish & Wildlife, *Species of Special Concern.* Available online at: https://wildlife.ca.gov/Conservation/SSC, accessed May 17, 2022.

designation is also intended to stimulate collection of additional information on the biology, distribution, and status of poorly known at-risk species, and focus research and management attention on them. Although these species generally have no special legal status, they may require consideration under CEQA during project review if they meet the definition of endangered, rare or threatened species in *CEQA Guidelines* Section 15380 which is not limited to listed species.

Fish and Wildlife Code Sections 3503 & 3513. According to Section 3503 of the California Fish and Game Code it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (except English sparrows (Passer domesticus) and European starlings (Sturnus vulgaris)). Section 3503.5 specifically protects birds in the orders Falconiformes and Strigiformes (birds-of-prey). Section 3513 essentially overlaps with the Migratory Bird Treaty Act (MBTA), prohibiting the take or possession of any migratory non-game bird. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered a "take" by the CDFW. The same procedures identified above to avoid a violation of the Federal Migratory Bird Treaty Act are recognized by the CDFW to avoid a take in violation of these provisions.

Local

Los Angeles City Fire Department (LAFD) Brush Clearance Requirements. According to Chapter 49 of the California Fire Code (Section 4906.3), which regulates hazardous vegetation and fuel management hazardous vegetation and fuels around all applicable buildings and structures shall be maintained in accordance with the following laws and regulations:

Public Resources Code, Section 4291. "Maintain defensible space of 100 feet from each side and from the front and rear of the structure… The amount of fuel modification necessary shall take into account the flammability of the structure as affected by building material, building standards, location, and type of vegetation. Fuels shall be maintained in a condition so that a wildfire burning under average weather conditions would be unlikely to ignite the structure."

California Code of Regulations, Title 14, Division 1.5, Chapter 7, Subchapter 3, Section 1299 (see guidance for implementation "General Guideline to Create Defensible Space"). "(A) Dead and dying woody surface fuels and aerial fuels shall be removed. Loose surface litter, normally consisting of fallen leaves or needles, twigs, bark, cones, and small branches, shall be permitted to a maximum depth of three inches (3 in.). (B) Cut annual grasses and forbs down to a maximum height of four inches (4 in.). (C) All exposed wood piles must have a minimum of ten feet (10 ft.) of clearance, down to bare mineral soil, in all directions."

California Code of Regulations, Title 19, Division 1, Chapter 1, Subchapter 1, Section 3.07. "(1) Maintain around and adjacent to such building or structure a firebreak made by removing and clearing away, for a

distance of not less than 30 feet on each side thereof or to the property line, whichever is nearer, all flammable vegetation or other combustible growth. This section does not apply to single specimens of trees, ornamental shrubbery, or similar plants which are used as ground cover, if they do not form a means of rapidly transmitting fire from the native growth to any building or structure. (2) Maintain around and adjacent to any such building or structure additional fire protection or firebreak made by removing all bush, flammable vegetation, or combustible growth which is located from 30 feet to 100 feet from such building or structure or to the property line, whichever is nearer, as may be required by the enforcing agency if he finds that, because of extra hazardous conditions, a firebreak of only 30 feet around such building or structure is not sufficient to provide reasonable fire safety. Grass and other vegetation located more than 30 feet from such building or structure and less than 18 inches in height above the ground may be maintained where necessary to stabilize the soil and prevent erosion."

These codes require fuel management and maintenance of defensible space, particularly in Very High Fire Hazard Severity Zones as well as adjacent to existing structures. The codes do not provide exceptions to fuel modification requirements for the purposes of maintaining habitat around protected trees or sensitive habitat. These requirements for fuel management include trees, as well as shrubs and grasses.

City of Los Angeles Municipal Code – Protected Trees and Shrubs. Native species of oak (Quercus sp., except scrub oak [Q. dumosa]), Southern California black walnut (Juglans californica), California bay laurel (Umbellularia californica) and western sycamore (Platanus racemosa) trees at least four inches in diameter (cumulative for multi-trunked trees) at 4.5 feet above the ground level at the base of the tree (or "diameter-at-breast height," or DBH) are protected in the City under Ordinance No. 177,404, which became effective April 23, 2006. On December 11, 2020, the City adopted Ordinance No. 186,873, extending protection status to include two native shrub species, the Mexican Elderberry (Sambucus mexicana) and Toyon (Heteromeles arbutifolia) shrubs and amending provisions of Sections 12.21, 17.02, 17.05, 17.06, 17.51, 46.00, 46.01, 46.02, 46.03, 46.04, and 46.06 of the Los Angeles Municipal Code (LAMC).

Section 17.05 of the LAMC prohibits, without a permit, the removal of any regulated protected tree including "acts which inflict damage upon root systems or other parts of the tree..." and requires replacement of all regulated protected trees that are removed on at least a four-to-one basis with trees that are of a protected variety. Replacement trees must be at least 15 gallons or larger, measure one inch or more in diameter at a foot above the base, and measure at least seven feet in height from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced. A protected tree shall only be replaced by other protected tree varieties and shall not be replaced by shrubs, and similarly, a protected shrub shall only be replaced by other protected shrub varieties and shall not be replaced by trees, to the extent feasible as determined by the Advisory Agency, Board of Public Works (Board), or certified arborist. Further, when replacing more than two protected trees or shrubs, the permit at issue must be

considered at a full public hearing of the Board. The City also requires preparation of a report by a tree expert identifying protected on-site trees, impacts to trees related to grading and construction, and mitigation measures for impacts to protected trees. However, native trees that have been planted as part of a tree planting program are exempt from this Ordinance and are not considered protected.

City of Los Angeles Framework Element. The Citywide General Plan Framework Element (Framework Element) establishes the conceptual basis for the City's General Plan. The Framework Element sets forth a comprehensive Citywide long-range growth strategy and defines Citywide policies regarding land use, housing, urban form and neighborhood design, open space and conservation, economic development, transportation, infrastructure and public services. Chapter 6, Open Space and Conservation, of the City's Framework Element identifies goals, objectives, and policies for the City relative to biological resources. As shown in **Table 4.3-2**, Objective 6.1 of the Open Space and Conservation Chapter of the City's Framework Element specifies the protection of "the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region." Policy 6.1.2 requires the coordination of "City operations and development policies for the protection and conservation of open space resources, by ... preserving habitat linkages, where feasible, to provide wildlife corridors and to protect natural animal ranges."

City of Los Angeles Conservation Element. The Conservation Element adopted in 2001, contains policies related to the identification and protection of sensitive plant, animal species, significant ecological areas (SEAs) and other resources. State law recognized that state requirements regarding the content of one element may overlap the requirements of another. As allowed by state law, Los Angeles has opted to incorporate natural open space agricultural and other open space features of the state's open space requirements into the Conservation Element which primarily addresses preservation, conservation, protection and enhancement of the city's natural resources.

State law intends that conservation elements address "conservation, development, and utilization of natural resources including water and hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources." State general plan legislation was amended (1995) to require that preparation of the water portion of the general plan address water and land reclamation, water (including ocean) pollution, regulation and use of land in stream beds, erosion, watershed protection, flood control and rock, sand and gravel resources. Open space, as defined by the California Government Code (Section 65560), is "any parcel or area of land or water that essentially is unimproved and devoted to an open-space use," including:

1. preservation of natural resources, e.g., preservation of flora and fauna (animal habitats), bird flyways, ecologic and other scientific study areas, watershed;

2. managed production of resources, e.g., recharge of ground water basins or containing mineral deposits that are in short supply;

3. outdoor recreation, e.g., beaches, waterways, utility easements, trails, scenic highway corridors; and/or public health and safety, e.g., flood, seismic, geologic or fire hazard zones, air quality enhancement.[21]

Table 4.3-2
Relevant General Plan Biological Resources Goals, Objectives, and Policies

Goal/Objective/Policy	Goal/Objective/Policy Description
	Framework Element-Chapter 6 Open Space and Conservation
Goal 6A	An integrated Citywide/regional public and private open space system that serves and is accessible by the City's population and is unthreatened by encroachment from other land uses.
Objective 6.1	Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.
Policy 6.1.1	Consider appropriate methodologies to protect significant remaining open spaces for resource protection and mitigation of environmental hazards, such as flooding, in and on the periphery of the City, such as the use of tax incentives for landowners to preserve their lands, development rights exchanges in the local area, participation in land banking, public acquisition, land exchanges, and Williamson Act contracts.
Policy 6.1.2	Coordinate City operations and development policies for the protection and conservation of open space resources, by: Encouraging City departments to take the lead in utilizing water re-use technology, including graywater and reclaimed water for public landscape maintenance purposes and such other purposes as may be feasible; Preserving habitat linkages, where feasible, to provide wildlife corridors and to protect natural animal ranges; and Preserving natural viewsheds, whenever possible, in hillside and coastal areas.
Policy 6.1.3	Reassess the environmental importance of the County of Los Angeles designated Significant Ecological Areas (SEAs) that occur within the City of Los Angeles and evaluate the appropriateness of the inclusion of other areas that may exhibit equivalent environmental value.
Policy 6.1.4	Conserve, and manage the undeveloped portions of the City's watersheds, where feasible, as open spaces which protect, conserve, and enhance natural resources.
Policy 6.1.5	Provide for an on-site evaluation of sites located outside of targeted growth areas, as specified in amendments to the community plans, for the identification of sensitive habitats, sensitive species, and an analysis of wildlife movement, with specific emphasis on the evaluation of areas identified on the Biological Resource Maps contained in the Framework Element's Technical Background Report and Environmental Impact Report.

[21] City of Los Angeles, *Conservation Element of the City of Los Angeles General Plan*, at p.I-2. 2001. Available online at: https://planning.lacity.org/odocument/28af7e21-ffdd-4f26-84e6-dfa967b2a1ee/Conservation_Element.pdf, , accessed on May 17, 2022.

Goal/Objective/Policy	Goal/Objective/Policy Description
Policy 6.1.6	Consider preservation of private land open space to the maximum extent feasible. In areas where open space values determine the character of the community, development should occur with special consideration of these characteristics.
Policy 6.1.7	Encourage an increase of open space where opportunities exist throughout the City to protect wild areas such as the Sepulveda Basin and Chatsworth Reservoir.
Conservation Element – Endangered Species	
Policy 1	Continue to require evaluation, avoidance, and minimization of potential significant impacts, as well as mitigation of unavoidable significant impacts on sensitive animal and plant species and their habitats and habitat corridors relative to land development activities.
Policy 2	Continue to administer city-owned and managed properties so as to protect and/or enhance the survival of sensitive plant and animal species to the greatest practical extent.
Policy 3	Continue to support legislation that encourages and facilitates protection of endangered, threatened, sensitive and rare species and their habitats and habitat corridors.
Conservation Element – Habitats	
Policy 1	Continue to identify significant habitat areas, corridors and buffers and to take measures to protect, enhance and/or restore them.
Policy 2	Continue to protect, restore, and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within City owned or managed sites.
Policy 3	Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive, and rare species.
Policy 4	Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.

Source: City of Los Angeles, The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, originally adopted 1996, re-adopted 2001; City of Los Angeles, City of Los Angeles General Plan Conservation Element, adopted 2001.

Los Angeles River Revitalization Master Plan. The City of Los Angeles adopted the Los Angeles River Revitalization Master Plan (LARRMP) in 2007 with the goal of restoring the ecological and hydrological functioning of the river, through the recreation of a riparian habitat corridor in the channel, and through the removal of concrete walls where feasible. This would help restore a continuous, functioning riparian ecosystem that supports vegetation as well as birds and mammals, and developing fish passages, fish ladders, and riffle pools.

Development and implementation of the Revitalization Master Plan would maintain the river as a resource that provides flood protection and opportunities for recreational and environmental enhancement, as well as intend to improve the aesthetics of the region, enrich the quality of life for residents, and help sustain the economy of the region. Goals of the plan include:

- Establishing environmentally sensitive urban design guidelines, land use guidelines, and development guidelines for the River zone that would create economic development opportunities to enhance and improve River-adjacent communities by providing open space, housing, retail spaces such as restaurants and cafes, educational facilities, and places for other public institutions.

- Improving the environment, enhancing water quality, improving water resources, and improving the ecological functioning of the River.
- Providing public access to the River.
- Providing significant recreation space and open space, new trails, and improve natural habitats to support wildlife.
- Preserving and enhancing the flood control features of the River.
- Fostering growth in community awareness of the Los Angeles River, and pride in the Los Angeles River.

River Implementation Overlay. The River Implementation Overlay (RIO) is a citywide zoning ordinance (No. 183,145) that applies to properties in close proximity to the Los Angeles River. Per Section 13.17(a), the purposes of the ordinance include but are not limited to: supporting the goals of the Los Angeles River Revitalization Master Plan (LARRMP), contributing to the environmental and ecological health of the City's watersheds, and providing a native habitat and supporting local species. Specific references are made in the ordinance to the LARRMP's native landscaping guidelines.

City of Los Angeles Stormwater Pollution Control Measures for Development Planning and Construction Activities Ordinance. Through LAMC Section 64.72, the City of Los Angeles has established Low Income Development (LID) practices and standards that aim to mitigate stormwater pollution and maximize open, green, and pervious areas on all new developments or redevelopments. The LID Ordinance requires developments of any kind to comply with the Development Best Management Practices Handbook. It also requires all development to be designed to manage and capture stormwater runoff to the maximum extent feasible. Suggested practices, in priority order, include infiltration, evapotranspiration, and capture and use, treated through high removal efficiency biofiltration/biotreatment systems.

City of Los Angeles General Plan Open Space Element. The Open Space Element of the General Plan includes goals, objectives, policies and programs directed towards the regulation of publicly and privately owned lands both for the benefit of the public as a whole, and for the protection of individuals from the misuse of these lands. The Open Space Element provides guidance and general policies for the conservation

and preservation of open space[22] areas containing the City's environmental resources including air and water.

Heritage Trees. The City of Los Angeles maintains an inventory of trees with historical, commemorative, or horticultural significance that the City intends to maintain and preserve on City properties, including parks. Heritage trees are not required to be one of the protected tree types covered by Ordinance 177,404. The list of heritage trees is maintained by the City of Los Angeles Department of Recreation and Parks (RAP).

4.3.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to biological resources if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance; and/or
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

4.3.5 METHODOLOGY

This section outlines the methodology for evaluating impacts to biological resources, including sensitive natural communities and special status species.

For this analysis, "sensitive natural communities" are considered to be habitats or natural communities that are unique, of relatively limited distribution in the region, and/or of particularly high value for wildlife. Sensitive habitats include specific natural communities defined by CDFW, as well as wetlands and riparian communities, which are considered special status natural communities due to their limited distribution in California (CDFW 2009). Sensitive natural communities are usually identified in regional or local plans, policies, or regulations, and may or may not contain special status species.

For purposes of this analysis, "special status species" include:

- Plants and wildlife species listed as rare, threatened, or endangered under the FESA or the CESA;
- Species that are candidates for listing under federal or state law;
- Species designated by the USFWS as Proposed or Candidates for listing and/or species designated as Species of Special Concern by CDFW;
- Species protected by the Federal Migratory Bird Treaty Act;
- Species identified as rare, threatened, or endangered by the California Native Plant Society (CNPS).
- Any other species that may be considered endangered or rare pursuant to *CEQA Guidelines* Section 15380(b).

The impact area studied in this analysis considered potential impacts to biological resources in the Boyle Heights CPA (including all open space areas), and portions of the Los Angeles River to the west. With the exception of migratory birds, urban parcels within and adjacent to the Boyle Heights CPA are not expected to contain special status species or sensitive natural communities.

The impact analysis considers the indirect impacts from the reasonably anticipated development of the Proposed Plan to special status species and sensitive natural communities under the threshold questions. Impacts to biological resources could include the direct take of a species or the removal or disturbance of habitats from future development or more indirect delayed or secondary effects from future development, such as fragmentation, pollination interruption, plant and wildlife dispersal interruption, increased risk of fire, and increased invasion of non-native animals and plants that out-compete natives.

4.3.6 IMPACTS

Threshold 4.3-1 **Would implementation of the Proposed Plan have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?**

This impact would be less than significant.

As shown in **Table 4.3-1**, there are nine special status animal species and nine special status plant species reported for the CPA and its vicinity. Of the identified species, none of the special status species have been sighted in over 30 years.[23] Two animal species are listed as endangered, and one is listed as threatened by the CDFW and/or the USFWS. Five animal species are listed as species of special concern by CDFW. The Proposed Plan's impact on these sensitive species is discussed below.

Endangered Animal Species

According to the CNDDB, the endangered species southwestern willow flycatcher (*Empidonax traillii extimus*) and least Bell's vireo (*Vireo bellii pusillus*) has been historically sighted in the CPA. The southwestern willow flycatcher was last observed in the CPA in 1906 and is presumed no longer present in the CPA. The habitat for this species is riparian woodlands, which the CPA does not contain. Impacts to the southwestern willow flycatcher are not likely to occur as a result of the Proposed Plan. Least Bell's vireo was last observed in the CPA in 1914. The habitat for this species is generally low riparian in vicinity of water or in dry river bottoms. The CPA does not contain riparian habitat. As such, impacts to the least Bell's vireo would not occur as a result of Project implementation.

Species of Special Concern

The species of special concern which have been historically sited in the CPA include the burrowing owl (*Athene cunicularia*), coast horned lizard (*Phrynosoma blainvillii*), California glossy snake (*Arizona elegans occidentalis*), American badger (*Taxidea taxus*), and western mastiff bat (*Eumops perotis californicus*). The burrowing owl was last observed in the CPA vicinity in 1921, and the habitat includes open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. The coast horned lizard was last recorded in the vicinity in 1974 and the habitat includes relatively open grasslands,

[23] California Department of Fish and Wildlife, California Natural Diversity Database (CNDDB) search for Los Angeles USGS quadrangle, 2017. Available online at: https://wildlife.ca.gov/Data/CNDDB. *See also*, State of California Natural Resources Agency, Department of Fish and Wildlife, and CNDDB, *Special Animals List,* April 2022. Available online at: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406, accessed May 18, 2022.

scrublands, and woodlands with fine, loose soil. The California glossy snake was last recorded in the vicinity in 1889 and habitat includes open sandy areas with scattered brush, but also found in rocky areas. American badgers habitat include drier open stages of most shrub, forest, and herbaceous habitats with friable soils. The western mastiff bat was last observed in the CPA vicinity in 1990, and this species' habitat is defined as open and semi-arid to arid, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. The areas in which these five species were historically found are developed today with urban uses. The CPA does not provide habitat for these species.

Threatened Plant and Animal Species

The bank swallow (*Riparia riparia*) is listed threatened at the California state level. The species was last observed in the CPA vicinity in 1894 and is listed as extirpated.[24]

Threatened plant species that have been historically sited to occur in the CPA include Davidson's saltscale (*Atriplex serenana var. davidsonii*), Plummer's mariposa lily (*Calochortus plummerae*), Los Angeles sunflower (*Helianthus nuttallii ssp. pariskii*), Graeta's aster (*Symphyotrichum greatae*), Robinson's pepper-grass (*Lepidium virginicum var. robinsonii*), round-leaved filaree (*California macrophylla*), Salt Spring checkerbloom (*Sidalcea neomexicana*), prostrate vernal pool navarretia (*Navarretia prostrata*), and mesa horkelia (*Horkelia cuneata var. puberula*). All nine plant species are possibly extirpated in the CPA. The habitat for Davidson's saltscale includes coastal bluff scrub and coastal scrub, and the species was last observed in the vicinity in 1902. The habitat for Plummer's mariposa-lily includes coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest and the species was last observed in the vicinity in 1913. The habitat for the Los Angeles sunflower usually occurs in coastal freshwater mashes and saltmarshes, and the species was last observed in the vicinity in 1901. The habitats for Salt Spring checkerbloom and Greata's aster include chaparral and coniferous forest, and the species was last observed in the CPA in 1902 and 1932, respectively. The habitats for Robinson's pepper-grass includes chaparral and coastal sage scrub, and the species was last recorded in the vicinity in 1950. Round-leaved filaree habitat includes cismontane woodland, valley, and foothill grassland on clay soils. The habitat for the prostrate vernal pool navarretia includes coastal scrub, grasslands, vernal pools, and meadows, and the species was last observed in the vicinity in 1907. The habitat for mesa horkelia includes chaparral, cismontane woodland, and coastal scrub, and the species was last recorded in the vicinity in 1902. Based on the type of habitat and quality of habitat for these species, all nine plant species have a CNDDB Occurrence Rank of None within the CPA.

---

24 *Ibid.* at California Department of Fish and Wildlife, California Natural Diversity Database (CNDDB) search for Los Angeles USGS quadrangle, 2017.

Based on the above, threatened plant and animal species are not expected to occur in the CPA. Therefore, impacts would be less than significant.

Migratory Birds

The development under the Proposed Plan could involve construction activity during the bird nesting season, which is generally from March 1 through August 31 and begins as early as February 1 for raptors. While the CPA is highly urbanized with few trees, any tree could support active bird nests. Hollenbeck Park, located toward the western edge of the CPA, includes open lands with stands of mature trees with higher likelihood of containing active bird nests. As such, tree trimming or removal in the CPA would have the potential to disturb active nests. However, as discussed above, destruction of any active nest is a violation of the federal MBTA and/or the CFGC. Therefore, impacts to active bird nests would be ***less than significant***.

Mitigation Measures

Although the impact conclusion related to nesting birds is found to be less than significant, the City adopts the following additional mitigation measure to add additional protections to ensure compliance with the existing federal and state regulations.

MM BIO-1 For all projects, if any active bird nest is found during a pre-construction nesting bird survey or is discovered inadvertently during earthwork or construction-related activities, a Qualified Biologist shall be retained by the Applicant or Owner to determine an appropriate avoidance buffer which shall be no less than is necessary to protect the nest, eggs and/or fledglings, from damage or disturbance in consideration of the following factors: the bird species, the availability of suitable habitat within the immediate area, the proposed work activity, and existing disturbances associated with surrounding land uses. The buffer shall be demarcated using bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary of the buffer. All construction personnel shall be notified of the buffer zone and shall avoid entering the protected area. No Ground Disturbing Activities or vegetation removal shall occur within this buffer area until the Qualified Biologist has confirmed that breeding/nesting is complete and the young have fledged the nest and/or that the nest is no longer an Active Nest. The Qualified Biologist shall prepare a report prior to the issuance of any building permit detailing the results of the nesting bird survey and subsequent monitoring, which shall be maintained for a minimum of five years after the Certificate of Occupancy is issued.

MM BIO-2 All project applicants for grading, excavation, or building permits will be notified of and shall include on their plans an acknowledgement of the requirement to comply with the federal MBTA and CFGC to not destroy active bird nests and of best practices recommended by qualified biologist to avoid impacts to active nests, including checking for nests prior to construction activities during February 1-August 31 and what to do if an active nest is found during grading or construction activities, including the need to comply with the measures in **MM BIO-1**.

Significance After Mitigation

Less than significant without mitigation.

Mitigation is added as an additional measure to provide additional protections to impacts that are less than significant.

Threshold 4.3-2 **Would implementation of the Proposed Plan have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

This impact would be less than significant.

Although the search of the CNDDB database revealed three sensitive natural communities in the USGS Los Angeles Quadrangle, it has been determined that these sensitive natural communities are not present in the CPA area. The CNPS has historically identified a special status plant community (California Walnut Woodland) in the vicinity of the CPA but has determined that it is no longer present. In addition, there are no SEAs in the CPA.

Any development projects that would occur upon implementation of the Proposed Plan would also be subject to the goals and policies of the City of Los Angeles General Plan Conservation Element to protect sensitive natural communities and riparian habitat, which would have direct and indirect beneficial outcomes for special status species, such as through the protection and preservation of sensitive natural communities and wildlife habitats. The Proposed Plan would not change the objectives, policies, and programs contained within the General Plan Conservation Element.

The Los Angeles River Revitalization Master Plan proposes to enhance and create riparian habitat along the sides of the River, which could occur in the Boyle Heights CPA. A long-term goal of the River Master Plan is to restore the ecological and hydrological functioning of the river, through the recreation of a

riparian habitat corridor within the channel, and through the removal of concrete walls where feasible. This would help restore a continuous, functioning riparian ecosystem that supports vegetation as well as birds and mammals, and developing fish passages, fish ladders, and riffle pools.[25]

As previously noted, the channelized Los Angeles River is not located within the boundaries of the CPA and is separated from the CPA's western boundary by active rail lines. Although River-adjacent areas within the CPA could have supported wildlife at one time, they have since been developed with industrial uses. Currently, the river adjacent area within the CPA contains rail lines and is designated as "Light Manufacturing" under the existing General Plan[26] and would be designated for light industrial uses under the Proposed Plan.[27] The zoning for this area is currently primarily M2-1-RIO-CUGU, a manufacturing zone.[28] Goal LU 12 of the Proposed Plan includes policies to encourage industrial land located adjacent to the Los Angeles river rail areas to provide a dynamic concentration of "career ladder" and local jobs and small businesses.

The Proposed Plan's policies also encourage the creation of a network of linked public spaces in areas along the rail-River corridor to provide public access to the Los Angeles River, including walkways and paseos. However, as noted, the CPA is separated from the Los Angeles River by multiple rail lines, and therefore development in the CPA, or policies in the Proposed Plan are unlikely to affect any species of importance. Rather, the Proposed Plan encourages that new heavy industrial development that could take place upon its implementation would be located generally on the southern edge of the CPA, further away from the river than is currently permitted. In addition, the concrete-lined nature of the River to the west of the CPA boundary ensures that sensitive natural communities are not present in the CPA, or in the vicinity of the river itself.

Although the Proposed Plan does not propose any changes that are inconsistent with the Light Industrial land use designation and corresponding industrial zone, it also would not preclude the portion of the CPA near the Los Angeles River from being developed with uses that are permitted by the Zoning Code or approved through the discretionary review process (e.g., conditional use permits.)

The Proposed Plan includes policies to improve access to the river, as well as the new Frontage regulations and Development Standards set forth in the New Zoning Code, along with the aforementioned zoning

---

28 City of Los Angeles. *Zimas.* Available online at: zimas.lacity.org, accessed October, 2017.

code change that would ensure future heavy industrial development would be located elsewhere in the CPA.

Because of the lack of presence of riparian habitat that could support sensitive species in the CPA, in addition to the fact that existing open space that supports wildlife would be unaffected, and the fact that the Proposed Plan would move heavy industrial development away from the river, impacts would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.3-3 **Would implementation of the Proposed Plan have a substantial adverse effect on state or federally-protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

This impact would be less than significant.

According to the USFWS National Wetlands Inventory, the only wetlands identified within or adjacent to the CPA are the Los Angeles River, is separated from the CPA by the rail line on the Western edge of the CPA, and Hollenbeck Park Lake.[29]

Reasonably anticipated development from the Proposed Plan would not directly or indirectly affect the Los Angeles River or Hollenbeck Park. As part of the Los Angeles River Revitalization Master Plan, goals in the plan intend to improve water quality, create, and restore habitat within and adjacent to the river. These restoration goals intend to ensure that any growth directly adjacent to the river would improve and not degrade existing conditions. These restoration goals intend to ensure that any growth directly adjacent to the river would improve and not degrade existing conditions. Development that would occur in areas adjacent to the rail-River corridor would be required to adhere to the new Frontage regulations and Development Standards set forth in the New Zoning Code. Furthermore, the City's Stormwater and Urban Runoff Pollution Control Ordinance would require future development in the CPA to comply with the

[29] U.S. Fish and Wildlife Service. National Wetlands Inventory. Available at: https://www.fws.gov/wetlands/data/mapper.html, accessed May 17, 2021.

SUSMP requirements, which require the inclusion of BMPs in a project's design to prevent, control and reduce stormwater pollutants, if applicable; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements to ensure that construction does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality that could affect downstream waterways including the LA River. Implementation of the Proposed Plan would have a ***less than significant*** impact.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.3-4 **Would implementation of the Proposed Plan interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

This impact would be less than significant.

The developed nature of the CPA has fragmented any potential wildlife corridors, in addition to the fact that the CPA is surrounded by other heavily developed areas of a major city. The only potential wildlife corridor near the CPA is the Los Angeles River. However, no portion of the Proposed Plan would alter the concrete-lined river in any way, including allowing development that could impede existing wildlife movement along its course. In addition, future development along the rail-River corridor would follow all adjacency buffers, light and glare standards, and river setback standards within the Proposed Plan in regard to areas adjacent to the river. Therefore, impacts are ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.3-5 Would implementation of the Proposed Plan conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance?

This impact would be less than significant.

The City of Los Angeles Tree Preservation Ordinance makes it illegal to remove or fatally harm protected trees and shrubs without the issuance of a permit. The City of Los Angeles RAP has also identified heritage trees throughout the City, although these are not protected by any regulation unless they are one of the protected species covered by the Tree Preservation Ordinance. As discussed in Existing Environmental Setting, approximately 295 heritage trees are located in the CPA.[30] Future development occurring in the CPA is not expected to affect heritage trees as these trees are located on public property and RAP is responsible for the maintenance and protection of heritage trees from injury.

Some ordinance-protected trees and shrubs may be located on private property and in street rights-of-way. These trees and shrubs are protected by the City of Los Angeles Tree Preservation Ordinance, which makes it illegal to relocate, remove, or fatally harm the trees or shrubs without the issuance of a permit by the LADPW. Per the Protected Tree Regulations (4a) listed in Ordinance 186873, in the event that the LADPW approves a tree removal, replacement of the tree would be required with at least two trees of a protected variety (Ordinance No. 186873). The Proposed Plan does not include any components that would preclude implementation of or alter these policies or procedures. Thus, implementation of the Proposed Plan would not conflict with any local policies or ordinances protecting biological resources, including protected trees.[31]

As provided in **Table 4.3-3**, the Proposed Plan would not conflict with goals, policies, and programs of the General Plan Framework or the City Conservation Element. Reasonably anticipated development from the Proposed Plan would include infill development in an urban area and, therefore, would not interfere with natural resources or degrade the sustainability of natural resources in the region. The Proposed Plan would not disrupt existing open space or encroach upon any natural settings.

31 Ordinance No. 186873. Available online at: https://clkrep.lacity.org/onlinedocs/2013/13-1339_ORD_186873_02-04-2021.pdf, accessed on September 17, 2021.

Table 4.3-3
Boyle Heights Community Plan Consistency with Relevant General Plan Biological Resources Goals, Objectives, and Policies

Goal/Objective/Policy	Consistency
Framework Element – Chapter 6 Open Space and Conservation	
Goal 6A: An integrated Citywide/regional public and private open space system that serves and is accessible by the City's population and is unthreatened by encroachment from other land uses	**Consistent.** The CPA is a developed urban area that lacks substantial open spaces. Reasonably anticipated development the Proposed Plan would not adversely affect planned private or public open spaces. To the contrary, the Proposed Plan encourages the preservation and enhancement of existing parks as well as the revitalization of adjacent segments of the Los Angeles River in accordance with the River Revitalization Master Plan.
Objective 6.1: Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.	**Consistent.** The CPA is a developed urban area that generally lacks native biological habitat. By facilitating development in an already urbanized area, the Proposed Plan would avoid potential impacts to habitat areas and corridors. In addition, any development that would occur in areas adjacent to the river would be required to adhere to the new Frontage regulations and Development Standard Rules set forth in the New Zoning Code in order to not disturb the Los Angeles River or otherwise conflict with the goals of the River Revitalization Master Plan, which seeks to improve water quality, create and restore habitat within and adjacent to the river.
Conservation Element	
Policy 1: Continue to identify significant habitat areas, corridors and buffers and to take measures to protect, enhance and/or restore them.	**Consistent.** The CPA is a developed urban area that generally lacks native biological habitat. By facilitating development in an already urbanized area, the Proposed Plan would avoid potential impacts to habitat areas and corridors. In addition, any development that would occur in areas adjacent to the river would be required to adhere to the new Frontage regulations and Development Standard Rules set forth in the New Zoning Code in order to not disturb the Los Angeles River or otherwise conflict with the goals of the River Revitalization Master Plan, which seeks to improve water quality, create and restore habitat within and adjacent to the river.
Policy 2: Continue to protect, restore, and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within City owned or managed sites.	**Consistent.** The CPA is a developed urban area that generally lacks native biological habitat. By facilitating development in an already urbanized area, the Proposed Plan would avoid potential impacts to habitat areas and corridors.
Policy 3: Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive, and rare species.	**Not Applicable.** This policy is aimed at working with other entities to protect habitats, which is not the specific purpose of the Proposed Plan. Nevertheless, as noted above, reasonably anticipated development from the Project would include infill development, thus relieving pressure for encroachment of urban development into areas containing natural resources.

Goal/Objective/Policy	Consistency
Policy 4: Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.	**Not Applicable.** This policy is aimed at support for legislation that would protect native plant and animal habitats, which is not the specific purpose of the Proposed Plan. Nevertheless, as noted above, reasonably anticipated development from the Proposed Plan would include infill development, thus relieving pressure for encroachment of urban development into areas containing natural resources.

Source: City of Los Angeles, The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, originally adopted 1996, re-adopted 2001. Available online at: https://planning.lacity.org/odocument/513c3139-81df-4c82-9787-78f677da1561/Framework_Element.pdf*; City of Los Angeles, City of Los Angeles General Plan Conservation Element, adopted 2001.* Available online at: https://planning.lacity.org/odocument/28af7e21-ffdd-4f26-84e6-dfa967b2a1ee/Conservation_Element.pdf.

As noted above, the rail lines on the western boundary of the CPA are between the CPA and the Los Angeles River. As discussed under Impact 4.3-2, any development project that would occur in areas adjacent to the rail lines, or that would encourage access to the river would be required to adhere to the Frontage regulations and Development Standards set forth in new the New Zoning. Therefore, impacts would be ***less than significant.***

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.3-6 Would implementation of the Proposed Plan conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No impact would occur.

There are no Habitat Conservation Plans, Natural Community Conservation Plans, or other approved local, regional, or state habitat conservation plans in the CPA. Therefore, ***no impact*** would occur.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

No impact.

4.3.7 CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable biological resource impacts includes the CPA and immediately adjacent areas that could be indirectly affected.

Sensitive Species and Habitats, including Riparian Habitat

Development within the CPA through 2040 generally would not affect sensitive plant or animal species since Boyle Heights is largely urbanized and the General Plan Framework and other policy documents primarily emphasize infill development in already urbanized areas that lack native biological habitats. Isolated individual projects may adversely affect sensitive species and habitats, including wetlands, but such impacts would be addressed on a case-by-case basis as part of project-level environmental reviews. Cumulative impacts would be ***less than significant***.

Trees located throughout the City, including the CPA, could potentially support migratory birds. As discussed previously, destruction of any active nest is a violation of federal and state regulatory measures (MBTA and/or the CFGC). Mitigation Measure BIO-1 has been included as an added precaution in this EIR for a less than significant impact to provide additional requirements to ensure compliance with the federal and state requirements. . The mitigation measures along with the he MBTA would ensure that cumulative impacts to migratory birds would not be significant.

Based on the above information, cumulative impacts to sensitive species and habitats, including riparian habitats, could occur within the CPA; however, the incremental contribution of the Proposed Plan to cumulative impacts to sensitive species and habitats would not be cumulatively considerable and cumulative impacts related to sensitive species and habitats would be ***less than significant***.

Wildlife Movement

Development within the CPA generally would not disrupt wildlife movement because the future development would primarily focus on infill development where wildlife corridors are not present. There are no wildlife corridors within the CPA and as such ***no cumulative impact*** would occur.

Heritage Trees and Ordinance-Protected Trees and Shrubs

The City's Tree Preservation Ordinance provides protection for four tree and two shrub species citywide, as previously discussed. All future development in the CPA would also be subject to these existing ordinances and regulations. Compliance with the Tree Preservation Ordinance would ensure that there would be no net loss of protected trees or shrubs citywide. Based on this information, the incremental effect

of the Proposed Plan would not be cumulatively considerable and cumulative impacts related to Protected Tree Ordinance and other local policies would be *less than significant*.

4.4 CULTURAL RESOURCES

4.4.1 INTRODUCTION

This section analyzes the potential environmental effects on cultural, historic, and archaeological resources in the Boyle Heights Community Plan Area (CPA) from implementation of the Proposed Plan. This section was prepared by using SurveyLA Historic Resources Survey Reports created by the City of Los Angeles. Topics addressed include historical and archaeological resources, and human remains.

4.4.2 EXISTING ENVIRONMENTAL SETTING

A Historic Resources Survey Report (Survey Report) was completed on behalf of the City of Los Angeles Department of City Planning's Office of Historic Resources (OHR) for the SurveyLA historic resources survey of the Boyle Heights CPA. The survey was undertaken from December 2013 to December 2014 by Architectural Resources Group (ARG).[1] Excerpts from that report are provided herein.

Boyle Heights Historical Background

Boyle Heights is among the oldest communities in Los Angeles and was developed as one of the city's first residential suburbs. Located on the flats and bluffs directly east of the Los Angeles River, the Boyle Heights area, like much of Los Angeles, was inhabited solely by the Native American group known as the Gabrielino until mid-eighteenth century. The name Gabrielino or Gabrieleño was applied by the Spanish to the indigenous people that were attached to Mission San Gabriel. Today, most contemporary Gabrielino prefer to identify themselves as Tongva. When California was colonized by the Spanish, the area comprised the easternmost section of the Los Angeles pueblo lands, which were incorporated in 1781 under Governor Felipe de Neve and extended eastward to present-day Indiana Street. This peripheral area was originally named El Paredón Blanco, or "white bluff," a reference to its rolling hills and commanding westward views of both the river and pueblo.

El Paredón Blanco was first settled in the 1830s by members of the pioneering López family, which had been deeded much of the area east of the Los Angeles River upon California's transference from Spanish to Mexican rule in 1821. Aside from a modest adobe residence (not extant) and various auxiliary structures that were erected to support agricultural uses, El Paredón Blanco retained a pastoral character and remained almost entirely undeveloped in the early and mid-nineteenth century. Rather, the vast expanses

[1] Historic Resources Survey Report – Boyle Heights Community Plan Area. City of Los Angeles Department of City Planning Office of Historic Resources. URL: https://planning.lacity.org/preservation-design/survey-la-results-boyle-heights Accessed: June 2021.

of open land comprising the area were occupied by farmsteads, which were used to support a variety of small-scale agricultural operations including the cultivation of vineyards and the production of wine.

Portions of El Paredón Blanco were sold over time to various investors and developers. Notably, in 1858, 22 acres of the flats and bluffs were sold to Andrew Aloysius Boyle, an entrepreneurial Irishman who had recently relocated to Southern California from San Francisco and operated a shoe store in Downtown Los Angeles. Boyle purchased an additional 20 acres the following year. On his newly-acquired land, Boyle constructed a brick residence, portions of which were extant until the mid-1990s; raised a stock of cattle and horses; and planted vineyards and orchards of oranges, walnuts, lemons, peaches, and figs. Despite its proximity to the center of Los Angeles, Boyle's land remained pastoral and was generally perceived as unfit for development at the time, due to its geographic isolation from the rest of the city via the Los Angeles River.

Development activity in the area first occurred in the 1870s, when construction of the Southern Pacific Railroad forged a link between Los Angeles and San Francisco and spurred the first of several real estate booms across Southern California. Among those eager to capitalize on the railroad's economic potential was William Henry Workman, the son-in-law of Andrew Boyle who had inherited Boyle's acreage upon his death in 1871. Workman, who was a member of the Los Angeles City Council (then known as the Los Angeles Common Council) at the time, later served as the mayor and treasurer of Los Angeles, and played an instrumental role in the development of the city's first high school and a citywide network of parks. In 1875, Workman, along with financiers Isaias Hellman and John Lazzarevitch, subdivided his inheritance into residential lots and named the subdivision "Boyle Heights" in honor of his late father-in-law. In addition to platting a system of streets and parcels, Workman constructed a water main and a horse-drawn streetcar line across the river to better connect Boyle Heights with the city's core and make the peripheral area a feasible place to settle.

It was not until a second real estate boom in the 1880s that Boyle Heights began to shed its pastoral roots and turn into a residential suburb. The completion of a transcontinental rail line to Southern California in 1885 and a subsequent fare "war" between the Southern Pacific and Santa Fe Railroads brought scores of newcomers to Los Angeles, which in turn produced a surge of land speculation and development activity across the region. Boyle Heights, which had already been platted and partially improved by Workman and others, was marketed at this time as an upscale residential district that boasted good views, a convenient location near the central city, and its own public transit line. At the height of the 1880s land boom, many affluent and prominent Angeleno families flocked to the area and constructed large houses atop the westward-facing bluffs.

As Boyle Heights began to come of age, the city embarked upon the development of several municipal parks to serve the residents of the new community. In 1890, at the height of Boyle Heights' early period of development, a 21-acre site at what was then the heart of the nascent community was donated to the City of Los Angeles by Elizabeth H. Hollenbeck and William H. Workman for use as a public park. Opened to the public in 1892, the new facility was named in honor of Hollenbeck's late husband, John Edward Hollenbeck, an entrepreneur who had invested heavily in the early development of Boyle Heights and was among the community's earliest and most distinguished settlers. With its picturesque setting and lushly-landscaped grounds, the park quickly emerged as a focal point of the community. Prospect Park, a four-acre site in nearby Brooklyn Heights that had been donated to the city in the 1870s for use as a city park, was improved and opened to the public in 1891.

Subsequent advances in inter-urban transportation accelerated the pace of development in the area, touching off a wave of rapid residential growth that ultimately transformed the sparsely populated district into a more urbanized streetcar suburb. In 1889, the horse-drawn streetcar line that served Boyle Heights was replaced by a cable rail line that was operated by the Los Angeles Cable Railway and ran down First Street; the cable car line, in turn, was replaced by a more modern and efficient electric streetcar line in the 1890s. An additional electric streetcar line was constructed on Brooklyn Avenue in 1899 to accommodate an increase in ridership, and by the early twentieth century streetcars traversed almost every major thoroughfare in the area. The availability of direct and reliable transit connections between Boyle Heights and the central city opened up once-inaccessible tracts of land and facilitated suburban growth.

Middle and working-class households accounted for much of this growth, as the availability of affordable public transit burgeoned while remaining within a reasonable commuting distance to their places of employment, most of which were located in and around Downtown. Between 1880 and 1900, Boyle Heights' population had increased from 300 or 400 families to 10,670 people; the population continued to steadily increase until the 1920s, at which point Boyle Heights had largely been built out.

The rapid residential growth that occurred within the area between the 1890s and 1920s was accompanied by the development of various commercial and institutional uses, which arose to serve the day-to-day needs of the area's growing population. Conforming to a pattern typical of streetcar suburbs, the majority of commercial development occurred along what were then the community's two principal streetcar routes, First Street and Brooklyn Avenue; among the earliest commercial properties to be developed in the area was the four-story Boyle Hotel (HCM #891).[2] Various public and private institutions including schools, churches, parks, hospitals, convalescent homes, and orphanages were developed across Boyle Heights

2 HCM = Historic-Cultural Monument, designated by the City of Los Angeles Office of Historic Resources

around the turn of the twentieth century and into the 1920s. By the 1920s, Boyle Heights, once on the fringes of the city, had matured into a bustling streetcar suburb.

Boyle Heights is often associated with residential and commercial development; however, its strategic location alongside two major railroad arteries also ushered in a wave of industrial development in the early twentieth century, most of which was concentrated in the "flats" that spanned the area's southern and western perimeters and occupied land adjacent to the railroad lines. Industrial development was diverse and included freight houses and freight yards developed by the railroads in addition to warehouses, manufacturing facilities, and salvage yards. Construction-related industries – including lumber yards and brick factories – set up shop to support the area's rapid residential growth. Sears, Roebuck and Company constructed a massive Art Deco-style mail order fulfillment center and retail store complex (HCM #788) on an eight-acre industrial parcel near the southwestern corner of the present-day CPA in 1927; though the mail order facility has long shuttered, and the retail store recently closed, the building continues to stand as one of the most iconic landmarks in Boyle Heights. Sears' presence helped catalyze the development of additional industries in the 1930s on nearby parcels that were subdivided but had not yet been developed.

By the 1930s, almost every large tract of land in the Boyle Heights area had been developed; an exception was a 72-acre parcel near the southwest corner of the community that belonged to the estate of D. Herbert Hostetter, proprietor of a company that manufactured a popular nostrum known as Dr. Hostetter's Stomach Bitters. Between 1938 and 1941, Hostetter's estate embarked upon the construction of an expansive multi-family housing development based upon planning principles espoused by Ebenezer Howard's Garden City movement, including the separation of pedestrian and vehicular traffic; superblock configuration, with internal and autonomous circulation networks; and a site plan that was oriented around an expansive common open space. Known as Wyvernwood, the sprawling development was the first garden apartment complex in Los Angeles, and its prototype was widely replicated by both public and private housing developers throughout the 1940s and '50s. Wyvernwood was geared toward middle and lower-income earners who were employed Downtown and at industrial centers located nearby.

Los Angeles, like most of the nation's major cities, experienced an acute housing crisis during the Great Depression that was characterized by overcrowding and the proliferation of deteriorated and substandard dwelling units. These conditions could be found across the city but were especially pronounced in Boyle Heights, due to the community's relatively high proportion of working-class residents and ample supply of lower-cost housing. Of particular note was the area immediately east of the Los Angeles River known as the "flats," which had deteriorated into one of Los Angeles' most notorious slum districts by the late 1930s.

Multiculturalism played a pivotal role in defining Boyle Heights' early history. Prior to World War II, Boyle Heights was considered to be the most ethnically heterogeneous community in Los Angeles, "a place often

described as one of the largest and earliest showcases for multicultural harmony" in the city.[3] Restrictive covenants and deed restrictions prohibited non-whites from owning or occupying property in many Los Angeles communities; however, these discriminatory housing tactics were never implemented on a widespread basis in Boyle Heights, making it one of the few places in the city where ethnic and religious minorities and new immigrants could settle. Mexican Americans had continuously lived in the Boyle Heights area since the nineteenth century, but in the early twentieth century they were joined by sizable numbers of Japanese Americans, many of whom had relocated to Los Angeles after the San Francisco Earthquake of 1906, and Russian and Eastern European Jews seeking refuge from World War I. The Molokan, a minority sect of Russian Christians who immigrated to Los Angeles between 1904 and '08 in order to avoid religious persecution and military conscription, settled in the "flats" where Aliso Village and Pico Gardens were later constructed. This area of Boyle Heights represented the largest concentration of Molokans in the United States until the 1940s, when the primary Molokan church was relocated to the eastern edge of Boyle Heights and members of the Molokan community migrated eastward, eventually re-settling in unincorporated East Los Angeles.

While no one ethnic group comprised a majority of Boyle Heights' population in the first half of the twentieth century, Boyle Heights became well-known as the epicenter of Los Angeles Jewish community during this time and boasted one of the largest Jewish populations in the western United States. Most restrictive covenants that applied to ethnic and racial minorities also discriminated against those of Jewish lineage, which steered Jewish immigrants toward the relatively-unrestricted housing market of Boyle Heights. Generally, the Jewish population settled in the northern section of Boyle Heights, near the Brooklyn Avenue corridor; Brooklyn Avenue abounded with Jewish-owned businesses and institutions, and the intersection of Brooklyn Avenue and Soto Street emerged as the heart of Jewish Los Angeles. Synagogues, meeting halls, and cultural institutions that served the Jewish population also arose in the vicinity. Over time, as demographics have changed and the Jewish community moved to other parts of the city, most of these businesses and institutions have evolved to meet the needs of changes in population; however, resources such as the Breed Street Shul (HCM #359) remain extant and offer tangible connections to this chapter in the area's rich cultural history.

The construction of an expansive freeway network throughout Southern California after World War II drastically altered the configuration and physical character of Boyle Heights. Five freeways and the multi-level East Los Angeles Interchange were routed through Boyle Heights between 1948 and 1965. Entire blocks were razed to make way for the Interstate 10 (San Bernardino), Interstate 5 (Golden State), US Route

---

3 Los Angeles Times. February 22, 2010. *Boyle Heights Celebrates its Ethnic Diversity.* URL: https://www.latimes.com/archives/la-xpm-2010-feb-22-la-me-boyle-heights22-2010feb22-story.html. Accessed September, 2020.

101 (Santa Ana), and State Route 60 (Pomona) freeways, which together consumed some fifteen percent of the total land area within Boyle Heights and culminated in the displacement of thousands of families. The largely at- and above-grade corridors truncated once-through streets and carved the once-cohesive community into multiple sections that became physically disjointed.

The area experienced significant demographic and cultural shifts during this time as well. These shifts can be attributed to a myriad of factors including the internment of California's Japanese American population during World War II as well as the easing of race restrictive covenants in the 1950s, which allowed Jewish households to move to other parts of the city including the San Fernando Valley and the Westside; this in turn led to the exodus of Boyle Heights's Japanese and Jewish populations. Other ethnic and religious groups with roots in the area had moved away from Boyle Heights by this time as well. However, for the most part the community's Latino population remained, largely due to language barriers, income inequality, fewer job opportunities, and a real estate market that continued to discriminate against certain racial and ethnic minorities. Economic changes and civil unrest that afflicted Mexico and Central America ushered in new waves of immigration to Los Angeles and particularly Boyle Heights beginning in the 1970s. The area subsequently evolved into a predominantly Latino community and a destination for new immigrants arriving from Mexico and, to a lesser extent, Central America; the population of Boyle Heights today is 94 percent Latino and 52 percent foreign-born.

Boyle Heights' demographic and cultural transformation in the second half of the twentieth century is manifest in the area's built environment. The Mexican American All Wars Memorial, an obelisk that honors Mexican American soldiers who served in the U.S. Armed Forces, was erected in 1947 at the intersection of Brooklyn Avenue, Indiana Street, and Lorena Street, an area that came to be known to those within the community as "Cinco Puntos." Businesses and institutions that historically catered to the area's Japanese and Jewish populations were repurposed to serve a largely-Latino clientele. New cultural institutions arose and became significant in their own right, including Mariachi Plaza (1993), a gathering place for local mariachi musicians. Boyle Heights emerged as a focal point for Chicano activism in the 1960s and '70s and contains a rich and expressive collection of murals painted by a variety of local Chicano artists. In 1994, Brooklyn Avenue was renamed César E. Chavez Avenue in honor of the iconic Mexican American labor leader and civil rights activist.

Additional changes to Boyle Heights' built environment have occurred in recent years. Due to their ongoing deterioration and issues related to gang violence and crime, the Aliso Village and Pico Gardens public housing projects, of which both had been prominent elements of Boyle Heights' urban fabric since the 1940s, were demolished and replaced with new residential complexes. Pico Gardens retains its name and its historical use as public housing, but Aliso Village was reconstructed as a mixed-income development called Pueblo del Sol that reflects contemporary trends in the design and operation of subsidized housing.

In the early 2000s, the Metropolitan Transportation Authority (Metro) extended the Gold Line light rail corridor eastward through the CPA via First Street which includes four stops in Boyle Heights. The Gold Line Extension has provided residents with more direct access to the central city and adjacent communities and has also helped to reinvigorate the local economy.

Existing Conditions

Cultural Resources

Los Angeles contains a wide range of cultural resource types spanning the entire history of Los Angeles from pre-colonization, through the Spanish pueblo era, the Mexican era, and the American era. Cultural heritage can be generally categorized as "tangible" or "intangible." Tangible cultural heritage includes the movable and immovable physical representations of heritage, including objects, archaeological sites, buildings, structures, districts, and landscapes. Intangible cultural heritage includes those aspects of heritage that are more ephemeral, such as events, traditions, organizations, knowledge, and the interaction between communities and their environment. Intangible cultural heritage is not a regulated category and intangible resources cannot be identified as historical resources under CEQA, but they can inform the significance of tangible cultural resources.

SurveyLA identifies potentially historic properties and/or districts that appear eligible for listing in the National Register, California Register, and/or for local designation as a Historic-Cultural Monument (HCM). In 2005, the City of Los Angeles entered into a multi-year grant agreement with the J. Paul Getty Trust to complete a Citywide historic resources survey, a process of systematically identifying and gathering information on properties and neighborhoods that reflect Los Angeles' architectural, social, and cultural history. SurveyLA findings are subject to change over time as properties age, additional information is uncovered, and more detailed analyses are completed. Resources identified through SurveyLA are not designated resources; however, Survey LA resources with a DPR Code of 1-5 have been determined potentially eligible for listing in a local, state or national register either individually or as a contributor to a potential historic district. Designation by the City of Los Angeles and nomination to the California Register or National Register require more in-depth research, an application process, and a separate public review process.

SurveyLA identifies the following resource types:

- **Residential Properties**. Many of the residential properties that were identified as individually eligible resources are single-family residences that date to the late nineteenth and early twentieth centuries and reflect the area's earliest settlement patterns. Generally, these houses are located in established neighborhoods where most other buildings have been substantially altered, thus making intact

examples of early residences relatively uncommon. Many of the single-family houses that were identified as individually eligible were also evaluated as examples of various Late Victorian and Arts and Crafts architectural styles. A number of multi-family residential properties were also identified as individually eligible resources as rare examples of their respective property type, though a few were also evaluated for their architectural merit. In addition, five residential historic districts and one residential planning district were identified in the Survey Area. Four of these districts were identified as significant examples of streetcar suburbanization that reflect development patterns associated with early advances in mass transit; one of these districts also contains a notable concentration of intact late nineteenth and early twentieth century residential architecture.

- **Commercial Properties**. Most commercial development in the Survey Area is concentrated along linear corridors that historically were served by electric streetcars. Historical surveys identified four neighborhood markets and one walk-up food stand that exemplify their respective property type; one 1930s service station and one 1940s repair garage that are significant examples of early automobile development; two intact streetcar commercial buildings that had not been previously evaluated; and several long-term businesses that contribute to Boyle Heights' cultural and commercial identity.

- **Industrial Properties.** Industrial development in Boyle Heights is largely confined to the area's south and west perimeters, which were also included in the CRA/LA's historic resources survey and were not re-evaluated. One industrial property located outside of the previously-surveyed industrial zones, a former powerhouse for the Los Angeles Railway, was identified as part of this survey.

- **Institutional Properties**. Public and private institutional properties represent the second most common resource type identified in the Survey Area, surpassed only by residences. Eligible institutional property types were recorded both as individual resources and districts, depending on the number of significant resources present at a given site. Institutional resources that were identified in the Survey Area consist largely of religious and educational facilities. Twenty-two churches and religious campuses were identified and were generally evaluated as rare examples of early institutional development in the area, for longstanding associations with particular ethnic and cultural groups. Other institutional resources that were identified include three municipal parks and recreation centers; two cultural centers and meeting halls associated with the area's Latino and Jewish communities; two former healthcare facilities, including a medical clinic and a sanitarium; one Department of Water and Power distributing station; one settlement house affiliated with the Catholic church; one parsonage that served an adjacent church; and one cemetery that dates to the late nineteenth century and is among the city's oldest burial grounds.

- **Other Properties**. The survey identified several resources that are not located on legal parcels and thus cannot be categorized under any of the aforementioned property types. These resources include five air raid sirens associated with civil defense efforts during World War II and the Cold War; five notable examples of pedestrian infrastructure including tunnels, bridges, and stairways; a war memorial associated with the Latino community that was installed in the 1940s; an intact retaining wall that spans the length of a residential subdivision from 1904; and a linear grouping of early utility poles that feature distinctive geometric details in their design.

The City's online database, HistoricPlacesLA, has identified a high concentration of designated resources in the CPA. These designated resources include properties listed in the National Register, California Register, and locally designated City HCMs. **Figure 4.4-1, Boyle Heights CPA Historical Resources**, displays known eligible and designated historical resources located in the Boyle Heights CPA. **Figure 4.4-2, Resources Identified by SurveyLA,** displays the locations of districts, non-parcel resources, and individual eligible resources in the Boyle Heights CPA that were identified by SurveyLA as potentially eligible for historic designation.

Intensive Historic Resources Survey

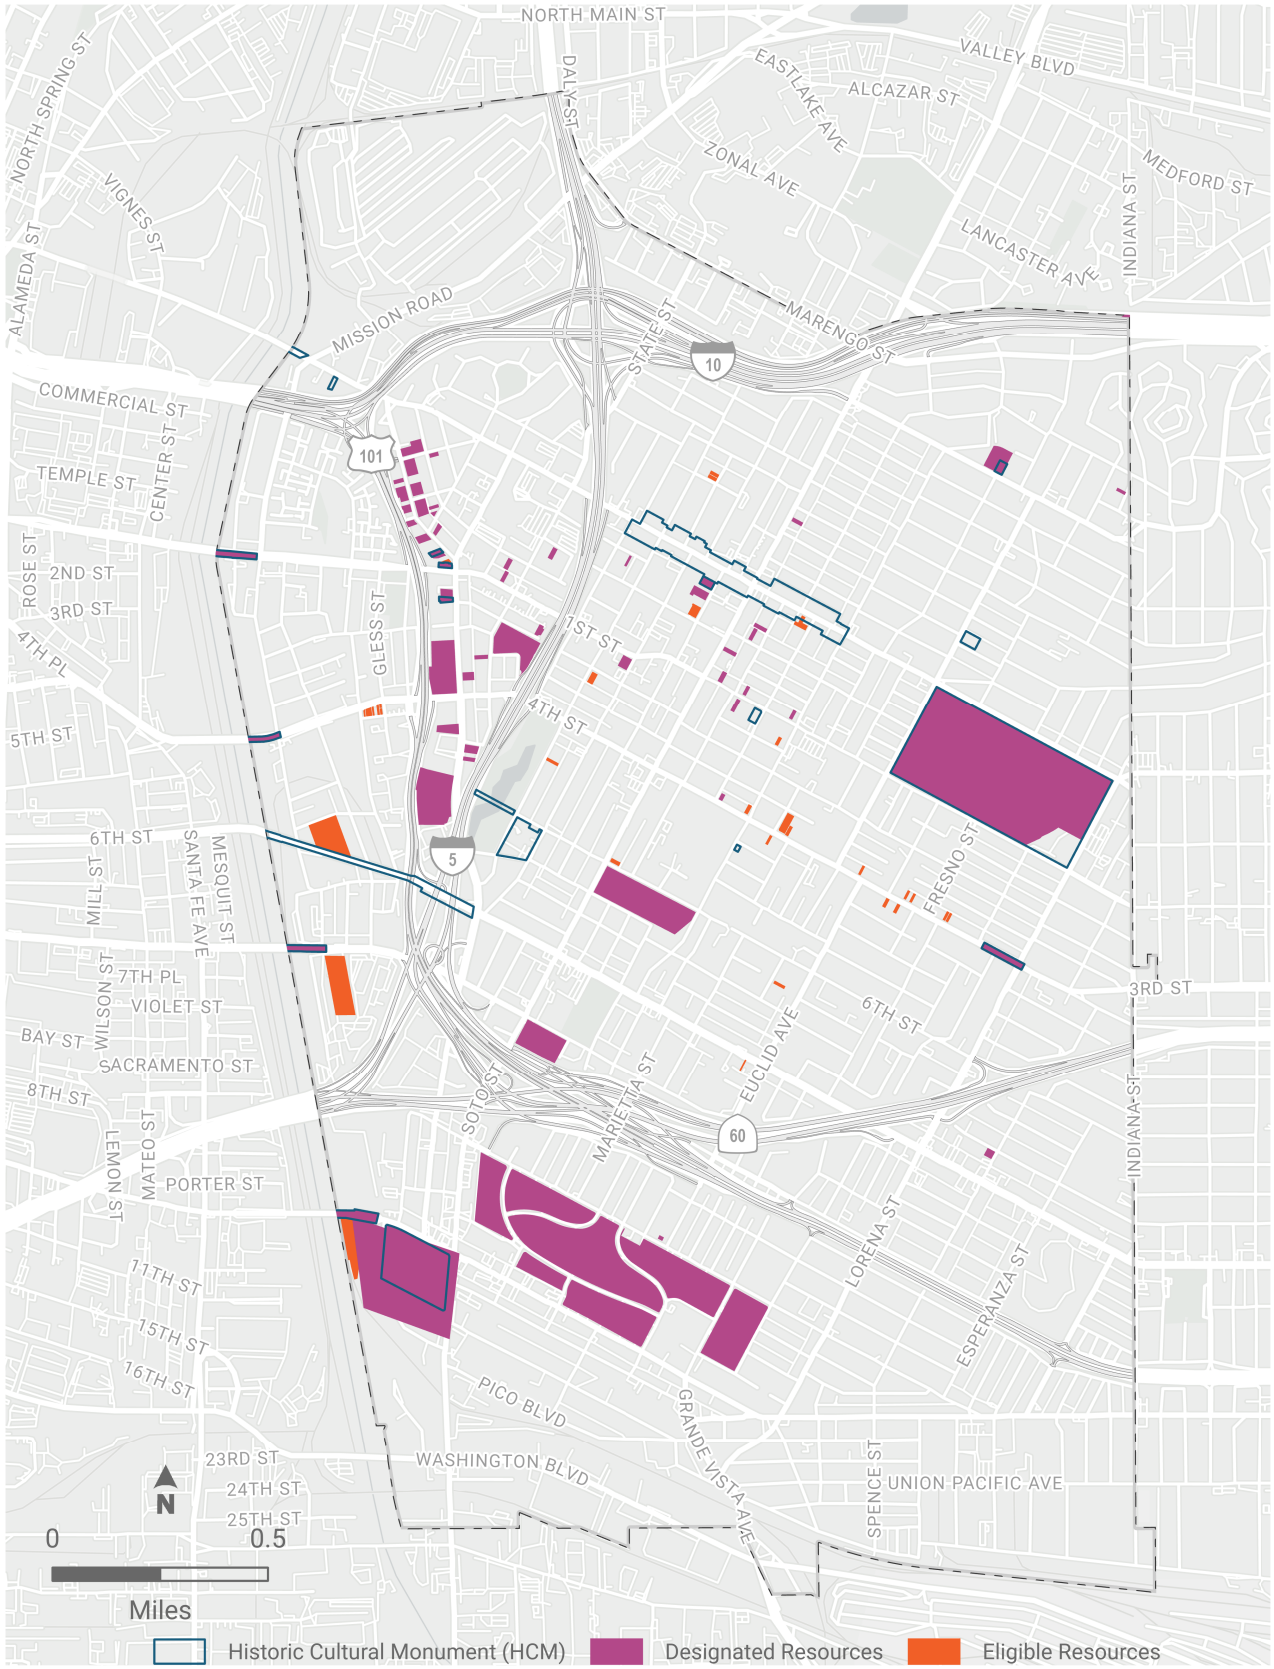
In addition to SurveyLA, the Intensive Historic Resources Survey was prepared for the former City of Los Angeles Community Redevelopment Agency (CRA) in July of 2008. The purpose of the Intensive Historic Resources Survey was to identify and evaluate historic properties within the Adelante Eastside Redevelopment Project Area and provide the CRA with recommendations regarding the eligibility of resources within the area for listing in the National Register of Historic Places, California Register of Historical Resources, and the Los Angeles Historic-Cultural Monuments Register.[4]

The CRA project area, which covers only a portion of the Plan Area, is made up of a mix of low- to moderate-density urban uses, including residential, commercial, and industrial resources dating from the 1880s through the 1950s, as well as some later infill development. Commercial development is concentrated along the major east-west streets, avenues and boulevards, while industrial uses are generally concentrated near the Los Angeles River and in the southern portion of the CPA. Residential architecture, including single-family dwellings as well as mixed-use buildings, exists along the commercial corridors and in some scattered locations within the industrial areas. A total of 153 parcels in the study area were identified as eligible historic properties either individually or as contributors in a historic district. A total of 131 properties were identified as individually eligible and 22 properties were identified solely as contributors

4 Community Redevelopment Agency. 2008. *Intensive Historic Resources Survey Adelante Eastside Redevelopment Los Angeles, California.* Available online at: https://planning.lacity.org/odocument/3af5db3a-d7cd-4ea7-86d9-28f7f1893647/Adelante_Draft_Report_revised_FINAL_print_0.pdf .

to an historic district. The survey also identified four potentially eligible historic districts, including two industrial districts (Hostetter and 500-600 South Anderson), one medical and institutional district (County/USC Medical Center), and one commercial district (Cesar E. Chavez) which are described below.

Hostetter Industrial District



The potential district is situated along the 2700-3100 blocks of East 11th and East 12th Streets, and 1500 South Evergreen Avenue in the southwest portion of Boyle Heights near the Los Angeles River is a grouping of 19 primarily one-story industrial buildings representing various architectural styles that were erected between 1931 and 1946. Architecturally distinctive contributors are representative examples of the Spanish Colonial Revival, Art Deco, Streamline Moderne, and Moderne styles. Each of the district's potential contributors is representative of the industrial architecture and urban history of the middle decades of the 20th century in Los Angeles. The first important business to establish itself in the Hostetter Industrial District was the Sears Roebuck Company in 1927. Sears finished the 12-story Art Deco style building in 1928 and it became a beacon for industrial businesses on the eastside of the City.

500-600 South Anderson Street Industrial Business District

The potential district is situated at 1600 East 6th Street, 601 South Clarence Street, and along the 500-600 blocks of South Anderson Street in the west portion of Boyle Heights near the Los Angeles River is a grouping of 11 one-, two-, and thee-story industrial buildings representing various architectural styles that were erected between 1916 and 1947. Architecturally distinctive contributors are representative examples of the utilitarian industrial and Moderne styles. Each of the district's potential contributors is representative of the industrial architecture and urban history of the first half of the 20th century in Los Angeles. Together these properties constitute a significant concentration of associated historical resources.

Commercial District (Cesar Chavez Business District)

The potential district runs between Cummings Street and Mott Street along Cesar Chavez Avenue and includes 90 parcels. Each of the 90 parcels was designated a City of Los Angeles Historic Cultural Monument as contributors to the Brooklyn Avenue Neighborhood Corridor in 1994. Cesar Chavez Avenue was originally known as Brooklyn Avenue, named after Brooklyn, New York, and its commercial corridor was known as the Brooklyn Avenue Neighborhood Corridor. The commercial district consists of 32 commercial buildings located along Cesar Chavez Avenue that were constructed between 1906 and 1939. The existing potential contributing buildings were constructed to accommodate the commercial needs of the Boyle Heights neighborhood as it developed during the first half of the 20th century.

Historic-Cultural Monuments (HCMs)

The City of Los Angeles Historic-Cultural Monuments designation recognizes buildings, structures, sites, or plant life as important to the history of the city, state, or nation. The City's Office of Historic Resources has recorded over 1,000 HCMs citywide, providing official recognition and protection for Los Angeles' most significant historic resources. **Table 4.4-1, Historic Cultural Monuments within the Boyle Heights CPA,** lists the registered monuments in the CPA. HCM designations are reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature. A historical or cultural monument is any site (including significant trees or other plant life located thereon), building, or structure of particular historical or cultural significance to the City of Los Angeles, as established and defined by the Cultural Heritage Ordinance and officially designated by the City Council as a Historic Cultural Monument in accordance with Sec. 22.171.10. Procedures for Designation of Monuments of the Los Angeles Administrative Code.[5] The location of HCMs within the CPA are shown in **Figure 4.4-1, Boyle Heights CPA Historical Resources.**

National and California Registers of Historic Places

The National Register of Historic Places (National Register) includes buildings, structures, objects, sites, and districts of local, state, or national significance in American history, architecture, archeology, engineering, and culture. The National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect historic and archeological resources. The National Register is administered by the National Park Service, which is part of the U. S. Department of the Interior. The California Register of Historical Resources (California Register) includes buildings, sites, structures, objects and districts significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural history of California. The California Register is the authoritative guide to the state's significant historical and archeological resources. The California Register program determines eligibility for state historic preservation grant funding and affords certain protections under the California Environmental Quality Act.

Seven buildings, located in the CPA, were identified in the National Register[6] and were also included as HCMs in the California Register. There are no additional resources that were included in the California Register. The National Register-listed buildings in the CPA include the following:

- Boyle Hotel
- Congregation Talmud Torah of Los Angeles
- Forsythe Memorial School for Girls
- Malabar Library
- Linda Vista Community Hospital

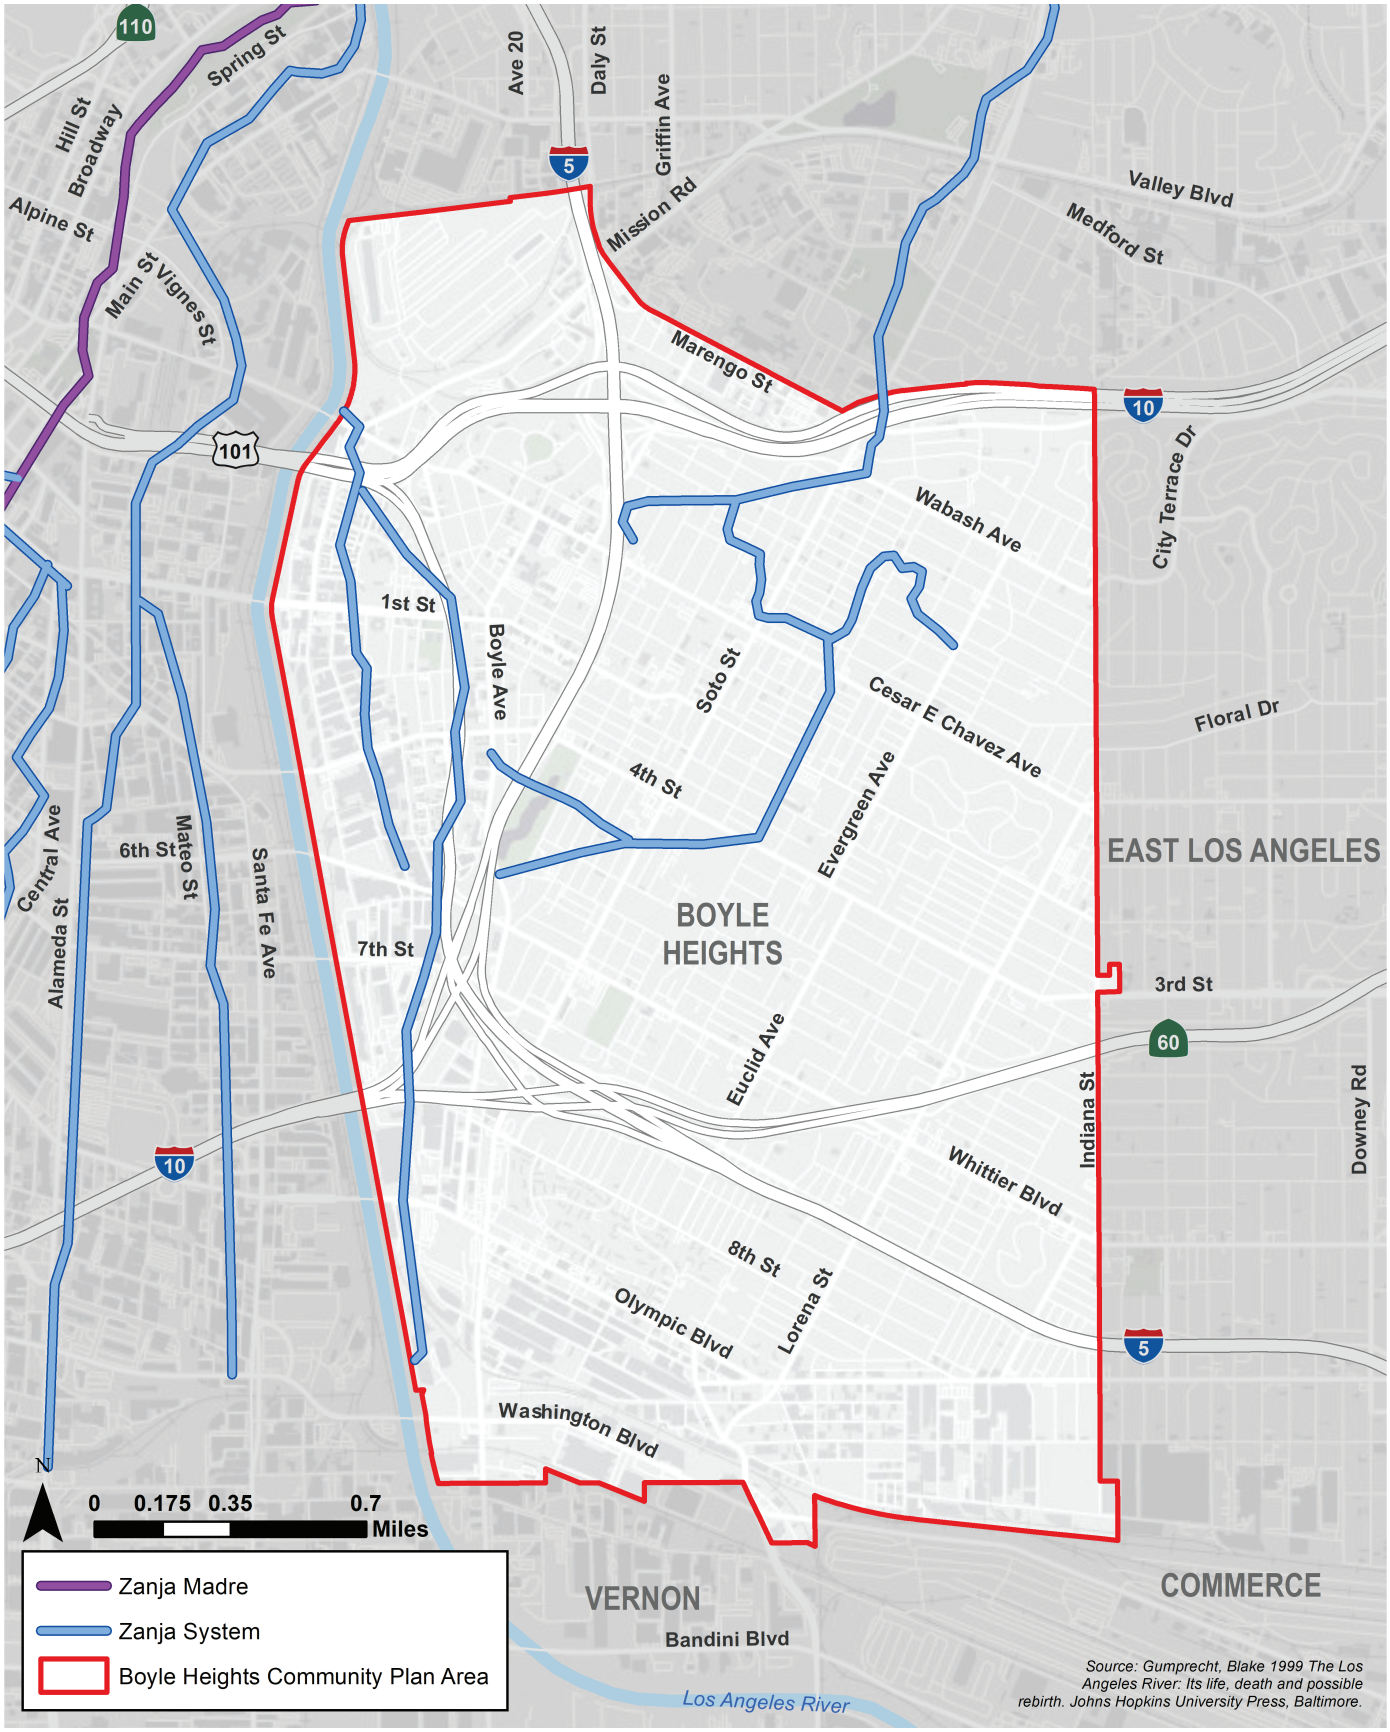
- Sears, Roebuck & Company Mail Order Building
- Robert Louis Stevenson Library

Historic Preservation Overlay Zones (HPOZs)

A Historic Preservation Overlay Zone, or HPOZ, is an area of the city which is designated as containing structures, landscaping, natural features or sites having historic, architectural, cultural or aesthetic significance. To receive such designation, areas must be adopted as an HPOZ by the City Planning Commission and the City Council through a zone change procedure that includes notification of all affected and nearby property owners and public hearings. Once designated, areas have an HPOZ overlay added to their zoning, and are subject to special regulations under Section 12.20.3 of the Los Angeles Municipal Code.

The Boyle Heights CPA currently does not contain any HPOZs within its boundaries.

Archaeological Resources



Pre-historic and historic archaeological sites exist throughout the City and may also exist in the Boyle Heights CPA. Hunter-gatherer tribes inhabited the Los Angeles region long before Europeans arrived. Remnants of their various cultures continue to be unearthed and documented. Before the Spaniards arrived, portions of the City, including the CPA was inhabited by the Tongva people, who may have left behind archaeological resources that may still exist within the CPA. Gabrielino territory included the watersheds of the San Gabriel, Santa Ana, and Los Angeles rivers; portions of the Santa Monica and Santa Ana mountains; the Los Angeles basin; the coast from Aliso Creek to Topanga Creek; and San Clemente, San Nicolas, and Santa Catalina Islands.

The remains of the "Zanja Madre" are believed to be potentially present within portions of the CPA running east from the Los Angeles River into and through areas near Hollenbeck Park, Mott Street, Brooklyn Heights neighborhood, and the Sears building site (see **Figure 4.4-3, Zanja Madre System**). The Zanja Madre was the original open ditch aqueduct that served Pueblo de Los Angeles, generally abandoned by 1904.[7] Sections of the Zanja Madre have been uncovered through various projects in the area, including discovery of sections of the brick Zanja Madre during construction of the Metro Gold Line in 2005.[8]

Zanja Madre Systeme

1264.003•06/2022

Archaeological resources from communities that previously inhabited the land may still exist within the CPA and are protected by various federal, state, and local regulations that have been promulgated to protect archaeological sites and resources. Although the City's General Plan calls for mapping of known pre-historic sites, all mapping of known pre-historic sites is confidential, pursuant to California Government Code Section 6254.10. This is to protect sites from disturbance, scavenging, and vandalism.

Human Remains

The Evergreen Cemetery is a Los Angeles County designated cemetery and is located within the boundaries of the CPA. Evergreen Cemetery is a focal point in the CPA and is located at the eastern end of Boyle Heights. Evergreen is roughly 67 acres in size and as one of the City's first and oldest cemetery, this scenic landmark holds significant cultural and historical values to the neighborhood. Odd Fellows Cemetery is also within the boundaries of the CPA, located in southeast Boyle Heights. Located on a major east-west commercial corridor, the cemetery is approximately 21 acres site. The cemetery appears to be largely unaltered and retains its original configuration, site plan, and landscape features.

The CPA falls within the Los Angeles Basin, which includes the Mission-associated Native American history of Los Angeles. It was often Native American practice to bury people outside Mission grounds in informal cemeteries. However, the nearest mission is the San Gabriel Mission located approximately six miles northeast of the CPA. No known informal cemetery sites are located within the CPA.

4.4.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Cultural Resources at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- National Historic Preservation Act and National Register of Historic Places
- Secretary of the Interior's Standards
- Native American Graves Protection and Repatriation Act
- Archaeological Resources Protection Act
- California Environmental Quality Act
- California Register of Historical Resources
- California Health and Safety Code
- California Public Resources Code

- City of Los Angeles Conservation Element
- City of Los Angeles Cultural Heritage Ordinance
- City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance
- City of Los Angeles Historic Resources Survey (SurveyLA)

Federal

National Historic Preservation Act and National Register of Historic Places

The National Historic Preservation Act of 1966 established the National Register of Historic Places (National Register) as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment."[9] The National Register recognizes a broad range of cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes. Within the National Register, approximately 2,500 (3 percent) of the more than 90,000 districts, buildings, structures, objects, and sites are recognized as National Historic Landmarks or National Historic Landmark Districts as possessing exceptional national significance in American history and culture.[10]

Whereas individual historic properties derive their significance from one or more of the criteria discussed in the subsequent section, a historic district derives its importance from being a unified entity, even though it is often composed of a variety of resources. With a historic district, the historic resource is the district itself. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties.[11] A district is defined as a geographic area of land containing a significant concentration of buildings, sites, structures, or objects united by historic events, architecture, aesthetic, character, and/or physical development. A district's significance and historic integrity determine its boundaries. Other factors include:

11 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 5.

- Visual barriers that mark a change in the historic character of the area or that break the continuity of the district, such as new construction, highways, or development of a different character;

- Visual changes in the character of the area due to different architectural styles, types, or periods, or to a decline in the concentration of contributing resources;

- Boundaries at a specific time in history, such as the original city limits or the legally recorded boundaries of a housing subdivision, estate, or ranch; and

- Clearly differentiated patterns of historical development, such as commercial versus residential or industrial.[12]

Within historic districts, properties are identified as contributing and non-contributing. A contributing building, site, structure, or object adds to the historic associations, historic architectural qualities, or archaeological values for which a district is significant because:

- It was present during the period of significance, relates to the significance of the district, and retains its physical integrity; or

- It independently meets the criterion for listing in the National Register.

A resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the National Historic Preservation Act.

Criteria

To be eligible for listing in the National Register, a resource must be at least 50 years of age, unless it is of exceptional importance as defined in Title 36 CFR, Part 60, Section 60.4(g). In addition, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Four criteria for evaluation have been established to determine the significance of a resource:

- Are associated with events that have made a significant contribution to the broad patterns of our history;

- Are associated with the lives of persons significant in our past;

[12] United States Department of the Interior, National Register Bulletin #21: Defining Boundaries for National Register Properties Form, 1997, page 12.

- Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

- Have yielded, or may be likely to yield, information important in prehistory or history.[13]

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. National Register Bulletin #15 states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear."[14] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to meeting one or more of the criteria of significance, a property must have integrity, which is defined as "the ability of a property to convey its significance."[15] The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. In general, the National Register has a higher integrity threshold than State or local registers.

In the case of districts, integrity means the physical integrity of the buildings, structures, or features that make up the district as well as the historic, spatial, and visual relationships of the components. Some buildings or features may be more altered over time than others. In order to possess integrity, a district must, on balance, still communicate its historic identity in the form of its character defining features.

13 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 8.

14 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, pages 7 and 8.

15 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 44.

Criteria Considerations

Certain types of properties, including religious properties, moved properties, birthplaces or graves, cemeteries, reconstructed properties, commemorative properties, and properties that have achieved significance within the past 50 years are not considered eligible for the National Register unless they meet one of the seven categories of Criteria Considerations A through G, in addition to meeting at least one of the four significance criteria discussed above, and possess integrity as defined above.[16] Criteria Consideration G is intended to prevent the listing of properties for which insufficient time may have passed to allow the proper evaluation of their historical importance.[17] The full list of Criteria Considerations is provided below:

- A religious property deriving primary significance from architectural or artistic distinction or historical importance; or
- A building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or
- A birthplace or grave of a historical figure of outstanding importance, if there is no other appropriate site or building directly associated with his or her productive life; or
- A cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
- A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
- A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historical significance; or
- A property achieving significance within the past 50 years if it is of exceptional importance.

16 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 25.

17 United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 41.

Secretary of the Interior's Standards

The National Park Service issued the Secretary of the Interior's Standards with accompanying guidelines for four types of treatments for historic resources: Preservation, Rehabilitation, Restoration, and Reconstruction. The most applicable guidelines should be used when evaluating a project for compliance with the Secretary of the Interior's Standards. Although none of the four treatments, as a whole, apply specifically to new construction in the vicinity of historic resources, Standards #9 and #10 of the Secretary of the Interior's Standards for Rehabilitation provides relevant guidance for such projects. The Standards for Rehabilitation are as follows:

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.

2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.

3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.

4. Changes to a property that have acquired significance in their own right will be retained and preserved.

5. Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.

6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

9. New additions, exterior alterations, or related new construction will not destroy historic

10. materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.

11. New additions and adjacent or related new construction will be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.[18]

It is important to note that the Secretary of the Interior's Standards are not intended to be prescriptive but, instead, provide general guidance. They are intended to be flexible and adaptable to specific project conditions to balance continuity and change, while retaining materials and features to the maximum extent feasible. Their interpretation requires exercising professional judgment and balancing the various opportunities and constraints of any given project. Not every Standard necessarily applies to every aspect of a project, and it is not necessary for a project to comply with every Standard to achieve compliance.

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (NAGPRA) requires federal agencies to return Native American cultural items to the appropriate Federally recognized Indian tribes or Native Hawaiian groups with which they are associated.[19]

Archaeological Resources Protection Act

The Archaeological Resources Protection Act (ARPA) of 1979 governs the excavation, removal, and disposition of archaeological sites and collections on federal and Native American lands. This act was most recently amended in 1988. ARPA defines archaeological resources as any material remains of human life or activities that are at least 100 years of age, and which are of archeological interest. ARPA makes it illegal for anyone to excavate, remove, sell, purchase, exchange, or transport an archaeological resource from federal or Native American lands without a proper permit.[20]

State

California Environmental Quality Act

The California Environmental Quality Act (CEQA) is the principal statute governing environmental review of projects occurring in the state and is codified in Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA Section 21084.1, a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.

Public Resources Code Section 21084.1 provides:

> *[A]n historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources. Historical resources included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, are presumed to be historically or culturally significant for purposes of this section, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. The fact that a resource is not listed in, or determined to be eligible for listing in, the California Register of Historical Resources, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1 shall not preclude a lead agency from determining whether the resource may be an historical resource for purposes of this section.*

CEQA Guidelines Section 15064.5 recognizes that historical resources include: (1) resources listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources; (2) resources included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any objects, buildings, structures, sites, areas, places, records, or manuscripts which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

If a lead agency determines that an archaeological site is a historical resource, the provisions of PRC Section 21084.1 and *CEQA Guidelines* Section 15064.5 apply. If an archaeological site does not meet the criteria for a historical resource contained in the *CEQA Guidelines*, then the site may be treated in accordance with the provisions of PRC Section 21083, if it meets the criteria of a unique archaeological resource. As defined in PRC Section 21083.2, a unique archaeological resource is an archaeological artifact, object, or site, about

which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If an archaeological site meets the criteria for a unique archaeological resource as defined in PRC Section 21083.2, then the site is to be treated in accordance with the provisions of PRC Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place.[21] If preservation in place is not feasible, mitigation measures shall be required. The *CEQA Guidelines* note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment.[22]

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in *CEQA Guidelines* Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired."[23] According to *CEQA Guidelines* Section 15064.5(b)(2), the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

B. Account for its inclusion in a local register of historical resources pursuant to PRC Section 5020.1(k) or its identification in a historical resources survey meeting the requirements of PRC Section 5024.1(g)

22 *State CEQA Statute and Guidelines*, Section 15064.5(c)(4).

23 *State CEQA Guidelines*, Section 15064.5(b)(1).

Code, unless the public agency reviewing the effects of the project establishes a preponderance of evidence that the resource is not historically or culturally significant; or

C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a Lead Agency for purposes of CEQA.

In general, a project that complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings is considered to have impacts that are less than significant.[24]

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[25] The California Register was enacted in 1992, and its regulations became official on January 1, 1998. The California Register is administered by the California Office of Historic Preservation (OHP). The criteria for eligibility for the California Register are based upon National Register criteria. Certain resources are determined to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must meet one of the criteria of significance described above and retain enough of its historic character or appearance (integrity) to be recognizable as a historical

---

24 *State CEQA Guidelines*, 15064.5(b)(3).

25 California Public Resources Code, Section 5024.1[a]. http://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=PRC&sectionNum=5024.1. Accessed May 16, 2022.

resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historic districts; and
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

California Health and Safety Code

California Health and Safety Code Sections 7050.5, 7051, and 7054 address the illegality of interference with human burial remains (except as allowed under applicable PRC Sections), and the disposition of Native American burials in archaeological sites. These regulations protect such remains from disturbance, vandalism, or inadvertent destruction, and establish procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including treatment of the remains prior to, during, and after evaluation, and reburial procedures.

California Public Resources Code (PRC)

PRC Sections 5097.5, 5097.9, and 5097.98-99

PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that:

No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

PRC Section 5097.9 establishes the California Native American Heritage Commission (NAHC) to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. NAHC is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid state agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally administered lands in California.

PRC Sections 5097.98-99 require that the NAHC be consulted whenever Native American graves or human remains are found. According to these sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984.

California Code of Regulations, Title 14, Section 4307 and Section 1427. Title 14, Section 4307 states that "no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces. Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave."

California Penal Code Section 6221/2

California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

California Penal Code Section 623

California Penal Code Section 623 provides the following: "Except as otherwise provided in Section 599c, any person who, without the prior written permission of the owner of a cave, intentionally and knowingly does any of the following acts is guilty of a misdemeanor punishable by imprisonment in the county jail not exceeding one year, or by a fine not exceeding one thousand dollars ($1,000), or by both such fine and imprisonment: (1) breaks, breaks off, cracks, carves upon, paints, writes or otherwise marks upon or in any manner destroys, mutilates, injures, defaces, mars, or harms any natural material found in any cave. (2) disturbs or alters any archaeological evidence of prior occupation in any cave. (3) kills, harms, or removes any animal or plant life found in any cave. (4) burns any material which produces any smoke or gas which is harmful to any plant or animal found in any cave. (5) removes any material found in any cave. (6) breaks, forces, tampers with, removes or otherwise disturbs any lock, gate, door, or any other structure or obstruction designed to prevent entrance to any cave, whether or not entrance is gained.

Assembly Bill (AB) 52

AB 52 specifies that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. AB 52 requires that a lead agency consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a project prior to the determination of whether a negative declaration, mitigated negative declaration, or environmental impact report is required for a project. Furthermore, it provides examples of mitigation measures that may be considered to mitigate any impact. These provisions are applicable to projects that have a notice of preparation (NOP) for an environmental impact or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015.

Local

City of Los Angeles Conservation Element

The City of Los Angeles General Plan includes a Conservation Element. Section 3 of the Conservation Element, adopted in September 2001, includes policies for the protection of archaeological resources. As stated therein, it is the City's policy that archaeological resources be protected for research and/or educational purposes. Section 5 of the Conservation Element recognizes the City's responsibility for identifying and protecting its cultural and historical heritage. The Conservation Element establishes the policy to continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities, with the related objective to protect

important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.[26]

In addition to the National Register and the California Register, two additional types of historic designations may apply at a local level:

1. Historic-Cultural Monument (HCM)

2. Classification by the City Council as a Historic Preservation Overlay Zone (HPOZ)

Policies from the Conservation Element related to paleontological, archaeological, and historical resources are listed in **Table 4.4-2, Relevant General Plan Cultural Resources Goals, Objectives, and Policies**.

Table 4.4-2
Relevant General Plan Cultural Resources Goals, Objectives, and Policies

Conservation Element – Archaeological and Paleontological	
Objective	Protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.
Policy	Continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities.
Conservation Element – Cultural and Historical	
Objective	Protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.
Policy	Continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition or property modification activities.

City of Los Angeles Cultural Heritage Ordinance

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and most recently amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (CHC) and criteria for designating an HCM. The CHC is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The City of Los Angeles Cultural Heritage Ordinance states that a HCM designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet

26 City of Los Angeles, Conservation Element of the General Plan, pages II-3 to II-5. https://planning.lacity.org/odocument/28af7e21-ffdd-4f26-84e6-dfa967b2a1ee/Conservation_Element.pdf. Accessed May 16, 2022.

one of the following criteria. A historical or cultural monument is any site, building, or structure of particular historical or cultural significance to the City of Los Angeles. The four criteria for HCM designation are stated below:

- The proposed HCM reflects the broad cultural, economic, or social history of the nation, state or community is reflected or exemplified; or
- The proposed HCM is identified with historic personages or with important events in the main currents of national, state or local history; or
- The proposed HCM embodies the characteristics of an architectural type specimen inherently valuable for a study of a period, style or method of construction;
- The proposed HCM is the notable work of a master builder, designer, or architect whose individual genius influenced his or her age.[27]

A proposed resource may be eligible for designation if it meets at least one of the criteria above. When determining historic significance and evaluating a resource against the Cultural Heritage Ordinance criteria above, the CHC and Office of Historic Resources (OHR) staff often ask the following questions:

- Is the site or structure an outstanding example of past architectural styles or craftsmanship?
- Was the site or structure created by a "master" architect, builder, or designer?
- Did the architect, engineer, or owner have historical associations that either influenced architecture in the City or had a role in the development or history of Los Angeles?
- Has the building retained "integrity"? Does it still convey its historic significance through the retention of its original design and materials?
- Is the site or structure associated with important historic events or historic personages that shaped the growth, development, or evolution of Los Angeles or its communities?
- Is the site or structure associated with important movements or trends that shaped the social and cultural history of Los Angeles or its communities?

Unlike the National and California Registers, the Cultural Heritage Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice, the seven aspects of

27 City of Los Angeles, Los Angeles Administrative Code, Section 22.171.7.

integrity from the National Register and California Register are applied similarly and the threshold of integrity for individual eligibility is similar. It is common for the CHC to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

In addition, the LAMC Section 91.106.4.5 states that the Los Angeles Department of Building and Safety "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the CEQA Initial Study and Check List, as specified in Section 19.05 of the LAMC. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure."[28] Under Section 91.106.4.5.1 of the LAMC, permits for the demolition of a building or structure that are over 45 years old will not be issued unless abutting properties owners and occupant, and the City Council District Office, and the Certified Neighborhood Council representing the site are notified in writing and a public notice of application for demolition has been posted at the site at least 60 days prior to the date of issuance of the demolition of building or structure permit.

City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance

The Los Angeles City Council adopted the ordinance enabling the creation of HPOZs in 1979; most recently, this ordinance was amended in 2017. An HPOZ is a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development.[29] Each HPOZ is established with a Historic Resources Survey, a historic context statement, and a preservation plan. The Historic Resources Survey identifies all Contributing and Non-Contributing features and lots. The context statement identifies the historic context, themes, and subthemes of the HPOZ as well as the period of significance. The preservation plan contains guidelines that inform appropriate methods of maintenance, rehabilitation, restoration, and new construction. Contributing Elements are defined as any building, structure, Landscaping, or Natural Feature identified in the Historic Resources Survey as contributing to the Historic significance of the HPOZ, including a building or structure which has been

28 City of Los Angeles, Los Angeles Municipal Code, Section 91.106.4.5.1.

29 City of Los Angeles, Los Angeles Municipal Code, Section 12.20.3.

altered, where the nature and extent of the Alterations are determined reversible by the Historic Resources Survey.[30] For CEQA purposes, Contributing Elements are treated as contributing features to a historic district, which is the historical resource. Non-Contributing Elements are any building, structure, Landscaping, Natural Feature identified in the Historic Resources Survey as being built outside of the identified period of significance or not containing a sufficient level of integrity. For CEQA purposes, Non-Contributing Elements are not treated as contributing features to a historical resource.

City of Los Angeles Historic Resources Survey (SurveyLA)

SurveyLA is a Citywide survey that identifies and documents potentially significant historical resources representing important themes in the City's history. The survey and resource evaluations were completed by consultant teams under contract to the City and under the supervision of the Department of City Planning's OHR. The program was managed by OHR, which maintains a website for SurveyLA. The field surveys cumulatively covered broad periods of significance, from approximately 1850 to 1980 depending on the location, and included individual resources such as buildings, structures, objects, natural features and cultural landscapes as well as areas and districts (archaeological resources are planned to be included in future survey phases). The survey identified a wide variety of potentially significant resources that reflect important themes in the City's growth and development in various areas including architecture, city planning, social history, ethnic heritage, politics, industry, transportation, commerce, entertainment, and others. Field surveys, conducted from 2010-2017, were completed in three phases by Community Plan area. However, SurveyLA did not survey areas already designated as HPOZs or areas already surveyed by Community Redevelopment Agencies. All tools, methods, and criteria developed for SurveyLA were created to meet state and federal professional standards for survey work.

Los Angeles' Citywide Historic Context Statement (HCS) was designed for use by SurveyLA field surveyors and by all agencies, organizations, and professionals completing historical resources surveys in the City of Los Angeles. The context statement was organized using the Multiple Property Documentation (MPD) format developed by the National Park Service for use in nominating properties to the National Register. This format provided a consistent framework for evaluating historical resources. It was adapted for local use to evaluate the eligibility of properties for city, state, and federal designation programs. The HCS used Eligibility Standards to identify the character defining, associative features and integrity aspects a property must retain to be a significant example of a type within a defined theme. Eligibility Standards also indicated the general geographic location, area of significance, applicable criteria, and period of significance associated with that type. These Eligibility Standards are guidelines based on knowledge of known significant examples of property types; properties do not need to meet all of the Eligibility

[30] City of Los Angeles, Los Angeles Municipal Code, Section 12.20.3.

Standards in order to be eligible. Moreover, there are many variables to consider in assessing integrity depending on why a resource is significant under the National Register, California Register or City of Los Angeles HCM eligibility criteria. SurveyLA findings are subject to change over time as properties age, additional information is uncovered, and more detailed analyses are completed. Resources identified through SurveyLA are not designated resources. Designation by the City of Los Angeles and nominations to the California or National Registers are separate processes that include property owner notification and public hearings.

Redevelopment Project Area Historic Resources Surveys

The Community Redevelopment Agency of the City of Los Angeles (CRA/LA) was established in 1948 to revitalize economically underserved areas within the City of Los Angeles by increasing the supply of low income housing, providing infrastructure for commercial and industrial development, and creating employment opportunities. To carry out these goals, CRA/LA adopts comprehensive plans for each Redevelopment Project Area. Some areas also include a historical resources survey that documents all of the historical resources--individual and districts--within the Redevelopment Project Area. These CRA/LA surveys were done independent of the City's SurveyLA effort, though some of the more recent surveys may have used the same methodology and technology that was used in SurveyLA. SurveyLA did not survey areas already surveyed by CRA/LA. Currently, there are 32 Redevelopment Project Areas throughout Los Angeles. On September 30, 2019, the Los Angeles City Council voted to adopt Ordinance No. 186325 to effectuate the transfer of land use related plans and functions of the CRA/LA to the City of Los Angeles. As a result, the Department of City Planning has jurisdiction over review of properties located within Redevelopment Project Areas as of November 11, 2019.

City of Los Angeles Cultural Heritage Master Plan

The City of Los Angeles Cultural Affairs Department developed a Cultural Heritage Master Plan, adopted by the City Council in 2000. The Master Plan contains numerous important policy recommendations on historic preservation in the City of Los Angeles, many of which have shaped the creation and early work of the Office of Historic Resources.

4.4.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to cultural resources if it would:

- Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5;

- Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5;

- Disturb any human remains, including those interred outside of dedicated cemeteries.

4.4.5 METHODOLOGY

The cultural resources analysis considers the presence and absence of known cultural resources, as well as the potential for significant cultural resources to occur, within the CPA and considers the potential impacts on such resources from adoption and implementation of the Proposed Plan.

The analysis of historical resources examines the likelihood that the Proposed Plan could cause a substantial adverse change in the significance of a historical resource. For purposes of the analysis of impacts to historical resources, historical resources include all resources on the State Register (which include those on the national register), all Historic Cultural Monuments, all HPOZs, and all resources identified as eligible for listing on a state or local register either individually or as a contributor to a potential historic district in SurveyLA or the Intensive Historic Resources survey prepared for CRA.

A significant impact to historic resources will occur if there is a "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired, which is considered to be a significant effect on the environment." *CEQA Guidelines* Section 15064.5(b)(1). Generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995) is considered to be mitigated to a level of less-than-significant impact on the historical resource.[31]

The analysis of archaeological resources identifies the likelihood of ground disturbing activities to potentially result in a significant impact to unique archaeological resources. PRC Section 21083.2 defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

---

31 California Code of Regulations, Title 14, Chapter 3 15064.5. (b)(3). https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Similar to archaeological resources, the analysis of human remains considers the likelihood of ground disturbing activities to potentially encounter human remains.

4.4.6 IMPACTS

Threshold 4.4-1 Would implementation of the Proposed Plan cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

The impact would be significant and unavoidable.

As discussed in the existing setting, and shown on **Figure 4.4-1, Boyle Heights CPA Historical Resources,** the Plan Area includes 12 HCMs, including five resources listed on the state or national register. Additionally, as discussed in **Chapter 3.0, Project Description**, any property in the Plan Area may redevelop over the approximately twenty-year plan horizon,

The Proposed Plan includes a series of goals, policies, and programs intended to guide development around historical resources in the CPA (**Table 4.4-3**).

Table 4.4-3
Goals and Policies in the Proposed Plan Related to Cultural Resources

Goals, Policies, and Programs	Description
Goal – LU 17	New development embraces the distinct physical character and local context of Boyle Heights.
Policy – LU 17.1	Design larger buildings to distinguish a base, middle, and top by employing changes in massing, fenestration, and building materials.
Policy – LU 17.2	Promote building facade design that reinforces the visual rhythm and historic development patterns by incorporating elements such as columns or pilasters, and frequent window and door placement.
Policy – LU 17.3	Encourage buildings to use design elements such as cornices, window bays, building materials, and fenestration, in a pattern, scale, and proportion that makes the building relatable from the street

Goals, Policies, and Programs	Description
Policy – LU 17.4	Incorporate architectural details, building material, and ornamentation that reflect the local context and historic development patterns in Boyle Heights.
Policy – LU 17.5	Support residential projects that follow traditional bungalow court and courtyard apartment style architecture and site layout.
Goal – LU 18	Boyle Heights' cultural heritage endures through the preservation and Restoration of cultural institutions and Historic resources that provide context for important social and cultural Themes that have shaped the community.
Policy – LU 18=.1	Prioritize the preservation and restoration of historic resources identified through the Los Angeles Historic Resources Survey (SurveyLA).
Policy – LU 18.2	Protect individually significant historic resources and districts in Boyle Heights from demolition or adverse alteration.
Policy – LU 18.3	Provide design standards that guide infill development in areas with an identified historic character to ensure that new buildings reinforce the historic scale and key architectural features of the area.
Policy – LU 18.4	Forge partnerships with relevant neighborhood organizations to advance preservation efforts in the community and document oral histories through educational and informational programs.
Policy – LU 18.5	Promote the restoration and reuse of vacant and/or deteriorating historic buildings for new uses that benefit the community and reinforce the site's historic and cultural legacy.
Policy – LU 18.6	Promote the preservation of remaining examples of bungalow courtyard and garden apartment
Policy – LU 18.7	Protect legacy businesses and cultural institutions from displacement.
Goal – LU 19	Vibrant commercial districts and public places that exhibit a strong cultural identity are reinforced through improved urban design and activation.
Policy – LU 19.1	Uphold the historic and cultural identity of Cesar E. Chavez Avenue, also known as the historic "Brooklyn Avenue Neighborhood Corridor," by promoting restoration and reuse of existing early 20th Century brick buildings.
Policy – LU 19.2	Ensure that new development along Cesar E. Chavez Avenue, also known as the historic "Brooklyn Avenue Corridor," reinforces the visual rhythm and underlying historic development pattern of the overall street through narrow shopfront bays, recessed entrances, and storefront awnings.
Policy – LU 19.3	Ensure that the area surrounding Mariachi Plaza continues to function as a vibrant cultural and community hub where local music and art are strongly expressed in the public realm and by local businesses.
Policy – LU 19.4	Support contextual infill development around Mariachi Plaza that reinforces the site's status as an important social and cultural resource for the community of Boyle Heights.
Policy – LU 19.5	Expand on the important role that El Mercado has played in fostering local commerce and culture by encouraging market related activity to extend along First Street and Lorena Street.
Policy – LU 19.6	Encourage future projects to build upon the commercial and cultural activity centered at El Mercado by incorporating additional space for market activities to take place.
Policy – LU 19.7	Promote greater integration and improved permeability between the indoor marketplace of El Mercado and surrounding streets. .
Policy – LU 19.8	Pursue opportunities for the development of centralized parking structures to relieve individual uses from providing on-site parking and prioritize excess surface parking lots for public space.
Goal – LU 20	Distinctive industrial architecture that is representative of early industrial development in Boyle Heights is preserved and restored for continued productive use.
Policy – LU 20.1	Maintain the visual rhythm and underlying historic lot pattern of historic industrial streets, such as Anderson Street, 11th Street, and 12th Street

Goals, Policies, and Programs	Description
Policy – LU 20.2	Encourage the restoration and adaptive reuse of distinctive industrial architecture dating from the first half of the 20th century.
Policy – LU 20.3	Support the adaptive reuse of the historic Sears building in a manner that preserves the architectural integrity of the structure as a landmark while incorporating uses that provide employment and economic benefits to Boyle Heights.
Policy – LU 20.4	Ensure that the redevelopment of surface parking areas surrounding the Sears building occurs in a manner that provides active frontages along Olympic Boulevard and Soto Street.
Policy – LU 20.5	Encourage buildings along Olympic Boulevard and Soto Street to include pathways that break up large blocks and serve to integrate the Sears site into the surrounding urban fabric.
Policy – LU 20.6	Ensure that future infill development around the Sears building reinforces its physical status as a popular landmark.
Goal – LU 21	Evergreen cemetery is valued and experienced as an educational memorial that contextualizes Los Angeles' multicultural history.
Policy – LU 21.1	Improve the pedestrian accessibility of Evergreen Cemetery through additional public gateways, streetscape landscaping, designated pathways, seating alcoves, and wayfinding signage designed in a manner that is compatible with the cemetery's historic significance.
Goal – LU 22	Art enriches the public realm by encouraging people to connect with the cultural, historical, spiritual, and social context of the community.
Policy – LU 22.1	Support efforts to preserve and restore the rich inventory of murals found throughout Boyle Heights.
Policy – LU 22.2	Encourage mural work by local artists to animate blank building surfaces along alleyways and side streets.
Policy – LU 22.3	Encourage new development to incorporate public art along building facades and in outdoor areas.
Policy – LU 22.4	Grant opportunities to local artists when commissioning artwork for both the public realm and private projects.
Policy – LU 22.5	Consider opportunities for multiple forms of public art, including but not limited to seating, lighting, landscaping, shade structures, sculptures, and imagery incorporated into outdoor installations.

Source: City of Los Angeles, Draft Boyle Heights Community Plan, 2022.

The Proposed Plan includes new zoning regulations that are intended to shape the massing and scale of a building. Future development within the CPA will be subject to compliance with zoning regulations for building mass and width, articulation, building entrances, entry features and transparencies, and in certain areas specific allowable building materials intended to ensure infill development is compatible with the building character of these areas.

The CPA currently does not introduce any features that would preclude implementation of or alter the regulatory control ordinances that designated historical resources are subject to in the HPOZ Ordinance, the HCM, or the Building Code regulations discussed above. Specifically, the Cultural Heritage Ordinance requires any project involving alteration, relocation or demolition of a designated HCM to be reviewed by the Historical Resource Commission and any potential demolition to be delayed up to 180 days, which can

be further extended another 180 days if found necessary. Additionally, the Building Code requires that no permit for a designated resource can be issued without CEQA review.

Nothing in the Proposed Plan alters the current City's practice for any discretionary project, which involves OHR reviewing any project involving a property identified in SurveyLA as potentially eligible for listing, and requiring avoidance measures, unless OHR agrees the resource is not eligible for listing. If OHR disagrees with an applicant that a resource is not eligible for listing, OHR will require the applicant to provide an impact assessment from a qualified preservation consultant and develop mitigation measures or OHR will advise if a significant impact is not avoidable. The Office of Historic Resources typically recommends modifications that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. Such modifications may include retention of significant character-defining features and adjustments to setbacks, step backs, and height, as well as other project features related to context-sensitive project design.[32] If an impact is not avoidable, the Planning Department will require the applicant to pay fees for the City to prepare an EIR.

The Proposed Plan also includes proposed procedures through the proposed Boyle Height Community Plan Implementation Overlay (CPIO) District that includes procedures to ensure that any resource that is either designated or determined eligible for listing as a historical resource in SurveyLA or the Intensive Historic Resource survey is subject to an environmental review process to mitigate or avoid impacts to the historical resource.

Moreover, no historical resources are called for removal or alteration under the Proposed Plan. However, development that would occur over the life of the Proposed Plan has the potential to occur on, or adjacent to, historical resources. This is particularly true for areas with proposed increased development potential along specific corridors and nodes near transit, which could result in pressure to remove historical resources.

Notwithstanding the above, new development could result in an impact to historical resources either through direct effects (demolition or alteration of a historical resource's physical characteristics that convey its historical significance, such as change to the façade inconsistent with the original façade) or through indirect effects to the area surrounding a resource (eliminating or diminishing the historic value of a resource without physically changing the resource, such as creating a visually incompatible structure adjacent to a historical structure). For example, new development in the area around the historic Boyle

[32] If the historic or cultural significance of a potential resource is contested, applicants will be required to provide a historic resource assessment prepared by a qualified architectural historian to determine the proposed resource's potential significance.

Hotel near Mariachi Plaza could cause ground surface disturbance which could potentially impact this City-designated HCM. However, the Proposed Plan includes policies to protect culturally significant areas within the CPA (Policy – LU 1919).

While the Office of Historic Resources reports that it is extremely uncommon in the City to lose designated historical resources when a property owner has complied with the City's regulations and under typical City practices, the Cultural Heritage Ordinance cannot prevent a property from being demolished or redeveloped or prevent structures from being altered. Rather these ordinances provide for processes, including environmental review, but they do not prohibit demolition. Although the proposed Boyle Heights CPIO District includes a review process for development projects that include the demolition or alteration of a designated or an eligible historical resource, it is possible that demolition and/or significant alteration to some of the historical resources within the CPA could occur during the life of the Proposed Plan. Therefore, the Proposed Plan's impacts related to historical resources would be ***potentially significant***.

Mitigation Measures

No feasible mitigation measures have been identified. As discussed above, historical resources that are designated under HCM may be demolished if an applicant goes through the discretionary review process and receives an approved entitlement. Resources included in SurveyLA or the CRA Survey are not prohibited from demolition or alteration, provided they go through the appropriate process including environmental review. As a policy matter, the City finds that requiring additional review of projects otherwise undergoing discretionary review is undesirable based on the requirements it would place on City resources and the delay it would result in for projects. Additionally, as a policy matter, the City finds that it is undesirable to put additional regulations or processes on projects involving historical resources that are designated under the HCM or HPOZ, or subject to other discretionary review. Based on the above, there is no feasible mitigation to prevent the demolition or substantial alteration of historical resources. Therefore, impacts to historical resources from the Proposed Plan will be ***significant and unavoidable.***

Significance after Mitigation

Significant and unavoidable.

Threshold 4.4-2 Would implementation of the Proposed Plan cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

The impact would be less than significant with mitigation.

As discussed above, portions of the City, including the CPA were inhabited by the Tongva people, who may have left behind archaeological resources that may still exist within the CPA. In addition, non-tribal resources (such as from local missions) from the same time periods may exist in the CPA. Portions of the Zanja Madre may also be present through portions of the CPA. Much of the CPA is highly urbanized and any archaeological resources that may have existed at the surface have likely been disturbed by past development. Future development under the Proposed Plan would likely include ground-disturbing activities that could go beyond human-made fills/existing disturbed areas and could impact previously undetected archaeological resources. A comprehensive survey of archaeological resources in the Boyle Heights area is not feasible at the Plan level. Projects within the CPA that do not disturb previously undisturbed soil would not be anticipated to cause any adverse change in the significance of archaeological resources. Projects within the CPA that disturb previously un-disturbed soils during construction could encounter resources and could have an adverse impact on archaeological resources.

Although it is a misdemeanor[33] for anyone to destroy or remove anything of archaeological interest, property owners and developers may not be aware of their legal obligations and the best means to ensure compliance with regulations. Therefore, without mitigation, impacts related to archaeological resources would be ***potentially significant***.

Mitigation Measures

MM.CR-1 For any project that requires a permit for grading or excavation; if a possible archaeological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Archaeologist has been retained to evaluate the find in accordance with National Register of Historic Places and California Register of Historical Resources criteria. The Qualified Archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius.

Any potential archaeological resource or associated materials that are uncovered shall not be moved or collected by anyone other than an Archaeological Monitor or Qualified Archaeologist unless the materials have been determined to be non-unique archaeological

33 PRC Sections 5097.5, 5097.9, and 5097.98-99. Available online at: http://nahc.ca.gov/codes/california-public-resources-code-5097-9/

resources, as defined in Public Resources Code Section 21083.1(h), by the Qualified Archaeologist. The Qualified Archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g).

Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows:

- The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource.
- When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a Qualified Archaeologist.

Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a Qualified Archaeologist. A report that describes the resource(s) and its disposition, as well as the assessment methodology, shall be prepared by the Qualified Archaeologist according to current professional standards and maintained for a minimum of five years after the Certificate of Occupancy is issued. . If appropriate, the report should also contain the Qualified Archaeologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply.

MM.CR-2 Prior to issuance of a permit for grading or excavation all project applicants will receive notice and acknowledge receipt of the following notice:

Several laws regulate the treatment of archaeological, paleontological, and tribal cultural resources and make it a criminal violation to destroy those resources. These regulations include, but are not limited to:

- California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

- Public Resources Code Section 5097.5(a) states: "A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands."

- California Code of Regulations, Title 14, Section 4307 states: "No person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces…Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave."

The following best practices are recognized by archaeologists and environmental consultants to ensure archaeological resources are not damaged during grading, excavation, or other Ground Disturbance Activities:

- Records Search. A cultural resources records search should be requested from and conducted by the California Historical Resources Information System's (CHRIS) South Central Coastal Information Center (SCCIC) located at California State University, Fullerton to determine whether any cultural resources have been previously identified on or within a 0.5-mile radius of the Project site. The results of this records search shall be used as an indicator of the archaeological sensitivity of the Project site.

- A Qualified Archaeologist shall be retained and use all reasonable methods, consistent with professional standards and best practices, to determine the potential for archaeological resources to be present on the Project site.

- If the Qualified Archaeologist determines there is a medium to high potential that archaeological resources may be located on the Project site and it is possible that such resources will be impacted by the Project, the Qualified Archaeologist shall advise the Applicant and Owner to retain an Archaeological Monitor to observe all Ground

Disturbance Activities within those areas identified as having a medium to high potential in order to identify any resources and avoid potential impacts to such resources.

- Monitoring. An Archaeological Monitor should monitor excavation and grading activities in soils that have not been previously disturbed in order to identify and record any potential archaeological finds and avoid potential impacts to such resources. In the event of a possible archaeological discovery, the Archaeological Monitor shall notify a Qualified Archaeologist. The Archaeological Monitor has the authority to temporarily halt earthwork activities.

- Handling, Evaluation, and Preservation. Any archaeological resource materials or associated materials that are uncovered shall not be moved or collected by anyone other than an Archaeological Monitor or Qualified Archaeologist unless they have been determined to be nonunique archaeological resources, as defined in Public Resources Code Section 21083.1(h) by a Qualified Archaeologist. A Qualified Archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g).

- Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows:

  – The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource.

  – When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a Qualified Archaeologist.

- If recommended by the Qualified Archaeologist, the resource(s) shall be curated by a public, non-profit institution with a research interest in the material, such as the Natural History Museum of Los Angeles County or another appropriate curatorial facility for educational purposes.

- Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a Qualified Archaeologist.

MM.CR-3 Projects within 500 feet of the currently mapped known segments of the Zanja system (see **Figure 4.4-3, Zanja Madre System**) have increased likelihood of encountering segments of the Zanja system during construction. If possible segments of the Zanja system are uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Archaeologist has been retained to inspect and evaluate the find. The Qualified Archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius.

At a minimum, and even if avoided, should the find be determined to be related to the Zanja system, the Qualified Archaeologist shall prepare a memo and complete all relevant State of California Department of Parks and Recreation (DPR) DPR 523 forms documenting the find.

If the Qualified Archaeologist, having evaluated the find, determines that the find retains integrity, documentation consistent with the standards and guidelines established the Historic American Engineering Record (HAER) shall be undertaken and transmitted to the Library of Congress before any alteration, demolition, construction, or removal activity may occur within the determined avoidance area. Documentation shall include narrative records, measured drawings, and photographs in conformance with HAER Guidelines. The found segments shall also be mapped using Geographic Information Systems (GIS) or 3D mapping technology in order to contribute to the existing record of the location and extent of the Zanja system as a whole. At minimum, GIS data shall include the geographic coordinates and depth of all portions of the find. All records, including geographic data, georeferenced photographs, and information about the depth of the find shall be submitted to City Planning. Report documentation and GIS files shall additionally be provided to the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton.

In addition to HAER documentation, if determined appropriate by the Qualified Archaeologist, one or more of the following specific treatments shall be developed and implemented based on potential California Register eligibility criteria or the significance of the find as a unique archaeological resource:

- Treatment Under Criterion 1: Treatment shall include interpretation of the Zanja Madre System for the public. The interpretive materials may include, but are not limited to, interpretive displays of photographs and drawings produced during the HAER documentation, signage at the Zanja Madre alignment, relocating preserved segments in a publicly accessible display, or other visual representations of Zanja alignments through appropriate means such as a dedicated internet website other online-based materials. At a minimum, the interpretive materials shall include photographs and drawings produced during the HAER documentation, and signage. These interpretive materials shall be employed as part of Project public outreach efforts that may include various forms of public exhibition and historic image reproduction. Additionally, the results of the historical and archaeological studies conducted for the Project shall be made available to the public through repositories such as the local main library branch or with identified non-profit historic groups interested in the subject matter. The interpretive materials shall be prepared at the expense of the Project applicant, by professionals meeting the Secretary of the Interior standards in history or historical archaeology. The development of the interpretive materials shall consider any such materials already available to the public so that the development of new materials would add to the existing body of work on the historical Los Angeles water system, and to this end, shall be coordinated, to the extent feasible and to the satisfaction of the Department of City Planning, in consultation with the Office of Historic Resources. The interpretive materials shall include a consideration of the Zanja Madre segment located on the Project Site in relation to the entire Zanja system. The details of the interpretive materials, including the content and format, and the timing of their preparation, shall be completed to the satisfaction and subject to the approval of the Department of City Planning, in consultation with the Office of Historic Resources.

- Treatment Under Criterion 2: No additional work; archival research about important persons directly associated with the construction and use of Zanja Madre would be addressed as part of HAER documentation.

- Treatment Under Criterion 3: No additional work; HAER documentation is sufficient.

- Treatment Under Criterion 4: No additional work; archaeological data recovery and HAER documentation are sufficient.

- Treatment as a unique archaeological resource, as defined by PRC Section 21083.2(g): Same as Criterion 1 treatment.

Significance after Mitigation

Implementation of **Mitigation Measures CR-1, CR-2, and CR-3,** would avoid significant direct impacts to archaeological resources to the maximum extent feasible and provide for recovery and/or documentation of any significant resources, including any present portions of the Zanja Madre, that cannot be preserved in place. With mitigation, significant archaeological resources would be preserved and impacts to archaeological resources would ***be less than significant with mitigation.***

Threshold 4.4-3 Would implementation of the Proposed Plan disturb human remains, including those interred outside of dedicated cemeteries?

The impact would be less than significant.

The Evergreen and Odd Fellows Cemeteries are Los Angeles County designated cemeteries and are located within the boundaries of the CPA.

The CPA contains two formal cemeteries, Evergreen Cemetery and Odd Fellows Cemetery, and no known informal cemeteries. The Proposed Plan does not include any changes to these properties. The potential to disturb human remains interred outside of formal cemeteries is considered low given the level of past human activity. During the Mission-associated Native American history of Los Angeles it was often Native American practice to bury people outside mission grounds in informal cemeteries. The nearest mission is the San Gabriel Mission located approximately nine miles east of the CPA. There is no history of any missions or their accompanying cemeteries in the CPA. Furthermore, the CPA is highly urbanized, and unmarked cemeteries or graves that may have existed at the surface have likely been disturbed by past development.

While the potential to disturb human remains interred outside of formal cemeteries within the CPA is considered low, it is possible that unknown human remains could be located within the CPA and that future development could encounter these remains. In the event of the inadvertent discovery or recognition of any human remains during future, project-related ground disturbance, California Health and Safety Code Section 7050.5 states that, if human remains are unearthed during construction, then no further disturbance shall occur until the County Coroner has made the necessary findings as to the origin and

disposition of the remains pursuant to PRC Section 5097.98. Section 5097.98 outlines the Native American Heritage Commission notification process and the appropriate procedures if the County Coroner determines the human remains to be Native American. Compliance with applicable regulations would protect unknown and previously unidentified human remains. Therefore, impacts related to human remains would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance after Mitigation

Less than significant.

4.4.7 CUMULATIVE IMPACTS

The cumulative context for the cultural resources analysis includes reasonably foreseeable future development within the City of Los Angeles, as well as the County of Los Angeles pursuant to applicable planning documents including the Regional Transportation Plan/Sustainable Communities Strategy and adjacent Community Plans, as well as previously approved but unbuilt projects in the CPA and in the County or adjacent Community Plan Areas.

Historical Resources

As discussed above, it is possible that future development within the CPA could result in demolition and/or significant alteration to some historical resources during the life of the Proposed Plan. Implementation of the Proposed Plan in combination with other projects located throughout the City of Los Angeles would similarly increase the potential for impacts to historical resources and could contribute to the loss of historical resources in the City. The Cultural Heritage Ordinance and HPOZ Ordinances cannot prevent a property from being impacted by demolition or redevelopment or prevent structures from being altered so long as an applicant has gone through all necessary processes, including environmental review. The potential for impacts to historical resources from individual developments is site-specific and depends on the location and nature of each individual development proposal. All future development projects would continue to be subject to existing federal, state, and local requirements and discretionary projects may be subject to project-specific mitigation requirements as outlined herein. It is anticipated that cumulative impacts to historical resources can be avoided through implementation of regulatory compliance measures (existing rules for HCM, for example) and project design features (Proposed Boyle Heights CPIO District,

and implementation of Proposed Plan policies) on a project-by-project basis, but alteration or demolition of historical resources remains a possibility throughout the CPA.

Based on the above, the incremental effect of the Proposed Project on historical resources would be cumulatively considerable and cumulative impacts to historical resources in the Boyle Heights CPA would be ***significant and unavoidable***.

Archaeological Resources

Based upon existing studies documenting archaeological resources recovered from the prehistoric era to the present, the Los Angeles Basin and San Fernando Valley are known to have high archaeological sensitivity, and past development has resulted in substantial adverse changes in the significance of various archaeological resources prior to the implementation of regulations enacted for the purpose of avoiding disturbance, damage, or degradation of these resources. Future development may uncover or disturb known or previously unknown archaeological resources. However, implementation of Mitigation Measures CR-1, CR-2, and CR-3, would reduce impacts related to archaeological resources to a less than significant level. The Proposed Plan's effect on archaeological resources would be reduced to a level that would be cumulatively ***less than significant***.

Human Remains

Past development has disturbed human remains, including those interred outside of dedicated cemeteries. This has led to the implementation of specific requirements to preserve such remains, as codified in *CEQA Guidelines Section* 15064.5(e) and PRC Section 5097.98. There is the possibility that ground-disturbing activities during future construction could uncover previously unknown and buried human remains. Treatment of human remains is addressed by standard regulatory requirements, which apply to all development projects statewide. Any development project, including those in accordance with the Proposed Plan would be subject to these same regulations. The Proposed Plan's effect on human remains would be reduced to a level that would be cumulatively ***less than significant***.

4.5 ENERGY

This section addresses the potential construction and operational impacts on energy resources. The analysis identifies the utility companies that provide electricity and natural gas services in the City, describes existing consumption, the nature and location of related infrastructure, and the anticipated changes in demand for electricity and natural gas.

4.5.1 EXISTING ENVIRONMENTAL SETTING

This section provides an overview of the various types of energy resources and a discussion of the existing supply and demand at the state, regional, and local levels.

Petroleum

California is one of the top producers of petroleum in the nation, with drilling operations primarily concentrated in Kern and Los Angeles Counties. A network of crude oil pipelines connects production areas to oil refineries in the Los Angeles area, the San Francisco Bay area, and the Central Valley. California oil refineries also process large volumes of Alaskan and foreign crude oil received in ports in Los Angeles, Long Beach, and the San Francisco Bay area. Crude oil production in California and Alaska is in decline, and California refineries have become increasingly dependent on foreign imports. Led by Saudi Arabia and Ecuador, foreign suppliers now produce more than half of the crude oil refined in California[1, 2]

According to the United States Energy Information Administration (EIA), transportation accounted for nearly 40 percent of California's energy demand, amounting to approximately 3,017 trillion British thermal units (Btu) in 2015.[3] California's transportation sector, including on-road and rail petroleum-based fuels are used for approximately 98.5 percent of the State's transportation activity.[4] Most gasoline and diesel fuel soil in California for motor vehicles is refined in California to meet state-specific formulations required by the California Air Resources Board (CARB).

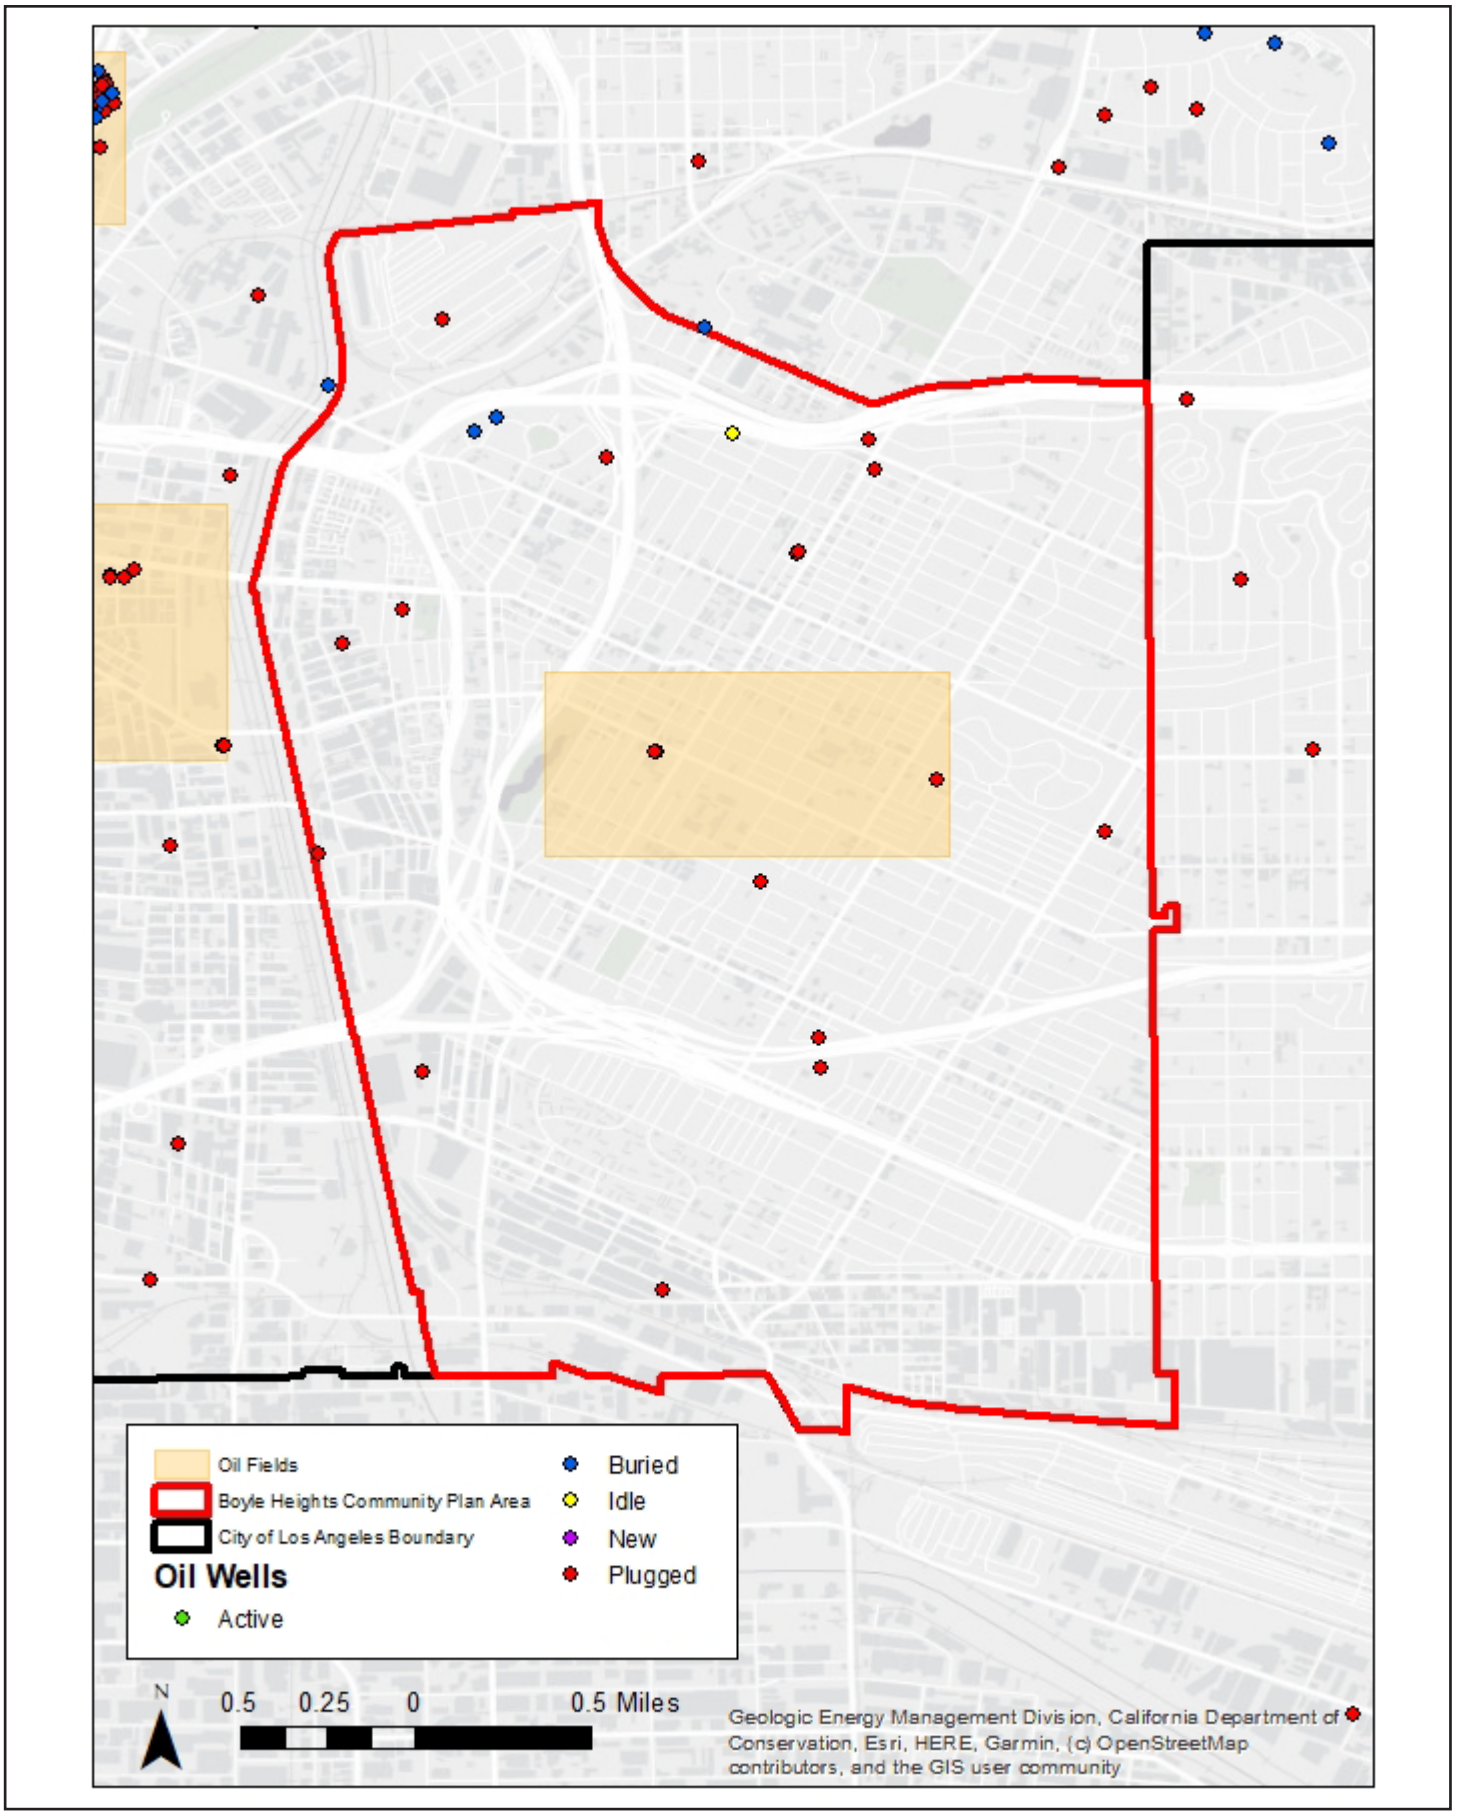
4 *Ibid*.

Boyle Heights Community Plan Area Petroleum Consumption



Petroleum fuels are generally purchased by individual users such as residents and employers. As shown in **Figure 4.5-1, Oil Fields and Active Wells within the Boyle Heights Community Plan Area**, while no petroleum refineries are located in the Community Plan Area (CPA), 14 gasoline stations are located in the CPA. The closest petroleum refineries are the Lunday-Thagard Co. Refinery, located at 9301 Garfield Avenue, and the World Oil Refining Refinery, located at 9302 Garfield Avenue in South Gate, approximately 5.2 miles southeast of the CPA.

Petroleum consumption was estimated by calculating the direct consumption through daily vehicle miles travelled as a result of trips that are associated with uses in the Boyle Heights CPA (see **Methodology** in **Section 4.5.4**). Daily vehicle miles traveled (VMT) within the CPA are discussed in detail in **Section 4.14, Transportation and Traffic,** and were estimated at approximately 2.97 million in 2016, as shown in **Table 4.5-1, Daily and Annual VMT in the Boyle Heights Community Plan Area**. Based on this daily VMT, approximately 20,820 million Btu (MMBtu) were consumed per day in 2016 by the transportation sector as a result of trips associated with uses in Boyle Heights, as shown below in **Table 4.5-2, 2016 Transportation Sector Energy Use in the Boyle Heights Community Plan Area.**

Table 4.5-1
2016 Daily and Annual VMT in the Boyle Heights Community Plan Area

	Daily VMT	Annual VMT[1]
Boyle Heights CPA Total	2,968,948	1,030,022,500

1 Annual VMT is calculated by multiplying daily VMT by 347 days, to account for reduced travel on weekends, in accordance with industry standards.
CPA = Community Plan Area; VMT = Vehicle Miles Traveled

Electricity

The CEC maintains a statewide database of annual electricity generation and consumption. In 2016, California produced approximately 68 percent of the electricity it used. The remainder was imported from outside the state. In 2016, total electrical generation was 290,567 gigawatt-hours (GWh) with approximately 198,227 GWh produced in-state with the remaining 92,340 GWh being imported from out-of-state sources.[5] Renewable sources accounted for approximately 27.9 percent of 2016 in-state generation.[6] Statewide electricity consumption in 2016 was estimated by the CEC to be 570,728 GWh, with Los Angeles County responsible for consuming approximately 138,828 GWh (24 percent).[7]

In 2016, LADWP supplied more than 26 million megawatt-hours (MWh) of electricity a year to approximately 1.5 million residential and business customers within the City of Los Angeles as well as

5 California Energy Commission. *2016 Total Electric Generation*, https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2019-total-system-electric-generation/2016, accessed June 11, 2021.

6 *Ibid.*

7 California Energy Commission. 2016. *Energy Consumption by County*, http://www.ecdms.energy.ca.gov/elecbycounty.aspx, accessed June 11, 2021.

5,000 customers in Owens Valley.[8] The LADWP has a capacity of over 7,640 Megawatts (MW) with a record peak instantaneous demand of 6,396 MW in 2014.[9] LADWP's Power Infrastructure includes 23 Generation Plants, 6,752 miles of overhead distribution lines, 3,626 miles of underground distribution cables and 160 distribution stations.[10] As a result of the shutdown of the Mohave Coal Power Plant in 2005, efficient energy solutions, ongoing repowering programs, and increased development of renewable resources, LADWP carbon dioxide (CO_2) emissions levels were 10.4 million metric tons (MMT) in 2016, 42 percent below its 1990 level (17.9 MMT). Greenhouse gas (GHG) emissions are expected to be 63 percent below 1990 levels by 2027.[11]

With the advent of energy efficiency, LADWP has developed Smart Grid L.A. in order to upgrade its power grid with communications technologies that will give customers empowerment of control of their energy uses and costs in real-time. There will be continuous communication and feedback from the power grid which will provide a balance of customer electricity demand and power production. Since 2013, the LADWP has already outfitted 52,000 residential and commercial customers with Smart Meters. The use of Smart Meters will enable the LADWP to gather information to better implement the Smart Grid LA plan.

Table 4.5-3, LADWP Power Resources (2016), shows the source of LADWP's power resources in 2016. Approximately 29 percent of power generation is from renewable sources, including biomass and biowaste, geothermal, small hydroelectric, solar, and wind energy. Specifically, wind energy provides the majority of renewable energy accounting for 11 percent of renewable energy. LADWP's eligible renewable "small hydro" resources include the Owens Gorge, the Owens Valley and Los Angeles Aqueduct hydroelectric plants.

LADWP Power Resources (2016)

Energy Source	Percent Contributed to LADWP Power
Renewable Energy	29%
Wind	15%
Biomass & Biowaste	2%
Geothermal	5%
Small hydroelectric	2%
Solar	5%
Coal	19%
Natural Gas	34%
Nuclear	9%
Large Hydroelectric	0%
Other/Unspecified	6%

Source: California Energy Commission. 2016 Power Content Label LADWP. https://www.energy.ca.gov/filebrowser/download/512, accessed May 25, 2021.
Note: LADWP = Los Angeles Department of Water and Power

Electricity from coal-fired power sources represents approximately 19 percent of LADWP's power supply. The Navajo and the Intermountain Generating Stations, located in Arizona and Utah, respectively, supply the LADWP coal-generated electricity.[12] These stations provide low-cost base load generation to Los Angeles; however, these stations also emit twice the amount of CO_2 compared to Natural Gas. Thus, the LADWP will continue to seek replacement options to lower the LADWP's power generation CO_2 emission levels.

Electricity from natural gas-fueled power sources represents approximately 34 percent of LADWP's power supply. The natural gas fired stations, owned by the LADWP and located throughout the Los Angeles Basin, include the Harbor, Haynes, Scattergood, and Valley generating stations supply the LADWP with natural gas-fueled electricity. Electricity from nuclear-fueled power sources represents approximately 10 percent of LADWP's power supply. The Palo Verde Nuclear Generation Station, located in Arizona, supplies the LADWP with nuclear-generated electricity. Electricity from large hydroelectric and other unspecified power sources represents a total of approximately seven percent of the LADWP's power

12 City of Los Angeles Department of Water and Power, *2006 Integrated Resource Plan*, https://www.lacitysan.org/cs/groups/public/documents/document/y250/mdew/~edisp/cnt010386.pdf January 2017.

supply. The Castaic Pumped Storage Power Plant and the Hoover Power Plant supply LADWP with hydroelectric-generated electricity, and are located in Castaic, California and Arizona, respectively.[13]

Boyle Heights Community Plan Area Electricity Consumption

Table 4.5-4, Existing (2016) Annual Electricity Demand in the Boyle Heights Community Plan Area, shows the estimated electricity usage of existing uses within the CPA using CalEEMod emission factors (see **Section 4.2, Air Quality**). The CalEEMod electrical emissions factors account for Title 24 building electricity use including space heating, space cooling, water heating, and ventilation as well as non-Title 24 uses such as appliances, electronics, and miscellaneous plug-ins.[14] Annually, the CPA is estimated to have an electrical demand of 380,552 MWh per year.[15] With a CPA population of approximately 86,504, this equates to approximately 4.40 MWh per capita per year of electricity consumption in 2016. Further, with a 2016 Boyle Heights CPA service population of 112,748 (86,504 residents and 26,244 employees), this equates to an electricity consumption of approximately 3.38 MWh per service population per year in 2016.

Table 4.5-4
Existing (2016) Annual Electricity Demand in the Boyle Heights Community Plan Area

Land Use	Size	Unit	T24E Rate (kWhr/unit)	NT24E (kWhr/unit)	Lighting (kWhr/unit)	Annual Electricity Use (MWhr)
Single Family	4,553	DU	572.03	6,155.97	1,608.84	37,958
Multi-Family	18,211	DU	258.09	3,054.10	1,001.10	78,549
Commercial	7,370,546	SF	4.6	4.62	3.77	95,743
Industrial	14,814,079	SF	2.25	5.75	3.1	164,436
Public Facilities	297,596	SF	4.6	4.62	3.77	3,866
					Total Annual Electricity Use	380,552
					Proportion of Statewide Consumption	0.07%
					Per Capita Electricity Consumption (MWhr/capita)	4.40
					Per Service Population Electricity Consumption (MWhr/SP)	3.38

Note: The per capita consumption for electricity is determined by dividing electricity consumption data from CalEEMod by the existing CPA population, as detailed in ***Section 4.12, Population, Housing and Employment.***
2016 population used to calculate per capita use: 86,504 people; 2016 population and employment used to calculate service population use: 86,504 residents and 26,244 employees, total of 112,748 people.
CPA = Community Plan Area; MWh = megawatt-hours; SF = square feet; DU = dwelling unit; T24E = title 24 electricity; NT24E = non-title 24 electricity; SP= service population

14 California Emissions Estimator Model. *User's Guide*, http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6, accessed June 11, 2021.

15 1 kilowatt/day = 0.365 Megawatts/year. 1 Megawatt = 1,000 kilowatt

Natural Gas

The City of Los Angeles, including the CPA, is served by the investor-owned Southern California Gas Company (SoCal Gas), a unit of Sempra Energy. SoCal Gas serves approximately 21.8 million customers through 5.9 million meters of gas lines within a 24,000-square-mile service area that includes over 500 communities in Central and Southern California.[16] In 2016, a total of approximately 5,124 million therms of natural gas were consumed by SoCal Gas' customers. Of this total, residential, industrial, commercial and miscellaneous other customers consumed 2,136 million, 1,725 million, 893 million, and 313 million therms of natural gas, respectively.[17,18,] In 2020, a total of 5,231 million therms of natural gas were consumed by SoCal Gas' customers. Of this total, residential, industrial, commercial and miscellaneous other customers consumed 2,426 million, 1,616 million, 802 million, and 388 million therms of natural gas, respectively.[19] California natural gas anticipates gas demand to decline at an annual rate of 1.4 percent between 2016 and 2035 as a result of modest growth in the Natural Gas Vehicle (NGV) market, economic growth, energy efficiency standards, other sources of renewable energy, metering infrastructure and the decline in demand of commercial and industrial sectors.[20] More specifically, from 2016 to 2035, SoCal Gas residential demand is expected to decline from 239 billion cubic feet (Bcf) to 218 Bcf, reflecting an annual decline rate of 0.5 percent, and non-residential markets are expected to decline from 113 Bcf in 2016 to 105 Bcf by 2035, reflecting an annual decline rate of 0.24 percent.[21]

SoCal Gas natural gas supplies originate from sedimentary basins located in California, New Mexico (San Juan Basin), west Texas (Permian Basin), the Rocky Mountains, western Canada, and local California supplies. Interstate pipelines used by SoCalGas and San Diego Gas and Electric (SDG&E) have a natural gas upstream capacity of 6,725 million cubic feet per day (MMcf/d).[22] Additionally, SoCal Gas and SDG&E currently have firm receipt capacity (i.e., access to supply from interstate pipelines for core customers) of

18 One therm is equal to 96.7 cubic feet of natural gas.

19 California Energy Commission, *California Energy Consumption Database*, http://ecdms.energy.ca.gov/ , accessed May 11, 2022.

20 California Gas and Electric Utilities, 2016 *California Gas Report*, 2016, https://www.pge.com/pipeline_resources/pdf/library/regulatory/downloads/cgr16.pdf, accessed June 8, 2021.

21 *Ibid.*

22 Beginning in April 2008, gas supplies to serve both SoCal Gas' and SDG&E's retail core gas demand are procured with a combined portfolio. SoCal Gas and SDG&E plan and design their systems to provide continuous service to their core customers under an extreme peak day event. The extreme peak day design criteria is defined as a 1 in 35 likelihood event for each utility's service area.

3,875 MMcf/d of natural gas. Locally, SoCalGas distributes natural gas through an extensive network of approximately 41,500 miles of underground gas mains.

Underground storage of natural gas plays a vital role in balancing the region's energy supply and demand. SoCal Gas owns and operates four underground storage facilities located in Aliso Canyon, Honor Rancho, Goleta, and Playa Del Rey. These facilities have a total storage capacity of 137.1 Bcf. Stored gas is appropriated as follows: 83 Bcf is allocated to core residential, small industrial and commercial customers; 4.2 Bcf is used for system balancing; and the remainder is available to other customers. In October 2015 the storage facility in Aliso Canyon had a natural gas leak resulting in DOGGR (now CalGEM) imposing a moratorium on the storage facility with a safety review for all 114 wells within the facility. The safety review requires the wells to be thoroughly tested for safe operation or removed from operation and isolated from the underground reservoir.

2016 California Gas Report

The 2016 California Gas Report presents a comprehensive outlook for natural gas requirements and supplies for California through the year 2035. This report is prepared in even-numbered years, followed by a supplemental report in odd-numbered years, in compliance with California PUC Decision D.95-01-039. The below projections in the California Gas Report are for long-term planning and do not necessarily reflect the day-to-day operational plans of the utilities.

California natural gas demand, including volumes not served by utility systems, is expected to decrease at an annual rate of 1.4 percent per year from 2016 to 2035. The forecast decline is due to a combination of moderate growth in the Natural Gas Vehicle market and across-the-board declines in all other market segments: residential, commercial, electric generation, and industrial markets.

Residential gas demand is expected to decrease at an annual average rate of 0.5 percent per year. Demand in the commercial and industrial market is expected to decline at an annual rate of 0.24 percent. Aggressive energy efficiency programs make a significant impact in managing growth in the residential, commercial, and industrial markets. Overall gas demand for electric generation is expected to decline at 1.3 percent per year for the 20 years due to more efficient power plants.

The 2020 California Gas Report was published in October 2020 and represents the most recent evaluation of gas supplies within the state of California.[23] Overall conclusions are consistent with the previous 2016

[23] California Gas and Electric Utilities. 2020. *2020 California Gas Report*, https://www.socalgas.com/sites/default/files/2020-10/2020_California_Gas_Report_Joint_Utility_Biennial_Comprehensive_Filing.pdf.

report, with variations in details such as residential gas demand being projected to decrease at an average of 1.7 percent each year, as opposed to the 2016 projected decrease of 0.5 percent.

SoCal Gas engages in a number of energy efficiency and conservation programs designed to help customers identify and implement ways to benefit environmentally and financially from energy efficiency investments. Programs administered by SoCal Gas include services that help customers evaluate their energy efficiency options and adopt recommended solutions, as well as simple equipment retrofit improvements, such as rebates for new hot water heaters.

Southwestern United States Gas Supplies

Natural gas obtained from the Southwestern United States, especially the San Juan Basin in New Mexico, provides the majority of gas sold by SoCal Gas. This gas is delivered to the Southern California region through the El Paso Natural Gas Company and the Transwestern Pipeline Company pipelines. The conventionally produced gas supplies from the San Juan Basin peaked in 1999 and have been declining at an annual rate of three percent, with an increase in the rate of decline in recent years. The Permian Basin has provided additional supplies, although increasing demand in Mexico for natural gas may reduce this supply source. There is currently a proposal to construct a North-South Pipeline from SoCal Gas' Adelanto compressor station near Victorville down to the Moreno pressure limiting station in Moreno Valley.[24]

Rocky Mountain Gas Supplies

Natural gas obtained from the Rocky Mountain sources is considered to be a viable alternative to the traditional source of natural gas in the Southwestern United States. These natural gas supplies are delivered to the Southern California region through the Kern River Gas Transmission Company's pipeline. Access to Rocky Mountain gas is also available through pipeline interconnections with the San Juan Basin. Rocky Mountain gas has increasingly flowed to Midwestern and Pacific Northwest markets.[25]

Canadian Gas Supplies

Natural gas obtained from Canada and delivered to Southern California is not expected to change significantly. Only a small share of Southern California gas supplies come from Canada due to the high cost of transport.[26]

25 *Ibid.*

26 *Ibid.*

Regional Gas Consumption

SoCal Gas is the distributor of natural gas in Southern California, providing retail and wholesale customers with transportation, exchange and storage services and procurement services to most retail core customers. SoCal Gas is a gas-only utility and, in addition to service the residential, commercial, and industrial markets, provides gas for enhanced oil recovery and electric generation customers in Southern California. SoCal Gas' natural gas system is the nation's largest natural gas distribution utility and serves a 24,000-square-mile area in Central and Southern California. The system supplies natural gas to 21.8 million customers through 5.9 million meters in more than 500 communities.[27]

Most natural gas consumed in Southern California is produced out of state.[28] The availability of natural gas is based upon present conditions of gas supply and regulatory policies because SoCal Gas is under the jurisdiction of the CPUC and federal regulatory agencies. In addition, SoCal Gas makes available to its customers, energy efficiency programs with rebates and incentives for the purpose of reducing natural gas consumption. SoCal Gas obtains its gas resources from several sedimentary basins, including the San Juan Basin in New Mexico, the Permian Basin in West Texas, Rocky Mountain, western Canada, and California. Natural gas also represents roughly 43 percent of California's total energy consumption from fossil fuels.[29]

In 2016, a total of approximately 7,258.7 million therms (MMthm) of natural gas were consumed by SoCalGas' customers. Of this total, residential, industrial (including mining and construction), commercial, and miscellaneous other customers consumed 2,181.0 MMthm, 4,023.1 MMthm, 977.5 MMthm, and 77.2 MMthm of natural gas, respectively.[30] From 2016 to 2035, residential demand is expected to decline from 239 Bcf to 218 Bcf. The decline is due to declining use per meter offsetting new meter growth. The core, nonresidential markets are expected to decline from 113 Bcf in 2016 to 105 Bcf by 2035. The change reflects an annual rate of decline of 0.5% over the forecast period. The noncore, non-energy markets are expected to decline from 170 Bcf in 2016 to 153 Bcf by 2035. The annual rate of decline is approximately 0.5% due to very aggressive energy efficiency goals and associated programs.[31]

Boyle Heights Community Plan Area Natural Gas Consumption

Table 4.5-5, Existing (2016) Natural Gas Demand in the CPA, shows the estimated natural gas usage of existing land uses within the CPA using CalEEMod emissions rates. Within CalEEMod, natural gas uses are categorized as Title 24 or Non-Title 24, with Title 24 uses including building heating and hot water end uses. Non-Title 24 natural gas uses include cooking and appliances (including pool/spa heaters).[32] The Boyle Heights CPA consumes approximately 688.6 billion Btu of natural gas. The Boyle Heights CPA accounted for approximately 0.06% of the State's Natural Gas Consumption.[33] With a 2016 Boyle Heights CPA population of 86,504, this equates to a natural gas consumption of approximately 7.96 million British Thermal Units (MM Btu) per capita. Further, with a 2016 Boyle Heights CPA service population of 112,748 (86,504 residents and 26,244 employees), this equates to a natural gas consumption of approximately 6.11 MM Btu per service population. With an estimated 2016 population of 38,654,206, the statewide per capita natural gas consumption is approximately 32.23 MM Btu.[34]

Table 4.5-5
Existing (2016) Natural Gas Demand in the CPA

Land Use	Size	Unit	Title 24 NG Rate (kBTU/unit)	Non Title 24 NG	Annual Natural Gas Use (kBTU)
Single Family	4,553	DU	23,546.37	6,281.00	135,804,016
Multi-Family	18,211	DU	4,967.18	6,281.00	204,840,606
Commercial	7,370,546	SF	10.02	0.39	76,727,384
Industrial	14,814,079	SF	13.65	4.45	268,134,830
Public Facilities	297,596	SF	10.02	0.39	3,097,974
				Total Natural Gas Use (billion Btu)	**688.6**
				Proportion of Statewide Consumption	**0.06%**
				Per Capita Natural Gas Consumption (MM Btu/capita)	**7.96**
				Per Service Population Natural Gas Consumption (MM Btu)	**6.11**

Note: The per capita consumption for natural gas is determined by dividing electricity consumption data from CalEEMod by the existing CPA population, as detailed in ***Section 4.12, Population, Housing and Employment.*** *The per service population consumption for natural gas is determined by dividing electricity consumption from CalEEMod by the existing CPA population and employment, as detailed in* ***Section 4.12, Population, Housing, and Employment****. CPA = Community Plan Area; MMBtu = million British Thermal Units; SP = service population; T24NG = title 24 natural gas uses; NT24NG = non title 24 natural gas uses*

Alternative Fuels

A variety of alternative fuels are used to reduce petroleum-based fuel demand. The use of these fuels is encouraged through various state-wide regulations and plans (e.g., Low Carbon Fuel Standard and SB 32). Conventional gasoline and diesel may be replaced, depending on the capability of the vehicle with transportation fuels including the following:

Hydrogen

Hydrogen is being explored for use in combustion engines and fuel cell electric vehicles. The interest in hydrogen as an alternative transportation fuel stems from its clean-burning qualities, its potential for domestic production, and the fuel cell vehicle's potential for high efficiency (two to three times more efficient than gasoline vehicles). Currently, 34 hydrogen refueling stations are located in California; however, none are located in the CPA.[35]

Biodiesel

Biodiesel is a renewable alternative fuel that can be manufactured from vegetable oils, animal fats, or recycled restaurant greases. Biodiesel is biodegradable and cleaner-burning than petroleum-based diesel fuel. Biodiesel can run in any diesel engine generally without alterations but fueling stations have been slow to make it available. There are currently 10 biodiesel refueling stations in California, none of which is located in the CPA.[36]

Electric Vehicles

Electricity can be used to power electric and plug-in hybrid electric vehicles directly from the power grid. Electricity used to power vehicles is generally provided by the electricity grid and stored in the vehicle's batteries. Fuel cells are being explored as a way to use electricity generated onboard the vehicle to power electric motors. In late 2021, there were approximately 10 electrical charging stations in the CPA.[37]

37 U.S. Department of Energy. *Electric Vehicle Charging Station Locations*. https://afdc.energy.gov/fuels/electricity_locations.html#/find/nearest?fuel=ELEC

Biogas

There is growing interest regarding biogas production potential in SoCal Gas' service territory from the following activities:

- Non-hazardous-waste landfills,
- Landfill diversion of organic waste material,
- Wastewater treatment,
- Concentrated animal feeding operations, and
- Food and green waste processing.

When biogas is conditioned and upgraded to pipeline quality specifications it can be interconnected to a gas utility's pipeline and distributed to a specific customer. Biomethane may also be consumed on-site for a variety of uses, including electrical power generation from internal combustion engines, fuel cells, and turbines, or as a fuel source for natural gas vehicles. Currently, there are instances where biogas is being vented naturally or flared to the atmosphere, which wastes this valuable renewable resource. In January 2014, the California Public Utilities Commission (CPUC) approved SoCal Gas' application to offer a Biogas Conditioning/Upgrading Services Tariff, which would meet the current and future needs of biogas producers seeking to upgrade their biogas for beneficial use.[38]

4.5.2 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Energy at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Energy Policy Conservation Act (EPCA) and CAFE Standards
- Phase 1 and 2 Heavy-Duty Vehicle GHG Standards
- Public Utility Regulatory Policies Act of 1978 (PURPA), Public Law 95-617
- National Energy Policy Act of 1992 (EPACT92)
- Energy Policy Act of 2005

Federal

Energy Policy Conservation Act (EPCA) and CAFE Standards

The EPCA of 1975 established nation-wide fuel economy standards in order to conserve oil. Pursuant to this Act, the National Highway Traffic Safety Administration (NHTSA), part of the U.S. Department of Transportation (USDOT), is responsible for revising existing fuel economy standards and establishing new vehicle fuel economy standards.

The Corporate Average Fuel Economy (CAFE) program was established to determine vehicle manufacturing compliance with the government's fuel economy standards. Compliance with CAFE standards is determined based on each manufacturer's average fuel economy for the proportion of their vehicles produced for sale in the United States.

First established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFE) standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and U.S. Environmental Protection Agency (U.S. EPA) jointly administer the café standards. The U.S. Congress has specified tcaféCAFE standards must be set at the "maximum feasible level" with consideration given for: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy.[39] When these standards are raised, automakers respond by creating a more fuel efficient fleet. The NHTSA sets standards to icaféase CAFE levels rapidly over the next several years, which will improve the nation's energy security and save consumer's money at the gas pump, while also reducing greenhouse gas (GHG) emissions. In 2012, the NHTSA established final passenger car and cafét truck CAFE standards for model years 2017 through 2021, which the agency projects will require in model year 2021, on average, a combined

[39] Federal Register, 49 U.S.C. 32902, Average Fuel Economy Standards.

fleet-wide fuel economy of 40.3 to 41.0 miles per gallons (mpg). In March 2020, the U.S. Department of Transportation (USDOT) and the U.S. EPA issued the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFÉ standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026.[40]

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by U.S. EPA and NHTSA. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type.[41] U.S. EPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.[42]

Phase 1 and 2 Heavy-Duty Vehicle GHG Standards

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by U.S. EPA and the National Highway Traffic Safety Administration (NHTSA). The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type.3 The U.S. EPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to

41 United States Environmental Protection Agency, Office of Transportation and Air Quality, Regulatory Announcement: EPA and NHTSA Adopt First-Ever Program to Reduce Greenhouse Gas Emissions and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles, APE-420-F-11-031, August 2011.

42 Federal Register, Vol. 81, No. 206, Tuesday, October 25, 2016, Rules and Regulations, United States Environmental Protection Agency, 40 CFR Parts 9, 22, 85, 86, 600, 1033, 1036, 1037, 1039, 1042, 1043, 1065, 1066, and 1068, and Department of Transportation, National Highway Traffic Safety Administration, 49 CFR Parts 523, 534, 535, and 538, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, Effective December 27, *2016*.

25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.[43]

Public Utility Regulatory Policies Act of 1978 (PURPA), Public Law 95-617

PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators (small power producers) from which, along with qualified co-generators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from qualifying facilities (Qfs) at avoided cost (i.e., the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market and demonstrated that electricity from nonutility generators could successfully be integrated with a utility's own supply. In addition, PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). The Fuel Use Act (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies, but Qfs, by definition not utilities, were able to take advantage of abundant natural gas and abundant new technologies (such as combined-cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.

National Energy Policy Act of 1992 (EPACT92)

EPACT92 calls for programs that promote efficiency and the use of alternative fuels. EPACT92 requires certain federal, state, and local government and private fleets to purchase a percentage of light duty alternative fuel vehicles (AFV) capable of running on alternative fuels each year. In addition, EPACT92 has financial incentives. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. The Act also requires states to consider a variety of incentive programs to help promote AFVs.

---

43 Federal Register, Vol. 81, No. 206, Tuesday, October 25, 2016, Rules and Regulations, United States Environmental Protection Agency, 40 CFR Parts 9, 22, 85, 86, 600, 1033, 1036, 1037, 1039, 1042, 1043, 1065, 1066, and 1068, and Department of Transportation, National Highway Traffic Safety Administration, 49 CFR Parts 523, 534, 535, and 538, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, Effective December 27, 2016.

Energy Policy Act of 2005

The Energy Policy Act of 2005 provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

Clean Air Act

Clean Air Act (CAA). CAA Section 211(o), as amended by the Energy Policy Act of 2005, requires the Administrator of the U.S. EPA to annually determine a renewable fuel standard (RFS) which is applicable to refineries, importers, and certain blenders of gasoline, and to publish the standard in the Federal Register by November 30 each year. On the basis of this standard, each obligated party determines the volume of renewable fuel that it must ensure is consumed as motor vehicle fuel. This standard is calculated as a percentage, by dividing the amount of renewable fuel that the Act requires to be blended into gasoline for a given year by the amount of gasoline expected to be used during that year, including certain adjustments specified by the CAA.

Energy Independence and Security Act of 2007

EISA is designed to improve vehicle fuel economy and help reduce U.S. dependence on oil. It expands the production of renewable fuels, reducing dependence on oil, and confronting global climate change. Specifically, it:

- Increases the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) that requires fuel producers to use at least 36 billion gallons of biofuel in 2022, which represents a nearly five-fold increase over current levels; and
- Reduces U.S. demand for oil by setting a national fuel economy standard of 35 miles per gallon by 2020
  - an increase in fuel economy standards of 40 percent.

Clean Cities Program

The U.S. Department of Energy's (DOE) Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of AFVs and building local AFV refueling infrastructure. The mission of the Clean Cities Program is to advance the nation's economic, environmental and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum

consumption. The Clean Cities Program carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.

State

Warren-Alquist Act

The 1975 Warren-Alquist Act established the California Energy Resources Conservation and Development Commission, now known as the California Energy Commission (CEC). The Act established a state policy to reduce wasteful, uneconomical, and unnecessary uses of energy by employing a range of measures. The California Public Utilities Commission (CPUC) regulates privately-owned utilities in the energy, rail, telecommunications, and water fields. Both CEC and CPUC have jurisdiction over Investor Owned Utilities (IOUs) in California, while the CEC is the primary energy policy and planning agency and CPUC is the primary regulatory agency.

California Energy Plan

CEC is responsible for preparing the California Energy Plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The current (2008) California Energy Plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero-emission vehicles and addressing their infrastructure needs; and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

Assembly Bill 2076: Reducing Dependence on Petroleum

Pursuant to Assembly Bill (AB) 2076 (Chapter 939, Statues of 2000), CEC and the California Air Resources Board (CARB) prepared and adopted in 2003 a joint agency report, *Reducing California's Petroleum Dependence*. This report includes recommendations to increase the use of alternative fuels to 20 percent of on-road transportation fuel use by 2020 and 30 percent by 2030, significantly increase the efficiency of motor vehicles, and reduce per capita VMT. Further, in response to the CEC's 2003 and 2005 *Integrated Energy Policy Reports*, the governor directed CEC to take the lead in developing a long-term plan to increase alternative fuel use. A performance-based goal of AB 2076 was to reduce petroleum demand to 15 percent below 2003 demand.

Integrated Energy Policy Report (IEPR)

Senate Bill (SB) 1389 (Chapter 568, Statutes of 2002) required CEC to conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The CEC shall use these assessments and forecasts to develop energy policies that conserve resources, protect the environment, ensure energy reliability, enhance the state's economy, and protect public health and safety.

CEC adopts an IEPR every two years and an update to the previous IEPR every year between. The 2016 IEPR provides a summary of priority energy issues currently facing the state and outlines strategies and recommendations to further the State's goal of ensuring reliable, affordable, and environmentally responsible energy sources. Energy topics covered in the IEPR include electricity resource and supply plans; electricity and natural gas demand forecasts; natural gas outlooks; transportation energy demand forecasts; energy efficiency savings; integrated resource planning; a barriers study; climate adaptation and resilience; renewable gas; southern California energy reliability; distributed energy resources; strategic transmission investment plans; and existing power plan reliability issues.

Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, SB 100, SB 350)

Established in 2002 under Senate Bill (SB) 1078, and accelerated in 2006 under SB 107, in 2011 under SB X 1-2, in 2015 under SB 350, and most recently in September 2018 under SB 100, California's Renewable Portfolio Standards (RPS) requires retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 40 percent by 2024, 50 percent by 2026, 60 percent by 2030, and 100 percent by 2045. The 33 percent standard is consistent with the RPS goal established in the Scoping Plan. Initially, the RPS provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SB X 1-2 (2011) added, for the first time, publicly-owned utilities to the entities subject to RPS.

Assembly Bill 32 (California Global Warming Solutions Act of 2006) and Senate Bill 32

Assembly Bill (AB) 32 (Health and Safety Code Sections 38500–38599), also known as the California Global Warming Solutions Act of 2006, commits the state to achieving year 1990 greenhouse gas (GHG) levels by 2020. To achieve these goals, AB 32 tasked the CPUC and CEC with providing information, analysis, and recommendations to the California Air Resources Board (CARB) regarding ways to reduce GHG emissions in the electricity and natural gas utility sectors.

SB 32, signed September 8, 2016, updates AB 32 (the Global Warming Solutions Act) to include an emissions reductions goal for the year 2030. Specifically, SB 32 requires CARB to ensure that statewide GHG emissions

are reduced to 40 percent below the 1990 level by 2030. The new plan, outlined in SB 32, involves increasing renewable energy use, imposing tighter limits on the carbon content of gasoline and diesel fuel, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

Assembly Bill 1493: Reduction of Greenhouse Gas Emissions

AB 1493 (Chapter 200, Statutes of 2002), known as the Pavley bill, amended Health and safety Code sections 42823 and 43018.5 requiring CARB to develop and adopt regulations that achieve maximum feasible and cost-effective reduction of greenhouse gas (GHG) emissions from passenger vehicles, light-duty trucks, and other vehicles used for noncommercial personal transportation in California. Implementation of new regulations prescribed by AB 1493 required that the State of California apply for a waiver under the federal Clean Air Act. Although the United States Environmental Protection Agency (U.S. EPA) initially denied the waiver in 2008, the U.S. EPA approved a waiver in June 2009, and in September 2009, CARB approved amendments to its initially adopted regulations to apply the Pavley standards that reduce GHG emissions to new passenger vehicles in model years 2009 through 2016. According to CARB, implementation of the Pavley regulations is expected to reduce fuel consumption while also reducing GHG emissions.[44] In 2018, the U.S. EPA and National Highway Traffic Safety Administration (NHTSA) proposed to freeze the clean car standards at the 2020 level through model year 2026 and to revoke California's authority to impose stricter rules.[45] Negotiations between the U.S. EPA, NHTSA, California, and 19 other states recently ended in February 2019 without a resolution. Federal agencies have not yet formally adopted the proposal to freeze the clean car standards, California officials have filed suit to block the proposal.

Energy Action Plan.

The first Energy Action Plan (EAP) emerged in 2003 from a crisis atmosphere in California's energy markets. The state's three major energy policy agencies (CPUC, CEC, and the Consumer Power and Conservation Financing Authority [established under deregulation and now defunct]) came together to develop one high-level, coherent approach to meeting California's electricity and natural gas needs. It was the first time that energy policy agencies formally collaborated to define a common vision and set of strategies to address California's future energy needs and emphasize the importance of the impacts of energy policy on the California environment. In the October 2005 *Energy Action Plan II*, CEC and CPUC updated their energy policy vision by adding some important dimensions to the policy areas included in

the original EAP, such as the emerging importance of climate change, transportation-related energy issues and research and development activities. In February 2008, CEC adopted an update to the EAP II that supplements the earlier EAPs and examines the State's ongoing actions in the context of global climate change.

Assembly Bill 1007: State Alternative Fuel Plans

AB 1007 (Chapter 371, Statutes of 2005) required CEC to prepare a State plan to increase the use of alternative fuels in California. CEC prepared the State Alternative Fuels Plan (SAF Plan) in partnership with the CARB and in consultation with other State, federal, and local agencies. The SAF Plan presents strategies and actions California must take to increase the use of alternative non-petroleum fuels in a manner that minimizes costs to California and maximizes the economic benefits of in-state production. The SAF Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Bioenergy Action Plan, Executive Order S-06-06

Executive Order (EO) S-06-06, which took effect in 2006, establishes targets for the use and production of biofuels and biopower, and directs state agencies to work together to advance biomass programs in California while providing environmental protection and mitigation. The EO establishes the following targets to produce a minimum of 20 percent of the state's biofuels in California by 2010, 40 percent by 2020, and 75 percent by 2050. EO S-06-06 also calls for the state to meet a target for use of biomass electricity. The 2011 Bioenergy Action Plan identifies those barriers and recommends actions to address them so that the State can meet its clean energy, waste reduction, and climate protection goals. The 2012 Bioenergy Action Plan updates the 2011 Plan and provides a more detailed action plan to achieve the following goals:

- Increase environmentally and economically sustainable energy production from organic waste
- Encourage development of diverse bioenergy technologies that increase local electricity generation, combined heat and power facilities, renewable natural gas, and renewable liquid fuels for transportation and fuel cell applications
- Create jobs and stimulate economic development, especially in rural regions of the state
- Reduce fire danger, improve air and water quality, and reduce waste

Title 24, California Code of Regulations

The California Code of Regulations (CCR), Title 24, Part 6, is California's Energy Efficiency Standards for Residential and Non-residential Buildings. Title 24 was established in 1978 in response to a legislative mandate to create uniform building codes to reduce California's energy consumption and provide energy efficiency standards for residential and nonresidential buildings. The standards are updated on an approximately three-year cycle to allow consideration and possible incorporation of new efficient technologies and methods. In 2016, CEC updated Title 24 standards with more stringent requirements effective January 1, 2017. All new buildings or substantial remodels for which an application for a building permit is submitted on or after January 1, 2017 must follow the 2016 standards.

Energy efficient buildings require less electricity; therefore, increase energy efficiency reduces fossil fuel consumption and decreased GHG emissions. The CEC Impact Analysis for California's 2016 Building Energy Efficiency Standards estimates that the 2016 Standards are 28 percent more efficient than the previous 2013 standards for residential buildings and five percent more efficient for non-residential buildings. The building efficiency standards are enforced through the local plan check and building permit process. Local agencies are required to adopt the latest Title 24 standards when they update their local building codes. They may also adopt and enforce additional energy standards for new buildings as reasonably necessary due to local climatologic, geologic, or topographic conditions, provided that these standards exceed those provided in Title 24.

California Green Building Standards Code (Title 24, Part 11)

The most recent update for the California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is the 2019 CALGreen Code, which went into effect on January 1, 2020.[46] The purpose of the CALGreen Code is to encourage sustainable construction practices in planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality. The 2019 CALGreen Code includes mandatory measures for residential and non-residential development related to site development; water use; weather resistance and moisture management; construction waste reduction, disposal, and recycling; building maintenance and operation; pollutant control; indoor air quality; environmental

46 California Building Standards Commission, 2019 California Green Building Standards Code, California Code of Regulations, Title 24, Part 11.

comfort; and outdoor air quality.[47] The 2019 CALGreen Code improves upon the 2016 CALGreen Code by updating standards for bicycle parking, electric vehicle charging, and water efficiency and conservation.

Western Electricity Coordinating Council and the North American Electric Reliability Council

The Western Electricity Coordinating Council (WECC) is a voluntary consortium of electrical power providers that is responsible for coordinating and promoting electricity reliability from the Canadian provinces of Alberta and British Columbia in the north of its jurisdiction to the northern Mexican State of Baja California in the south of its jurisdiction, and the 14 western states.[48] The Los Angeles Department of Water and Power (LADWP) is a member of the WECC. The WECC has implemented Standard BAL-STD-002-0 to require reliable operation of the power system while ensuring adequate generating capacity at all times. As a means of ensuring power system reliability, the LADWP maintains an extra reserve margin of power generation resources in the event of a power system disturbance. In order to determine how much extra generation reserves are needed, the LADWP adheres to the WECC Reliability Standard. WECC Standard BAL-STD-002-0 requires its providers to:

- Supply requirements for load variations
- Replace generating capacity and energy lost due to forced outages of generation or transmission equipment
- Meet on-demand obligations
- Replace energy lost due to curtailment of interruptible imports

Executive Order S-1-07 (California Low Carbon Fuel Standard)

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10-percent total reduction in 2020.[49] Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products, or

49 California, Office of the Governor, Executive Order S-01-07, Low Carbon Fuel Standard, January 18, 2007.

buy LCFS credits from other California Air Resources Board companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.[50]

Sustainable Communities Strategy (SB 375)

The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction mandates established in AB 32. SB 375 specifically requires each Metropolitan Planning Organization (MPO) to prepare a "sustainable communities strategy" (SCS) as part of its Regional Transportation Plan (RTP), which is required by the state and federal government, that will achieve GHG emission reduction targets set by CARB for the years 2020 and 2035 by reducing vehicle miles travelled (VMT) from light duty vehicles through the development of more compact, complete, and efficient communities. The SCS also contains land use, housing, and transportation strategies that, if implemented, would allow the region to meet its GHG emission reduction targets.[51] The City of Los Angeles and, thus, all projects are located within the MPO area of the Southern California Association of Governments (SCAG). SCAG's compliance with SB 375, through preparation of a Regional Transportation Plan/Sustainable Communities Strategy, is described below under the regional regulatory setting.

Assembly Bill 758

AB 758 requires the CEC to develop a comprehensive program to achieve greater energy efficiency in the state's existing buildings. As part of the requirements of AB 758, the AB 758 Action Plan was released March 2015 and provides a 10-year roadmap that would result in accelerated growth of energy efficiency markets, more effective targeting and deliver of building upgrade services, improved quality of occupant and investor decisions, and vastly improved performance of California's buildings in service of those who own and occupy them. The AB 758 Action Plan provides a comprehensive framework centered on five goals, each with an objective and a series of strategies to achieve it.

Senate Bill 1389

SB 1389 (Public Resources Code Sections 25300-25323) requires the development of an integrated plan for electricity, natural gas, and transportation fuels. Under the bill, the CEC must adopt and transmit to the Governor and Legislature an Integrated Energy Policy Report every two years. The most recently completed report, the 2017 Power Strategic Long-Term Resource Plan, addresses a variety of issues

50 California, Office of the Governor, Executive Order S-01-07, Low Carbon Fuel Standard, January 18, 2007.

51 California, State Bill 375, The Sustainable Communities and Climate Protection Act of 2008, 2008.

including greenhouse gas emissions reductions, ensuring grid reliability, increasing renewable resources, once-through-cooling, and the *California Energy Demand Forecast*.[52]

California Environmental Quality Act

In accordance with the California Environmental Quality Act (CEQA) Appendix F, Energy Conservation, of the *State CEQA Guidelines*, and the applicable provisions of Appendix G, in order to assure that energy implications are considered in project decisions, EIRs are required to include a discussion of the potential significant energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. Appendix F of the *State CEQA Guidelines* provides a list of energy-related topics that should be analyzed in the EIR. In addition, while not described or required as significance thresholds for determining the significant of impacts related to energy, Appendix F of the *State CEQA Guidelines* provides several topics that the lead agency may consider in the discussion of energy use in an EIR, where topics are applicable or relevant to the project. Refer to **Section 4.15, Utilities and Service Systems,** for a discussion of the potential impacts of the project's capacity demand on the electric power, natural gas, and telecommunication services facilities.

Regional

SCAG Regional Transportation Plan/Sustainable Communities Strategy

SB 375, signed in August 2008, enhances the State's ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from vehicles for 2020 and 2035. In addition, SB 375 directs each of the State's 18 major Metropolitan Planning Organizations (MPO) to prepare a "sustainable communities strategy" (SCS) that contains a growth strategy to meet these emission targets for inclusion in the Regional Transportation Plan (RTP). On September 3, 2020, SCAG adopted the 2020-2045 RTP/SCS, also known as Connect SoCal. Rooted in past RTP/SCS plans, Connect SoCal's "Core Vision" centers on maintaining and better managing the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets. The plans "Key Connections" augment the "Core Vision" to address challenges related to the intensification of core planning strategies and increasingly aggressive greenhouse gas reduction goals, and include but are not limited to, Housing Supportive Infrastructure, Go Zones, and Shared Mobility. Connect SoCal intends to create benefits for the SCAG region by achieving regional goals for sustainability, transportation equity, improved public health and safety, and enhancement of the regions' overall quality of life.

Air Quality Management Plan.

As mentioned in **Section 4.2, Air Quality**, under state law, the SCAQMD is required to prepare a plan for air quality improvement for pollutants for which the District is in non-compliance. The SCAQMD updates the plan every three years. Each iteration of the SCAQMD's Air Quality Management Plan (AQMP) is an update of the previous plan and has a 20-year horizon. The 2016 AQMP, adopted on March 3, 2017, incorporates new scientific data and notable regulatory actions that have occurred since adoption of the 2012 AQMP, including the approval of the new federal 8-hour ozone standard of 0.070 ppm that was finalized in 2015. The 2016 AQMP addresses several state and federal planning requirements and incorporates new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and updated meteorological air quality models (SCAQMD 2017). This Plan builds upon the approaches taken in the 2012 AQMP for the attainment of federal PM and ozone standards and highlights the significant amount of reductions to be achieved. It emphasizes the need for interagency planning to identify additional strategies to achieve reductions within the timeframes allowed under the federal Clean Air Act, especially in the area of mobile sources. The 2016 AQMP also includes a discussion of emerging issues and opportunities, such as fugitive toxic particulate emissions, zero-emission mobile source control strategies, and the interacting dynamics among climate, energy, and air pollution. The Plan also includes attainment demonstrations of the new federal eight-hour ozone standard and vehicle miles travelled (VMT) emissions offsets, as per recent U.S. EPA requirements.

Local

City of Los Angeles Air Quality Element

The Air Quality Element of the City's General Plan includes a goal (Goal 5) that aims to increase energy efficiency through land use and transportation planning; the use of renewable resources and less-polluting fuels; and the implementation of conservation measures including passive methods such as site orientation and tree planting.[53] Additionally, Section 19: Resource Management (Fossil Fuels) of the Conservation Element of the General Plan includes Policy 1, which aims to continue to encourage energy conservation and petroleum product reuse.[54]

City of Los Angeles Safety Element

The updated Safety Element, adopted by the City Council on November 24, 2021, includes an objective and policies to address climate change, including air quality.

Table 4.5-6
Safety Element Goals, Policies, and Objectives

Safety Element Goals, Policies, and Objectives	
Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Policy 1.2.1	Environmental Justice. In keeping with the Plan for a Healthy LA, build a fair, just and prosperous city where everyone experiences the benefits of a sustainable future by correcting the long running disproportionate impact of environmental burdens faced by low income families and communities of color.
Policy 1.2.2	Renewable Energy. Aggressively pursue renewable energy sources, transitioning away from fossil based sources of energy and toward 100% renewable energy sources.
Policy 1.2.4	Clean and Healthy Buildings. Design, build and rebuild buildings using passive energy principals, advanced efficiency measures, and on-site renewable energy.
Policy 1.2.5	Housing and Development. In keeping with the Housing Element, put affordable housing within reach of every family and a roof over the head of every Angeleno by developing housing that is affordable, efficient and connected to transportation options.
Policy 1.2.6	Mobility. In keeping with the Mobility Plan, build a comprehensive and integrated transportation network that changes how Angelenos get around and reduces car dependency.
Policy 1.2.7	Zero Emissions Vehicles. In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increases zero emissions infrastructure including charging.

City of Los Angeles Green Building Code.

The following types of projects are subject to the Los Angeles Green Building Code:

- All new buildings (residential and non-residential)
- All additions (residential and non-residential)
- Alterations with building valuations over $200,000 (residential and non-residential)

The Los Angeles Green Building Code is based on the 2016 CALGreen Standards. The program addresses five key areas: (1) Site: location, site planning, landscaping, storm water management, construction and demolition recycling; (2) Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation; (3) Energy & Atmosphere: energy efficiency, and clean/renewable energy; (4) Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and (5) Indoor

Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control. Specifically, the Los Angeles Green Building Code requires all non-residential buildings to be constructed such that they're solar ready, while all residential buildings three stories and under must include solar photovoltaic (PV) systems. Likewise, all residential buildings greater than three stories must be solar ready.

On December 27, 2019, the Los Angeles City Council approved Ordinance No. 186,488, which amended Chapter IX of the Los Angeles Municipal Code, referred to as the Los Angeles Green Building Code, to alter certain provisions of Article 9 to reflect local administrative changes and incorporate by reference portions of the 2019 CALGreen Code. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) non-residential and high-rise residential buildings; and (3) additions and alterations to non-residential and high-rise residential buildings. LAMC Article 9, Division 5 includes measures for newly constructed non-residential and high-rise residential buildings. The Los Angeles Green Building Code includes some requirements that are more stringent than state requirements such as increased requirements for electric vehicle charging spaces and water efficiency.

Los Angeles 2016 Final Power Integrated Resource Plan

On January 13, 2017, LADWP adopted the *2016 Power Integrated Resource Plan* (IRP), which provides a 20-year roadmap to guide LADWP in meeting future energy needs by forecasting demand for energy and determine how that demand will be met by executing new projects and replacement projects and programs. The IRP is an update of the 2015 IRP and provides the required reliability and necessary flexibility to adapt to economic, environmental, and regulatory conditions. Major changes from the 2015 IRP include Senate Bill 350, which was signed into law requiring a 50 percent renewable portfolio standard by December 31, 2030; the completion of the Maximum Distribution Renewable Energy Penetration Study (MDRPES); and a natural gas prices and renewable energy costs have been revised downwards compared to the 2014 IRP.

The 2016 IRP incorporates updates to reflect the latest load forecast, fuel price, and projected renewable price forecasts, and other numerous modeling assumptions. This IRP considers a 20-year planning horizon to guide LADWP as it executes major new and replacement projects and programs. The overriding purpose is to provide a framework to assure the future energy needs of LADWP customers are met in a manner that balances the following key objectives: maintaining a high level of electric service reliability; keeping energy rates competitive; and exercising environmental stewardship.

Green LA: An Action Plan to Lead the Nation in Fighting Global Warming

The City of Los Angeles adopted its climate action plan, Green LA: An Action Plan to Lead the Nation in Fighting Global Warming (Green LA), in May 2007. Green LA set the goal of reducing the City's GHG

emissions to 35 percent below 1990 levels by 2030. The action plan outlines several actions in the fields of energy, water, waste, and transportation. These actions include improved transportation centered around mobility for people rather than cars, increasing recycling to 70 percent diversion, meeting all additional water use through reclaimed water, and increasing renewable energy to 35 percent by 2020. The action plan also outlines goals to help residents become "energy misers" by distributing compact fluorescent lamps (CFL's) and increasing rebates for energy efficient appliances and retrofits.

Los Angeles Green New Deal (Sustainable City pLAn)

Additionally, in April 2015, the City released its first Sustainable City Plan (Sustainable City pLAn), which established a set of goals related to fourteen sectors to help transform Los Angeles by 2035. The Sustainable City pLAn is defined as a roadmap for Los Angeles that is environmentally healthy, economically prosperous, and equitable in opportunity for all. Specifically, the Sustainable City pLAn provides a vision for the City's future; pathway to short-term results that lay foundation for long-term outcomes; framework to build out policies; platform for collaboration; set of tools to manage the City; dashboard of sustainability metrics to transparently measure progress; and a pathway for engaging residents.

The Green New Deal (Sustainable City pLAn 2019) further accelerates the following goals: a 95 percent solid waste diversion rate by 2035 and a 100 percent diversion rate by 2050; a reduction of municipal solid waste generation per capita by at least 15 percent, including phasing out of single-use plastics, by 2028; the elimination of organic waste going to landfill by 2028; and increased proportion of waste products and recyclables productively reused and/or repurposed within Los Angeles County to at least 25 percent by 2025 and 50 percent by 2035.

Existing Buildings Energy & Water Efficiency Program Ordinance

The City also has an Existing Buildings Energy & Water Efficiency (EBEWE) Program Ordinance that requires owners of buildings over certain sizes to disclose their buildings' energy and water consumption.

City of Los Angeles Solid Waste Programs and Ordinances

The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced. For example, in 2015, 3.61 million tons of aluminum were produced by recycling in the United States, saving enough energy to provide electricity

to 7.5 million homes.[55] In 1989, California enacted AB 939, the California Integrated Waste Management Act which establishes a hierarchy for waste management practices such as source reduction, recycling, and environmentally safe land disposal.[56]

The City implements various programs and ordinances related to solid waste. These include: (1) the City of Los Angeles Solid Waste Management Policy Plan, adopted in 1993, which is a long-range policy plan that proposes an approach for the City to achieve a goal of 90-percent diversion by 2025; (2) the RENEW LA Plan, which is a Resource Management Blueprint with the aim to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources now going to disposal so as to achieve an overall diversion level of 90 percent or more by 2025; (3) the Waste Hauler Permit Program (Ordinance No. 181,519), which requires all private waste haulers collecting solid waste, including construction and demolition waste, to obtain AB 939 Compliance Permits and to transport construction and demolition waste to City certified construction and demolition processing facilities;[57] and (4) the Exclusive Franchise System Ordinance (Ordinance No. 182,986), which, among other requirements, sets maximum annual disposal levels and specific diversion requirements for franchised waste haulers in the City to promote solid waste diversion from landfills in an effort to meet the City's zero waste goals. These solid waste reduction programs and ordinances not only help to reduce the number of trips to haul solid waste, therefore reducing the amount of petroleum-based fuel, but also help to reduce the energy used to process solid waste.

City of Los Angeles Los Angeles 100% Renewable Energy Study (LA100)

The Los Angeles 100% Renewable Energy Study (LA100), published in March 2021, explores possible pathways on how the City could achieve a 100% clean energy future by 2045. The study outlines goals, future scenarios, and implementation pathways but does not present recommendations. All LA100 scenarios include significant deployment of renewable and zero-carbon energy by 2035, accounting for 84%–100% of energy. The study describes how in the future Los Angeles would rely on technologies like wind, solar, and batteries to meet most of the City's everyday needs, and only on combustion turbines— supplied with renewable fuels— for limited periods. The study explores some of the following topics:

---

55 American Geosciences Institute, "How Does Recycling Save Energy?" https://www.americangeosciences.org/critical-issues/faq/how-does-recycling-save-energy#:~:text=Extracting%20and%20processing%20raw%20resources,turn%20them%20into%20usable%20materials. Accessed May 2022

56 CalRecycle, History of California Solid Waste Law, 1985-1989. https://calrecycle.ca.gov/laws/legislation/calhist/1985to1989/ Accessed May 2022

57 The California Integrated Waste Management Act of 1989 (AB 939), as amended, was enacted to reduce, recycle, and reuse solid waste generation in the state. AB 939 requires city and county jurisdictions to divert 50 percent of the total waste stream from landfill disposal.

electricity demand projection, options for local solar and storage, renewable energy investments and operations, as well as the impacts and costs for 100% renewable energy pathways. Results show that a 100% renewable electricity supply is achievable by 2045 or sooner.[58]

In addition to the executive summary, the report makes high-level findings and has 12 chapters, including specific topics such as electricity demand projections, customer-adopted rooftop solar and storage, renewable energy investments and operations, air quality and public health, environmental justice, and economic impacts and jobs.

4.5.3 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G and Appendix F of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to energy if it would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.5.4 METHODOLOGY

Total energy consumption was calculated for existing conditions (2016), future (2040) No Project conditions, and future (2040) with Proposed Plan conditions. Future energy use without the Proposed Plan is provided for informational purposes and not impact analysis; the determination of significance is based on comparison of future conditions with the Project to existing conditions. This forecast is not exhaustive and does not include all sources of energy consumption in the region (i.e., industrial processes, planes, ships, etc.); however, it provides a reasonable estimate of the future energy use based on the types of land uses expected with the CPA.

The impact analysis for energy compares available energy supplies from LADWP and SoCal Gas at the citywide level to the estimated demand for energy of the Proposed Plan. In developing CalEEMod, CAPCOA developed energy demand factors for various land uses. By applying the CalEEMod factors to existing development and to the estimated buildable square footages by land use type, an estimate was made as to energy demand for existing conditions and for the reasonably foreseeable development under the Proposed Plan. This increase in demand is compared to the existing available energy supplies from

58 Cochran, Jaquelin, and Paul Denholm, eds. 2021. The Los Angeles 100% Renewable Energy Study. Golden, CO: National Renewable Energy Laboratory. https://www.nrel.gov/docs/fy21osti/79444-ES.pdf Accessed on November 29, 2021. NREL/TP-6A20-79444. https://maps.nrel. gov/la100/ Accessed on November 23, 2021.

LADWP and SoCalGas to determine if these utilities would be able to accommodate the Proposed Plan's energy demands. This analysis does not rely upon, or use, population data but rather uses reasonably expected development (dwelling units and square footage of non-residential land uses) by 2040.

Petroleum consumption was estimated by calculating the direct transportation fuels energy consumption of the CPA using daily VMT, fleet mix, and average fleetwide fuel consumption factors derived from EMFAC. Daily VMT within the CPA were obtained from the transportation analysis and the regional fleet mix was derived from CalEEMod. Average fuel economy is forecast to continue to increase, with the most recent automotive trends report for 2021 showing preliminary real-world fuel economy at 25.3 miles per gallon.[59] Therefore, applying the 2016-based average fuel economy to future year (2040) VMT provides a conservative evaluation of energy consumption as the energy use of vehicles in 2040 is likely to be lower than current fuel use. While there are per capita VMT and GHG targets, there are no state standards established requiring future decreases in per capita energy use.

Electricity consumption was estimated by calculating the electricity consumption by land use with electricity factors derived from the California Emissions Estimator Model. Electricity factors for the existing and future conditions only account for 2016 energy standards, as a result, the analysis below provides a conservative estimate of the CPA's future electricity consumption.

4.5.5 IMPACTS

Threshold 4.5-1 **Would implementation of the Proposed Plan result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?**

This impact would be less than significant.

Long-term operation of development accommodated by the CPA would require permanent grid connections for electricity and natural gas service to power internal and exterior building lighting, and heating and cooling systems. In addition, the increase in vehicle trips associated with future Boyle Heights CPA development would increase fuel consumption within the CPA. Increases in motor vehicle trips are primarily a combined function of population and employment growth. Population growth and growth in

[59] U.S. Environmental Protection Agency. 2021. The 2021 EPA Automotive Trends Report. Available at: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1013L1O.pdf, accessed May 12, 2022.

VMT would occur in the region regardless of whether the Proposed Plan is implemented. As a result, energy consumption would increase beyond the 2016 baseline under any scenario.

Table 4.5-7, Change in Direct Transportation Energy Use Under the Boyle Heights Proposed Plan, shows daily VMT and estimated fuel consumption translated into energy use (MMBtu) in the CPA under Existing (2016), Future (2040) No Project, and Future (2040) with Proposed Plan conditions. With respect to transportation energy use, as shown in **Table 4.5-7**, future total daily energy consumption under implementation of the Proposed Plan is expected to increase; however, per capita energy consumption is anticipated to decrease from 0.240 to 0.207 MMBtu per capita, a decrease of 14 percent. This change can be attributed to the fact that implementation of the Proposed Plan would lower per capita VMT due to the location of jobs and housing near each other and creation of substantial opportunities to use such transportation modes as transit, bicycling, and walking.

Table 4.5-7
Change in Direct Transportation Energy Use under the Boyle Heights Proposed Plan

Year	Daily VMT	Annual VMT[1]	Daily Energy Use (MMBtu)	Annual Use (MMBtu)	Daily Per Capita Energy Use (MMBtu)	Daily Per Service Population Use (MM Btu)	Annual Per Capita Energy Use (MM Btu)	Annual Per Service Population Use (MM Btu)
Baseline (2016)	2,968,948	1,030,022,500	20,584	7,142,648	0.240	0.180	82.57	63.35
Future (2040) with Proposed Plan	3,334,100	1,156,933,000	23,898	8,292,606	0.207	0.155	71.95	53.76
Future (2040) No Project	3,323,000	1,153,081,000	23,818	8,264,846	0.243	0.183	84.33	63.57
Change from Baseline to Future (2040) with Proposed Plan	**+365,152**	**+126,910,500**	**+3,314**	**+1,149,958**	**-0.033**	**-0.025**	**-10.62**	**-9.59**

*Transportation energy consumption was derived from the Boyle Heights Community Plan Area VMT (see **Table 4.5-1**), default fleet mix from CalEEMod (see **Appendix 4.5, Energy,** to this DEIR), average fuel economy from the United States Department of Transportation – Federal Highway Administration, and energy unit data from EIA. 1 Annual VMT is calculated by multiplying daily VMT by 347 days, to account for reduced travel on weekends, in accordance with industry standards. SOURCE: United States Department of Transportation – Federal Highway Administration 2016; EIA 2018; Fehr & Peers 2018.*
MMBtu = million British Thermal Units; VMT = Vehicle Miles Traveled

Table 4.5-8 shows estimated annual electricity consumption in the CPA under existing (2016), future (2040) No Project, and future (2040) with Proposed Plan conditions. As shown in **Table 3.0-4**, the Proposed Plan

is anticipated to result in growth of approximately 33,000 housing units, 115,000 residents, and 39,000 jobs. With that anticipated growth of the Proposed Plan, future total annual electricity consumption under implementation of the Proposed Plan is expected to increase by 717,404 MMBtu. Additionally, as the Proposed Plan anticipates increases in industrial and commercial uses of 32,868,018 sf and 12,474,119 sf, respectively, and as these uses would not add to the residential population for the CPA, per capita electricity consumption is anticipated to increase from 4.40 to 9.55 MWh per capita and per service population electricity consumption is anticipated to increase from 3.38 to 7.13 MWh per service population. Importantly, these numbers are the result of conservative assumptions to disclose reasonable worst-case scenario and are likely to overestimate future usage. First, future energy consumption estimates only account for compliance with existing energy efficiency standards (i.e., 2016 Title 24). Similar to current plans, reasonably anticipated future development anticipated to occur with the implementation of the Boyle Heights Community Plan would be subject to Title 24, Part 6 of the California Administrative Code, the Energy Efficiency Standards for Residential and Nonresidential Buildings, which requires local jurisdictions to use energy efficient appliances, weatherization techniques, and efficient cooling and heating systems to reduce energy demand stemming from new development. In addition, future development would also be required to comply with the City of Los Angeles' Green Building Code Energy Efficiency requirements. Although the analysis contained herein does not account for future improvements in energy efficiency, development accommodated by the Proposed Plan would be expected to consume less energy than existing developments as building standards become more stringent. Additionally, the calculations take a conservative measure of future usage relying on assumptions that future commercial and industrial uses will be heavy users of electricity. The increase in commercial and industrial uses would result in an increase in energy demand; however, the uses would not result in an increase to the population which is used for per capita calculations. While the new residential uses in the Proposed Plan would add to the future population and adjust the per capita calculations, the number of residential uses is not high enough to offset the new commercial and industrial uses in the CPA. Again, these are conservative assumptions to ensure the City has analyzed a reasonable worst-case scenario of electricity usage but the CPA may not build out with these industrial and commercial uses that use this level of electricity. As a result, the electricity consumption disclosed in **Table 4.5-8, Future (2040) with Proposed Plan Annual Electricity Demand in Boyle Heights Community Plan Area,** and **Table 4.5-9, Change in Electricity Consumption Under the Boyle Heights Proposed Plan,** provides a conservative estimate of the Proposed Plan's electricity consumption. Furthermore, as shown below, while the annual electricity consumption under the Proposed Plan would be higher than under the future 2040 no project scenario the per capita electricity consumption would be lower due to the increase in population. In any case, compliance with the

above described energy efficiency standards and the City's Green Building Code requirements would ensure that electricity consumption would not be wasteful or inefficient.

Table 4.5-8
Future (2040) with Proposed Plan Annual Electricity Demand in the Boyle Heights Community Plan Area

Land Use	Size	Unit	T24E Rate (kWhr/unit)	NT24E (kWhr/unit)	Lighting (kWhr/unit)	Annual Electricity Use (MWhr)
Single Family	6,623	DU	572.03	6,155.97	1,608.84	55,215
Multi-Family	26,766	DU	258.09	3,054.10	1,001.10	115,500
Commercial	19,844,665	SF	4.6	4.62	3.77	257,782
Industrial	47,682,097	SF	2.25	5.75	3.1	529,271
Public Facilities	10,791,956	SF	4.6	4.62	3.77	140,188
					Total Annual Electricity Use	1,097,956
					Proportion of Statewide Consumption	0.38%
					Per Capita Electricity Consumption (MWhr/capita)	9.55
					Per Service Population Electricity Consumption (MWhr/SP)	7.13

Source: Impact Sciences, 2021.
Note: The per capita consumption for electricity is determined by dividing electricity consumption data from CalEEMod by the existing CPA population, as detailed in ***Section 4.12, Population, Housing and Employment****.*
Source: CEC, Electricity Consumption by County. http://ecdms.energy.ca.gov/elecbycounty.aspx
CPA = Community Plan Area; MWh = megawatt-hours; SF = square feet; DU = dwelling unit; T24E = title 24 electricity; NT24E = non-title 24 electricity; SP= service population

Table 4.5-9
Change in Electricity Consumption under the Boyle Heights Proposed Plan

Year	Annual Electricity Consumption (MWh)	Proportion of Statewide Consumption	Per Capita Electricity Consumption (MWh)	Per Service Population Consumption (MWh)
Baseline (2016)	380,552	0.07%	4.40	3.38
Future (2040) with Proposed Plan	1,097,956	0.38%	9.55	7.13
Future (2040) No Project	1,024,400	0.35%	10.45	7.88
Change from Baseline to Future (2040) with Proposed Plan	+717,404	+0.31%	+5.15	+3.75

Note: Electricity consumption calculated based on CalEEMod energy factors. The per capita consumption for electricity consumption is determined by dividing electricity consumption data from CalEEMod by the existing Boyle heights Plan Area population, as detailed in ***Section 4.12, Population, Housing and Employment****. Proportion of statewide consumption based on 2016 electrical consumption.*

MWh = Megawatt hours

Table 4.5-10, Change in Natural Gas Consumption Under the Boyle Heights Proposed Plan, shows estimated annual natural gas consumption in the CPA under existing (2016), future (2040) No Project, and future (2040) with Proposed Plan conditions. With the anticipated growth of the Proposed Plan, future total annual natural gas consumption under implementation of the Proposed Plan is expected to increase. Additionally, as the Proposed Plan anticipates increases in industrial and commercial uses which would not add to the residential population, per capita natural gas consumption is anticipated to increase from 7.96 to 14.79 MMBtu per capita, an increase of 6.83 MMBtu per capita and per service population natural gas consumption is anticipated to increase from 6.11 to 11.04 MM Btu per service population, an increase of 4.93 MM Btu/service population. Importantly, these numbers are the result of conservative assumptions to disclose reasonable worst-case scenario and are likely to overestimate future usage. Future natural gas consumption estimates, included in **Table 4.5-10**, only takes into account compliance with existing energy efficiency standards (i.e., 2016 Title 24). Individual development projects accommodated by the Proposed Plan would be expected to consume less natural gas than existing developments as energy conservation standards become more stringent. Additionally, the calculations take a conservative measure of future usage relying on assumptions that future commercial and industrial uses will be heavy users of natural gas. The increase in commercial and industrial would result in an increase in natural gas demand; however, the uses would not add to the population which is used for per capita calculations. While the new residential uses in the Proposed Plan would add to the future population and adjust the per capita

calculations, the number of residential uses is not high enough to offset new commercial and industrial uses in the CPA. Again, these are conservative assumptions to ensure the City has analyzed a reasonable worst-case scenario of natural gas usage but the CPA may not build out with these industrial and commercial uses that use this level of natural gas. In any case, compliance with the above described energy efficiency standards and the City's Green Building Code requirements would ensure that natural gas consumption would not be wasteful or inefficient.

Table 4.5-10
Change in Natural Gas Consumption under the Boyle Heights Proposed Plan

Year	Annual Natural Gas Consumption (billion Btu)	Proportion of Statewide Consumption (percent)	Per Capita Natural Gas Consumption (MMBtu per capita)	Per Service Population Consumption (MM Btu per service population)
Baseline (2016)	688.6	0.060%	7.96	6.11
Future (2040) with Proposed Plan	1,704	0.068%	14.79	11.04
Future (2040) No Project	1,800	0.072%	15.62	13.86
Change from Baseline to Future (2040) with Proposed Plan	**+1,015**	**+0.008%**	**+6.83**	**+4.93**

Note: Natural gas consumption based on CalEEMod energy factors. The per capita consumption for natural gas is determined by dividing electricity consumption data from CalEEMod by the existing Boyle heights Plan Area population, as detailed in ***Section 4.12, Population, Housing and Employment****. 1 Total annual natural gas consumption is expressed in billion Btu, while per capita annual natural gas consumption is expressed in million Btu.*
Sources: California Energy Commission. 2016. Gas Consumption by County. Available at: https://ecdms.energy.ca.gov/gasbycounty.aspx, accessed May 2021.
Btu= British thermal units; MMBtu = million British Thermal Units

Construction and maintenance of reasonably anticipated development from the Proposed Plan would result in short-term consumption of energy from the use of construction equipment and processes. In addition, roadway and transit construction materials, such as asphalt, concrete, surface treatments, steel, rail ballast, as well as building materials, require energy to be produced, and would likely be used in projects that involve new construction or replacement of older materials, as well as construction of future infill and transit-oriented development (TOD) projects/developments envisioned by the Proposed Plan. Construction energy demand is not calculated because, precise location, lot acreage, size of buildings, and construction durations for development under the Proposed Plan is currently unknown and estimates would be speculative. However, nothing in the Proposed Plan would foreseeably increase construction energy demand. Furthermore, there is already construction happening within the CPA and it would

foreseeably occur in the CPA or elsewhere in the City based on SCAG projections without the Proposed Plan. Zoning changes and increased zoning allowances may lead to increased levels of construction; however, construction is cyclical and increases in construction depends more on the state of the economy than changes in zoning. Moreover, CalGreen includes specific requirements related to recycling, construction materials and energy efficiency standards, which would apply to construction of roadway and transit improvement projects in addition to future infill and TOD envisioned by the Proposed Plan and would help to minimize waste and energy consumption. All construction and maintenance accommodated by the Proposed Plan would be required to comply with relevant provisions of CalGreen.

Consistency with Energy Conservation and Renewable Energy Policies

As previously discussed, the Proposed Plan would result in decreases in per service population transportation-related energy use, while per capita and per service population electricity and natural gas use in the CPA would increase. Although implementation of the Proposed Plan would result in greater net energy consumption than baseline conditions, the Proposed Plan would not result in the inefficient, wasteful, or unnecessary consumption of energy if it is consistent with existing relevant energy conservation policies. The discussion below examines consistency with adopted plans and policies related to energy conservation.

The Proposed Plan is a land use plan and does not include regulations related to fuel efficiency or alternative fuel vehicles. However, the Proposed Plan would reduce per service population VMT and the associated use of fuels, by increasing access to transit and promoting the use of active transportation modes by accommodating compact development and mix of land uses in close proximity to transit. Therefore, the Proposed Plan would not conflict, but would instead support the goals of these regulations. (e.g., Energy Policy and Conservation Act and CAFE Standards, EPAct, Energy Independence and Security Act of 2007, AB 1493: Reduction of Greenhouse Gas Emissions, AB 1007: State Alternative Fuels Plan). The 1975 Warren-Alquist Act established the California Energy Resource Conservation and Development Commission, now known as the California Energy Commission (CEC), and established a State policy to reduce wasteful, uneconomical and unnecessary uses of energy. The Proposed Plan would be subject to California's Energy Efficiency Standards in the California Code of Regulations, Title 24, Part 6, which requires local jurisdictions to enforce energy efficient appliances, construction materials and building systems for new development. In addition, the City of Los Angeles' Green Building Code would require new development in the CPA to comply with its energy efficiency requirements.

As demonstrated in Tables 4.5-7 through 4.5-10 above, the Proposed Plan would result in higher per capita and per service population electricity and natural gas use in comparison to the baseline conditions and would result in lower per capita transportation fuel use in comparison to baseline conditions. As stated

above, the Proposed Plan anticipates non-residential land to be developed to greater intensities than existing conditions by the year 2040. Additionally, the addition of non-residential uses with their proportionally higher electricity and natural gas use compared to residential uses would add energy use without adding to the population proportionally within the CPA. As a result, the increase in per capita electricity and natural gas use is a result of the expansion of these non-residential land uses. Further, the analysis does not account for reductions in energy uses from newer buildings that will be constructed throughout the proposed timeline and will be required to adhere to stricter energy and building codes as compared to baseline conditions. Therefore, the Proposed Plan would not result in wasteful, inefficient, or unnecessary use of energy and would not be inconsistent with applicable Warren-Alquist Act policies.

SB 1078, as accelerated by SB 350, established a renewable portfolio standard for electricity supply, and required that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide 33 percent of their supply from renewable sources by 2020, 44 percent by 2024, 52 percent by 2027, and 60 percent by 2030.[60] In addition, the 2017 Integrated Energy Policy Report (IEPR) includes a set of strategies to address California's future energy needs. Key topics covered in the report include electricity resource and supply plans; electricity and natural gas demand forecasts; natural gas outlooks; transportation energy demand forecasts; energy efficiency savings; integrated resource planning; a barriers study; climate adaptation and resilience; renewable gas; distributed energy resources; strategic transmission investment plans; and existing power plan reliability issues. The Proposed Plan would not conflict with these policies. Refer to **Section 4.7, Greenhouse Gas Emissions**, for a discussion of greenhouse gas emissions reductions related to the Boyle Heights Community Plan.

In addition, future development projects accommodated by the Proposed Plan are expected to promote energy efficiency as they support implementation of the SCAQMD 2016 Air Quality Management Plan transportation control measures, including transportation demand management, transportation system management, commuter and public transit; rail, bike and pedestrian programs, among others (refer to **Section 4.2, Air Quality**).

The Proposed Plan would be consistent with the Air Quality and Conservation Elements of the Los Angeles General Plan, which encourages the use of renewable energy, energy conservation, and energy efficiency techniques in all new building design, orientation, and construction and support of alternative transportation and fuels. As described above, the Proposed Plan includes policies intended to improve the efficiency and effectiveness of the transportation system, thus reducing fuel consumption and enhancing

60 California Energy Commission. Renewables Portfolio Standard – Verification and Compliance. Available at: https://www.energy.ca.gov/programs-and-topics/programs/renewables-portfolio-standard/renewables-portfolio-standard, accessed May 12, 2022.

opportunities for the use of transit and other alternative modes of transportation through the development of new pedestrian and bicycle facilities and promotion of mixed use and infill development.

In summary, the Proposed Plan would not result in wasteful or inefficient energy consumption and is consistent with applicable policies regarding energy conservation and renewable energy. Therefore, the Proposed Plan would have a ***less than significant*** impact with respect to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Impact 4.5-2 **Would implementation of the Proposed Plan result in a conflict with or obstruct a state or local plan for renewable energy or energy efficiency.**

This impact would be less than significant.

As discussed under **Impact 4.5-1**, inconsistencies between the Proposed Plan and adopted plans and policies related to decreasing reliance on fossil fuels and increasing reliance on renewable energy sources have not been identified. SB 1078, as accelerated most recently by SB 100, established an RPS for electricity supply, and requires that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide 33 percent of their supply from renewable sources by 2020, 60 percent by 2030, and 100 percent by 2045. To meet this state requirement, as well as the local desire to achieve 100 percent renewable energy, the LADWP's 2016 IRP expresses plans to increase the LADWP's RPS to 55 percent by 2030 and to 65 percent by 2036 along with the sale of LADWP's 21-percent share in the coal-fired Navajo Generation Station. Many of these strategies are aimed at reducing greenhouse gas emissions, but also result in improved energy efficiency and an increased integration of renewable energy sources. The Proposed Plan would not conflict with these policies or objectives. Refer to **Section 4.7, Greenhouse Gas Emissions**, for a discussion of greenhouse gas emissions reductions related to the Proposed Plan.

The Proposed Plan would also be consistent with the City of Los Angeles General Plan Air Quality and Conservation Elements, which encourages the use of renewable energy, energy conservation, and energy efficiency techniques in all new building design, orientation, and construction and support of alternative transportation and fuels. As described under **Impact 4.5-1**, the Proposed Plan includes policies intended to improve the efficiency and effectiveness of the transportation system and provide options for alternative

transportation. In summary, the Proposed Plan would not result in an increased reliance on fossil fuels and a decreased reliance on renewable energy sources and is consistent with applicable policies regarding energy conservation and renewable energy. Therefore, the Proposed Plan's impact with respect to conflicting with a state or local plan for renewable energy or energy efficiency would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.5.6 CUMULATIVE IMPACTS

Energy Consumption

Locally, energy resources are provided by various oil companies, LAWDP, and SoCal Gas, but the issue of energy is global in nature and the state as well as regional and local governments have adopted policies aimed at energy conservation. The service areas for energy providers are varied, with LADWP primarily serving the City, SoCal Gas serving a 23,000 square mile region covering much of central and southern California, and oil companies serving customers all over the world. No single geographic scope can address the full extent of issues related to energy resources, so the cumulative analysis contained herein considers energy demand in the City of Los Angeles and the southern California region served by SoCal Gas in the context of statewide energy demand and state mandates related to energy conservation.

As discussed above, cumulative development in Los Angeles and throughout southern California would continue to increase energy use to meet the City's and region's growing population; however, implementation of future community plans is expected to generally improve the efficiency of energy use in the City, while adherence to existing state regulations such as CalGreen and the Low Carbon Fuel Standard would ensure the incorporation of energy efficient measures in the design and operation of future developments throughout the region. Thus, cumulative impacts related to energy use arising from cumulative development in Los Angeles and throughout the region would be less than significant.

As discussed under **Impact 4.5-1**, implementation of the Proposed Plan would generally improve the efficiency of energy use in the CPA on a per capita basis and would not contribute to a cumulative impact related to the wasteful, unnecessary, or inefficient use of energy. Furthermore, development emphasis on compact land use and growth patterns that facilitate transit and non-motorized transportation are

anticipated to result in less energy consumption. As mentioned in **Section 4.7, Greenhouse Gas Emissions,** SCAG's 2020 Connect SoCal RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system as well as reduce energy use and associated GHG emissions within the region. The Proposed Plan would accommodate concentrated, mixed-use development adjacent to transit corridors in order to conserve resources, protect existing residential neighborhoods, and reduce energy use through the increase in active transportation and use of transit. Another goal of the RTP/SCS is to actively encourage and create incentives for energy efficiency, where possible. When new development occurs, new buildings would be constructed as CALGreen compliant buildings, which are more energy efficient than any existing buildings that might be replaced. While implementation of the Proposed Plan would result in increased demand for energy and natural gas, the impact to the City's and region's energy resources would be less than significant. The Proposed Plan would support energy efficient practices and would not result in wasteful or inefficient use of energy.

Renewable Energy/Energy Efficiency Plan Consistency

As discussed above, cumulative development in the City of Los Angeles and throughout southern California would continue to increase energy use to meet the City's and region's growing population; however, implementation of the Proposed Plan, as well as other future land use plans in the City, is expected to generally improve the efficiency of energy use in the City, while adherence to existing state regulations, such as the California's Energy Efficiency Standards, CalGreen, and the Low Carbon Fuel Standard, would ensure the incorporation of energy efficient measures in the design and operation of future developments throughout the region. The Proposed Plan would also be consistent with the SCAQMD 2016 Air Quality Management Plan and the City of Los Angeles General Plan Air Quality and Conservation Elements. These plans promote and encourages energy efficiency, Thus, impacts related to consistency with renewable energy or energy efficiency plans would be less than significant and would not be cumulatively considerable.

Conclusion

Based on the above, the incremental effect of the Proposed Plan on energy resources would not be cumulative considerable and cumulative impacts would be less than significant.

4.6 GEOLOGY AND SOILS

4.6.1 INTRODUCTION

This section analyzes the potential environmental effects on geology and soils in the CPA from implementation of the Proposed Plan. Topics addressed include suitability of soil for development, seismicity, faults, ground shaking, liquefaction, and landslides. This section was prepared using documents and maps published by the California Department of Conservation (DOC), California Geological Survey (CGS), City of Los Angeles, and other applicable sources.

4.6.2 EXISTING ENVIRONMENTAL SETTING

Regional Setting

The CPA is located in the Los Angeles basin and is underlain by unconsolidated alluvial sediments. These materials were deposited by the meandering rivers and streams that make up the Los Angeles River watershed. There are eight major tributaries to the Los Angeles River as it flows from its headwaters to the Pacific Ocean. The major tributaries include Burbank Western Channel, Pacoima Wash, Tujunga Wash, and Verdugo Wash in the San Fernando Valley; and the Arroyo Seco, Compton Creek, and Rio Hondo south of the Glendale Narrows.

The CPA is located in the Peninsular Ranges Geomorphic Province. The basin is bounded to the east and southeast by the Santa Ana Mountains and San Joaquin Hills, and to the northwest by the Santa Monica Mountains. The Peninsular ranges are characterized by northwest-trending blocks of mountain ridges and sediment floored valleys. The dominant geologic structure features are northwest trending fault zones that either die out to the northwest or terminate at east-trending faults that form the southern margin of the Transverse Ranges. Over 22 million years ago, the Los Angeles Basin was a deep marine basin formed by tectonic forces between the North American and Pacific plates. Since that time, over five miles of marine and non-marine sedimentary rock, as well as intrusive and extrusive igneous rocks have filled the basin. During the last two million years, defined by the Pleistocene and Holocene epochs, the Los Angeles Basin and surrounding mountain ranges have been uplifted to form the present-day landscape. Erosion of the surrounding mountains has resulted in deposition of unconsolidated sediments in low-lying areas by rivers such as the Los Angeles River.

Local Setting

The CPA is a highly urban in setting, which both contains and is surrounded by developed areas. Over 90 percent of the CPA land use is zoned for development. Land uses include residential, industrial, and

commercial. Multiple active rail lines adjacent to the channelized Los Angeles River form the western border of the CPA. Other boundaries include freeways, rail rights-of-way, and large streets, all within the City of Los Angeles.

The CPA is relatively flat and highly urbanized, lacking major geologic or topographic features such as hilltops, ridges, hillslopes, canyons, ravines, outcrops, and water bodies. The elevation within the CPA ranges from 168 mean sea level (msl) to 500 msl. **Figure 4.6-1, Hillside Areas of Boyle Heights CPA,** illustrates the hillside areas of the CPA. Areas that are designated as "Hillside" by the zoning ordinance include the western and southwest portion of Boyle Heights, adjacent to the intersection of US-101, I-10, and I-5. Other "Hillside" areas include the area north of SR-60 that traverses the center section of the CPA, north of Evergreen Cemetery near the eastern boundary of the CPA, and the northeast corner of the CPA north of Wabash Avenue. There are no riparian areas or streambeds in the CPA, and no natural undisturbed open spaces. Existing open space areas in the CPA consist primarily of public parks, utility corridors, and vacant lots.

The Boyle Heights CPA is located in the Northeast Los Angeles Geologic Subregion.[1] This subregion is underlain by Tertiary bedrock units which become increasingly older from south to north.[2] The Boyle Heights CPA is composed of older dissected surficial deposits consisting of gravel, sand, and silt. Along the northern edge of the CPA, the area is composed of small areas of Unnamed Shale and Fernando Formation. Numerous south draining canyons are filled with younger less consolidated surficial deposits of about the same composition.[3]

Faulting and Seismicity

A fault is a fracture or line of weakness in the earth's crust, along which rocks on one side of the fault are offset relative to the same rocks on the other side of the fault. Based on criteria established by the California Geologic Survey, faults may be categorized as active, potentially active, or inactive. Active faults are those that show evidence of surface displacement within the last 11,000 years (Holocene age). Potentially active faults are those that show evidence of surface displacement within the last 1.6 million years (Quaternary age). Faults showing no evidence of surface displacement within the last 1.6 million years may be considered inactive in most cases.

3 *Ibid.*

Many active earthquake fault zones are mapped in the Los Angeles area. A number of earthquake faults are visible and aboveground, such as the San Andreas Fault. However, earthquakes along unmapped faults, such as the blind thrust fault associated with the Northridge earthquake, are increasingly becoming the focus of study and concern. These faults may dominate the geology of the Los Angeles Basin in a way not previously known. **Table 4.6-1, Major Named Faults in Southern California,** provides a summary of major active faults in the Los Angeles region, and **Figure 4.6-2, Faults Located Near or Within the Boyle Heights CPA,** identifies the faults in the Southern California region and within the CPA regional vicinity.

As shown in **Figure 4.6-2**, there are two potentially active fault lines traversing the CPA. The first potentially active fault is a currently unnamed Late Quaternary fault identified as "Unnamed fault west of Monterey Park" by the California Department of Conservation.[4] The fault primarily trends east west running from Boyle Heights towards Montebello, but arcs to the north in City Terrace.[5] Though no recent seismic activity has been recorded along this fault, a major earthquake occurring along this fault would be capable of generating seismic hazards and strong ground shaking effects within the CPA. The second potentially active fault is a Quaternary fault located at the norther boundary of the CPA, adjacent to and traversing through Piggyback Yard. The fault primarily trends east west, running from Monterey Park in the east, towards Elysian Park, where it then trends northwest toward the Hollywood fault. No recent activity has been recorded on this fault.

Several Pre-Quaternary Faults are also located north of the CPA. However, these faults have not experienced movement within the past 1.6 million years and are considered inactive.[6]

The closest faults that are associated with an Alquist Priolo Earthquake Fault Zone are the Raymond Fault located approximately 4.5 miles to the north of the CPA and the East Montebello Fault located approximately 6 miles to the east.[7] Thus, no fault rupture hazard is anticipated along the fault traces that pass through the CPA.

Recent Seismic Activity

Seismic events present the most widespread threat of devastation to life and property in the southern California region. With an earthquake, there is no containment of potential damage. Since 1800, there have

been approximately 60 damaging seismic events, or earthquakes, in the Los Angeles region. Since 1933, there have been four moderate-size earthquakes, which have caused numerous deaths and substantial property damage in the metropolitan Los Angeles area. These four events are identified by their location as the Long Beach (March 11, 1933; magnitude 6.3), San Fernando (February 9, 1971; magnitude 6.4), Whittier Narrows (October 1, 1987; magnitude 5.9), and Northridge (January 17, 1994; magnitude 6.7) earthquakes. The Northridge earthquake, the most recent of these seismic episodes, occurred January 17, 1994, with a magnitude of 6.7 which produced strong ground motions over an extensive area. The earthquake occurred on a previously unrecognized blind thrust fault, and no surface rupture that can be unequivocally associated with the main shock has been identified. Analysis by the United States Geologic Survey (USGS) and Caltech indicates that the earthquake rupture initiated about 11 miles below the San Fernando Valley.[8]

Table 4.6-1
Major Named Faults in Southern California

Fault	Maximum Magnitude	Slip Rate (mm/yr)	Type of Fault	Most Recent Seismic Event
Cabrillo	6.0 - 6.8	Uncertain	Right normal	Holocene
Cucamonga	6.0 - 7.0	5.0 - 14.0	Thrust	Holocene

Seismic and Soil Hazards

As the entire Southern California area is considered a seismically active region, the CPA may be exposed to strong ground shaking during a seismic event. General issues of concern relating to earthquakes include fault rupture, strong ground shaking, liquefaction, and landslides.

Soil Hazards include hazards associated with soils and include erosion, shrink/swell potential (expansive soils), landslides, and subsidence, as described below. Most of the City is urbanized and most of the land surface is covered in structures and pavement, which limits the extent of exposed surface soils. As shown in **Figure 4.6-3, Soil Types within the Boyle Heights CPA**, Alluvium underlies the majority of urban land in the CPA.[9] Aside from small areas of Unnamed Shale and Fernando Formation along the north edge of the CPA, the area is composed of older dissected surficial deposits consisting of gravel, sand, and silt.[10] The soil types in the majority of the CPA consist of Azuvina-Montebello soil complex and Ballona-Typic Xerorthents, fine substratum complex.[11] Most of these areas have slopes of between 0 and 5 percent. Some areas in the northern portion of the CPA consist of Montebello-Xerorthents complex with slopes between 0 to 15 percent. The northeastern corner of the CPA has soils classified as Counterfeit-Nacimiento, warm-Urban land association and has considerably steeper slopes at 20 to 55 percent.[12]

Surface Rupture. Surface rupture represents the breakage of ground along the surface trace of a fault, which is caused by the intersection of the fault surface area ruptured in an earthquake with Earth's surface. Fault displacement occurs when material on one side of a fault moves relative to the material on the other side of the fault. This can have particularly adverse consequences when buildings are located within the rupture zone. It is not feasible, from a structural or economic perspective, to design and build structures that can accommodate rapid displacement involved with surface rupture. Amounts of surface displacement can range from a few inches to tens of feet during a rupture event.

The Alquist-Priolo Earthquake Fault Zoning Act regulates development near active faults to mitigate the hazard of surface fault rupture. Essentially, this Act prohibits the location of most structures for human occupancy across the trace of active faults and establishes Earthquake Fault Zones and requires geologic/seismic studies of all proposed developments within a delineated zone. The Earthquake Fault Zones are delineated and defined by the State Geologist and identify areas where potential surface rupture

12 *Ibid.*

along a fault could occur. No Alquist-Priolo Earthquake Fault Zones are located in the Boyle Heights CPA.[13]

Seismic Ground Shaking. The principal seismic hazard occurring as a result of an earthquake produced by local faults is strong ground shaking. Seismic ground shaking is the direct result of movement along a fault. The intensity of ground shaking depends on several factors, including the magnitude of the earthquake, distance from the earthquake epicenter, and the underlying soil conditions. In general, the larger the magnitude of an earthquake and the closer a site to the epicenter of the event, the greater the effects will be. However, soil conditions can also amplify the earthquake shock waves. Generally, the shock waves remain unchanged in bedrock, but are amplified to a degree in thick alluvium, and are greatly amplified in thin alluvium. Modern, well-constructed buildings are designed to resist ground shaking through the use of shear walls and reinforcements. However, buildings in this seismically active region are susceptible to ground shaking and earthquakes.

Seismically Induced Settlement. The thick alluvial deposits which underlay the CPA would be subject to differential settlement due to the intense shaking associated with seismic events. This type of hazard results primarily in the damage to property when an area settles to different degrees over a relatively short distance. The actual potential for settlement is difficult to predict as the conditions under which this hazard can occur are site specific.

Liquefaction. Liquefaction involves the sudden loss of strength in saturated, cohesionless soils that are subjected to ground vibration and result in temporary transformation of the soil into a fluid mass. If the liquefying layer is near the surface, the effects are much like that of quicksand for any structures located on top of it. If the layer is deeper in the subsurface, it may provide a sliding surface for the material above it. The effects of liquefaction include the loss of the soil's ability to support footings and foundations, which may cause buildings and foundations to buckle. These failures have been observed in the 1971 San Fernando and the 1994 Northridge earthquakes. Liquefaction-related phenomena include subsidence and lateral spreading. Subsidence is the gradual settling or sudden sinking of land due to movement or removal of underlying earth materials. Lateral spreading can occur on relatively shallow slopes. Liquefaction of shallow layers causes a loss of shear strength, allowing the surface to move laterally across gentle slopes. Areas with lateral spreading potential would most likely be adjacent to drainages where slopes are steepest and water may be more likely to accumulate.

Areas susceptible to liquefaction in the CPAs are identified in **Figure 4.6-4, Seismic and Soil Hazards within the Boyle Heights CPA**. Liquefaction zones are primarily limited to the northern portion of the

13 California Department of Conservation. Earthquake Zones of Required Investigation. Available at: https://maps.conservation.ca.gov/cgs/EQZApp/app/, accessed May 14, 2021.

CPA, north of the I-10 and 101 Freeway. Small portions of the liquefaction zone also occur southwest of the junction between the I-10 and 101 Freeway as well the southern tip of the CPA. Methods exist for safely designing and constructing facilities in liquefaction-prone areas; however, they are costly. While avoidance is a better option, liquefaction areas lie within already developed regions. Therefore, early planning recognition will allow more intelligent siting of critical facilities that must remain functional following a local earthquake.

Landslides. A landslide is a mass down-slope movement of earth materials under the influence of gravity, and includes a variety of forms including: rockfalls, debris slides, mudflows, block slides, soil slides, slumps, and creeps. These mass movements are triggered or accelerated by earthquake-induced ground motion, increased water content, excessive surface loading, or alteration of existing slopes by man or nature. Earthquake-induced landslides, usually associated with steep canyons and hillsides, can originate on, or move down, slopes as gentle as one degree in areas underlain by saturated, sandy materials. As shown in **Figure 4.6-4, Seismic and Soil Hazards within the Boyle Heights CPA,** earthquake induced landslide zones are located on the northeastern corner of the CPA as well as on the western portion of the CPA along US-101 and I-10.

Unstable Soils. The CPA would be subject to low-level differential settlement due to the intense shaking associated with seismic events. This type of hazard results primarily in damage to property when an area settles to different degrees over a relatively short distance. The actual potential for settlement is difficult to predict as the conditions, under which this hazard can occur, are site specific.

Expansive Soils. Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated changes in the moisture content. The ability of clayey soil to change volume can result in uplift or cracking to foundation elements or other rigid structures such as slabs-on-grade, rigid pavements, sidewalks, or other slabs or hardscape founded on these soils.

Soil Erosion. The factors contributing to soil erosion potential include climate, the physical characteristics of soils, topography, land use, and the amount of soil disturbance. In general, the loss of ground cover caused by construction activities is a primary factor contributing to an increase in soil erosion potential. Erosion potential is also directly related to the steepness of the terrain. As the CPA is a highly urbanized area covered by impermeable surfaces, and the terrain is relatively flat, potential for erosion is relatively low. However, the actual potential for erosion is difficult to predict as the conditions under which this hazard can occur are site specific.

Lateral Spreading. Lateral spreading involves the lateral displacement of surficial blocks of sediment (e.g., alluvium and terrace sands) as a result of liquefaction in a subsurface layer. The initial gradient of a

particular site that fails in lateral spreading can be small since the soil mass usually moves on a liquefied layer of loose, saturated granular material.

Ground Lurching. Certain soils have been observed to move in a wave-like manner in response to intense seismic groundshaking, forming ridges or cracks on the ground surface. Areas underlain by thick accumulations of colluvium and alluvium appear to be more susceptible to ground lurching than bedrock. Under strong seismic ground motion conditions, lurching can be expected within loose, cohesionless soils, or in clay- rich soils with a high moisture content. Generally, only lightly loaded structures, such as pavement, fences, pipelines, and walkways, are damaged by ground lurching; more heavily loaded structures appear to resist such deformation.

Paleontological Resources

Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. These include mineralized, partially mineralized, or un-mineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered nonrenewable resources because the organisms they represent no longer exist. Thus, once destroyed, a fossil can never be replaced.

The Society for Vertebrate Paleontology (SVP) broadly defines significant paleontological resources as follows:

> *"Fossils and fossiliferous deposits consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years)."*

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, diagnostically important, or are common but have the potential to provide valuable scientific information for evaluating evolutionary patterns and processes, or which could improve our understanding of paleochronology, paleoecology, paleophylogeography or depositional histories. New or unique specimens can provide new insights into evolutionary history; however, additional specimens of even well represented lineages can be equally important for studying evolutionary pattern and process, evolutionary rates and paleophylogeography. Even unidentifiable material can provide useful data for dating geologic units if radiocarbon dating is possible. As such, common fossils (especially vertebrates) may be scientifically important, and therefore considered highly significant.

The SVP describes sedimentary rock units as having high, low, undetermined, or no potential for containing significant nonrenewable paleontological resources. These criteria are based on rock units within which vertebrate or significant invertebrate fossils have been determined by previous studies to be present or likely to be present. Significant paleontological resources are fossils or assemblages of fossils, which are unique, unusual, rare, uncommon, diagnostically or stratigraphically important, and those which add to an existing body of knowledge in specific areas, stratigraphically, taxonomically, or regionally. While these standards were specifically written to protect vertebrate paleontological resources, all fields of paleontology have adopted these guidelines. Paleontological sensitivity was evaluated according to the following SVP categories.

High Potential (sensitivity)

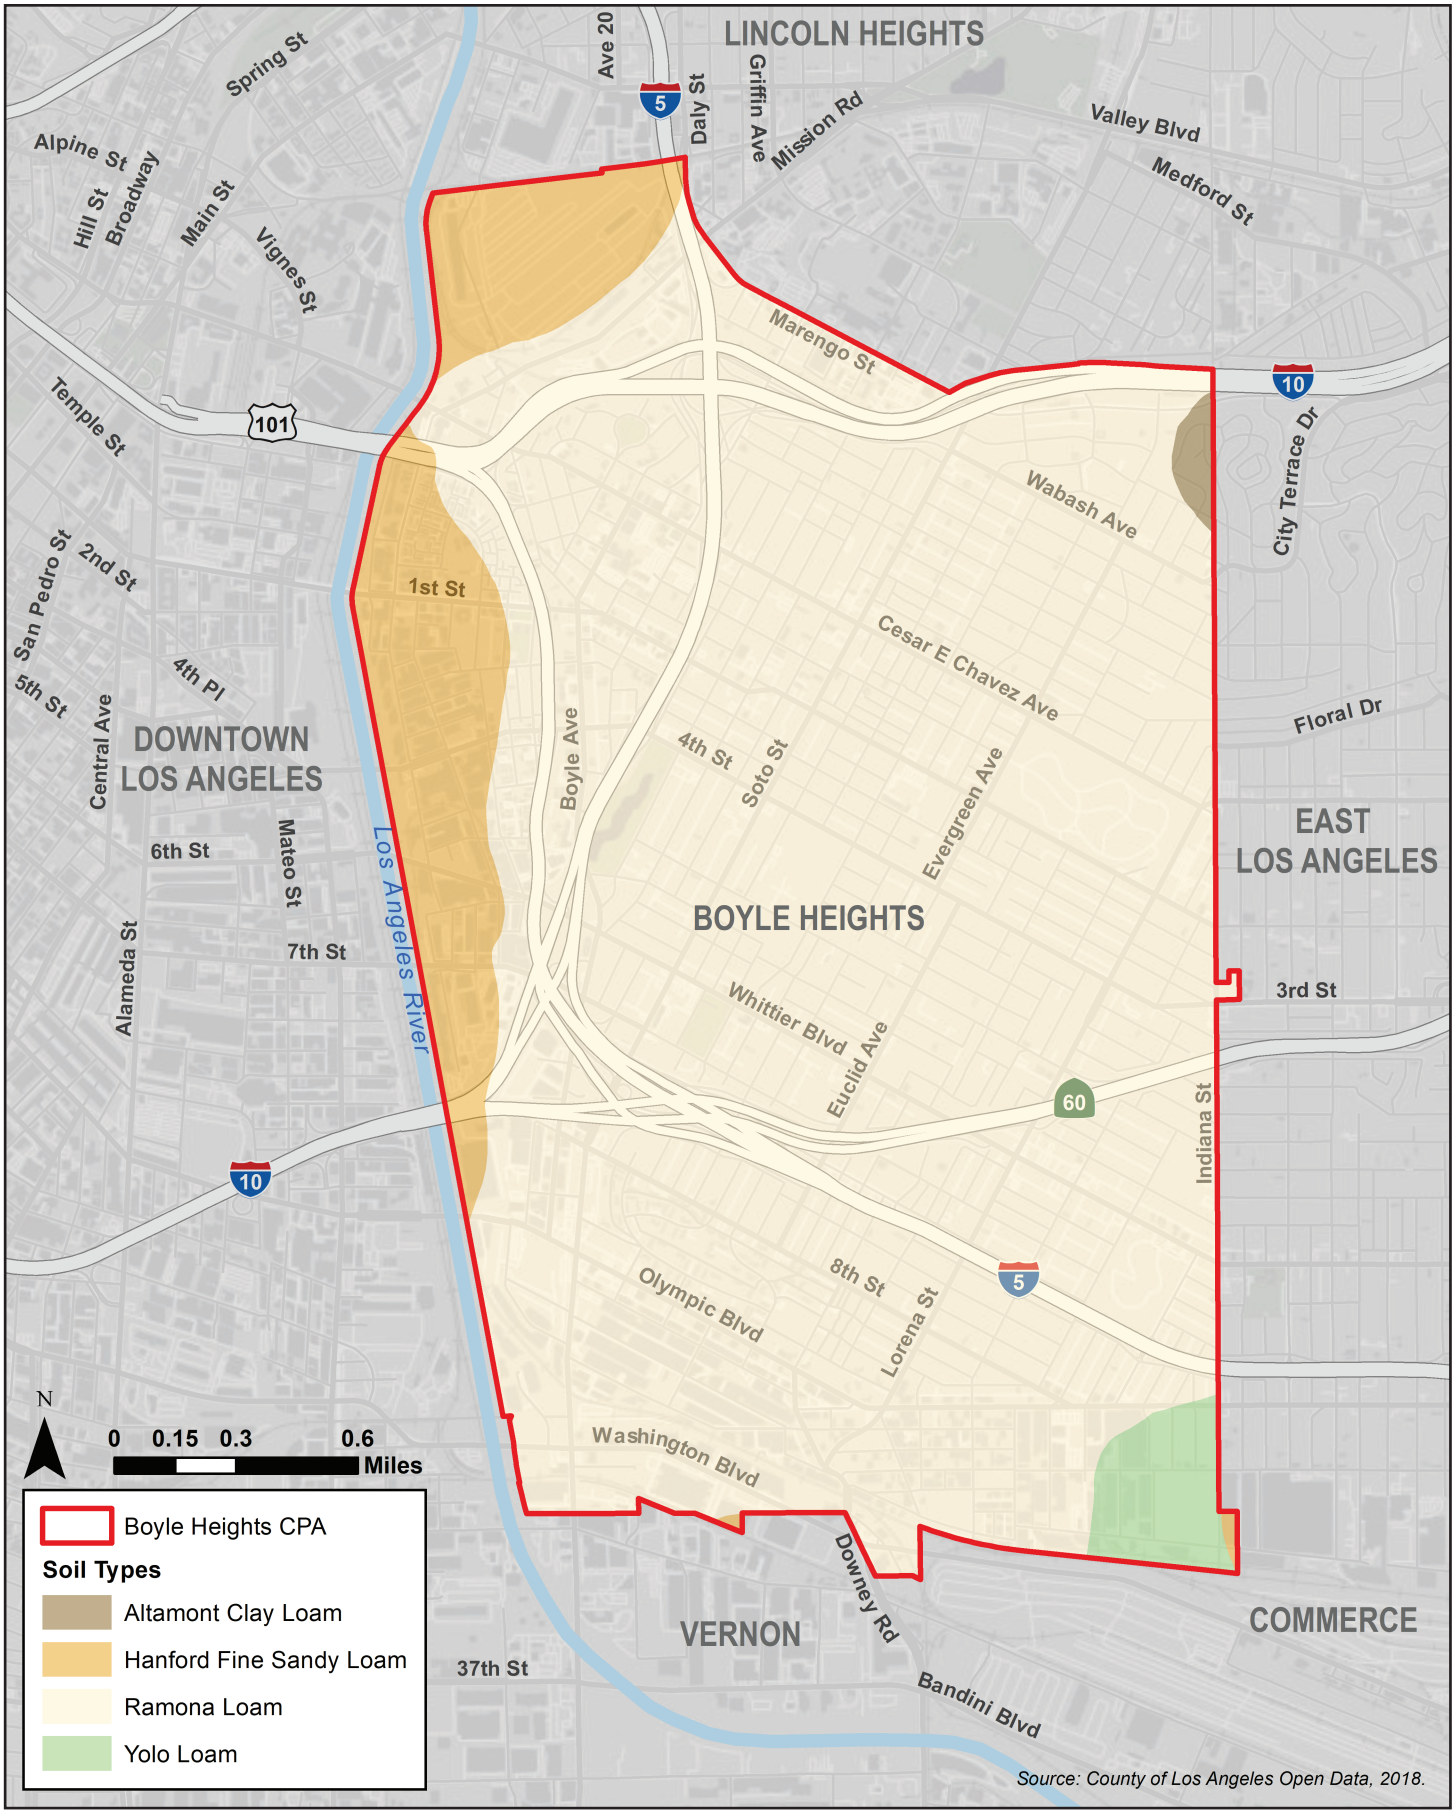
Rock units from which significant vertebrate or significant invertebrate fossils or significant suites of plant fossils have been recovered are considered to have a high potential for containing significant non-renewable fossiliferous resources. These units include but are not limited to, sedimentary formations and some volcanic formations which contain significant nonrenewable paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. Sensitivity comprises both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, or botanical and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, ecologic, or stratigraphic data. Areas which contain potentially datable organic remains older than Holocene, including deposits associated with nests or middens, and areas that may contain new vertebrate deposits, traces, or trackways are also classified as significant.

Low Potential (sensitivity)

Sedimentary rock units that are potentially fossiliferous, but have not yielded fossils in the past or contain common and/or widespread invertebrate fossils of well-documented and understood taphonomic, phylogenetic species and habitat ecology. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils prior to the start of construction. Generally, these units will be poorly represented by specimens in institutional collections and will not require protection or salvage operations. However, as excavation for construction gets underway significant and unanticipated paleontological resources could be encountered and require a change of classification from Low to High Potential and, thus, require monitoring and mitigation if the resources are found to be significant.

Undetermined Potential (sensitivity)

Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials. Field surveys by a qualified vertebrate paleontologist to specifically determine the potentials of the rock units are required before programs of impact mitigation for such areas may be developed.



No Potential

Rock units of metamorphic or plutonic igneous origin are commonly classified as having no potential for containing significant paleontological resources.

Regional Setting

Three major groups of rocks are represented within the Los Angeles Basin: older igneous and metamorphic bedrock (100 to 75 million years old), older sedimentary rocks (about 65 to 15 million years old), and younger sedimentary rocks (15 to 1 million years old). The sedimentary rock layers contain shale, siltstone, sandstone, and conglomerates, as well as some interbedded volcanic rocks. Over 22 million years ago, the Los Angeles Basin was a deep marine basin formed by tectonic forces between the North American and Pacific plates. Since that time, over five miles of marine and non-marine sedimentary rock, as well as intrusive and extrusive igneous rocks, have filled the basin. During the last two million years, defined by the Pleistocene and Holocene epochs, the Los Angeles Basin and surrounding mountain ranges have been uplifted to form the present-day landscape. Erosion of the surrounding mountains has resulted in deposition of unconsolidated sediments in low-lying areas by rivers, such as the Los Angeles River.

The Los Angeles Basin is known for its significant paleontological resources, particularly those associated with Ice Age mammals. Fossils have been found mostly in sedimentary rock that has been uplifted, eroded, or otherwise exposed. Undiscovered vertebrate fossils are likely to be found in rock formations. Pleistocene older alluvium of similar lithologies elsewhere in Los Angeles County and southern California has been reported to contain locally abundant and scientifically significant vertebrate, invertebrate and plant fossils. These localities have yielded fossils of extinct Ice-Age mammals, including mammoths, mastodons, ground sloth, dire wolves, short-faced bears, saber-toothed cats, large and small horses, large and small camels, bison, and other fauna similar to fossil specimens recovered from the Rancho La Brea asphalt deposits.

Local Geology

1264.03•05/2022

Local Setting

Structurally, the Los Angeles Basin can be divided into four primary structural blocks: the northwest, southwest, central, and northeastern blocks. Each of these informal basin subdivisions are separated by major zones of faulting or flexure in the basement rocks, resulting in contrasting stratigraphy.[14] The Boyle Heights CPA is located on the central structural block, which is characterized by an alluviated lowland plain that rises into the bordering highlands that were relatively uplifted as a result of Quaternary deformation. The central block is bounded by higher elevations such as the Santa Ana Mountains to the east, the San Joaquin Hills to the southeast, low-lying hills along the Newport-Inglewood zone to the southwest, the Santa Monica Mountains to the northwest, and the Coyote and Puente Hills to the northeast.[15] **Figure 4.6-5, Local Geology**, shows that the majority of the local geology in the CPA is comprised of Old Alluvium, with a pocket of Sandstone, Siltstone, Shale, and Conglomerate in the north east corner and Alluvium along the western and southern border. Older Alluvium, such as Quaternary Older Alluvium, has a higher paleontological resource potential in the Los Angeles region.

4.6.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Geology and Soils at the federal, state, and local levels. As described below, these plans, guidelines, and laws include the following:

- Paleontological Resources Preservation Act
- Society for Vertebrate Paleontology Standard Guidelines
- National Pollutant Discharge Elimination System (NPDES)
- Earthquake Hazards Reduction Act
- California Penal Code Section 622.5
- California PRC Section 5097.5
- California Building Code
- Alquist-Priolo Earthquake Fault Zoning Act
- Seismic Hazards Mapping Act

Federal

Paleontological Resources Preservation Act. The Paleontological Resources Preservation Act (PRPA) was signed into law in 2009. It directs the Department of Agriculture and the Department of the Interior to implement comprehensive paleontological resource management programs on federal lands. The PRPA protects scientifically significant fossils on federal lands and provides a permitting system where researchers can collect and study scientifically significant fossils which will remain in the public trust. The act also allows for the collection of common plant and invertebrate fossils for personal, non-commercial use on federal lands.[16] The PRPA requires the Secretaries of the Interior and Agriculture to manage and protect paleontological resources on federal land. The PRPA furthers the protection of fossils on federal lands by criminalizing the unauthorized removal of fossils.

Society for Vertebrate Paleontology Standard Guidelines. The Society for Vertebrate Paleontology (SVP) has established standard guidelines[17] that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. The Paleontological Resources Preservation Act (PRPA) of 2009 calls for uniform policies and standards that apply to fossils on all federal public lands. All federal land management agencies are required to develop regulations that satisfy the stipulations of the PRPA. As defined by the SVP,[18] significant nonrenewable paleontological resources are:

Fossils and fossiliferous deposits here are restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined

16 United States Department of the Interior, National Park Service, Paleontological Resources Preservation Act.

17 Society of Vertebrate Paleontology, Standard procedures for the assessment and mitigation of adverse impacts to paleontologicalresources,2010, https://vertpaleo.org/wp-content/uploads/2021/01/SVP_Impact_Mitigation_Guidelines.pdf, accessed June 15, 2022.

18 Society of Vertebrate Paleontology, Assessment and mitigation of adverse impacts to nonrenewable paleontologic resources: standard guidelines, Society of Vertebrate Paleontology News Bulletin 163:22-27, 1995.

as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP,[19] significant fossiliferous deposits are:

> *A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years BP [before present].*

Based on the significance definitions of the SVP,[20] all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new information on the taxon it represents, its paleoenvironment, and/or its distribution. Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils or if defined as significant by project paleontologists, specialists, or local government agencies.

National Pollutant Discharge Elimination System (NPDES). NPDES was created by the Clean Water Act in 1972. Construction activities that disturb one or more acres of land surface are subject to the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (NPDES General Construction Permit) (Order No. 20120006DWQ) adopted by the State Water Resources Control Board (SWRCB). Compliance with the permit requires each qualifying development project to file a Notice of Intent with the SWRCB. Permit conditions require development of a stormwater pollution prevention plan (SWPPP), which must describe the site, the facility, erosion and sediment controls, runoff water quality monitoring, means of waste disposal, implementation of approved local plans, control of construction sediment and erosion control measures, maintenance responsibilities, and non-stormwater management controls. Inspection of construction sites before and after storms is also required to identify stormwater discharge from the construction activity and to identify and implement erosion controls, where necessary.

---

19 Society of Vertebrate Paleontology, Assessment and mitigation of adverse impacts to nonrenewable paleontologic resources.

20 Society of Vertebrate Paleontology, Assessment and mitigation of adverse impacts to nonrenewable paleontologic resources.

In the City of Los Angeles, SWPPP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are reviewed for compliance with the stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate Best Management Practices (BMPs) are incorporated to address stormwater pollution prevention goals as they relate to erosion and sediment movement on the project site. Sediment and erosion control measures can include both stabilization and structural practices. Stabilization practices, which refer to methods of covering or maintaining existing soil cover, can include seeding, vegetation and tree preservation, and contouring of project design. Such measures prevent initial disturbance of soil that can enable subsequent potential erosion during construction activities. Structural practices involve the use of devices to divert, store, or limit runoff that can transport sediment offsite and can include use of silt fences, earth dikes, sedimentation basins, and sediment traps. These measures obstruct runoff flows to reduce erosion and other soil transport.

Earthquake Hazards Reduction Act. The Earthquake Hazards Reduction Act was enacted in 1977 to "reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards and reduction program." To accomplish this, the Earthquake Hazards Reduction Act established the National Earthquake Hazards Reduction Program (NEHRP). This program was substantially amended by the NEHRP Reauthorization Act of 2004 (Public Law 108-360).

NEHRP's mission includes improved understanding, characterization, and prediction of hazards and vulnerabilities; improvement of building codes and land use practices; risk reduction through post-earthquake investigations and education; development and improvement of design and construction techniques; improvement of mitigation capacity; and accelerated application of research results. The NEHRP designates the Federal Emergency Management Agency (FEMA) as the lead agency of the program and assigns it several planning, coordinating, and reporting responsibilities. Programs under NEHRP help inform and guide local planning and building code requirements such as emergency evacuation responsibilities and seismic code standards such as those to which a proposed project would be required to adhere.

International Building Code. The International Building Code (IBC) is published by the International Code Council (ICC). The scope of this code covers major aspects of construction and design of structures and buildings. The IBC has replaced the Uniform Building Code (UBC) as the basis for the California Building Code (CBC) and contains provisions for structural engineering design. The 2015 IBC addresses the design and installation of structures and building systems through requirements that emphasize performance. The IBC includes codes governing structural as well as fire- and life-safety provisions covering seismic, wind, accessibility, egress, occupancy, and roofs.

State

Seismic Safety Act. The California Seismic Safety Commission was established by the Seismic Safety Act in 1975 with the intent of providing oversight, review, and recommendations to the Governor and State Legislature regarding seismic issues. The commission's name was changed to Alfred E. Alquist Seismic Safety Commission in 2006. Since then, the Commission has adopted several documents based on recorded earthquakes, such as the 1994 Northridge earthquake, 1933 Long Beach earthquake, the 1971 Sylmar earthquake, etc. Some of these documents are listed as follows:

- Research and Implementation Plan for Earthquake Risk Reduction in California 1995 to 2000, report dated December 1994;
- Seismic Safety in California's Schools, 2004, "Findings and Recommendations on Seismic Safety Policies and Requirements for Public, Private, and Charter Schools," report dated December 1994;
- Findings and Recommendations on Hospital Seismic Safety, report dated November 2001;
- Commercial Property Owner's Guide to Earthquakes Safety, report dated October 2006; and
- California Earthquake Loss Reduction Plan 2007–2011, report dated July 2007.

California Penal Code Section 623. California Penal Code Section 623 provides the following: "Except as otherwise provided in Section 599c, any person who, without the prior written permission of the owner of a cave, intentionally and knowingly does any of the following acts is guilty of a misdemeanor punishable by imprisonment in the county jail not exceeding one year, or by a fine not exceeding one thousand dollars ($1,000), or by both such fine and imprisonment: (1) breaks, breaks off, cracks, carves upon, paints, writes or otherwise marks upon or in any manner destroys, mutilates, injures, defaces, mars, or harms any natural material found in any cave. (2) disturbs or alters any archaeological evidence of prior occupation in any cave. (3) kills, harms, or removes any animal or plant life found in any cave. (4) burns any material which produces any smoke or gas which is harmful to any plant or animal found in any cave. (5) removes any material found in any cave. (6) breaks, forces, tampers with, removes or otherwise disturbs any lock, gate, door, or any other structure or obstruction designed to prevent entrance to any cave, whether or not entrance is gained.

California Penal Code Section 622.5. California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

California PRC Section 5097.5. California PRC Section 5097.5 provides protection for paleontological resources on public lands, where Section 5097.5(a) states, in part, that:

> *No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.*

California Building Code. The CBC, which is codified in Title 24 of the California Code of Regulations, Part 2, was promulgated to safeguard the public health, safety, and general welfare by establishing minimum standards related to structural strength, means of egress facilities, and general stability of buildings. The purpose of the CBC is to regulate and control the design, construction, quality of materials, use/occupancy, location, and maintenance of all buildings and structures within its jurisdiction. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under State law, all building standards must be centralized in Title 24 or those standards are not enforceable. The provisions of the CBC apply to the construction, alteration, movement, replacement, location, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California.

The 2019 edition of the CBC is based on the 2018 International Building Code (IBC) published by the International Code Council. The code is updated triennially, and the 2019 edition of the CBC was published by the California Building Standards Commission on July 1, 2019, and became effective January 1, 2020. Every three years, the State adopts new codes (known collectively as the California Building Standards Code) to establish uniform standards for the construction and maintenance of buildings, electrical systems, plumbing systems, mechanical systems, and fire and life safety systems. Sections 17922, 17958 and 18941.5 of the California Health and Safety Code require that the latest edition of the California Building Standards Code apply to local construction 180 days after publication. The significant changes to Title 24 in the 2019 edition can be found at California Department of General Services website.[21]

Appendix J of the CBC applies to grading, excavation, and earthwork construction, and prohibits grading from occurring without first having obtained a permit from the building official. A geotechnical report must be prepared and include the following:

- The nature and distribution of existing soils,

21 California Department of General Services. California Building Standards Code. Available at: https://www.dgs.ca.gov/BSC/Codes#@ViewBag.JumpTo/, accessed June 15, 2022.

- Conclusions and recommendations for grading procedures,
- Soil design criteria for any structure of embankments required to accomplish the proposed grading, and
- Where necessary, slope stability studies, and recommendations and conclusions regarding site geology.

Alquist-Priolo Earthquake Fault Zoning Act. The Alquist-Priolo Earthquake Fault Zoning Act (formerly the Alquist-Priolo Special Studies Zone Act) was signed into law December 22, 1972 (revised in 1994) and codified into State law in the Public Resources Code as Division 2, Chapter 7.5 to address hazards from earthquake fault zones. The purpose of this law is to mitigate the hazard of surface fault rupture by regulating development near active faults. As required by the Act, the State has delineated Earthquake Fault Zones (formerly Special Studies Zones) along known active faults in California, which vary in width around the fault trace from about 200 to 500 feet on either side of the fault trace. Cities and counties affected by the zones must regulate certain development projects within the zones. The State Geologist is also required to issue appropriate maps to assist cities and counties in planning, zoning, and building regulation functions. Local agencies enforce the Alquist-Priolo Earthquake Fault Zoning Act in the development permit process, where applicable, and may be more restrictive than State law requires. According to the Alquist-Priolo Earthquake Fault Zoning Act, before a project that is within an Alquist-Priolo Earthquake Fault Zone can be permitted, cities and counties shall require a geologic investigation, prepared by a licensed geologist, to demonstrate that buildings will not be constructed across active faults. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back a distance to be established by a California Certified Engineering Geologist. Although setback distances may vary, a minimum 50-foot setback is typically required.

Seismic Hazards Mapping Act. In order to address the effects of strong ground shaking, liquefaction, landslides, and other ground failures due to seismic events, the State of California passed the Seismic Hazards Mapping Act of 1990 (Public Resources Code Sections 2690-2699.6). Under the Seismic Hazards Mapping Act, the State Geologist is required to delineate "seismic hazard zones." Cities and counties must regulate certain development projects within these zones until the geologic and soil conditions of their project sites have been investigated and appropriate mitigation measures, if any, have been incorporated into development plans. The State Mining and Geology Board provides additional regulations and policies to assist municipalities in preparing the Safety Element of their General Plans and to encourage the adaptation of land use management policies and regulations to reduce and mitigate seismic hazards to protect public health and safety. Under PRC Section 2697, cities and counties must require, prior to the approval of a project located in a seismic hazard zone, submission of a geotechnical report defining and delineating any seismic hazard.

California Division of Oil, Gas, and Geothermal Resources. CalGEM regulates production of oil and gas, as well as geothermal resources, within the State of California. CalGEM requirements in preparation of environmental documents under CEQA are defined in CCR, Title14, Division 2, Chapter 2. Staff also assists operators in avoiding or reducing environmental impacts from the development of oil, gas, and geothermal resources in California, including subsidence. PRC Sections 3315, et seq. CalGEM regulations, which are defined in CCR, Title 14, Division 2, Chapter 4, include well design and construction standards, surface production equipment and pipeline requirements, and well abandonment procedures and guidelines to ensure effectiveness in preventing migration of oil and gas from a producing zone to shallower zones, including potable groundwater zones, as well as subsidence.

Local

City of Los Angeles Conservation Element. The City's General Plan Conservation Element recognizes paleontological resources in Section 3: "Archeological and Paleontological" (II-3), specifically the La Brea Tar Pits, and identifies protection of paleontological resources as an objective (II-5). The General Plan identifies site protection as important, stating, "Pursuant to CEQA, if a land development project is within a potentially significant paleontological area, the developer is required to contact a bonafide paleontologist to arrange for assessment of the potential impact and mitigation of potential disruption of or damage to the site. Section 3 of the Conservation Element, adopted in September 2001, includes policies for the protection of paleontological resources. As stated therein, it is the City's policy that paleontological resources be protected for historical, cultural research, and/or educational purposes. Section 3 sets as an objective the identification and protection of significant paleontological sites and/or resources known to exist or that are identified during "land development, demolition, or property modification activities." Section 5 of the Conservation Element recognizes the City's responsibility for identifying and protecting its cultural and historical heritage. The Conservation Element establishes the policy to continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities, with the related objective to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.[22]

City of Los Angeles Safety Element. The City's General Plan Safety Element, which was previously adopted in 1996, addresses public safety risks due to natural disasters, including seismic events and geologic conditions, and sets forth guidance for emergency response during such disasters. The City Council adopted the updated Safety Element on November 24, 2021. The Safety Element offers a high-level overview of how the City plans for disasters and references readers to other implementation documents, including the Local Hazard Mitigation Plan, where more detailed information is available, and also

22 City of Los Angeles General Plan, Conservation Element, pages II-6 to II-9.

provides maps of designated areas within Los Angeles that are considered susceptible to earthquake-induced hazards, such as fault rupture and liquefaction. The 2021 General Plan Safety Element has three goals and they are associated with various objectives, policies, and implementation programs.[23]

Goal 1: Hazard Mitigations

A city where potential injury, loss of life, property damage and disruption of the social and economic life of the City due to hazards is minimized.

Goal 2: Emergency Response

A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.

Goal 3: Disaster Recovery

A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.

Los Angeles Municipal Code. Municipal Code Chapter IX, Article 1, Building Code, (the LABC), incorporates the CBC, to provide geotechnical hazard prevention regulations. In general, the LAMC includes requirements for construction and ground disturbance that could affect geologic risks, as well as standards for building foundations, earthquake/seismic structural designs, and development within landslide susceptible areas. Division 18 of Article 1, in adopting the CBC, provides guidance for development located on expansive soils; Division 70 provides general construction, grading and site excavation requirements and restricts issuance of grading permits for development in landslide areas; and Division 88 establishes standards for structural seismic resistance for existing buildings.[24] Division 70 further includes provisions for managing and reducing erosion during construction activities, especially as it relates to controlling stormwater pollution from sediments. Specifically, per the LAMC, requires project applicants to incorporate any best management practices necessary to control stormwater pollution in accordance with the "Development Best Management Practices Handbook, Part A Construction Activities" as adopted by the Board of Public Works.

23 City of Los Angeles General Plan, Safety Element. https://planning.lacity.org/odocument/c2e048eb-817c-4e9d-a550-57e33444621a/Safety_Element_CityofLosAngeles_SeptDraft.pdf. Accessed November 24, 2021.

24 City of Los Angeles. Municipal Code. Available at: https://codelibrary.amlegal.com/codes/los_angeles/latest/lamc/0-0-0-107363, accessed June 15, 2022.

The Los Angeles Department of Building and Safety (LADBS) has the authority to withhold building permit issuance if a project cannot mitigate potential hazards to the project or which are associated with the project. Throughout the permitting, design, and construction phases of a building project, LADBS engineers and inspectors confirm that the requirements of the LAMC pertaining specifically to geoseismic and soils conditions are being implemented by project architects, engineers, and contractors.

The function of the City's Building Code, which comprises Chapter IX of the LAMC, is to protect life safety and ensure compliance with the LAMC. Chapter IX addresses numerous topics, including earthwork and grading activities, import and export of soils, erosion and drainage control, and general construction requirements that address flood and mudflow protection, landslides, and unstable soils. Additionally, the LAMC includes specific requirements addressing seismic design, grading, foundation design, geologic investigations and reports, soil and rock testing, and groundwater.

Specifically, Chapter IX of LAMC Div. 18, Sec. 91.1803,[25] requires a Final Geotechnical Report with final design recommendations prepared by a California-registered geotechnical engineer and submitted to the LADBS for review prior to issuance of a grading permit. Final foundation design recommendations must be developed during final project design, and other deep foundation systems that may be suitable would be addressed in the Final Geotechnical Report. All earthwork (i.e., excavation, site preparation, any fill backfill placement, etc.) must be conducted with engineering control under observation and testing by the Geotechnical Engineer and in accordance with LADBS.

Hillside Construction Regulation (HCR). The HCR Supplemental Use District, effective March 2017 and updated in May 2018, was established by Ordinance No. 184827 to provide additional protections that would address the cumulative construction-related impacts of multiple single-family houses in hillside areas. All single-family home development projects within the HCR District shall comply with LAMC Section 13.20. However, if a Haul Route approval by the Board of Building and Safety Commissioners is required for import and/or export of 1,000 cubic yards or more, then the conditions or "Hauling Truck Operations Standards" set by the Board of Building and Safety Commissioners during the Haul Route approval process shall prevail. In addition, the builder of any single-family home development exceeding 17,500 square feet in HCR Districts needs to file for a Site Plan Review discretionary approval.

4.6.4 THRESHOLDS OF SIGNIFICANCE

In 2015, the California Supreme Court in *CBIA v. BAAQMD*, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project.

[25] California Building Code, 2019 Part 2, Volume 1, Chapter 18, Soils and Foundations, Section 1803, Geotechnical Investigations.

However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on future residents and users of a project, as well as other impacted individuals. The following Appendix G thresholds of significance will be analyzed consistent with this decision.

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to geology and soils if it would:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving;
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42.
  - Strong seismic ground shaking.
  - Seismic-related ground failure, including liquefaction.
  - Landslides.
- Result in substantial soil erosion or the loss of topsoil.
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

4.6.5 METHODOLOGY

This analysis uses the thresholds in Appendix G of the *State CEQA Guidelines* to make a significance determination.

Baseline information for the analysis was compiled from a review of published geologic maps and reports, as well as information compiled and evaluated by the City of Los Angeles in conjunction with its overall planning and hazard mitigation processes to identify geologic conditions and geologic hazards in the areas that could potentially be affected by the Proposed Plan. For geology and soils, the areas that could potentially be affected by the Proposed Plan is the CPA since potential impacts related to geology and soils are generally site-specific.

Independent of the CEQA process, there is a comprehensive regulatory framework implemented at the State and City levels to mitigate potential hazards associated with geologic and soils conditions. The design-controllable aspects of building foundation support, protection from seismic ground motion, and soil instability are governed by existing regulations. Compliance with these regulations is required, not optional. Any proponent of a development project must demonstrate compliance by incorporating the regulations in the project's design before permits for project construction are issued. The analysis presented herein assumes compliance with all applicable laws, regulations, and standards, as part of the initial CEQA baseline and future conditions.

The impact analysis for geology and soils addresses impacts within the entire CPA. It was based on proposed land use designations under the Proposed Plan, the existing geologic conditions and hazards in the CPA, and the thresholds of significance for geology and soils.

The analysis of paleontological resources identifies the likelihood of ground disturbing activities to encounter rock units with potential for containing significant paleontological resources, which is considered high in quaternary alluvial fan deposits exhibiting a composition conducive to the preservation of fossil resources. Paleontological resources in the CPA were evaluated qualitatively based on general information about CPA conditions. In the absence of an inventory of unique paleontological resources, the potential for such resources to be present and impacted is generally assessed.

4.6.6 IMPACTS

Threshold 4.6-1 **Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?**

This impact would be less than significant.

The California Supreme Court ruled in *CBIA v. BAAQMD* that CEQA does not require a lead agency to consider the impacts of the existing environment on the future users of a project unless the project will exacerbate the existing environmental condition. As such, the potential for adverse effects on people or structures from fault rupture is not an impact under CEQA. The Proposed Plan would see development occur of a type that is consistent with the existing urban environment and would therefore not involve mining or other types of deep excavation that would lead to stresses on the crust of the Earth resulting in fault rupture. While the Proposed Plan would increase development potential in areas where density is expected to increase, and other areas that have less dense land uses could potentially be redeveloped with higher density uses as permitted by the existing Zoning Code and General Plan land use designation, thereby potentially increasing the number of people and structures exposed to the potential effects of fault rupture, the Proposed Plan would neither cause nor exacerbate existing geologic hazards. This condition exists throughout the Los Angeles Basin as it is a seismically active area. Future development would not exacerbate existing seismic conditions in the CPA.

Population growth could occur under the Proposed Plan, as could visits to the CPA for work and leisure. As a result, more people could be exposed to the effects of fault rupture upon implementation of the Proposed Plan. However, implementation of the Proposed Plan would not exacerbate (i.e., through mining, fracking or similar uses) existing geologic hazards, including the likelihood of fault rupture, as those risks already exist in the CPA and the Proposed Plan would only be adding more of the types of uses that already exist within the CPA.

In addition, the Alquist-Priolo Act has elements that serve to mitigate potential faulting hazards by prohibiting the location of most structures for human occupancy across active faults. No Alquist-Priolo Earthquake Fault Zones are located in the Boyle Heights CPA.[26] LADBS also requires a surface fault rupture hazard investigation for any development project that would be located within an Alquist-Priolo Earthquake Fault Zone. This is to ensure that the proposed development would not be located astride an active fault. In the event that a development project proposes to locate a structure on such a fault or fault trace, a licensed California Certified Engineering Geologist or Professional Geologist would identify the appropriate setback of the structure from the fault, typically 50 feet. As required by CBC Chapter 16 for the construction of new buildings or structures, specific engineering design and construction measures would be implemented to minimize the potential for adverse impacts to human life and property caused by seismically induced ground shaking. Chapter 33 of the CBC requires all new development to comply with

26 California Department of Conservation. Earthquake Zones of Required Investigation. Available at: https://maps.conservation.ca.gov/cgs/EQZApp/app/, accessed May 14, 2021.

specific geologic design parameters and geotechnical recommendations, which would be incorporated into individual development projects to minimize the potential for adverse impacts.

Because the implementation of the Proposed Plan would not exacerbate existing geologic hazards including fault rupture, in addition to the fact that there are no known Alquist-Priolo fault lines in the CPA, there are already procedures in place under State law and the City's Building Code that would apply to development in the CPA to mitigate such risks to any planned development, the potential impacts of the Proposed Plan with regard to fault rupture are ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-2 **Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?**

This impact would be less than significant.

As discussed above under **Threshold 4.6-1**, the California Supreme Court ruled in *CBIA v. BAAQMD* that CEQA does not require a lead agency to consider the impacts of the existing environment on the future users of a project unless the project exacerbates existing conditions. In light of this, the potential for substantial adverse effects on people or structures from strong seismic ground shaking is not an impact under CEQA. The Proposed Plan would allow the type of development consistent with highly urbanized areas of the type that already exists in the CPA and would therefore not involve mining or deep excavation into the Earth that could cause unstable seismic conditions resulting in an increased risk associated with strong seismic ground shaking. While the Proposed Plan could increase the number of people and structures exposed to strong seismic ground shaking by increasing development potential and density in some areas of the CPA, the Proposed Plan would neither cause nor exacerbate existing geologic hazards. This condition exists throughout the Los Angeles Basin as it is a seismically active area. Future development would not exacerbate existing seismic conditions in the CPA.

The CBC strictly regulates structures erected or modified within the State due to the pervasiveness of seismic activity, particularly in the Los Angeles Basin. Individual jurisdictions enforce these regulations and adopt their own compliant building codes, in this case the City of Los Angeles Building Code (LABC).

Any new development that would take place under the Proposed Plan would be required to comply with both CBC and LABC standards, in addition to other regulatory measures detailed above.

Because existing geologic hazards such as seismic ground shaking would not be exacerbated as a result of Project implementation, in addition to the fact that any new development or redevelopment would be subject to existing State and local regulations designed to mitigate such hazards, impacts associated with strong seismic ground shaking would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-3 **Would implementation of the Proposed Plan directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction and/or landslides?**

This impact would be less than significant.

The California Supreme Court ruled in *CBIA v. BAAQMD* that the potential for adverse effects on people or structures from any seismic-related hazards is not an impact under CEQA unless the project exacerbates existing conditions. As mentioned above, the type of development that would occur under the Proposed Plan is consistent with that found in highly developed urban areas of the sort that already comprise the CPA. No activities such as mining or deep excavation would occur that would exacerbate the seismic risks already present in the CPA. While the Proposed Plan would increase development potential and density in some areas, thereby potentially increasing the number of people and structures exposed to strong seismic ground shaking, the Proposed Plan would neither cause nor exacerbate existing geologic hazards. As such, future development under the Proposed Plan would neither cause nor exacerbate existing conditions with respect to seismic-related ground failure in the CPA.

In addition, the LABC ensures that any new or significantly renovated structure is built in such a way as to minimize the impact of seismic-related ground failure such as liquefaction or landslides. LABC requires all new construction to assess the potential for liquefaction at the building site, and then provide design recommendations to mitigate the site's liquefaction potential. Any new development that would occur

under the Proposed Plan could also be subject to specific requirements set by the LADWP as well as the City Engineer.

Because implementation of the Proposed Plan would not exacerbate the likelihood of significant seismic-related impacts occurring in the CPA, and the fact that both the State and the City have existing building codes and regulations in place to mitigate such risks, impacts would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-4 Would implementation of the Proposed Plan result in substantial soil erosion or the loss of topsoil?

This impact would be less than significant.

Soil erosion and its subsequent loss are the result of the actions of water and wind. The likelihood of erosion is higher with in an increase in slope, the narrowing of runoff channels, and the removal of groundcover such as vegetation. Human activities associated with development such as grading, particularly on slopes, increase the risk for erosion in affected areas. Erosion also increases the risks of dust storms which can serve to degrade air quality.

Grading activities that would be associated with development under the Proposed Plan would typically occur less than five feet below the surface. Examples of these activities include the creation of building pads, foundations, and excavation for utility trenches. However, there is also the possibility that the construction of underground facilities such as parking and footings for taller buildings would involve deeper excavation into the ground.

Implementation of the Proposed Plan could involve an increased level of construction and development potential over the life of the Plan. This could lead to an increase in grading and other that could lead to an increased risk of erosion or the loss of topsoil. However, all construction activities in the CPA that would involve excavation and/or grading would be subject to the requirements of Chapter IX, Division 70 of the LAMC. This portion of the code addresses grading, fills, and excavations as well as the recommendations of a site-specific geotechnical report. Both the City and PRC Section 2697 require the preparation of a site-specific geotechnical report in order to evaluate soil issues. The City also has an existing Low Impact

Development Ordinance (see **Section 4.9, Hydrology and Water Quality)** that would help ensure reductions in erosion and the loss of topsoil.

Throughout California, the RWQCB set erosion control standards due to the fact that one of the major effects of grading is sedimentation of receiving waters. These control standards are administered via the NPDES permit process for storm drainage discharge. One of the requirements of this permit is the implementation of nonpoint source control of stormwater runoff through the application of Best Management Practices (BMPs). A Storm Water Pollution Prevention Plan (SWPPP) is required by the RWQCB to describe the BMPs that would control both the quality and amount of stormwater runoff on a particular project site. Erosion and sedimentation issues are addressed more fully in **Section 4.9, Hydrology and Water Quality**. Any new development that would occur under the Proposed Plan would be required to comply with this process.

Impacts would be ***less than significant*** because any projects that would occur under the Proposed Plan would be required to be in compliance with existing state and City permitting, regulatory, and grading processes as well as the application of BMPs.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-5 **Would implementation of the Proposed Plan be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, or collapse?**

This impact would be less than significant.

Parts of the CPA could be susceptible to landslides due to their location on the sides of hills. The City's standard practice is to require the preparation and approval of geotechnical reports for any new development or redevelopment in areas that are considered to be susceptible to landslides. In addition to compliance with any recommendations made in the geotechnical report, new development is also subject to the requirements of the LABC, as well as any other requirements that might be conditioned to the project by either LADWP or the City Engineer.

Lateral spreading is a phenomenon in where large blocks of intact soil move downslope in a rapid fluid-like flow movement. This is usually associated with liquefaction events. The mass moves towards an unconfined area, such as downslope on slopes as small as one degree. Lateral spreading often occurs along riverbanks, where soft soils are often present, as well as in other areas prone to liquefaction. Section 1613 of the CBC states that projects located in liquefaction zones shall incorporate seismic design features into both grading and construction plans. In addition, compliance with the recommendations of the geotechnical report, as well as the LABC, would serve to mitigate lateral spreading and other liquefaction-related hazards.

Subsidence, described above, is a relatively slow mass movement that results in the sinking of the Earth's surface due to the extraction of mineral resources such as oil, groundwater, or natural gas. Collapse is when the ground cover is abruptly depressed. As mineral extraction activities do not take place on or near the CPA, the risk of subsidence and collapse is less than significant.

Any on-site grading and site preparation activities must comply with the LAMC, Chapter IX, Division 70, described above, which addresses grading and excavations. The requirements laid out therein are considered minimum standards for the design and construction of buildings, particularly for those located on soils that are unstable or that have the potential to be unstable. Additionally, the City requires that the recommendations contained within the geotechnical report to be implemented by the individual project applicant. The requirements of LAMC, Chapter IX, Division 70 as well as the recommendations of the geotechnical report must be incorporated into any final project designs. In addition to these provisions, all grading activities require grading permits from the LADBS that include requirements designed to limit potential impacts related to unstable soils.

Because of the existing requirements related to new development designed to limit unstable soils, and the fact that these requirements would apply to projects that could occur under the Proposed Plan, impacts related to on or off site landslides, lateral spreading, subsidence, liquefaction or collapse would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-6 **Would implementation of the Proposed Plan be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?**

This impact would be less than significant.

Expansive soils typically consist of clay or clay-like soils that have a tendency to expand and contract in association with repeated changes in their moisture content. The result of this is sometimes observed in the cracking or uplift of structures, particularly slab-on-grade, sidewalks, driveways, and hardscape.

Portions of the CPA are underlain by expansive soils, such as alluvium. Their presence on the site of a project would be identified in the required geotechnical report, described above. All grading and other earthwork project require permits from the LADBS, whose standards ensure that impacts related to construction on such soils are limited to less than significant levels. In addition, all grading and other site preparation must be done in compliance with the LAMC, Chapter IX, Division 70, which addresses grading, fills, and excavations.

Because any project that could occur under the Proposed Plan would be subject to the recommendations of the geotechnical report as well as to the requirements of the applicable portion of the LAMC, impacts would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.6-7 **Would implementation of the Proposed Plan have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?**

No impact would occur.

The City of Los Angeles has a standing policy that all new development must be connected to the City's sewer system as part of the conditions of approval. No part of the CPA is lacking in sewer service; therefore, ***no impact*** would occur.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

No Impact.

Threshold 4.6-8 Would implementation of the Proposed Plan directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

This impact would be less than significant with mitigation measures.

Unique Geological Feature. Earth moving activities may alter landforms in various ways, including lowering ridgelines, covering wetlands, filling canyons, or removing rock outcrops. The Proposed Plan would not interfere with policies or regulations protecting unique geologic features. Furthermore, the LABC includes requirements for excavations, fills, and the planting and irrigation of graded slopes. There are no identified unique geological features in the CPA that would be affected by the Proposed Plan. Therefore, there is ***no impact*** to unique geological features.

Unique Paleontological Resources and Sites. As described in the Existing Conditions, the Boyle Heights CPA is located in the Northeast Los Angeles Geologic Subregion. This subregion is underlain by Tertiary bedrock units which become increasingly older from south to north. The Boyle Heights CPA is composed of older dissected surficial deposits consisting of gravel, sand, and silt. Along the northern edge of the CPA, the area is composed of small areas of Unnamed Shale and Fernando Formation. As these sediments increase in age with depth, subsurface sediments may have high paleontological sensitivity as few as five feet below ground surface. Therefore, paleontological resources may be present in fossil-bearing sediments in relatively shallow depths below much of the CPA. Ground disturbing activities that include excavation greater than five feet below ground surface have the potential to damage or destroy an unknown quantity of paleontological resources in this area. In addition, the western boundary of the CPA, near the river, has high paleontological sensitivity.

In general, the potential for a specific development to result in negative impacts to paleontological resources is directly proportional to the amount of ground disturbance associated with the development; thus, the higher the amount of ground disturbances within geological units with a known paleontological sensitivity, the greater the potential for adverse impacts to paleontological resources. Development involving subsurface parking would have a high potential for major excavation that could impact subsurface resources. The area of high sensitivity along the western edge CPA is primarily confined to the Los Angeles County River. Because

development in or immediately adjacent to the river bed would not occur, development in this portion of the CPA has low potential to disturb resources. Nevertheless, there is potential for ground disturbing activities for future development throughout the CPA, including the area with high paleontological sensitivity. Therefore, activities resulting from any reasonably anticipated development from the Proposed Plan, which includes construction-related and earth-disturbing activities could damage or destroy fossils in these geologic units, resulting in a ***potentially significant impact***.

Mitigation Measures

MM.GEO-1 **Paleontological Resources**. For all discretionary projects that are excavating earth for two or more subterranean levels within previously undisturbed land or below previously excavated depths within native soils, a determination shall be made using all reasonable methods to determine the potential that paleontological resources are present on the project site, including through searches of databases and records, and surveys. If there is a medium to high potential that paleontological resources are located on the project site and it is possible that these resources will be impacted, monitoring will be conducted for all excavation, grading or other ground disturbance activities to identify any resources and avoid potential impacts to such resources as follows:

- **Paleontological Worker Environmental Awareness Program (WEAP).** Prior to the start of construction, the paleontological monitor shall conduct training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction staff. In the event of a fossil discovery by construction personnel, all work in the immediate vicinity of the find shall cease and a qualified paleontologist shall be contacted to evaluate the find before restarting work in the area. If it is determined that the fossil(s) is(are) scientifically significant, the paleontological monitor shall complete the next two steps.

- **Fossil Salvage.** The Qualified Paleontologist or designated paleontological monitor shall recover intact fossils. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case the paleontologist shall have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner. Any fossils shall be handled and deposited consistent with a mitigation plan prepared by the paleontological monitor.

- **Paleontological Resource Construction Monitoring**. Additional ground disturbing construction activities (including grading, trenching, foundation work and other excavations) in undisturbed sediments, below five feet, with high paleontological sensitivity shall be monitored on a full-time basis by a Qualified Paleontologist or designated paleontological monitor during initial ground disturbance. If the paleontological monitor determines that full-time monitoring is no longer warranted, he or she may recommend that monitoring be reduced to periodic spot-checking or cease entirely. Monitoring shall be reinstated if any new or unforeseen deeper ground disturbances are required.

MM.GEO-2 **Treatment of Paleontological Resources**. If a probable paleontological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a Qualified Paleontologist has been retained to evaluate the find in accordance with the Society of Vertebrate Paleontology's Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources. Temporary flagging shall be installed around the find in order to avoid any disturbance from construction equipment. Any paleontological materials that are uncovered shall not be moved or collected by anyone other than a Qualified Paleontologist or his/her designated representative such as a Paleontological Monitor. If cleared by the Qualified Paleontologist, Ground Disturbance Activities may continue unimpeded on other portions of the site. The found deposit(s) shall be treated in accordance with the Society of Vertebrate Paleontology's Standard Procedures. Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by Qualified Paleontologist. A report that describes the resource and its disposition, as well as the assessment methodology, shall be prepared by the Qualified Paleontologist according to current professional standards and maintained pursuant to the proof of compliance requirements in Subsection I.D.6. If appropriate, the report should also contain the Qualified Paleontologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply.

MM.GEO-3 **Notification of Intent to Excavate Language.** For all projects not subject to **MM-GEO-1** that are seeking excavation or grading permits, the Department of Building and Safety shall issue the following notice and obtain an acknowledgement of receipt of the notice from applicants:

- California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

- PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that: "No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands."

- California Code of Regulations, Title 14, Section 4307 states that "no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value." Section 1427 "recognizes that California's archaeological resources are endangered by urban development and population growth and by natural forces…every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave."

- Best practices to ensure unique geological and paleontological resources are not damaged include compliance with **MM GEO-2**.

Significance After Mitigation

Implementation of **Mitigation Measures MM.GEO-1**, **GEO-2**, and **GEO-3** would reduce impacts to paleontological resources to a less than significant level by ensuring that potential resources are identified and either avoided or recovered.

4.6.7 CUMULATIVE IMPACTS

It is not anticipated that the Proposed Plan would contribute to a cumulatively considerable increase in risk associated with geologic hazards. Future development under the Proposed Plan would not foreseeably exacerbate any seismic conditions in the CPA. This includes fault rupture, seismic-related ground failure,

substantial erosion or the loss of topsoil, landslides, lateral spreading, subsidence, collapse, and unstable soil. In addition, no development would occur in areas that do not have existing sewer service.

Cumulative development throughout Los Angeles could potentially disturb known and currently unknown paleontological resources that could be present throughout the City. It is anticipated that citywide development would have the potential to disturb paleontological resources. Potentially significant cumulative paleontological resource impacts could, however, be mitigated to below a level of significance through resource avoidance or recovery on a case by-case basis. As discussed under **Impact 4.6-8**, the Proposed Plan could potentially disturb paleontological resources that may be present in the CPA. However, **Mitigation Measures GEO-1**, **GEO-2**, and **GEO-3** are expected to reduce to a less than significant level and would ensure that the impacts from the Proposed Plan would not be cumulatively considerable as they would ensure on-site resources are protected or recovered.

Therefore, the Proposed Plan would not result in a cumulatively considerable contribution to a significant impact with respect to geology, soils and paleontological resources.

4.7 GREENHOUSE GAS EMISSIONS

4.7.1 INTRODUCTION

This section evaluates potential impacts related to greenhouse gas (GHG) emissions. GHGs are emitted by both natural processes and human activities. The accumulation of GHGs in the atmosphere regulates Earth's temperature. The State of California has undertaken initiatives designed to address the effects of GHGs, and to establish targets and emission reduction strategies for GHG emissions in California. The GHG data supporting this section is included as **Appendix 4.7, Greenhouse Gases,** to this EIR. The analysis of GHG emissions and climate change is unique under CEQA, largely because of the global nature of climate change. Typical CEQA analyses address local actions that have local – or regional – impacts, whereas climate change analyzes the relationship between local activities and the resulting potential, if any, for global environmental impacts. Based on this, the focus of GHG emission analysis is on cumulative impacts. As provided by the State Natural Resources Agency in the latest update to the *CEQA Guidelines* Section 15064.4(b): "In determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effect of climate change."

4.7.2 EXISTING ENVIRONMENTAL SETTING

GHG Emissions and Climate Change

Earth's natural warming process is known as the "greenhouse effect." The greenhouse effect compares the Earth and the atmosphere surrounding it to a greenhouse with glass panes. The glass panes in a greenhouse let heat from sunlight in and reduce the amount of heat that escapes. Certain atmospheric gases, known as GHGs, act as an insulating blanket for solar energy to keep the global average temperature in a suitable range for life support. These GHGs keep the average surface temperature of the Earth close to 60 degrees Fahrenheit (°F). Without the natural greenhouse effect, the Earth's surface would be about 61°F cooler.[1] It is normal for Earth's temperature to fluctuate over extended periods of time. Over the past one hundred years, Earth's average global temperature has generally increased by 1°F. In some regions of the world, the increase has been as much as 4°F.

Scientists studying the particularly rapid rise in global temperatures during the late 20th century believe that natural variability alone does not account for that rise. Rather, human activity spawned by the industrial revolution has likely resulted in increased emissions of carbon dioxide (CO_2) and other forms of

1 California Environmental Protection Agency, *Climate Action Team Report to Governor Schwarzenegger and the Legislature*, 2006.

GHGs, primarily from the burning of fossil fuels (i.e., during motorized transport, electricity generation, consumption of natural gas, industrial activity, manufacturing, etc.) and deforestation, as well as agricultural activity and the decomposition of solid waste.[2]

GHG Pollutants and Effects

The California Global Warming Solutions Act of 2006 (discussed in the following pages) defined GHGs to include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulfur hexafluoride (SF_6), and nitrogen trifluoride. Black carbon also contributes to global warming, but it is a solid particle or aerosol, not a gas. A general description of each GHG discussed in this section is provided in **Table 4.7-1, Description of Greenhouse Gases**. CO_2 is the most abundant GHG. Other GHGs are less abundant but have higher global warming potential (discussed below) than CO_2. Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO_2, referred to as CO_2 equivalents and denoted as CO_2e. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions.

Table 4.7-1
Description of Greenhouse Gases

Pollutant	General Description
Carbon Dioxide (CO_2)	CO_2 is an odorless, colorless GHG, which has both natural and man-made sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing; man made sources of CO_2 are burning coal, oil, natural gas, and wood.
Methane (CH_4)	CH_4 is a flammable gas and is the main component of natural gas. When one molecule of CH_4 is burned in the presence of oxygen, one molecule of CO_2 and two molecules of water are released. There are no ill health effects from CH_4. A natural source of CH_4 is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH_4, which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.
Nitrous Oxide (N_2O)	N_2O is a colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. N_2O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.

2 Center for Climate and Energy Solutions, Climate Change 101, 2011.

Pollutant	General Description
Hydrofluorocarbons (HFCs)	HFCs are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (CFCs) for automobile air conditioners and refrigerants. CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at Earth's surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, non-toxic, and nonflammable gas. SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.
Black Carbon /a/	Black Carbon. Black carbon is the most strongly light-absorbing component of particulate matter emitted from burning fuels such as coal, diesel, and biomass.

Source: Association of Environment Professionals, Alternative Approaches to Analyze Greenhouse Gas Emissions and Global Climate Change in CEQA Documents, 2007.
/a/ Black carbon contributes to global warming, but it is a solid particle or aerosol, not a gas.

Global Warming Potential

Global Warming Potential (GWP) is one type of simplified index based upon radiative properties that is used to estimate the potential future impacts of emissions of different gases upon the climate system in a relative sense. GWP is based on a number of factors, including the radiative efficiency (heat-absorbing ability) of each gas relative to that of CO_2, as well as the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of CO_2. A summary of the atmospheric lifetime and GWP of selected gases is presented in **Table 4.7-2, Atmospheric Lifetimes and Global Warming Potential for Greenhouse Gases**.

Table 4.7-2
Atmospheric Lifetimes and Global Warming Potential for Greenhouse Gases

Greenhouse Gas	Lifetime (Years)	Global Warming Potential Factor (20-Year)	Global Warming Potential Factor (100-Year)
Carbon Dioxide	100	1	1
Nitrous Oxide	121	264	298
Nitrogen Trifluoride	500	12,800	16,100
Sulfur Hexafluoride	3,200	17,500	23,500
Perfluorocarbons	3,000-50,000	5,000-8,000	7,000-11,000
Black Carbon	days to weeks	270-6,200	100-1,700
Methane	12	84	25
Hydrofluorocarbons	Uncertain	100-11,000	100-12,000

Source: CARB, Climate Change Scoping Plan First Update, 2013.
Note: "Global Warming Potential" is a relative measure of how much heat a GHG traps in the atmosphere, as compared to CO_2.

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources though potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Long-term trends have found that each of the past three decades has been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest. The observed global mean surface temperature for the decade from 2006 to 2015 was approximately 0.87 °C (0.75°C to 0.99°C) higher than the average over the period from 1850 to 1900. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature obtained from station observations are in agreement that air and sea surface temperatures have increased. Due to past and current activities, anthropogenic GHG emissions are increasing global mean surface temperature at a rate of 0.2°C per decade. In addition to these findings, there are identifiable signs that global warming is currently taking place, including substantial ice loss in the Arctic over the past two decades.[3,4]

According to California's Fourth Climate Change Assessment, statewide temperatures from 1986 to 2016 were approximately 1°F to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snow pack, sea level rise, more extreme heat

3 IPCC, *5th Assessment Report*, 2014.

4 IPCC, *Special Report on the Impacts of Global Warming*, 2018.

days per year, more large forest fires, and more drought years. While there is growing scientific consensus about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to statewide projections, California's Fourth Climate Change Assessment includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally-specific climate change case studies.[5] Below is a summary of some of the potential effects that could be experienced in California as a result of climate change.

Air Quality. Higher temperatures, which are conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and therefore its indirect effects, are uncertain. As temperatures have increased in recent years, the areas burned by wildfires throughout the state has increased, and wildfires have been occurring at higher elevations in the Sierra Nevada Mountains.[6] If higher temperatures continue to be accompanied by an increase in the incidence and extent of large wildfires, air quality would worsen. However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would tend to temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thereby ameliorating the pollution associated with wildfires. Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state.[7]

Water Supply. Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. Uncertainty remains with respect to the overall impact of climate change on future precipitation trends and water supplies in California. For example, many southern California cities have experienced their lowest recorded annual precipitation twice within the past decade; however, in a span of only two years, Los Angeles experienced both its driest and wettest years on record.[8] This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand is not well understood. However, the average early spring snowpack in the western United States, including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 5.9 inches along the central and southern

California coast.[9] The Sierra snowpack provides the majority of California's water supply by accumulating snow during the state's wet winters and releasing it slowly during the state's dry springs and summers. A warmer climate is predicted to reduce the fraction of precipitation falling as snow and result in less snowfall at lower elevations, thereby reducing the total snowpack.[10,11] The State of California projects that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050.[12]

Hydrology and Sea Level Rise. As discussed above, climate change could potentially affect the amount of snowfall, rainfall, and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion. Climate change has the potential to induce substantial sea level rise in the coming century.[13] The rising sea level increases the likelihood and risk of flooding. The rate of increase of global mean sea levels over the 2001-2010 decade, as observed by satellites, ocean buoys and land gauges, was approximately 3.2 millimeter per year, which is double the observed 20th century trend of 1.6 millimeter per year.[14] As a result, global mean sea levels averaged over the last decade were about 8 inches higher than those of 1880.[15]

Sea levels are rising faster now than in the previous two millennia, and the rise is expected to accelerate, even with robust GHG emission control measures. The most recent Intergovernmental Report on Climate Change (IPCC) report predicts a mean sea–level rise of 10 to 37 inches by 2100.[16] A rise in sea levels could completely erode 31 to 67 percent of southern California beaches, result in flooding of approximately 370 miles of coastal highways during 100-year storm events, jeopardize California's water supply due to salt water intrusion, and induce groundwater flooding and/or exposure of buried infrastructure.[17] In addition, increased CO_2 emissions can cause oceans to acidify due to the carbonic acid it forms. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.

17 State of California, *California's Fourth Climate Change Assessment Statewide Summary Report*, 2018.

Agriculture. California has a $50 billion annual agricultural industry that produces over a third of the country's vegetables and two-thirds of the country's fruits and nuts.[18] Higher CO_2 levels can stimulate plant production and increase plant water-use efficiency. However, if temperatures rise and drier conditions prevail, certain regions of agricultural production could experience water shortages of up to 16 percent; water demand could increase as hotter conditions lead to the loss of soil moisture; crop-yield could be threatened by water-induced stress and extreme heat waves; and plants may be susceptible to new and changing pest and disease outbreaks.[19] In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thereby affect their quality.[20]

Ecosystems and Wildlife. Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century.[21] Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species' composition and the incidence of nonnative species within communities; and (4) ecosystem processes, such as carbon cycling and storage.[22,23]

Statewide GHG Emissions

CalEPA published a report titled Scenarios of Climate Change in California: An Overview (Climate Scenarios report) in February 2006 that, while not adequate for a CEQA project-specific or cumulative analysis, is generally instructive about the future impacts of global warming on California. In addition, on December 2, 2009, the California Natural Resources Agency released its California Climate Adaptation Strategy report that details many vulnerabilities arising from climate change with respect to matters such as temperature extremes, sea level rise, wildfires, floods and droughts and precipitation changes. According to these reports, substantial temperature increases arising from increased GHG emissions potentially could result in a variety of impacts to the people, economy, and environment of California. This includes an associated projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. Under the emissions scenarios of the Climate Scenarios report, the impacts of global climate change in California have the potential to include,

but are not limited to, the areas of public health, water resources, agriculture, forests and landscapes, and rising sea levels. The potential effects of climate change are detailed in the section below.

CARB publishes an annual statewide emissions inventory trends report with the most recent iteration covering the years 2000–2019. Emission inventory trends over the past decade demonstrate that GHG emissions have decreased by eight percent over that period, as shown in **Table 4.7-3**.[24] The units of GHG emissions presented in the table are in million metric tons of carbon dioxide equivalents ($MMTCO_2e$). The transportation sector represents California's largest source of GHG emissions and contributed approximately 40 percent of total annual emissions in 2019.

Table 4.7-3
California Greenhouse Gas Emissions Inventory

The data in **Table 4.7-3** convey a steady increase in GHG emissions from the transportation sector between 2013 and 2017, followed by sequential years of reductions in 2018 and 2019. This recent decline is consistent with the long-term direction of transportation-related GHG emissions resulting from statewide reduction initiatives, as evidenced by 2019 transportation emissions being lower than 2009 levels despite the growing population. Transportation sector GHG emissions have declined as a material benefit of more stringent fuel economy standards and enhanced alternative fuel vehicle programs mandated and enforced by the CARB.

Local GHG Emissions

As part of the Sustainable City pLAn, the City began tracking its GHG emissions inventory and progress in control strategies to reduce emissions in annual reports. Consistent with state-level regulatory initiatives to reduce GHG emissions, the City selected the 1990 GHG emissions level of 54.1 $MMTCO_2e$ as the comparative baseline for determining the efficacy of emission control strategies. According to Los Angeles' First Annual Report (2015–2016), the City has reduced GHG emissions to 20 percent below 1990 levels as of 2013, which was initially the stated goal to achieve by 2017.[25] The annual citywide GHG emissions inventory that is an element of the Sustainable City pLAn determined that emissions were reduced to 25 percent below 1990 levels in the 2017–2018 reporting year. The chart below displays the total annual emissions for the City between 2013–2017 and the contributions by sector.[26] Within the City, the combination of stationary (i.e., building envelope energy) and transportation sources comprise approximately 95 percent of total GHG emissions. The City is also currently striving to go from 50 percent energy-reliant on coal power to coal-free by 2025 and to go from 30 percent renewable energy reliant to 100 percent by 2045. The Sustainable City pLAn is described in more detail above under Regulatory Framework.

4.7.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding GHGs at the international, federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Intergovernmental Panel on Climate Change
- U.S.–China Climate Agreement
- Paris United Nations Framework Convention on Climate Change (Paris Accord)
- North American Climate, Clean Energy, and Environment Partnership Action Plan
- Federal Clean Air Act
- Corporate Average Fuel Economy (CAFE) Standards
- Energy Independence and Security Act
- California Air Resources Board
- Statewide GHG Reduction Targets and Scoping Plans
- *CEQA Guidelines*
- SCAG Regional Transportation Plan/Sustainable Communities Strategy
- South Coast Air Quality Management District CEQA Guidance
- Los Angeles Green New Deal
- City of Los Angeles Green Building Code
- City of Los Angeles General Plan
- Existing Buildings Energy and Water Efficiency (EBEWE) Ordinance

International

Intergovernmental Panel on Climate Change. The World Meteorological Organization (WMO) and United Nations Environmental Program (UNEP) established the IPCC in 1988. The goal of the IPCC is to evaluate the risk of climate change caused by human activities. Rather than performing research or monitoring climate, the IPCC relies on peer-reviewed and published scientific literature to make its assessment. While not a regulatory body, the IPCC assesses information (i.e., scientific literature) regarding human-induced climate change and the impacts of human-induced climate change and recommends

options to policy makers for the adaptation and mitigation of climate change. The IPCC reports its evaluations in special reports called assessment reports. The latest assessment report (i.e., Fifth Assessment Report, consisting of three working group reports and a synthesis report based on the first three reports) was published in 2013. In its 2013 report, the IPCC stated that global temperature increases since 1951 were extremely likely attributable to man-made activities (greater than 95 percent certainty).[27] The IPCC anticipates the release of the Sixth Assessment Report in 2022.[28]

U.S.–China Climate Agreement. In November 2014, the United States and China made a joint announcement to cooperate on combating climate change and promoting clean energy. In the United States, President Barack Obama announced a climate target to reduce GHG emissions by 26 to 28 percent below 2005 levels by 2025. In China, President Xi Jinping announced a climate target to reduce peak CO_2 emissions by 2030 and to increase the renewable energy share across all sectors to 20 percent by 2030. China will need to build an additional 800 to 1,000 gigawatts of nuclear, wind, solar, and other zero emission generation capacity by 2030 to reach this target. Together, the United States and China have agreed to: expand joint clean energy research and development at the U.S.-China Clean Energy Research Center, advance major carbon capture, use and storage demonstrations, enhance cooperation on HFCs, launch a climate-smart/low-carbon cities initiative, promote trade in green goods, and demonstrate clean energy on the ground.[29]

Paris United Nations Framework Convention on Climate Change (Paris Accord). A new international climate change agreement was adopted at the Paris United Nations Framework Convention on Climate Change conference in December 2015. The last two climate conferences in Warsaw (2013) and Lima (2014) decided that countries were to submit their proposed emissions reduction targets for the 2015 conference as "intended nationally determined contributions" prior to the Paris conference. The European Union has committed to an economy-wide, domestic GHG reduction target of 40 percent below 1990 levels by 2030. The United States has set its intended nationally determined contribution to reduce its GHG emissions by 26 to 28 percent below its 2005 level in 2025 and to make best efforts to reduce its emissions by 28 percent. These targets are set with the goal of limiting global temperature rise to well below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.

28 IPCC, *AR6 Synthesis Report: Climate Change 2022.* Available online at: https://www.ipcc.ch/report/sixth-assessment-report-cycle/, 2022.

29 The White House, *Fact Sheet: U.S.-China Joint Announcement on Climate Change and Clean Energy Cooperation*, November 11, 2014.

In June 2017, the U.S. announced its intent to withdraw from the Paris Accord with an effective date of withdrawal of November 2020. On Friday, February 19, 2021, the United States formally rejoined the Paris Agreement.

In an effort to reach the goals set by the Paris Accord, over 9,000 cities and local governments from 132 countries across the world formed the Global Covenant of Mayors (GCoM) with the goal of collectively reducing 1.3 billion tons of CO_2 emissions per year by 2030.[30] 158 cities within the United States joined the GCoM (prior to the US formally rejoining the Paris Accord), including the City of Los Angeles.[31]

North American Climate, Clean Energy, and Environment Partnership Action Plan. The North American Climate, Clean Energy, and Environment Partnership Action Plan was announced by Prime Minister Justin Trudeau, President Barack Obama, and President Enrique Peña Nieto on June 29, 2016, at the North American Leaders Summit in Ottawa, Canada. This Action Plan identifies the deliverables to be achieved and activities to be pursued by the three countries as part of this enduring Partnership. The three leaders declared their common vision in a historic North American Climate, Clean Energy, and Environment Partnership, described in a Leaders' Statement and Action Plan that details the actions our leaders will pursue. These actions include:

- Setting a target to increase clean power to 50 percent of the electricity generated across North America by 2025;
- Reducing methane emissions from the oil and gas sector by 40 to 45 percent by 2025;
- Strengthening standards for energy efficiency and vehicle emissions, including aligning energy efficiency standards that will amount to over four billion per year in annual savings for United States businesses and consumers by 2025;
- Strengthening vehicle efficiency, improving fuel quality, and reducing tailpipe pollutants;
- Affirming their support for joining and implementing the Paris Agreement this year and committing to work together to address climate issues through the Montreal Protocol, International Civil Aviation Organization, G-20, and other forums; and

30 Global Covenant of Mayors for Climate & Energy Change. *About Us*. Available online at: https://www.globalcovenantofmayors.org/about/.

31 Global Covenant of Mayors for Climate & Energy. *USA*. Available online at: https://www.globalcovenantofmayors.org/region/usa/

- Celebrating our strong environmental cooperation, including expanding cooperation on early warning systems for natural disasters, supporting habitat for migratory species including Monarchs and birds, and developing action plans to combat wildlife trafficking.

Federal

Federal Clean Air Act. The United States Environmental Protection Agency (U.S. EPA) is responsible for implementing federal policy to address GHGs. The United States Supreme Court (Supreme Court) ruled in *Massachusetts v. Environmental Protection Agency*, 127 S.Ct. 1438 (2007), that CO_2 and other GHGs are pollutants under the federal Clean Air Act (CAA), which the U.S. EPA must regulate if it determines they pose an endangerment to public health or welfare. In December 2009, U.S. EPA issued an endangerment finding for GHGs under the Clean Air Act, setting the stage for future regulation.

The Federal Government administers a wide array of public-private partnerships to reduce the GHG intensity generated in the United States. These programs focus on energy efficiency, renewable energy, methane and other non-CO_2 gases, agricultural practices, and implementation of technologies to achieve GHG reductions. U.S. EPA implements numerous voluntary programs that contribute to the reduction of GHG emissions. These programs (e.g., the ENERGY STAR labeling system for energy-efficient products) play a significant role in encouraging voluntary reductions from large corporations, consumers, industrial and commercial buildings, and many major industrial sectors.

Corporate Average Fuel Economy (CAFE) Standards. In response to the *Massachusetts v. Environmental Protection Agency* ruling, President George W. Bush issued Executive Order 13432 in 2007, directing the U.S. EPA, the United States Department of Transportation (USDOT), and the United States Department of Energy (USDOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. The National Highway Traffic Safety Administration (NHTSA) subsequently issued multiple final rules regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model year 2011 and later for model years 2012-2016, and 2017-2021. In March 2020, the USDOT and the U.S. EPA issued the final Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFE standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026.[32] These standards set a combined fleet wide average of 36.9 to 37 for the model years affected.[33]

---

32 U.S. Environmental Protection Agency, *Final Rule for Model Year 2021 - 2026 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards*, published April 30, 2020.

33 National Highway Traffic Safety Administration (NHTSA), *Corporate Average Fuel Economy standards.*

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011 the U.S. EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the U.S. EPA, this regulatory program would reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines. Building on the first phase of standards, in August 2016, the EPA and NHTSA finalized Phase 2 standards for medium and heavy-duty vehicles through model year 2027 that will improve fuel efficiency and cut carbon pollution. The Phase 2 standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons.[34]

Energy Independence and Security Act. The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;

- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;

- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and

- While superseded by the U.S. EPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."[35]

---

34 U.S. EPA, *EPA and NHTSA Adopt Standards to Reduce GHG and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles for Model Year 2018 and Beyond, August 2016.*

35 A green job, as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources.

Global Change Research Act (1990). In 1990, Congress passed—and the President signed—Public Law 101-606, the Global Change Research Act.[36] The purpose of the legislation was: "...to require the establishment of a United States Global Change Research Program aimed at understanding and responding to global change, including the cumulative effects of human activities and natural processes on the environment, to promote discussions towards international protocols in global change research, and for other purposes." To that end, the Global Change Research Information Office was established in 1991 to serve as a clearinghouse of information. The Act requires a report to Congress every four years on the environmental, economic, health and safety consequences of climate change; however, the first and only one of these reports to date, the National Assessment on Climate Change, was not published until 2000. In February 2004, operational responsibility for GCRIO shifted to the U.S. Climate Change Science Program.

National Fuel Efficiency Policy. On May 19, 2009, the president announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution. This policy is expected to increase fuel economy by more than five percent by requiring a fleet-wide average of 35.5 miles per gallon by 2016 starting with model year 2012.

Fuel Economy Standards. On September 15, 2009, the U.S. EPA and the NHTSA issued a joint proposal to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. The proposed standards were to be phased in and require passenger cars and light-duty trucks to comply with a declining emissions standard. In 2012, passenger cars and light-duty trucks were required to meet an average emissions standard of 295 grams of CO_2 per mile and 30.1 miles per gallon. By 2016, the vehicles were required to meet an average standard of 250 grams of CO_2 per mile and 35.5 miles per gallon. The final standards were adopted on April 1, 2010.

On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA (42 United States Code Section 7521):

Endangerment Finding: The Administrator found that the current and projected concentrations of the six key well-mixed GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) in the atmosphere threaten the public health and welfare of current and future generations.

---

36 Global Change Research Act (Public Law 101-606, 104 Stat. 3096-3104). 1990. Available online at: https://www.govinfo.gov/content/pkg/STATUTE-104/pdf/STATUTE-104-Pg3096.pdf

Cause or Contribute Finding: The Administrator found that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

While these findings do not impose additional requirements on industry or other entities, this action is a prerequisite to finalizing the U.S. EPA's proposed GHG emissions standards for light-duty vehicles, which were jointly proposed by the U.S. EPA and the NHTSA. On April 1, 2010, the U.S. EPA and the NHTSA issued final rules requiring that by the 2016 model-year, manufacturers must achieve a combined average vehicle emission level of 250 grams CO_2 per mile, which is equivalent to 35.5 miles per gallon as measured by U.S. EPA standards.

On November 16, 2011, EPA and NHTSA issued a joint proposal to extend the national program of harmonized GHG and fuel economy standards to model year (MY) 2017 through 2025 passenger vehicles. In August 2012, President Obama finalized standards that will increase fuel economy to the equivalent of 54.5 mpg for cars and light-duty trucks by MY 2025.

On January 12, 2017, the U.S. EPA Administrator Gina McCarthy signed her determination to maintain the GHG emissions standards for model year MY 2022-2025 vehicles. Her final determination found that automakers are well positioned to meet the standards at lower costs than previously estimated.[37]

On March 15, 2017, the new U.S. EPA Administrator Scott Pruitt and Department of Transportation Secretary Elaine Chao announced that the U.S. EPA intended to reconsider the final determination, issued on January 12, 2017, that recommended no change to the greenhouse gas standards for light duty vehicles for model years 2022- 2025.[38]

On April 2, 2018, the Administrator signed the Mid-term Evaluation Final Determination which finds that the model year 2022-2025 greenhouse gas standards are not appropriate in light of the record before EPA and, therefore, should be revised.[39]

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle mandates, and fuel

---

37 U.S. Environmental Protection Agency. *Midterm Evaluation of Light-Duty Vehicle Greenhouse Gas Emissions Standards for Model Years 2022-2025.* Available online at: https://www.epa.gov/regulations-emissions-vehicles-and-engines/midterm-evaluation-light-duty-vehicle-greenhouse-gas

38 *Ibid.*

39 *Ibid.*

economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and preempts California's Advanced Clean Car Regulations and may potentially impact SCAG's Connect SoCal and transportation projects in the SCAG region.[40,41]

On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that EPA lacks the legal authority to withdraw the California waiver. In April 2021, the U.S. EPA announced it would reconsider its previous withdrawal and grant California permission to set more stringent climate requirements for cars and SUVs. On March 9, 2022, the U.S. EPA restored California's 2013 waiver to full force, including both its GHG standards and zero-emissions vehicles sales requirements.

Executive Order 13693. Issued on June 10, 2015, Executive Order 13693 — Planning for Federal Sustainability in the Next Decade. The goal of Executive Order 13693 is to maintain federal leadership in sustainability and GHG emission reductions. This Executive Order outlines forward-looking goals for federal agencies in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition. Federal agencies shall, where life-cycle cost-effective, beginning in 2016:

- Reduce agency building energy intensity as measured in British Thermal Units per square foot by 2.5 percent annually through 2025;
- Improve data center energy efficiency at agency buildings;
- Ensure a minimum percentage of total building electric and thermal energy shall be from clean energy sources;
- Improve agency water use efficiency and management (including storm water management); and
- Improve agency fleet and vehicle efficiency and management by achieving minimum percentage GHG emission reductions.

40 U.S. Department of Transportation and U.S. EPA. 2019. *One National Program Rule on Federal Preemption of State Fuel Economy Standards*. Available online at: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100XI4W.pdf, accessed October 29, 2019.

41 Southern California Association of Governments. 2019. *Final Federal Safer, Affordable, Fuel-Efficient Vehicles Rule Part I (Supplemental Report).* Available online at: http://www.scag.ca.gov/committees/CommitteeDocLibrary/EEC_Item8_RC_Item10%20Supplemental%20Report.pdf

Executive Order 13783. Issued on March 28, 2017, Executive Order 13783 — Promoting Energy Independence and Economic Growth — revokes multiple prior Executive Orders and memoranda including Executive Order 13653, the Power Sector Carbon Pollution Standards, Presidential Memorandum – Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment, and Presidential Memorandum – Climate Change and National Security, as well as other federal reports and provisions. Executive Order 13783 represents a reversal on federal climate policy relative to the work of previous administrations and its objective is to reduce the regulatory framework applicable to GHG emissions to spur fossil fuel production. This Executive Order "established a national policy to promote the clean and safe development of our energy resources while reducing unnecessary regulatory burdens" (Federal Register 2017).[42] The order also "directs the U.S. EPA to review existing regulations, orders, guidance documents and policies that potentially burden the development or use of domestically produced energy resources." As of April 2020, the Council on Environmental Quality (CEQ) is considering updating its National Environmental Policy (NEPA) implementing regulations and has issued a Notice of Proposed Rulemaking that incorporates Executive Order 13783.[43] How these proposed rule changes will affect GHG emissions cannot be predicted at this time.

Executive Order 13795. Issued on April 28, 2017, Executive Order 13795 — Implementing an America-First Offshore Energy Strategy — directs the "policy of the United States to encourage energy exploration and production, including on the Outer Continental Shelf, in order to maintain the Nation's position as a global energy leader and foster energy security and resilience for the benefit of the American people, while ensuring that any such activity is safe and environmental responsible".[44] The objective of the order is to expand the opportunity for offshore energy development by removing restrictions on resource exploration and extraction. This Executive Order prioritizes the development of offshore energy resources over the protection of National Marine Sanctuaries and authorizes the review and potential revision or withdrawal of the Bureau of Ocean Energy Management's Proposed Rule entitled "Air Quality Control, Reporting, and Compliance," 81 Federal Register 19718 and any other related rules and guidance. The implications of implementing Executive Order 13795 with regards to the national GHG emissions inventory cannot be reasonably determined at this time.

Presidential Executive Order 13990. President Biden signed Executive Order 13990 – Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis — on January 20, 2021. The order directs all executive departments and agencies to immediately review and, as appropriate and

consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the 2017–2021 executive tenure that conflict with the following national objectives: to improve public health and protect the environment; to ensure access to clean air and water; to limit exposure to dangerous chemicals and pesticides; to hold polluters accountable, including those who disproportionately harm communities of color and low-income communities; to reduce GHG emissions; to bolster resilience to the impacts of climate change; to restore and expand our national treasures and monuments; and to prioritize both environmental justice and the creation of the well-paying union jobs necessary to deliver these goals.[45]

Presidential Executive Order 14008. President Biden signed Executive Order 14008 – Tackling the Climate Crisis At Home and Abroad — on January 27, 2021. The order affirmed the United States as rejoining the Paris Agreement and expressed its commitment to exercising leadership in promoting global climate ambition to meet the climate challenge.[46]

State

California Air Resources Board. The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's State Implementation Plan (SIP), for which it works closely with the Federal Government and the local air districts. The SIP is required for the State to take over implementation of the Federal Clean Air Act. CARB also has primary responsibility for adopting regulations to meet the State's goal of reducing GHG emissions. The State has met its goals to reduce GHG emissions to 1990 levels by 2020. Subsequent State goals include reducing GHG emissions to 40 percent below 1990 levels by 2030 and to 80 percent below 1990 levels by 2050.

Statewide GHG Reduction Targets and Scoping Plans. Executive Order S-3-05, Assembly Bill 32, Senate Bill 32, 2017 Scoping Plan (CARB), Executive Order B-55-18, Cap-and-Trade Program, Senate Bill 350,

---

45 Federal Register, *Executive Order 13990 of January 20, 2021: Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, Vol. 86, No. 14*, January 25, 2021.

46 Federal Register, *Executive Order 14008 of January 27, 2021: Tackling the Climate Crisis at Home and Abroad, Vol. 86, No. 19*, February 1, 2021.

Senate Bill 1383, Senate Bill 97, Senate Bill 375, Emission Performance Standards, Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, and SB 100), Assembly Bill 1493, Low Carbon Fuel Standard (Executive Order S-01-07), Advanced Clean Cars Program, Senate Bill 743, California Integrated Waste Management Act (AB 341), California Appliance Efficiency Regulations, California Green Building Code (California Code of Regulations Title 24).

Executive Order S-3-05. Executive Order S-3-05, issued in June 2005, established GHG emissions targets for the State, as well as a process to ensure the targets are met. The order directed the Secretary for the CalEPA to report every two years on the State's progress toward meeting the Governor's GHG emission reduction targets. As a result of this executive order, the California Climate Action Team (CCAT), led by the Secretary of the CalEPA, was formed. The CCAT is made up of representatives from a number of State agencies and was formed to implement global warming emission reduction programs and reporting on the progress made toward meeting statewide targets established under the Executive Order. The CCAT reported several recommendations and strategies for reducing GHG emissions and reaching the targets established in the Executive Order (CalEPA 2006). The statewide GHG targets are as follows:

- By 2010, reduce to 2000 emission levels;
- By 2020, reduce to 1990 emission levels; and
- By 2050, reduce to 80 percent below 1990 levels.

However, with the adoption of the California Global Warming Solutions Act of 2006 (also known as Assembly Bill [AB] 32), discussed below, the Legislature did not adopt the 2050 horizon-year goal from Executive Order No. S-3-05. In the last legislative session, the Legislature rejected legislation to enact the Executive Order's 2050 goal.[47]

The original mandate for the CCAT was to develop proposed measures to meet the emission reduction targets set forth in E.O. S-3-05. The CAT has since expanded and currently has members from 18 state agencies and departments. The CCAT also has ten working groups, which coordinate policies among their members. The working groups and their major areas of focus are:

---

47 The original version of SB 32 as introduced in the Legislature contained a commitment to the 2050 goal, but this commitment was not included in the final version of the bill. See: *https://leginfo.legislature.ca.gov/faces/billVersionsCompareClient.xhtml?bill_id=201520160SB32&cversion=20150SB3299INT*. In addition, the Supreme Court recently held in Cleveland National Forest Foundation et al. v San Diego Association of Governments (SANDAG)(S223603, July 13, 2017) that SANDAG did not abuse its discretion in declining to adopt the 2050 goal as a measure of significance in an analysis of the consistency of projected 2050 GHG emissions with the goals in Executive Order S-3-05.

- Agriculture: Focusing on opportunities for agriculture to reduce GHG emissions through efficiency improvements and alternative energy projects, while adapting agricultural systems to climate change;
- Biodiversity: Designing policies to protect species and natural habitats from the effects of climate change;
- Energy: Reducing GHG emissions through extensive energy efficiency policies and renewable energy generation;
- Forestry: Coupling GHG mitigation efforts with climate change adaptation related to forest preservation and resilience, waste to energy programs and forest offset protocols;
- Land Use and Infrastructure: Linking land use and infrastructure planning to efforts to reduce GHG from vehicles and adaptation to changing climatic conditions;
- Oceans and Coastal: Evaluating the effects of sea level rise and changes in coastal storm patterns on human and natural systems in California;
- Public Health: Evaluating the effects of GHG mitigation policies on public health and adapting public health systems to cope with changing climatic conditions;
- Research: Coordinating research concerning impacts of and responses to climate change in California;
- State Government: Evaluating and implementing strategies to reduce GHG emissions resulting from state government operations; and
- Water: Reducing GHG impacts associated with the state's water.

The CCAT stated that smart land use is an umbrella term for strategies that integrate transportation and land-use decisions. Such strategies generally encourage jobs/housing proximity, transit-oriented development, and high-density residential/commercial development along transit corridors. These strategies develop more efficient land-use patterns within each jurisdiction or region to match population growth and workforce and socioeconomic needs for the full spectrum of the population. "Intelligent transportation systems" involve the application of advanced technology systems and management strategies to improve operational efficiency of transportation systems and the movement of people, goods, and service.[48]

---

48 California Environmental Protection Agency, *Climate Action Team Report to Governor Schwarzenegger and the Legislature*, 2006.

Assembly Bill 32. The California Global Warming Solutions Act of 2006 (AB 32) was signed into law in September 2006 after considerable study and expert testimony before the Legislature. The law instructs CARB to develop and enforce regulations for the reporting and verifying of statewide GHG emissions. AB 32 directed CARB to set a GHG emission limit based on 1990 levels, to be achieved by 2020. AB 32 set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.[49]

The heart of AB 32 is the requirement to reduce statewide GHG emissions to 1990 levels by 2020. AB 32 required CARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions. CARB accomplished the key milestones set forth in AB 32, including the following:

- June 30, 2007. Identification of discrete early action GHG emissions reduction measures. On June 21, 2007, CARB satisfied this requirement by approving three early action measures.[50] These were later supplemented by adding six other discrete early action measures.[51]

- January 1, 2008. Identification of the 1990 baseline GHG emissions level and approval of a statewide limit equivalent to that level and adoption of reporting and verification requirements concerning GHG emissions. On December 6, 2007, CARB approved a statewide limit on GHG emissions levels for the year 2020 consistent with the determined 1990 baseline.[52]

- January 1, 2009. Adoption of a scoping plan for achieving GHG emission reductions. On December 11, 2008, CARB adopted Climate Change Scoping Plan: A Framework for Change (Scoping Plan).[53]

- January 1, 2010. Adoption and enforcement of regulations to implement the "discrete" actions. Several early action measures have been adopted and became effective on January 1, 2010. [54,55]

53 CARB, *Climate Change Scoping Plan*, 2008.

54 CARB, *Consideration of Recommendations for Discrete Early Actions for Climate Change Mitigation in California*, 2007.

55 CARB, *Public Meeting to Consider Approval of Additions to the List of Early Action Measures to Reduce Greenhouse Gas Emissions under the California Global Warming Solutions Act of 2006 and to Discuss Concepts for Promoting and Recognizing Voluntary Early Actions*, 2007.

- January 1, 2011. Adoption of GHG emissions limits and reduction measures by regulation. On October 28, 2010, CARB released its proposed cap-and-trade regulations, which would cover sources of approximately 85 percent of California's GHG emissions.[56] CARB's Board ordered its Executive Director to prepare a final regulatory package for cap-and-trade on December 16, 2010.[57]

- January 1, 2012. GHG emissions limits and reduction measures adopted in 2011 became enforceable.

As noted above, CARB adopted the Scoping Plan in 2008 to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions for various categories of emissions. CARB determined that achieving the 1990 emission level by 2020 would require an approximately 28.5 percent reduction of GHG emissions in the absence of new laws and regulations (referred to as "business as usual" or "No Action Taken"). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and Climate Action Team early actions and additional GHG reduction measures by both entities, and identifies additional measures to be pursued as regulations, and outlines the role of a cap-and-trade program. Key elements of the Scoping Plan include the following:[58]

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;

- Achieving a statewide renewable energy mix of 33 percent;

- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions;

- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets;

- Adopting and implementing measures pursuant to existing state laws and policies, such as California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and

56 CARB, *Cap and Trade 2010*, 2011.

57 CARB, *California Cap-and-Trade Program, Resolution 10-42*, 2010.

58 CARB, *Climate Change Scoping Plan*, 2008.

- Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

In connection with the preparation of the environmental impact analyses (referred to as the Functional Equivalent Document [FED] and the Supplement to the FED) to support AB 32 Scoping Plan, CARB released revised estimates of the expected 2020 emission reductions in consideration of the economic recession and the availability of updated information from development of measure specific regulations. Incorporation of revised estimates in consideration of the economic recession reduced the projected 2020 emissions from 596 metric tons of CO_2 equivalent ($MTCO_2e$) to 545 million $MTCO_2e$ ($MMTCO_2e$) (CARB 2011c). Under this scenario, achieving the 1990 emissions level in 2020 would require a reduction of GHG emissions of 118 $MMTCO_2e$, or 21.7 percent. This revised reduction represents a 6.8 percentage point reduction from the 28.5 percent level determined in CARB's 2008 Scoping Plan. The 2020 AB 32 baseline was also updated to account for measures incorporated into the inventory, including Pavley (vehicle model-years 2009 to 2016) and the renewable portfolio standard (12 percent to 20 percent). Inclusion of these measures further reduced the 2020 baseline to 507 $MMTCO_2e$.

Executive Order B-30-15. On April 29, 2015, Governor Brown issued Executive Order B-30-15. Therein, the Governor directed the following:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030.

- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets.

- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

Senate Bill 32. In 2016, the Legislature passed Senate Bill (SB) 32 with the companion bill AB 197, which further requires California to reduce GHG emissions to 40 percent below 1990 levels by 2030. The bill targets reductions from the leading GHG emitters in the State. Transportation is the largest sector of GHG emissions in California and will be a primary subject for reductions. Through advances in technology and improved public transportation, the State plans to reduce GHG emissions from transportation sources to assist in meeting the 2030 reduction goal. AB 197, signed September 8, 2016, is a bill linked to SB 32 and signed on September 8, 2016, prioritizes efforts to cut GHG emissions in low-income or minority communities. AB 197 requires CARB to make available, and update at least annually, on its website the emissions of GHGs, criteria pollutants, and toxic air contaminants for each facility that reports to CARB

and air districts. In addition, AB 197 adds two Members of the Legislature to the CARB board as ex officio, non- voting members and creates the Joint Legislative Committee on Climate Change Policies to ascertain facts and make recommendations to the Legislature and the houses of the Legislature concerning the State's programs, policies, and investments related to climate change.

2017 Scoping Plan. In response to the passage of SB 32 and the identification of the 2030 GHG reduction target, CARB adopted the 2017 Climate Change Scoping Plan in December 2017.[59] The 2017 Update builds upon the framework established by the 2008 Climate Change Scoping Plan and the First Update while identifying new, technologically feasible, and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health. The 2017 Update includes policies to require direct GHG reductions at some of the State's largest stationary sources and mobile sources. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade program, which constraints and reduces emissions at covered sources.[60]

CARB's projected Statewide 2030 emissions takes into account 2020 GHG reduction policies and programs.[61] The 2017 Scoping Plan also addresses GHG emissions from natural and working lands of California, including the agriculture and forestry sectors. Under the Scoping Plan Scenario, the majority of the reductions would result from the continuation of the Cap-and-Trade regulation. Additional reductions would be achieved from electricity sector standards (i.e., utility providers to supply 50 percent renewable electricity by 2030), doubling the energy efficiency savings at end uses, additional reductions from the LCFS, implementing the short-lived GHG strategy (e.g., hydrofluorocarbons), and implementing the mobile source strategy and sustainable freight action plan. Implementation of mobile source strategies (cleaner technology and fuels) include the following:

- At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025
- At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030
- Further increase GHG stringency on all light-duty vehicles beyond existing Advanced
- Clean Cars regulations
- Medium- and heavy-duty GHG Phase 2

59 CARB, *California's 2017 Climate Change Scoping Plan*, November 2017.

60 *Ibid*.

61 *Ibid*.

- Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low- NOX standard.

- Last Mile Delivery: New regulation that would result in the use of low NOX or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for Class 3–7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030.

- Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."

The alternatives in the Scoping Plan are designed to consider various combinations of these programs, as well as consideration of a carbon tax in the event the Cap-and-Trade regulation is not continued. However, in July 2017, the California Legislature voted to extend the Cap-and-Trade regulation to 2030.

The 2017 Scoping Plan discusses the role of local governments in meeting the State's GHG reductions goals because local governments have jurisdiction and land use authority related to: community-scale planning and permitting processes, local codes and actions, outreach and education programs, and municipal operations.[62]. Furthermore, local governments may have the ability to incentivize renewable energy, energy efficiency, and water efficiency measures.[63]

For individual projects under CEQA, the 2017 Scoping Plan states that local governments can support climate action when considering discretionary approvals and entitlements. According to the 2017 Scoping Plan, lead agencies have the discretion to develop evidence-based numeric thresholds consistent with the Scoping Plan, the State's long-term goals, and climate change science (CARB 2017).

The City of Los Angeles has not developed per capita targets for 2030 or 2050; however, the City recognizes that GHG emissions reductions are necessary in the public and private sectors. The City has taken the

62 *Ibid*.

63 *Ibid*.

initiative in combating climate change by developing programs such as the Green New Deal and Green Building Code. Each of these programs is discussed further below.

A summary of the required estimated GHG emissions reductions is provided in **Table 4.7-4**.

Table 4.7-4
Required Estimated Statewide Greenhouse Gas Emissions Reductions

Emissions Scenario	GHG Emissions ($MMTCO_2E$)
2008 Scoping Plan (IPCC SAR)	
2020 BAU Forecast (2008 Scoping Plan Estimate)	596
2020 Emissions Target Set by AB 32 (i.e., 1990 level)	427
Reduction below Business-As-Usual necessary to achieve 1990 levels by 2020	169 (28.4%)[1]
2014 Scoping Plan Update (IPCC AR4)	
2020 BAU Forecast (CARB 2014 Scoping Plan Estimate)	509.4
2020 Emissions Target Set by AB 32 (i.e., 1990 level)	431
Reduction below Business-As-Usual necessary to achieve 1990 levels by 2020	78.4 (15.4%)[2]
2017 Scoping Plan Update	
2030 BAU Forecast ("Reference Scenario" – 2020 GHG reduction policies and programs)	389
2030 Emissions Target (i.e., 40% below 1990 Level)	260
Reduction below Business-As-Usual to Achieve 40% below 1990 Level by 2030	129 (33.2%)[3]

MMTCO2e = million metric tons of carbon dioxide equivalents

[1] 596 – 427 = 169 / 596 = 28.4%

[2] 509.4 – 431 = 78.4 / 509.4 = 15.4%

[3] 389 – 260 = 129 / 389 = 33.2%

Source: CARB, Final Supplement to the AB 32 Scoping Plan Functional Equivalent Document (FED), Attachment D, August 19, 2011; CARB, 2020 Business-as-Usual (BAU) Emissions Projection, 2014 Edition, 2017, http://www.arb.ca.gov/cc/inventory/data/bau.htm. Accessed May 2022; CARB, California's 2017 Climate Change Scoping Plan, November 2017.

Under the Scoping Plan Scenario, continuation of the Cap-and-Trade regulation (or carbon tax) is expected to cover approximately 34 to 79 $MMTCO_2$ of the 2030 reduction obligation.32 The State's short-lived climate pollutants strategy, which is for GHGs that remain in the atmosphere for shorter periods of time compared to longer-lived GHGs like CO_2, is expected to cover approximately 17 to 35 $MMTCO_2e$. The Renewables Portfolio Standard with 50 percent renewable electricity by 2030 is expected to cover approximately 3 $MMTCO_2$. The mobile source strategy and sustainable freight action plan includes maintaining the existing vehicle GHG emissions standards, increasing the number of zero emission vehicles and improving the freight system efficiency, and is expected to cover approximately 11 to 13 $MMTCO_2$. Under the Scoping Plan Scenario, CARB expects that the reduction in GHGs from doubling of the energy efficiency savings in natural gas and electricity end uses in the CEC 2015 Integrated Energy Policy Report by 2030 would cover approximately 7 to 9 $MMTCO_2$ of the 2030 reduction obligation. The other strategies would be expected to cover the remaining 2030 reduction obligations.

Draft 2022 Scoping Plan. CARB released the Draft 2022 Scoping Plan Update in May 2022.[64] The Draft 2022 Scoping Plan Update identifies a technologically feasible, cost-effective and equity-focused path to achieve carbon neutrality by 2045, or earlier, while also assessing the progress the State is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. The Draft 2022 Update builds upon current and previous environmental justice efforts to integrate environmental justice directly into the plan to ensure that no community is left behind. Specifically, the Draft 2022 Update:

- Identifies a path to keep California on track to meet its SB 32 GHG reduction target of at least 40 percent below 1990 emissions by 2030;
- Identifies a technologically feasible, cost-effective path to achieve carbon neutrality by 2045 or earlier;
- Focuses on strategies for reducing California's dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs;
- Integrates equity and protecting California's most impacted communities as a driving principle;
- Incorporates the contribution of natural and working lands to the state's GHG emissions inventory, as well as its role in achieving carbon neutrality;
- Relies on the contemporary science, including the need to deploy all viable tools to address the existential threat that climate change poses, including carbon capture and sequestration as well as direct air capture.
- Evaluates multiple options for achieving GHG and carbon neutrality targets, as well as the public health benefits and economic impacts associated with each.

The Draft 2022 Update evaluated four scenarios to reach carbon neutrality and the most viable path to achieve the State's 2030 interim GHG reduction and 2035/2045 GHG neutrality targets. Ultimately, CARB staff selected Scenario 3 as the "Proposed Scenario," which achieves carbon neutrality by 2045 by deploying a broad portfolio of existing and emerging fossil fuel alternatives and clean technologies. Among the proposed actions by sector are the following:

- VMT per capita to be reduced 12% below 2019 levels by 2030 and 22% below 2019 levels by 2045.

64 CARB, *Draft 2022 Scoping Plan Update*, May 2022.

- 100% of light duty vehicle (LDV) sales to be zero emission (ZEV) by 2035.
- New buildings, all electric appliances beginning in 2026 (residential) and 2029 (commercial).
- Existing residential buildings 80% of appliance sales are electric by 2030 and 100% by 2035.
- Existing commercial buildings 80% of appliance sales are electric by 2030 and 100% by 2045.
- Construction equipment 25% energy demand electrified by 2030 and 75% by 2045.

Executive Order B-55-18. On September 10, 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

Cap-and-Trade Program. As mentioned above, the Scoping Plan identifies a cap-and-trade program as one of the strategies the State will employ to reduce GHG emissions that cause climate change. The cap-and-trade program is implemented by CARB and "caps" GHG emissions from the industrial, utility, and transportation fuels sections, which account for roughly 85 percent of the State's GHG emissions. The program works by establishing a hard cap on about 85 percent of total statewide GHG emissions. The cap starts at expected business-as-usual emissions levels in 2012 and declines two to three percent per year. Originally with a planning horizon of 2020, the recent approval of AB 398 in July 2017 extended the program until 2030. Fewer GHG emissions allowances are available each year, requiring covered sources to reduce their emissions or pay increasingly higher prices for those allowances. The cap level is set in 2030 to ensure California complies with SB 32's emission reduction target of 40 percent below 1990 GHG emission levels.

The scope of GHG emission sources subject to cap-and-trade in the first compliance period (2013-2014) includes all electricity generated and imported into California (the first deliverer of electricity into the State is the "capped" entity and the *one that* will have to purchase allowances as appropriate), and large industrial facilities emitting more than 25,000 $MTCO_2e$ per year (e.g., oil refineries and cement manufacturers). The scope of GHG emission sources subjected to cap-and-trade during the second compliance period (2015 onward) expands to include distributors of transportation fuels (including gasoline and diesel), natural gas, and other fuels. The regulated entity will be the fuel provider that distributes the fuel upstream (not the gas station). In total, the cap-and-trade program is expected to include roughly 350 large businesses, representing about 600 facilities. Individuals and small businesses will not be regulated.

Under the program, companies do not have individual or facility-specific reduction requirements. Rather, all companies covered by the regulation are required to turn in allowances[65] in an amount equal to their total GHG emissions during each phase of the program. The program gives companies the flexibility to either trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more will have to turn in more allowances, and companies that can cut their emissions will have to turn in fewer allowances. Furthermore, as the cap declines, total GHG emissions are reduced. On October 20, 2011, CARB's Board adopted the final cap-and-trade regulation. The cap-and-trade program began on January 1, 2012, with an enforceable compliance obligation beginning with the 2013 GHG emissions.[66] In July 2017, the Legislature passed legislation to extend the cap-and-trade program to 2030.[67]

Senate Bill 350. Adopted on October 7, 2015, SB 350 supports the reduction of GHG emissions from the electricity sector through a number of measures, including requiring electricity providers to achieve a 50 percent renewables portfolio standard by 2030, a cumulative doubling of statewide energy efficiency savings in electricity and natural gas by retail customers by 2030.

Senate Bill 1383. Approved by the governor in September 2016, SB 1383 requires the CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. The bill requires the strategy to achieve the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

The bill also requires California Department of Resources Recycling and Recovery (CalRecycle), in consultation with the State board, to adopt regulations that achieve specified targets for reducing organic waste in landfills.

Senate Bill 97. Per SB 97, which was signed into law in 2007, the California Natural Resources Agency adopted amendments to the *State CEQA Guidelines*, which address the specific obligations of public agencies when analyzing GHG emissions under CEQA to determine a project's effects on the environment

---

65 "Allowance" means a limited tradable authorization to emit up to one metric ton of carbon dioxide equivalent.

66 CARB, *California Cap-and-Trade Program*, Resolution 10-42, 2015.

67 Office of the Governor, *Governor Brown Signs Landmark Climate Bill to Extend California's Cap-and-Trade Program*, 2017.

(codified as Public Resources Code [PRC] 21083.05). Specifically, PRC 21083.05 states, "[t]he Office of Planning and Research and the Natural Resources Agency shall periodically update the guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions."

Sustainable Communities and Climate Protection Act (Senate Bill 375). The Sustainable Communities and Climate Protection Act of 2008, or SB 375 (Chapter 728, Statutes of 2008), establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions, was adopted by the State on September 30, 2008. SB 375 finds that the "transportation sector is the single largest contributor of greenhouse gases of any sector."[68] Under SB 375, CARB is required, in consultation with the Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. SCAG is the Metropolitan Planning Organization in which the City of Los Angeles is located in. CARB set targets for 2020 and 2035 for each of the 18 metropolitan planning organization regions in 2010, and updated them in 2018.[69] In March 2018, the CARB updated the SB 375 targets for the SCAG region to require an 8 percent reduction by 2020 and a 19 percent reduction by 2035 in per capita passenger vehicle GHG emissions.[70] As discussed further below, SCAG has adopted an updated Regional Transportation Plan / Sustainable Community Strategies (RTP/SCS) subsequent to the update of the emission targets. The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.[71]

Under SB 375, the target must be incorporated within that region's Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities would then need to be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plans) are not required to be consistent with either the RTP or SCS.

Emission Performance Standards. SB 1368, signed September 29, 2006, is a companion bill to AB 32, which requires the CPUC and the CEC to establish GHG emission performance standards for the generation of electricity. These standards also generally apply to power that is generated outside of California and

imported into the State. SB 1368 provides a mechanism for reducing the emissions of electricity providers, thereby assisting CARB to meet its mandate under AB 32.

Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, and SB 100). Established in 2002 under SB 1078, and accelerated in 2006 under SB 107,in 2011 under SB X 1-2, and again in 2018 under SB 100, California's Renewable Portfolio Standards (RPS) require retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 44 percent by 2024, 52 percent by 2027, and 60 percent in 2030.[72, 73] Additionally, the State has made a commitment that renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity by 2045.[74] Initially, the RPS provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SB X 1-2 added, for the first time, publicly-owned utilities to the entities subject to RPS.

Assembly Bill 1493. Mobile Source Reductions Assembly Bill 1493, the "Pavley Standard," required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model year 2009 through 2016. The bill also required the California Climate Action Registry to develop and adopt protocols for the reporting and certification of GHG emissions reductions from mobile sources for use by CARB in granting emission reduction credits. The bill authorizes CARB to grant emission reduction credits for reductions of GHG emissions prior to the date of enforcement of regulations, using model year 2000 as the baseline for reduction.[75] In 2004, CARB applied to the U.S. EPA for a waiver under the federal Clean Air Act to authorize implementation of these regulations. On June 30, 2009, the U.S. EPA granted the waiver with the following provision: CARB may not hold a manufacturer liable or responsible for any noncompliance caused by emission debits generated by a manufacturer for the 2009 model year. CARB has adopted a new approach to passenger vehicles (cars and light trucks), by combining the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The new approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emission vehicles in California.

Low Carbon Fuel Standard (Executive Order S-01-07). Executive Order S-01-07 (January 18, 2007) requires a 10 percent or greater reduction in the average fuel carbon intensity for transportation fuels in California regulated by CARB. CARB identified the Low Carbon Fuel Standard (LCFS) as a Discrete Early Action item

75 CARB, *Clean Car Standards – Pavley, Assembly Bill 1493*, 2017.

under AB 32, and the final resolution (09-31) was issued on April 23, 2009.[76] In 2009, CARB approved for adoption the LCFS regulation, which became fully effective in April 2010 and is codified at Title 17, California Code of Regulations (CCR), Sections 95480-95490. The LCFS reduced GHG emissions by reducing the carbon intensity of transportation fuels used in California by 10 percent between 2011 and 2020. In 2018, CARB approved amendments to LCFS regulations, which included strengthening and smoothing the carbon intensity benchmarks through 2030 in-line with California's 2030 GHG emission reduction target enacted through SB 32, adding new crediting opportunities to promote zero emission vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector.

Advanced Clean Cars Program. In 2012, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model year 2017 through 2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles. By 2025, when the rules will be fully implemented, the new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

Senate Bill 743 (SB 743). SB 743, adopted September 27, 2013, encourages land use and transportation planning decisions and investments that reduce vehicle miles traveled (VMT), which contribute to GHG emissions, as required by AB 32. Key provisions of SB 743 include reforming aesthetics and parking CEQA analysis for certain urban infill projects and eliminating the measurement of auto delay, including Level of Service (LOS), as a metric that can be used for measuring traffic impacts in transit priority areas. SB 743 requires the Governor's Office of Planning and Research (OPR) to develop revisions to the *CEQA Guidelines* establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the "…reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses." It also allows OPR to develop alternative metrics outside of transit priority areas. In December 2018, the Natural Resources Agency updated the *CEQA Guidelines* and provided guidance for implementing SB 743.

California Integrated Waste Management Act (AB 341). The California Integrated Waste Management Act of 1989, as modified by AB 341, requires each jurisdiction's source reduction and recycling element to include an implementation schedule that shows: diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities; diversion of 50 percent of all solid waste on and after January 1, 2000; and diversion of 75 percent of all solid waste by 2020, and annually thereafter.

---

76 CARB, *Initial Statement of Reasons for Proposed Regulation for the Management of High Global Warming Potential Refrigerants for Stationary Sources*, 2009.

California Appliance Efficiency Regulations. The Appliance Efficiency Regulations (Title 20, Sections 1601 through 1608), adopted by the CEC, include standards for new appliances (e.g., refrigerators) and lighting, if they are sold or offered for sale in California. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

California Green Building Code (California Code of Regulations Title 24). Although not originally aimed at reducing GHG emissions, CCR Title 24 Part 6: *California's Energy Efficiency Standards for Residential and Nonresidential Buildings* (Title 24), was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. Since then, Title 24 has been amended to recognize that energy-efficient buildings require less electricity and reduce fuel consumption, which subsequently reduces GHG emissions. The current 2019 Title 24 standards were adopted, among other reasons, to respond to the requirements of AB 32. Specifically, new development projects constructed within California after January 1, 2019 are subject to the mandatory planning and design, energy efficiency, water efficiency and conservation, material conservation and resources efficiency, and environmental quality measures of the California Green Building Standards (CalGreen) Code (CCR Title 24, Part 11). Title 24 standards are updated triennially; the next update is scheduled to be adopted in 2022 and will take effect on January 1, 2023.

CEQA Guidelines. In August 2007, the California State Legislature adopted Senate Bill 97 (SB 97) (Chapter 185, Statutes of 2007), requiring the Governor's Office of Planning and Research (OPR) to prepare and transmit new *CEQA Guidelines* for the mitigation of GHG emissions or the effects of GHG emissions to the Resources Agency by July 1, 2009. In response to SB 97, the OPR adopted *CEQA Guidelines* that became effective on March 18, 2010.

However, neither a threshold of significance nor any specific mitigation measures are included or provided in the guidelines.[77] The guidelines require a lead agency to make a good-faith effort, based on the extent possible on scientific and factual data, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. Discretion is given to the lead agency whether to: (1) use a model or methodology to quantify GHG emissions resulting from a project, and which model or methodology to use; or (2) rely on a qualitative analysis or performance-based standards. Furthermore, three factors are identified that should be considered in the evaluation of the significance of GHG emissions:

---

77 See 14 Cal. Code Regs. §§ 15064.7 (generally giving discretion to lead agencies to develop and publish thresholds of significance for use in the determination of the significance of environmental effects), 15064.4 (giving discretion to lead agencies to determine the significance of impacts from GHGs).

1. The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.[78]

The administrative record for the Guidelines Amendments also clarifies "that the effects of greenhouse gas emissions are cumulative and should be analyzed in the context of California Environmental Quality Act's requirements for cumulative impact analysis."[79]

Senate Bill 1 (SB 1) and Senate Bill 1017 (SB 1017) (Million Solar Roofs). SB 1 and SB 1017, enacted in August 2006, set a goal to install 3,000 megawatts of new solar capacity by 2017 – with a stated intent to move the state toward a cleaner energy future and help lower the cost of solar systems for consumers. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to $3.3 billion in financial incentives that decline over time.

GHG Emissions Standards for Baseload Generation. SB 1368, which was signed into law on September 29, 2006, prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. This performance standard (i.e., reducing long-term GHG emissions as a result of electrical baseload generation) applies to electricity generated both within and outside of California, and to publicly owned, as well as investor-owned, electric utilities.

Senate Bill 350 (SB 350). Adopted on October 7, 2015, SB 350 supports the reduction of GHG emissions from the electricity sector through a number of measures, including requiring electricity providers to achieve a 50 percent renewable portfolio standard by 2030, a cumulative doubling of statewide energy efficiency savings in electricity and natural gas by retail customers by 2030.

California Green Building Standards Code (CalGreen Code) (California Code of Regulations [CCR], Title 24). Although not originally aimed at reducing GHG emissions, CCR Title 24 Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24), was first adopted in

78 14 Cal. Code Regs. § 15064.4(b).

79 Letter from Cynthia Bryant, Director of the Governor's Office of Planning and Research to Mike Chrisman, California Secretary for Natural Resources, dated April 13, 2009.

1978 in response to a legislative mandate to reduce California's energy consumption. Since then, Title 24 has been amended to recognize that energy-efficient buildings require less electricity and reduce fuel consumption, which subsequently decreases GHG emissions. The current 2016 Title 24 standards were adopted, among other reasons, to respond to the requirements of AB 32. The goals of the Title 24 standards include achieving a 20 percent reduction of indoor water use and a 50 percent reduction of construction waste. Specifically, new development projects constructed within California after January 1, 2017, are subject to the mandatory planning and design, energy efficiency, water efficiency and conservation, material conservation and resources efficiency, and environmental quality measures of the CalGreen Code (CCR, Title 24, Part 11). The outdoor water use standards of the CalGreen Code, which requires a 20 percent reduction in indoor water use, are already addressed by the City's Water Conservation Ordinance.

Regional

SCAG Regional Transportation Plan/Sustainable Communities Strategy. To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (2020–2045 RTP/SCS) in October 2020. The vision for the region incorporates a range of best practices for increasing transportation choices, reducing dependence on personal automobiles, further improving air quality, and encouraging growth in walkable, mixed-use communities with ready access to transit infrastructure and employment. More and varied housing types and employment opportunities would be located in and near job centers, transit stations and walkable neighborhoods where goods and services are easily accessible via shorter trips. To support shorter trips, people would have the choice of using neighborhood bike networks, car share or micro-mobility services like shared bicycles or scooters. For longer commutes, people would have expanded regional transit services and more employer incentives to carpool or vanpool. Other longer trips would be supported by on-demand services such as micro transit, carshare, and citywide partnerships with ride hailing services. For those that choose to drive, hotspots of congestion would be less difficult to navigate due to cordon pricing and using an electric vehicle will be easier thanks to an expanded regional charging network.

The 2020–2045 RTP/SCS states that the SCAG region was home to about 18.8 million people in 2016 and currently includes approximately 6.0 million homes and 8.4 million jobs.[80] By 2045, the integrated growth forecast projects that these figures will increase by 3.7 million people, with nearly 1.6 million more homes and 1.6 million more jobs. Transit Priority Areas[81] (TPAs) will account for less than 1 percent of regional

80 2020–2045 RTP/SCS population growth forecast methodology includes data for years 2010, 2010, 2016, and 2045.

81 Defined by the 2020–2045 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a major transit stop (rail or bus rapid transit station) with 15-minute or less service frequency during peak commute hours

total land but are projected to accommodate 30 percent of future household growth between 2016 and 2045. The 2020–2045 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in the region's TPAs. TPAs are a cornerstone of land use planning best practice in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.[82] Due to fuel economy and efficiency improvements, GHG emission rates of model year 2017 vehicles have decreased by 15 to 20 percent when compared to model year 2008 and earlier vehicles. However, for purposes of SB 375 emissions reduction targets, the fuel economy improvements have been largely excluded from the reduction calculation. The SB 375 target focuses on the amount of vehicle travel per capita. As discussed above, OPR recommended that achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals (i.e., SB 375 goal). The reductions generated by fuel economy improvements are already included as part of the State's GHG emissions reduction program and are not double counted in the SB 375 target calculation.

South Coast Air Quality Management District CEQA Guidance. The City of Los Angeles is located in the South Coast Air Basin (Air Basin), which consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties, in addition to the San Gorgonio Pass area in Riverside County. The South Coast Air Quality Management District (SCAQMD) is responsible for air quality planning in the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished through air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.[83] A GHG Significance Threshold Working Group was formed to further evaluate potential GHG significance

82 SCAG, *Final 2020–2045 RTP/SCS, Chapter 0: Making Connections*, p. 5, May 7, 2020.

83 SCAQMD, Board Meeting, December 5, 2008, Agenda No. 31, http://www3.aqmd.gov/hb/2008/December/081231a.htm. Accessed May 5, 2022.

thresholds.[84] The SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 $MTCO_2e$ per year. Under this proposal, commercial/residential projects that emit fewer than 3,000 $MTCO_2e$ per year would be assumed to have a less than significant impact on climate change. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold of 10,000 $MTCO_2e$ per year for stationary source/industrial projects where the SCAQMD is the lead agency. However, the SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects). The Working Group has been inactive since 2011, and SCAQMD has not formally adopted any GHG significance threshold for other jurisdictions.

Local

Los Angeles Green New Deal. The City of Los Angeles addressed the issue of global climate change in Green LA, An Action Plan to Lead the Nation in Fighting Global Warming ("LA Green Plan/ClimateLA") in 2007. This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities.

In April 2019, the Green New Deal (Sustainable City Plan 2019), was released, consisting of a program of actions designed to create sustainability-based performance targets through 2050 designed to advance economic, environmental, and equity objectives.[85] L.A.'s Green New Deal is the first four-year update to the City's first Sustainable City pLAn that was released in 2015.[86] It augments, expands, and elaborates L.A.'s vision for a sustainable future and tackles the climate emergency with accelerated targets and new aggressive goals.

While not a plan adopted solely to reduce GHG emissions, within the Green New Deal, "Climate Mitigation," or reduction of GHG is one of eight explicit benefits that help define its strategies and goals. These include reducing GHG emissions through near-term outcomes:

- Reduce potable water use per capita by 22.5 percent by 2025; 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.

- Reduce building energy use per square feet for all building types 22 percent by 2025; 34 percent by 2035; and 44 percent by 2050 (from a baseline of 68 mBTU/sq.ft in 2015).

---

84 SCAQMD, *Greenhouse Gases CEQA Significance Thresholds*, http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds. Accessed May 5, 2022.

85 City of Los Angeles. LA's Green New Deal, 2019.

86 City of Los Angeles, Sustainable City pLAn, April 2015.

- All new buildings will be net zero carbon by 2030 and 100 percent of buildings will be net zero carbon by 2050.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; and 75 percent by 2035.
- Increase the percentage of all trips made by walking, biking, micro-mobility/matched rides, or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.
- Reduce VMT per capita by at least 13 percent by 2025; 39 percent by 2035; and 45 percent by 2050.
- Increase the percentage of electric and zero emission vehicles in the city to 25 percent by 2025; 80 percent by 2035; and 100 percent by 2050.
- Increase landfill diversion rate to 90 percent by 2025; 95 percent by 2035 and 100 percent by 2050.
- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 lbs. of waste generated per capita per day in 2011).
- Eliminate organic waste going to landfill by 2028.
- Reduce urban/rural temperature differential by at least 1.7 degrees by 2025; and 3 degrees by 2035.
- Ensure the proportion of Angelenos living within 1/2 mile of a park or open space is at least 65 percent by 2025; 75 percent by 2035; and 100 percent by 2050.

City of Los Angeles Green Building Code. On December 11, 2019, the Los Angeles City Council approved Ordinance No. 186,488, which amended Chapter IX of the Los Angeles Municipal Code (LAMC), referred to as the Los Angeles Green Building Code, by adding a new Article 9 to incorporate various provisions of the 2019 CALGreen Code. Projects filed on or after January 1, 2020, must comply with the provisions of the Los Angeles Green Building Code. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) nonresidential and high-rise residential buildings; and (3) additions and alterations to nonresidential and high-rise residential buildings. Article 9, Division 5 includes mandatory measures for newly constructed nonresidential and high-rise residential buildings.

City of Los Angeles General Plan

Air Quality Element

The City does not have a General Plan Element specific to climate change and GHG emissions. However, the following five goals from the City's General Plan Air Quality Element would also lead to GHG emission reductions:[87]

- Less reliance on single-occupancy vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimal impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels, and the implement of conservation measures, including passive measures, such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution.

Safety Element

The updated Safety Element, adopted by the City Council on November 24, 2021, includes an objective and policies to address climate change, including air quality. These are shown in **Table 4.7-5**.

87 City of Los Angeles, Air Quality Element, June 1991, pages IV-1 to IV-4.

Table 4.7-5
Safety Elements

Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Policy 1.2.1	Environmental Justice. In keeping with the Plan for a Healthy LA, build a fair, just and prosperous city where everyone experiences the benefits of a sustainable future by correcting the long running disproportionate impact of environmental burdens faced by low income families and communities of color.
Policy 1.2.2	Renewable Energy. Aggressively pursue renewable energy sources, transitioning away from fossil based sources of energy and toward 100% renewable energy sources.
Policy 1.2.4	Clean and Healthy Buildings. Design, build and rebuild buildings using passive energy principals, advanced efficiency measures, and on-site renewable energy.
Policy 1.2.5	Housing and Development. In keeping with the Housing Element, put affordable housing within reach of every family and a roof over the head of every Angeleno by developing housing that is affordable, efficient and connected to transportation options.
Policy 1.2.6	Mobility. In keeping with the Mobility Plan, build a comprehensive and integrated transportation network that changes how Angelenos get around and reduces car dependency.
Policy 1.2.7	Zero Emissions Vehicles. In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increases zero emissions infrastructure including charging.
Policy 1.2.9	Waste and Resource Recovery. Harvest waste as a resource, stimulate economic innovation, and create green jobs by improving and expanding existing systems of trash and recycling.
Policy 1.2.12	Prosperity and Green Jobs. Leverage investments in green infrastructure and systems to create inclusive economic opportunities for the city's workforce.
Policy 1.2.13	Lead by Example. Leverage government owned properties and publicly-driven investments to realize broader climate change goals.

Source: City of Los Angeles, Safety Element, 2021.

Mobility Plan 2035. Mobility Plan 2035, updated in September 2016, serves as the Mobility Element of the General Plan. Mobility Plan 2035 establishes new street designations, classifies each of the City's arterial streets and incorporates a "complete street" policy framework (i.e., the idea that transportation facilities should be designed for all types of users, including pedestrians, cyclists, and trucks, as well as passenger vehicles), thus providing a foundation for future policies and principles promoting residents' interaction with their streets. Discussed in detail in **Section 4.10, Land Use and Planning,** Mobility Plan 2035 also promotes equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.

Existing Buildings Energy and Water Efficiency (EBEWE) Ordinance. Effective in 2017, the EBEWE Ordinance makes public the annual energy and water consumption of all buildings over 20,000 square feet in the City. Beginning in 2017, privately owned buildings that are 20,000 square feet or more and buildings owned by the City that are 7,500 or more are required to be benchmarked, and owners must disclose annual energy and water consumption. Privately owned buildings that are 100,000 square feet or more must begin benchmarking reporting by December 1, 2017, and smaller buildings must begin reporting over the following two years. This Ordinance is designed to facilitate the comparison of buildings' energy and water consumption, and reduce building operating costs, leading to reduced GHG emissions.

Sustainable City pLAn (pLAn). In addition to GreenLA, Mayor Eric Garcetti released Los Angeles's first-ever Sustainable City pLAn on April 8, 2015.[88] The Sustainable City pLAn is a roadmap to achieving short-term results and sets a path to strengthen and transform the City in future decades. Actionable goals include increasing the green building standard for new construction, creating a benchmarking policy for building energy use, developing "blue, green, and black" waste bin infrastructure, reducing water use by 20 percent, and possibly requiring LEED Silver or better certification for new construction.[89] In 2019, the Sustainable City pLAn was updated with new goals, targets, and actions through adoption of L.A.'s Green New Deal as discussed in greater detail below.

City of Los Angeles Green Building Program. The purpose of the City's Green Building Program is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional, and global ecosystems. The program consists of a Standard of Sustainability and Standard of Sustainable Excellence. The program addresses five key areas:

- Site: location, site planning, landscaping, storm water management, construction and demolition recycling;
- Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation;
- Energy & Atmosphere: energy efficiency, and clean/renewable energy;
- Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and

88 City of Los Angeles, *Los Angeles Sustainable City pLAn*, April 2015. Available at: https://plan.lamayor.org/background/background_plan.html. Accessed November 2021.

89 *Ibid*.

- Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control.

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the United States Green Building Council's Leadership in Energy and Environmental Design (LEED) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50 percent of the existing building's replacement cost.

The voluntary Standard of Sustainable Excellence establishes an incentive program for projects that register with the LEED program, contract with a certified LEED professional, and can demonstrate how the project will achieve LEED certification at a Silver or higher level. These projects are eligible for priority processing services within the Department of City Planning and expedited services within the Bureau of Engineering. The Department of Building and Safety.

City of Los Angeles Solid Waste Programs and Ordinances. The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced as well as disposal energy averted. In 1989, California enacted AB 939, the California Integrated Waste Management Act, which establishes a hierarchy for waste management practices such as source reduction, recycling, and environmentally safe land disposal.

The City has developed and is in the process of implementing the Solid Waste Integrated Resources Plan, also referred to as the Zero Waste Plan, whose goal is to lead the City towards being a "zero waste" City by 2030. These waste reduction plans, policies, and regulations, along with Mayoral and City Council directives, have increased the level of waste diversion for the City to 76 percent as of 2013. The RENEW LA Plan, aims to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources not going to disposal and achieving a diversion rate of 90 percent or more by 2025. The City has also approved the Waste Hauler Permit Program (Ordinance No. 181,519, LAMC Chapter VI, Article 6, Section 66.32-66.32.5), which requires private waste haulers to obtain AB 939 Compliance Permits to transport construction and demolition waste to City-certified construction and demolition waste processors. The City's Exclusive Franchise System Ordinance (Ordinance No. 182,986), among other requirements, sets a maximum annual disposal level and diversion requirements for franchised waste haulers to promote waste diversion from landfills and support the City's zero waste goals. These programs reduce the number of

trips to haul solid waste and therefore reduce the amount of petroleum-based fuels and energy used to process solid waste.

4.7.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *CEQA Guidelines*, the Proposed Plan would have a significant impact related to GHG emissions if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; and/or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions.

To answer the Appendix G questions above for the Proposed Plan, the City of Los Angeles will rely on the following threshold of significance to assess the environmental impacts associated with GHG emissions for the Proposed Plan:

- Consistency with AB 32, SB 32 (and Executive Order B-30-15 through demonstration of conformance with 2017 Scoping Plan), SB 375 (through demonstration of conformance with Connect SoCal 2020-2045 RTP/SCS), the Sustainable City pLAn, and GreenLA.

The basis for the project specific threshold is provided as follows. The City has not adopted specific GHG significance thresholds. SCAQMD has not adopted a GHG significance threshold for land use development projects, although it has adopted significance thresholds for industrial-type projects for which it is the lead agency under CEQA.[90] Those industrial thresholds are not relevant to the Proposed Plan, as the only projects for which the SCAQMD serves as the lead agency are those involving the adoption of air quality rules or regulations, or projects that have not gone through CEQA environmental review via another lead agency. No such projects would occur under implementation of the Proposed Plan. In the absence of adopted thresholds for land use development projects based on SCAQMD guidance, the City has the discretion to use a significance threshold relevant to the Proposed Plan.

On November 30, 2015, the California Supreme Court issued an opinion on GHG significance thresholds for CEQA in the case Center for Biological Diversity et al. vs. California Department of Fish and Wildlife. The following discussion is paraphrased from that case, which assessed the use of GHG significance thresholds.

---

90 SCAQMD, *SCAQMD Air Quality Significance Thresholds*, 2019.

The Court stated that California air pollution control officials and air quality districts have made several proposals for numerical thresholds. Multiple agencies' efforts at framing GHG significance issues have not yet coalesced into any widely accepted set of numerical thresholds but have produced a certain level of consensus on the value of AB 32 consistency as a criterion. Neither AB 32 nor the CARB Scoping Plan set out a mandate or method for CEQA analysis of GHG emissions from a proposed project. A 2007 CEQA amendment, however, required the preparation, adoption, and periodic update of guidelines for mitigation of GHG impacts. The resulting state direction was that a lead agency should attempt to describe, calculate, or estimate the amount of GHG emissions a project will emit, but recognized that agencies have discretion in how to do so. It goes on to provide that when assessing the significance of GHG emissions, the agency should consider these factors among others:

(1) the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;

(2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and,

(3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

The Court also acknowledged that the scope of global climate change and the fact that GHGs, once released into the atmosphere, are not contained in the local area of their emission means that the impacts to be evaluated are global rather than local. For many air pollutants, the significance of their environmental impact may depend greatly on where they are emitted; for GHG, it does not. For projects that are designed to accommodate long-term growth in California's population and economic activity in a sustainable manner, such as the Proposed Plan, this fact gives rise to an argument that a certain amount of GHG emissions is as inevitable as population growth. Under this view, a significance criterion framed in terms of efficiency and conservation in land use (as compared to a business-as-usual [BAU] pattern of growth) is superior to a simple numerical threshold because CEQA is not intended as a population control measure.

This consideration favors consistency with AB 32's statewide goals as a permissible significance criterion for project GHG emissions. Meeting statewide reduction goals does not preclude all new development. Rather, the Scoping Plan, the State's roadmap for meeting AB 32's target, assumes continued growth and

depends on increased efficiency and conservation in land use and transportation from all Californians. To the extent a project incorporates efficiency and conservation measures sufficient to contribute its portion of the overall GHG reductions necessary for the entire State, one can reasonably argue that its impact is not cumulatively considerable, because it would be helping to solve the cumulative problem of GHG emissions as envisioned by California law. Given the reality of growth, some GHG emissions from new housing and commercial developments are inevitable. The critical CEQA question is the cumulative significance of a project's GHG emissions and, as discussed previously, from a climate change point of view it does not matter where in the State those emissions are produced. Under these circumstances, evaluating the significance of a project's GHG emissions with respect to their effect on the State's efforts to meet its long-term goals is a reasonable threshold.

The Supreme Court in Center for Biological Diversity recognized potential options for analyzing cumulative significance of a project's GHG emissions, including:

- Business-as-usual (BAU) Model. BAU comparison based on the Scoping Plan methodology if supported by substantial evidence that the metric used identifies what level of reduction from business as usual a new land use development at the proposed location must contribute to comply with state goals.

- Consistency with GHG Regulations or Requirements. 1) Consistency with AB 32's goal in whole or in part by looking at compliance with regulatory programs designed to reduce GHG, provided the project complies with or exceeds the regulations that were adopted by CARB or other state agencies to comply with the Scoping Plan, and provided the significance analysis only relates to impacts within the area governed by the regulation (e.g., reliance on Title 24 energy efficiency rules that are intended to reduce GHG from buildings would not address GHG impacts from transportation); and/or 2) consistency with local GHG reduction plans (e.g., a climate action plan) to provide a basis for the tiering or streamlining of project-level CEQA analysis, including as consistent with *CEQA Guidelines* Section 15183.3.

- Relying on numerical thresholds for significance for GHG.

CEQA Guidelines Section 15064.4 was amended in 2019 to incorporate the holding in Center for Biological Diversity case as well as others. That section now directs lead agencies as follows:

> *Section 15064.4. Determining the Significance of Impacts from Greenhouse Gas Emissions.*
>
> *(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency shall make a good- faith effort, based to the extent possible on scientific and factual data, to describe, calculate*

or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

(1) Quantify greenhouse gas emissions resulting from a project; and/or

(2) Rely on a qualitative analysis or performance based standards.

(b) In determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. A lead agency should consider the following factors, among others, when determining the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

(c) A lead agency may use a model or methodology to estimate greenhouse gas emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Based on the above legal standards, the City finds analyzing the Proposed Plan's GHG emissions through consistency with the state's laws and programs to address climate change (including AB 32, SB 32, SB 375), regional plans to address climate change consistent with state laws and plans (including the 2020-2045 SCS/RTP), and local plans, ordinances and policies to address climate change (including GreenLA and the

Sustainable City pLAn) is the appropriate threshold. Calculating and analyzing per-capita GHG emissions, while not a threshold of significance, is a useful indicator as to whether regional GHG impacts are consistent with AB 32 and SB 32. Per-capita GHG emissions reflect on average GHG emissions taking into account population density. As part of its strategy for meeting the 2030 GHG emissions target codified in SB 32, CARB promulgated a community-wide annual goal of 6 metric tons of carbon dioxide equivalent ($MTCO_2e$) per capita by 2030 and 2 $MTCO_2e$ per capita by 2050 to be implemented through a future statewide Climate Action Plan.

In accordance with the objectives and requirements of SB 375, the 2020–2045 RTP/SCS assessed regional per-capita GHG emissions from passenger and light duty vehicles. As noted above, CARB established SB 375 targets for passenger vehicles in the SCAG region compared to 2005 emissions: 1) an eight percent reduction in emissions by 2020 and 2) a 19 percent reduction in emissions by 2035. The 2020-2045 RTP/SCS indicates that the SCAG region will achieve a 19 percent reduction in per-capita passenger vehicle GHG emissions by 2035. With that said, there is no adopted City or CARB per-capita GHG emission target or other numerical criteria adopted as a threshold of significance that would be applicable to the Proposed Plan. Using consistency with AB 32's statewide goal for GHG reduction, among the other regulations, standards and policies, rather than a numerical threshold, as a significance criterion is consistent with the broad guidance provided by Section 15064.4 of the *CEQA Guidelines*. Section 15064.4, to reflect that there is no iron-clad definition of significance. Section 15064.4 was not intended to restrict agency discretion in choosing a method for assessing GHG emissions, but rather to assist lead agencies in investigating and disclosing all that they reasonably can, regarding a project's GHG emissions impact.

4.7.5 METHODOLOGY

GHG emissions result from both direct and indirect sources. Direct emissions include emissions from fuel combustion in vehicles and natural gas combustion from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity and water consumption and solid waste. In addition, construction activities would result in direct and indirect emissions. As GHGs are evaluated on a regional basis, the following analysis addresses the Community Plan Area (CPA) as it pertains to the region. Mobile source emissions were estimated using CPA VMT data presented in **Table 4.7-6** and aggregate fleet average emission rates from CARB's EMFAC2021 model for Los Angeles County vehicles for the years 2016 and 2040. The CARB EMFAC model was used to produce emission rates for non-trucks (light and medium duty autos and light duty trucks) and trucks in grams of pollutant emitted per VMT (g/mi) corresponding to the upper bounds of the speed ranges displayed in **Table 4.7-6** (i.e., 5, 10, and 15 mph).

Table 4.7-6
Daily Vehicle Miles Traveled

Speed Range (Miles per Hour)	Existing Conditions (2016)	Future No Project (2040)	Proposed Plan (2040)
0-5	630.7	490.7	1,313.4
5-10	48,711.4	48,118.7	53,984.5

Source: Cambridge Systematics, 2019.

Area source emissions related to existing and future demand for water, wastewater treatment and conveyance, solid waste disposal, and energy were estimated using the calculation methodologies developed for the California Emissions Estimator Model (CalEEMod). Water and wastewater calculations relied on City-specific demand and generation rates from the LADWP Urban Water Management Plan. GHG emissions result from the energy use to supply, distribute, and treat water and wastewater, as well as from solid waste disposal by landfilling, recycling, or composting (as CH_4 and CO_2 gas are emitted in the process). Refer to **Section 4.16, Utilities and Service Systems**, for a detailed estimate of utility use and **Section 4.4, Energy**, for a detailed estimate of energy consumption.

Energy emissions estimates take into account California's Renewable Portfolio Standard (RPS) requiring retail sellers of electric services to increase procurement from eligible renewable energy resources to 60 percent by 2030 per SB 100. CalEEMod currently uses a carbon intensity factor for LADWP from reporting year 2007 and does not take into account utility compliance with RPS standards over time. As of 2010, LADWP achieved its RPS goal of 20 percent of retail sales generated by carbon neutral sources and in 2017 LADWP achieved its RPS goal of 25 percent. By the end of 2016, LADWP's RPS contribution was

approximately 29 percent according to its Power Content Label submitted to the CEC,[91] and the delivered electricity to consumers was generated with a carbon intensity factor of 834 pounds of CO_2 per MWh ($lbCO_2/MWh$).[92] With the contribution of renewable resources anticipated to rise from 29 percent under existing conditions to at least 60 percent by 2040, the carbon intensity factor for LADWP supplied electricity was assumed to decrease by half to 417 $lbCO_2/MWh$ in the future analysis scenarios with and without the Proposed Plan. The energy emissions estimates take into account these expected carbon intensity factors for existing emissions and future emissions forecast for 2040 with and without the Proposed Plan.

It is anticipated that future conservation (as a result of increased pressure to conserve and increased prices) will result in more efficient energy use by all sectors resulting in reduced energy demand. As energy providers and water suppliers respond to AB 32 and the Scoping Plan, emission rates associated with power and water delivery are anticipated to decrease. It is anticipated that the state and region will comply with AB 32 and SB 32, but at the present time sector-specific improvements, beyond those associated with RPS identified above, cannot be quantified for this analysis.

GHG emissions would also be generated by construction activity through exhaust from off-road equipment and on-road vehicles that consume fuel. No specific development projects have been proposed as part of the Proposed Plan, and an annualized quantification of the incremental increase in construction emissions resulting from implementation of the Proposed Plan would be speculative. Quantification of short-term construction related GHG emissions is generally based on the size of each individual project, the equipment inventory, and the construction schedule. Such detailed information is not available for development within the CPA over a 20-year horizon, and it is not practicable to attempt to estimate the incremental changes in annual construction-related GHG emissions within the CPA throughout the 20-year horizon that would result from implementation of the Proposed Plan. GHG emissions would be generated by construction of each individual project; such emissions are temporary on each site -- lasting only for the duration of construction activities on each site. Within the CPA construction is one sector of the economy and is an on-going source of emissions. Construction-related GHG emissions represent a fraction of total regional emissions when considering the emissions generated by mobile, building energy, and other sources. Implementation of the Proposed Plan would have a negligible effect on annual average construction-related GHG emissions in the context of the regional and statewide inventories.[93] Therefore, construction emissions are addressed qualitatively.

---

91 LADWP, *2016 Power Content Label*, July 2017.

92 LADWP, *2017 Power Strategic Long-Term Resource Plan*, December 2017.

93 SCAG's Connect SoCal Program EIR states that construction related emissions account for less than 0.3 percent of total annual emissions within the SCAG region.

4.7.6 IMPACTS

Threshold 4.7-1 **Whether the Proposed Plan is consistent with AB 32, SB 32 (and Executive Order B-30-15 through demonstration of conformance with 2017 Scoping Plan), SB 375 (through demonstration of conformance with Connect SoCal 2020-2045 RTP/SCS), the Sustainable City pLAn, and GreenLA?**

This impact would be less than significant.

GHG Emissions Generation

Reasonably anticipated development from the Proposed Plan would generate GHG emissions through individual project construction and operation during the twenty year planning horizon of the Proposed Plan. GHG emissions would specifically arise from direct sources such as motor vehicles, natural gas consumption, solid waste handling/treatment, and indirect sources such as electricity generation. **Table 4.7-7** compares current annual GHG emissions for the CPA to 2040 emissions with and without the Proposed Plan. Mobile source emissions are presented for the CPA based on existing conditions in 2016 and reasonably anticipated development with and without (i.e., No Project) the Proposed Plan in 2040. The emissions estimates include some codified requirements (such as Pavley regulations and RPS) but do not account for anticipated laws (such as increasingly stringent Title 24 standards, refinery regulations, and the Cap-and-Trade program) that will further reduce future GHG emissions.

Based on the 2040 reasonably anticipated development under the Proposed Plan, total annual GHG emissions generated in the CPA and by regional vehicle travel would be greater than existing emissions by approximately 81,361.4 $MTCO_2e$. This represents an increase in total GHG emissions of about 13 percent as compared to existing conditions, whereas the population of the CPA is projected to grow by approximately 34 percent and the employment within the CPA is projected to grow by approximately 50 percent. Consequently, despite the overall increase in GHG emissions generated in the CPA, per capita GHG emissions would decrease by approximately 15 percent (from 7.4 $MTCO_2e$ per capita to 6.3 $MTCO_2e$ per capita) within the CPA due to a combination of state mandated GHG emission reduction strategies and the Proposed Plan's influence on concentrating new development near multimodal transit hubs and neighborhood design to shorten vehicle trips due to the location of jobs and housing in close proximity to each other and creation of substantial opportunities to use such transportation modes as transit, bicycling, and walking. Importantly, emissions modeling for the Proposed Plan in 2040 does not account for commitments established in L.A.'s Green New Deal to reduce citywide average building energy use per square foot for all building types by 22 percent by 2025 and 34 percent by 2035. If these targets are met, building energy emissions estimates for 2040 could decrease by over one third of emissions presented in

Table 4.7-7. Implementation of the Proposed Plan would direct growth within a future TPA, which is the top priority development area according to the Connect SoCal Plan.

Table 4.7-7
Operational Greenhouse Gas Emissions

Source Category	Annual GHG Emissions ($MTCO_2e$)		
	Existing (2016)	**Future No Project (2040)**	**Proposed Plan (2040)**
On-Road Vehicles[1]	403,410.0	320,103.5	323,457.4
Area Sources	574.7	712.0	836.9
Building Energy[2]	192,873.5	290,920.7	310,450.3
Waste Disposal	30,828.9	69,326.0	78,923.4
Water Resources	14,963.3	8,901.2	10,343.7
Total	**642,650.3**	**689,963.5**	**724,011.7**
	Change from Existing (2016)	***47,313.2***	***81,361.4***
Residential Population	86,504	98,005	115,248
Annual per Capita GHG Emissions ($MTCO_2e$/Resident)[3]	**7.4**	**7.0**	**6.3**
Service Population	112,748	129,979	154,423
Annual per Capita GHG Emissions ($MTCO_2e$/Service Population)	**5.7**	**5.3**	**4.7**

Source: TAHA, 2021; Impact Sciences, 2021.
[1] Accounts for vehicle trips with origins and/or destinations within the CPA under each scenario; daily VMT is multiplied by a factor of 347 to estimate annual VMT in accordance with CARB GHG emissions inventory preparation methodologies.
[2] Energy source emissions account for SB 100 requiring electricity providers to meet 60 percent supply from eligible renewables by 2030.
[3] SB 375 and the 2020 RTP/SCS address per capita emissions not emissions per service population; the Boyle Heights CPA has a relatively high job-base and therefore this CPA may have higher per capita GHG emissions compared to a CPA with more residents and fewer jobs. For this reason, emissions per Service Population (residents plus employment within the CPA) are also provided in the table. The City's VMT thresholds also utilize the service population metric; therefore, both per-resident and per-service population values are shown.

In accordance with transportation and land use planning requirements under SB 375 and associated regional GHG reduction targets, the GHG emissions assessment specifically analyzes per-capita GHG emissions from passenger vehicles and light duty trucks. The Connect SoCal Plan established a target of reducing per-capita GHG emissions from passenger vehicles by 19 percent within the SCAG region by 2045. Based on the CARB mobile source emissions inventory, passenger vehicles and light duty trucks comprised approximately 94.5 percent of regional VMT in 2016 and would comprise approximately 93.3 percent of regional VMT in 2040. **Table 4.7-8** presents an analysis of the annual CPA passenger vehicle and light duty truck VMT and corresponding GHG emissions for existing conditions and future 2040 conditions without and with the Proposed Plan. Under existing conditions, the CPA daily per capita GHG emissions from passenger vehicles are approximately 24.6 $lbCO_2$ per resident, which is marginally higher than the

SCAG estimated 2005 per capita CO_2 emission rate from cars and light-duty trucks of 23.8 $lbCO_2$ per capita.[94] With implementation of the Proposed Plan, per capita CO_2 emissions from cars and light-duty trucks would be approximately 14.9 $lbCO_2$ per CPA resident, which represents a 39 percent decrease relative to existing conditions and a 37 percent decrease relative to the SCAG 2005 per capita emissions level used to establish the SB 375 regional targets. Despite the increase in population from the existing condition to 2040 Proposed Plan conditions, per capita GHG emissions would decrease within the CPA due to a combination of state mandated GHG emission reduction strategies and the Proposed Plan's influence on concentrating new development near multimodal transit hubs and neighborhood design to shorten vehicle trips due to the location of jobs and housing in close proximity to each other and creation of substantial opportunities to use such transportation modes as transit, bicycling, and walking. The Proposed Plan transportation benefits are also shown in the comparison between Future No Project and Proposed Plan conditions, which also shows a decrease in per capita GHG emissions. Therefore, implementation of the Proposed Plan would achieve per capita reductions exceeding those established by CARB for the SCAG region and would be consistent with SB 375.

Table 4.7-8
Boyle Heights CPA SB 375 Passenger Vehicle Per Capita CO_2 Emissions

	Existing Conditions (2016)	Future No Project (2040)	Proposed Plan (2040)
Resident Population	86,504	98,005	115,248
Daily CO_2 Emissions (Pounds)[1]	2,127,500.3	1,698,199.1	1,720,588.5
Per Capita Emissions (Pounds)[2]	24.6	17.3	14.9
Percent Difference from 2005 SCAG Regional Per Capita Emissions Level[2]	+3%	-27%	-39%

Source: TAHA, 2021; SCAG, Draft PEIR 2016-2040 RTP/SCS, 2016.
[1] Transportation emissions in future analysis scenarios are based on GHG emission rates for passenger and light duty vehicles from EMFAC2021 that account for continued implementation of the Pavley standards.
[2] SB 375 and the 2020 RTP/SCS address per capita emissions not emissions per service population; the Boyle Heights CPA has a relatively high job-base and therefore this CPA may have higher per capita GHG emissions compared to a CPA with more residents and fewer jobs.
[3] SCAG estimates the per capita 2005 emissions from cars and light-duty trucks as 23.8 pounds CO_2 per person per day.

By guiding development near transit corridors and encouraging mixed land uses, the Proposed Plan creates an efficient strategy for reasonably anticipated development in the CPA, consistent with AB 32, SB 32 and the Connect SoCal Plan. Targeting concentrated growth in TPAs and HQTAs is a pillar of the land use and transportation strategies contained in the Connect SoCal Plan. The reduction in per capita emissions would

94 SCAG, *Draft Program Environmental Impact Report for the 2016–2040 RTP/SCS*, December 2015.

also contribute to meeting the statewide 2050 goal of two $MTCO_2e$ per capita. The per capita reduction in GHG emissions demonstrates compliance with regional, state, and federal efforts to reduce climate impacts from development and transportation. Finally, it should be recognized that although total GHG emissions in the CPA would incrementally increase due to the amount of growth anticipated in this area of the City, the anticipated growth for the CPA is within the overall growth projection for the City. Thus, the population growth and associated GHG emissions associated with implementation of the Proposed Plan would not add to overall citywide emissions, but rather would concentrate development in the CPA rather than in other parts of the City. Because of the proximity of jobs and housing and enhanced opportunities for transit use in the CPA, focusing growth in the CPA would reduce citywide and regionwide emissions as compared to accommodating more of the projected growth in other parts of the City and/or region.

To assess future GHG emission reductions resulting from a development project, the future condition is often compared to a BAU condition - typically the proposed development without the various GHG reduction measures. For land use plans, such as the Proposed Plan, BAU is much more difficult to determine and would be entirely speculative to quantify. While the future 2040 No Project conditions with the existing community plan identifies what is reasonably foreseeable to occur in the CPA if the Proposed Plan were not to proceed, it is not a complete picture of BAU for the region. The Proposed Plan is a planned response to forecast growth, so if growth does not occur in the CPA, it would foreseeably occur elsewhere in the City or SCAG region based on SCAG forecasts. The Proposed Plan combines sustainable strategies (e.g., proximity to transit, mixed-use, increased density) to respond to state, regional and local policies aimed at reducing GHG emissions. If development were to occur elsewhere in a less sustainable fashion (BAU), regional emissions would be greater. The existing zoning in the CPA (No Project) does not emphasize future development along corridors and nodes. As such, development under the No Project with the existing zoning would likely be less compact and transit focused. However, for land use plans such as the Proposed Plan, full quantification of BAU is not possible because, at this scale, it is not possible to anticipate where growth would go and how different it would be as compared to the project in terms of proximity to transit, mix of uses and density. Therefore, a comparison of the Proposed Plan emissions in the future to emissions under BAU is not possible.

Based on the plan-level analysis, the Proposed Plan would decrease per-capita emissions in the CPA compared to existing conditions and, therefore, considered in isolation, would contribute to reducing emissions in California below existing emissions and would contribute to AB 32 and SB 32 GHG reduction goals. The Proposed Plan is not occurring in isolation; it would be part of a regional strategy (contained in the RTP/SCS) to direct growth to urban areas in order to achieve the following:

- Undertake modern, efficient construction techniques that result in using less energy and less water as compared to less dense development;

- Create a mix of uses that encourages pedestrian and bicycle activity, reducing vehicle trips; and
- Develop areas in close proximity to transit in order to reduce vehicular trips.

The Proposed Plan would also be consistent with the City's Sustainable City pLAn by accommodating growth while providing transportation options. This strategy would result in lower per capita emissions than less dense growth and would contribute to the City reaching the 2025 Sustainable City pLAn reduction target of 45 percent.

Finally, it should be recognized that although total GHG emissions in the CPA would incrementally increase due to the relatively large amount of growth anticipated in this area of the City, the growth projection is within the overall growth projection for the City contained in the most recent RTP/SCS. Thus, the population and job growth and associated GHG emissions associated with implementation of the Proposed Plan would not add to overall citywide emissions but would concentrate development in the CPA rather than in other parts of the City. Because of the proximity of jobs and housing and enhanced opportunities for transit use in the CPA, it is anticipated that focusing growth in the CPA would reduce citywide emissions as compared to accommodating more of the projected growth in other parts of the City.

Consistency with State and Regional Plans, Policies, and Regulations

SCAG RTP/SCS. The State of California has adopted plans and policies designed to reduce regional and local GHG emissions. SB 375 requires that each MPO prepare an SCS in the RTP that demonstrates how the region will meet greenhouse gas emissions targets. SB 375 establishes a collaborative relationship between MPOs and CARB to establish GHG emissions targets for each region in the state. Under the guidance of the goals and objectives adopted by SCAG's Regional Council, the RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. The RTP/SCS represents the culmination of several years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations. Adoption of the 2020 RTP/SCS substantiated that the growth forecasts for the SCAG region, taking into account efforts to reduce climate change impacts from GHG emissions, were consistent with the goals of SB 375.

The primary goal of the SCS is to provide a vision for future growth in southern California that will decrease per capita GHG emissions from passenger vehicles. However, the strategies contained in the SCS will produce benefits for the region far beyond simply reducing GHG emissions. The SCS integrates the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375. The SCS focuses the majority

of new housing and job growth in high-quality transit areas and other opportunity areas on existing main streets, in downtowns, and on commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development.

The underlying purpose of the Proposed Plan is to plan for and accommodate foreseeable growth in the CPA, consistent with the growth strategies of the City as provided in the City's General Plan Framework Element, as well as the policies of SB 375 and the SCS. The Proposed Plan would allow for concentrated, mixed-use development adjacent to transit corridors within a TPA in order to conserve resources, protect existing residential neighborhoods, and improve air quality by reducing the reliance on cars. The 2020 RTP/SCS identifies growth within TPAs as a top priority strategy for implementing the Strategic Growth Vision. Focusing increased density in communities surrounding multimodal transit hubs is a fundamental component of SCAG's initiatives to improve transportation efficiency and shorten and displace on-road vehicle trips. The Proposed Plan is expected to contribute to reductions in per capita GHG emissions corresponding to CPA uses, as detailed above. As illustrated in **Table 4.7-8**, the Proposed Plan would contribute to reductions in per capita GHG emissions from passenger vehicles. As a result, and as elaborated in **Table 4.7-9**, the Proposed Plan would be consistent with SCS and SB 375 goals.

Table 4.7-9
Consistency Analysis of the Proposed Plan with the SCAG 2020 RTP/SCS

Goals	Consistency
Goal 2: Improve mobility, accessibility, reliability, and travel safety for people and goods.	**Consistent**. The Proposed Plan would increase development density in areas with future transportation infrastructure. The Proposed Plan would allow for infill development of additional residential units and job-producing uses located near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana stations as well as along major corridors. The proposed land use and zone changes would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and would facilitate the use of transit and non-motorized transportation. By increasing development density near the Metro L Line transit stations, the Proposed Plan would improve mobility and accessibility. The Proposed Plan does not include components that would influence travel safety or reliability.
Goal 5: Reduce greenhouse gas emissions and improve air quality.	**Consistent**. Daily per capita GHG emissions from light duty vehicles are estimated at 24.6 $lbCO_2$/resident in 2016 and 14.9 $lbCO_2$/resident in 2040 with implementation of the Proposed Plan. This change represents a 39 percent drop in per capita emissions, which can be attributed to a combination of state-mandated GHG emission reduction strategies and the fact that implementation of the Proposed Plan would lower per capita VMT due to the location of jobs and housing in close proximity to transit. Annual per capita GHG emissions from the Proposed Plan as a whole (which includes emissions

Goals	Consistency
	from on-road vehicles, area sources, building energy, waste disposal, and water resources) are estimated to reduce from 7.4 $MTCOE_2e$/resident in 2018 to 6.3 $MTCOE_2e$/resident in 2040, which equates to a 15 percent decrease in per capita emissions.
Goal 6: Support healthy and equitable communities.	**Consistent.** The Proposed Plan aims to improve compatibility between industrial land and residential neighborhoods, encourages new housing, particularly affordable housing, and employment near transit options. Another focus of the Proposed Plan is residential development that supports the diverse housing needs. This includes incentives for multi-unit projects that offer a range of housing unit types and sizes to varying family sizes, multi-generational households, single-room occupants, and independent seniors.
Goal 7: Adapt to a changing climate and support an integrated regional development pattern and transportation network.	**Consistent**. The Proposed Plan promotes commercial and multi-family residential development, including mixed-use development, in close proximity to transit stations and corridors in order to conserve resources and create more sustainable development pattern by encouraging transit ridership and walking as mobility alternatives to reduce automobile dependence.
Goal 9: Encourage development of diverse housing types in areas that are supported by multiple transportation options.	**Consistent**. The Proposed Plan would promote various types of multi-family residential units in areas near the Metro L Line stations.

Source: TAHA, 2021; SCAG, 2020–2045 RTP/SCS, 2020.

Executive Order S-03-05, AB 32 and AB 32 Scoping Plan and First Update. The Proposed Plan is consistent with the State's Executive Order S-3-05, which calls for strategies for the purpose of reducing GHG emissions. (Goals identified in this Executive Order were adopted in AB 32.) These strategies encourage the development of more efficient land-use patterns to match population increases, workforce, and socioeconomic needs for the full spectrum of the population. The type of compact, urban development along public transportation lines that would be developed with implementation of the Proposed Plan would be entirely consistent with policies in the 2017 Scoping Plan. The Proposed Plan promotes concentrated commercial and multi-family residential development, including mixed-use development, in close proximity to transit stations and corridors in order to conserve resources and create more sustainable development pattern by encouraging transit ridership and walking as mobility alternatives to reduce automobile dependence. Accordingly, the Proposed Plan is consistent with Executive Order S-3-05.

AB 32 (Cal. Health and Safety Code sections 35500 et seq.) calls for the reduction of GHG emissions to 1990 levels by the Year 2020. The AB 32 Scoping Plan and 2014 First Update provides the basis for policies that will reduce cumulative GHG emissions within California to 1990 levels by 2020. **Table 4.7-10** evaluates the Proposed Plan consistency with the AB 32 Scoping Plan and 2014 First Update to determine whether it

would result in adverse cumulative impacts to global climate change. The Proposed Plan is consistent with the focus of the Scoping Plan and 2014 First Update focus on emission reductions from several key sectors:

- Energy Sector: Continued improvements in California's appliance and building energy efficiency programs and initiatives, such as the state's zero net energy building goals, would serve to reduce the Project's emissions level.[95] Additionally, further additions to California's renewable resource portfolio would favorably influence the Project's emissions level.[96]

- Transportation Sector: Anticipated deployment of improved vehicle efficiency, zero emission technologies, lower carbon fuels, and improvement of existing transportation systems all will serve to reduce the Project's emissions level.[97]

- Water Sector: The Project's emissions level will be reduced as a result of further desired enhancements to water conservation technologies.[98]

- Waste Management Sector: Plans to further improve recycling, reuse and reduction of solid waste will beneficially reduce the Project's emissions level

Based on this evaluation, the Proposed Plan would be consistent with all feasible and applicable strategies recommended in the AB 32 Scoping Plan and First Update.

Table 4.7-10
Consistency with AB 32 Scoping Plan GHG Emissions Reduction Strategies

Objective	Proposed Plan Consistency
California Cap-and-Trade Program. Implement a broad-based California cap-and-trade program to provide a firm limit on emissions.	**Not Applicable**. The statewide program is not relevant to the Proposed Plan.
California Light-Duty Vehicle Greenhouse Gas Standards. Implement adopted Pavley standards and planned second phase of the system. Align zero-emission vehicle, alternative and renewable fuel and vehicle technology programs with long-term climate change goals.	**Not Applicable**. The development of standards is not relevant to the Proposed Plan.
Energy Efficiency. Maximize energy efficiency building and appliance standards and pursue additional efficiency efforts including new technologies, and new policy and mechanisms.	**Consistent**. Development under the Proposed Plan would be designed to meet Cal Green building standards by including several measures designed to reduce energy consumption.

95 CARB, *California's 2017 Climate Change Scoping Plan*, November 2017.

96 *Ibid*.

97 *Ibid*.

98 *Ibid*.

Objective	Proposed Plan Consistency
Pursue comparable investment in energy efficiency from all retail providers of electricity in California.	
Renewables Portfolio Standard. Achieve 33 renewable energy mix statewide by 2020.	**Consistent**. The Proposed Plan would utilize energy from the Los Angeles Department of Water and Power, which has goals to diversify its portfolio of energy sources to increase the use of renewable energy.
Low-Carbon Fuel Standard. Develop and adopt the Low Carbon Fuel Standard.	**Not Applicable**. The statewide program is not relevant to the Proposed Plan.
Regional Transportation-Related Greenhouse Gases. Develop regional greenhouse gas emissions reduction targets for passenger vehicles.	**Not Applicable**. The development of regional planning goals is not relevant to the Proposed Plan. The Proposed Plan would allow for infill development of additional residential units and job-producing uses located near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana stations as well as along major corridors. The proposed land use and zone changes would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and would facilitate the use of transit and non-motorized transportation. By increasing development density near the Metro L Line transit stations, the Proposed Plan would improve mobility and accessibility.
Vehicle Efficiency Measures. Implement light-duty vehicle efficiency measures.	**Not Applicable**. State agencies are responsible for implementing efficiency measures.
Goods Movement. Implement adopted regulations for the use of shore power for ships at berth. Improve efficiency in goods movement activities.	**Not Applicable**. State agencies are responsible for implementing regulations and promoting efficiency in goods movement.
Million Solar Roofs Program. Install 3,000 MW of solar-electric capacity under California's existing solar programs.	**Consistent**. Implementation of the Proposed Plan would not interfere with the planned expansion of local solar energy production and energy storage capacity. Redevelopment within the CPA resulting from the Proposed Plan would not obstruct LADWP local solar and energy storage projects. There are no existing or planned LADWP energy storage facilities within the CPA.
Medium/Heavy-Duty Vehicles. Adopt medium and heavy-duty vehicle efficiency measures.	**Not Applicable**. State agencies are responsible for implementing efficiency measures.
Industrial Emissions. Require assessment of large industrial sources to determine whether individual sources within a facility can cost-effectively reduce greenhouse gas emissions. Reduce greenhouse gas emissions from fugitive emissions from oil and gas extraction and gas transmission.	**Consistent**. While the Proposed Plan includes industrial zoning, the Plan does not include large industrial sources, such as power plants, that would generate excessive GHG emissions.
High Speed Rail. Support implementation of a high speed rail system.	**Not Applicable**. This calls for the California High Speed Rail Authority and stakeholders to develop a statewide rail transportation system.
Green Building Strategy. Expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings.	**Consistent**. The Proposed Plan is designed to meet Cal Green building standards and will include several measures designed to reduce energy consumption.
High Global Warming Potential Gases. Adopt measures to reduce high global warming potential gases.	**Not Applicable**. State agencies are responsible for implementing these measures.
Recycling and Waste. Reduce methane emissions at landfills. Increase waste diversion, composting and other beneficial uses of organic materials and mandate commercial recycling. Move toward zero waste.	**Consistent**. The Proposed Plan is expected to have minimal impact on solid waste facilities.

Objective	Proposed Plan Consistency
Sustainable Forests. Preserve forest sequestration and encourage the use of forest biomass for sustainable energy generation.	**Not Applicable**. Resource Agency departments are responsible for implementing this measure.
Water. Continue efficiency programs and use cleaner energy sources to move and treat water.	**Consistent**. As discussed in **Section 4.16, Utilities and Service Systems**, water demand generated by the Proposed Plan would be met by expanding water recycling and conservation. All new development within the CPA would be required to implement water conservation measures, which would attenuate some of the added demand for water resources from new development as the Proposed Plan is implemented. Relative to existing conditions, water demand would increase overall as would per capita water use, although per capita use would be lower than under the Future No Project scenario. The increase in both overall and per capita water demand relative to Existing Conditions can be attributed to the relatively high proportion of CPA land uses that are nonresidential, as the analysis relied on water consumption factors that are based on nonresidential square footage that do not take into account future improvements in the efficiency of nonresidential buildings water use. Water conservation efforts at the local (City) level, including reduced-volume plumbing apparatuses and appliances, drought-tolerant landscaping, and enhanced water recycling and treatment technologies would help reduce demand. However, reductions in average water consumption by nonresidential floor area could not be reasonably estimated using substantial underlying evidence and therefore would provide no informational value.
Agriculture. In the near-term, encourage investment in manure digester and at the five-year Scoping Plan update determine if the program should be made mandatory by 2020.	**Not Applicable**. The Proposed Plan does not include agricultural facilities.

Source: TAHA, 2022.

Executive Order B-30-15, SB 32 and 2017 Scoping Plan. On April 29, 2015, Governor Brown issued an executive order setting a statewide GHG reduction target of 40 percent below 1990 levels by 2030. SB 32, which codified Executive Order B-30-15, calls for Statewide reductions in GHG 40 percent below 1990 levels by 2030. In November 2017, CARB adopted a Climate Change Scoping Plan (2017 Scoping Plan) that addressed how long-term objectives could be met, including SB 32 targets in 2030. (Specifically, the 2017 Scoping Plan states that the Plan "establishes a path that will get California to its 2030 target" and "identifies how the State can reach our 2030 climate target to reduce…GHG emissions by 40 percent from 1990 levels." (2017 Plan at pp. 1).[99] Also, many of the emission reduction strategies recommended by CARB would serve to reduce the Proposed Plan's post-2020 emissions level to the extent applicable by law and help lay the foundation "…for establishing a broad framework for continued emission reductions beyond 2020, on the

99 CARB, *California's 2017 Climate Change Scoping Plan*, November 2017.

path to 80 percent below 1990 levels by 2050," as called for in CARB's First Update to the AB 32 Scoping Plan.[100,101]

The 2017 Scoping Plan and the SB 32 objectives that drive it involve increasing renewable energy use, imposing tighter limits on the carbon content of gasoline and diesel fuel, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries. Although a number of these strategies are currently promulgated, some have not yet been formally proposed or adopted. It is expected that these measures or similar actions to reduce GHG emissions will be adopted as required to achieve statewide GHG emissions targets. Based on the following analysis provided in **Table 4.7-11**, the Proposed Plan would be consistent with the State's Climate Change Scoping Plan's objective of reducing 2030 GHG emissions in accordance with SB 32.

Table 4.7-11
Consistency Analysis – 2017 Scoping Plan

Actions and Strategies	Responsible Party(ies)	Proposed Plan Consistency
Senate Bill 350 (SB 350) requires that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by 2030. • Increase RPS to 50 percent of retail sales by 2030. • Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030. • Reduce GHG emissions in the electricity sector through the implementation of the above measures as modeled in Integrated Resource Plans to meet GHG planning targets in the IRP. Load-serving entities and publicly-owned utilities meet GHG emission reductions through measures described in IRPs.	California Public Utilities Commission, California Energy Commission, CARB	**Consistent.** The Proposed Plan would use electricity consistent with the requirements of SB 350 as LADWP would provide electricity service. LADWP plans to receive at least 33 percent of electricity from renewable sources by year 2020 and 50 percent by 2030. The Proposed Plan would comply with CalGreen and Title 24 energy efficiency standards.
Senate Bill 100 (SB 100). The California Renewables Portfolio Standard Program (2018) requires a Statewide renewables energy portfolio that requires retail sellers to procure renewable energy that is at least 50 percent by December 31, 2026 and 60 percent by December 31, 2030. It would also require that local publicly owned electric utilities procure a minimum quantity of electricity from renewable energy resources achieve 44 percent of retail sales by	LADWP, California Public Utilities Commission	**Consistent.** LADWP is required to generate electricity that would increase renewable energy resources to 33 percent by 2020 and 50 percent by 2030. The results of DWP's Los Angeles 100% Renewable Energy Study (LA100), released March 2021, show that a reliable, 100-percent renewable electricity supply is indeed achievable for LA by 2045 or even a decade sooner. The Proposed Plan would use electricity consistent with the requirements

100 CARB, *First Update to the Climate Change Scoping Plan First Update*, May 2014.
101 *Ibid.*

Actions and Strategies	Responsible Party(ies)	Proposed Plan Consistency
December 31, 2024 and 60 percent by December 31, 2030.		of SB 100 as LADWP would provide electricity service. The Proposed Plan would comply with this this action/strategy being located within the LADWP service area and compliance with CalGreen and Title 24 energy efficiency standards
Implement Mobile Source Strategy (Cleaner Technology and Fuels) • At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025. • At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030. • Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean Cars regulations. • Medium- and heavy-duty GHG Phase 2. • Innovative Clean Transit • Last Mile Delivery • Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."	CARB, California State Transportation Agency, Southern California Gas, Caltrans California Energy Commission, Office of Planning and Research, Local agencies	**Consistent.** GHG emissions generated by vehicular travel would benefit from proposed regulation, and mobile source emissions generated by the Project would be reduced with implementation of standards under the Advanced Clean Cars Program for LEV and ZEVs, consistent with reduction of GHG emissions under AB 32. Mobile source GHG emissions estimates conservatively do not include this additional 34- percent reduction in mobile source emissions as the CalEEMod model does not yet account for this regulation. In addition, in December 2008, the regulation requires all public transit agencies to gradually transition to a 100-percent zero-emission bus fleet and encourages them to provide innovative first and last-mile connectivity and improved mobility for transit riders. Promoting the development and use of advanced clean trucks will help CARB achieve its emission reduction strategies as outlined in the State Implementation Plan (SIP), Sustainable Freight Action Plan, SB 350, and AB 32. With regard to SB 375, The Proposed Plan is expected to contribute to reductions in per capita GHG emissions corresponding to CPA uses, as detailed above. As illustrated in Table 4.7-8, the Proposed Plan would contribute to reductions in per capita GHG emissions from passenger vehicles. As a result, the Proposed Plan would be consistent with SCS and SB 375 goals.
Increase Stringency of SB 375 Sustainable Communities Strategy (2035 Targets).	CARB	**Consistent.** The underlying purpose of the Proposed Plan is to plan for and accommodate foreseeable growth in the CPA, consistent with the growth strategies of the City as provided in the City's General Plan Framework Element, as well as the policies of SB 375 and the SCS. The Proposed Plan would allow for concentrated, mixed-use development adjacent to transit corridors within a TPA in order to conserve resources, protect existing residential neighborhoods, and improve air quality by reducing the reliance on cars. The 2020 RTP/SCS

Actions and Strategies	Responsible Party(ies)	Proposed Plan Consistency
		identifies growth within TPAs as a top priority strategy for implementing the Strategic Growth Vision. Focusing increased density in communities surrounding multimodal transit hubs is a fundamental component of SCAG's initiatives to improve transportation efficiency and shorten and displace on-road vehicle trips. The Proposed Plan is expected to contribute to reductions in per capita GHG emissions corresponding to CPA uses.
By 2019, adjust performance measures used to select and design transportation facilities. Harmonize project performance with emissions reductions, and increase competitiveness of transit and active transportation modes (e.g., via guideline documents, funding programs, project selection).	California State Transportation Agency and Southern California Gas, Office of Planning and Research, CARB, GoBiz, IBank, Department of Finance, California Transportation Commission, Caltrans	**Not Applicable.** The Proposed Plan would not involve construction of transportation facilities. However, the Project would be located in close proximity to ample transit opportunities, including Metro local routes and LADOT transit services. The access to active transportation infrastructure for both pedestrians and bicyclists would further reduce impacts to the transportation infrastructure.
By 2019, develop pricing policies to support low-GHG transportation (e.g., low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).	California State Transportation Agency, Caltrans, California Transportation Commission, Office of Planning and Research/Southern California Gas, CARB	**Consistent.** The Proposed Plan would support this policy by providing the electric vehicle supply wiring (EV-ready) for code-required parking spaces.
Implement California Sustainable Freight Action Plan, including improving freight system efficiency. This includes deploying over 100,000 freight vehicles and equipment capable of zero emission operation and maximize zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.	CARB	**Not Applicable.** The Proposed Plan would not interfere or impede the implementation of the Sustainable Freight Action Plan.
Adopt a Low Carbon Fuel Standard (LCFS) with a Carbon Index (CI) reduction of 18 percent.	CARB	**Not Applicable.** This regulatory program applies to fuel suppliers, not directly to land use development. GHG emissions related to vehicular travel associated with the Proposed Plan would benefit from this regulation because fuel used by vehicles would be required to comply with LCFS. Mobile source GHG emissions estimates were calculated using CalEEMod that includes implementation of the LCFS into mobile source emission factors. The current LCFS, last amended in September 2018, establishes a 20 percent reduction in CI from a 2010 baseline by 2030.

Actions and Strategies	Responsible Party(ies)	Proposed Plan Consistency
Implement the Short-Lived Climate Pollutant Strategy by 2030: • 40 percent reduction in methane and hydrofluorocarbon emissions below 2013 levels. • 50 percent reduction in black carbon emissions below 2013 levels.	CARB, CalRecycle, California Department of Food and Agriculture, California State Water Resources Control Board, Local air districts	**Consistent.** The Proposed Plan would comply with the CARB Short-Lived Climate Pollutant Reduction Strategy, which limits the use of hydrofluorocarbons for refrigeration uses.
By 2019, develop regulations and programs to support organic waste landfill reduction goals in the SLCP and SB 1383.	CARB, CalRecycle, California Department of Food and Agriculture, California State Water Resources Control Board, Local air districts	**Not Applicable.** This strategy calls on regulators to reduce GHG emissions from landfills and is not applicable to land use plans. Under SB 1383, the California Department of Resources Recycling and Recovery is responsible for achieving a 50 percent reduction in the level of statewide disposal of organic waste from the 2014 level by 2020 and 75- percent reduction by 2025.
Implement the post-2020 Capand-Trade Program with declining annual caps.	CARB	**Not Applicable.** This applies to State regulators and is not applicable to a land use plan. Assembly Bill 398 (AB 398) was enacted in 2017 to extend and clarify the role of the state's Cap-and-Trade Program from January 1, 2021, through December 31, 2030. As part of AB 398, refinements were made to the Cap-and-Trade program to establish updated protocols and allocation of proceeds to reduce GHG emissions.
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink: • Protect land from conversion through conservation easements and other incentives. • Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity. • Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments. • Establish scenario projections to serve as the foundation for the Implementation Plan.	California Natural Resources Agency and departments within, California Department of Food and Agriculture, CalEPA, CARB	**Not Applicable.** This applies to State regulators and is not applicable to a land use plan. This regulatory program applies to Natural and Working Lands, not directly related to development of the Proposed Plan. However, the Proposed Plan would not interfere or impede implementation of the Integrated Natural and Working Lands Implementation Plan.
Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018.	CARB	**Not Applicable.** This applies to State regulators and is not applicable to a land use plan. This regulatory program applies to Natural and Working Lands, not directly related to development of the Proposed Plan. However, the Proposed Plan would not interfere or impede implementation of the Integrated Natural and Working Lands Implementation Plan.

Actions and Strategies	Responsible Party(ies)	Proposed Plan Consistency
Implement Forest Carbon Plan.	California Natural Resources Agency, CAL FIRE, CalEPA	**Not Applicable.** This applies to State regulators and is not applicable to a land use plan. This regulatory program applies to state and federal forest land, not directly related to development of the Proposed Plan. However, the Proposed Plan would not interfere or impede implementation of the Forest Carbon Plan.
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	State Agencies & Local Agencies	**Not Applicable.** This applies to State regulators and is not applicable to a land use plan. Funding and financing mechanisms are the responsibility of the state and local agencies. The Proposed Plan would not conflict with funding and financing mechanisms to support GHG reductions.

Source: TAHA, 2022.

City of Los Angeles GreenLA Climate Action Plan (CAP). The City of Los Angeles enacted its GreenLA CAP in 2007 to outline strategies for reducing the City's emissions of GHG and consequent effects on climate change. The CAP's primary long-term objective is to establish a framework for implementing GHG emissions reduction efforts that would achieve a goal of reducing citywide emissions to 35 percent below 1990 levels by 2030. With regard to planning, elements of the CAP designed to aid in regional GHG reductions include promotion of high-density housing close to major transportation arteries, implementation of transit-oriented development, and expanding availability of City land for housing, mixed-use development, parks, and open space.

The Proposed Plan would add multi-family housing as well as new commercial and industrial space to the CPA and would incorporate transit-oriented development. The Proposed Plan includes a public benefits component that would allow individual developments to be eligible for increased floor area, building height, and/or density in exchange for providing public benefits, such as publicly accessible open space and transit-supporting infrastructure. Furthermore, implementation of the Proposed Plan would encourage pedestrian-friendly, mixed-use development that would require less use of passenger vehicles. The Proposed Plan would allow for a more dense, integrated land use and transportation environment that would encourage the use of transit. The Proposed Plan encourages sustainable and transit-oriented development with form regulations that prioritizes pedestrian walkability. Together, these regulations encourage increased use of transit resources and support a shift in travel mode. The combination of these strategies is consistent with the goals of GreenLA. **Table 4.7-12** illustrates the Proposed Plan consistency with the City's GreenLA CAP.

Table 4.7-12
Consistency Analysis of the Proposed Plan with The City's GreenLA CAP

Objective	Proposed Plan Consistency
Energy	
Transform Los Angeles into the model of an energy efficient city.	**Consistent**. As discussed above, Proposed Plan per capita GHG emissions would be within state targets.
Water	
Decrease per capita water use.	**Consistent**. See the response to Energy: Transform Los Angeles into the model of an energy efficient city, above.
Transportation	
Lower the environmental impact and carbon intensity of transportation.	**Consistent** As illustrated by the analysis presented in **Table 4.7-7** and **Table 4.7-8**, implementation of the Proposed Plan would result in a reduction in per capita GHG emissions by 2040.
Focus on mobility for people, not cars.	**Consistent**. The Proposed Plan would facilitate the use of transit and non-motorized transportation by increasing commercial and residential development potential in areas near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana light rail stations. By improving mobility and accessibility to transit, the Proposed Plan supports reductions in VMT and ultimately GHG emissions. While total daily VMT would increase from existing conditions to 2040 with Proposed Plan conditions, per capita VMT would decrease from 34.3 to 28.9 VMT per capita daily (based on population values summarized in Section 4.12, Population, Housing and Employment.
Create a more livable city.	**Consistent**. The Proposed Plan would increase development potential in areas with existing transportation infrastructure. The Proposed Plan would allow for infill development of additional residential units and job-producing uses located near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana light rail stations as well as along major mixed-use corridors. The proposed land use and zone changes would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and would facilitate the use of transit and non-motorized transportation. By increasing development potential near the Metro L Line transit stations, the Proposed Plan would improve mobility and accessibility and would create a more livable city.

Source: TAHA, 2021; City of Los Angeles, Green LA: An Action Plan to Lead the Nation in Fighting Global Warming, 2007.

Sustainable City pLAn. The Sustainability City pLAn (Green New Deal) is the City's sustainability planning document that embraces both short- and long-term goals to improve equity, the City's economy, and the environment. Focus areas for the environmental aspect of the Sustainability City pLAn includes improving local water supply, increasing local electricity supply from solar, incentivizing energy efficient buildings, reducing atmospheric carbon, reducing waste destined for landfills, and embracing climate leadership. **Table 4.7-13** below compares the objectives of the Sustainability City pLAn with the Proposed Plan.

Table 4.7-13
Consistency Analysis of the Proposed Plan with L.A.'s Green New Deal
(2019 Sustainable City pLAn)

Objective	Proposed Plan Consistency
Renewable Energy	
LADWP will supply 55 percent renewable energy by 2025; 80 percent by 2036; and 100 percent by 2045.	**Consistent**. Implementation of the Proposed Plan would not interfere with LADWP meeting the renewable energy targets set forth in LA's Green New Deal. Land use development would be limited to the CPA and would not constrain any future expansion of LADWP renewable infrastructure. As discussed in **Section 4.16, Utilities and Services Systems**, and **Section 4.5, Energy**, implementation of the Proposed Plan would not require the expansion of existing electrical facilities and would not place an undue burden on current capacity.
Increase local solar generation and total energy storage capacity to 900-1,500 MW/1,654-1,750 MW by 2025, 1,500-1,800 MW/3,000 MW by 2035, and 1,950 MW/4,000 MW by 2050, respectively.	**Consistent**. Implementation of the Proposed Plan would not interfere with the planned expansion of local solar energy production and energy storage capacity. Redevelopment within the CPA resulting from the Proposed Plan would not obstruct LADWP local solar and energy storage projects. There are no existing or planned LADWP energy storage facilities within the CPA.
Local Water	
Reduce per capita potable water use and increase recycled water.	**Consistent**. As discussed in **Section 4.16, Utilities and Service Systems**, water demand generated by the Proposed Plan would be met by expanding water recycling and conservation. All new development within the CPA would be required to implement water conservation measures, which would attenuate some of the added demand for water resources from new development as the Proposed Plan is implemented. Relative to existing conditions, water demand would increase overall as would per capita water use, although per capita use would be lower than under the Future No Project scenario. The increase in both overall and per capita water demand relative to Existing Conditions can be attributed to the relatively high proportion of CPA land uses that are nonresidential, as the analysis relied on water consumption factors that are based on nonresidential square footage that do not take into account future improvements in the efficiency of nonresidential buildings water use. Water conservation efforts at the local (City) level, including reduced-volume plumbing apparatuses and appliances, drought-tolerant landscaping, and enhanced water recycling and treatment technologies would help reduce demand. However, reductions in average water consumption by nonresidential floor area could not be reasonably estimated using substantial underlying evidence and therefore would provide no informational value.
Building Energy	
All new buildings will be net zero carbon by 2030; and 100 percent of buildings will be net zero carbon by 2050.	**Consistent**. See responses to Local Water: Reduce per capita potable water use and increased recycled water, above, and Lead by Example: Reduce municipal building energy consumption, below.
Reduce building energy use for all building types by 22 percent by 2025, 34 percent by 2035, and 44 percent by 2050.	**Consistent**. All individual land use redevelopment projects within the CPA will be subject to compliance with the contemporaneous Title 24 energy efficiency standards and Los Angeles Green Building Code provisions at the time of project approval. Implementation of the Proposed Plan would not compromise future developments from meeting the applicable codes and regulations that are designed in accordance with City policies to reduce building energy use.

Objective	Proposed Plan Consistency
Housing & Development	
Increase cumulative new housing unit construction to 150,000 by 2025 and 275,000 units by 2035.	**Consistent**. As discussed in **Section 4.12, Population, Housing, & Employment**, implementation of the Proposed Plan would increase the number of new multifamily housing units accommodated within the CPA and in close proximity to transit.
Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025 and 75 percent by 2035.	**Consistent**. As discussed in **Section 4.12, Population, Housing, & Employment**, implementation of the Proposed Plan would increase the number of new multifamily housing units accommodated within the CPA and in close proximity to transit.
Waste & Resource Recovery	
Execute and expand plans to increase landfill diversion and recycling.	**Consistent**. As discussed in **Section 4.16, Utilities and Service Systems**, future CPA development would participate in City recycling and waste diversion programs.
Encourage innovative expansion of recycling and waste diversion.	**Consistent**. See response to Waste and Landfills: Execute and expand plans to increase landfill diversion and recycling, above.
Mobility and Transit	
Improve pedestrian and bicycle infrastructure and other sustainable transport, emphasizing connections to mass transit, to increase the percentage of all trips made by walking, biking, micro-mobility, or transit.	**Consistent**. The Proposed Plan would increase development density in areas with future transportation infrastructure. The Proposed Plan would allow for infill development of additional residential units and job-producing uses located near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana light rail stations as well as along major mixed-use corridors. The proposed land use and zone changes would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and would facilitate the use of transit and non-motorized transportation.
Reduce VMT per capita by at least 13 percent by 2025, 39 percent by 2035, and 45 percent by 2050 relative to the 2017 level of 15 VMT per capita per day.	**Consistent**. The per capita VMT reductions for this Citywide goal would be achieved cumulatively through citywide planning initiatives, including the proposed comprehensive update to the City's Transit Demand Ordinance. Reasonably expected development with implementation of the Proposed Plan would reduce VMT per capita associated with uses in the CPA by approximately 15 percent relative to existing conditions (from 34.3 to 28.9 VMT/resident), which would contribute to City efforts to reach the targets set forth in L.A.'s Green New Deal. The Proposed Plan would concentrate new growth near multimodal transit hubs that will result in the shortening and displacement of vehicle trips. In addition, City regulations require development to include active transportation components such as bicycle parking.
Air Quality & Zero Emission Vehicles	
Transition personal transport toward zero emissions to obtain the U.S. EPA ozone standard by 2025.	**Consistent.** The Proposed Plan would promote the use of public transportation by increasing development intensity near transit stations. By increasing development intensity near transit stations, the Proposed Plan would encourage a transportation mode shift from private vehicles to public transit. VMT and delay times would be reduced, which would reduce per capita GHG emissions. Additionally, future residential development projects within the CPA would be subject to the Los Angeles Green Building Code requirements related to the provision of electric charging station facilities. As zero emission vehicles become a larger proportion of the regional on-road fleet, the expansion of electric vehicle charging stations will both encourage and accommodate the use of zero emission vehicles, which will contribute to reductions in per-capita mobile source GHG emissions.

Source: TAHA, 2021; City of Los Angeles, LA's Green New Deal: Sustainable City pLAn 2019, April 2019.

In addition, individual development projects constructed within the CPA would be required to comply with the Los Angeles Green Building Code. The City's Green Building Code includes energy and water saving measures that reduce GHG emissions below 2013 Title 24 requirements. It promotes sustainable building practices by creating a series of requirements and incentives for developers to meet the United States Building Council's Energy and Design standards. The Green Building Code includes the following key mandatory measures for non-residential and high-rise residential buildings related to GHG reduction:

- Short-Term Bicycle Parking: If a development project is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passersby, for five percent of visitor motorized vehicle parking capacity, with a minimum of one two-bike capacity rack.

- Long-Term Bicycle Parking: For buildings with over 10 occupants, provide secure bicycle parking for five percent of motorized vehicle parking capacity, with a minimum of one space. Acceptable parking facilities shall be convenient from the street and may include:

  - Covered, lockable enclosures with permanently anchored racks for bicycles.
  - Lockable bicycle rooms with permanently anchored racks.
  - Lockable, permanently anchored bicycle lockers.

- Designated Parking: Provide designated parking, by means of permanent marking or a sign, for any combination of low-emitting, fuel-efficient, and carpool/van pool vehicles as described in Table 5.106.5.2 of the Green Building Code.

- Energy Conservation: Provide electric vehicle supply wiring for a minimum of five percent of the total number of parking spaces.

- Energy Conservation: A project must exceed the California Energy Code requirements, based on the 2008 Energy Efficiency Standards, by 15 percent using an Alternative Calculation Method approved by the California Energy Commission.

- Energy Conservation: Each appliance provided and installed shall meet Energy Star requirements if an Energy Star designation is applicable for that appliance.

- Energy: Provide future access, off-grid pre-wiring, and space for electrical solar systems.

Because the Proposed Plan would be consistent with the goals of GreenLA and the Sustainable City pLAn, and future development projects within the CPA would be required to comply with the City's Green Building Code, the Proposed Plan would be consistent with the City's strategies for reducing GHG.

City of Los Angeles General Plan Framework Element. The Proposed Plan focuses on mobility, urban design, public safety, and healthy, sustainable communities. A vision of concentrated, mixed-use development near a transit corridor is promoted in order to conserve resources, protect existing residential neighborhoods, and improve air quality by reducing the use of cars. As part of the Proposed Plan, General Plan designations in the Change Areas would be updated to allow for a range of uses that improve the link between land use and transportation in a manner that is consistent with the citywide comprehensive growth strategy identified in the City's General Plan Framework Element. **Table 4.7-14** discusses consistency of the Proposed Plan with the City of Los Angeles' General Plan Framework Element.

Table 4.7-14
Consistency Analysis of the Proposed Plan with the City of Los Angeles General Plan Framework Element

Objective	Proposed Plan Consistency
Objective 3.15: Focus mixed commercial/residential uses, neighborhood-oriented retail, employment opportunities, and civic and quasi-public uses around urban transit stations, while protecting and preserving surrounding low-density neighborhoods from the encroachment of incompatible land uses.	**Consistent**. The Proposed Plan would increase development potential in commercial corridors and select multi-family residential neighborhoods near transit. The proposed changes in the commercial areas would allow for opportunities for mixed-use development.
Objective 3.16: Accommodate land uses, locate and design buildings, and implement streetscape amenities that enhance pedestrian activity.	**Consistent**. The Proposed Plan supports mobility and connectivity in the CPA through transit use and pedestrian-oriented design. Development standards would support pedestrian-friendly activities and would include pedestrian-oriented design for new development projects in areas that are served by transit.
Objective 4.2: Encourage the location of new multi- family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods.	**Consistent**. The Proposed Plan would provide opportunities to develop multi-family residential development in areas near transit. It would increase opportunities for mixed-use development, with incentives for affordable housing along commercial corridors and allowing increased residential density, with incentives for affordable housing, in multi-family residential areas in proximity to transit. Higher density development would generally occur along commercial corridors (primarily in the Community Center designated areas). while the Proposed Plan encourages infill on existing residential properties, the Plan directs the majority of new housing development towards mixed-use corridors and around existing and future bus and rail transit service. This strategy helps alleviate development pressures on the existing residential neighborhoods. Multi-family residential areas would be lower in density as it transitions away from commercial corridors.

Objective	Proposed Plan Consistency
Objective 9.40: Ensure efficient and effective energy management in providing appropriate levels of lighting for private outdoor lighting for private streets, parking areas, pedestrian areas, security lighting, and other forms of outdoor lighting and minimize or eliminate the adverse impact of lighting due to light pollution, light trespass, and glare.	**Consistent**. Future development in the CPA would be required to comply with energy efficiency lighting and light pollution reduction requirements included in the 2016 California Building Code (including the CalGreen Code), the Los Angeles Building Code, and Los Angeles Green Building Code (LAMC Chapter IX). The Los Angeles Building Code and Green Building Code largely incorporate and amend the 2013 California Building Code and CalGreen Code, respectively. For example, Subsection 99.05.106.8 of the Los Angeles Green Building Code sets restrictions on residential outdoor lighting, and Section 99.04.211.4 requires residences to be constructed with solar-ready features as specified in the California Energy Code. Future development would also be required to comply with LAMC Sections 93.0117, which limits exterior lighting intensity from light source on properties containing residential units to 2 fc. As discussed in **Section 4.1, Aesthetics**, the existing lighting regulations in the current City Zoning Code would be updated and incorporated into development standards as part of the New Zoning Code. The proposed development standards include lighting regulations that minimize light trespass, shield adjacent properties and the night sky from outdoor lighting, and provide lighting standards to support a range of environments. The New Zoning Code also includes regulations for the shielding of light fixtures, the amount of illumination required or allowed for different uses and certain zone modules, and illuminated signs.

Source: TAHA, 2021; City of Los Angeles, General Plan Framework Element, 1995.

City of Los Angeles General Plan Air Quality Element. The City's General Plan Air Quality Element, adopted in 2003, sets forth goals, objectives, and policies that aim to guide the City in implementing its air quality improvement programs and strategies. The Air Quality Element recognizes that air quality strategies must be integrated into land use and transportation decisions and aims to facilitate consistency with regional Air Quality, Growth Management, Mobility, and Congestion Management Plans. **Table 4.7-15** shows objectives contained in the City's Air Quality Element applicable to reducing GHG emissions and how the Proposed Plan satisfies these objectives.

Table 4.7-15
Consistency Analysis of the Proposed Plan with the City of Los Angeles General Plan Air Quality Element

Objective	Proposed Plan Consistency
Objective 1.1: Reduce air pollutants consistent with the Regional Air Quality Management Plan (AQMP), increase traffic mobility, and sustain economic growth citywide.	**Consistent**. As discussed in **Section 4.2, Air Quality**, the Proposed Plan would generate emissions that exceed the SCAQMD significance thresholds. However, growth under the Proposed Plan would be consistent with SCAG forecasts for which the AQMP is based. The Proposed Plan would increase development intensity near the Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana light rail stations, which would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and would facilitate the use of transit and non-motorized transportation. By increasing development intensity near these transit stations mobility would improve, and the Proposed Plan would support economic growth.
Objective 2.1: Reduce work trips as a step towards attaining trip reduction objectives necessary to achieve regional air quality goals.	**Consistent.** The proposed land use and zone changes associated with the Proposed Plan would allow for opportunities to increase the amount of jobs and housing that would be located within close proximity to transit and to each other, which would reduce vehicle work trips. While total daily VMT in the CPA would increase from existing conditions to 2040 with Proposed Plan conditions, per capita VMT would decrease from 34.3 to 28.9 VMT per capita daily (based on population values summarized in **Section 4.12, Population, Housing, and Employment**). A portion of this per capita reduction would be related to opportunities for employees to live closer to work job centers and transit options.
Objective 2.2: Increase vehicle occupancy for non-work trips by creating disincentives for single passenger vehicles and incentives for high occupancy vehicles.	**Consistent**. The Proposed Plan would enhance mobility by focusing future growth in areas well-served by transit in order to encourage transit ridership. By increasing opportunities for commercial, multi-family residential and mixed-use development around Metro L Line Pico/Aliso, Mariachi Plaza/Boyle Heights, Soto, and Indiana transit stations, residents, employees and visitors would have mobility choices that enable them to reduce the number and length of single-passenger vehicle trips.
Objective 3.1: Increase the portion of work trips made by transit to levels that are consistent with the goals of the AQMP and Congestion Management Plan (CMP).	**Consistent**. See response to General Plan Air Quality Element Objective 2.1.
Objective 3.2: Reduce vehicular traffic during peak periods.	**Consistent.** See response to General Plan Air Quality Element Objective 2.1. The overall reduction in per capita vehicle trips and VMT would also reduce peak period traffic.
Objective 4.2: Reduce vehicle trips and vehicle miles traveled associated with land use patterns.	**Consistent**. See response to General Plan Air Quality Element Objective 2.1. Reasonably anticipated development from the Proposed Plan would include a mix of residential and job-generating uses that would encourage transit use and walking while minimizing travel distances and VMT.
Objective 5.1: Increase energy efficiency of City facilities and private developments.	**Consistent.** As discussed in ***Section 4.5 .2 Regulatory Setting*** of the Energy analysis of this EIR and Section 4.7.2, above, the City's Green Building Code would enforce the application of the 2019 CALGreen standards and subsequent updates and would apply to all new buildings, all additions, and any alterations with building valuations over $200,000. In addition, the Proposed Plan would encourage efficient building techniques and the use of sustainable materials to guide lasting development that minimizes the adverse effects on the environment.

Source: TAHA, 2021; City of Los Angeles, General Plan Air Quality Element, 1992.

City of Los Angeles General Plan Mobility Element. As discussed in **Section 4.14, Transportation**, the citywide Ordinance on TDM and Trip Reduction Measures (Ordinance No. 168,700) would continue to be implemented within the CPA. This Ordinance calls for several measures to be taken by non-residential developments in an effort to reduce single-occupancy vehicle trips. Additionally, the City is currently preparing a comprehensive update to the TDM Ordinance, as part of the program to move to VMT metrics and implement the Mobility Plan. As illustrated in **Table 4.7-16**, the Proposed Plan would be consistent with the City's Mobility Plan 2035.

Table 4.7-16
Consistency Analysis of the Proposed Plan with the City of Los Angeles Mobility Plan 2035

Objective	Proposed Plan Consistency
Objective 4.2: Meet a 9 percent per capita GHG reduction for 2020 and a 16 percent per capita reduction for 2035.	**Consistent**. As illustrated in **Table 4.7-8**, implementation of the Proposed Plan would result in a 39 percent reduction in per capita GHG emissions from passenger vehicles by 2040 in comparison to existing conditions, which substantially exceeds the Mobility Element's reduction goals for 2020 and 2035.
Objective 4.3: Convert 100 percent of City General Services Division vehicle fleet to alternative fuels and/or zero emission vehicles by 2035.	**Consistent**. Although the Proposed Plan does not include specific elements to implement this objective, it would not preclude conversion of the City's vehicle fleet to alternative fuel and zero emission vehicles.
Objective 4.4: Convert 100 percent of City refuse collection trucks and street sweepers to alternative fuels by 2020.	**Consistent**. Although the Proposed Plan does not include specific elements to implement this objective, it would not preclude conversion of the City's vehicle fleet.
Objective 4.5: Reduce transportation-related energy use by 95 percent and reduce maintenance requirements of City vehicle fleet.	**Consistent**. Implementation of the Proposed Plan would reduce per capita transportation energy consumption by approximately 39 percent relative to existing conditions by the horizon year of 2040. Furthermore, implementation of the Proposed Plan would not obstruct City efforts to enhance the longevity and durability of its fleet to require less frequent maintenance.

Source: TAHA, 2021; City of Los Angeles, Mobility Plan 2035, 2016.

Summary of Consistency Analysis. The Proposed Plan would concentrate development around multimodal transit hubs in TPAs and HQTAs and contribute to the expansion of livable corridors within the City. By increasing development intensity near transit stations, the Proposed Plan would encourage a transportation mode shift from private vehicles to public transit. These characteristics are anticipated to reduce per capita GHG emissions associated with cars and light trucks. The Proposed Plan would be consistent with AB 32, SB 32, the 2017 Scoping Plan, SB 375, the 2020 RTP/SCS, regional and local strategies to reduce GHG, and can be expected to contribute to reductions in per capita GHG emissions when viewed at the regional level. Therefore, GHG emissions impacts for the Proposed Plan would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.7.7 CUMULATIVE IMPACTS

The analysis above analyzes GHG emissions consistent with *CEQA Guidelines* Section 15064.4(b) and considers whether the incremental contributions of the Proposed Plan could be cumulatively considerable. No significant GHG impacts are expected to result from implementation of the Proposed Plan, and cumulative impacts related to GHG emissions would be less than significant and would not be cumulatively considerable. No further cumulative impact analysis is necessary

4.8 HAZARDS AND HAZARDOUS MATERIALS

4.8.1 INTRODUCTION

This section provides an overview of hazardous conditions in the Boyle Heights Community Plan Area (CPA) and evaluates potential hazards and hazardous materials impacts associated with the Proposed Plan. Topics addressed include the transport, use, disposal, and/or release of hazardous materials; hazardous materials sites; airport hazards; emergency response plans; and wildland fires. This section was prepared using the *Environmental Data Resources, Inc. (EDR) DataMap Area Study*, dated July 10, 2017, and updated data from Envirostor, Geotracker, and Envirofacts which provide information regarding the contaminated sites within the CPA.[1]

4.8.2 EXISTING ENVIRONMENTAL SETTING

Overview

Hazard versus Risk. Workers' health and general public health are potentially at risk whenever hazardous materials have been used or where there could be an exposure to such materials. Inherent in the setting and analyses presented in this section are the concepts of the "hazard" of these materials and the "risk" they pose to human health. Exposure to some chemical substances may harm internal organs or systems in the human body, ranging from temporary effects to permanent disability, or death. Hazardous materials that result in adverse effects are generally considered "toxic." Other chemical materials, however, may be corrosive, or react with other substances to form other hazardous materials, but they are not considered toxic because organs or systems are not affected. Because toxic materials can result in adverse health effects, they are considered hazardous materials, but not all hazardous materials are necessarily "toxic." For purposes of the information and analyses presented in this section, the terms hazardous substances or hazardous materials are used interchangeably and include materials that are considered toxic.

The risk to human health is determined by the probability of exposure to a hazardous material and the severity of harm such exposure would pose. That is to say, the likelihood and means of exposure, in addition to the inherent toxicity of a material, are used to determine the degree of risk to human health. For example, a high probability of exposure to a low toxicity chemical would not necessarily pose an unacceptable human health or ecological risk, whereas a low probability of exposure to a very high toxicity chemical might. Various regulatory agencies, such as the U.S. Environmental Protection Agency (U.S. EPA), California Environmental Protection Agency's (Cal/EPA), State Water Resources Control Board

[1] Environmental Data Resources, Inc., *EDR DataMap Area Study, Boyle Heights Community Plan Area, Los Angeles, CA,* July 10, 2017. See Appendix 4.8-1.

(SWRCB), Cal/EPA Department of Toxic Substances Control (DTSC), and State and federal Occupational Safety and Health Administration (OSHA) are responsible for developing and/or enforcing risk-based standards to protect the public and the environment.

Hazardous Materials. The term "hazardous material" can have varying definitions for different regulatory programs. For the purpose of the Proposed Plan, the term "hazardous materials" refers to both hazardous materials and hazardous waste. The California Health and Safety Code Section 25501(n)(1) defines hazardous materials as any material that "because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment." Hazardous materials include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or environment.

A material is hazardous if it exhibits one or more of the following characteristics: toxicity, ignitability, corrosivity, and reactivity.[2] These types of hazardous materials are defined below:

- *Toxic Substances:* Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or even death. For example, such substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels. (The level depends on the substances involved and is chemical-specific.) Carcinogens (substances that can cause cancer) are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and suspected carcinogen) and methylene chloride (a common laboratory solvent and a suspected carcinogen).

- *Ignitable Substances:* Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.

- *Corrosive Materials:* Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).

- *Reactive Materials:* Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

---

2 Title 22, California Code of Regulations, Division 4.5, Chapter 11, Article 3, Section 66261.20-66261.24. Available online at: https://www.law.cornell.edu/regulations/california/title-22/division-4-5/chapter-11/article-3, accessed October 19, 2021.

Soil and groundwater can become contaminated by hazardous material releases in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, with the result that numerous industrial properties and public landfills became dumping grounds for unwanted chemicals. The largest and most contaminated of these sites became Superfund sites, so named for their eligibility to receive cleanup money from a federal fund established under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The National Priorities List (NPL) is the list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories. The NPL is intended primarily to guide the U.S. EPA in determining which sites warrant further investigation. Sites are added to the NPL following a hazard ranking system.

As discussed further below, under "Hazardous Materials Sites," the CPA does not contain NPL sites. However, numerous smaller properties have been designated as contaminated sites. Often these are gas station sites where leaking Underground Storage Tanks (USTs) were upgraded under a federal requirement in the late 1980s. Another category of sites (which may overlap with the site types already mentioned) is "brownfield." A brownfield is a previously used and often abandoned site that is undeveloped or underused because of actual or suspected contamination. Both the U.S. EPA and DTSC maintain lists of known brownfield sites. These sites are often difficult to inventory due to their owners' reluctance to publicly label their property as potentially contaminated. As discussed further below, under "Hazardous Materials Sites," the CPA contains one brownfield site.

Asbestos Containing Materials (ACMs). Asbestos is a naturally occurring fibrous material that was widely used in structures built between 1945 and 1978 for its fireproofing and insulating properties. ACMs were banned by U.S. EPA between the early 1970s and 1991 under the authority of the federal Clean Air Act (CAA) and Toxic Substance Control Act (TSCA). Asbestos has been linked to various human lung diseases, including lung cancer. Common ACMs include vinyl flooring and associated mastic, wallboard and associate joint compound, plaster, stucco, acoustic ceiling spray, ceiling tiles, heating system components, and roofing materials. Commercial/industrial structures are affected by asbestos regulations if damage occurs or if remodeling, renovation, or demolition activities disturb ACMs. Because many structures within the CPA were constructed before 1978, there is a potential for the presence of ACMs to exist in a wide variety of buildings within the CPA.

Lead and Lead-Based Paint (LBP). Lead is a naturally occurring metallic element. Because of its toxic properties, lead is regulated as a hazardous material. Excessive exposure to lead can result in the accumulation of lead in the blood, soft tissues, and bones.

Children are particularly susceptible to potential lead-related health problems because it is easily absorbed into developing systems and organs. Lead can affect almost every organ and system in the body and can result in behavior and learning problems, lower IQ and hyperactivity, hearing problems, and anemia in children, and cardiovascular effects, decreased kidney function, and reproductive problems in adults.[3] Among its numerous uses and sources, lead can be found in paint, water pipes, solder in plumbing systems, and in soils around buildings and structures painted with LBP. LBP was primarily used during the same time period as ACMs. Commercial/industrial structures are affected by lead-based paint regulations if the paint is in a deteriorated condition or if remodeling, renovation, or demolition activities disturb LBP surfaces. Since many structures within the CPA were constructed before 1978, there is potential for structures within the CPA to contain paints and coatings with detectable or elevated concentrations of lead.

Polychlorinated Biphenyls (PCBs). PCBs are mixtures of up to 209 individual chlorinated compounds. There are no known natural sources of PCBs. PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they do not burn easily and are good insulators. The manufacture of PCBs was stopped in the United States in 1977 because of evidence that they build up in the environment and can cause harmful health effects such as liver damage and skin rashes. Health risks include cancer as well as non-cancer effects on the immune system, reproductive system, nervous system, endocrine system, such as a decrease in the size of the thymus gland, decreased birth weight and gestational age for children born to women exposed to PCBs, and decreased thyroid hormone levels.[4] Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

Environmental Setting

Hazardous Materials Sites

The locations where hazardous materials are used, stored, treated, and/or disposed of comes to the attention of regulatory agencies through various means, including licensing and permitting, enforcement actions, and anonymous tips. To the extent possible, the locations of these businesses and operations are recorded in several database lists maintained by various state, federal, and local regulatory agencies. In some cases, businesses that use hazardous materials in quantities greater than certain established thresholds are required to file business plans with the Los Angeles Fire Department (LAFD). Other businesses that engage in the transport, storage, treatment, or disposal of hazardous materials are required

4 United States Environmental Protection Agency (USEPA). 2017c. Polychlorinated Biphenyls (PCBs). https://www.epa.gov/pcbs/learn-about-polychlorinated-biphenyls-pcbs#healtheffects. Accessed June 2022.

to maintain detailed records of all their hazardous materials-related activities. Federal, state, and local agencies enforce regulations applicable to hazardous waste generators and users, and the Los Angeles County Fire Department Health Hazardous Materials Division tracks and inspect hazardous materials handlers to ensure appropriate reporting and compliance.

Permitted uses of hazardous materials include those facilities that use hazardous materials or handle hazardous wastes in accordance with current hazardous materials and hazardous waste regulations. The use and handling of hazardous materials from these sites is considered low, although there can be instances of unintentional chemical releases. In such cases, the site would be tracked in the environmental databases as an environmental case. Permitted sites without documented releases are, nevertheless, potential sources of hazardous materials in the soil and/or groundwater (compared to sites where there are no hazardous materials used or stored) because of accidental spills, incidental leakage, or spillage that may have gone undetected. Many of the facilities are permitted for more than one hazardous material use and, therefore, could appear in more than one database.

The potential to encounter hazardous materials in soil and groundwater in the CPA was based on a search of federal, State, and local regulatory databases that identify permitted hazardous materials uses, environmental cases, and spill sites. The following sources were reviewed to identify contaminated sites:

- Environmental Data Resources (EDR), EDR DataMap Area Study, Boyle Heights Community Plan Area, Los Angeles, CA, July 10, 2017
- California Department of Toxic Substances Control (DTSC) EnviroStor Database
- State Water Resources Control Board (SWRCB) Geo Tracker Database
- U.S. EPA Superfund Enterprise Management Systems (SEMS) Database in Envirofacts

The EDR records search reviewed federal, state, local, tribal, and EDR proprietary databases to characterize the general environmental regulatory status of properties within and in the vicinity of the CPA.[5] The EnviroStor database contains information on properties in California where hazardous substances have been released or where the potential for a release exists. The GeoTracker database contains information on properties in California for sites that require cleanup, such as leaking underground storage tank (LUST) sites, which may impact, or have potential impacts, to water quality, with emphasis on groundwater. The SEMS database lists Superfund sites that are found on the NPL.

5 Environmental Data Resources, Inc., *EDR DataMap Area Study, Boyle Heights Community Plan Area, Los Angeles, CA,* July 10, 2017.

EDR Report

The EDR records search provided the number of recorded hazardous material sites within the search area. The search identified a total of 3,689 properties within and in the vicinity of the CPA with potential hazardous concerns. Based on the EDR Report,[6] 0 NPL sites, 1 SEMS site, 42 RCRA-LQG sites, 138 RCRA-SQG sites, 1 U.S. Brownfield site, and 1 Cortese site were identified within and in the vicinity of the CPA. The locations of the sites are identified in **Figure 4.8-1** and **Figure 4.8-2**.

EnviroStor Database

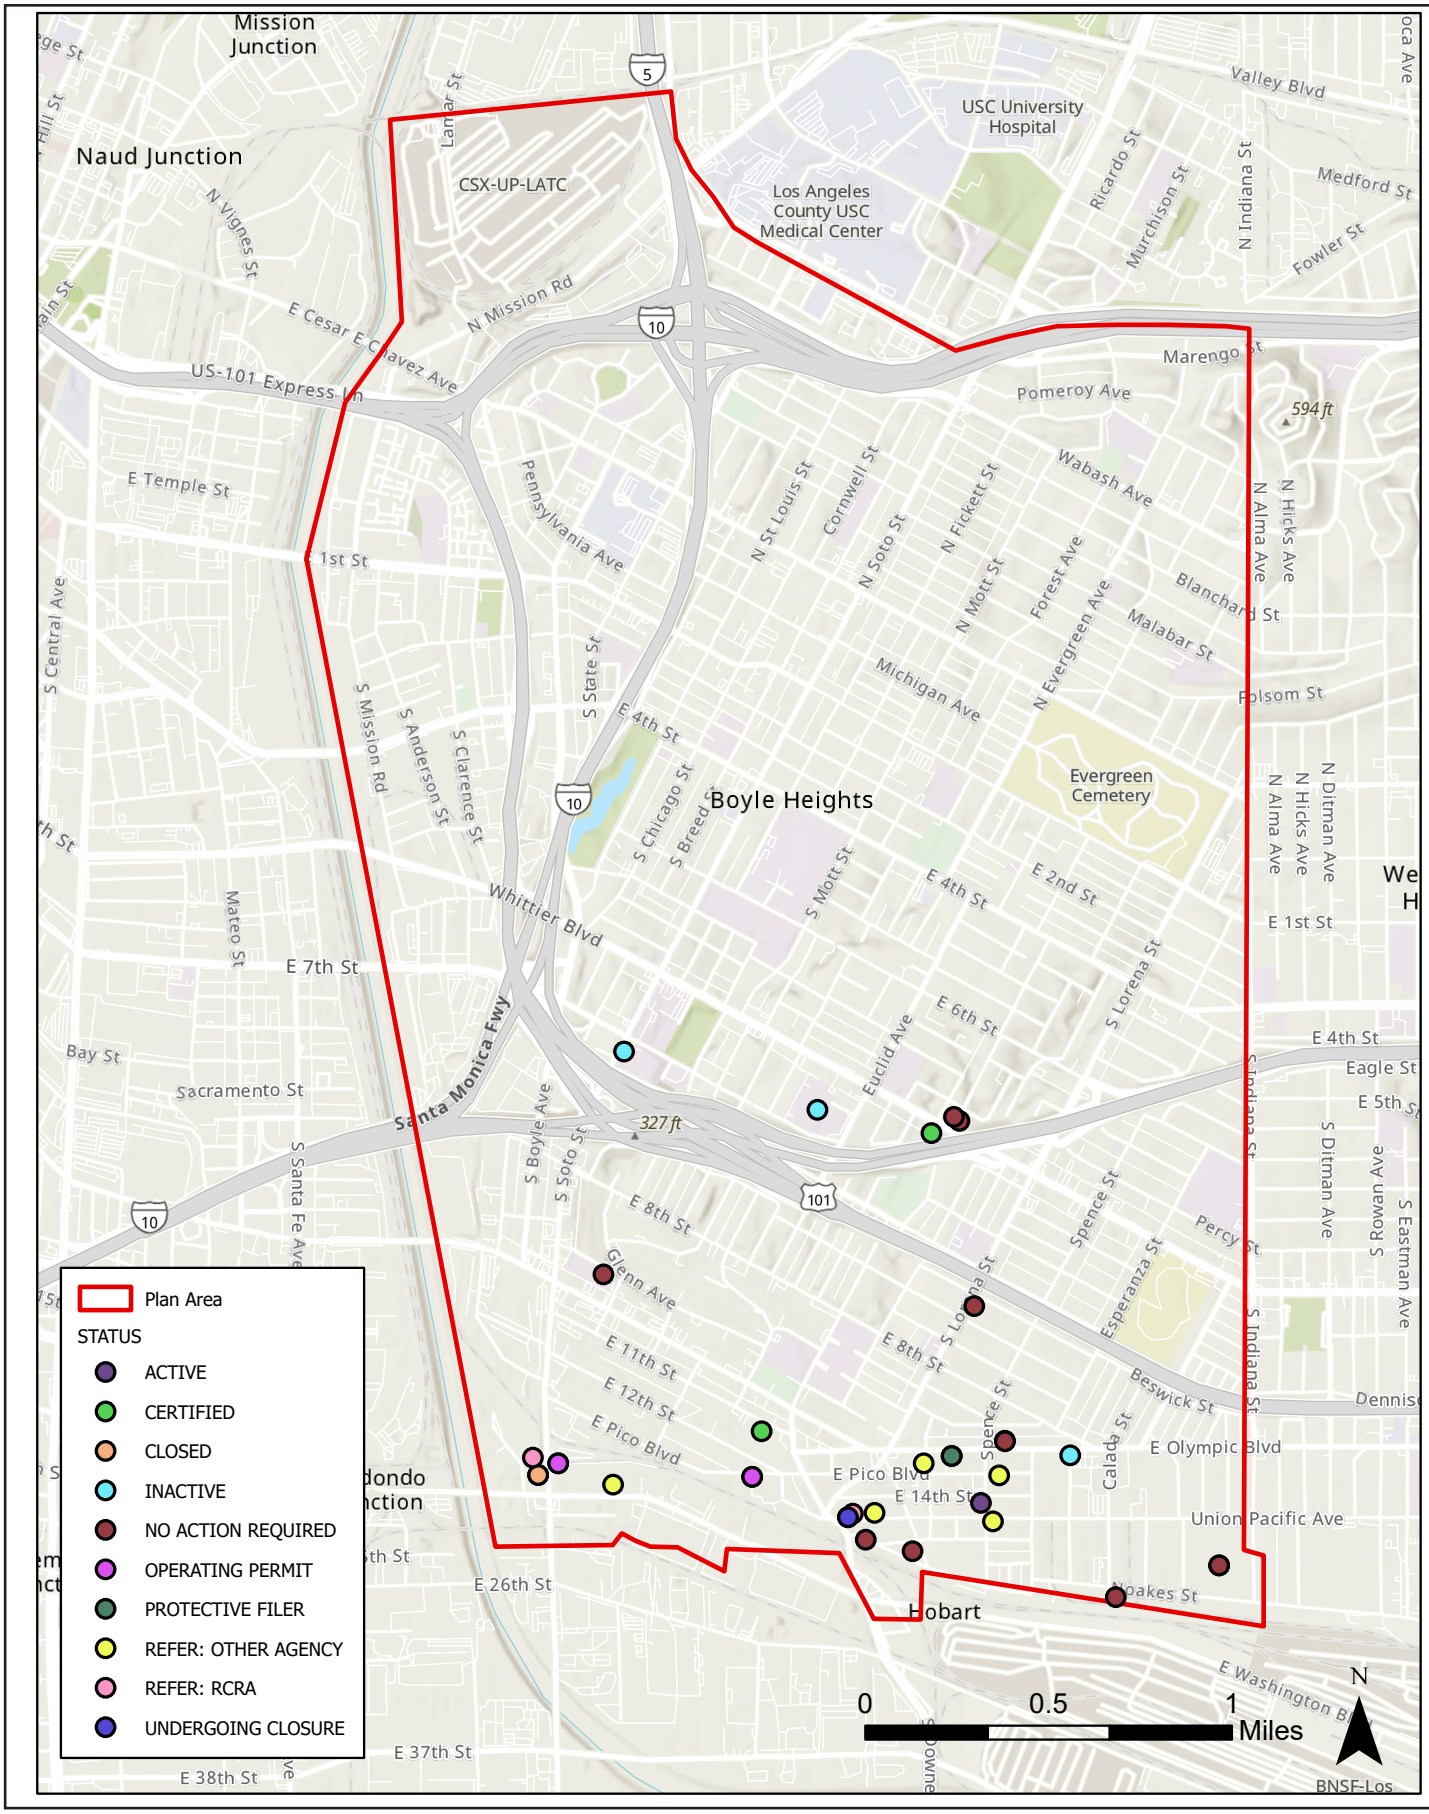
A more recent search was conducted in May 2022 of the Hazardous Waste and Substances Sites List through the EnviroStor database which identified 86 cleanup sites within the CPA and surrounding areas (zip codes 90023 and 90033). The database search identified 6 "Active" sites in the CPA. An "Active" site indicates that an investigation and/or remediation is currently in progress and that the DTSC is actively involved, either in a lead or support capacity. **Table 4.8-1** lists DTSC cleanup sites in the CPA, including the aforementioned 6 active sites as well as a number of sites that are inactive or do not require further action**. Figure 4.8-1** maps the DTSC sites in the CPA.

Active sites in the CPA include, but are not limited to the following:

1. **Gene's Plating Works** – 3498 East 14th Street: The site's past use that caused contamination includes above ground storage tanks, metal finishing and metal plating. This led to potential contaminated surface/structure, indoor air, soil and soil vapor under investigation. The potential contaminants of concern are under investigation but include metals and VOCs. The facility is currently working on completing the work set forth in the latest version of the site workplan.

2. **Grover's Products Co**. – 3424 East Olympic Boulevard: The site was purchased by Grover's products in 1971 and was used for forming operations until a fire in December 2005, destroyed the building. A work plan to conduct a limited soil investigation was submitted to DTSC in August 2011. Three Areas of Concern were identified: facility main horns manufacturing building, Oily/wet floor in metal forming building and, Wastewater treatment area. The potential contaminants of concern remain under investigation.

3. **Industrial Service Oil Co. Inc.**– 1700 South Soto Street: The site is currently in the process of completing a Corrective Measures Study to determine the preferred method to remediate the contamination that has been found. Past site uses include above ground storage tanks and hazardous



6 *Ibid*.

waste storage leading to potential contaminants of concern which include TPH-motor oil, PCE and TCE. Due to the levels of contamination and PCB discovery, characterization and delineation is occurring concurrently.

4. **Pacific Resource Recovery Services (PRRS) Inc.** – East Pico Boulevard: The site currently does not have details regarding past uses and potential contaminants of concern, per the Envirostor search. In June 2012 DTSC issued a permit to PRRS. DTSC is evaluating the Phase III results to determine the extent of contamination and if further investigation is needed as of July 2018.

5. **Pentrate Metal Processing, Inc.** – 3517 East Olympic Boulevard: A limited investigation was conducted at this site in 2010 and detected PCE, TCE and Zinc in the soil and soil vapor. A proposed workplan was submitted in October 2017. Pentrate entered a Corrective Action Agreement with DTSC in August 2017, and a supplemental site investigation was conducted in January 2018. This investigation found elevated levels of PCE and TCE persisting in soil vapor as well as exceedance of zinc at one foot of soil. The responsible party is currently implementing the CMP which was approved as final on June 30, 2020.

6. **Ekco Metals –** 1700 Perrino Place: Based on the findings of the Five-Year LUC report developed in June, 2014, DTSC found high levels of lead, copper, nickel, and beryllium were released on the Facility's eastern fence line. This release was considered a new Solid Waste Management Unit that was not previously identified. DTSC is currently developing the draft RCRA Corrective Action Consent Agreement to identify and remediate this and other potential AOCs emanating.

** Data shown for zip codes 90023 and 90033*

California State Water Resources Control Board (SWRCB) GeoTracker Database

A search of this database was conducted on May 20, 2022 and identified 9 "Open" cleanup sites in the CPA and 141 cases that were completed and closed. A completed and closed site indicates that a closure letter or other formal decision document has been issued for the site. Open sites are categorized as "Assessment and Interim Remedial Action," "Remediation," "Site Assessment," Verification Monitoring," "Reopen Case," "Eligible for Closure," or "Inactive" for sites where no regulatory oversight activities are being conducted by the Lead Agency**. Table 4.8-2** lists GeoTracker cleanup sites in the CPA and **Figure 4.8-2** presents these sites on a map.

The open sites within and in the vicinity of the CPA include:

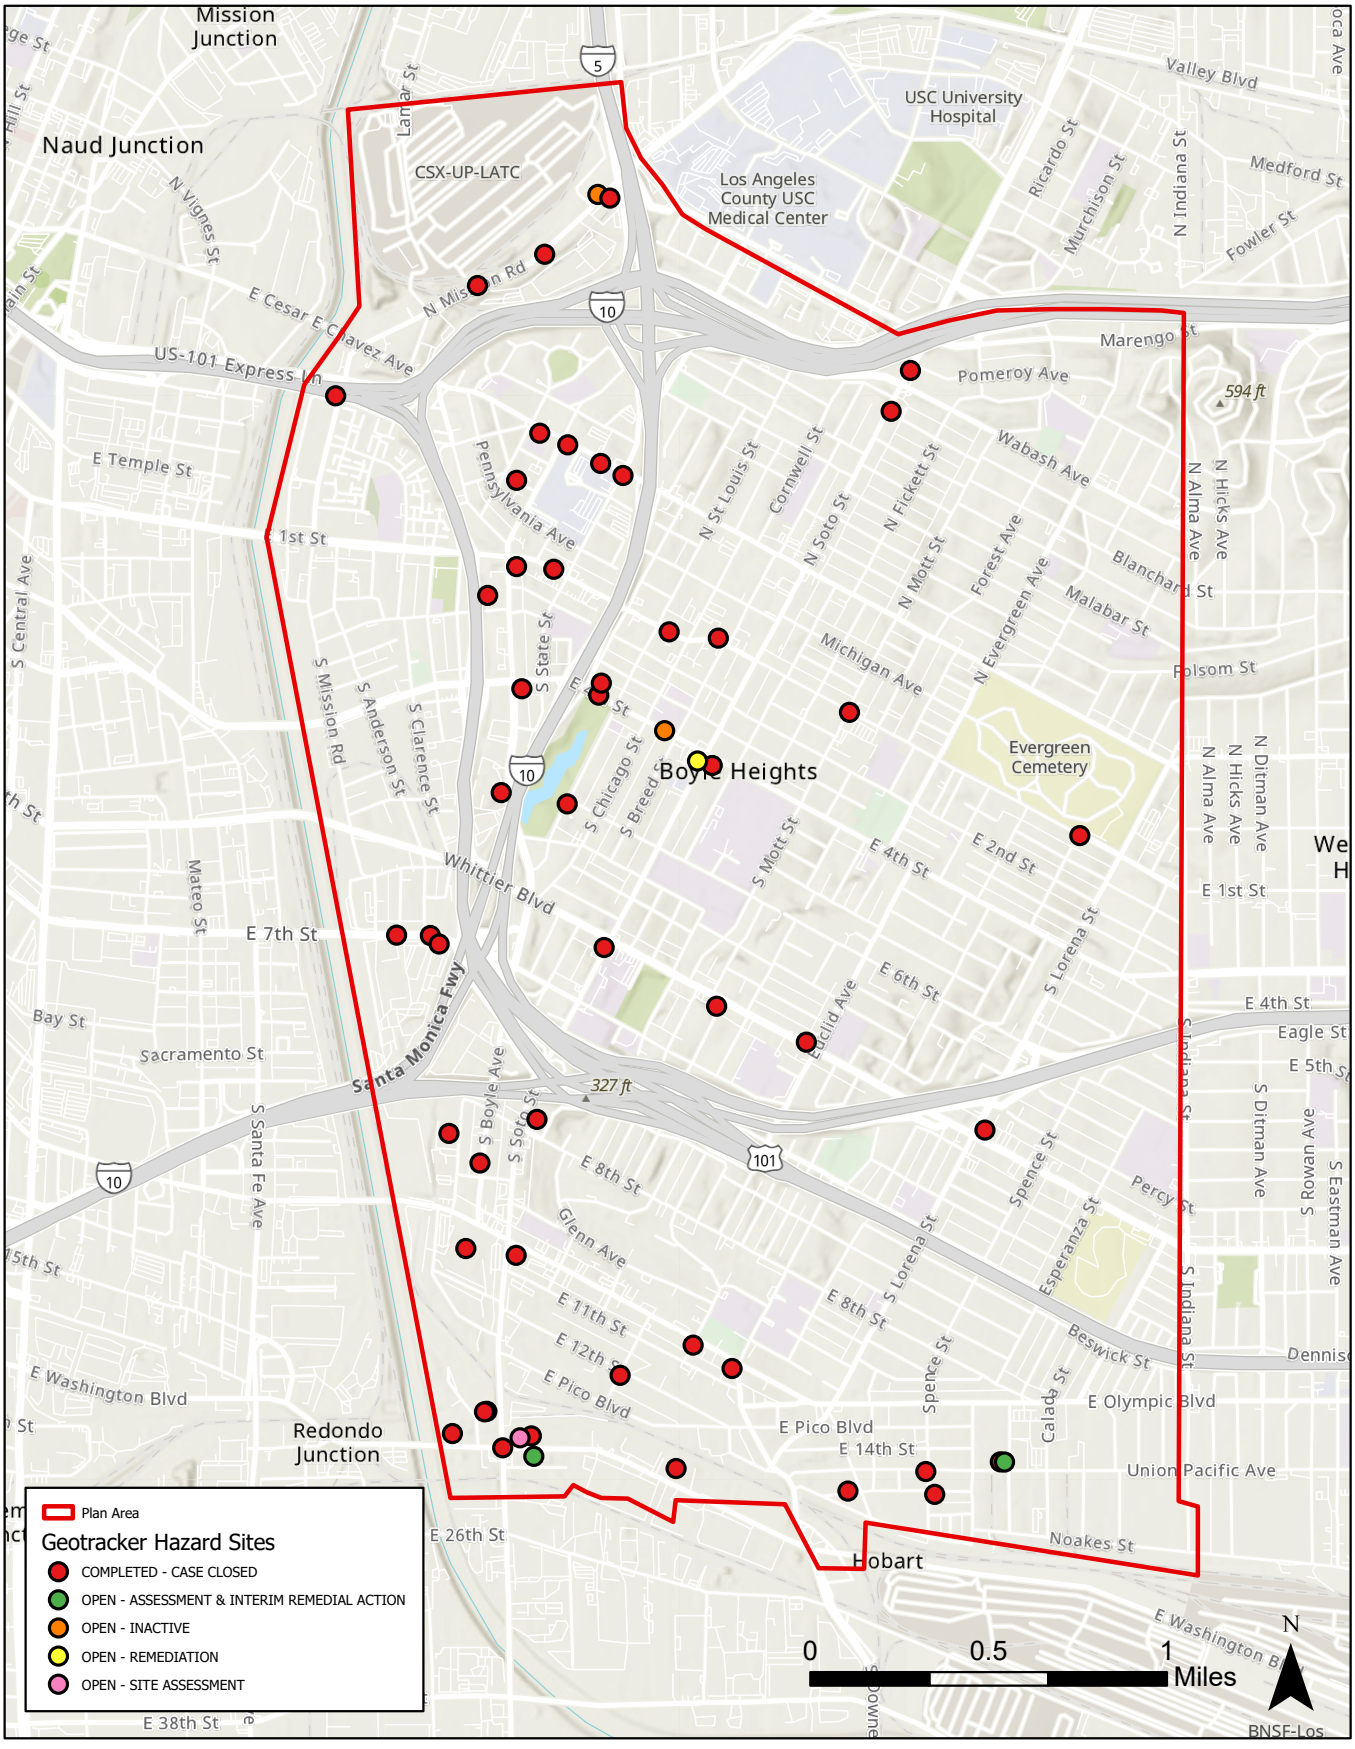
1. **Union Pacific Railroad J Yard** – 1999 East 25TH Street: This site is a railroad switching yard with investigations beginning in 1992. Through investigation PCE and TCE were detected leading to an assessment requirement. Both PCE and TCE were delineated in the soil and remediated via soil extraction and excavation for the ACRL. Further assessment work found no water at a depth of at least 243 feet below ground surface.

2. **2305 S Santa Fe Avenue Site –** 2305 South Santa Fe Avenue: This site is a property improved with a two-story warehouse building constructed in 1987. Prior use of the site includes a lumber storage yard, lumber shed, various uses of warehouse and storage buildings, knife manufacturing shop, machine shops, a salvage store, tow/motor repair shop, maintenance shop, and office building. In May 2019, the Regional Board received a response from Fulcrum Resources (FR) Environmental requesting response/opinion on the opening and closure of the site. A no further action letter has been requested by the property owner once the Regional Board determines potential soil, soil vapor and groundwater impacts have been addressed. The potential contaminants of this site include lead, nickel, other metals, PCE, TPH and TCE.

3. **Former Ace Plating** – 719 Towne Avenue: Plating operations were conducted by Ace Plating, specifically electrochemical coating of metal parts, until 2005. Assessments at the site indicates soil has been impacted with VOCs and metals. The source of existing PCE in the soil is unknown, however higher concentrations exist in the central portions of plating rooms. Two groundwater monitoring wells have been installed and hexavalent chromium was not found above laboratory detection limits in any of the ground water samples collected. PCE and 1,1-dichloroethene are the only VOC detected in the ground water.

4. **Southern California Aluminum (Former)** – 2829 East Washington Boulevard: Per GeoTracker, the SCAT facility is currently closed, and equipment has been partially dismantled. The potential contaminants of concern include TCA, PCE and TCE. No further information is available on GeoTracker.

5. **Winhall #1** – 401 Soto Street South: Limited information regarding site information is currently available on GeoTracker. The potential contaminant of concern at the site is gasoline, with 7 wells being monitored semi-annually. The clean-up status of the site is open- remediation as of May 15, 2013.



6. **Alcazar Maintenance Yard** – 1525 Alcazar Street: The site clean-up status is open – inactive as of December 2, 2014. The potential contaminants of concern include petroleum, fuels, soils, and volatile

organic compounds. The media of concern is the aquifer used for drinking water supply as well as the soil. No further information is available on GeoTracker.

7. **Ekco Metals –** 1700 Perrino Place: This site has no specified potential contaminants or media of concern according to GeoTracker. It has an open- inactive status as of October 30, 2014. No further information is available on GeoTracker.

8. **Cal-Doran** – 2830 East Washington Boulevard: This site is the former Cal Doran Facility that was demolished in 2006. Bodycote Thermal processing currently owns the two parcels of land totaling 9.76 acres. VOC used during the previous use of the site have been released into the groundwater. Subsurface investigations conducted at the site have found VOCs in the vapor phase in soil to depths of 230 feet below ground surface, and in the underlying groundwater. Since 2007 there has been ongoing soil vapor extraction to remove VOC impact in soils as well as quarterly ground monitoring.

9. **Soco-Lynch Corporation** – 3629 East Union Pacific Boulevard: The site is currently a Soco-Lynch corporation facility. The property was at one point a wood manufacturing mill and later used for lumber storage and wood treatment activities. The site was then used as a metal manufacturing site and then a storage site for metal barrels. The site has since been a chemical blending facility focused on transporting, loading, blending and repackaging of various chemicals for sale. The 15 underground storage tanks (USTs) at the site were removed in 1999 and the Los Angeles City Fire Department granted a UST case closure to the owner in 2000. Site investigations indicate a limited area near the southeast corner of the site was impacted by VOCs including acetone, bromomethane, tetrachloroethene (PCE), toluene and xylenes. Site assessment is still being conducted under Regional Board's oversight.

U.S. EPA Superfund Enterprise Management System (SEMS) Database in Envirofacts

A search of the U.S. EPA database of Superfund sites conducted on May 20, 2022 revealed no sites on the National Priorities List, and one SEMS site. While the DTSC's Envirostor database, discussed above, lists several National Priorities List (NPL) sites in the CPA. These sites are older and are primarily listed as inactive.

The SEMS site in the CPA is discussed below:

1. **Capri Pumping Service** — 3128 Whittier Boulevard: The facility located at this site once operated as a hazardous waste treatment, storage and transport facility. The site had an emergency response removal of 120 drums of cyanide, acids and metals. After a complaint was filed with the City of Los Angeles, contaminated soils and wastes were characterized and removed.

Environmental databases are updated as new sites are identified and existing sites are resolved. The intent of the database searches summarized in this document is not to provide a comprehensive listing of contaminated sites, but to provide a general characterization of the types of contamination found in the CPA.

Use, Transport, and Disposal of Hazardous Materials

The use of hazardous materials is typically associated with industrial land uses. Activities, such as manufacturing, plating, cleaning, refining, and finishing, frequently involve chemicals that are considered hazardous when accidentally released into the environment. There are several clusters of industrial uses scattered throughout the CPA. The western edge of the CPA, adjacent to the east bank of the Los Angeles River, is mainly used for manufacturing and storage warehouses. Other existing industrial clusters are

present at the southern border of the CPA, south of Olympic Boulevard. Uses in this area consist of various warehousing, storage, distribution, textiles, and other industrial uses. This area is adjacent to the City of Vernon's northern border that has industrial uses of the same nature and are compatible with the industrial uses within the CPA. The area of the CPA to the north of the Interstate-10 / US-101 junction by Mission Road has a smaller concentrated pocket of industrial uses. This area contains uses centered around vehicle repair and salvage and contains multiple automotive glass businesses.

To a lesser extent, hazardous materials may also be used by various commercial enterprises, as well as residential uses. Dry cleaners, in particular, use cleaning agents considered to be hazardous materials. Hardware stores typically stock paints and solvents, as well as fertilizers, herbicides, and pesticides. Swimming pool supply stores stock acids, algaecides, and caustic agents. In fact, most commercial businesses occasionally use commonly available cleaning supplies which, when used in accordance with manufacturers' recommendations, are considered safe by the State of California, but when not handled properly can be considered hazardous. Private residences also use and store commonly available cleaning materials, paints, solvents, swimming pool and spa chemicals, as well as fertilizers, herbicides, and pesticides.

If improperly handled, hazardous materials can result in public health hazards through human contact with contaminated soils or groundwater, or through airborne releases in vapors, fumes, or dust. There is also the potential for accidental or unauthorized releases of hazardous materials that would pose a public health concern. The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, State, and local regulations. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous waste transporters are required to complete and carry a hazardous waste manifest (which is a set of forms, reports, and procedures designed to seamlessly track hazardous waste).

Most transportation of hazardous materials through and within the CPA consists of trucks that traverse along freeways, such as Interstate 5 (I-5), the Pomona Freeway (I-60), the Santa Monica Freeway (I-10), and US-101, and major thoroughfares in the CPA. Major thoroughfares in the CPA include Marengo Avenue, Cesar E Chavez Avenue, First Street, Fourth Street, Whittier Boulevard, Olympic Boulevard, Washington Boulevard, and Soto Street.

Citywide Use, Transport, and Abatement of Hazardous Materials

Hazardous materials are used in commercial, industrial, institutional, and agricultural operations throughout the City. Hazardous materials are shipped, stored, and used at the major airport (Los Angeles

International Airport) and harbor facilities (Port of Los Angeles) within the City boundaries. Hazardous materials are also transported along freeways and highways that route through the City and stored in facilities. Identification, handling, storage, and transport of hazardous materials are managed and regulated by federal, State, and City regulations.[7]

Boyle Heights Use, Transport, and Abatement of Hazardous Materials

Hazardous materials use is primarily concentrated in the Industrial and Manufacturing area on the western edge of the CPA and also along the CPA's eastern boundary adjacent to the City of Vernon where light and heavy industry are present. Most transportation of hazardous materials through and within the CPA consists of trucks that travel along freeways and major thoroughfares in the CPA, although hazardous materials are also moved by rail through the CPA along the Union Pacific rail lines on the western portion of the CPA.

Oil Fields and Wells

Oil fields and oil production activities present a variety of hazards in urbanized areas, including the potential for toxic air contaminants and dust from oil production, and the potential of contaminant release into an aquatic environment. Unconstrained oil seepage from oil fields and wells can contaminate the soil and groundwater aquifers.

The California Department of Conservation Geologic Energy Management Division (CalGEM) provides information regarding oil and gas wells and other types of related facilities throughout the state. The Boyle Heights CPA contains one State Designated Oil Field now listed as abandoned.[8] The Boyle Heights Oil Field contained thirteen wells that are currently plugged and not in operation.[9] Five other wells are located within the CPA that are currently listed as being idle and not currently used for extraction. Drilling of oil wells and the production from the wells of oil, gases, or other hydrocarbon substances are permitted in the City's Supplemental Use Oil Drilling District ("O" District) subject to the provisions of LAMC Section 13.01. The oil wells within the CPA are depicted in **Figure 4.8-3, Oil Wells within the Community Plan Area.**

There are no active oil wells in the CPA. All oil wells located within the CPA are identified as plugged, idle, or buried and idle. Plugged wells prevent fluid from migrating between underground rock layers prior to abandonment. Idle wells are identified as not having produced oil or natural gas for six consecutive

9 *Ibid*.

months of continuous operation during the last five or more years. Buried-idle wells are characterized the same as idle wells and are also buried.

Exide

The former Exide Facility is located at 2700 South Indiana Street in the City of Vernon, California. A lead recycling facility operated at the former Exide Facility property from 1922 until March 2014. Exide acquired the facility in 2000 and used the facility for lead recycling to recover lead from automotive batteries and other lead-bearing materials. In March 2014, Exide shut down its operations because it could not meet new rules enacted by the South Coast Air Quality Management District (SCAQMD) and has not operated since that date. According to the Revised AB 2588 Health Risk Assessment prepared for Exide in January 2013, Exide had intended to implement air pollution risk reduction measures required by SCAQMD and DTSC to restart operations at the facility in March 2015, but in January 2015, DTSC determined that the liner system under the containment building where Exide stored crushed battery feed material had failed. On January 30, 2015, DTSC ordered Exide to investigate the extent of contamination under the containment building so that Exide could implement any necessary corrective actions.

Activities conducted at the former Exide Facility that contributed to contamination of surrounding properties (including those within the CPA) include battery breaking, smelting, refining lead, and storage, handling, and transportation of batteries, finished lead product, and other materials associated with lead recycling operations. These activities, which occurred for decades before environmental statutes or regulations existed and therefore were carried out without proper environmental control measures, have been identified as contributing to releases of lead within the CPA.

In response to findings in a risk assessment prepared by Exide for SCAQMD, DTSC ordered Exide to conduct soil sampling in communities around the facility. The initial phase (Phase 1) assessment of lead concentrations in residential soil focused on two areas, collectively referred to as the "Initial Assessment Areas." DTSC ordered Exide to sample 19 residential properties in in Boyle Heights and East Los Angeles and 20 residential properties in Maywood between August and November 2014. The study determined that the concentration of lead in soils in the Northern and Southern Assessment Areas exceeded the Office of Environmental Health Hazard Assessment (OEHHA) health screening level of 80 milligrams per kilogram (mg/kg).[10] Concurrently with Phase 1 sampling, Exide conducted a preliminary background study in a residential area with similar urban and industrial characteristics as those around the former Exide Facility, approximately 14 miles to the south of the facility in Long Beach, California. Exide's

[10] DTSC. *Technical Review of Off-Site Soil Sampling Report*. 2014. Available online at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2021/07/2014_03_10_DTSC_Exide_Soil_Sampling_Report-ADA.pdf, accessed May 16, 2022.

preliminary background study indicated that background lead concentrations in the Long Beach soil samples were below DTSC's screening level for lead in residential soils (80 milligrams per kilogram (mg/kg) or parts per million (ppm).

Because the Phase 1 soil sampling results from the Initial Assessment Areas exceeded background lead concentrations and DTSC's screening level for lead in residential soils, DTSC ordered Exide to perform soil cleanup of all residential properties with concentrations exceeding the residential screening criteria for lead in the soil. Under that order, Exide cleaned up 186 residential properties in the Initial Assessment Areas between August 2014 and November 2015. DTSC also ordered Exide to conduct additional step-out sampling (Phase 2) within areas referred to as the Northern Expanded Assessment Area and Southern Expanded Assessment Area (collectively referred to as the "Expanded Assessment Areas"). In March 2014, Exide collected soil samples from 146 residential properties in the Expanded Assessment Areas. Many of the properties sampled during Phase 2 exceeded DTSC's screening level for lead in residential soils. DTSC ordered further sampling along dominant wind directions out to a distance of 4.5 miles from the former Exide Facility. Based on the additional sampling, the DTSC concluded that Exide operations impacted properties within a 1.7 miles radius around the facility, including the southern portion of the Boyle Heights CPA.[11] The Preliminary Investigation Area (PIA -- 1.7-mile radius from the Exide site) is shown in **Figure 4.8-4, Exide Location and CPA**.

In 2016, Governor Jerry Brown allocated $176.6 million in taxpayer funds to begin the cleanup of 2,500 highly contaminated parcels. Governor Gavin Newsom since allocated an additional $74.5 million in 2019 and $332.4 million in 2021 to continue the cleanup. The DTSC is in charge of this cleanup effort and at the time had planned to clean the parcels within two years of cleanup activities. The DTSC is prioritizing the cleanup of properties with the highest levels of lead in soil that also pose the greatest risk of exposure, see **Section 4.8.3, Regulatory Framework**, for a description of the Exide Clean Up Plan Final EIR. As of January 2022, the DTSC sampled approximately 8,600 parcels[12] and 3,200 parcels within the PIA have been cleaned by the DTSC.[13] In 2021, Exide filed for bankruptcy and was allowed to walk away from its obligations with regard to the cleanup effort. Consequently, the State of California has continued to fund the cleanup effort. The DTSC anticipates completing cleanup of an additional 2,700 parcels by March 2025. To date, more than 8,600 of the estimated 10,000 parcels that fall within the cleanup area have been sampled for contamination.

---

11 DTSC. *Residential Cleanup: Preliminary Investigation Area, Former Exide Vernon Facility Scoping Meeting*. 2016. Available online at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/03/Scoping-Meeting_Final.pdf, accessed May 16, 2022.

12 DTSC. *Sampling Data for the Exide Preliminary Investigation Area*. Available online at: https://dtsc.ca.gov/soil-sampling-data-for-the-exide-preliminary-investigation-area/, accessed June 15, 2021.

13 DTSC. *Site Mitigation & Restoration Program*, https://dtsc.ca.gov/residential-cleanup/, accessed May 18, 2022.

In 2021 DTSC conducted additional sampling and conducted a human health risk assessment of the parkways in the PIA as previous cleanup efforts were limited to yards. Exide began collecting soil samples in parkways on May 24, 2019, and released the Final Draft Investigation Report and Final Draft Human Health Risk Assessment for the public parkways on February 1, 2021. The public comment period on this document ended on June 15, 2021.[14] To date, the DTSC has not selected a preferred clean up scenario for the parkways, although the sampling has shown elevated levels of contamination.

Methane Gas

Methane gas is produced by anaerobic decay of organic matter deep under the Earth's surface and is the major component of natural gas, about 87 percent by volume.[15] In common usage, deposits rich in natural gas (i.e., methane) are called natural gas fields. At room temperature and standard pressure, methane is a colorless, odorless gas. While not toxic, it is highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space. The concentrations at which flammable or explosive mixtures form are much lower than the concentration at which asphyxiation risk is significant. When structures are built on or near landfills or naturally occurring natural gas fields, methane gas can penetrate the buildings' interiors and expose occupants to significant levels of methane. As shown in **Figure 4.8-5, Methane Zones in the CPA**, several areas within the CPA are located within a Methane Zone and Methane Buffer Zone.[16] Generally, the center and scattered residential portions of the CPA are identified to be within a Methane Zone or Methane Buffer Zone. Parcels within the Methane Zone are subject to more restrictive mitigation requirements, and parcels within the Methane Buffer Zone are subject to less restrictive mitigation requirements, though requirements are site-specific and can vary.

Schools

School locations require consideration because children are particularly sensitive to hazardous materials exposure. Additional protective regulations apply to projects that could use or disturb potentially hazardous materials/wastes near or at schools. The California Public Resources Code requires projects that would be located within 0.25 miles of a school and might reasonably be expected to emit or handle hazardous materials to consult with the school district regarding potential hazards.

IMPACT SCIENCES

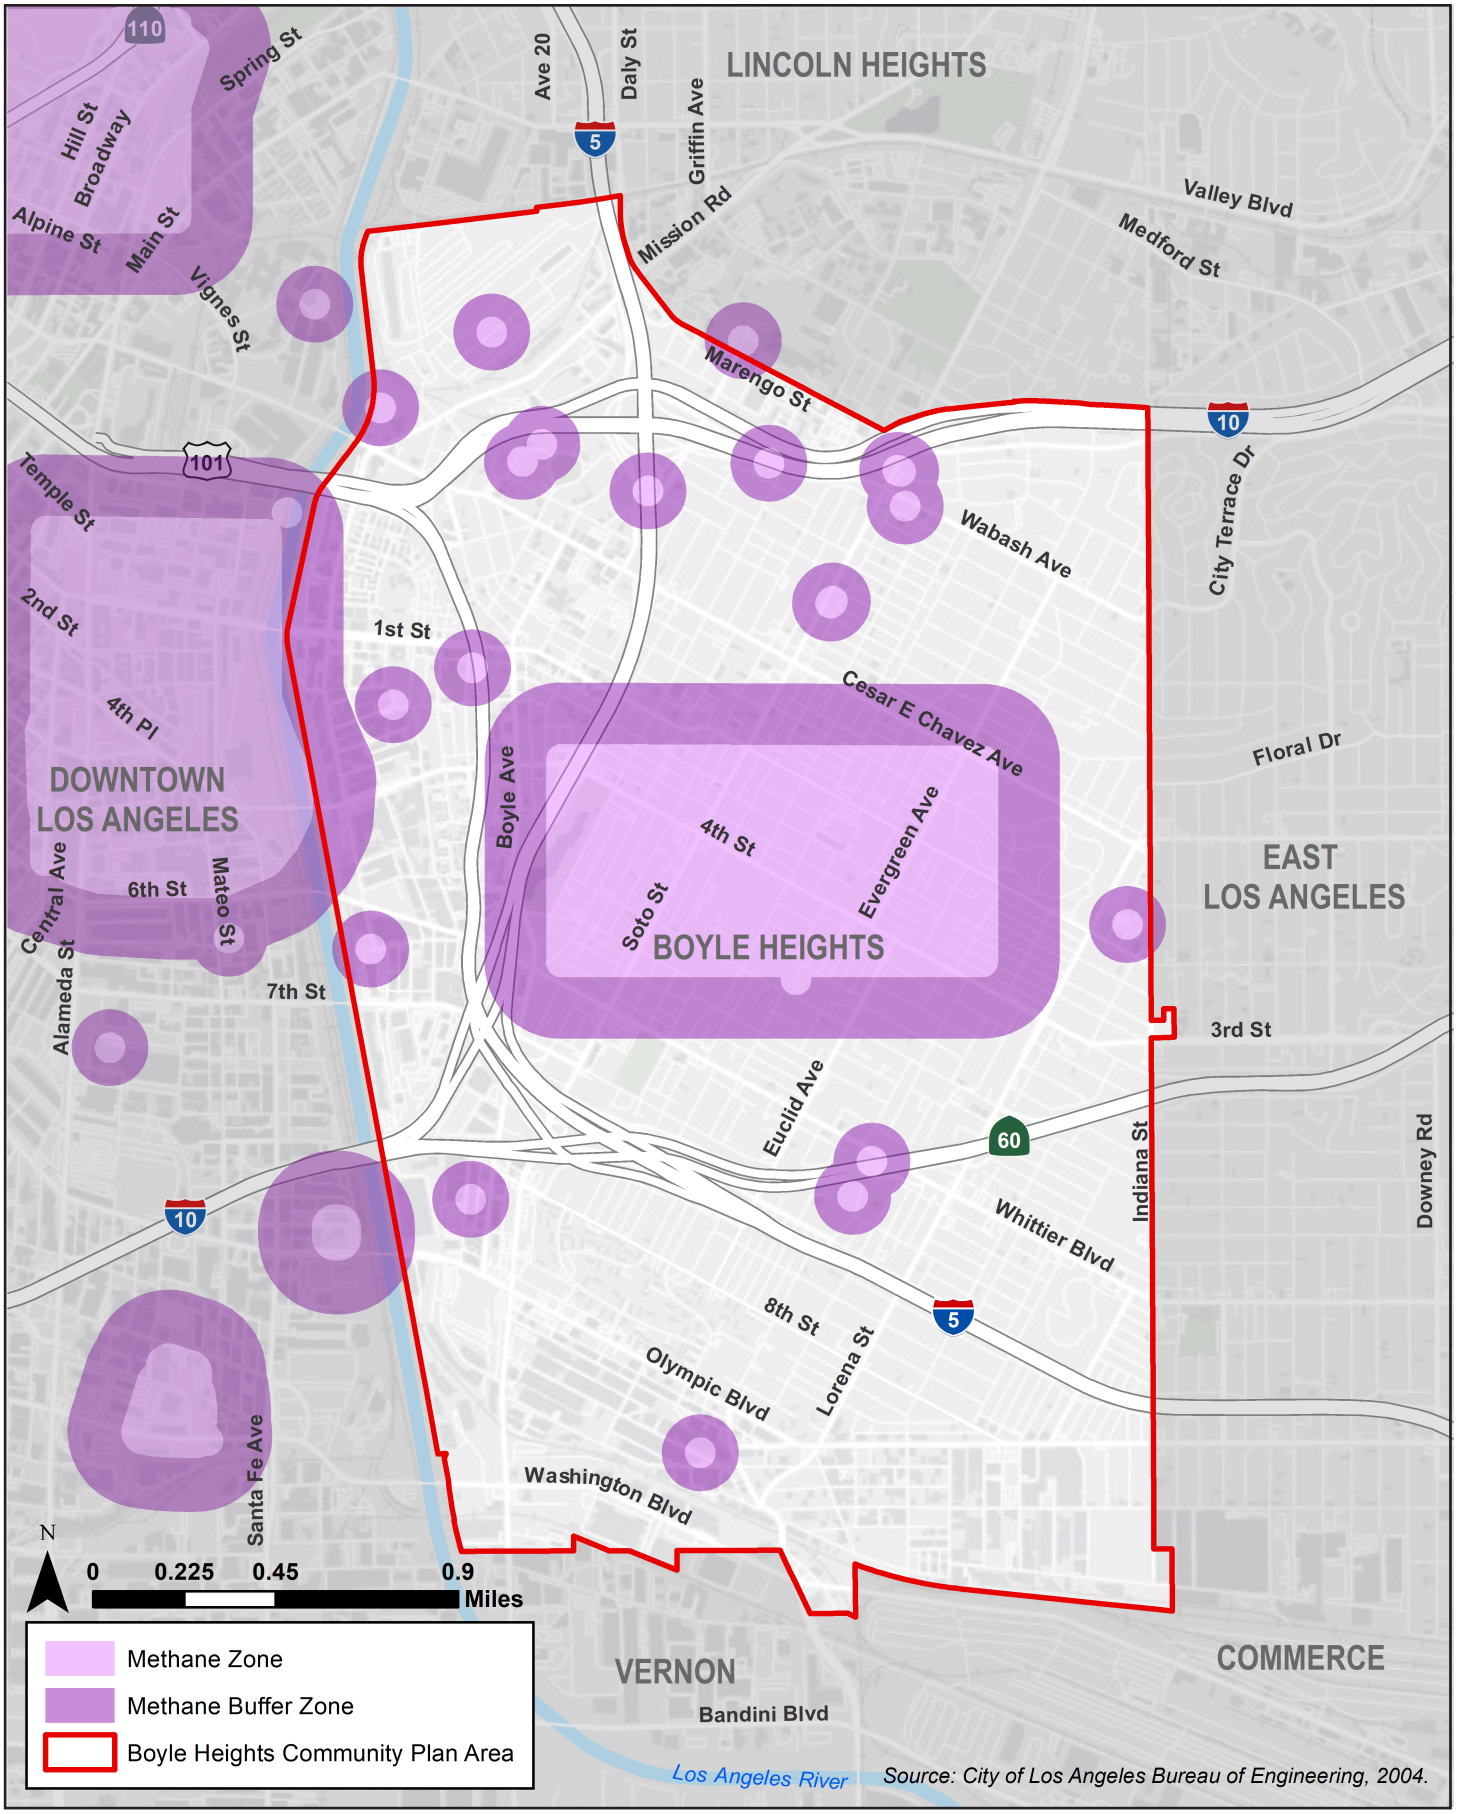
Exide Location and PIA area in relation to the CPA



The Los Angeles Unified School District (LAUSD) is the second largest school district in the nation encompassing over 720 square miles, including the City of Los Angeles as well as all or parts of 31 smaller municipalities plus several unincorporated sections of Southern California. There are over 900 schools and 187 public charter schools within LAUSD, which hosts students from kindergarten to 12th grade. In addition to schools within LAUSD, the City of Los Angeles has other educational facilities which include colleges, preschools, nurseries, and private schools. As discussed in **Section 4.13, Public Services and Recreation**, a total of 27 LAUSD public schools serve the CPA, including 6 primary/early education centers, 15 elementary schools, 2 middle schools, 4 high schools, and 7 charter schools. **Figure 4.8-6** shows educational facilities in or near the CPA.

For the purposes of analysis, the Proposed Plan anticipates that all the students residing in the CPA would attend public schools within the CPA. However, LAUSD students would have the option of attending public schools outside the CPA through the Choices program or the option of private schooling. Schools, in particular high schools, may include use and/or storage of hazardous materials and generation of hazardous wastes and may be listed as large or small generators of hazardous materials. Activities within schools that are associated with hazardous materials include chemistry labs, automobile repair shops, print shops, and photography labs as part of the educational curriculum as well routine maintenance supplies including cleaning and painting materials and herbicides and pesticides. Nonetheless, regulatory compliance for the specialized handling of hazardous materials by school program administrators would ensure that students' exposure to toxins is minimized.

Airport

The CPA is not located within two miles of any public or private airports. The nearest airports located in proximity to the CPA include the El Monte Airport located at 4233 Santa Anita Avenue, in the City of El Monte; the Hollywood Burbank Airport located at 2627 N. Hollywood Way, in the City of Burbank; and the Los Angeles International Airport located at 1 World Way. These airports are approximately 10 miles east, 13.4 miles northwest, and 13.5 miles southwest from the nearest CPA boundary, respectively. Los Angeles International Airport is the nearest international airport, which is 13.5 miles southwest of the CPA Boundary. To prevent the creation of airport hazard zones, restrictions are placed on development in the immediate vicinity of airport runways where take-off and final approach maneuvers occur. There are no airports located within the CPA and the CPA is not located within the Los Angeles County Airport Land Use Commission (ALUC) planning boundaries of the airports.[17]

Wildland and Fire Hazards

The California Department of Forestry and Fire Protection (CAL FIRE) identifies fire hazard areas and fire-threatened communities at the wildland urban interface. CAL FIRE maps identify fire hazard severity zones in the state and local responsibility areas. Wildland fire protection in California is the responsibility of either the state, local government, or the federal government. A designated State Responsibility Area (SRA) is an area "in which the financial responsibility of preventing and suppressing fires is primarily the responsibility of the state" (Public Resources Code Section 4125). Local responsibility areas (LRA) in include incorporated cities, cultivated agricultural lands, and portions of the desert. LRA fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

Classification of a zone as moderate, high, or very high fire hazard is based on a combination of how a fire will behave and the probability of flames and embers threatening buildings.

No part of the CPA is located within a Very High Fire Hazard Severity (VHFHS) Zone, as identified by LAFD.[18] The closest landmark to the CPA in a VHFHS is the Dodger Stadium/Elysian Park, approximately 1.5 miles northwest.

Properties located within VHFHS and Fire Brush Clearance Zones are required to minimize fire risks during the high fire season through vegetation clearance; maintenance of landscape vegetation to minimize fuel supply that would spread the intensity of a fire; compliance with provisions for emergency vehicle access, use of approved building materials and design; and compliance with LAFD hazardous vegetation clearance requirements.[19]

The developed portions of the CPA and its surrounding areas are characterized by features typical of the urban landscape and include commercial, industrial, and residential uses. Urban fires can result from a number of causes, including arson, carelessness, home or industrial accidents, or from ignorance of proper safety procedures. The International Building Code regulates developments and requires certain built-in fire protection devices when maximum allowable uses or heights are exceeded, or the building use presents a life or property protection problem. In addition, LAFD has guidelines to lessen the impacts of fire hazards such as inspection programs.

---

18 City of Los Angeles. Navigate Los Angeles, https://navigatela.lacity.org/navigatela/, accessed June 23, 2021.

19 Los Angeles Fire Department, *Fire Zone – Very High Fire Hazard Severity Zone*, https://www.lafd.org/fire-prevention/brush/fire-zone/fire-zone-map, accessed June 23, 2021.

Citywide Emergency Response

The City of Los Angeles Emergency Management Department (EMD) is comprised of five divisions and two units including administrative services division, community preparedness and engagement division, operational readiness division, planning division, and training exercise division. [20] The EMD works with City departments, municipalities, and with community-based organizations to ensure that the City and its residents have the resources and information they need to prepare, respond, and recover from emergencies, disasters, and significant events.[21] The Emergency Operations Organization (EOO) is the operational department responsible for the City's emergency preparations (planning, training, and mitigation), response and recovery operations. The EOO centralizes command and information coordination to enable its unified chain-of-command to operate efficiently and effectively in managing the City's resources.

The Emergency Operation Center (EOC) is the focal point for coordination of the City's emergency planning, training, response, and recovery efforts. EOC processes follow the National All-Hazards approach to major disasters such as fires, floods, earthquakes, acts of terrorism, and large-scale events in the City that require involvement by multiple City departments. The EOC is a state-of-the-art facility comprised of a Main Coordination Room (MCR), Media Center, Training Room, Management Section Room, Public Information Officer Room, Executive Conference Room, 6 flexible-use Break Out Rooms (includes Business Operations Center), Amateur Radio Operations Room, and two storage rooms.[22]

Rescue and provision of medical care to victims of fires and other emergencies are the responsibilities of LAFD. However, the CPA adjoins other jurisdictions (i.e., the County of Los Angeles, the City of Vernon). As such, the City has several joint-use agreements with other jurisdictions for cooperative response and management of fires and other emergency incidences. Under such agreements, the first respondents would usually be the nearest fire or police units, regardless of jurisdictional boundaries. Key to a successful rapid response is LAFD's goal of maintaining adequate response distances from any given fire outbreak to the closest fire station. See **Section 4.13, Public Services and Recreation,** for further discussion about LAFD and emergency response.

Boyle Heights Plan Area Emergency Response

The City's General Plan Safety Element specifies several disaster routes in the CPA. Disaster routes typically parallel major north-south and east-west corridors in the CPA. Disaster routes within and adjacent to the CPA include US-101; I-10; SR-60; I-5; the north-south corridors of Soto Street and Lorena Street; and the east-west corridors of Cesar Chavez Avenue, 1st Street, 3rd Street, 4th Street, Whittier Boulevard, Olympic Boulevard, and Washington Boulevard.[23]

4.8.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Hazards and Hazardous Materials at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Fire Safety Act
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)
- Disaster Mitigation Act of 2000
- Resource Conservation and Recovery Act
- Toxic Substances Control Act
- Hazardous Materials Transportation Act (HMTA)
- Occupational Safety and Health Act of 1970
- Research and Special Programs Administration
- Other Hazardous Materials Regulations
- Federal Emergency Management Act (FEMA)
- U.S. Environmental Protection Agency
- Title 40 Code of Federal Regulations
- State Policies and Regulations
- California Hazardous Materials Release Response Plans and Inventory Law of 1985

Federal

Federal Fire Safety Act. The FFSA of 1992 is different from other laws affecting fire safety as the law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government that houses at least 25 federal employees during their employment.

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as "Superfund," was enacted by Congress on December 11, 1980.[24] This law provided broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites, providing for liability of persons responsible for releases of hazardous waste at these sites, and established a trust fund to provide for cleanup when no responsible party could be identified. CERCLA also enabled the revision of the National Contingency Plan. The National Contingency Plan provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants. The National Contingency Plan also establishes the National Priorities List, which is a list of contaminated sites warranting further investigation by the EPA. CERCLA was amended by the Superfund Amendments and Reauthorization Act on October 17, 1986.[25]

Disaster Mitigation Act of 2000. Disaster Mitigation Act (42 United States Code [U.S.C.] §5121) provides the legal basis for FEMA mitigation planning requirements for State, local, and Indian Tribal governments as a condition of mitigation grant assistance. It amends the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. §5121-5207) by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need and creates incentives for state, Tribal, and local agencies

---

24 U.S. EPA, "Superfund CERCLA Overview," https://www.epa.gov/superfund/superfund-cercla-overview, accessed May 12, 2022.

25 U.S. EPA, "Summary of the Comprehensive Environmental Response, Compensation, and Liability Act (Superfund)," https://www.epa.gov/laws-regulations/summary-comprehensive-environmental-response-compensation-and-liability-act, accessed May 12, 2022.

to closely coordinate mitigation planning and implementation efforts. This Act reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and the streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- Funding pre-disaster mitigation activities;
- Developing experimental multi-hazard maps to better understand risk;
- Establishing state and local government infrastructure mitigation planning requirements;
- Defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP); and
- Adjusting ways in which management costs for projects are funded.

The mitigation planning provisions outlined in Section 322 of this Act establish performance-based standards for mitigation plans and require states to have a public assistance program (Advance Infrastructure Mitigation [AIM]) to develop county government plans. The consequence for counties that fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding 10-year period by the same type of event.

Resource Conservation and Recovery Act. The federal Resource Conservation and Recovery Act (RCRA) (42 United States Code [U.S.C.] secs. 6901-6992k), which amended and revised the Solid Waste Disposal Act, regulates the generation, transportation, treatment, storage, and disposal of hazardous waste. Under RCRA regulations, generators of hazardous waste must register and obtain a hazardous waste activity identification number. RCRA allows individual states to develop their own programs for the regulation of hazardous waste as long as they are at least as stringent as RCRA's.

Underground Storage Tanks (USTs) are regulated under Subtitle I of RCRA and its regulations, which establish construction standards for UST installations installed after December 22, 1988, as well as standards for upgrading existing USTs and associated piping. Since 1998, all non-conforming tanks were required to be either upgraded or closed.

Toxic Substances Control Act. In 1976, the federal Toxic Substances Control Act (15 USC Sections 2601–2671) established a system of evaluation in order to identify chemicals which may pose hazards. The Toxic Substances Control Act is enforced by the U.S. EPA through inspections of places in which ACMs are manufactured, processed, and stored and through the assessment of administrative and civil penalties and

fines, as well as injunctions against violators. The Toxic Substances Control Act establishes a process by which public exposure to hazards may be reduced through manufacturing, distribution, use and disposal restrictions or labeling of products. Polychlorinated Biphenyls (PCB)s are hazardous materials regulated by the EPA under the Toxic Substances Control Act (TSCA). These regulations ban the manufacture of PCBs although the continued use of existing PCB-containing equipment is allowed. PCBs were formerly used in such applications as hydraulic fluids, plasticizers, adhesives, fire retardants, and electrical transformers, among others. TSCA also contains provisions controlling the continued use and disposal of existing PCB-containing equipment. The disposal of PCB wastes is also regulated by TSCA (40 Code of Federal Regulations [CFR] 761), which contains life cycle provisions similar to those in RCRA. In addition to TSCA, provisions relating to PCBs are contained in the HWCL, which lists PCBs as hazardous waste.

Under the TSCA, the U.S. EPA has enacted strict requirements on the use, handling, and disposal of asbestos-containing materials (ACMs). These regulations include the phasing out of friable asbestos and ACMs in new construction materials began in 1979. In 1989, the U.S. EPA banned most uses of asbestos in the country. Although most of the ban was overturned in 1991, the current banned product categories include corrugated paper, rollboard, commercial paper, specialty paper, flooring felt, and any new uses. TSCA also establishes U.S. EPA's Lead Abatement Program regulations, which provide a framework for lead abatement, risk assessment, and inspections. Those performing these services are required to be trained and certified by U.S. EPA.[26]

Hazardous Materials Transportation Act (HMTA). The U.S. Department of Transportation (U.S. DOT) prescribes strict regulations for the safe transportation of hazardous materials, including requirements for hazardous waste containers and licensed haulers who transport hazardous waste on public roads. The Secretary of the Department of Transportation receives the authority to regulate the transportation of hazardous materials from the Hazardous Materials Transportation Act (HMTA), as amended and codified in 49 U.S. Code (U.S.C.) Section 5101 et seq. The Secretary is authorized to issue regulations to implement the requirements of 49 U.S.C. The Pipeline and Hazardous Materials Safety Administration (PHMSA)[27], formerly the Research and Special Provisions Administration, was delegated the responsibility to write the hazardous materials regulations, which are contained in Title 49 of the Code of Federal Regulations (CFR) Parts 100-180.[28] Title 49 of the CFR, which contains the regulations set forth by the HMTA, specifies

26 U.S. EPA, 40 CFR Park 745, Rules 402 and 404, August 29, 1996

27 U.S. DOT. Federal Hazardous Materials Transportation Law: An Overview. 2021. https://www.phmsa.dot.gov/standards-rulemaking/hazmat/federal-hazardous-materials-transportation-law-overview, accessed May 12, 2022.

28 National Archives and Records Administration. Code of Federal Regulations Parts 100 to 185. 2010. https://www.govinfo.gov/content/pkg/CFR-2010-title49-vol2/pdf/CFR-2010-title49-vol2.pdf, accessed May 12, 2022.

requirements and regulations with respect to the transport of hazardous materials. It requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Under the HMTA, the Secretary "may authorize any officer, employee, or agent to enter upon, inspect, and examine, at reasonable times and in a reasonable manner, the records and properties of persons to the extent such records and properties relate to: (1) the manufacture, fabrication, marking, maintenance, reconditioning, repair, testing, or distribution of packages or containers for use by any "person" in the transportation of hazardous materials in commerce; or (2) the transportation or shipment by any "person" of hazardous materials in commerce."

Occupational Safety and Health Act of 1970. The Occupational Safety and Health Act of 1970, which is implemented by the federal Occupational Safety and Health Administration (OSHA), contains provisions with respect to hazardous materials handling. OSHA was created to assure safe and healthful working conditions by setting and enforcing standards and by providing training, outreach, education, and assistance. OSHA provides standards for general industry and construction industry on hazardous waste operations and emergency response. OSHA requirements, as set forth in 29 Code of Federal Regulations (CFR) Section 1910, et. seq., are designed to promote worker safety, worker training, and a worker's right–to-know. The U.S. Department of Labor has delegated the authority to administer OSHA regulations to the State of California. The California OSHA program (Cal/OSHA) (codified in the CCR, Title 8, or 8 CCR generally and in the Labor Code secs. 6300-6719) is administered and enforced by the Division of Occupational Safety and Health (DOSH). Cal/OSHA is very similar to the OSHA program. Among other provisions, Cal/OSHA requires employers to implement a comprehensive, written Injury and Illness Prevention Program (IIPP) for potential workplace hazards, including those associated with hazardous materials.

Research and Special Programs Administration. RSPA regulations cover definition and classification of hazardous materials, communication of hazards to workers and the public, packaging and labeling requirements, operational rules for shippers, and training. They apply to interstate, intrastate, and foreign commerce by air, rail, ships, and motor vehicles, and also cover hazardous waste shipments. The RSPA's Federal Highway Administration (FHWA) is responsible for highway routing of hazardous materials and highway safety permits. The U.S. Coast Guard regulates bulk transport by vessel. The hazardous material regulations include emergency response provisions, including incident reporting requirements. Reports of major incidents go to the National Response Center, which in turn is linked with CHEMTREC, a service of the chemical manufacturing industry that provides details on most chemicals shipped in the United States.

Other Hazardous Materials Regulations. In addition to the U.S. DOT regulations for the safe transportation of hazardous materials, other applicable federal laws that also address hazardous materials. These include:

- Community Environmental Response Facilitation Act (CERFA) of 1992
- Clean Water Act
- Clean Air Act
- Safe Drinking Water Act
- Atomic Energy Act
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

Federal Emergency Management Act (FEMA). FEMA was established in 1979 via executive order and is an independent agency of the federal government. In March 2003, FEMA became part of the U.S. Department of Homeland Security with the mission to lead the effort in preparing the nation for all hazards and effectively manage federal response and recovery efforts following any national incident.[29] FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

U.S. Environmental Protection Agency. The U.S. EPA's mission is to protect human health and the environment. U.S. EPA takes action to reduce risks associated with exposure to chemicals in commerce, indoor and outdoor environments, and products and food. U.S. EPA continues to oversee the introduction and use of pesticides, improve their Integrated Risk Information System (IRIS) program, reduce radon risks, identify and address children's health risks in schools and homes, and improve chemical management practices. Oversight of chemical storage and manufacturing in coordination with their interagency partners remains a key focus of U.S. EPA, as well as efforts to reduce urban air toxins.

Title 40 Code of Federal Regulations. Title 40 of the CFR Part 264 "Standards for Owners of Hazardous Waste Treatment, Storage and Disposal Facilities," establishes minimum national standards which define the acceptable management of hazardous waste. This standard applies to owners and operators of all facilities which treat, store, or dispose of hazardous waste.

State

The primary state agencies with jurisdiction over hazardous chemical materials management are CalEPA (Department of Toxic and Substance Control) DTSC and the Los Angeles Regional Water Quality Control Board (LARWQCB). Other state agencies involved in hazardous materials management include California OSHA (Cal/OSHA) and the State Office of Emergency Services (Cal OES).

---

29 Federal Emergency Management Act, https://www.fema.gov/about/history, accessed May 12, 2022.

Authority for the statewide administration and enforcement of RCRA rests with Cal/EPA DTSC. While DTSC has primary state responsibility in regulating the generation, storage and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, DTSC is responsible and/or provides oversight for contamination cleanup and administers statewide hazardous waste reduction programs. DTSC operates programs to accomplish the following: (1) manage the aftermath of improper hazardous waste management by overseeing site cleanups; (2) prevent releases of hazardous waste by ensuring that those who generate, handle, transport, store, and dispose of wastes do so properly; and (3) evaluate soil, water, and air samples taken at sites.

The storage of hazardous materials in underground storage tanks (USTs) is regulated by the SWRCB, which delegates authority to the Regional Water Quality Control Board (RWQCB) on the regional level, and typically to the local fire department on the local level.

The Cal/OSHA program is administered and enforced by the Division of Occupational Safety and Health (DOSH). Cal/OSHA is very similar to the federal OSHA program. For example, both programs contain rules and procedures related to exposure to hazardous materials during demolition and construction activities. In addition, Cal/OSHA requires employers to implement a comprehensive, written Injury and Illness Prevention Program (IIPP). An IIPP is an employee safety program for potential workplace hazards, including those associated with hazardous materials.

The Cal OES Hazardous Materials (HazMat) section under the Fire and Rescue Division coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, the HazMat section staff is called upon to provide state and local emergency managers with emergency coordination and technical assistance.

California Hazardous Materials Release Response Plans and Inventory Law of 1985 Hazardous Waste and Substance Sites. The Business Plan Act requires preparation of Hazardous Materials Business Plans and disclosure of hazardous materials inventories, including an inventory of hazardous materials handled, plans showing where hazardous materials are stored, an emergency response plan, and provisions for employee training in safety and emergency response procedures for businesses that handle, store, or transport hazardous materials in amounts exceeding specified minimums (California HSC, Division 20, Chapter 6.95, Article 1). Statewide, DTSC has primary regulatory responsibility for management of hazardous materials, with delegation of authority to local jurisdictions that enter into agreements with the state. Local agencies are responsible for administering these regulations.

Several state agencies regulate the transportation and use of hazardous materials to minimize potential risks to public health and safety, including CalEPA and the California Emergency Management Agency. The California Highway Patrol and Caltrans enforce regulations specifically related to the transport of hazardous materials. Together, these agencies determine container types used and license hazardous waste haulers for hazardous waste transportation on public roadways.

Hazardous Waste and Substances Sites (Cortese List). Government Code Section 65962.5, amended in 1992, requires the CalEPA to develop and update annually the Hazardous Waste and Substances Sites (Cortese) List, which is a list of hazardous waste sites and other contaminated sites. The Cortese List is a planning document used by the State, local agencies, and developers to comply with CEQA requirements pertaining to providing information about the location of hazardous materials release sites. While the Cortese List is no longer maintained as a single list, the following databases provide information that meet the Cortese List requirements:

1. List of Hazardous Waste and Substances sites from Department of Toxic Substances Control (DTSC) Envirostor database (Health and Safety Codes 25220, 25242, 25356, and 116395);

2. List of open and active leaking underground storage tank (LUST) Sites by County and Fiscal Year from the State Water Resources Control Board GeoTracker database (Health and Safety Code 25295);

3. List of solid waste disposal sites identified by the State Water Resources Control Board with waste constituents above hazardous waste levels outside the waste management unit (Water Code Section 13273[e] and 14 CCR Section 18051);

4. List of "active" Cease and Desist Orders and Cleanup and Abatement Orders from the State Water Resources Control Board (Water Code Sections 13301 and 13304); and

5. List of hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code, identified by the DTSC.

Hazardous Waste Control Law. The Hazardous Waste Control Law (HWCL) empowers the Department of Toxic Substances Control (DTSC) to administer the state's hazardous waste program and implement the federal program in California. CCR Titles 22 and 23 address hazardous materials and wastes. Title 22 defines, categorizes, and lists hazardous materials and wastes. Title 23 addresses public health and safety issues related to hazardous materials and wastes and specifies disposal options.

License to Transport Hazardous Materials – California Vehicle Code, Section 32000.5 et seq. The California Department of Transportation (Caltrans) regulates hazardous materials transportation on all

interstate roads. Within California, the State agencies with primary responsibility for enforcing federal and State regulations and for responding to transportation emergencies are the California Highway Patrol and Caltrans. Together, federal and State agencies determine driver-training requirements, load labeling procedures, and container specifications for vehicles transporting hazardous materials.

Underground Storage Tanks Program. The State regulates Underground Storage Tanks (USTs) through a program pursuant to HSC, Division 20, Chapter 6.7, and CCR Title 23, Division 3, Chapter 16 and Chapter 18. The State's UST program regulations include among others, permitting USTs, installation of leak detection systems and/ or monitoring of USTs for leakage, UST closure requirements, release reporting/ corrective action, and enforcement. Oversight of the statewide UST program is assigned to the State Water Resources Control Board (SWRCB) which has delegated authority to the Regional Water Quality Control Boards (RWQCB) and typically on the local level, to the fire department. The Los Angeles Fire Department (LAFD) administers and enforces federal and state laws and local ordinances for USTs at the Project Site. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LAFD Inspectors. If a release affecting groundwater is documented, the project file is transferred to the appropriate RWQCB for oversight.

Aboveground Petroleum Storage Act. In 1989, California established the Aboveground Petroleum Storage Act instituting a regulatory program covering ASTs containing specified petroleum products (Health and Safety Code Sections 25270–25270.13). The Aboveground Petroleum Storage Act applies to facilities with storage capacities of 10,000 gallons or more or are subject to oil pollution prevention and response requirements under 40 CFR Part 112. Under the Aboveground Petroleum Storage Act, each owner or operator of a regulated aboveground storage tank (AST) facility must file biennially a storage statement with the SWRCB disclosing the name and address of the AST facility; the contact person for the facility; and the location, size, age, and contents of each AST that exceeds 10,000 gallons in capacity and that holds materials that are at least five percent petroleum. In addition, each owner or operator of a regulated AST must prepare a Spill Prevention Control and Countermeasure Plan in accordance with federal and state requirements (40 CFR Part 112 and Health and Safety Code Section 25270.5[c]). The responsibility for inspecting ASTs and ensuring that Spill Prevention Control and Countermeasure Plans have been prepared lies with the RWQCBs.

Lead Based Paint Regulations. Lead-based paint (LBP) is defined as any paint, varnish, stain, or other applied coating that has a one milligram per square centimeter (mg/cm2) (5,000 microgram per gram (μg/g) or 0.5% by weight) or more of lead. The US Consumer Product Safety Commission (16 Code of Federal Regulations [CFR] 1303) banned paint containing more than 0.06 percent lead for residential use in 1978. Buildings built before 1978 are much more likely to have LBP.

The demolition of buildings containing LBPs is subject to a comprehensive set of California regulatory requirements that are designed to assure the safe handling and disposal of these materials. Cal/OSHA has established limits of exposure to lead contained in dusts and fumes, which provides for exposure limits, exposure monitoring, and respiratory protection, and mandates good working practices by workers exposed to lead, particularly since demolition workers are at greatest risk of adverse exposure. Lead-contaminated debris and other wastes must also be managed and disposed of in accordance with applicable provisions of the California Health and Safety Code.

California Division of Occupational Safety and Health (Cal/OSHA). Cal/OSHA is responsible for developing and enforcing workplace safety standards and ensuring worker safety in the handling and use of hazardous materials (8 CCR, Section 1529). Among other requirements, Cal/OSHA requires entities handling specified amounts of certain hazardous chemicals to prepare injury and illness prevention plans and chemical hygiene plans and provides specific regulations to limit exposure of construction workers to lead. OSHA applies to this Project because contractors will be required to comply with its handling and use requirements that would increase worker safety and reduce the possibility of spills, and to prepare an emergency response plan to respond to accidental spills.

The Safe Drinking Water and Toxic Enforcement Act. The Safe Drinking Water and Toxic Enforcement Act (Health Safety Code, Section 25249.5, et seq.) Proposition 65, lists chemicals and substances believed to have the potential to cause cancer or deleterious reproductive effects in humans. It also restricts the discharges of listed chemicals into known drinking water sources above the regulatory levels of concern, requires public notification of any unauthorized discharge of hazardous waste, and requires that a clear and understandable warning be given prior to a known and intentional exposure to a listed substance.

California Water Code. The California Water Code (CWC) authorizes the SWRCB to implement provisions of the Clean Water Act, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants. With regards to construction dewatering discharge analysis and treatment, groundwater may be encountered during deeper excavations for the subterranean parking structure, building foundations, or other subterranean building components. Under the CWC, discharges of any such groundwater to surface waters, or any point sources hydrologically connected to surface waters, such as storm drains, is prohibited unless conducted in compliance with a Waste Discharge Requirement (WDR) permit. In addition to the CWC, these permits implement and are in compliance with the federal Clean Water Act's National Pollutant Discharge Elimination System (NPDES) program. In accordance with these legal requirements, dewatering, treatment, and disposal of groundwater encountered during construction activities would be conducted in accordance with the Los Angeles Regional Quality Control Board (LARWQCB)'s Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los

Angeles and Ventura Counties, pursuant to adopted Order No. R4-2013-0095, or any other appropriate WDR permit identified by the LARWQCB.[30] Compliance with an appropriate WDR permit would include monitoring, treatment if appropriate, and proper disposal of any encountered groundwater in accordance with applicable water quality standards. If, for example, extracted groundwater contains Total Petroleum Hydrocarbons (TPH) or other petroleum breakdown compounds in concentrations exceeding water quality standards, compliance with legal requirements would mandate treatment to meet published state water quality standards prior to discharge into a storm drain system.

Government Code Section 3229, Division (California Geologic Energy Management Division). In compliance with Section 3229, Division 3 of the California Public Resources Code, before commencing any work to abandon any well, the owner or operator shall request approval from the California Geologic Energy Management Division (CalGEM), formerly the Division of Oil, Gas, and Geothermal Resources (DOGGR), via a written notice of intention to abandon the well.

California Fire Code. The 2019 California Fire Code (CFC), written by the California Building Standards Commission, is based on the 2018 International Fire Code. The International Fire Code (IFC) is a model code that regulates minimum fire safety requirements for new and existing buildings, facilities, storage and processes. The IFC addresses fire prevention, fire protection, life safety, and safe storage and use of hazardous materials in new and existing buildings, facilities, and processes.

The CFC, Chapter 9 of Title 24 of the California Code of Regulations (CCR), was created by the California Building Standards Commission based on the International Fire code and is updated every three years. The overall purpose of the CFC is to establish the minimum requirements to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. Chapter 49 of the CFC contains minimum standards for development in the wildland–urban interface and fire hazard areas. The CFC also provides regulations and guidance for local agencies in the development and enforcement of fire safety standards.

Uniform Fire Code. The Uniform Fire Code, Article 80 (Section 80.103 of the Uniform Fire Code as adopted by the State Fire Marshal pursuant to Health and Safety Code Section 13143.9), includes specific requirements for the safe storage and handling of hazardous materials. These requirements are intended to reduce the potential for a release of hazardous materials and for mixing of incompatible chemicals, and

---

30 Los Angeles Regional Water Quality Control Board, Order No. R4-2013-0095, Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, June 6, 2013, https://www.waterboards.ca.gov/losangeles/board_decisions/adopted_orders/permits/general/npdes/r4-2013-0095/Dewatering%20Order.pdf. Accessed May 12, 2022.

specify the following specific design features to reduce the potential for a release of hazardous materials that could affect public health or the environment:

- Separation of incompatible materials with a noncombustible partition;
- Spill control in all storage, handling, and dispensing areas; and
- Separate secondary containment for each chemical storage system. The secondary containment must hold the entire contents of the tank, plus the volume of water needed to supply the fire suppression system for a period of 20 minutes in the event of catastrophic spill.

California Governor's Office of Emergency Services (Cal OES). In 2009, the State of California passed legislation creating the Cal OES and authorized it to prepare a Standard Emergency Management System (SEMS) program (Title 19 CCR Section 2401 *et seq.*), which sets forth measures by which a jurisdiction should handle emergency disasters. In California, SEMS provides the mechanism by which local governments request assistance. Non-compliance with SEMS could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. Cal OES coordinates the state's preparation for, prevention of, and response to major disasters, such as fires, floods, earthquakes and terrorist attacks. During an emergency, Cal OES serves as the lead state agency for emergency management in the state. It also serves as the lead agency for mobilizing the state's resources and obtaining federal resources. Cal OES coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with the local government. Local jurisdictions first use their own resources and, as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system (see discussion of Mutual Aid Agreements, below). California Emergency Management Agency (Cal-EMA) maintains oversight of the state's mutual aid system.

Emergency Managed Mutual Aid (EMMA) System. Cal OES developed the Emergency Managed Mutual Aid (EMMA) System in response to the 1994 Northridge Earthquake. The EMMA System coordinates emergency response and recovery efforts along the coastal, inland, and southern regions of California. The purpose of EMMA is to provide emergency management personnel and technical specialists to afflicted jurisdictions in support of disaster operations during emergency events. Objectives of the EMMA Plan is to provide a system to coordinate and mobilize assigned personnel, formal requests, assignment, training and demobilization of assigned personnel; establish structure to maintain the EMMA Plan and its procedures; provide the coordination of training for EMMA resources, including SEMS training, coursework, exercises, and disaster response procedures; and to promote professionalism in emergency

management and response. The EMMA Plan was updated in November 2012 and supersedes the 1997 EMMA Plan and November 2001 EMMA Guidance.

California Code of Regulations, Division 4.5, Title 22. California Health and Safety Code and Title 22 regulates processes that produce hazardous waste. The Regulation requires an ID number, regulates accumulation of onsite hazardous materials, shipping and transport, emergency procedures, and worker training.

California Health and Safety Code, Title 22, Chapter 20 Hazardous Waste Permit Program. Title 22, Chapter 20 Hazardous Waste Permit Program, establishes provisions for the issuance and administration of hazardous waste permits pursuant to the Health and Safety Code. Regulations cover basic permitting requirements, such as application requirements, standard permit conditions, and monitoring and reporting requirements. Hazardous Waste Permits are required for the transfer, treatment, storage, and disposal of any waste which is hazardous waste pursuant to section 66261.3. Owners and operators of certain facilities require hazardous waste facility permits as well as permits under other programs for certain aspects of the facility operation.

California Code of Regulations Title 23, Chapter 15 Discharges of Hazardous Waste to Land Section 2511(b). California Code of Regulations Title 23, Chapter 15 Discharges of Hazardous Waste to Land Section 2511(b) pertains to water quality aspects of waste discharge to land. The regulation establishes waste and site classifications and waste management requirements for waste treatment, storage, or disposal in landfills, surface impoundments, waste piles, and land treatment facilities. Requirements are minimum standards for proper management of each waste category, which allow regional water boards to impose more stringent requirements to accommodate regional and site-specific conditions. In addition, the requirements of California Code of Regulations Title 23, Chapter 15 applies to cleanup and abatement actions for unregulated discharges to land of hazardous waste (e.g., spills).

California Constitution Article XIII Section 35. Section 35 of Article III of the California Constitution at subdivision (a)(2) provides: "The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services." Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services. California Government Code Sections 30051-30056 provide rules to implement Proposition 172. Public safety services include fire protection. Section 30056 provides that cities are not allowed to spend less of their own financial resources on their combined public safety services in any given year compared to the 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on fire protection, as well as other public safety services. In *City of Hayward*

v. Trustee of California State University (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. (See *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, 847, stating "the city has a constitutional obligation to provide adequate fire protection services".)

Title 8 California Code of Regulations (CCR) Sections 1270 and 6773. In accordance with CCR, Title 8 Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration (Cal-OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hosing sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code Section 13100-13135. California Health Safety Code Section 13100-13135 codifies regulations known as the "Regulations of the State Fire Marshal" and constitutes the Basic Building Design and Construction Standards of the State Fire Marshall. The regulations establish minimum standards for the preservation and protection of life and property against fire, explosion, and panic through requirements for fire protection and notification systems, fire protection devices, and fire suppression training.

Regional

South Coast Air Quality Management District Rule 1403. SCAQMD Rule 1403, Asbestos Emissions from Renovation/Demolition Activities, regulates asbestos as a toxic material and controls the emissions of asbestos from demolition and renovation activities by specifying agency notifications, appropriate removal procedures, and handling and clean up procedures. Rule 1403 applies to owners and operators involved in the demolition or renovation of structures with ACMs, asbestos storage facilities, and waste disposal sites.

South Coast Air Quality Management District Rule 1166. SCAQMD Rule 1166, Volatile Organic Compound Emissions from Decontamination of Soil, requires that an approved mitigation plan be obtained from SCAQMD prior to commencing excavation of a UST; excavation of piping which has stored VOCs; excavation or grading of soil containing VOC material including gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOCs; the handling or storage of VOC-contaminated soil at or from an excavation or grading site; or the treatment of VOC-contaminated soil at a facility.

Certified Unified Program Agency (CUPA). The primary local agency with responsibility for implementing federal and state laws and regulations pertaining to hazardous materials management is the Los Angeles County Health Department, Environmental Health Division. The Los Angeles County Health Department is the Certified Unified Program Agency (CUPA) for the County of Los Angeles. A CUPA is a local agency that has been certified by CalEPA to implement the six state environmental programs within the local agency's jurisdiction. This program was established under the amendments to the California Health and Safety Code made by Senate Bill 1082 in 1994. The six consolidated programs are:

- Hazardous Materials Release Response Plan and Inventory (Business Plans)
- California Accidental Release Prevention (CalARP)
- Hazardous Waste (including Tiered Permitting)
- Underground Storage Tanks (USTs)
- Above Ground Storage Tanks (Spill Prevention Control and Countermeasures [SPCC] requirements)
- Uniform Fire Code (UFC) Article 80 Hazardous Material Management Program (HMMP) and Hazardous Material Identification System (HMIS)

As the CUPA for County of Los Angeles, the Los Angeles County Health Department Environmental Health Division maintains the records regarding location and status of hazardous materials sites in the county and administers programs that regulate and enforce the transport, use, storage, manufacturing, and remediation of hazardous materials. By designating a CUPA, Los Angeles County has accurate and adequate information to plan for emergencies and/or disasters and to plan for public and firefighter safety.

A Participating Agency is a local agency that has been designated by the local CUPA to administer one or more Unified Programs within their jurisdiction on behalf of the CUPA. The Los Angeles County Health Department, Environmental Health Division has designated the Los Angeles Fire Department (LAFD) as a Participating Agency. The LAFD monitors the storage of hazardous materials in the City for compliance with local requirements. Specifically, businesses and facilities that store more than threshold quantities of hazardous materials as defined in California Health and Safety Code Chapter 6.95 are required to file an Accidental Risk Prevention Program with LAFD. This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. LAFD also has the authority to administer and enforce federal and State laws and local ordinances for USTs. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LAFD Inspectors.

Waste Discharge Requirements. Effective on December 28, 2012, the Los Angeles RWQCB adopted Order No. R4-2012-0175, NPDES Permit No. CAS004001, Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges into the Coastal Watersheds of Los Angeles County. The permit establishes new performance criteria for new development and redevelopment projects in the coastal watersheds of Los Angeles County (with the exception of the city of Long Beach). Storm water and non-storm water discharges consist of surface runoff generated from various land uses, which are conveyed via the municipal separate storm sewer system and ultimately discharged into surface waters throughout the region ("storm water" discharges are those that originate from precipitation events, while "non-storm water" discharges are all those that are transmitted through an MS4 Storm Water Permit and originate from precipitation events). Discharges of stormwater and non-storm water from the MS4s, or storm drain systems, in the Coastal Watersheds of Los Angeles County convey pollutants to surface waters throughout the Los Angeles Region. Non-storm water discharges through an MS4 in the Los Angeles Region are prohibited unless authorized under an individual or general NPDES permit; these discharges are regulated by the Los Angeles County NPDES Permit, issued pursuant to CWA Section 402. Coverage under a general NPDES permit such as the Los Angeles County permit can be achieved through development and implementation of a project-specific SWPPP.[31]

Los Angeles County Operational Area Emergency Response Plan (ERP). The County of Los Angeles developed the ERP to ensure the most effective allocation of resources for the maximum benefit and protection of the public in time of emergency. The ERP does not address normal day-to-day emergencies or the well-established and routine procedures used in coping with them. Instead, the operational concepts reflected in this plan focus on potential large-scale disasters like extraordinary emergency situations associated with natural and man-made disasters and technological incidents which can generate unique situations requiring an unusual or extraordinary emergency response. The purpose of the plan is to incorporate and coordinate all facilities and personnel of the County government, along with the jurisdictional resources of the cities and special districts within the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid and other appropriate response procedures. The goal of the plan is to take effective life-safety measures and reduce property loss, provide for the rapid resumption of impacted businesses and community services, and provide accurate documentation and records required for cost-recovery.

Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan (ALUC). In Los Angeles County, the Regional Planning Commission has the responsibility for acting as the Airport Land

---

31 California Regional Water Quality Control Board, Los Angeles Region. Order No. R47-2012-0175 NPDES Permit No. CAS004001. https://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/municipal/la_ms4/2012/Order%20R4-2012-0175%20-%20A%20Final%20Order%20revised.pdf. Accessed June 2022.

Use Commission (ALUC) and for coordinating the airport planning of public agencies within the county. ALUC coordinates planning for the areas surrounding public use airports. The Los Angeles County Airport Land Use Plan (dually titled Comprehensive Land Use Plan) provides for the orderly expansion of Los Angeles County's public use airports and the area surrounding them. It is intended to provide for the adoption of land use measures that will minimize the public's exposure to excessive noise and safety hazards. In formulating this plan, the Los Angeles County ALUC has established provisions for safety, noise insulation, and the regulation of building height within areas adjacent to each of the public airports in the County.

Exide Final Closure Plan EIR. CalEPA's DTSC certified a FEIR on July 17, 2017 that includes the DTSC's detailed analysis of potential environmental impacts associated with closing the hazardous waste treatment and storage facility owned and operated by Exide. The FEIR identified potentially significant impacts to the following environmental resource areas: air quality, greenhouse gas emissions, cultural and historic resources, geology and soils, and noise and vibration. The DTSC developed mitigation measures for air quality, greenhouse gas emissions, cultural and historic resources, and noise and vibration which will reduce the potential impacts to cultural and historic resources, and noises and vibration to less than significant. Impacts to air quality, greenhouse gas emissions, and geology and soils will potentially be significant but are unavoidable.

The DTSC requires the following in the Final Closure Plan:

- Enhanced protections for workers – detailed Health and Safety Plan that incorporates suggestions from commenters, complies with the most up to date Cal OSHA standards, protects workers in confined spaces, and is reviewed and updated as conditions change;
- Complete enclosures of buildings to prevent release of dust as they are deconstructed;
- Real-time air monitoring to continuously monitor particulate concentrations and stop work if needed;
- Clean and dry trucks that are covered before exiting the facility to prevent contamination from being tracked off site;
- Restrictions on truck routes to prevent trucks hauling construction waste from driving through communities;
- Visible marking of trucks (bright yellow flag) for community members to easily identify trucks leaving Exide;

- Third-party oversight: An independent consultant, directed by the DTSC and the South Coast Air Quality Management District (SCAQMD), responsible for real-time air monitoring, confirming compliance with truck-loading procedures, truck-decontamination procedures and transportation routes, and ensuring that the closure activities do not add additional environmental impacts; and

- Inclusion of inspectors from each agency in the oversight process to ensure that all work meets the highest standard of environmental compliance.[32]

Local

City of Los Angeles Hazard Mitigation Plan. The City of Los Angeles has completed the 2017 Hazard Mitigation Plan (HMP) to lessen the vulnerability to disasters and demonstrate the City's commitment to reducing risks from natural hazards. An HMP serves as a guide for decision makers as they commit City resources to minimize the effects of natural hazards. The HMP is intended to integrate with existing planning mechanisms such as building and zoning regulations, long-range planning mechanisms, and environmental planning. The planning process includes conducting a thorough hazard vulnerability analysis, creating community disaster mitigation priorities, and developing subsequent mitigation strategies and projects.

Los Angeles Fire Code. At the local level, the LAFD monitors the storage of hazardous materials for compliance with local requirements. Specifically, businesses and facilities that store more than threshold quantities of hazardous materials as defined in Chapter 6.95 of the California Health and Safety Code are required to file an Accidental Risk Prevention Program with the LAFD.[33] This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. The LAFD also issues permits for hazardous materials handling and enforces California's Hazardous Materials Release Response Plans and Inventory Law (HSC sec. 25500 et seq.). Basic requirements of California's Hazardous Materials Release Response Plans and Inventory Law include the development of detailed hazardous materials inventories used and stored on-site, a program of employee training for hazardous materials release response, identification of emergency contacts and response procedures, and reporting of releases of hazardous materials. Any facility that meets the minimum reporting thresholds (i.e., a mixture containing a hazardous material that has a quantity at any one time during the reporting year that is equal to, or greater than, 55 gallons for materials that are

32 DTSC. 2016. *Final Environmental Impact Report and Final Closure Plan for the Exide Technologies Battery Recycling Facility*. https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/03/Exide_Comm-Update_Final-EIR2.pdf, accessed June 23, 2021.

33 The CalARP program encompasses both the federal "Risk Management Program," established in the Code of Federal Regulations, Title 40, Part 68, and the State of California program, in accordance with the Title 19 of the California Code of Regulations, Division 2, Chapter 4.5.

liquids, 500 pounds for solids, or 200 cubic feet for compressed gas) must comply with the reporting requirements and file a Business Emergency Plan (BEP) with the local administering agency.[34]

The LAFD also administers the Fire Life Safety Plan Check and Fire Life Safety Inspections interpreting and enforcing applicable standards of the Fire Code, Title 19, Uniform Building Code, City, and National codes concerning new construction and remodeling. As part of the Fire Life Safety Plan Check and Fire Life Safety Inspections, businesses that store hazardous waste or hazardous materials in amounts exceeding the thresholds noted above are subject to review.

Section 91.7109.2 of the LAMC requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of the California Division of Oil, Gas, and Geothermal Resources (DOGGR).

City of Los Angeles General Plan Safety and Conservation Elements. The Safety Element provides a contextual framework for understanding the relationship between hazard mitigation, response to a natural disaster, and initial recovery from a natural disaster. The Safety Element addresses hazardous materials relative to potential natural hazards.

The intent of the Conservation Element of the General Plan is the conservation and preservation of natural resources. Policies of the Conservation Element address the conservation of petroleum resources (i.e., oil and gas) and appropriate, environmentally sensitive extraction of petroleum deposits to protect the petroleum resources for the use of future generations and to reduce the City's dependency on imported petroleum and petroleum products.

Policies from the Safety and Conservation Elements related to Hazards and Hazardous Materials are listed below in **Table 4.8-3**.

[34] California Health & Safety Code, Division 20, Chapter 6.95, Article 1; California Code of Regulations, Title 19, Sections 2620-2732; California Code of Regulations, Title 24, Part 9, Section 80.115; Los Angeles Municipal Code, Article 7 of Chapter V, Section 57.120.1, and 57.120.1.4

Table 4.8-3
Relevant General Plan Hazardous Materials Goals, Objectives, and Policies

Safety Element – Hazard Mitigation	
Goal 1	A city where potential injury, loss of life, property damage and disruption of the social and economic life of the City due to hazards is minimized.
Objective 1.1	Implement comprehensive hazard mitigation plans and programs that are integrated with each other and with the City's comprehensive emergency response and recovery plans and programs.
Policy 1.1.1	**Coordination.** Coordinate information gathering, program formulation and program implementation between City agencies, other jurisdictions and appropriate public and private entities to achieve the maximum mutual benefit.
Policy 1.1.2	**Disruption Reduction.** Reduce potential disruption due to disaster, with an emphasis on critical facilities, governmental functions, infrastructure and information resources.
Policy 1.1.3	**Facility/Systems Location and Maintenance.** Locate new critical facilities and infrastructure outside of hazard areas, especially VHFHSZs, when feasible. If no feasible alternative site exists, ensure that these facilities incorporate all necessary protections to allow them to continue to serve essential community needs during and after disaster events. Provide redundancy (back-up) systems and strategies for continuation of adequate critical infrastructure systems and services so as to assure adequate circulation, communications, power, transportation, water and other services for emergency response in the event of disaster related systems disruptions and the growing climate emergency.
Policy 1.1.4	**Health/Environmental Protection.** Protect the public and workers from the release of hazardous materials and protect City water supplies and resources from contamination resulting from release or intrusion resulting from a disaster event, including protection of the environment and public from potential health and safety hazards associated with program implementation.
Policy 1.1.5	**Risk Reduction.** Reduce potential risk hazards due to disaster with a focus on protecting the most vulnerable people, places and systems.
Policy 1.1.7	**Building Community Capacity.** Build social cohesion and increase local resilience through community collaboration and education. Provide outreach and education on topics including: local hazards, disaster prevention and preparation and evacuation procedures with an emphasis on reaching vulnerable communities.
Policy 1.1.8	**Land Use.** Consider hazard information and available mitigations when making decisions about future land use. Maintain existing low density and open space designations in Very High Fire Hazard Severity Zones. Ensure mitigations are incorporated for new development in hazard areas such as VHFHSZs, landslide areas, flood zones and in other areas with limited adaptive capacity.
Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Goal 2	A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.
Objective 2.1	Develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City's comprehensive hazard mitigation and recovery plans and programs.
Policy 2.1.1	**Coordination.** Coordinate program formulation and implementation between City agencies, adjacent jurisdictions and appropriate private and public entities. Continue to participate in mutual aid agreements with surrounding jurisdictions to achieve the maximum mutual benefit for emergency response.

Safety Element – Hazard Mitigation	
Policy 2.1.2	**Health and Environmental Protection.** Develop and implement procedures to protect the environment, sensitive species and public from potential health and safety hazards associated with disaster events, hazard mitigation and disaster recovery efforts.
Policy 2.1.3	**Information.** Develop and implement training programs and informational materials designed to assist property owners, tenants and the general public in understanding and mitigating disaster risks and regulations that may impact their homes and businesses, with an emphasis on reaching vulnerable communities.
Policy 2.1.4	**Interim Procedures.** Develop and implement pre-disaster plans for interim evacuation, sheltering and public aid for disaster victims displaced from homes and for disrupted businesses. Plan to utilize park space and other public facilities in emergency situations. Plans should include provisions to assist businesses which provide significant services to the public, plans for reestablishment of the financial viability of the City and assistance for residents to remain in the city.
Policy 2.1.5	**Response.** Develop, implement and continue to improve the City's ability to respond to emergency events. Participate in regularly scheduled disaster exercises to better prepare Police, Fire, Public Works and other City employees with disaster responsibilities.
Policy 2.1.6	**Standards/Fire.** Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression and safety. A. Enforce peak water supply requirements. B. Enforce minimum roadway widths and clearances for evacuation and fire suppression. C. Maintain special fire-fighting units at the Port of Los Angeles, Los Angeles International Airport, and Van Nuys Municipal Airport capable of responding to special emergencies unique to the operations of those facilities. D. Coordinate with CALFIRE, local fire agencies, fire safe councils, private landowners, and other responsible agencies to identify the best method(s) of fuel modification to reduce the severity of future wildfires, including: Prescribed fire; Forest thinning; Grazing; Mechanical clearing; Hand clearing (piling, burning/chipping); Education; and Defensible space. E. Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Policy 2.1.7	**Building Community Capacity.** Develop and implement strategies for involving volunteers, community groups, and civic organizations in emergency response activities.
Safety Element – Disaster Recovery (Multi-Hazard)	
Goal 3	A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.
Objective 3.1	Develop and implement comprehensive disaster recovery plans which are integrated with each other and with the City's comprehensive hazard mitigation and emergency response plans and programs.
Policy 3.1.1	**Coordination.** Coordinate between city departments, county and state agencies, local jurisdictions and with appropriate private and public entities prior to a disaster to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster.
Policy 3.1.2	**Health/Safety/Environment.** Develop and establish procedures for identification 58 Los and abatement of physical and health hazards which may result from a disaster. Provisions shall include measures for protecting workers, the public and the environment from contamination or other health and safety hazards associated with the hazard in addition to abatement, repair and reconstruction programs.

Safety Element – Hazard Mitigation	
Policy 3.1.4	**Interim Services/Systems.** Develop and establish procedures prior to a disaster for immediate reestablishment and maintenance of damaged or interrupted critical infrastructure systems and services so as to provide communications, circulation, power, transportation, water and other necessities for movement of goods, provision of services and restoration of the economic and social life of the City and its environs pending permanent restoration of the damaged systems.
Policy 3.1.5	**Restoration**. Look to the future and rebuild based on the lessons of the past. Prior to a disaster, develop and establish procedures for securing assistance and expediting inspection and permitting activities to facilitate the rapid repair and rebuilding of those parts of the private and public sectors which were damaged or disrupted as a result of the disaster with an added consideration of future safety. Develop and establish procedures to enhance the resilience of buildings and infrastructure that are rebuilt following a disaster. Develop tools to ensure that vulnerable residents and business owners are included in community rebuilding efforts.
Conservation Element – Resource Management (Fossil Library) - Petroleum (Oil And Gas)	
Policy 1	Continue to encourage energy conservation and petroleum product reuse.
Policy 3	Continue to protect neighborhoods from potential accidents and subsidence associated with drilling, extraction and transport operations, consistent with California Department of Conservation, Division of Oil and Gas requirements.

Source: City of Los Angeles Conservation Element, 2001, and Safety Element 2021

Los Angeles Municipal Code

One of the primary purposes of zoning is to segregate uses that are thought to be incompatible. With respect to hazards, the City uses zoning to separate businesses that use, store, transport, treat, or dispose of hazardous materials, or businesses that engage in potentially hazardous activities, such as manufacturing or refining, from residential areas and the general public.

The Methane Seepage Regulations, contained within the Los Angeles Municipal Code (LAMC) Chapter IX, Article 1, Division 71 (Sections 91.7101 through 91.7109), establishes requirements for mitigation and other general building requirements to prevent potential environmental and harmful health effects that could be caused by the construction of buildings located in a defined Methane Hazard Zone within the City of Los Angeles. All new buildings and paved areas located in a Methane Zone or Methane Buffer Zone must comply with the requirements of LAMC Sections 91.7103 and 91.7104 and the Methane Mitigation Standards established by the Superintendent of Building. The Methane Mitigation Standards identify installation procedures, design parameters and test protocols for the methane gas mitigation system. As established under LAMC Section 91.106.4.1, LADBS has the authority to withhold permits on projects located within a Methane Zone or Methane Buffer Zone. Building permits may be issued upon submittal of detailed plans that show adequate protection against flammable gas incursion by providing the installation of suitable methane mitigation and monitoring systems.

Section 91.7109.2 of the LAMC requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of the California Division of Oil, Gas, and Geothermal Resources (CalGEM).

4.8.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to hazards and hazardous materials if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; and/or
- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

4.8.5 METHODOLOGY

This discussion of hazards and hazardous materials addresses impacts in and outside the CPA that have the potential to be impacted by the Proposed Plan. The impact analysis was based on several factors, including the policies and land uses of the Proposed Plan, the degree to which land uses would change, and the thresholds of significance for hazards and hazardous materials. The analysis addresses the

potential to encounter hazardous substances in soil and groundwater during future project construction as well as the potential for risk of upset from the use, handling, transport and/or disposal of hazardous materials with foreseeable operational activities. The evaluation was performed based on baseline conditions (2016) in the Boyle Heights CPA, information in environmental databases, applicable regulations and guidelines, and future development that may have the potential to introduce hazards. Relationships and proximities of potential future development to schools, airports, and fire hazard zones are also identified. The above significance criteria are used in this section as the basis for determining the significance of impacts related to hazards and hazardous materials.

It is reasonably assumed that development projects would comply with applicable regulatory requirements pertaining to hazardous materials during construction and operation. Individual businesses are subject to intensive regulatory review as part of the permit and approval process, as well as being subject to a myriad of regulations regarding hazardous material use, storage, transportation, and disposal. In most cases, this regulatory review and regulatory compliance review ensures that adjacent populations are protected from unusual hazards from such uses. While the Proposed Plan may encourage greater redevelopment of older potentially contaminated sites, they are subject to the federal, state, and local policies and guidelines discussed above.

4.8.6 IMPACTS

Threshold 4.8-1 Would implementation of the Proposed Plan create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

This impact would be less than significant with mitigation for construction and less than significant for operation.

Construction Impacts

Implementation of the Proposed Plan would facilitate new development throughout the CPA including via redevelopment of sites currently or historically used for industrial uses that may have used hazardous materials in their operations. Because unknowns may exist regarding existing soil or other contaminants in the areas currently or historically zoned as industrial in the CPA, or properties contaminated by Exide, there is the possibility that future development may uncover previously undiscovered contaminated soil.

The southern and western portions of the CPA lie within DTSC's Exide Cleanup area. As discussed above, the Exide facility operated from 1922 to 2014 as a lead battery recycling facility. Exide shut down operations in 2015 because it was not in compliance with new SCAQMD rules. The Exide Clean Up EIR found that

with implementation of project design features, the excavation and export of approximately 460,000 cubic yards of contaminated soil, which would occur as part of the cleanup activities and is a separate project from the Proposed Plan, would not pose a risk to the community and the impacts of that separate project would be less than significant.[35]

As stated above, the southern and western portion of the CPA is within the Exide PIA and undergoing clean up from the DTSC. However, it is possible that additional contaminated properties are located outside of the PIA within the CPA. Grading and excavation of sites for future development outside of the PIA could result in additional contaminated soils being disturbed. Due to the potential for lead contamination within the soil from the Exide facility beyond the PIA, redevelopment, excavation, and grading have the potential to stir up contaminated materials including dust. If any unidentified sources of contamination are encountered during grading or excavation (from Exide or other industrial operations), transport or use of contaminated soils offsite could pose health and safety risks from exposure to hazardous materials or vapors unless the contaminants are identified and handled, transported and disposed of pursuant to all state and federal laws.

While compliance with dust control regulations (SCAQMD Rule 403) would reduce fugitive dust emissions during construction until sites are cleared of potential contamination there is the risk that contaminated soils could be disturbed and handled, transported or used in violation of regulations and in a manner that could expose neighbors to the contaminated site or elsewhere to hazardous materials. As stated above, because there is not a specific legal requirement for a Phase I ESA for all excavation or construction, there is the potential for soil or groundwater contamination to go undetected. Thus, future grading and construction would have the potential to result in exposure of construction workers and occupants of neighboring properties and others to releases of hazardous materials through the improper handling of contaminated soils or the transport or use of the contaminated soils off-site. This would be a ***potentially significant impact***.

While all demolition and construction within the CPA would be required to comply with all local, state, and federal regulations, further mitigation may be required to reduce risks from unknown toxic substances existing on sites. Such sites would have the potential to create a significant hazard to the public or the environment through transport of soils offsite and/or through disposal unless an environmental site assessment is conducted to determine potential risks; in general, once contamination is identified regulatory compliance will address potential hazards. This would be a ***potentially significant impact***.

35 DTSC. 2020. *Exide Residential Clean Up*. https://dtsc.ca.gov/residential-cleanup/.

Operations Impacts

The types of hazardous materials that could be present during operation of commercial, residential, and industrial uses of the Proposed Plan include maintenance products (e.g., paints and solvents); oils, lubricants and refrigerants associated with building, mechanical, and HVAC systems; and grounds and landscape maintenance products formulated with hazardous substances, including fuels, cleaners and degreasers, solvents, paints, lubricants, adhesives, sealers, pesticides/herbicides, and industrial related chemicals.

The precise potential future increase in the amount of hazardous materials that could be used in the CPA cannot be predicted as specific development projects are not reasonably foreseeable. Future development under the Proposed Plan involving residential, commercial, industrial, public facilities, and open space would include the use of and storage of common hazardous materials such as paints, solvents, and cleaning products. Additionally, building mechanical systems, and grounds and landscape maintenance could also use a variety of products formulated with hazardous materials, including fuels, cleaners, lubricants, adhesives, sealers, and pesticides/herbicides. The extent and exposure of individuals to hazardous materials would be limited by the relatively small quantities of these materials that would be stored and used on individual project sites throughout the CPA. Although common maintenance products and chemicals would also be used in new development projects, these hazardous materials would not pose any greater risk compared to other similar development or to existing conditions. Compliance with warning labels and storage recommendations from the individual manufacturers would ensure people in the CPA would not be exposed to unusual or significant risks from hazardous materials.

The Proposed Plan would maintain the existing mix of Light Industrial and Heavy Industrial land along the western and southern borders of the CPA. Industrial areas closest to residential neighborhoods, primarily along the western boundary of the CPA adjacent to the Los Angeles River are proposed to change from heavy industrial zones to lighter industrial zones. In the industrial area south of Olympic Boulevard, existing Heavy Industrial zoning will be changed to Light Industrial zoning. While the Proposed Plan would accommodate new or additional residential uses in proximity to industrial uses, existing and future uses would be required to comply with existing safety standards related to the handling, use and storage of hazardous materials, and applicable federal, State and local laws and regulations. Moreover, the placement of residences near industrial activity would not increase the use of hazardous materials. It would not be expected to increase, change or exacerbate any risk currently existing from industrial uses that would impact the existing residents and businesses or future residents or businesses from development of the Proposed Plan.

Furthermore, any new businesses allowed by the Proposed Plan in the industrial designated land that use, store, or transport large quantities of hazardous materials are required to comply with health and safety, and environmental protection laws and regulations previously described, which require businesses handling or storing certain amounts of hazardous materials to prepare a hazardous materials business plan. The hazardous materials plan includes an inventory of hazardous materials used or stored on-site, and procedures to be used in the event of a significant or threatening significant release of a hazardous material. The hazardous materials plan must include a Material Safety Data Sheet (MSDS) for each hazardous material used or stored on-site. To accomplish this, and to otherwise provide a safe and healthy environment, businesses that use hazardous materials must implement health and safety policies and procedures. In addition, future development within the CPA would be required to complete all applicable environmental review processes and to conform with environmental regulations related to new construction and hazardous materials storage, use and transport. Existing hazardous materials regulations would minimize the potential for the public to be exposed to adverse health or safety effects associated with the release of hazardous materials into the environment.

To ensure that workers and others at individual development sites in the CPA are not exposed to unacceptable levels of risk associated with the use and handling of hazardous materials employers and businesses that handle large quantities of hazardous materials are required to implement existing hazardous materials regulations, with compliance monitored by the State (e.g., OSHA in the workplace or DTSC for hazardous waste) and the City. Compliance with applicable local, State, and federal regulations would ensure that operational impacts related to the use, transport, and disposal of hazardous materials under the Proposed Plan would be ***less than significant***.

Mitigation Measures

MM HAZ-1 Any project that requires a grading, excavation, or building permit from LADBS and which is:

- Located on or within 500 feet of a Hazardous Materials site listed in any of the following databases:
  - State Water Resources Control Board GeoTracker (refer to https://geotracker.waterboards.ca.gov);
  - DTSC EnviroStor (refer to https://www.envirostor.dtsc.ca.gov/public);
  - DTSC Hazardous Waste Tracking System (refer to https://hwts.dtsc.ca.gov);

  - LAFD Certified Unified Program Agency (refer to the active, inactive, and historical inventory lists at https://www.lafd.org/fire-prevention/cupa/public-records);

  - Los Angeles County Fire Department Health Hazardous Materials Division (refer to the active and inactive facilities, site mitigation, and California Accidental Release Prevention inventory lists at https://fire.lacounty.gov/public-records-requests);

  - SCAQMD Facility Information Detail (refer to https://xappprod.aqmd.gov/find); or

- Located on or within 500 feet of a Hazardous Materials site designated as a Resource Conservation and Recovery Act (RCRA) Small Quantity Generator or Large Quantity Generator (refer to the U.S. EPA Envirofacts database at https://enviro.epa.gov/index.html); or

- Located in an Oil Drilling District (O) or located on or within 50 feet of a property identified as having an oil well or an oil field (active or inactive) by the California Geologic Energy Management Division (refer to https://www.conservation.ca.gov/calgem/Pages/WellFinder.aspx); or

- Located on land currently or previously designated with an industrial use class or industrial zoning, in whole or in part; or

- Located on land currently or previously used for a gas station or dry cleaning facility.

Or:

- The Applicant or Owner are aware or have reason to be aware that the Project site was previously used for an industrial use, gas station or dry cleaner.

And:

- The site has not been previously remediated to the satisfaction of the relevant regulatory agency/agencies for any contamination associated with the above uses or site conditions.

Then a Phase I Environmental Site Assessment shall be prepared by a Qualified Environmental Professional in accordance with State standards/guidelines and current professional standards, including the American Society for Testing and Materials' (ASTM) Standard Practice for Environmental Site Assessments, to evaluate whether the site, or the surrounding area, is contaminated with hazardous substances from any past or current land uses, including contamination related to the storage, transport, generation, or disposal of toxic or Hazardous Waste or materials.

If the Phase I identifies a Recognized Environmental Condition (REC) and/or if recommended in the Phase I, a Phase II Environmental Site Assessment shall also be prepared by a Qualified Environmental Professional. The Phase I and/or Phase II Environmental Site Assessment(s) shall be maintained pursuant to appropriate proof of compliance for a minimum of five years after the Certificate of Occupancy is issued and made available for review and inclusion in the case file by the appropriate regulatory agency, such as the State Water Resources Control Board, the State Department of Toxic Substances Control, or the LAFD Hazard Mitigation Program. Any remediation plan recommended in the Phase II Environmental Site Assessment or by the appropriate regulatory agency shall be implemented and, if required, a No Further Action letter shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, the Qualified Environmental Professional shall provide written verification of compliance with and completion of the remediation plan, such that the site meets the applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements.

MM HAZ-2 For discretionary projects that do not meet the criteria in **MM HAZ-1** and are not within the Exide PIA, and involve any ground and/or soil disturbance, soil samples shall be collected and tested to determine the presence of lead or arsenic and the extent of contamination, if any. Any remediation plan recommended by the appropriate regulatory agency shall be implemented and, if required, a No Further Action letter shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, a Qualified Environmental Professional shall provide written verification of compliance with and completion of the remediation plan, such that the site meets the

applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements.

MM HAZ-3 Any project that requires a grading, excavation, or building permit from LADBS and which suspected Hazardous Materials, contamination, debris, or other features or materials that could present a threat to human health or the environment are discovered during earthwork or construction, such activities shall cease immediately until the affected area is evaluated by a Qualified Environmental Professional. If the Qualified Environmental Professional determines that a hazard exists, a remediation plan shall be developed by the Qualified Environmental Professional in consultation with the appropriate regulatory agency, and the remediation identified shall be completed. Work shall not resume in the affected area until appropriate actions have been implemented in accordance with the remediation plan, to the satisfaction of the regulatory agency.

A report that describes the Hazardous Materials, contamination or debris and its disposition, shall be prepared by the Qualified Environmental Professional, according to current professional standards and maintained pursuant to appropriate proof of compliance requirements.

Significance After Mitigation

As discussed in the Regulatory Setting, contamination of soils with hazardous materials is heavily regulated by multiple statutes and agencies. Compliance with applicable laws will ensure less than significant impacts. Mitigation measures are provided to ensure that applicants are put on notice of the need to determine if there is contamination on site and avoid impacts that may result from lack of detection. The above measures provide for processes to ensure that any development under the Boyle Heights Community Plan would not create a significant hazard to the public or environment. Thus, this impact would be ***less than significant with mitigation incorporated***.

Threshold 4.8-2 **Would implementation of the Proposed Plan create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**

This impact would be less than significant with mitigation.

As previously discussed in **Threshold 4.8-1**, all future development projects in the CPA would be required to comply with environmental regulations related to demolition and new construction and hazardous materials storage, use, and transport.

Impacts associated with implementation of the Proposed Plan relate to possible temporary exposure to asbestos, lead, PCBs and other contaminants during demolition of older buildings, temporary and long-term exposure to methane, and hazards from oil wells. Potential impacts from upset and accidents involving the handling, use, storage, transportation of hazardous materials, including from contaminated soils disturbed during construction activities, are discussed in **Threshold 4.8-1**.

Asbestos/Lead/PCB Exposure. Demolition and/or renovation activities in the CPA would potentially encounter asbestos containing materials (ACMs), lead-based paint (LBP), and/or polychlorinated biphenyls (PCBs), depending on the age of the structures to be renovated or demolished. ACMs and LBP were widely used in structures built between 1945 and 1978. PCBs were widely used in structures built or renovated between 1950 and 1979. It is therefore reasonable to assume that these materials could be encountered during rehabilitation and demolition of structures built during this time period. Thus, site workers and neighboring properties could potentially be exposed to ACMs, LBP, or PCBs if these materials are not removed and properly disposed of prior to renovation or demolition.

With respect to ACMs, SCAQMD Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities) requires the owner or operator of any demolition or renovation activity to complete a facility survey for the presence of asbestos prior to any demolition or renovation activity. The survey must include the inspection, identification, and quantification of all friable, and Class I and Class II non-friable ACMs. In instances where friable ACMs are identified and could be disturbed by demolition or renovation activities, Rule 1403 also includes specific notification, removal, and disposal procedures for the ACMs. The individual conducting all work must be certified by Cal/OSHA. Compliance with Rule 1403 requirements would reduce the potential for impacts related to ACMs to a less than significant level.

Similarly, there are numerous regulations related to the handling of LBPs and PCBs in federal and state regulations (e.g., Title 40 of the CFR and Title 22 of the CCR). Consequently, the impact related to the release of LBP or PCBs from individual construction projects that could be undertaken under the Boyle Heights Community Plan would be ***less than significant***.

Oil Fields/Methane Exposure. As shown in **Figure 4.8-4**, Methane Zones or Methane Buffer Zones are generally located at the center of the CPA and within scattered residential portions.

Methane poses a hazard to humans because its highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space; however, the concentrations at which flammable or explosive mixtures form are much lower than the concentrations at which asphyxiation risk is significant. Thus, explosion due to the accumulation of methane in an enclosed area is the primary concern posed by methane. LAMC Section 91.7101 requires new buildings in a Methane

or Methane Buffer Zone to incorporate a menu of measures to control methane intrusion from geological sources. These menus include site testing for methane hazard, installation of a passive system for methane mitigation comprised of a de-watering system, sub-slab vent system, and impervious membrane that essentially facilitates release of methane in a manner where is can diffuse without harm; or installation of an active system comprised of a sub-slab system for mechanical extraction, a lowest occupied space system (includes a gas detection system, mechanical ventilation and alarm system), and a control plant. Compliance with LAMC would ensure impacts related to methane would be ***less than significant***.

The Boyle Heights CPA contains one State Designated Oil Field now listed as abandoned.[36] The Boyle Heights Oil Field contains 13 wells that are currently plugged and not in operation.[37] Five other wells are located within the CPA that are currently listed as being idle and not currently used for extraction.[38] There are no active wells in the CPA. Producing wells can emit air toxics and dust, while idle wells can be a potential source of soil and groundwater contamination if not properly plugged and abandoned. LAMC Section 91.6105 prohibits the development of specific uses and buildings in proximity to an oil well casing. These include schools, sanitariums, an assembly occupancy (i.e., gathering place for 50 or more people), fuel manufacturing plant, or public utility generating, receiving, or distributing electricity, and buildings more than 400 square feet in area and taller than 36 feet in height. In addition, in accordance with LAMC Section 91.7109.2, any abandoned oil well encountered during construction is required to be evaluated by the Fire Department and may be required to be re-abandoned in accordance with applicable rules and regulations of CalGEM.

Compliance with existing regulations would ensure that the implementation of the Proposed Plan would not create a significant hazard to the public or environment due to the release of methane or hazardous materials associated with oil production wells. Therefore, impacts related to methane zones and oil well hazards would be ***less than significant***.

Existing Contaminated Sites. Impacts specific to the Exide cleanup are addressed under **Threshold 4.8-1**. As previously discussed, **Figures 4.8-1** and **4.8-2** identify the location of the hazardous material sites within the CPA. Thus, as discussed under **Impact 4.8-1**, construction activity that disturbs soil or groundwater could have the potential to result in the release of previously unidentified hazardous materials, which could adversely affect construction workers and/or neighboring properties. To address such possible concerns, it

---

36 California Department of Conservation, Geologic Energy Management Division. 2020. Well Finder. Available at: https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.20913/34.04704/14

37 CalGEM. *Well Finder*. https://maps.conservation.ca.gov/doggr/wellfinder/#/-118.20217/34.04168/14, accessed June 23, 2021.

38 CalGEM. *Well Finder*. https://maps.conservation.ca.gov/doggr/wellfinder/#/-118.20217/34.04168/14, accessed June 23, 2021.

is common for a Phase I ESA to be conducted prior to excavation and construction activity. The purpose of the Phase I ESA is to identify RECs associated with soil and groundwater contamination. The scope of work for the Phase I ESA consists of four elements: records review, site reconnaissance, interviews, and report preparation. The Phase I ESA determines whether there are any known contaminated sites are located near the site or if current or historic uses of the site could have resulted in contamination of the soil or groundwater. Based on the results of the Phase I ESA, an additional Phase II subsurface investigation may be warranted to determine whether any identified RECs involve contamination exceeding regulatory action levels. If contamination exceeding action levels is identified, it would need to be remediated with regulatory oversight from an appropriate agency. Depending on the level and type of contamination, the oversight agency could be the City, the County of Los Angeles, the RWQCB, the DTSC, or the U.S. EPA. Remedial actions would typically involve removal and proper disposal, capping, or treatment of contaminated soil or groundwater.

The process described above would normally identify and, as necessary, remediate soil or groundwater contamination. Remediation of contamination exceeding regulatory action levels would address potential impacts during ground disturbance and improve conditions in the long term. However, because there is not a specific legal requirement for a Phase I ESA for all excavation or construction, there is the potential for soil or groundwater contamination to go undetected. Thus, future grading and construction would have the potential to result in exposure CPA construction workers and occupants of neighboring properties to releases of hazardous materials. This would be a ***potentially significant impact***.

Underground Storage Tanks (USTs). It is possible that old USTs that were in use prior to permitting and record-keeping requirements may be present in the CPA. If an unidentified UST were uncovered or disturbed during construction activities, it would be closed in place or removed pursuant to existing regulations. Potential risks, if any, posed by USTs would be minimized by managing the tank according to existing Los Angeles County standards as enforced and monitored by the Department of Environmental Health. If groundwater contamination is identified as a result of an existing UST, remediation activities would be required by LARWQCB prior to the commencement of any new construction activities. Therefore, impacts related to USTs would be ***less than significant***.

4.8.7 MITIGATION MEASURES

Refer to **MM HAZ-1, MM HAZ-2** and **MM HAZ-3.**

Significance After Mitigation

As discussed in the Regulatory Setting, contamination of soils with hazardous materials is heavily regulated by multiple statutes and agencies. Compliance with applicable laws will ensure less than significant impacts. Mitigation measures are provided to ensure that applicants are put on notice of the need to determine if there is contamination on site and avoid impacts that may result from lack of detection. The above measures provide for processes to ensure that any development under the Boyle Heights Plan would not create a significant hazard to the public or environment. Thus, this impact would be ***less than significant with mitigation***.

Threshold 4.8-3 **Would implementation of the Proposed Plan emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?**

This impact would be less than significant with mitigation.

A total of 27 LAUSD educational facilities are located within the CPA, including 6 primary/early education centers, 15 elementary schools, 2 middle schools, 4 high schools, and 7 charter schools. Several schools are located within 0.25 miles of sites that may contain hazardous materials or are themselves generators or storage facilities that utilize hazardous materials (See **Figure 4.8-5**). Six schools fall within the 1.7-mile PIA around the Exide Facility as described in **Section 4.8.2, Existing Environmental Setting**.

Construction activities would involve the use of diesel-powered trucks and equipment, which result in diesel emissions that have the potential to be a health hazard. These impacts are discussed in **Section 4.2, Air Quality.**

To ensure that workers and others at individual development sites within the Boyle Heights CPA are not exposed to unacceptable levels of risk associated with the use and handling of hazardous materials, employers and businesses are required to implement existing hazardous materials regulations, with compliance monitored by the State (e.g., OSHA in the workplace or DTSC for hazardous waste) and the City. All development, including future development within the CPA would be required to comply with all applicable federal, state, and local environmental regulations related to new construction and hazardous materials storage, use and transport. California Health and Safety Code Chapter 6.95, "Hazardous Materials Release Response Plans and Inventory," requires businesses that handle more than a specified amount of hazardous materials on-site to submit a Hazardous Materials Business Plan. Such businesses are required to provide emergency response plans and procedures, training program information, and a hazardous material chemical inventory disclosing hazardous materials stored, used, or handled on site. In

addition, various federal, state, and local regulations and guidelines pertaining to abatement of, and protection from, exposure to asbestos, lead, and other hazardous materials have been adopted for demolition activities and would apply to all new development. All demolition that could result in the release of lead and/or asbestos must be conducted according to Cal/OSHA standards. Compliance with existing regulations would ensure that schools and the general public would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities.

The Boyle Heights Community Plan would not involve direct handling or emissions of hazardous materials within one-quarter mile of schools. Additionally, future development in the CPA will foreseeably comply with all applicable local, state, and federal laws and regulations, as described in **Section 4.8.3, Regulatory Framework**, which would regulate, control, or respond to hazardous waste, transport, storage, disposal, and clean-up in order to ensure that hazardous materials do not pose a significant risk to nearby receptors. See **Threshold 4.8-1** related to potential impacts from the use, handling, storage or disposal of hazardous materials related to operations. Thus, impacts related to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school from operations under the Proposed Plan would be ***less than significant.***

As previously discussed, **Tables 4.8-1** and **4.8-2** identify the locations of hazardous material sites in the Boyle Heights CPA and impacts related to construction and contaminated sites, including the Exide site, have the potential to result in significant impacts. As discussed in detail under **Threshold 4.8-2**, a process to identify and, as necessary, remediate soil and/or groundwater contamination exists and would normally address such hazards. However, because there is not a specific legal requirement to undertake a preliminary investigation to determine the possible presence of hazardous material contamination, it is possible that such contaminants could be overlooked. This could result in the release of hazardous materials during excavation and grading of individual construction sites. Impacts related to the release of hazardous emissions during construction activities within 0.25 miles of a school would be ***potentially significant***.

Mitigation Measures

Refer to **MM HAZ-1, MM HAZ-2,** and **MM HAZ-3.**

Significance After Mitigation

Implementation of **MM HAZ-1, HAZ-2,** and **HAZ-3** would reduce impacts to schools to a less than significant level by ensuring the identification and, as necessary, remediation of soil and/or groundwater contamination prior to excavation or grading on properties within 0.25 mile of schools. Impacts related to hazardous emissions within 0.25 miles of existing schools would be ***less than significant with mitigation***.

Threshold 4.8-4 **Would development under the Proposed Plan be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

This impact would be less than significant with mitigation.

Government Code section 65962.5 requires CalEPA to develop an updated Cortese List. The DTSC is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies are required to provide additional hazardous material release information for the Cortese List.[39] The following resources were reviewed to provide hazardous material release information:

- Environmental Data Resources, EDR DataMap Area Study, Boyle Heights Community Plan Area, Los Angeles, CA, July 10, 2017
- California Department of Toxic Substances Control (DTSC) EnviroStor Database
- State Water Resources Control Board Geo Tracker Database
- U.S. EPA Superfund Enterprise Management Systems (SEMS) Database in Envirofacts

As previously discussed, and as shown in **Tables 4.8-1** and **4.8-2**, the CPA contains sites that have been identified on various regulatory databases as being contaminated from the release of hazardous substances in the soil or groundwater. Thus, construction activity that disturbs soil or groundwater could have the potential to result in the release of hazardous materials, which could adversely affect construction workers and/or neighboring properties and occupants. To address such possible concerns, it is common for a Phase I ESA to be conducted prior to excavation and construction activity. The purpose of the Phase I ESA is to identify RECs associated with soil and groundwater contamination. The scope of work for the Phase I ESA consists of four elements: records review, site reconnaissance, interviews, and report preparation. The Phase I ESA determines whether there are any known contaminated sites are located near the site or if current or historic uses of the site could have resulted in contamination of the soil or groundwater. Based on the results of the Phase I ESA, an additional Phase II subsurface investigation may be warranted to determine whether any identified RECs involve contamination exceeding regulatory action levels. If contamination exceeding action levels is identified, it would need to be remediated with regulatory oversight from an appropriate agency. Depending on the level and type of contamination, the oversight agency could be the City, the County of Los Angeles, the RWQCB, the DTSC, or the U.S. EPA. As discussed

39 DTSC. *Site Mitigation & Restoration Program*, https://dtsc.ca.gov/residential-cleanup/, accessed June 23, 2021.

under **Threshold 4.8-2**, remedial actions would typically involve removal and proper disposal, capping, or treatment of contaminated soil or groundwater.

The process described above would normally identify and, as necessary, remediate soil or groundwater contamination. Remediation of contamination exceeding regulatory action levels would address potential impacts during ground disturbance and improve conditions in the long term. However, because there is not a specific legal requirement for a Phase I ESA for all excavation or construction, there is the potential for soil or groundwater contamination to go undetected. Thus, future grading and construction would have the potential to result in exposure of Boyle Heights CPA construction workers and occupants of neighboring properties to releases of hazardous materials. This impact is ***potentially significant***.

Mitigation Measures

Refer to **MM HAZ-1, MM HAZ-2,** and MM **HAZ-3.**

Significance After Mitigation

Implementation of **MM HAZ-1, HAZ-2** and **HAZ-3** would reduce potential impacts by ensuring the identification of properties listed on a hazardous materials sites compiled pursuant to Government Code Section 65962.5, and any contamination is adequately remediated to federal and state standards. Impacts related to hazardous emissions would be ***less than significant with mitigation***.

Threshold 4.8-5 **Would development under the Proposed Plan be within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the Project Area?**

No impact.

The CPA is not located within two miles of a public airport or public use airport and is not located within the Los Angeles County ALUC planning boundaries of nearby airports. Therefore, implementation of the Proposed Plan would not result in a safety hazard or be exposed to safety hazards related to the operation of an airport, and ***no impact*** would occur.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

No impact.

Threshold 4.8-6 **Would implementation of the Proposed Plan impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?**

This impact would be less than significant.

Construction and operational activities associated with future development in the CPA could interfere with adopted emergency response or evacuation plans. For instance, temporary construction activities like construction barricades within rights-of-way could impede emergency access, or increased traffic during operation could result in additional traffic within roadways. However, the goals, objectives, and policies of the Safety Element of the Los Angeles City General Plan and the Los Angeles County Operational Area ERP provide guidance during unique situations requiring an unusual or extraordinary emergency response. Implementation of the ERP would coordinate all the facilities and personnel of County government with the jurisdictional resources of the cities and special districts within the County into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid and other appropriate response procedures. The City's General Plan Safety Element Policies 1.1.1, 2.1.1, and 3.1.1 provide procedures for coordination among City agencies and other jurisdictions to provide mutual assistance in the event of an emergency or natural disaster and establishment of disaster recovery programs.[40] Compliance with these policies and plans would minimize potential interference with the City and County emergency response plans from construction and operational activities resulting from implementing the Proposed Plan.

The City's EOO implements the goals and policies of the Safety Element. The Safety Element outlines the scope of the EOO's on-going efforts to use experiences and new information to improve the City's hazard program. The EOO Master Plan and individual agency Emergency Response Plans set forth procedures for City personnel to follow in the event of an emergency situation stemming from natural disasters, technological incidents and nuclear defense operations, and other unforeseeable disasters or crises.

The City of Los Angeles Department of Transportation and LAFD would be responsible for ensuring that future development does not impair or physically interfere with an adopted emergency response or evacuation plan. As part of standard development procedures, plans would be submitted for review and

40 City of Los Angeles General Plan. *Safety Element.* Accessed December 2021 online at: https://planning.lacity.org/odocument/f2e2e621-70a3-47c7-9586-c3c6c350438a.

approval to ensure all new development has adequate emergency access and escape routes (clearly marked and delineated) in compliance with existing City regulations. The Proposed Plan would not introduce any features that would preclude implementation of or alter these policies or procedures in any way, or impair implementation of, or physically interfere with the SEP or the ERP. Construction and operation activities within the CPA with respect to emergency response or evacuation plans due to temporary construction barricades or other obstructions that could impede emergency access would be subject to the City's permitting process. Compliance with existing regulations would ensure that implementation of the Proposed Plan would not impair or physically interfere with adopted emergency response plans or emergency evacuation plans. Therefore, impacts related to emergency response plans and emergency evacuation plans are ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.8-7 **Would implementation of the Proposed Plan expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?**

This impact would be less than significant.

As discussed in **Section 4.8.1, Environmental Setting**, areas within a Fire Brush Clearance Zone and VHFHS Zone are at risk for wildfire due to a combination of weather conditions, topography, native vegetation, and seasonal Santa Ana winds. Impacts from wildfires may include loss or damage to structures and properties, impacts to health as a result of poor air quality, bodily injury or death, and secondary impacts such as mudslides or soil erosion due to the loss of natural plant material that prevents erosion. No part of the CPA is within a VHFHS Zone; the nearest VHFHS Zone is approximately 1.5 miles northwest. Thus, impacts related to wildland fires are ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.8.8 CUMULATIVE IMPACTS

The geographic context for the cumulative analysis of hazards and hazardous materials is Los Angeles County, based on the geographic area that could be affected by accidental release into the environment. The cumulative context for the hazards analysis includes future development within the City of Los Angeles, as well as the County of Los Angeles pursuant to applicable planning documents including the RTP/SCS and adjacent Community Plans.

Routine Transport, Use, or Disposal of Hazardous Materials. Impacts related to hazards and hazardous materials are generally site-specific and exposure to a hazard at one location generally does not increase hazards at another location. Therefore, although Citywide growth could potentially increase overall quantities of hazardous materials transported, used, and disposed in the City these impacts would generally remain site specific. Further, as discussed under Impact 4.8-1, the Proposed Plan would not foreseeably result in new development that involves the use, storage, or transport of large quantities of hazardous materials. Moreover, businesses that transport, use, or dispose of hazardous materials throughout the City would be subject to numerous federal, state, and local regulations, as discussed in the Regulatory Framework. All new development would be subject to hazardous materials regulations codified in Titles 8, 22, and 26 of the CCR, as well as Cal/OSHA, SCAQMD, and Cal/EPA regulations concerning the release, use, and transport of hazardous materials. Compliance with all federal, state, and local regulations during the construction and operation of new developments in the City would ensure that cumulative impacts from the routine transportation, use, disposal, or release of hazardous materials and impacts related to the handling of hazardous materials would be less than significant with implementation of **MM HAZ-1, HAZ-2,** and **HAZ-3**. Therefore, the Proposed Plan would not make a cumulatively considerable contribution related to routine transport, use, or disposal of hazardous materials. Impacts would be ***less than significant.***

Upset/Accidental Release of Hazardous Materials. Impacts related to upsets and accidents involving hazardous materials are also generally site-specific and an accident at one location generally does not increase hazards at another location. Cumulative development could occur on properties listed on hazardous materials sites or involve the demolition of existing structures, which may contain hazardous materials such as LBP and ACMs. Various regulations and guidelines pertaining to abatement of, and protection from, exposure to asbestos and lead have been adopted for demolition activities and would apply to all new development in the City and County. All demolition that could result in the release of lead

and/or asbestos must be conducted according to Cal/OSHA standards. In addition, as discussed under Impact 4.8-2, the Proposed Plan would not foreseeably result in new development that would be expected to increase the potential for accidents involving hazardous materials and businesses that transport or use hazardous materials throughout the City, including the CPA, would be subject to federal, state, and local regulations, as discussed in the Regulatory Framework Compliance with applicable regulations and guidelines pertaining to abatement of, and protection from, exposure to ACMs, LBPs, and other hazardous materials would ensure that the general public would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities**. Mitigation Measure HAZ-1** requires a comprehensive search of databases of sites containing hazardous waste or hazardous materials, including on lists prepared pursuant to Government Code, section 65962.2 and that any contaminated sites be remediated as appropriate. Accidental release of hazardous materials is often localized and in addition, with **MM HAZ-1, MM HAZ-2,** and **MM HAZ-3** the Proposed Plan would not make a cumulatively considerable contribution related to the accidental release of hazardous materials. Impacts would be ***less than significant.***

Hazardous Materials Near Schools. As discussed above, impacts related to hazards and hazardous materials are generally site-specific and exposure to a hazard at one location generally does not increase hazards at another location. Therefore, although Citywide growth could potentially increase the overall potential for hazardous material emissions or releases to affect schools, such impacts generally are not cumulative in nature. In addition, as discussed under **Threshold 4.8-3**, the Plan would not accommodate new development that would increase the use, storage, or transport of large quantities hazardous materials near schools and businesses that transport, use, or dispose of hazardous materials throughout the City, including CPA, would be subject to federal, state, and local regulations, as discussed in the Regulatory Framework. Mitigation required under **Threshold 4.8-1** would address any potential impacts in the CPA related to the possible release of hazardous materials near schools.

The Proposed Plan along with cumulative development could expose schools to hazardous emissions, depending on the specific location and type of use proposed, resulting in significant impacts to nearby schools if the hazardous emissions result in health risks to students and staff at local schools. Compliance with applicable regulations and guidelines pertaining to abatement of, and protection from, exposure to hazardous materials would ensure that schools would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities. Compliance with **MM HAZ-1, MM HAZ-2,** and **MM HAZ-3** would ensure compliance with all regulations. Therefore, the Proposed Plan would not make a cumulatively considerable contribution to impacts related to school hazards. Impacts would be ***less than significant.***

Hazardous Materials Sites. Existing regulations ensure that either new development does not occur on hazardous materials sites, or such sites are cleaned up to appropriate levels. With the implementation of **MM HAZ-1, MM HAZ-2** and **MM HAZ-3** for development projects within the CPA that would be located on a listed hazardous materials site, impacts would be less than significant with mitigation. **MM HAZ-1** requires a comprehensive search of databases of sites containing hazardous waste or hazardous materials, including on lists prepared pursuant to Government Code, section 65962.2 and that any contaminated sites be remediated as appropriate. As all known contaminated sites are well regulated and required to be remediated prior to development, this cumulative impact would be less than significant with mitigation. Contaminated sites would be required to comply with all local, state, and federal regulations and would ensure that contaminated sites undergo remediation activities prior to development activities. Contamination is often localized and with mitigation impacts would be further reduced such that the Proposed Plan would not make a cumulatively considerable contribution to impacts related to contaminated sites. Impacts would be ***less than significant.***

Public Airports/Private Airstrips. Because no portion of the CPA is located in the vicinity of a public airport or private airstrip, the Proposed Plan would have no contribution to any cumulative impact related to these hazards. Impacts would not be cumulatively considerable and there would be no cumulative impacts**.**

Emergency Response and Evacuation. Compliance with federal, state, and local regulations would ensure that the Proposed Plan would not make a cumulatively considerable contribution to impacts related to interference with adopted emergency plans, including temporary street closures. Impacts would not be cumulatively considerable and cumulative impacts would be ***less than significant.***

Wildland Fires. No part of the CPA is within the VHFHS zone; therefore, the potential for future development under the Proposed Plan in areas that are located in or around the VHFHS zone in the future would be negligible. For this reason, the incremental effect of the Proposed Plan with respect to potential exposure to wildland fire hazards would not be cumulatively considerable and cumulative impacts would be ***less than significant.***

4.9 HYDROLOGY AND WATER QUALITY

4.9.1 INTRODUCTION

This section analyzes the potential environmental effects on hydrology and water quality in the Community Plan Area (CPA) from implementation of the Proposed Plan. Topics addressed include stormwater runoff and urban pollutants, flood hazards, drainage, and groundwater resources. The evaluation of the Proposed Plan's effects on water supplies, including groundwater, is analyzed in **Section 4.16, Utilities and Service Systems,** of this Draft EIR.

4.9.2 EXISTING ENVIRONMENTAL SETTING

Groundwater and surface water are inter-dependent and are physically connected by the hydrologic cycle. The hydrologic cycle refers to the circulation of water from the ocean through the atmosphere to the land and ultimately back to the ocean. A watershed carries water "shed" from the land after rain falls and snow melts (surface water) and channels it into soils, groundwater, creeks, streams, or rivers, and eventually the ocean. Watersheds in the strictest sense are geographic areas draining into a river system, ocean, or other body of water through a single outlet and include the receiving waters. They are usually bordered, and separated from, other watersheds by mountain ridges or other naturally elevated areas.

For planning purposes, Los Angeles Regional Water Quality Control Board (LARWQCB) divides surface waters within the region into hydrologic units. The Los Angeles-San Gabriel Hydrologic Unit covers most of Los Angeles County and small areas of southeastern Ventura County. This hydrologic unit, or drainage area, totaling 1,608 square miles is highly urbanized and much of the area is covered with semi-permeable or non-permeable material (i.e., paved surfaces). The Los Angeles River, San Gabriel River, and Ballona Creek are the major drainage systems of most of Los Angeles County. These surface waters also recharge large reserves of groundwater that exist in alluvial aquifers underlying the San Fernando and San Gabriel Valleys and the Los Angeles Coastal Plain.

Topography

The CPA is relatively flat and highly urbanized, lacking major geologic or topographic features such as hilltops, ridges, hillslopes, canyons, ravines, outcrops, and water bodies. The elevation within the CPA ranges from 168 mean sea level (msl) to 500 msl. Areas that are zoned as "Hillside" include the western boundary and southwest corner of Boyle Heights, adjacent to the intersection of the US-101, the I-10, and the I-5. Other "Hillside" areas include the area north of I-10 that traverses the center section of the CPA, north of Evergreen Cemetery near the eastern boundary of the CPA, and the northeast corner of the CPA north of Wabash Avenue.

Surface Water

The City of Los Angeles has four watersheds: Los Angeles River, Ballona Creek, Dominguez Channel, and Santa Monica Bay. The CPA is located within the Los Angeles River Watershed, as shown in **Figure 4.9-1, Los Angeles River Watershed**, and discussed in further detail below.

Los Angeles River Watershed

The Los Angeles River Watershed, one of the largest watersheds in the Los Angeles Region consisting of 834 square miles, extends between the Santa Monica Mountains and the San Gabriel Mountains and covers the entirety of the Los Angeles River's length (from the coastal plains to the San Pedro Bay).[1] The eastern portion spans from the Santa Monica Mountains to the Simi Hills and in the west from the Santa Susana Mountains to the San Gabriel Mountains. The watershed encompasses and is shaped by the path of the Los Angeles River, which flows from its headwaters in the mountains eastward to the northern corner of Griffith Park. Here the channel turns southward through the Glendale Narrows before it flows across the coastal plain and into San Pedro Bay near Long Beach. The Los Angeles River Watershed also includes the coastal interface zone and coastal waters of Marina del Rey, the Venice Canals, Ballona Lagoon, Del Rey Lagoon, and Oxford Lagoon.

Several tributaries make up the Los Angeles River Watershed, including the Upper Los Angeles River, Rio Hondo, and Compton Creek.[2] Approximately 324 square miles of the watershed are covered by forest or open space land including the area near the headwaters, which it originates, and approximately 205 miles of the Los Angeles River Watershed system is made of engineered channels. Specifically, land uses within the Los Angeles River Watershed consist of 37% residential, 8% commercial, 11% industrial, and 44% open space.[3]

The Los Angeles River runs adjacent to the CPA's western boundary, separating the CPA with the Central City North CPA. The upper reaches of the river flows from the San Fernando Valley, where it conveys municipal separate storm sewer system (MS4) discharges. Below the Sepulveda Basin, flows are dominated by tertiary-treated effluent from three municipal wastewater treatment plants. Near the CPA, the Los Angeles River flows mainly through industrial uses and beneath the Santa Monica Freeway (I-10). From the Arroyo Seco, north of downtown Los Angeles, to the confluence with the Rio Hondo, the river flows through industrial and commercial areas and is bordered by rail yards, freeways, and storage facilities. From the Rio Hondo to the Pacific Ocean, the river flows through industrial, residential, and commercial

areas, including major refineries and petroleum products storage facilities, major freeways, and rail yards serving the Ports of Los Angeles and Long Beach.

See **Section 4.3, Biological Resources**, for further discussion on the habitats and species that can be found along the Los Angeles River.

Surface Water Quality

Water quality is influenced by a number of factors, including climate, circulation, biological activity, surface runoff, and effluent discharges. Water column contaminants often include metals (particularly cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc), oil and grease, chlorinated hydrocarbons (DDT and DDE), and polychlorinated biphenyls (PCBs). Other water quality parameters such as phosphates and nitrates change from day to day and are influenced by factors that include biological processes, wastewater discharge, and storm runoff. Urban runoff and illegal dumping are major contributors to impaired water quality. Pollution originating over a large land area without a single point of origin and generally carried by stormwater is considered non-point pollution.

The Los Angeles River Watershed is highly urbanized, contributing to urban runoff, MS4 discharges, and illegal dumping that are major contributors to impaired water quality in the Los Angeles River and tributaries. The Los Angeles Regional Board's Basin Plan[4] sets water quality objectives that must be attained to protect the designated beneficial uses for surface water and groundwater. Accordingly, uncontrolled pollutants from nonpoint sources are believed to be the greatest threats to rivers and streams within the Los Angeles region. The RWQCB has established total maximum daily loads (TMDLs) in the watersheds to implement applicable water quality standards. TMDLs represents the assimilative capacity of a receiving water to absorb a pollutant and is the sum of the individual wasteload allocations for point sources, load allocations for nonpoint sources plus an allotment for natural background loading, and a margin of safety. A TMDL is implemented by reallocating the total allowable pollution among the different pollutant sources (through the permitting process or other regulatory means) to ensure that the water quality objectives are achieved. TMDLs have been established for the Los Angeles River Watershed and include sediment, nutrients, toxics, bacteria, metals, and trash.[5]

Surface Water Resources and Dams

As shown in **Figure 4.9-2, Boyle Heights CPA Surface Water Resources and Dams**, The nearest surface water resource is the Los Angeles River, which borders the western boundary of the CPA. The Silver Lake Reservoirs are two concrete-lined basins, Ivanhoe Reservoir and Silver Lake Reservoir. The two basins are divided by a spillway. The Silver Lake Reservoir is located approximately 3.65 miles northwest of the CPA western boundary. Additionally, the Garvey Reservoir is also located proximate to the CPA. The Garvey Reservoir lies impounded behind a north dam and a south dam, and is located approximately 4.25 miles east of the CPA boundary.

Groundwater

The Los Angeles Groundwater Basin comprises the Hollywood, Santa Monica, Central, and West Coast Sub-basins. The CPA overlies the Los Angeles Coastal Plain's Central Sub basin, commonly referred to as the Central Basin. The Central Basin covers approximately 277 square miles and is bounded on the north by a surface divide called the La Brea High, and on the northeast and east by the Elysian Hills, Repetto Hills, Merced Hills, and Puente Hills. The southeast boundary between the Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage province boundary. The southwest boundary is formed by the Newport Inglewood fault system and the West Coast Basin. The location of the groundwater basin can be found in **Figure 4.9-3, Boyle Heights CPA Groundwater Basins**.

Historically, groundwater flow in the Central Basin has been from recharge areas in the northeast part of the sub-basin, toward the Pacific Ocean on the southwest. However, pumping has lowered the water level in the Central Basin causing water levels in some aquifers on both sides of the Newport-Inglewood uplift to be approximately equal. However, even with the decrease in outflow, groundwater continues to flow from the northeast to the southwest toward the West Coast Sub-basin.

Historically high groundwater levels within the CPA in the Central Sub-basin range from 20 to 200 feet below ground surface (bgs).[6] Limited groundwater is produced from this zone but water from this zone can percolate into the underlying aquifers. In a recent report by the Water Replenishment District of Southern California, groundwater data was collected from wells in the deeper basin aquifers where the majority of groundwater pumping occurs. The deeper aquifers include: the Lynwood; Silverado; and Sunnyside. The fall 2019 Contour Map shows that in the Central Basin water levels range from highs in excess of 160 feet above mean see leavel (msl) to lows deeper than 105 feet below msl. The highest water

6 City of Los Angeles, Department of Public Works. NavigateLA. Available at: http://navigatela.lacity.org/navigatela/, accessed October 11, 2021.

levels are in the Montebello Forebay; water levels decrease to the south and west towards the Long Beach area, the Newport-Inglewood Uplift, and the Los Angeles Forebay. In the West Coast Basin, water levels range from highs of nearly 10 feet above msl to lows of more than 60 feet below msl.[7] With the exception of the Montebello Forebay and along the West Coast Basin Project, the majority of the groundwater levels in the district are below sea level, which is why continued injection at the seawater barriers is needed to prevent saltwater intrusion. In addition, perched groundwater may be encountered in various locations throughout the region where dense soil conditions allow precipitation to be trapped in the soil strata.

Flood Control and Drainage Facilities

The Los Angeles General Plan Safety Element explains that the purpose of local flood control and drainage facilities is to quickly route storm waters to the Santa Monica and San Pedro Bays in order to prevent flooding in the City. The City's storm drain system, maintained by the Bureau of Engineering, consists of an extensive network of underground pipes and open channels that were designed to prevent flooding. The City's storm drain system consists of approximately 1,500 miles of storm drains beneath the streets, approximately 35,000 catch basins that collect runoff, spreading grounds, and pumping facilities. Spreading grounds are facilities that re-absorb stormwater into the ground and re-supply the underground water system. Reservoirs, dams, and stormwater management ponds collect and store stormwater. The City's system is designed to accommodate 50-year magnitude storms. During dry weather, the combined County and City storm drainage systems carry tens of millions of gallons of runoff daily. During storms, the system carries billions of gallons of storm runoff per day. As it flows over the land surface, stormwater picks up potential pollutants that may include sediment, nutrients (from lawn fertilizers), bacteria (from animal and human waste), pesticides (lawn and garden chemicals), metals (from rooftops and roadways), and petroleum by-products (from leaking vehicles). Stormwater runoff is carried via open flood control channels directly to the ocean or to collection systems. The storm drain system receives no treatment or filtering process and is completely separate from the City's sewer system.

With the exception of undeveloped open space areas and parks, most of the CPA is covered with impervious surfaces including roadways, parking lots, hardscaping, and rooftops that generate stormwater runoff. Stormwater runoff within the CPA is directed toward Los Angeles River via storm drains, curbs and gutters, and urban sheet flow. Runoff in the CPA drains from the street into gutters and enters the City's storm drain system through catch basins. From catch basins, runoff flows into underground tunnels that empty into flood control channels, which discharge to over 65 shoreline outfalls rimming the Los Angeles area coastline. The

7 Water Replenishment District. 2020. *Regional Groundwater Monitoring Report Water Year 2018-2019.* Available online at: https://www.wrd.org/sites/pr/files/2019%20RGWMR%20FINAL_0.pdf, accessed October 11, 2021.

Los Angeles River is a major flood control facility for draining stormwater from the CPA and directing it safely to the ocean.

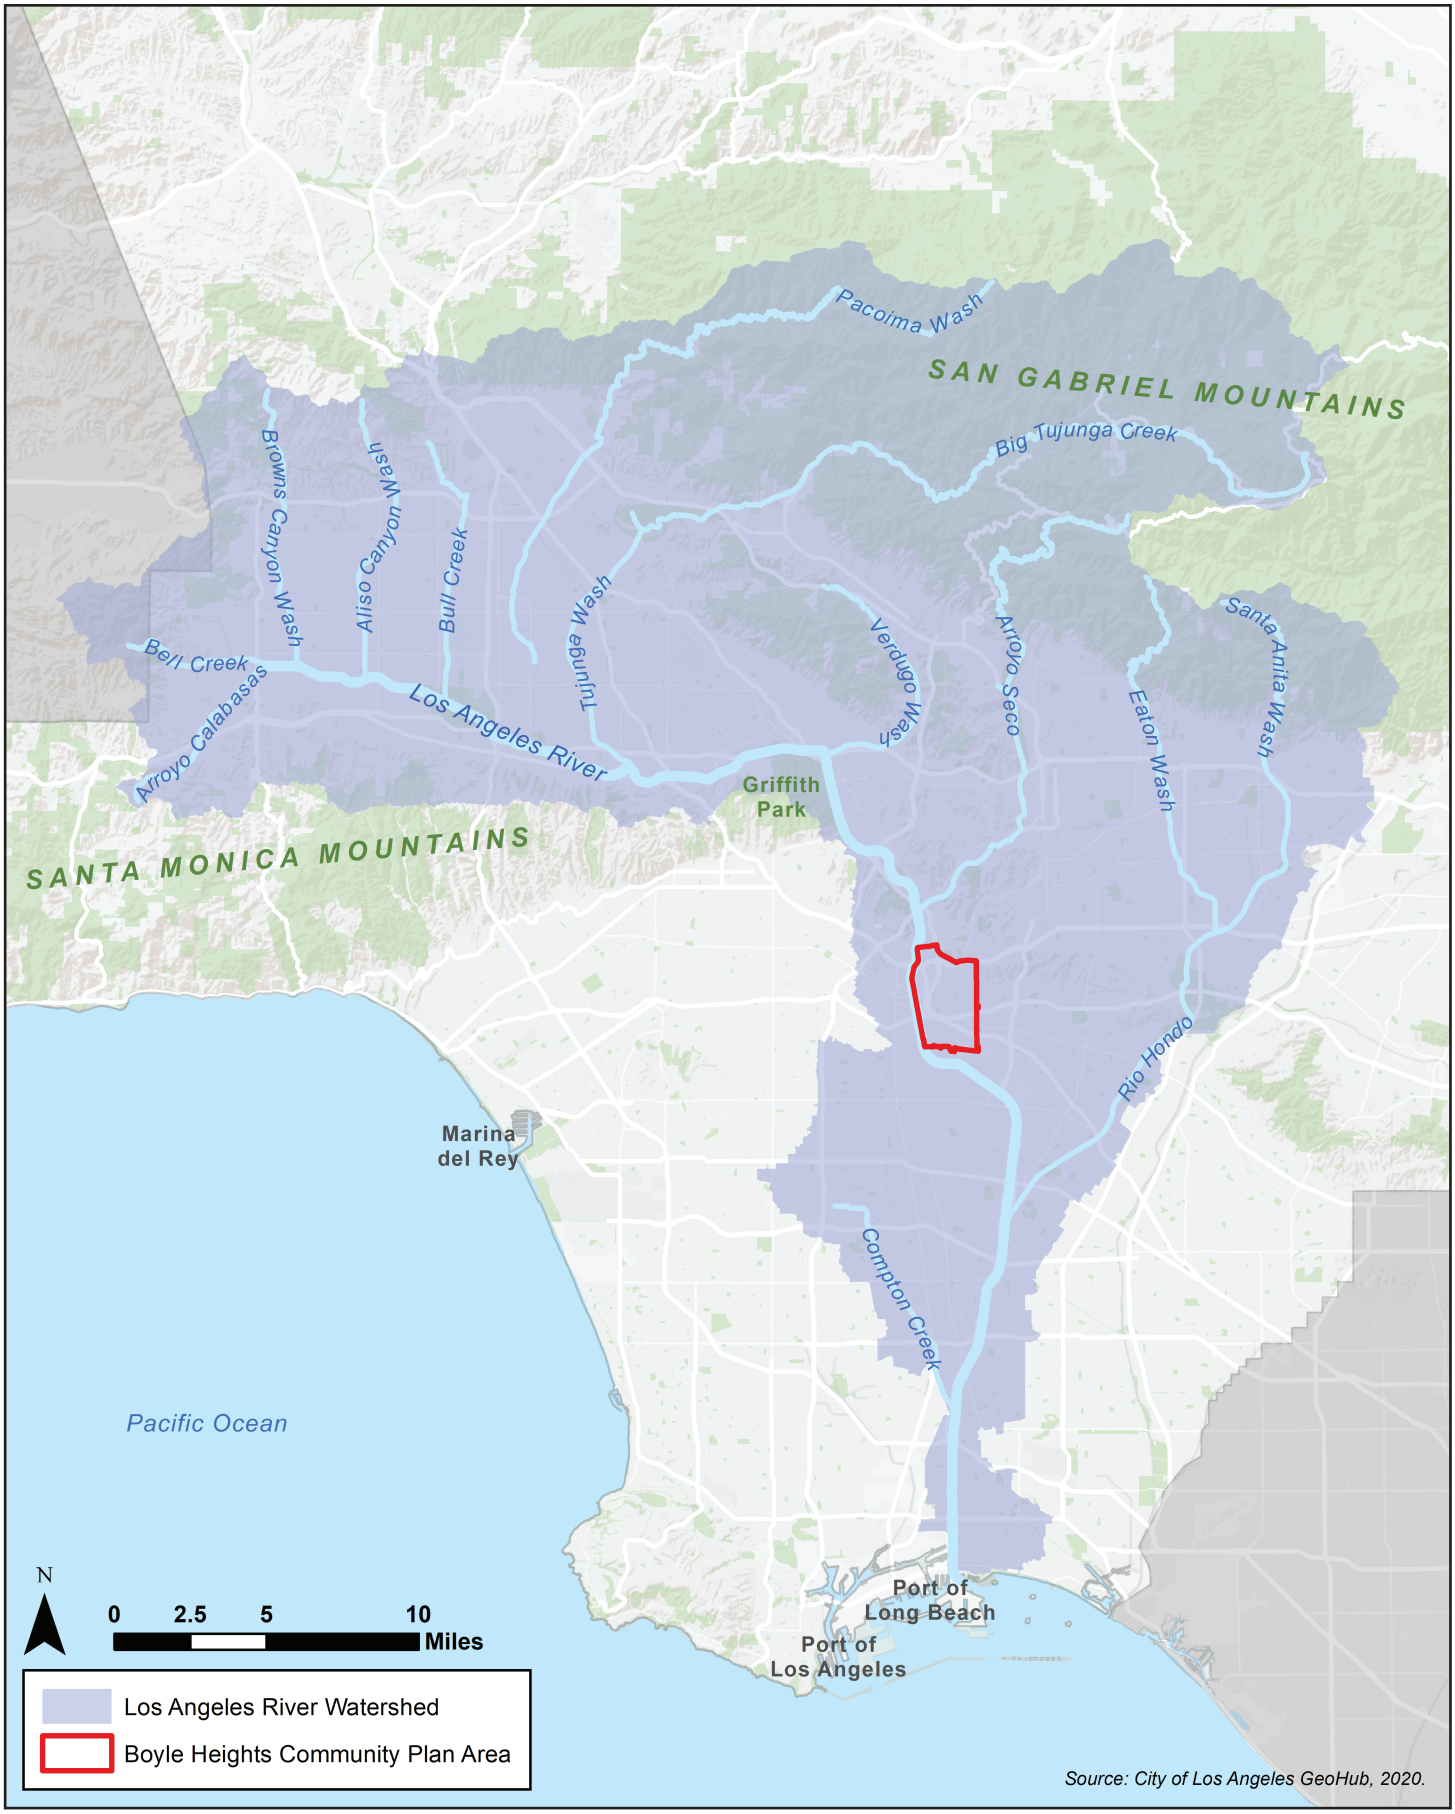
Flood Hazards. Los Angeles County is subject to a wide range of flood hazards, including those caused by intense storms, earthquakes, and failure of man-made structures. Storm conditions, topography, drainage patterns, and the adequacy of the stormwater system combine under certain conditions to create areas of flooding.

Flood Plains. The Federal Emergency Management Agency (FEMA) considers land that is subject to inundation by a 100-year flood to be a Special Flood Hazard Area. FEMA defines a 100-year flood as a flood event that has a 1 in 100 chance (1% probability) of being equaled or exceeded in any given year, and a 500-year flood as a flood event that has a 1 in 500 chance (0.2 percent probability) of being equaled or exceeded in any given year. The 500-year flood zone is used to designate base floodplains of lesser hazards, such as areas protected by levees from 100-year flood, or shallow flooding areas with average depths of less than one foot or drainage areas less than 1 square mile. **Figure 4.9-4, Flood Hazards within the Boyle Heights CPA,** identifies areas located within a 100-year and 500-year flood plain within the vicinity of the CPA. As shown in **Figure 4.9-4,** Special Flood Hazard Areas designated within and adjacent to the CPA that include the areas by the Los Angeles River, the northwestern boundary and corner of the CPA, which are mainly industrial uses.

The City is a participating community in the National Flood Insurance Program (NFIP). The City floodplain management ordinance includes flood-proofing requirements for new construction within a Special Flood Hazard Area at defined base flood elevations, which are based on FEMA guidelines.

Inundation. Dam inundation is defined as the flooding that occurs as the result of structural failure of a dam. **Figure 4.9-4** identifies the area along and adjacent to the Los Angeles River as potential inundation areas. Within the CPA boundaries, on the northwestern corner, potential inundation areas associated with the Los Angeles River are used primarily as industrial uses and the Union Pacific rail yard. Just outside of the western CPA boundary, land uses adjacent to potential indundation areas associated with the Los Angeles River include industrial uses, public facilities (regional roadways), and some residential and commercial uses.

Pursuant to the California Water Code (CWC), the California Division of Safety of Dams oversees the design and construction of dams and conducts yearly inspections to insure that the dams are performing and being maintained in a safe manner. In addition, the City's Local Hazard Mitigation Plan provides a list



of existing programs, proposed activities, and specific projects that may assist the City in reducing risks and injury from natural and human-made hazards, including dam failure.[8]

Seiches. Seiches are oscillations generated in enclosed bodies of water which can be caused by ground shaking associated with an earthquake. The CPA is not proximate to any enclosed bodies of water that would expose buildings or residents to substantial effects of seiches.

Tsunamis. Tsunamis are large ocean waves generated by sudden water displacement caused by a submarine earthquake, landslide, or volcanic eruption. The CPA is located more than 14 miles inland from the Pacific Ocean. According to the Safety Element of the General Plan, the CPA is not located within a Tsunami Hazard Mitigation Zone.

Mudflow/Mudslides. Mudflows develop when saturated, loose surface materials (e.g., soil, colluvium/slopewash, and weathered bedrock formations) in hillside areas become unstable and, due to gravitational forces, slide down the hillside slopes. The CPA is relatively flat and highly urbanized, lacking major geologic or topographic features such as hilltops, ridges, hillslopes, canyons, ravines, outcrops, and water bodies. Development occurring within the hillsides are required to comply with the citywide Hillside Ordinance during construction to minimize risks related to construction in high risk hillside areas.

4.9.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Hydrology at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Clean Water Act
- Federal Antidegradation Policy
- Safe Drinking Water Act
- National Flood Insurance Program
- Porter-Cologne Water Quality Act (California Water Code)
- Sustainable Groundwater Management Act (SGMA) of 2014
- NPDES Permit Program
- County of Los Angeles Hydrology Manual
- Low Impact Development Ordinance
- Stormwater Program – Los Angeles County MS4 Permit Citywide Implementation
- Los Angeles Floodplain Hazard Management Specific Plan Ordinance (No. 172,081)
- 2020 Floodplain Management Plan
- Local Hazard Mitigation Plan
- Los Angeles Municipal Code Section 62.105, Construction "Class B" Permit
- Los Angeles Municipal Code Sections 12.40 through 12.43, Landscape Ordinance
- Los Angeles Municipal Code Section 64.70, Stormwater and Urban Runoff Pollution Control Ordinance
- Los Angeles Municipal Code Section 64.72, Stormwater Pollution Control Measures for Development Planning and Construction Activities
- Water Quality Compliance Master Plan for Urban Runoff

Federal

Clean Water Act.

The Clean Water Act (CWA), formerly known as the Federal Water Pollution Control Act, was first introduced in 1948, with major amendments in the 1960s, 1970s and 1980s.[9] The CWA authorizes Federal, state, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries. Amendments to the CWA in 1972 established the National Pollutant Discharge Elimination System (NPDES) permit program, which prohibits discharge of pollutants into the nation's waters without procurement of a NPDES permit from the United States Environmental Protection Agency (USEPA). The purpose of the permit is to translate general requirements of the Clean Water Act into specific provisions tailored to the operations of each organization that is discharging pollutants. Although federally mandated, the NPDES permit program is generally administered at the State and Regional levels.

The USEPA NPDES Program requires NPDES permits for: (1) Municipal Separate Storm Sewer Systems (MS4) Permit generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. As of March 2003, Phase II of the NPDES Program extended the requirements for NPDES permits to numerous small municipal separate storm sewer systems, construction sites of one to five acres, and industrial facilities owned or operated by small municipal separate storm sewer systems, which were previously exempted from permitting.

Federal Antidegradation Policy

The Federal Antidegradation Policy has been incorporated within the Clean Water Act and requires states to develop state-wide antidegradation policies and identify methods for implementing them.[10] Pursuant to the Code of Federal Regulations, state antidegradation policies and implementation methods must, at a minimum, protect and maintain: (1) existing in-stream water uses; (2) existing water quality, where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that

---

9 United States Environmental Protection Agency, Clean Water Act, November 2002, https://www.epa.gov/sites/production/files/2017-08/documents/federal-water-pollution-control-act-508full.pdf. Accessed September 2020.

allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource.

Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) is the main federal law that ensures the quality of the Nation's drinking water.[11] The SDWA was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply and its sources: rivers, lakes, reservoirs, springs, and groundwater wells. Under SDWA, the USEPA sets standards for drinking water quality and oversees the states, localities, and water suppliers that implement those standards. The SDWA regulates contaminants of concern in domestic water supply, including MCLs, and that the EPA has delegated the Cal Dept. of Public Health the responsible agency for administering California's drinking water program. MCLs are established under CCR Title 22, Div. 4, Ch. 15, Article 4 (Title 22 Standards).

National Flood Insurance Program

The National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973 mandate the Federal Emergency Management Agency (FEMA) to evaluate flood hazards.[12] FEMA provides flood insurance rate maps (FIRMs) for local and regional planners to promote sound land use and development practices, by identifying potential flood areas based on the current conditions. To delineate a FIRM, FEMA conducts engineering studies referred to as flood insurance studies (FIS). Using information gathered in these studies, FEMA engineers and cartographers delineate special flood hazard areas (SFHA) on FIRMs.

The Flood Disaster Protection Act requires owners of all structures within identified SFHAs to purchase and maintain flood insurance as a condition of receiving federal or federally-related financial assistance, such as mortgage loans from federally-insured lending institutions. Community members within designated areas are able to participate in the National Flood Insurance Program (NFIP) afforded by FEMA.

National Pollutant Discharge Elimination System (NPDES)

The federal government also administers the National Pollutant Discharge Elimination System (NPDES) permit program, which regulates discharges into surface waters. Section 404 of the Clean Water Act prohibits the discharge of dredged or fill materials into Waters of the United States or adjacent wetlands

11 United States Code, Title 42 – The Public Health and Welfare- Chapter 6A Public Health and Service, Safe Drinking Water Act. 2006 Edition, Supplement 4, https://uscode.house.gov/view.xhtml?path=/prelim@title42/chapter6A/subchapter12&edition=prelim. Accessed September 2020.

12 The National Flood Insurance Act of 1968, as amended, and The Flood Disaster Protection Act of 1973, 42 U.S.C. 4001 et. seq., https://www.fema.gov/media-library/assets/documents/21010. Accessed September 2020.

without a permit from the U.S. Army Corps of Engineers. As discussed under *Flood Hazards*, the Federal Emergency Management Agency (FEMA) establishes base flood heights for 100-year and 500-year flood zones.

The primary regulatory control relevant to the protection of water quality is the Federal National Pollution Discharge Elimination System (NPDES) permit administered by the State Water Resources Control Board. This board establishes requirements prescribing the quality of point sources of discharge and establishes water quality objectives. These objectives are established based on the designated beneficial uses (e.g., water supply, recreation, and habitat) for a particular surface water body or groundwater basin. The NPDES permits are issued to point source dischargers of pollutants to surface waters and are issued pursuant to Water Code Chapter 5.5 that implements the Federal Clean Water Act. Examples include, but are not limited to, public wastewater treatment facilities, industries, power plants, and groundwater cleanup programs discharging to surface waters (State Water Resources Control Board, Title 23, Chapter 9, Section 2200). Discharge limits, under the NPDES permits, for minerals and pollutants are established and regulated by the California Regional Water Quality Control Board.

State

Porter-Cologne Water Quality Act (California Water Code)

The Porter-Cologne Water Quality Control Act established the legal and regulatory framework for California's water quality control.[13] The California Water Code (CWC) authorizes the State Water Resources Control Board (SWRCB) to implement the provisions of the CWA, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants. In California, the NPDES stormwater permitting program is administered by the SWRCB.

Under the CWC, the State of California is divided into nine Regional Water Quality Control Boards (RWQCBs), which govern the implementation and enforcement of the CWC and the CWA. The Project Site is located within Region 4, also known as the Los Angeles Region (LARWQCB). The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California's waters, acknowledging areas of different climate, topography, geology, and hydrology. Each RWQCB is required to formulate and adopt a Water Quality Control Plan or Basin Plan for its region. The Basin Plan establishes beneficial use definitions for the various types of water bodies, and serves as the basis for establishing water quality objectives, discharge conditions and prohibitions, and must adhere to the policies set forth in the CWC and established by the SWRCB. In this regard, the LARWQCB issued the Los Angeles Basin Plan on

13 State Water Resources Control Board, Porter-Cologne Water Quality Control Act, January 2018, https://www.waterboards.ca.gov/laws_regulations/docs/portercologne.pdf. Accessed September 2020.

August 29, 2014 for the Coastal Watersheds of Los Angeles and Ventura Counties, with subsequent amendments. The RWQCB is also given authority to issue waste discharge requirements, enforce actions against stormwater discharge violators, and monitor water quality.[14]

Sustainable Groundwater Management Act (SGMA) of 2014

The Sustainable Groundwater Management Act of 2014 (SGMA) requires the designation of groundwater sustainability agencies (GSAs) by one or more local agencies and the adoption of groundwater sustainability plans (GSPs) for basins designated as medium- or high-priority by the California Department of Water Resources (DWR). SGMA grants new powers to GSAs, including the power to adopt rules, regulations, ordinances, and resolutions; regulate groundwater extractions; and to impose fees and assessments. SGMA also allows the State Water Resources Control Board (SWRCB) to intervene if local agencies will not or do not meet the SGMA requirements, in addition to mandating that critically overdrafted basins be sustainable by 2040, and medium- or high-priority by 2042.

California Toxics Rule

In 2000, the California Environmental Protection Agency (Cal-EPA) promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State.[15] Cal-EPA promulgated this rule based on Cal-EPA's determination that the numeric criteria of specific concentrations of regulated substances are necessary for the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health.

California State Water Resource Control Board (SWRCB)

The SWRCB was established through the California Porter Cologne Water Quality Act of 1969. At the State level, SWRCB has responsibility for the protection of water quality and sets Statewide policies and regulations for the implementation of water quality control programs mandated by federal and State water quality statutes and regulations. The SWRCB delegates to the nine RWQCBs the responsibility for the protection of water quality in each major drainage basin throughout the state. The LARWQCB has

jurisdiction over the coastal drainages between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line. A more detailed discussion of the LARWQCB is presented below.

NPDES General Construction Activity Stormwater Permit (GCASP)

Pursuant to CWA Section 402(p) and the Porter-Cologne Water Quality Control Act, SWRCB has issued a Statewide NPDES General Permit, or GCASP, under Order No. 2009-0009-DWQ, NPDES No. CAR000002, which was adopted on September 2, 2009.[16] The Order requires that prior to the beginning of construction activities, the permit applicant must obtain coverage under a GCASP permit by preparing and submitting a Notice of Intent (NOI) along with the appropriate fee to SWRCB. Construction activities subject to GCASP include clearing, grading, and disturbances to the ground, such as stockpiling or excavation, that result in soil disturbances of one acre of total land area or more.

Prior to obtaining the GCASP, an adequate Stormwater Pollution Prevention Plan (SWPPP) has to be prepared. The SWPPP specifies BMPs that will prevent construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off-site into receiving waters. BMPs are intended to diminish impacts to the Maximum Extent Practicable (MEP), which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of stormwater discharges and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in stormwater as well as non-stormwater discharges. The SWPPP includes a description of: (1) the site, (2) erosion and sediment controls, (3) means of waste disposal, (4) implementation of approved local plans, (5) control of post-construction sediment and erosion control measures and maintenance responsibilities, and (6) non-stormwater management controls. Dischargers are also required to inspect their construction sites before and after storms to identify stormwater discharge associated with construction activity and to identify and implement controls where necessary.

BMPs are intended to diminish impacts to the MEP, which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. Reducing impacts to the MEP generally relies on BMPs that emphasize pollution prevention and source control, with additional structural controls as needed.

Within the City of Los Angeles, SWPPP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are

16 California Water Code Section 13263(i).

reviewed for compliance with the stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

Cobey-Alquist Flood Plain Management Act

CWC Sections 8400 et seq. documents the state's intent to support local governments in their use of land use regulations to accomplish floodplain management and to provide assistance and guidance, as appropriate.

Regional

Water Replenishment District of Southern California

The City of Los Angeles is included within the Water Replenishment District of Southern California (WRD). The WRD service area is categorized as a High Priority basin and pursuant to the SGMA must either: (a) form a groundwater sustainability agency (GSA) to prepare and submit a groundwater sustainability plan; or directly submit an Alternative Analysis in lieu of forming a GSA. The WRD, in conjunction with key stakeholders including the Los Angeles Department of Water and Power (LADWP), has prepared and submitted an Alternative Analysis that satisfies the requirements of the SGMA. The Alternative Analysis demonstrates compliance with applicable portions of the CWC and provides adequate information to show that the applicable, underlying Central Subbasin has operated within its sustainable yield over a period of at least 10 years; and that the Alternative Analysis satisfies SGMA's objectives by promoting sustainable management of the groundwater in the Central Subbasin.

Los Angeles County Standard Urban Stormwater Mitigation Plan (SUSMP)

On March 8, 2000, Los Angeles County Standard Urban Stormwater Mitigation Plan (SUSMP) requirements were approved by the LARWQCB as part of the MS4 permit to address stormwater pollution from new construction and redevelopment projects. SUSMP is a comprehensive stormwater quality program to manage urban stormwater and minimize pollution of the environment. The purpose of the SUSMP is to reduce the discharge of pollutants in stormwater by outlining BMPs that must be incorporated into the design plans of new development and redevelopment. The SUSMP requirements contain a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce the post-project discharge of pollutants from stormwater conveyance systems. The SUSMP requirements define, based upon land use type, the types of practices that must be included and issues that must be addressed as appropriate to the development type and size. The SUSMP requirements apply to all development and redevelopment projects that fall into one of the following categories:

- Single-family hillside residences
- One acre or more of impervious surface area for industrial/commercial developments
- Automotive service facilities
- Retail gasoline outlets
- Restaurants
- Ten or more residential units (BMP)
- Parking lots of 5,000 square feet or greater or with 25 or more spaces
- Projects located in or directly discharging to an Ecologically Sensitive Area

The SUSMP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, individual development project plans are reviewed for compliance with stormwater requirements.

Water Quality Control Plan for the Los Angeles Region (Basin Plan)

All of Los Angeles is within the jurisdiction of the LARWQCB, which is one of the nine regional WQCBs in California. The LARWQCB provides permits for projects that may affect surface waters and groundwater locally and is responsible for preparing the Basin Plan, which is updated as necessary every three years. The Basin Plan establishes narrative and numerical water quality objectives for surface waters and groundwater within the Los Angeles region and designates the beneficial uses of inland surface waters, including the Hollywood Reservoir and Los Angeles River. Water quality objectives, as defined by the CWA Section 13050(h), are the "limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses or the prevention of nuisance within a specific area." The State has developed TMDLs, which are a calculation of the maximum amount of a pollutant that a water body can have and still meet water quality objectives established in the Basin Plan.

Enhanced Watershed Management Plans (EWMPs)

On November 8, 2012, RWQCB adopted the current municipal stormwater permit (NPDES Permit No. CAS004001, Order No. R4-2012-0175), which contains the most extensive provisions to date with 32 incorporated TMDLs, of which 22 affect the City, expanded programs for Minimum Control Measures, development and implementation of watershed management plans, and expanded monitoring provisions. The NPDES permit provides for the development of EWMPs by the MS4 permittees to implement the requirements of the permit on a watershed scale through customized strategies, control measures, and

BMPs. EWMPs also address compliance requirements of the 22 TMDLs that currently are effective, as well as other elements of the City's Stormwater Program.

NPDES Permit Program

As indicated above, in California, the NPDES stormwater permitting program is administered by the SWRCB through its nine RWQCBs. This NPDES permit, referred to as General Permit for Stormwater Discharges from Construction Activities by the SWRCB, establishes a risk-based approach to stormwater control requirements for construction projects.

Construction: Stormwater Pollution Prevention Plan

For all construction activities disturbing one acre of land or more, California mandates the development and implementation of Stormwater Pollution Prevention Plans (SWPPP). The SWPPP documents the selection and implementation of best management practices (BMPs) to prevent discharges of water pollutants to surface or groundwater. The SWPPP also charges owners with stormwater quality management responsibilities. The developer or contractor for a construction site subject to the General Permit must prepare and implement a SWPPP that meets the requirements of the General Permit.[17] The purpose of an SWPPP is to identify potential sources and types of pollutants associated with construction activity and list BMPs that would prohibit pollutants from being discharged from the construction site into the public stormwater system. BMPs typically address stabilization of construction areas, minimization of erosion during construction, sediment control, control of pollutants from construction materials, and post-construction stormwater management (e.g., the minimization of impervious surfaces or treatment of stormwater runoff). The SWPPP is also required to include a discussion of the proposed program to inspect and maintain all BMPs.

A site-specific SWPPP could include, but not be limited to the following BMPs:

- Erosion Control BMPs – to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels. Such BMPs may include, but would not be limited to, use of geotextiles and mats, earth dikes, drainage swales, and slope drains.

- Sediment Control BMPs – are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping

17 Construction Stormwater Program, State Water Resources Control Board, October 30, 2019. https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.html. Accessed September 2020.

sediments on-site and controlling the site boundaries. Such BMPs may include, but would not be limited, to use of silt fences, sediment traps, and sandbag barriers, street sweeping and vacuuming, and storm drain inlet protection.

The SWRCB adopted a General Permit for Stormwater Discharges from Construction Activities on September 2, 2009 and most recently amended the permit on July 17, 2012 (Order No. 2012-0006-DWQ, General NPDES Permit No. CAS000002). The Construction General Permit regulates construction activity, including clearing, grading, and excavation of areas one acre or more in size, and prohibits the discharge of materials other than stormwater, authorized non-stormwater discharges, and all discharges that contain a hazardous substance, unless a separate NPDES permit has been issued for those discharges.

To obtain coverage under the Construction General Permit, a developer is required to file a Notice of Intent (NOI) with the appropriate RWQCB and provide proof of the NOI prior to applying for a grading or building permit from the local jurisdiction, and must prepare a State SWPPP that incorporates the minimum BMPs required under the permit as well as appropriate project-specific BMPs. The SWPPP must be completed and certified by the developer and BMPs must be implemented prior to the commencement of construction, and may require modification during the course of construction as conditions warrant. When project construction is complete, the developer is required to file a Notice of Termination with the RWQCB certifying that all the conditions of the Construction General permit, including conditions necessary for termination, have been met.

NPDES Permit for Discharges of Groundwater from Construction and Project Dewatering

Dewatering operations are practices that discharge non-stormwater, such as ground water, that must be removed from a work location to proceed with construction into the drainage system. Discharges from dewatering operations can contain high levels of fine sediments, which if not properly treated, could lead to exceedance of the NPDES requirements. A NPDES Permit for dewatering discharges was adopted by the LARWQCB on September 13, 2018 (Order No. R4-2018-0125, General NPDES Permit No. CAG994004. Similar to the Construction General Permit, to be authorized to discharge under this Permit; the developer must submit a NOI to discharge groundwater generated from dewatering operations during construction in accordance with the requirements of this Permit and shall continue in full force until it expires November 13, 2023.[18] In accordance with the NOI, among other requirements and actions, the discharger must demonstrate that the discharges shall not cause or contribute to a violation of any applicable water quality

[18] Los Angeles Regional Water Quality Control Board, Order No. R4-2018-0125, General NPDES Permit No. CAG994004, Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, September 13, 2018, http://www.waterboards.ca.gov/losangeles/board_decisions/adopted_orders/permits/general/npdes/r4-2013-0095/Dewatering%20Order.pdf. Accessed September 2020.

objective/criteria for the receiving waters, perform reasonable potential analysis using a representative sample of groundwater or wastewater to be discharged. The discharger must obtain and analyze (using appropriate methods) a representative sample of the groundwater to be treated and discharged under the Order. The analytical method used shall be capable of achieving a detection limit at or below the minimum level. The discharger must also provide a feasibility study on conservation, reuse, and/or alternative disposal methods of the wastewater and provide a flow diagram of the influent to the discharge point.[19]

Operation: Los Angeles County Municipal Stormwater NPDES Program

The County of Los Angeles and the City are two of the Co-Permittees under the Los Angeles County MS4 Permit (Order No. R4-2012-0175, NPDES Permit No. CAS004001). The Los Angeles County MS4 Permit has been determined by the State Water Resources Control Board to be consistent with the requirements of the Clean Water Act and the Porter-Cologne Act for discharges through the public storm drains in Los Angeles County to statutorily-defined waters of the United States (33 United States Code [USC] §1342(p); 33 CFR Part 328.11). On September 8, 2016, the LARWQCB amended the Los Angeles County MS4 Permit to incorporate modifications consistent with the revised Ballona Creek Watershed Trash Total Maximum Daily Load (TMDL) and the revised Los Angeles River Watershed Trash TMDL, among other TMDLs incorporated into the Los Angeles County MS4 Permit and the Basin Plan for the Coastal Waters of Los Angeles and Ventura Counties.

Under the amended Los Angeles County MS4 Permit, the County and City are both required to implement development planning guidance and control measures that control and mitigate stormwater quality and runoff volume impacts to receiving waters as a result of new development and redevelopment. The County and the City also are required to implement other municipal source detection and elimination programs, as well as maintenance measures.

Under the Los Angeles County MS4 Permit, permittees are required to implement a development planning program to address stormwater pollution. This program requires project applicants for certain types of projects to implement a Low Impact Development (LID) Plan, except where the Standard Urban Stormwater Mitigation Plan (SUSMP) is proven applicable. The purpose of the LID Plan is to reduce the discharge of pollutants in stormwater by outlining BMPs, which must be incorporated into the design of new development and redevelopment. These treatment control BMPs must be sufficiently designed and

19 Los Angeles Regional Water Quality Control Board, Order No. R4-2013-0095, General NPDES Permit No. CAG994004, Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, June 6, 2013, http://www.waterboards.ca.gov/losangeles/board_decisions/adopted_orders/permits/general/npdes/r4-2013-0095/Dewatering%20Order.pdf. Accessed September 2020.

constructed to treat or retain the greater of an 85th percentile rain event or first 0.75 inch of stormwater runoff from a storm event.

The Los Angeles County MS4 Permit (Part VI.D.7.c, New Development/Redevelopment Project Performance Criteria) includes design requirements for new development and substantial redevelopment. These requirements apply to all projects that create or replace more than 5,000 square feet of impervious cover. Where redevelopment results in an alteration to more than 50 percent of impervious surfaces of a previously existing development and the existing development was not subject to post-construction stormwater quality control requirements, the entire project would be subject to post-construction stormwater quality control measures.

This Enhanced Watershed Management Program for the Upper Los Angeles River (ULAR EWMP) describes a customized compliance pathway that participating agencies will follow to address the pollutant reduction requirements of the Los Angeles County MS4 Permit.[20] By electing the optional compliance pathway in the MS4 Permit, the Upper Los Angeles River Watershed Management Group (EWMP Group) has leveraged this EWMP to facilitate a robust, comprehensive approach to stormwater planning for the Upper Los Angeles River watershed. The objective of the EWMP Plan is to determine the network of control measures (BMPs) that will achieve required pollutant reductions while also providing multiple benefits to the community and leveraging sustainable green infrastructure practices. The Permit requires the identification of Watershed Control Measures, which are strategies and BMPs that will be implemented through the EWMP, individually or collectively, at watershed-scale to address the Water Quality Priorities. The EWMP Implementation Strategy is used as a recipe for compliance for each jurisdiction to address Water Quality Priorities and comply with the provisions of the MS4 Permit. The EWMP Implementation Strategy includes individual recipes for each of the 18 jurisdictions and each watershed/assessment area – Los Angeles River above Sepulveda Basin, Los Angeles River below Sepulveda Basin, Compton Creek, Rio Hondo, Verdugo Wash, Arroyo Seco, Burbank Western Channel, Tujunga Wash, Bull Creek, Aliso Wash, Bell Creek, McCoy-Dry Canyon, and Browns Canyon Wash. Implementation of the EWMP Implementation Strategy will provide a BMP-based compliance pathway for each jurisdiction under the MS4 Permit. The Permit specifies that an adaptive management process will be revisited every two years to evaluate the EWMP and update the program. The EWMP strategy will evolve based on monitoring results by identifying updates to the EWMP Implementation Plan to increase its effectiveness.

20 Upper Los Angeles River Watershed Management Group, Enhanced Watershed Management Program, January 2016,https://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/municipal/watershed_management/los_angeles/upper_losangeles/20160127/UpperLARiver_mainbody_revEWMP_Jan2016.pdf Accessed September 2020

The Los Angeles County MS4 Permit contains provisions for implementation and enforcement of the Stormwater Quality Management Program. The objective of the Stormwater Quality Management Program is to reduce pollutants in urban stormwater discharges to the "maximum extent practicable," to attain water quality objectives and protect the beneficial uses of receiving waters in Los Angeles County. Special provisions are provided in the Los Angeles County MS4 Permit to facilitate implementation of the Stormwater Quality Management Program. In addition, the Los Angeles County MS4 Permit requires that permittees implement a LID Plan, as discussed above, that designates BMPs that must be used in specified categories of development projects to infiltrate water, filter, or treat stormwater runoff; control peak flow discharge; and reduce the post-project discharge of pollutants into stormwater conveyance systems. In response to the Los Angeles County MS4 Permit requirements, the City adopted Ordinance No. 173,494 (LID Ordinance), as authorized by Los Angeles Municipal Code (LAMC) Section 64.72.

The City supports the requirements of the Los Angeles County MS4 Permit through the City of Los Angeles' *Development Best Management Practices Handbook, Low Impact Development Manual, Part B: Planning Activities* (5th edition, May 2016) (LID Handbook),[21] which provides guidance to developers to ensure the post-construction operation of newly developed and redeveloped facilities comply with the Developing Planning Program regulations of the City's Stormwater Program. The LID Handbook assists developers with the selection, design, and incorporation of stormwater source control and treatment control BMPs into project design plans, and provides an overview of the City's plan review and permitting process.

The City implements the requirement to incorporate stormwater BMPs, including LID BMPs, through the City's plan review and approval process. During the review process, project plans are reviewed for compliance with the City's General Plan, zoning ordinances, and other applicable local ordinances and codes, including stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

Stormwater Program – Los Angeles County MS4 Permit Citywide Implementation

The Watershed Protection Division of the Department of Public Works, Bureau of Sanitation is responsible for stormwater pollution control throughout the City in compliance with the Los Angeles County MS4 Permit. The Watershed Protection Division administers the City's Stormwater Program, which has two major components: Pollution Abatement and Flood Control. The Watershed Protection Division publishes the two-part Development Best Management Practices Handbook that provides guidance to developers for

21 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf. Accessed September 2020.

compliance with the Los Angeles County MS4 permit through the incorporation of water quality management into development planning. The Development Best Management Practices Handbook, Part A: Construction Activities, provides specific minimum BMPs for all construction activities.[22] The Development Best Management Practices Handbook, Low Impact Development Manual, Part B: Planning Activities (5th edition, May 2016) (LID Handbook) provides guidance to developers to ensure the post-construction operation of newly developed and redeveloped facilities comply with the Developing Planning Program regulations of the City's Stormwater Program.[23] The LID Handbook assists developers with the selection, design, and incorporation of stormwater source control and treatment control BMPs into project design plans, and provides an overview of the City's plan review and permitting process. The LID Handbook addresses the need for frequent and/or regular inspections of infiltration facilities in order to ensure on-site compliance of BMP standards, soil quality, site vegetations, and permeable surfaces. These inspections are required to guarantee that facilities follow all proprietary operation and maintenance requirements.

During the development review process, project plans are reviewed for compliance with the City's General Plan, zoning ordinances, and other applicable local ordinances and codes, including stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

County of Los Angeles Hydrology Manual

Drainage and flood control in the City of Los Angeles (City) are subject to review and approval by the Department of Public Works, Bureau of Engineering (Bureau of Engineering). Storm drains within the City are constructed by both the City and the Los Angeles County Flood Control District (County Flood Control). The County Flood Control constructs and has jurisdiction over regional facilities such as major storm drains and open flood control channels, while the City constructs and is responsible for local interconnecting tributary drains. Per the City's Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works' Hydrology Manual as its basis of design for

22 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf . Accessed September 2020.

23 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf Accessed September 2020.

storm drainage facilities.[24] The Department of Public Works' Hydrology Manual requires that a storm drain conveyance system be designed for a 25-year storm event and that the combined capacity of a storm drain and street flow system accommodate flow from a 50-year storm event. Areas with sump conditions are required to have a storm drain conveyance system capable of conveying flow from a 50-year storm event. The County also limits the allowable discharge into existing storm drain (MS4) facilities based on the County's MS4 Permit, which is enforced on all new developments that discharge directly into the County's MS4 system.

Drainage and flood control structures and improvements within the City are subject to review and approval by the City's Department of Public Works and Department of Building and Safety. As required by the Department of Public Works, all public storm facilities must be designed in conformity with the standards set forth by Los Angeles County. The Department of Public Works reviews and approves MS4 plans prior to construction. Any proposed increases in discharge directly into County facilities, or proposed improvements of County-owned MS4 facilities, such as catch basins and drainage lines, require approval from County Flood Control to ensure compliance with the County's Municipal NPDES Permit requirements.

Local

Los Angeles Municipal Code (LAMC).

The City of Los Angeles relies on Municipal Code Chapter VI, *Public Works and Property* to require permits and oversee the implementation of any land use or development involving grading activities, or the construction of new structures or paving. Article 4 *Sewers, Water Courses and Drains* and Article 4.4 *Stormwater and Urban Runoff Pollution Control* of the Municipal Code establishes minimum standards, guidelines, and/or criteria for specific discharges, connections, and/or Best Management Practices (BMPs). Additional measures are required by the City, when applicable, to prevent or reduce the discharge of pollutants to achieve water quality standards and receiving water limitations. Article 4.4 includes prohibitions for illicit discharges to enter the MS4 and requires implementation of BMPs and Low Impact Development (LID) practices per LAMC 64.70 (City of Los Angeles 2017). In addition, the City requires all construction activities and facility operations to be consistent with the landscape ordinance (Ordinance No. 170,978) as well as other related requirements, outlined in Chapter XII, *The Water Conservation Plan of the City of Los Angeles*, and the *Planning and Land Development Handbook for Low Impact Development (LID)*. The *Handbook* is a tool for developers to comply with the requirements of the City's Standard Urban Stormwater

[24] Los Angeles County Department of Public Works, Hydrology Manual, January 2006, http://dpw.lacounty.gov/wrd/Publication/engineering/2006_Hydrology_Manual/2006%20Hydrology%20Manual-Divided.pdf. Accessed September 2020.

Mitigation Plan (SUSMP). The handbook summarizes the City's project review and permitting process, identifies stormwater mitigation measures, and references source and treatment control BMP information. The latest edition was adopted on May 9, 2016

Proposition O

Proposition O, a $500 million bond, authorized the City to fund projects that protect public health, capture stormwater for reuse and meet the federal CWA through removal and prevention of pollutants entering regional waterways. Proposition O projects include but are not limited to: the Temescal Canyon Park Stormwater BMP, Los Angeles Zoo Parking Lot, the Westchester Stormwater BMP, Echo Park Lake Rehabilitation Project, and the Hansen Dam Recreational Area Parking Lot and Wetlands Restoration. In addition, Proposition O funds were utilized for the Catch Basin Screen Cover and Insert Project, which provided for the installation of catch basin inserts and screen covers throughout the City beginning in 2005 with completion on September 30, 2007 (Phase I and Phase II). Phase III began in the spring of 2008 and will retrofit approximately 34,000 remaining catch basins with opening screen covers .

Flood Control Authority in the City of Los Angeles

In general, flood control authority can be summarized as follows: (1) the U.S. Army Corps of Engineers (USACE) oversees construction of projects associated with navigable bodies of water, including the Los Angeles River-related flood control systems and ocean harbors; (2) LACDPW oversees construction of ancillary Los Angeles County Flood Control District (LACFCD) facilities and designs and/or maintains the flood control drainage facilities, including the Los Angeles River system (under the guidance of USACE) to mitigate 100- and 500-year storms; and (3) LADPW BOE oversees construction and maintenance of the City's storm drainage system which is designed to mitigate 50-year magnitude storms. Various City agencies implement development permit, slope stability, and watershed protection regulations.

Los Angeles River Revitalization Master Plan (LARRMP)

Adopted in April 2007, the LARRMP contains goals in the creation of parks, paths, and open spaces along the Los Angeles River. The LARRMP includes recommendations for physical improvements along the Los Angeles River corridor; policies for managing public access and management structure; and short- and long-term priority projects and potential funding strategies.

River Improvement Overlay (RIO) District

Following the adoption of the LARRMP, the RIO District (Ordinance Nos. 18314 and 183145), effective August 2014 and revised in January 2015, was established to help implement the vision and goals of the

LARRMP by focusing on sustainable environments in the surrounding neighborhoods, including guidelines for both private property and public rights-of-way. The RIO provides guidelines for new "complete" streets and includes mobility strategies to meet the needs of pedestrians, bicyclists, transit riders, and vehicle drivers. The RIO District includes all of the neighborhoods within the City of Los Angeles that are adjacent to the Los Angeles River, and generally extends 0.5-mile on either side of the River, creating an area that is potentially 32 miles long and one mile wide. As described in *Chapter 3, Project Description*, applicable development regulations and measures to protect sensitive biological resources in the existing RIO will be incorporated into Frontage Districts and development standard rules of the New Zoning Code.

City of Los Angeles General Plan Safety, Conservation, and Framework Elements

The intent of the Conservation Element is the conservation and preservation of natural resources. Policies of the Conservation Element address the effect of erosion on such natural resources as beaches, watersheds, and watercourses. The General Plan Framework Element is a more general, long-term, programmatic element. The policies in the Framework Element address infrastructure and public service systems, many of which are interrelated, and all of which support the City's population and economy. Objectives and policies related to hydrology and water quality contained in these elements are listed in **Table 4.9-1**.

Table 4.9-1
Relevant General Plan Hydrology & Water Quality Objectives and Policies

Objective/Policy	Objective/Policy Description
	Safety Element – Hazard Mitigation
Policy 1.1.6	State and Federal Regulations. Assure compliance with applicable state and federal planning and development regulations. Regularly adopt new provisions of the California Building Standards Code, Title 24, and California Fire Code into the LAMC to ensure that new development meets or exceeds State and National standards. Facilitate existing non-conforming structures and evacuation routes coming into compliance with new standards.
	Safety Element – Emergency Response (Multi-Hazard)
Policy 2.1.2	Health and Environmental Protection. Develop and implement procedures to protect the environment, sensitive species and public from potential health and safety hazards associated with disaster events, hazard mitigation and disaster recovery efforts.
	Conservation Element – Erosion
Policy 2	Continue to prevent or reduce erosion that will damage the watershed or beaches or will result in harmful sedimentation that might damage beaches or natural areas.
	Conservation Element – Ocean
Policy 1	Continue to reduce pollutant discharge into the bays from both natural and human sources.

Objective/Policy	Objective/Policy Description
	Framework Element – Chapter 9 Infrastructure and Public Services
Policy 9.3.2	Consider the use of treated wastewater for irrigation, groundwater recharge, and other beneficial purposes.
Objective 9.5	Ensure that all properties are protected from flood hazards in accordance with applicable standards and that existing drainage systems are adequately maintained.
Policy 9.5.1	Develop a stormwater management system that has adequate capacity to protect its citizens and property from flooding which results from a 10-year storm (or a 50-year storm in sump areas, a pit or hollow in which liquid collects).
Policy 9.5.2	Assign the cost of stormwater system improvements proportionately to reflect the level of runoff generated and benefits.
Policy 9.5.3	Implement programs to correct any existing deficiencies in the stormwater collection system.
Policy 9.5.4	Ensure that the City's drainage system is adequately maintained.
Objective 9.6	Pursue effective and efficient approaches to reducing stormwater runoff and protecting water quality.
Policy 9.6.1	Pursue funding strategies which link the sources of revenues for stormwater system improvement to relevant factors including sources of runoff and project beneficiaries.
Policy 9.6.2	Establish standards and/or incentives for the use of structural and non-structural techniques which mitigate flood-hazards and manage stormwater pollution.
Policy 9.6.3	The City's watershed-based approach to stormwater management will consider a range of strategies designed to reduce flood hazards and manage stormwater pollution. The strategies considered will include, but not necessarily be limited to: Support regional and City programs which intercept runoff for beneficial uses including groundwater recharge; Protect and enhance the environmental quality of natural drainage features; Create stormwater detention and/or retention facilities which incorporate multiple-uses such as recreation and/or habitat; On-site detention/retention and reuse of runoff; Mitigate existing flood hazards through structural modifications (flood proofing) or property by-out; Incorporate site design features which enhance the quality of off-site runoff; and Use land use authority and redevelopment to free floodways and sumps of inappropriate structures which are threatened by flooding and establish appropriate land uses which benefit or experience minimal damages from flooding.
Policy 9.6.4	Proactively participate in inter-agency efforts to manage regional water resources, such as the Santa Monica Bay Restoration Project, the Los Angeles River Master Plan, the Los Angeles River Parkway Project and the Los Angeles County Drainage Area Water Conservation and Supply Feasibility Study.
Objective 9.7	Continue to develop and implement management practices based stormwater program which maintains and improves water quality.
Policy 9.7.1	Continue the City's active involvement in the regional NPDES municipal stormwater permit.
Policy 9.7.2	Continue to aggressively develop and implement educational outreach programs designed to foster an environmentally-aware citizenry.
Policy 9.7.3	Investigate management practices which reduce stormwater pollution to identify technically feasible and cost effective-approaches, through: Investigation of sources of pollution using monitoring, modeling and special studies; Prioritization of pollutants and sources; Conducting research and pilot projects to study specific management practices for the development of standards; and Developing requirements which establish implementation standards for effective management practices.
Objective 9.9	Manage and expand the City's water resources, storage facilities, and water lines to accommodate projected population increases and new or expanded industries and businesses.
Policy 9.9.3	Protect existing water supplies from contamination, and clean up groundwater supplies so those resources can be more fully utilized.
Policy 9.9.4	Work to improve water quality and reliability of supply from the State Water Project and other sources.

Objective/Policy	Objective/Policy Description
Policy 9.9.5	Maintain existing rights to groundwater and ensure continued groundwater pumping availability.
Objective 9.11	Ensure, to the maximum extent possible, the continued provision of water capacity, quality and delivery after an earthquake or other emergency.
Policy 9.11.1	Provide for the prompt resumption of water service with adequate quantity and quality of water after an emergency.

Low Impact Development Ordinance

In 2011, the City adopted a Citywide Low Impact Development Ordinance (LID Ordinance) that amended the City's existing Stormwater Ordinance (LAMC Section Nos. 64.70 and 64.72, discussed above). The LID Ordinance, effective May 12, 2012, and updated in September 2015 (Ordinance No. 183,833), enforces the requirements of the Los Angeles County MS4 Permit. LID is a stormwater management strategy with goals to mitigate the impacts of increased runoff and stormwater pollution as close to their source as possible; and that promotes the use of natural infiltration systems, evapotranspiration, and the reuse of stormwater.

The goal of LID practices is to remove nutrients, bacteria, and metals from stormwater while also reducing the quantity and intensity of stormwater flows. Through the use of various infiltration strategies, LID is aimed at minimizing impervious surface area. Where infiltration is not feasible, the use of bioretention, rain gardens, green roofs, and rain barrels that will store, evaporate, detain, and/or treat runoff can be used.[25]

The intent of LID standards is to:

- Require the use of LID practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff;
- Reduce stormwater/urban runoff while improving water quality;
- Promote rainwater harvesting;
- Reduce off-site runoff and provide increased groundwater recharge;
- Reduce erosion and hydrologic impacts downstream; and
- Enhance the recreational and aesthetic values in our communities.

25 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf. Accessed September 2020.

The Citywide LID strategy addresses land development planning as well as storm drain infrastructure. Toward this end, LID is implemented through BMPs that fall into four categories: site planning BMPs, landscape BMPs, building BMPs, and street and alley BMPs. While the LID Ordinance and the BMPs contained therein comply with Los Angeles County MS4 Permit requirements for stormwater management, the MS4 requirements apply only to proposed new development and redevelopment of a certain size, primarily address stormwater pollution prevention as opposed to groundwater recharge, and vary over time as the permit is reissued every five years. The LID Ordinance provides a consistent set of BMPs that are intended to be inclusive of, and potentially exceed, SUSMP standards, apply to existing as well as new development, and emphasize natural drainage features and groundwater recharge in addition to pollution prevention in receiving waters. The LID Ordinance requires the capture and management of the greater of an 85th percentile rain event or the first 0.75-inch of runoff flow during storm events defined in the City's LID BMPs, through one or more of the City's preferred LID improvements in priority order: on-site infiltration, capture and reuse, or biofiltration/biotreatment BMPs, to the maximum extent feasible.

Per the City's 2016 LID Manual's Figure 3.3 and Section 4.1, the City's preferred LID improvement is on-site infiltration of stormwater, site since it allows for groundwater recharge and reduces the volume of stormwater entering municipal drains.[26] If Project Site conditions are not suitable for infiltration, the City requires on-site retention via stormwater capture and reuse. Should capture and reuse be deemed technically infeasible, high efficiency bio-filtration/ bioretention systems should be utilized. Lastly, under the LID Ordinance (LAMC Section 64.72 (C) 6), as interpreted in the LID Manual, if no single approach listed in the LID Manual is feasible, then a combination of approaches may be used. [27]

The LID Ordinance applies first to a project in lieu of SUSMP. If a large project cannot meet the requirements of the LID Ordinance, then SUSMP applies instead.

Los Angeles Floodplain Hazard Management Specific Plan Ordinance (No. 172,081)

On April 14, 2021 the City adopted an update to the Los Angeles Floodplain Hazard Management Specific Plan Ordinance (No. 172,081). This amendment ensured that the Specific Plan Ordinance conforms to federal regulations and maps relating to the NFIP. Conformance to the requirements of the NFIP is

Accessed September 2020.

27 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf . Accessed September 2020.

necessary in order to participate in the program. Requirements of the ordinance include: new construction and substantial improvements in flood-prone areas including service facilities to be designed to prevent water entry or accumulation, new or replacement water supply and sanitary sewer systems to minimize or eliminate infiltration and to require on-site waste disposal systems be located to avoid impairment or contamination, notification of neighboring communities of watercourse alterations or relocations, among other requirements.

2020 Floodplain Management Plan

The 2020 Floodplain Management Plan (FMP) identifies 78 flood hazard mitigation actions to mitigate impacts of flood hazards in the Los Angeles area. These include coordinating local floodplain management activities with federal, state and regional programs, educating residents on the flooding hazard, loss reduction measures, and the natural and beneficial functions of floodplains, and fulfilling planning requirements for obtaining state or federal assistance.

Local Hazard Mitigation Plan

The Local Hazard Mitigation Plan (LHMP) is a regulatory document that includes long-term and short-term policies, programs, projects, and other activities to alleviate the death, injury, and property damage that can result from a disaster. The LHMP complies with federal and state hazard mitigation planning requirements to establish eligibility for funding under FEMA grant programs.

Los Angeles Municipal Code Section 62.105, Construction "Class B" Permit

Proposed drainage improvements within the street rights-of-way or any other property owned by, to be owned by, or under the control of the City, require the approval of a B-permit (LAMC Section 62.105). Under the B-permit process, storm drain installation plans are subject to review and approval by the Bureau of Engineering. Additionally, connections to the MS4 system from a property line to a catch basin or a storm drain pipe require a storm drain permit from the Bureau of Engineering.

Los Angeles Municipal Code Sections 12.40 through 12.43, Landscape Ordinance

In 1996, Ordinance No. 170,978 amended LAMC Sections 12.40 through 12.43 to establish consistent landscape requirements for new projects within the City. LAMC Section 12.40 contains general requirements, including a point system for specific project features and techniques in order to determine compliance with the Ordinance, and defines exemptions from the Ordinance. LAMC Section 12.41 sets minimum standards for water delivery systems (irrigation) to landscapes. LAMC Section 12.43 defines the practices addressed by the Ordinance, of which two are applicable to stormwater management. The Heat

and Glare Reduction practice states among its purposes the design of vehicular use areas that reduce stormwater runoff and increase groundwater recharge. The Soil and Watershed Conservation practice is intended to encourage the restoration of native areas that are unavoidably disturbed by development; to conserve soil and accumulated organic litter and reduce erosion by utilization of a variety of methods; and to increase the "residence time of precipitation" (i.e., the time between the original evaporation and the returning of water masses to the land surface as precipitation) within a given watershed. Implementation guidelines developed for the Ordinance provide specific features and techniques for incorporation into projects, and include water management guidelines addressing runoff, infiltration, and groundwater recharge. This Ordinance is incorporated into the LID Ordinance discussed below.

Los Angeles Municipal Code Section 64.70, Stormwater and Urban Runoff Pollution Control Ordinance

LAMC Section 64.70, the Stormwater and Urban Runoff Pollution Control Ordinance, was added by Ordinance No. 172,176 in 1998 and prohibits the discharge of unauthorized pollutants in the City. The Watershed Protection Program (Stormwater Program) for the City is managed by the Bureau of Sanitation along with all City Flood Protection and Pollution Abatement (Water Quality) Programs, including but not limited to, regulatory compliance, implementation, operations, reporting and funding. Section 64.70 sets forth uniform requirements and prohibitions for discharges and places of discharge into the storm drain system and receiving waters necessary to adequately enforce and administer all federal and state laws, legal standards, orders and/or special orders that provide for the protection, enhancement and restoration of water quality. Through a program employing watershed-based approaches, the regulation implements the following objectives:

1. To comply with all Federal and State laws, lawful standards and orders applicable to stormwater and urban runoff pollution control;

2. To prohibit any discharge which may interfere with the operation of, or cause any damage to the storm drain system, or impair the beneficial use of the receiving waters;

3. To prohibit illicit discharges to the storm drain system;

4. To reduce stormwater runoff pollution;

5. To reduce non-stormwater discharge to the storm drain system to the maximum extent practicable; and

6. To develop and implement effective educational outreach programs designed to educate the public on issues of stormwater and urban runoff pollution.

The Ordinance applies to all dischargers and places of discharge that discharge stormwater or non-stormwater into any storm drain system or receiving waters. While non-stormwater discharge is generally prohibited under the County's Municipal NPDES Permit, adoption of the Ordinance allows enforcement by the Department of Public Works as well as the levy of fines for violations. General Discharge Prohibitions require that no person shall discharge, cause, permit, or contribute to the discharge any hazardous materials and substances (liquids, solids, or gases) into to the storm drain system or receiving waters that constitute a threat and/or impediment to life and the storm drain system, singly or by interaction with other materials. A specific list of prohibited substances can be found under LAMC Section 64.70.

Under LAMC Section 64.70.02.D, Requirement to Prevent, Control, and Reduce Stormwater Pollutants, any owner of a facility engaged in activities or operations as listed in the Critical Sources Categories, Section III of the Board's Rules and Regulations shall be required to implement BMPs as promulgated in the Rules and Regulations. The owner/developer of a property under construction shall be required to implement the stormwater pollution control requirements for construction activities as depicted in the project plans approved by the Department of Building and Safety. In the event a specified BMP proves to be ineffective or infeasible, the additional and/or alternative, site-specific BMPs or conditions deemed appropriate to achieve the objectives of this Ordinance as defined in Subsection B of LAMC Section 64.70.

Los Angeles Municipal Code Section 64.72, Stormwater Pollution Control Measures for Development Planning and Construction Activities.

LAMC Section 64.72, Stormwater Pollution Control Measures for Development Planning and Construction Activities, was added by Ordinance 173,494 (LID Ordinance) in 2000 and sets forth requirements for construction activities and facility operations of development and redevelopment projects to comply with the requirements of the NPDES permit SUSMP requirements. The provisions of this section contain requirements for construction activities and facility operations of development and redevelopment projects to comply with the Land Development requirements of the Los Angeles County MS4 permit through integrating LID practices and standards for stormwater pollution mitigation, and maximize open, green and pervious space on all developments and redevelopments consistent with the City's Landscape Ordinance and other related requirements in the Development Best Management Practices Handbook. The LID Ordinance applies first to a project in lieu of SUSMP. If a large project cannot meet the requirements of the LID Ordinance, then SUSMP measures are applied.

Water Quality Compliance Master Plan for Urban Runoff.

The Water Quality Compliance Master Plan for Urban Runoff (Water Quality Compliance Master Plan)[28] was developed by the Department of Public Works, Bureau of Sanitation, Watershed Protection Division, and was adopted in April 2009.

The Water Quality Compliance Master Plan addresses planning, budgeting, and funding for achieving clean stormwater and urban runoff for the next 20 years and presents an overview of the status of urban runoff management within the City. The Water Quality Compliance Master Plan identifies the City's four watersheds; summarizes water quality conditions in the City's receiving waters as well as known sources of pollutants; summarizes regulatory requirements for water quality; describes BMPs required by the City for stormwater quality management; and discusses related plans for water quality that are implemented within the Los Angeles region, particularly TMDL Implementation Plans and Watershed Management Plans in Los Angeles.

4.9.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to hydrology and water quality if it would:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- Substantially alter the existing drainage pattern of the area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces in a manner which would;
  - result in substantial erosion or siltation on- or off-site;
  - substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

28 City of Los Angeles Department of Public Works, Bureau of Sanitation, Watershed Protection Division, Planning and Land Development for Low Impact Development (LID), Part B: Planning Activities, 5th Edition, May 2016, https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf. Accessed September 2020.

  - create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
  - impede or redirect flood flows;
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

4.9.5 METHODOLOGY

Baseline information for the analysis was compiled from a review of data and reports published by state agencies, environmental documents for projects in the vicinity, as well as information compiled and evaluated by the City of Los Angeles in conjunction with its stormwater management and hazard mitigation programs. The result of the effort is a general and qualitative analysis of the types of hydrologic and water quality changes that could be expected relative to the implementation of the Proposed Plan.

The analysis of water quality impacts identifies the types of pollutants potentially associated with future development as a result of implementation of the Proposed Plan and considers their effects on water quality. Consideration is given to BMPs, which would serve to minimize pollutants in stormwater runoff. Further, the Proposed Plan's consistency with relevant regulatory permits/requirements is evaluated to demonstrate how compliance would protect water quality.

Independent of the CEQA process, there is a comprehensive regulatory framework implemented at the State and City level to reduce the impacts of effects related to storm drainage, urban pollutants, and flood hazards. Compliance with these regulations is required, not optional. Compliance must be demonstrated by the project proponent to have been incorporated in the project's design before permits for project construction would be issued. Based upon the comprehensiveness of the regulations and the requirement that compliance must be demonstrated to have been incorporated in the project's design before permits are issued, the assumption that compliance with all applicable laws, regulations, and standards is reasonable. Therefore, the analysis presented herein assumes compliance with all applicable laws, regulations, and standards.

This discussion of hydrology and water quality addresses impacts within the entire CPA. The impact analysis was based on several factors, including the policies and land uses of the Proposed Plan, the degree to which existing land uses in the CPA would change, and the thresholds of significance for hydrology and water quality.

4.9.6 IMPACTS

Threshold 4.9-1 **Would implementation of the Proposed Plan violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?**

This impact would be less than significant.

Hydrology and water quality resources of concern within the CPA are subject to the federal, State, and local standards and regulations protecting water quality and hydrological resources. The Proposed Plan and its implementing ordinances do not contain any specific guidelines or changes that would violate any water quality standards or waste discharge requirements. In addition, the Proposed Plan includes a number of policies to support stormwater management and improve water quality. Individual development projects would be required to comply with applicable regulations, standards, and policies, which would prevent violations of water quality standards and waste discharge requirements. Regulations and policies that would apply to project construction and operational activities are discussed below.

Due to the existing urbanized nature of the CPA, the rate and volume of stormwater runoff as an indirect result of the Proposed Plan would not result in a substantial increase in stormwater flows to the City's system that discharges to the Los Angeles River and other connected urban watersheds. The CPA is urbanized and only a small portion of the land in the CPA is vacant or undeveloped. Under the Proposed Plan, employment growth is targeted for the industrial land located at the western edge of the CPA adjacent to the rail line which separates the Plan area from the LA River where increased development is anticipated. Facilitating job growth and development along the river is intended to coincide with efforts to establish the riverside as a public destination. Form and frontage standards are proposed for development along industrial areas near the Los Angeles River that require new buildings to appeal to pedestrians by providing building breaks, active frontages, and outdoor amenity space, such as walkways, plazas and landscaped areas in order to contribute to efforts increase access and open space along the riverside.

As mentioned in the Methodology discussion, there is a comprehensive regulatory framework implemented at the State and City level to reduce the impacts of effects related to storm drainage, urban pollutants, and flood hazards. Compliance with these regulations is required, not optional. These standards in relation to the construction or operation of a development project within the CPA are discussed in more detail below. Furthermore, all future development along the river would need to be designed in accordance 2014 the River Improvement Overlay District (RIO) design standards which will be incorporated into the New Zoning Code for the CPA. The RIO design standards were crafted to reduce the amount of untreated runoff entering the LA River and its tributaries, including dry weather runoff.

Construction (Temporary/Short-term).

Grading, excavation, and other construction activities associated with development projects within the CPA could impact water quality due to erosion resulting from exposed soils that may be transported from the CPA in stormwater runoff. In addition, construction activities have the potential to generate short-term water pollutants, including sediment, trash, construction materials, and equipment fluids. However, all construction activities are subject to NPDES GCASP permit requirements and the City's Stormwater and Urban Runoff Pollution Control Ordinance, which requires construction activities to comply with the requirements of the SUSMP to address stormwater pollution from construction and redevelopment projects.

The City enforces its SUSMP per NPDES permit requirements, to the maximum extent practicable through BMPs. As required by the SUSMP, all development projects (as applicable), including development projects that could be constructed in the CPA, will be required to implement BMPs to control release of pollutants in stormwater runoff. The SUSMP identifies the types and size of private development projects that are subject to these requirements (see the Regulatory Framework subsection above for the types of development that are subject to SUSMP requirements). Typical BMPs include:

- Using temporary de-silting basins to ensure that surface water flows do not carry significant amounts of onsite soils and contaminants downstream
- Conducting construction vehicle maintenance in staging areas where appropriate controls have been established to ensure that fuels, motor oil, coolant, and other hazardous materials are not deposited into areas where they may enter surface water and groundwater
- Restricting the use of chemicals that may be transferred to surface waters by storm water flows or leach to groundwater basins through water percolation into the soil
- Requiring that permanent slopes and embankments be vegetated following final grading
- Installation of silt fences, erosion control blankets
- Proper handling and disposal of wastes
- Installation of anti-tracking pads at site exits to prevent off-site transport of soil material

Requirements of the SUSMP are enforced through the City's plan approval and permit process, and all new development projects are subject to City inspection. Compliance with the LAMC would ensure that

construction does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

For development projects where construction activities would disturb more than one acre of land, construction activities are also subject to NPDES GCASP requirements, which require the preparation and implementation of a SWPPP. Compliance with the City's Stormwater and Urban Runoff Pollution Control Ordinance, SUSMP requirements, and GCASP requirements would ensure that construction within the CPA does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

Construction activities, such as excavation for subterranean parking structures and foundation-laying for taller structures, may extend down into the water table necessitating de-watering of the soils to lower the water table. Depending on the method used for de-watering, displaced groundwater may need to be captured and discharged elsewhere, possibly into surface waters, such as the Los Angeles River. NPDES Order No. R42013-0095 establishes requirements for discharges of groundwater from construction dewatering to surface waters in coastal watersheds of Los Angeles and Ventura County. The permit sets criteria for the quality of discharges, such as a maximum daily concentration of 75 mg per liter of suspended solids per day and an acceptable water pH and temperature range, and criteria for the quality of the receiving water after it has received the discharge. The permit also requires that the discharger store potential pollutants in areas where they would not contribute to runoff and to contain, remove, and clean any spills of such materials immediately. Thus, impacts during construction would be ***less than significant***.

Operational (Long-term)

All development projects within the CPA are required to comply with the LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES permit requirements, which prohibit the discharge of pollutants, into the storm drain system or receiving waters, and require the implementation of BMPs to prevent, control and reduce stormwater pollutants. The City's Stormwater and Urban Runoff Pollution Control Ordinance requires future development to comply with the SUSMP requirements; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements.

Required elements of the SUSMP include provisions for:

- Peak stormwater runoff discharge rates
- Conservation of natural areas
- Minimization of stormwater pollutants of concern

- Protection of slopes and channels
- Storm drain system stenciling and signage
- Properly designed outdoor material storage areas
- Properly designed trash storage areas
- Proof of ongoing BMP maintenance
- Design standards for structural or treatment control BMPs
- Provisions for individual priority project categories
- Limitations on use of infiltration BMPs

Therefore, implementation of LID and NPDES requirements, as well as compliance with the Stormwater and Urban Runoff Pollution Control Ordinance would ensure future development projects occurring under the Proposed Plan does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

Furthermore, discharges associated with the Proposed Plan would not create pollution, contamination or nuisance as defined in CWC Section 13050 or cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body. Implementation of the Proposed Plan would not compromise the beneficial uses of the LA River or the facilities that serve those beneficial uses, or impair the waters of the State in a way that creates a hazard to public health or diminishes the community enjoyment of property. Implementation of the Proposed Plan would not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality. Thus, impacts would be ***less than significant***.

Conclusion

Compliance with federal, State and local regulations would serve to reduce impacts resulting from future development in the CPA due to implementation of the Proposed Plan. Furthermore, the Proposed Plan does not introduce any features that would preclude implementation of or alter these policies and procedures in any way. Therefore, implementation of the Proposed Plan would not violate any water quality standards or waste discharge requirements or otherwise substantially surface or groundwater quality, and impacts would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.9-2 **Would implementation of the Proposed Plan substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?**

This impact would be less than significant.

Construction (Temporary/Short Term)

While construction activities may use water (typically provided by LADWP) for varying purposes, the duration of such activities and the amount of water used is generally limited and would not have the potential to deplete groundwater supplies as construction activities are short-term and generally use less water than the future site use. **Section 4.16, Utilities and Service Systems,** of this EIR addresses sources of LADWP water as well as temporary increases in water use associated with construction activities and indicates that such uses would not be substantial in relation to groundwater supplies. Use of groundwater for construction would not reduce the yields of groundwater wells or well fields.

Future development in the CPA would be subject to the stormwater quality BMPs. Implementation of BMPs would ensure that surface water quality is effectively maintained so that stormwater infiltration, if any, would not represent a substantial risk to groundwater quantity or quality. In addition, compliance with the City's Stormwater and Urban Runoff Pollution Control Ordinance and NPDES GCASP permit requirements is mandatory. These regulations would ensure construction activities associated with future development would not substantially deplete groundwater supplies or interfere with groundwater recharge. Thus, implementation of the Proposed Plan would not have a significant impact on groundwater level in a way that would change potable water levels sufficiently. Thus, impacts related to groundwater supplies during construction would be ***less than significant***.

Operational (Long-Term)

The Boyle Heights CPA is located within the geographic boundaries of the Central Basin of the Los Angeles Coastal Plain Groundwater Basin, as shown in **Figure 4.9-3, Groundwater Basin**. Groundwater from the Los Angeles Coastal Plain Groundwater Basin is not a substantial source of water for the region. Implementation of the Proposed Plan would not involve direct groundwater withdrawal or injection that would create a net deficit in aquifer volume, yields or change the rate or direction of groundwater. In

addition, implementation of the Proposed Plans would not result in a demonstrable or sustained reduction of groundwater recharge capacity, such that there would be a lowering of the local groundwater table level.

Water supply for residential and commercial uses in the CPA is provided by LADWP. While LADWP does obtain some of its water from groundwater sources within the City of Los Angeles (approximately 12 percent in 2015), the majority of water is provided by the Los Angeles Aqueduct and Metropolitan Water District (MWD). Due to issues with groundwater overdraft beginning over 50 years ago, withdrawals from much of the Central Basin is controlled by court adjudications (LADWP 2015); LADWP currently has the right to withdraw 17,236 acre-feet per year (AFY) from the Central Basin, which accounts for approximately 16 percent of the City of Los Angeles' allowed groundwater withdrawal. This prevents depletion of groundwater supplies from the Central Basin and limits the amount of groundwater resources that could be used to serve the Boyle Heights Community Plan Area development. While future CPA development would increase demand for LADWP water by increasing the intensity of use and residential density, this demand would need to be met in a number of ways other than increasing groundwater withdrawal, such as increasing the amount of water purchased from the Metropolitan Water District, implementing water conservation measures, increasing use of recycled water, and/or implementing groundwater recharge projects. See **Section 4.16, Utilities and Service Systems**, for a discussion of the adequacy of LADWP water supplies for meeting future demand, including that associated with future development in the CPA.

Although the Proposed Plan would increase development density along Transit Corridors, these areas of the CPA are highly urbanized and covered largely by non-permeable surfaces (e.g. buildings, road, parking lots, etc.) that interfere with groundwater recharge. Thus, any new development occurring during the lifetime of the Proposed Plan, whether more intense than existing conditions or not, would not result in a substantial increase in impervious surfaces that would further impact groundwater recharge. Further, new development has the potential to increase the permeable surface as new projects will be required to provide a certain amount of lot amenity space designed with a minimum amount of permeable surface. Implementation of the Proposed Plan may provide some benefits to groundwater recharge by replacing older development with new development subject to open space, landscaping, and stormwater BMP requirements that would increase pervious surfaces associated with development. In addition, as discussed in **Section 4.13, Public Servies and Recreation**, the Proposed Plan includes a number of policies to support the construction of new parks and green spaces that would also increase the amount of pervious surface and facilitate groundwater recharge. Thus, operational impacts related to groundwater supplies would be ***less than significant***.

Conclusion

Implementation of the Proposed Plan would not deplete the groundwater supply, or interfere substantially with groundwater recharge. Compliance with applicable water quality and stormwater regulations would ensure that impacts related to groundwater would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.9-3 **Would implementation of the Proposed Plan substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would result in substantial erosion or siltation on- or off-site?**

- **i. result in substantial erosion or siltation on- or off-site?**
- **ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**
- **iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?**
- **iv. impede or redirect flood flows?**

This impact would be less than significant.

Construction (Temporary/Short Term)

Construction activities occurring during the life of the Proposed Plan would occur within the developed portions of the CPA. In these areas, grading for new structures is expected to consist of grading for foundations, building pads, access roads, and utility trenches. These types of construction activities could result in small, localized changes in surface drainage patterns that could cause increased erosion potential when soils are exposed during construction.

All earthwork and grading activities would require grading permits from the Department of Building and Safety that include requirements and standards designed to limit potential erosion and siltation.

Additionally, earthwork and grading activities would be required to comply with applicable provisions of LAMC Chapter IX, Division 70, which addresses grading, excavations, and fills. This section of the LAMC also requires the preparation of a site-specific geotechnical report to evaluate soils issues for new development. Applicants of development projects will be required to comply with the recommendations contained within the geotechnical report. Additionally, all applicable development must comply with LAMC Chapter VI, Article 4.4, Section 664.72, which governs pollutant control requirements and construction activity. Compliance with these precautions within the LAMC would reduce erosion and siltation potential within the CPA.

As noted above in the Regulatory Framework discussion, all future development subject to NPDES permit requirements (e.g. projects over 1 acre) would be required to develop a SWPPP and SUSMP, which would ensure that future development within the CPA would not result in changes to surface drainage patterns that could cause substantial increased erosion or siltation. The NPDES permit sets erosion control standards and requires implementation of nonpoint source control of surface drainage through the application of a number of BMPs to decrease the effects of erosion and sedimentation associated with grading. These BMPs are meant to reduce the amount of constituents, including eroded sediment, that enter streams and other water bodies. A SWPPP, as required by RWQCB as part of the NPDES permitting, describes the stormwater BMPs that would control the quality and quantity of stormwater runoff for any project that would potentially cause sedimentation to a receiving water body. NPDES permit requirements would ensure that future development within the CPA would not result in changes to surface drainage patterns that could cause increased erosion or siltation. Thus, construction impacts related to drainage patterns would be ***less than significant***.

The Proposed Plan would not alter the existing drainage pattern of the CPA through the alteration of the course of a stream or river. The Proposed Plan would preserve existing open space areas, including the public parks in the CPA and riverfront areas adjacent to industrial land uses. The existing drainage patterns of open space would remain unchanged. The Proposed Plan would increase development potential, with the most potential proposed around and along transit corridors. Future development would be concentrated in areas of the CPA containing impervious surfaces; therefore, implementation of the Proposed Plan would result in a negligible increase in impervious surfaces compared to existing conditions.

Future development would be subject to the City's building codes, which establish design standards that deal with flood prevention and control. The City's zoning codes that establish zoning designations that allow for floodplains and flood control facilities and the City's LID Ordinance, which requires all development or redevelopment that is 500 square feet or more in size to capture and manage 100 percent of the first three-quarter-inch of stormwater on-site by implementing best management practices for on-site infiltration, capture and use, and biofiltration/bio-treatment to the maximum extent feasible. Through

the building permit application review and approval process, the City would be able to monitor and ensure the availability of sufficient drainage capacity. Compliance with the City's ordinances and regulations, as well as compliance with NPDES permit requirements, would ensure that future development during the lifetime of the Proposed Plan would not cause a substantial increase in the peak flow rates or volumes of stormwater runoff that would cause on-site or off-site flooding. Therefore, impacts related to surface runoff that would result in flooding are ***less than significant***.

Operational (Long Term)

Stormwater runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff. In addition, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations.

The Proposed Plan would increase development potential along the transit corridors, which are concentrated mainly in the center of the CPA, along Soto Street, First Street, Fourth Street, and Whittier Boulevard. Employment and job growth would be focused in the industrial area adjacent to the Los Angeles River. However, any residential or non-residential development that may occur close to the Los Angeles River will be required to design a minimum amount of permeable surface as part of the individual development project. Future development within the CPA would occur primarily as infill on previously developed or, to a lesser extent, vacant sites. Any new development within the CPA, regardless of building densities and lot coverage, would not result in a substantial increase in non-permeable surfaces such that surface drainage patterns would be altered. Further, new development has the potential to increase the permeable surface as new projects will be required to provide a certain amount of outdoor amenity space designed with a minimum amount of permeable surface. Thus, operational impacts related to drainage patterns would be ***less than significant.***

Conclusion. Compliance with state NPDES permit and applicable LAMC regulatory requirements, in combination with the City's standard grading and building permit requirements would minimize any potential water quality impacts from erosion and siltation. Additionally, future development during the lifetime of the Proposed Plan, regardless of building densities and lot coverage, would not result in a substantial increase in non-permeable surfaces such that surface drainage patterns would be altered. Therefore, implementation of the Proposed Plan would not cause changes in surface drainage patterns and surface water bodies in a manner that could cause erosion or siltation, contribute to runoff that would exceed the existing capacity or provide substantial additional sources of polluted runoff, or substantially

increase the rate or amount of runoff in a manner which would result in on or off site flooding. Impacts related to changing drainage patterns would be ***less than significant.***

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.9-4 Would implementation of the Proposed Plan in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project indundation?

This impact would be less than significant.

Flood Plains

FEMA considers land that is subject to inundation by a 100-year flood to be a Special Flood Hazard Area. As previously discussed, **Figure 4.9-4** identifies areas located within a 100-year flood plain within the vicinity of the CPA. The only Special Flood Hazard Areas designated within and adjacent to the CPA include the areas by the Los Angeles River in the northwestern boundary and corner of the CPA, which is mainly comprised of industrial uses. Intensified land uses are not expected to occur along the riverfront, as the industrial land uses will be maintained. However, any future development that would occur in the 100-year flood hazard zones would be subject to restrictions and requirements as part of the City's existing permitting process. Future development within the 100-year flood plain or floodway would be required to incorporate appropriate City and FEMA flood plain management measures in the design of new buildings, as specified in the Flood Hazard Specific Plan Guidelines and Floodplain Management Plan and enforced by the Department of Building and Safety. Flood plain management measures include, but are not limited to, requiring nonresidential development in flood prone areas to be anchored and flood-proofed to prevent damage from a 100-year flood or elevated to at least one foot above the 100-year flood level. Flooding, which could occur on industrial land uses, could pose a risk to the release of pollutants into the environment. However, this condition already exists and the Proposed Plan would not cause or excerbate existing flood hazards because as described in **Section 4.8, Hazards and Hazardous Materials**, businesses that use, store or transport large quantities of hazardous materials are required to comply with health and safety, and environmental protection laws and regulations which require businesses handling or storing certain amounts of hazardous materials to prepare a hazardous materials business plan. The plan includes an inventory of hazardous materials used or stored on-site, and establishes procedures in the event of the

release of a hazardous material. In addition, the City participates in NFIP and provides emergency response services for flood events. The City's hazard mitigation planning and emergency response programs would continue to be implemented to reduce potential losses. These measures are expected to ensure against reasonably foreseeable damage and loss of property and human life. Based on all of the above, it is not reasonably foreseeable that the any new industrial development allowed under the Proposed Plan would exacerbate any existing conditions and result in impacts from the release of a pollutants due to a flood event.

Tsunamis

The CPA is located more than 14 miles inland from the Pacific Ocean. According to **Figure 4.9-4**, the CPA is not located within a Tsunami Hazard Mitigation Zone. The CPA is not located within an area that is designated by the City as having the potential to be impacted by a tsunami.[29] Thus, no impacts related to tsunami hazards would occur.

Seiches

The CPA is not proximate to any enclosed bodies of water that would expose buildings or residents to substantial effects of seiches. Therefore, no impacts related to seiche would occur.

Inundation

Figure 4.9-4 identifies the area along and adjacent to the Los Angeles River as potential inundation areas. Within the CPA, the areas that are identified as potential inundation areas associated with the Los Angeles River are used primarily as industrial uses, such as the Union Pacific rail yard.

There are no levees, dams or reservoirs within the CPA that would present a potential risk of loss, injury or death involving flooding due to failure. Dam inundation is defined as the flooding that occurs as the result of structural failure of a dam. Structural failure may be caused by seismic activity. Seismic activity may also cause inundation by the action of a seismically induced wave, which overtops the dam without causing structural failure; this action is referred to as a seiche. The most proximate dam to the CPA is the Garvey Reservoir located approximately 4.25 miles east of the CPA boundary. The Metropolitan Water District completed a substantial overhaul of the facility in 1999 to address seepage and ensure overall reservoir integrity. The State Department of Conservation, Division of Dam Safety conducts periodic dam inspections to verify the dams' ability to withstand seismic stresses. Additionally, the effect of flooding due

---

29 City of Los Angeles, *General Plan Safety Element, Exhibit G,* adopted by the City Council, November 26, 1996. https://planning.lacity.org/odocument/31b07c9a-7eea-4694-9899-f00265b2dc0d/Safety_Element.pdf

to dam failure on the CPA would be minimal due to the distance of the CPA from the dam. No other large bodies of water are present in the immediate vicinity of the CPA that are known risks.

Compliance with the existing regulatory requirements related to flood plain management would ensure implementation of the Proposed Plan would not place housing within a flood hazard area without incorporating proper floodplain management measures that are designed to ensure against foreseeable risk of loss or damage to property and human life. Therefore, implementation of the Proposed Plan for the CPA would not exacerbate existing conditions and impacts related to placing housing within a flood hazard, tsunami, or seiche zone is ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.9-5 Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

This impact would be less than significant.

Future development in the CPA would be subject to federal, State, and local standards and regulations protecting water quality and hydrological resources. In addition, the Proposed Plan includes a number of policies to support stormwater management and improve water quality. Individual development projects would be required to comply with applicable regulations, standards, and policies, which would prevent violations of water quality standards and waste discharge requirements. Impacts related to obstruction of a water quality control plan would be ***less than significant.***

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.9.7 CUMULATIVE IMPACTS

The analysis of hydrology and water quality impacts resulting from the adoption and implementation of the Proposed Plan considers the effects of future growth and development throughout the geographic extent of the Proposed Plan. The cumulative context for the analysis of hydrology and water quality impacts is a function of the type of impact and geographic considerations. Some cumulative impacts may have a broad, regional context, while others may be limited by site-specific conditions or location. Cumulative development resulting from planning efforts that include the RTP/SCS, adjacent community plans, and the Proposed Plan contribute to cumulative impacts.

Water Quality Impacts

The Proposed Plan along with cumulative projects could result in significant impacts related to water quality if development were to result in substantial decreases in water quality. All development within the Los Angeles River and Ballona Creek Watersheds is required to conform to applicable Waste Discharge Requirements (WDRs) that are imposed by the City and County of Los Angeles. Stormwater runoff from cumulative development in the watershed, including development that could be facilitated by the Proposed Plan, could contribute to water quality impairments if measures are not implemented to minimize pollutant levels in runoff. However, all future development, including projects that could be constructed in the CPA (as applicable), are required to implement operational BMPs to control the release of pollutants in stormwater runoff per NPDES GCASP permit and SUSMP requirements, and also comply with all applicable local regulations. Requirements of the SUSMP are enforced through the City's plan approval and permit process, and all new development projects are subject to City inspection. Furthermore, all applicable projects must comply with LAMC Chapter VI, Article 4.4, Section 64.72, which governs pollutant control requirements and construction activity requirements. Future development resulting from implementation of the Proposed Plan would occur primarily as infill on previously developed or vacant sites, the nature of which would not significantly change the types or amounts of pollutants in stormwater runoff. Therefore, the Proposed Plan would not make a cumulatively considerable contribution to impacts on water quality.

Groundwater Impacts

The Proposed Plan along with cumulative projects could result in significant impacts related to groundwater supply and recharge if development substantially impeded groundwater recharge and/or resulted in contaminated groundwater. Future development in the CPA and in the City would be subject to the City's stormwater quality BMPs, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES GCASP permit requirements. These regulations would ensure construction activities associated

with future development would not substantially deplete groundwater supplies or interfere with groundwater recharge. Other jurisdictions located within the groundwater basin would also be subject to federal, State regional, and local regulations and requirements, including NPDES GCASP permit. Furthermore, based on the urbanized state of the City, future development in already developed areas would not result in demonstrable or sustained reduction of groundwater recharge capacity, such that there would be a lowering of the local groundwater table level. Future development in the City would occur primarily as infill on previously developed or vacant sites. Therefore, the Proposed Plan would not make a cumulatively considerable contribution related to groundwater supply and recharge.

Drainage, Runoff, and Localized Flooding Impacts

The Proposed Plan along with cumulative projects could result in significant impacts related to drainage, runoff, and localized flooding if such development significantly increased the need for drainage, significantly increased runoff and/or localized flooding or if it made conditions worse than they would otherwise be. The area of impact for cumulative impacts would be the extensive storm drain system operated by the City of Los Angeles, which is described in the Environmental Setting above. Stormwater flows from the CPA currently combine with those from surrounding development in the greater Los Angeles area and are discharged into the storm drain system that conveys flows to Ballona Creek and Los Angeles River. LAMC Section 17.05(M) prescribes performance standards for storm drain systems, which would apply to cumulative development contributing flows to the system. Open space areas in the CPA would be preserved, and future development would be concentrated in areas of the CPA already containing impervious surfaces. Therefore, flows from areas of future development are already accounted for in system capacity. Potential development projects that could be implemented under the Proposed Plan would not result in substantial increases in impervious surfaces. Therefore, the rate and volume of stormwater flows from the Proposed Plan would represent a negligible contribution to system flows. The Proposed Plan would not make a cumulatively considerable contribution related to drainage, runoff, and flooding.

Impacts Related to 100-Year Flood Hazard Areas

The Proposed Plan along with cumulative projects could result in significant impacts related to 100-year flood hazard areas if such development increased the likelihood of a 100-year storm event or if it made such an event worse. The area of impact for cumulative impacts would be the incorporated boundary of the City of Los Angeles, which participates in the NFIP and provides emergency response services for flood events. Other adjacent jurisdictions that have areas within a 100-year flood plain also participate in NFIP and provide emergency response service for flood events. As previously discussed and as shown in **Figure**

4.9-4, the only Special Flood Hazard Areas designated within and adjacent to the CPA include the areas by the Los Angeles River the northwestern boundary and corner of the CPA, which are mainly industrial uses.

All future development along the riverfront would be subject to restrictions and requirements as part of the City's existing permitting process. Future development within the 100-year flood plain or floodway would be required to incorporate appropriate City and FEMA flood plain management measures in the design of new buildings as specified in the Flood Hazard Specific Plan Guidelines and Floodplain Management Plan and enforced by the Department of Building and Safety. Compliance with these existing regulatory requirements would ensure the Proposed Plan would not place housing within a flood hazard area without incorporating proper measures and reducing this impact to less than significant. In addition, the City's hazard mitigation planning and emergency response programs would also continue to be implemented to reduce potential losses. As previously discussed under Impact 4.9-4, the Proposed Plan would not make a cumulatively considerable contribution related to 100-year flood hazard areas.

Inundation and Mudslide Impacts

The Proposed Plan along with cumulative projects could result in significant impacts related to seiche, inundation, and mudslides if such development increased the likelihood of seiche, inundation and/or mudslides or made such events worse. The City of Los Angeles and nearby jurisdictions participate in the NFIP and provide emergency response services for flood events. Cumulative development could be at risk of dam failure inundation or mudflow/mudslide, depending on location. However, as there are no dams located within the CPA, the Proposed Plan would not result in physical changes that would alter or redirect dam flooding or flow directions for mudslides/mudflows or exacerbate existing conditions with respect to the risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam. As discussed above and in **Section 4.8, Hazards and Hazardous Materials**, new industrial development in the 100-year flood hazard zones would be subject to restrictions and requirements as part of the City's existing permitting process and as required under extensive federal and state hazardous material requirements for storage, use, transportation and disposal. Future development within the 100-year flood plain or floodway would be required to incorporate appropriate City and FEMA flood plain management measures in the design of new buildings, as specified in the Flood Hazard Specific Plan Guidelines and Floodplain Management Plan and enforced by the Department of Building and Safety. Flood plain management measures include, but are not limited to, requiring nonresidential development in flood prone areas to be anchored and flood-proofed to prevent damage from a 100-year flood or elevated to at least one foot above the 100-year flood level The location of future development and potential impact related to dam failure or mudflow/mudslide would be evaluated on a case-by-case basis during the permitting process to ensure proper siting of facilities and project design. Cumulative population growth could result in an increase in the number of people and structures exposed to hazards; however, the City

and other nearby jurisdictions' hazard mitigation planning and emergency response programs would continue to be implemented to reduce potential losses. The Proposed Plan would have no impact related to physical changes that would alter or redirect dam flooding or flow directions for mudslides/mudflows or exacerbate existing conditions with respect to the risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam. The Proposed Plan would not make a cumulatively considerable contributions to impacts related to seiche, inundation, and mudslides.

4.10 LAND USE AND PLANNING

4.10.1 INTRODUCTION

This section provides an overview of land use and planning policy for the Boyle Heights CPA and evaluates the impacts associated with the Proposed Plan. Topics addressed include the potential for the Proposed Plan to divide an established community, and whether the Proposed Plan would conflict with any applicable land use plan, policy, or regulations.

4.10.2 EXISTING ENVIRONMENTAL SETTING

The Boyle Heights CPA is located in the City of Los Angeles immediately east of Downtown and the Los Angeles River. The CPA contains approximately 3,008 acres or 4.7 square miles of land use area, approximately 6.67 square miles of land inclusive of streets, and is roughly bounded by the San Bernardino Freeway (I-10 Freeway) and Marengo Street to the north, the Union Pacific and Santa Fe Railroad lines to the south and west, and Indiana Street to the east. The southern and eastern borders of the CPA align with the city limits of Los Angeles with the City of Vernon located to the south and the unincorporated community of East Los Angeles located to the east of the CPA. Located to the north are the Los Angeles communities of Lincoln Heights and El Sereno and located to the west are the industrial districts of Downtown. Adjoining City of Los Angeles Community Plans include the Central City North CPA to the west and the Northeast Los Angeles CPA to the north.

The CPA contains primarily multi-family residential neighborhoods and some single-family neighborhoods, as well as multiple centers of commercial and industrial activity. The predominant land use in the Boyle Heights CPA is residential. Approximately 42% (1,258 acres) of the Boyle Heights CPA is currently zoned Residential (R1, R2, R3, R4, [Q]R5, RD1.5, RD2, and RD3). Existing residential areas within the Boyle Heights CPA are primarily designated for multi-family, with the Multiple Family zoning covering 98% of all residential areas within the CPA. The remaining 2% of residential land is designated Low Density for single-family use. Low Density designated areas only exist in three small clusters near the edges of the CPA.

The CPA has a mix of commercial intensities that allow both low-scale small businesses and office buildings, depending on the commercial land use designation and zone. Because of Boyle Heights's historic pattern of development, commercial districts are diverse and include a mix of uses and a variety of character. A total of approximately 9% (260 acres) of the total land area of the CPA is zoned Commercial (CR, C1, C1.5, C2, C4, and CM). The four major east-west commercial corridors of Cesar Chavez Avenue, First Street, Fourth Street, and Whittier Boulevard contain the majority of the CPA's commercial land uses.

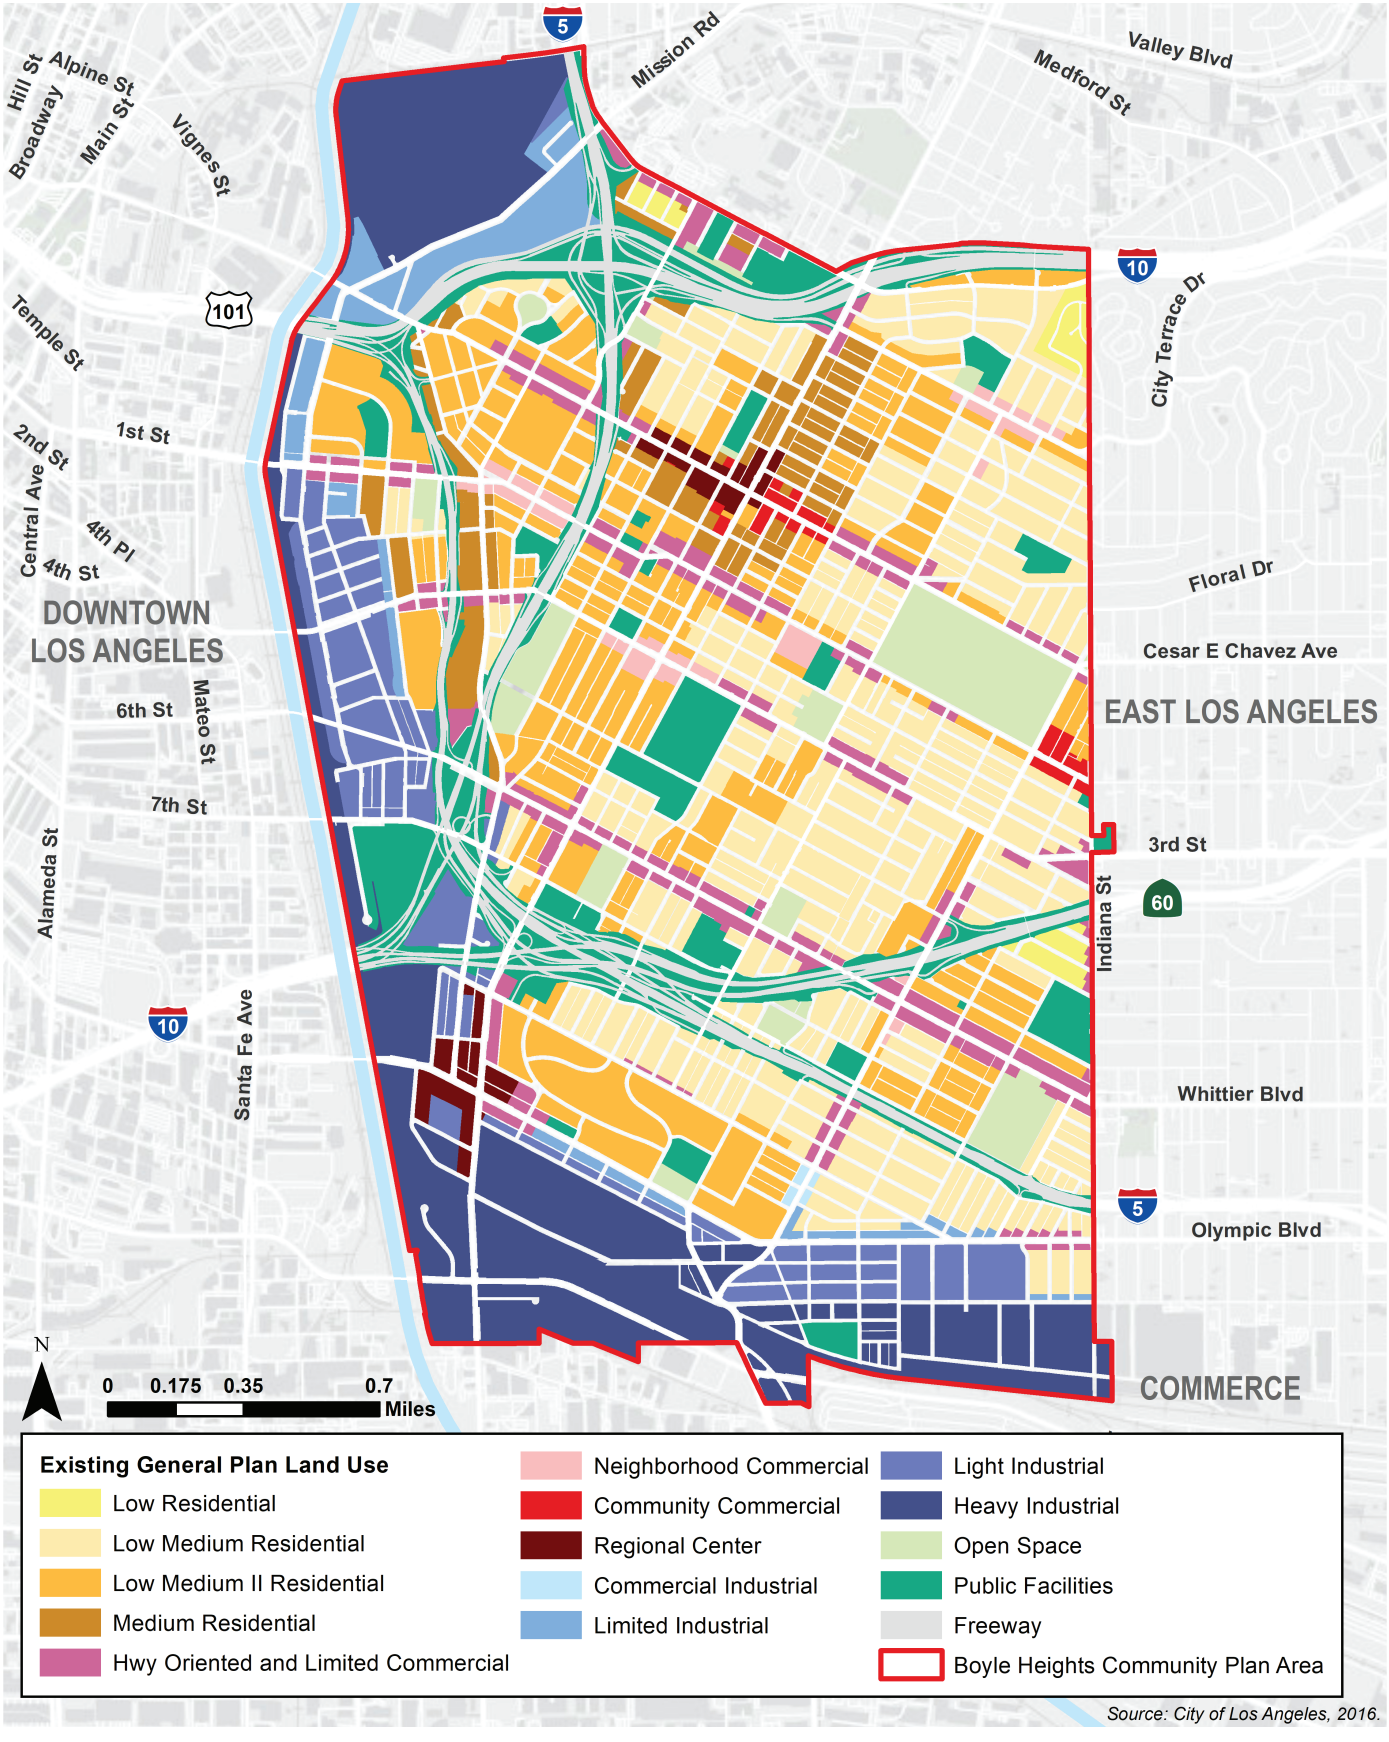
Smaller concentrations are located along Marengo Street, Wabash Avenue, Soto Street, Lorena Street, and Olympic Boulevard. Commercial uses in the CPA are locally-oriented, containing a mix of retail, restaurants, offices, and services primarily established to serve the immediate residential community.

A total of approximately 26% (780 acres) of the land area in the CPA is zoned Industrial (M1, M2, M3, MR1, and MR2). A continuous belt of industrial land runs from the northwest corner of the CPA and extends southward along the Los Angeles River and adjacent rail lines, continuing southeast and occupying the southern portion of the CPA. Industrial land throughout most of the CPA is intensely used with goods processing and distribution, making up a significant portion of business activity. As a result, the area attracts heavy goods movement traffic along the corridors that pass through the industrial areas, with Mission Road, Fourth Street, Olympic Boulevard, and Soto Street serving as the primary routes. A large freight railroad yard, officially called the Los Angeles Transfer Facility and colloquially known as 'Piggyback Yard,' occupies an approximately 130-acre site adjacent to the river at the northwest corner of the CPA.

There are currently two designated Regional Centers in Boyle Heights, they include a six-block section of Cesar Chavez Avenue, and the location of the historic Sears building situated at the southwest corner of Soto Street and Olympic Boulevard. Both Regional Centers were designated as such with future objectives in mind. While it was anticipated that a subway line would be extended beneath Cesar Chavez Avenue during the previous Community Plan update process which took place during the 1990s, a transit line was instead built beneath First Street thus removing the possibility that Cesar Chavez Avenue would develop into a major transit corridor on a regional scale.

Boyle Heights is mostly built out and contains few natural features and no significant areas of natural open space. Land designated Open Space in the General Plan consists of approximately 5% (149 acres) of the total area in the CPA, with the most significant civic open space being Hollenbeck Park. Other smaller civic parks include Lou Costello Jr Recreational Center, Evergreen Recreational Center, Ramon Garcia Recreational Center, Prospect Park, and State Street Recreation Center. Other large portions of land designated as Open Space consist of cemetery land within Evergreen Cemetery and Odd Fellows Cemetery.

The CPA's transportation system includes a circulation network of freeways, highways, and surface roadways; a public transit system; bicycle routes; and a pedestrian circulation system of sidewalks and crosswalks. Four freeways traverse the Boyle Heights CPA, with the San Bernardino Freeway (I-10 Freeway) traversing through the northern portion of the Boyle Heights CPA and Interstate 5 (I-5), the Pomona Freeway (SR-60) and the Hollywood Freeway (US 101) traverse through the southern portion of the Boyle Heights CPA. All four freeways converge over much of the western portion of the Boyle Heights CPA to form the East Los Angeles Interchange. The street network is composed of arterial streets



(Boulevards and Avenues), collectors, City-designated scenic highways, divided streets, and local streets. Streets in the flatlands are laid out in a grid pattern, slightly offset from compass points, similar to streets in Downtown and Westlake.

The public transit system consists of the Metro L Line, Metro Rapid Bus, and numerous local bus lines, including regular and 24-hour lines and neighborhood DASH lines. Within the CPA, there are Class II Bike Lanes on 1st Street between Boyle Avenue and Lorena Street and 8th Street between Boyle Avenue and Olympic Boulevard. The existing General Plan land use designations for the CPA are shown in **Figure 4.10-1, General Plan Land Use Map. Table 4.10-1, Existing Land Use Designations,** lists the land use designation acreages and their percentages for the Existing Plan.

Table 4.10-1
Existing Land Use Designations

Land Use	Acreage	Percentage
Residential	1,278	43
Commercial	244	8
Industrial	783	26
Public / Semi-Public	703	23

IMPACT SCIENCES

Existing General Plan Land Use Map

1264.003•06/2022

4.10.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Land Use and Planning at the state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- California Government Code Section 65302 (General Plan)
- Senate Bill 375
- Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)
- City of Los Angeles General Plan
- Framework Element
- Mobility Plan 2035
- Housing Element
- Los Angeles Municipal Code
- Overlays
- Specific Plans
- Redevelopment Plans
- Plan for a Healthy LA
- Citywide Design Guidelines

State

California Government Code Section 65302 (General Plan). California law requires that every city and county prepare and adopt a long-range comprehensive General Plan to guide future development and to identify the community's environmental, social, and economic goals. As stated in Section 65302 of the California Government Code, "The general plan shall consist of a statement of development policies and shall include a diagram or diagrams and text setting forth objectives, principle, standard, and plan proposals." While a general plan will contain the community vision for future growth, California law also

requires each plan to address the mandated elements listed in Section 65302. The mandatory elements for all jurisdictions are land use, circulation, housing, conservation, open space, noise, safety, and environmental justice.

Senate Bill 375. On September 30, 2008, Senate Bill (SB) 375 was instituted to help achieve Assembly Bill (AB) 32 goals through regulation of cars and light trucks. SB 375 aligns three policy areas of importance to local government: (1) regional long-range transportation plans and investments; (2) regional allocation of the obligation for cities and counties to zone for housing; and (3) achievement of greenhouse gas (GHG) emission reduction targets for the transportation sector set forth in AB 32. It establishes a process for the California Air Resource Board (CARB) to develop GHG emission reduction targets for each region (as opposed to individual local governments or households). SB 375 also requires Metropolitan Planning Organizations (MPO) to prepare a Sustainable Communities Strategy (SCS) within the Regional Transportation Plan (RTP) that guides growth while taking into account the transportation, housing, environmental, and economic needs of the region. SB 375 uses California Environmental Quality Act (CEQA) streamlining as an incentive to encourage residential or mixed-use residential projects, which help achieve AB 32 goals to reduce GHG emissions.

State Density Bonus Law (Government Code Section 65915). The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with 10 percent or more housing for lower income households, 5 percent or more of the housing for very low income households, senior citizen housing, and 10 percent of the total dwelling units provided as affordable housing in condominium projects. The City has implemented the State Density Bonus Law in various municipal code sections of the LAMC.

On September 27, 2014, Governor Brown signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222 requires that density bonus projects resulting in a loss of existing affordable and otherwise locally-regulated (i.e., rent-stabilized) housing units replace those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units. Several other clarifications of the existing law are also included, but they were not judged to represent a change to current City policy.

Complete Streets Act. Assembly Bill 1358, the Complete Streets Act (Government Code Sections 65040.2 and 65302), was signed into law by former Governor Arnold Schwarzenegger in September 2008. As of January 1, 2011, the law requires cities and counties, when updating the part of a local general plan that addresses roadways and traffic flows, to ensure that those plans account for the needs of all roadway users. Specifically, the legislation requires cities and counties to ensure that local roads and streets adequately

accommodate the needs of bicyclists, pedestrians and transit riders, as well as motorists. At the same time, the California Department of Transportation (Caltrans) unveiled a revised version of Deputy Directive 64, an internal policy document that now explicitly embraces Complete Streets as the policy covering all phases of state highway projects, from planning to construction to maintenance and repair.

Regional

Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). On September 3, 2020, the Southern California Association of Governments (SCAG) Regional Council adopted the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), also known as Connect SoCal. The 2020-2045 RTP/SCS presents a long-term transportation vision through the year 2045 for the six-county region of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties. The 2020-2045 RTP/SCS contains baseline socioeconomic projections that are used as the basis for SCAG's transportation planning, and the provision of services by other regional agencies. SCAG's overarching strategy for achieving its goals is integrating land use and transportation. SCAG policies are directed towards the development of regional land use patterns that contribute to reductions in vehicle miles and improvements to the transportation system. Rooted in past RTP/SCS plans, Connect SoCal's "Core Vision" centers on maintaining and better managing the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets. The plans "Key Connections" augment the "Core Vision" to address challenges related to the intensification of core planning strategies and increasingly aggressive greenhouse gas reduction goals, and include but are not limited to, Housing Supportive Infrastructure, Go Zones, and Shared Mobility. Connect SoCal intends to create benefits for the SCAG region by achieving regional goals for sustainability, transportation equity, improved public health and safety, and enhancement of the regions' overall quality of life. These benefits include but are not limited to a five percent reduction in VMT per capita and vehicle hours traveled by nine percent, increase in work-related transit trips by two percent, create more than 264,500 new jobs, reduce greenfield development by 29 percent, and, building off of the 2019-2040 RTP.SCS, increase the share of new regional household growth occurring in High Quality Transit Areas (HQTA's) by six percent and the share of new job growth in HQTAs by 15 percent.

Regional Housing Needs Assessment (RHNA). The RHNA is a key tool used by SCAG and its member governments to plan for growth. The 6th cycle Final RHNA Allocation Plan was adopted by the SCAG Regional Council on March 22, 2021 (then updated July 1, 2021) and quantifies the need for housing within

each jurisdiction between October 2021 and October 2029.[1] Communities then plan and determine how they will address this need through the process of completing the housing elements of their general plans. The RHNA allows communities to anticipate growth, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment. The RHNA is produced periodically by SCAG, as mandated by State law, to coincide with the region's schedule for preparing housing elements. It consists of two measurements: 1) existing unmet needs for housing and 2) future need for housing. Factors, such as overcrowding and cost burden, were included to better account for the deficit, which resulted in significantly larger 6th RHNA cycle allocations.[2] The City of Los Angeles's 2021-2029 Housing Element must accommodate a total of 456,643 units, of which 184,721 units must be affordable to lower income households (Very Low and Low levels).[3]

Local

City of Los Angeles General Plan. The City of Los Angeles General Plan (General Plan), originally adopted in 1974, sets forth goals, objectives, policies, and programs to provide an official guide to the future development of the City, while integrating a range of state-mandated elements,[4] including Land Use, Circulation (Mobility Plan 2035), Housing, Conservation, Open Space, Safety, Noise, Air Quality, and Environmental Justice (Plan for a Health Los Angeles or Health and Wellness Element). The City's General Plan also includes the Framework Element, the Infrastructure Systems Element, and the Public Facilities & Services Element. Both the City's General Plan land use controls and the goals, objectives, and policies within individual elements of the General Plan include numerous provisions that are intended to avoid or reduce potential adverse effects on the environment. The elements that make up the City's General Plan are described in more detail below.

Framework Element

The City of Los Angeles General Plan Framework Element (General Plan Framework) establishes the conceptual basis for the City's General Plan. The General Plan Framework sets forth a Citywide comprehensive long-range growth strategy and establishes Citywide policies regarding land use, housing, urban form, neighborhood design, open space and conservation, economic development, transportation, infrastructure, and public services. The General Plan Framework provides guidelines for future updates of the City's community plans and does not supersede the more detailed community and specific plans.

Land Use Chapter

The General Plan Framework Land Use Chapter designates Districts (i.e., Neighborhood Districts, Community Centers, Regional Centers, Downtown Center, and Mixed-Use Boulevards) that include standards and policies that shape the scale and intensity of proposed uses with the purpose of supporting the vitality of the City's residential neighborhoods and commercial districts. The establishment of the designated arrangement of land uses and development densities addresses an array of environmental issues, including, but not limited to: reductions in VMT, reductions in noise impacts, improved efficiency in the use of energy, improved efficiency and thus greater service levels within the infrastructure systems, availability of open space, compatibility of land uses, support for alternative modes of transportation, and provision of an attractive pedestrian environment.

Housing Chapter

The overarching goal of the General Plan Framework Housing Chapter is to define the distribution of housing opportunities by type and cost for all residents of the City. The General Plan Framework Housing Chapter recognizes that the distribution of housing in proximity to transit can reduce vehicle trips and provide residents with the opportunity to walk between their home, job, and/or neighborhood services. The Housing Chapter provides the following policies to achieve this goal through a number of measures:

- Concentrating opportunities for new development in the City's Neighborhood Districts and in Community Centers, Regional Centers, and the Downtown Center, as well as along primary transit corridors/boulevards;

- Providing development opportunities along boulevards located near existing or planned major transit facilities and areas characterized by low-intensity or marginally viable commercial uses with structures that integrate commercial, housing, and/or public service uses; and

- Focusing mixed uses around urban transit stations, while protecting and preserving surrounding low-density neighborhoods from the encroachment of incompatible land uses.

Urban Form and Neighborhood Design Chapter

The General Plan Framework Urban Form and Neighborhood Design Chapter establishes the goal of creating a city that is attractive to future investment and a city of interconnected, diverse neighborhoods that builds on the strength of those neighborhoods and functions at both the neighborhood and Citywide scales. The purpose of the Urban Form and Neighborhood Design Chapter is two-fold: first, to support the population distribution principles of the General Plan Framework through proper massing and design of buildings and second, to enhance the physical character of neighborhoods and communities within the City. The General Plan Framework does not directly address the design of individual neighborhoods or communities but embodies general neighborhood design and implementation programs that guide local planning efforts and lay a foundation for community plan updates. The Urban Form and Neighborhood Design Chapter encourages growth in areas that have a sufficient base of both commercial and residential development to support transit service. The existing and planned transit system provides the opportunity to concentrate development and conserve the existing character of stable neighborhoods.

Open Space and Conservation Chapter

The General Plan Framework Open Space and Conservation Chapter provides guidance for overall City provision of open space and sets forth policies for the protection of the City's natural environment resources. The Open Space and Conservation Chapter's objectives are oriented around the conservation of natural resources, provision of outdoor recreational opportunities, minimization of public risks from environmental hazards, and use of open space to enhance community and neighborhood character. Economic, social, and ecological imperative require the City to take full advantage of all existing open space elements. The ecological dimension is based on the improvement of water quality and supply, the reduction of flood hazards, improved air quality, and the provision of ecological corridors for birds and wildlife.

Economic Development Chapter

The General Plan Framework Economic Development Chapter includes goals, policies and objectives that address the appropriate land use locations for development. The chapter also establishes mutual development objectives for land use and economic development. This Chapter set forth policies for the development of an infrastructure investment strategy to support population and employment growth areas. The Chapter also includes goals, objectives, and policies focused on preserving commercial uses within walking distance to residential areas and promoting opportunities in areas where growth can be

accommodated without encroaching on residential neighborhoods. It also focuses on establishing a balance of land uses that provide for commercial and industrial development which meet the needs of local residents, sustaining economic growth, and assuring maximum feasible environmental quality.

Transportation Chapter

The General Plan Framework Transportation Chapter includes proposals for major improvements to enhance the movement of goods and to provide greater access to major intermodal facilities. While the focus of the Transportation Chapter is on guidance for transportation investments, the Transportation Chapter also includes goals, policies and objectives that overlap with policies included in other Framework chapters of the General Plan Framework regarding land use patterns and the relationship of the pedestrian system to arrangement of land uses. The Transportation Chapter of the General Plan Framework is implemented through the General Plan's Mobility Plan 2035, which is a comprehensive update of the General Plan Transportation Element.

Infrastructure and Public Services Chapter

The General Plan Framework Infrastructure and Public Services Chapter addresses infrastructure and public service systems, including wastewater, stormwater, water supply, solid waste, police, fire, libraries, parks, power, schools, telecommunications, street lighting, and urban forests. For each of the public services and infrastructure systems, basic policies call for monitoring service demands and forecasting the future need for improvements, maintaining an adequate system/service to support the needs of population and employment growth, and implementing techniques that reduce demands on utility infrastructure or services. Generally, these techniques encompass a variety of conservation programs (e.g., reduced use of natural resources, increased site permeability, watershed management, and others). Strategic public investment is advocated in the Infrastructure and Public Services Chapter as a method to stimulate economic development as well as maintain environmental quality. Attention is also placed on the establishment of procedures for the maintenance and/or restoration of service after emergencies, including earthquakes.

Mobility Plan 2035. The Mobility Plan 2035, adopted on January 20, 2016, and readopted September 7, 2016, is a comprehensive update of the General Plan Transportation Element. The Mobility Plan 2035 provides the policy foundation for achieving a transportation system that balances the needs of all road users, incorporates "complete streets" principles and lays the policy foundation for how future generations of Angelenos interact with their streets, in compliance with the Complete Streets Act (Assembly Bill [AB] 1358).

The purpose of the Mobility Plan 2035 is to present a guide to the future development of a Citywide transportation system for the efficient movement of people and goods. While the Mobility Plan 2035 focuses on the City's transportation network, it complements other components of the General Plan that pertain to the arrangement of land uses to reduce VMT and policies to support the provision and use of alternative transportation modalities. The Mobility Plan 2035 includes the following five main goals that define the City's high-level mobility priorities:

- Safety First;
- World Class Infrastructure;
- Access for All Angelenos;
- Collaboration, Communication, and Informed Choices; and
- Clean Environments and Healthy Communities.

Housing Element. The Housing Element of the General Plan is prepared pursuant to state law and provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides the array of programs the City intends to implement to create and preserve sustainable, mixed-income neighborhoods across the City. The goals of the 2021-2029 Housing Element are as follows:

- A City where housing production results in an ample supply of housing to create more equitable and affordable options that meet existing and projected needs.
- A City that preserves and enhances the quality of housing and provides greater housing stability for households of all income levels.
- A City in which housing creates healthy, livable, sustainable, and resilient communities that improve the lives of all Angelenos.
- A City that fosters racially and socially inclusive neighborhoods and corrects the harms of historic racial, ethnic, and social discrimination of the past and present.
- A City that is committed to preventing and ending homelessness.

Conservation Element. The City of Los Angeles General Plan includes a Conservation Element, which addresses the preservation, conservation, protection, and enhancement of the City's natural resources. Section 5 of the Conservation Element recognizes the City's responsibility for identifying and protecting its

cultural and historical heritage. The Conservation Element establishes an objective to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes and a corresponding policy to continue protecting historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities. The Conservation Element refers to the Open Space Element for a discussion of open space aspects of the City, including park sites.

Los Angeles Municipal Code. All development activity on the Project site is subject to the City of Los Angeles Municipal Code (LAMC), particularly Chapter 1, General Provisions and Zoning, also known as the City of Los Angeles Planning and Zoning Code. The LAMC defines the range of zoning classifications throughout the City, provides the specific permitted uses applicable to each zoning designation, and applies development regulations to each zoning designation.

The LAMC is currently undergoing a comprehensive update to all Zoning Code sections as part of the re:code LA effort, which is being implemented alongside the Community Plan Updates. Re:code LA will update the Zoning Code to make the Code more streamlined, visual, and easy to use. The existing Zoning Code regulations are not being repealed as part of the re:code LA effort. The existing Zoning Code will continue to be located in Chapter 1 of the LAMC, while the New Zoning Code will be located in a new Chapter 1A of the LAMC.

Clean Up Green Up Ordinance. As part of its Clean UP Green UP campaign, the City Council adopted Ordinance 184,245 (effective June 2016) adding Sections 95.314.3 and 99.04.504.6 to the LAMC and amending Section 99.05.504.5.3 of the LAMC to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns within the City. Section 99.04.504.6 of the LAMC requires mechanically ventilated buildings within 1,000 feet of a freeway to provide regularly occupied areas of the building with air filtration media for outside and return that provides a Minimum Efficiency Reporting Value (MERV) of 13.

River Improvement Overlay (RIO). Effectuated by Ordinance No. 183,145 in August 2014, the River Improvement Overlay (RIO) District enables the City of Los Angeles to better coordinate land use development along the 32-mile corridor of the Los Angeles River that flows within the City's boundaries. The RIO District is a proposed special use district that requires new development projects to follow and implement applicable development regulations and design guidelines. The purposes of the RIO District are to support the goals of the Los Angeles River Revitalization Master Plan (LARRMP); contribute to the environmental and ecological health of the City's watersheds; provide native habitat and support local species; establish a positive interface between the Los Angeles River and adjacent properties; promote pedestrian, bicycle and other multi-modal connections between the river and surrounding neighborhoods;

provide an aesthetically pleasing environment; provide safe, convenient access to and along the river; promote river identity; and support the City's stormwater ordinances and programs.

Redevelopment Plan(s). Redevelopment Plans outline a community vision and revitalization opportunities within specific neighborhoods across the City. Each Redevelopment Project Area has a unique set of land use restrictions designed specifically to enhance the quality of life for the community.

The Boyle Heights CPA contains one active redevelopment project area that was managed by the Community Redevelopment Agency of the City of Los Angeles (CRA/LA). Prior to 2012, the CRA/LA was the agency in charge of developing, implementing and overseeing CRA projects in the City. The passage of AB1x-26 and the California Supreme Court's decision in California Redevelopment Association v. Matosantos in 2012 effectively abolished redevelopment agencies in the State. Since the dissolution of the CRA/LA, activities in the redevelopment project areas have been administered through the Designated Local Authority (DLA). In November 2019, all land use related plans and functions, including those provisions in the Redevelopment Plans related to land use functions, transferred to the City. The CPA contains one redevelopment project area (the Adelante Eastside Redevelopment Project Area), which expires March 24, 2030.

The Adelante Eastside Redevelopment Project Area is located immediately east of downtown Los Angeles along the eastern side of the Los Angeles River. The Redevelopment Project Area, comprises approximately 2,164 acres, is an irregularly shaped area zoned predominately for commercial and industrial uses in portions of Boyle Heights Community Plan, and the Northeast LA Community Plan (in consisting of the El Sereno and Lincoln Heights neighborhoods). Generally, the Redevelopment Project Area boundaries include the industrial areas located south of Olympic Boulevard to the Los Angeles City boundary; east of the Los Angeles River to Soto Street; the Golden State and Santa Ana Freeways and Mission Road, north to the San Bernardino Freeway to Main Street; and along Alhambra Road and Valley Boulevard from Soto Street on the west to the City of Los Angeles/City of Alhambra boundary. The Redevelopment Project Area also includes commercial/mixed-use frontages along the major east-west thoroughfares within the Boyle Heights CPA. The principal thrust of the Adelante Eastside Redevelopment Plan is the preservation of industrial and commercial uses to promote a stable industrial base to provide jobs for the community, as well as enhancing the existing commercial areas.

Plan for a Healthy LA. The Plan for a Healthy Los Angeles, the Health, Wellness and Equity Element of the City's General Plan, provides high-level policy vision, along with measurable objectives and implementation programs to elevate health as a priority for the City's future growth and development and complies with the requirements for the City to have an environmental justice element consistent with Senate Bill 1000. The Plan for a Healthy Los Angeles was originally adopted in 2015, and targeted

amendments to the Plan were adopted by the City Council on November 24, 2021. Through a new focus on public health from the perspective of the built environment and City services, the City seeks to achieve better health and social equity through its programs, policies, plans, budgeting, and community engagement. The plan acknowledges the relationship between public health and issues such as transportation, housing, environmental justice, and open space, among others. The plan includes the following goals:

- Los Angeles, A Leader in Health and Equity;
- A City Built for Health;
- Bountiful Parks and Open Spaces;
- Food that Nourishes the Body, Soul, and Environment;
- An Environment Where Life Thrives;
- Lifelong Opportunities for Learning and Prosperity; and
- Safe and Just Neighborhoods.

Included in this General Plan Element are policies pertaining to the arrangement of land uses within the City and building design procedures.[5] As such, these policies address characteristics of the physical environment that contribute to public health.

Los Angeles River Revitalization Master Plan (LARRMP). Adopted in April 2007, the LARRMP contains goals in the creation of parks, paths, and open spaces along the Los Angeles River. The LARRMP includes recommendations for physical improvements along the Los Angeles River corridor; policies for managing public access and management structure; and short- and long-term priority projects and potential funding strategies.

Citywide Design Guidelines. The Citywide Design Guidelines serve to implement the General Plan Framework Element's urban design principles and are intended to be used by City of Los Angeles Department of City Planning staff, developers, architects, engineers, and community members in evaluating project applications, along with relevant policies from the Framework Element and Community Plans. By offering more direction for proceeding with the design of a project, the Citywide Design

5 Los Angeles City Planning, *Plan for a Healthy Los Angeles, A Health and Wellness Element of the General Plan*, March 2015. Policy 2.2, Healthy building design and construction, page 42; and Policy 5.7, Land use planning for public health and GHG emission reduction, page 94. Available online at: https://planning.lacity.org/plan-healthy-los-angeles#:~:text=As%20an%20Element%20of%20the,a%20technical%20update%20in%202021, accessed on May 13, 2022.

Guidelines illustrate options, solutions, and techniques to achieve the goal of excellence in new design. The Citywide Design Guidelines, which were initially adopted by the City Planning Commission in July 2013 and updated in October 2019, are intended as performance goals and not zoning regulations or development standards and, therefore, do not supersede regulations in the LAMC. The guidelines "carry out the common design objectives that maintain neighborhood form and character while promoting quality design and creative infill development solutions" and are organized in relation to Pedestrian-First Design, 360 Degree Design, and Climate-Adapted Design. The Citywide Design Guidelines incorporate the goals of the previous Walkability Checklist and interact with other guidelines such as those found in Community Design Overlays.

Industrial Land Use Policy Project. In January 2008, the Department of City Planning (DCP) and the Community Redevelopment Agency of Los Angeles (CRA/LA) presented the findings of the Industrial Land Use Policy (ILUP) Project to the City Planning Commission. The ILUP Project was a two-year study that gathered and analyzed information regarding the viability of the City's industrial districts, particularly those areas experiencing pressure to be converted to residential uses. The result of the two-year effort underscored the appropriateness of the current policy adopted by the City Council and Mayor and contained in the General Plan Framework and elsewhere in adopted documents and made no change to any policy. The ILUP Project does not establish new land use plans or policies and was never formally presented to the City Council for consideration or adoption. Since the ILUP was never formally adopted by the City Council, the City considers zone changes and General Amendments from industrial designations on a case-by-case basis, as it has historically done.

Freeway Adjacent Advisory Notice for Sensitive Users (ZI No. 2427). Zoning Information File 2427 (ZI No. 2427) provides design and siting guidelines for discretionary residential projects and sensitive uses (i.e., schools, day care centers, and senior care centers) located within 1,000 feet of a freeway. ZI No. 2427 requires all projects seeking discretionary approval for which findings must be made regarding conformance to the General Plan to adhere to the Citywide Design Guidelines, including those that address freeway proximity.

Affordable Housing Linkage Fee Ordinance. On December 13, 2017, Mayor Eric Garcetti passed the Affordable Housing Linkage Fee Ordinance. The ordinance requires developers to pay a fee for new development projects in order to mitigate the need for affordable housing associated with the new project. The ordinance exempts new development projects with at least 40 percent moderate-income dwelling units, 20 percent low-income households, 11 percent very low, or 8 percent extremely low-income dwelling units, public institution projects, hospitals, grocery stores, and other categories of development.

Residential Hotel Unit Conversion and Demolition Ordinance. The Residential Hotel Unit Conversion and Demolition Ordinance (RHO) prohibits conversion or demolition of dwelling units in a residential hotel without approval from the Los Angeles Housing Department (LAHD). The ordinance adds Article 7.1 to Chapter IV of the LAMC and amends Sections 91.106.4.1, 151.06, and 151.09.[6] The ordinance seeks to preserve dwelling units provided by residential hotels, which often serve as affordable housing for the very low income, elderly, and disabled.[7]

Rent Stabilization Ordinance. LAMC Chapter XV encodes the City's Rent Stabilization Ordinance (RSO). Generally, the Rent Stabilization Ordinance (RSO) applies to rental properties that were built on or before October 1, 1978, as well as replacement units. The RSO applies to most dwelling units with the exception of single-family homes that solely occupy a parcel and caps annual rent increases for continuing tenants based on the Consumer Price Index averaged for a 12-month period.

Transit Oriented Communities Affordable Housing Incentive Program. The Transit Oriented Communities Affordable Housing Incentive Program (TOC Program) was developed pursuant to Section 6 of Measure JJJ, which was passed by City voters in 2016 (LADCP 2018a). The program provides incentives for developers to build properties that include affordable units within a one-half mile radius of a major transit stop. TOC Program Guidelines were released by the City Planning department on September 22, 2017 and last revised on February 26, 2018.

Development projects can qualify for incentives under one of four tiers (Tier 1 through 4). Each tier has different eligibility requirements related to the type of transit options located in proximity to the property and the composition of affordable units offered. The higher the tier number, the more transit options and affordable housing units a development needs to qualify. All TOC-eligible developments receive baseline incentives, which include an increase in the number of allowable dwelling units, an increase in the allowable floor-area ratio (FAR), and reduced parking requirements. Developments with a higher tier number are also eligible for additional incentives with higher tiers being permitted a greater number of additional incentives.

Value Capture Ordinance. On December 13, 2017, the City Council approved the Value Capture Ordinance (City of Los Angeles 2017). The ordinance requires residential and mixed-use development projects seeking a development density or FAR higher than permitted, through entitlements not subject to Measure JJJ such

6 City of Los Angeles , *Ordinance No. 179868*, 2008. Available online at: http://clkrep.lacity.org/onlinedocs/2008/08-0644_ord_179868.pdf, accessed on May 19, 2022.

7 City of Los Angeles, *Los Angeles Housing + Community Investment Department*, 2018. Available online at: https://housing.lacity.org/wp-content/uploads/2020/05/2018-2019_annual_report_regarding_the_low_and_moderate_housing_income_asset_fund.pdf?download=1, accessed on May 19, 2022.

as Conditional Use Permits (CUPs) to provide a certain percent of restricted affordable dwelling units. The ordinance also provides an additional density bonus for projects that provide restricted affordable units beyond the minimum percentage required.[8]

4.10.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to Land Use and Planning if it would:

- Physically divide an established community; and/or
- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

4.10.5 METHODOLOGY

The discussion of a significant impact with regard to conflicts with any applicable land use plan, policy, or regulation serves two purposes, identifying significant impacts related to land use, and compliance with *CEQA Guidelines* Section 15125(d), which requires that an EIR include a discussion of any inconsistencies with applicable plans. A conflict between a project and an applicable plan is not necessarily a significant impact under CEQA unless the inconsistency will result in an adverse physical change to the environment that is a "significant environmental effect" as defined by 15382. An inconsistency between a proposed project and an applicable plan is a legal determination that may or may not indicate the likelihood of a physical environmental impact. In some cases, an inconsistency may be evidence that an underlying physical impact is significant and adverse. For example, if a proposed project affected agricultural land, one standard for determining whether the impacts were significant would be to determine whether the project violated a plan or policy protecting agricultural land; the environmental impact, however, would be the physical conversion of agricultural land to non-agricultural uses. Similarly, an excerpt from Section 12.34 of the legal practice guide, Practice under the California Environmental Quality Act by the Continuing Education of the Bar, illustrates the point:

> *…if a project affects a river corridor, one standard for determining whether the impact is significant might be whether the project violates plan policies protecting the corridor; the environmental impact, however, is the physical impact on the river corridor.*

Analysis of conflicts and consistency with applicable plans will be included in this impact section. Under State Planning and Zoning law (Gov't Code §§ 65000, et seq.) strict conformity with all aspects of a plan is

---

8 City of Los Angeles, *Value Capture Ordinance,* 2017. Available online at: https://planning.lacity.org/ordinances/docs/ValueCapture/ProposedOrdinance.pdf, accessed on May 19, 2022.

not required. Generally, plans reflect a range of competing interests and agencies are given great deference to determine consistency with their own plans. A proposed project should be considered consistent with a general plan or elements of a general plan if it furthers one or more policies and does not obstruct other policies. Generally, given that land use plans reflect a range of competing interests, a project should be compatible with a plan's overall goals and objectives but need not be in perfect conformity with every plan policy.

For purpose of identifying significant impacts related to land use impacts, they can be either direct or indirect. Direct impacts result in division of neighborhoods or communities, such as a community that could be physically divided by the construction of a new road, freeway, or railway that effectively isolates a portion of the community from the remainder of the community; or interference with land use plans, including habitat or wildlife conservation plans that result in significant environmental effects. Land use compatibility is typically addressed based on direct physical environmental impacts – primarily noise and air quality but also aesthetics, traffic, hazards, water quality and other physical environmental issues (i.e., where one use generates physical impacts that could significantly adversely affect another use). These issues are generally addressed through existing regulations and policies and are comprehensively addressed in each environmental issue area in this document and summarized as applicable and appropriate in the discussion of **Impact 4.10-2** below. As related to impact analysis, this section focuses on direct land use impacts. Indirect impacts are secondary effects resulting from land use policy implementation are generally addressed in other topical sections of this EIR. For example, traffic impacts resulting from increased traffic as a result of reasonably anticipated development under the Proposed Plan would be discussed in the transportation section of this EIR; public service impacts resulting from increased demand from increased development under the Proposed Plan is discussed in public services section of this EIR.

4.10.6 IMPACTS

Threshold 4.10-1 Would implementation of the Proposed Plan physically divide an established community?

No impact would occur.

The Boyle Heights CPA is urbanized, with a mix of residential, commercial, and light and heavy industrial uses at varying densities and intensities. An established community may be divided in multiple ways; actions that divide a community include constructing a new road, freeway, or railway through an established community, or adopting major changes to land use or zoning that results in radically different

land use patterns inconsistent with existing development that impede access from one area of an established community to another area in the same community.

The Proposed Plan does not propose any substantial changes to roadways or circulation in the CPA. Specifically, the Proposed Plan does not involve construction of or propose any new freeways, roadways or transit infrastructure in the CPA that would physically divide or isolate existing established communities.

The Proposed Plan would include changes to land use and zoning in areas within the CPA; these changes would influence future land use and development patterns. Any development resulting from the changes in the Proposed Plan would not result in land use or development patterns that would result in infrastructure changes that could physically divide an established community.

The Proposed Plan does not include any changes to land use designation, zoning, or have new policies that would promote or support the construction of any barriers that would physically divide or separate any neighborhood from another in the CPA. Rather, the Proposed Plan reinforces mobility and connectivity in the CPA by focusing new development in major nodes and along major corridors near public transportation.

Zoning changes are to one single-family residential neighborhood. The area bounded by Marengo Street on the north, Pomeroy Avenue on the south, Lord Street on the west, and State Street on the east is currently zoned for single-family residential but has properties with both single-family and multi-family residential uses. The Proposed Plan would change the designation in this area to permit low density and multi-family residential development, maintaining similar height limits as the R1 zone permits, but allowing an equivalent of current RD2 density (one dwelling unit per 2,000 square feet of lot area). No physical barrier would be introduced to the neighborhood as a result of this change, nor would this change lead to development patterns that would divide or isolate this existing established community.

Development potential in specific nodes and corridors near public transportation would be increased as a result of the Proposed Plan. These changes focus on areas and parcels located near public transportation and Metro L Line stations, along commercial corridors, in commercial districts, and in multi-family areas where underutilized parcels can be incentivized for jobs, housing, and mixed-use to accommodate additional development potential. Many of these parcels are located near Metro stations or Metro bus lines and developing jobs and housing near them would enhance mobility and reduce reliance on vehicles. The potential increase in density and development intensity in these areas within the CPA would not radically change the existing land use patterns; these areas currently exhibit land use patterns consistent with the proposed designations and would be able to support the increased density and development intensity. In

many cases, the changes would make the designation for some areas more compatible with the existing built environment than the current designation. In any case, changes in land use patterns would not physically divide a community.

Finally, the Proposed Plan does not propose any new major transportation infrastructure in the CPA or any other kind of physical barrier. Changes to the transportation network associated with the Mobility Plan generally include four networks: Bicycle Enhanced Network (BEN), Transit Enhanced Network (TEN), Neighborhood Enhanced Network (NEN), and Vehicle Enhanced Network (VEN). The types of improvements associated with each network are further described in **Section 4.14 Transportation**. The Proposed Plan mobility network is illustrated in **Section 2.0, Project Description, Figure 2.0-7.** As described in Section 4.14, these modifications would work within existing rights-of-way and would not create physical barriers. Therefore, the Proposed Plan would not physically divide the established community. Therefore, there would be ***no impact*** related to the division of an established community.

Mitigation Measures

Significant impacts related to the division of an established community have not been identified; therefore, no mitigation measures are required.

Significance After Mitigation

No impact.

Threshold 4.10-2 **Would implementation of the Proposed Plan** cause a significant environmental impact due to a **conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?**

This impact would be less than significant.

The Boyle Heights Plan would generally be consistent with the overall intent of applicable land use policies, goals, strategies, and/or objectives, including those contained in the City of Los Angeles General Plan and SCAG's RTP/SCS. Impacts related to conflict with applicable plans would be ***less than significant.***

The following section evaluates the potential for conflicts with land use plans or policies, consistent with 14 CCR, Section 15125(d), and for the purposes of analyzing the threshold question, focuses on aspects of such plans and polices that have the purpose of avoiding or mitigating one or more environmental effects.

Applicable land use plans that direct or guide development in the CPA and therefore could avoid or mitigate environmental effects include the 2020 RTP/SCS (Connect SoCal), the Complete Streets Act (as

implemented through the City's Mobility Plan, the 2016 AQMP, the City's General Plan, and the Redevelopment Plan and relevant Zoning Ordinances. This section includes a consistency analysis for the RTP/SCS, the City's General Plan, and the Redevelopment Plan and relevant Zoning Ordinances. **Section 4.2, Air Quality,** discusses the Proposed Plan's with the 2016 AQMP and **Section 4.14, Transportation,** discusses the Proposed Plan's consistency with the City's Mobility Plan 2035.

SCAG RTP/SCS. The CPA is located within the six-county region that comprises the SCAG planning area. SCAG has adopted RTPs since 1976, but the Sustainable Communities and Climate Protection Act of 2008, also known as SB 375, required SCAG to prepare an SCS as an integral part of its RTP. The 2020 RTP/SCS seeks to balance the region's future mobility and housing needs with economic, environmental, and public health goals. The 2020 RTP/SCS envisions growing more compact communities in existing urban areas with efficient public transit and safe mobility opportunities and preserving open space and natural lands. Major themes include integrating transportation investments and future land use patterns, striving for sustainability, providing more transportation choices, responding to demographic and housing market demand for smaller housing and a more walkable lifestyle, supporting economic growth with infrastructure, and improving public health.

The Proposed Plan meets SCAG's criteria for a regionally significant project; therefore, an analysis is done with respect to the 2020 RTP/SCS. **Table 4.10-2** provides an analysis of the Proposed Plan's consistency with the 2020 RTP/SCS.

Table 4.10-2
Consistency of Proposed Plan with 2020 SCAG RTP/SCS

Goal	Project Consistency
Goal 1: Encourage regional economic prosperity and global competitiveness.	Consistent: The Proposed Plan would accommodate a variety of housing and commercial opportunities near the Metro L Line rail stations and along major corridors with bus lines. The Proposed Plan would preserve and promote mixed-use, commercial, and light industrial land uses for employment opportunities, including light industrial activities in the area along the western plan boundary adjacent to the Los Angeles River. The proposed land use designation and zone changes would promote a better balance of housing units and jobs near transit that would improve regional economic development and competitiveness.
Goal 2: Improve mobility, accessibility, reliability, and travel safety for people and goods.	Consistent: Proposed land use and zoning changes would allow for jobs, housing, and community-serving uses to be located within close proximity to existing public transit. Increasing development potential near public transit encourages new development in these areas, and ensures that a greater share of residents, workers, and visitors in the CPA would have the option to use public transit. The proposed land use and zone changes would promote pedestrian-friendly environments, especially along corridors near transit and in the areas proposed to be designated Community Center near the Metro stations. These actions would serve to improve and maximize mobility and accessibility.

Goal	Project Consistency
Goal 3: Enhance the preservation, security, and resilience of the regional transportation system.	Consistent: The Proposed Plan supports programs that prioritize street design improvements, such as protected bicycle lanes, to improve the function and safety of streets and achieve high-impact reductions in crash-related injuries and fatalities.
Goal 4: Increase person and goods movement and travel choices within the transportation system.	Consistent: See response to Goal 2. The Metro L Line stations and bus lines in the CPA are part of Metro's regional transportation system as well as transportation systems of surrounding local jurisdictions. This is inclusive of Montebello bus lines, Commerce bus lines, and a DASH bus operated by LADOT. The L Line stations in the CPA provide residents and visitors with local and regional access directly from the Metro L Line or through transfers to other Metro light rail lines. Increased coordination of land use and transportation planning by strategically directing development potential near transit under the Proposed Plan would help preserve and enhance a sustainable regional transportation system.
Goal 5: Reduce greenhouse gas emissions and improve air quality.	Consistent: See response to Goal 2. By allowing for more jobs, housing, and community serving uses, and by supporting the creation of a pedestrian oriented environment along major corridors, the Proposed Plan encourages transit ridership, walking, and biking as mobility alternatives to reduce vehicle dependence. This results in lower potential vehicle miles per resident, and potential reductions in air quality emissions. The Proposed Plan proposes pedestrian-friendly design standards for new development in Community Center areas and along commercial corridors near transit, encouraging mobility options
Goal 6: Support healthy and equitable communities.	Consistent. The Plan meets this goal by incorporating sustainable design features creating a healthy community for the residents. The Plan also enhances bicycle infrastructure through bike parking and access to Los Angeles River Path. It furthers this Goal by encouraging affordable housing (to very low income and workforce households) immediately adjacent to jobs, transit, and bicycle, pedestrian, and other outdoor opportunities. The Proposed Plan also seeks to maintain much of its industrial land for future employment, while also proposing changes to improve compatibility between industrial land and residential neighborhoods.
Goal 7: Adapt to a changing climate and support an integrated regional development pattern and transportation network.	Consistent. The Proposed Plan accommodates growth near more sustainable transit options that reduce individual vehicle miles traveled, traffic and greenhouse gas emissions.
Goal 8: Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	Consistent. This strategy calls on SCAG to use new transportation technologies and data-driven solutions to increase travel efficiency. The Proposed Plan would advance this goal with the proposed land and zoning changes that would allow for jobs, housing, and community-serving uses to be located close to existing public transit.
Goal 9: Encourage development of diverse housing types in areas that are supported by multiple transportation options.	Consistent. See response to Goal 2.
Goal 10: Promote conservation of natural and agricultural lands and restoration of habitats	Consistent. While the CPA is not located in an identified "constrained" area such as on agricultural land, open space, or tribal lands, the Proposed Plan seeks to improve access and connectivity to the LA River for residents through policies that build off the existing LA River Revitalization Master Plan and the River Improvement Overlay (RIO) district. The Proposed Plan aims to bring more public green space to developments near the LA River

Source: SCAG, 2020 RTP/SCS, 2021, Impact Sciences, 2021

City of Los Angeles General Plan, Framework Element. The Framework Element contains goals, objectives, and policies related to land use that address the issues of land use distribution, policies specific to Framework land use designations, and density. The primary objectives of the policies in the Framework Element's Land Use chapter are to support the viability of the City's residential neighborhoods and commercial districts, and, when growth occurs, to encourage sustainable growth in a number of higher-intensity commercial and mixed-use districts, centers and boulevards and industrial districts. The Framework Element seeks to focus this growth to areas in proximity to transportation corridors and transit stations. The Framework's key guiding principles, along with their relationship to the Proposed Plans, are presented below:

Grow strategically. Growth should be focused in a number of higher-intensity commercial and mixed-use districts, centers, and boulevards, particularly in proximity to transportation corridors and transit stations. This links new development with available infrastructure and encourages more walkable and transit-friendly neighborhoods. New development in walkable and transit-oriented areas helps reduce residents' and visitors' reliance on vehicles and minimizes the need for new vehicle-oriented infrastructure.

- The Proposed Plan would increase development potential for a variety of housing and commercial development near the Metro Gold Line stations, in areas designated Community Center, and along major corridors served by bus lines. The Plan would direct new higher-intensity development into these areas of the CPA and maintain and preserve the existing lower-intensity residential areas elsewhere in the CPA. The Proposed Plan would encourage transit-oriented and walkable development in areas near existing transit, providing additional transportation alternatives to vehicles.

Conserve existing residential neighborhoods. By focusing much of the City's growth potential in centers and along commercial corridors, the City can better protect the existing scale and character of its stable single- and multi-family neighborhoods. The elements that contribute to the unique character of different residential neighborhoods should be identified and preserved whenever possible.

- Less than 1% of the CPA is designated for single-family residential under the Existing Plan. The Proposed Plan generally directs growth away from these low-density neighborhoods. Stable multi-family neighborhoods are generally maintained, consistent with the Framework, under the Proposed Plan. One existing area developed with single- and multi-family residential uses and with multifamily zoning would be re-designated as Community Center under the Proposed Plan; this is consistent with Objective 3.7 of the Framework: "allow for growth in areas where there is sufficient public infrastructure and services and the residents' quality of life can be maintained or improved." The area is served by transit, near employment and commercial areas, and will have design standards.

Balance the distribution of land uses. Maintaining a variety of land uses is crucial to the long-term sustainability of the City. Commercial and industrial uses contribute to a diverse local economy, while residential uses provide necessary housing for the community. Integrating these uses within smaller geographical areas can better allow for a diversity of housing types, jobs, services, and amenities.

- The Proposed Plan maintains a variety of land uses by preserving single-family neighborhoods, multi-family neighborhoods, public facilities, light and heavy industrial areas, and open space. The Proposed Plan promotes residential and commercial development opportunities in areas served by transit and would improve the jobs-housing ratio.

Enhance neighborhood character through better development standards. Better development standards will improve both the maintenance and enhancement of existing neighborhood character and ensure a high level of design quality in new development.

- The Proposed Plan would promote and create pedestrian-friendly environments near transit areas, such as along selected major corridors and mixed-use areas in the CPA. Proposed design standards would cover regulations such as ground floor minimum height, window transparency, and location of parking, and would apply to new development projects. The Proposed Plan includes design standards for buildings, including spacing and step backs, lot coverage, and parking design, which aim to preserve and enhance a pedestrian-scale environment in areas designated Community Center.

Create more small parks, pedestrian districts, and public plazas. While regional parks and green networks are an important component of the City's open space strategy, more small-scale, urban open spaces must be developed as well, as they are crucial to the quality of life of the City's residents. There are many opportunities at the community level to create public "pocket" parks as part of new developments, to enhance pedestrian orientation in key commercial areas, and to build well-designed public plazas.

- The Proposed Plan supports the creation of additional small parks and public plazas. Much of the CPA is urbanized, and the majority of project sites within the CPA boundary would be incentivized to provide a minimum amount of publicly accessible open space on the ground floor. The Proposed Plan envisions pedestrian-oriented design and walkability near transit areas and would require pedestrian-oriented design for new projects in appropriate locations and along commercial corridors with transit. Pedestrian-oriented scale is a key consideration of the CPA proposed design standards.

Improve the connection of public and private space through good urban design. Good urban design improves the relationship between private development and the public realm. The placement of architectural features, windows, entrances, walkways, street trees, landscaping, and lighting all help to establish either a positive

or negative interaction between a building and its surroundings. Good urban design practices help to create successful public and private spaces where people feel comfortable and that foster a sense of community.

- The consistency analysis regarding small parks, pedestrian districts, and public plazas applies. In addition, the Proposed Plan improves the function and design of neighborhoods throughout the CPA by preserving and reinforcing existing neighborhood character and promoting pedestrian-friendly environments. The Proposed Plan re-designates specific areas as Community Center, with proposed design standards promoting good urban design practices.

Improve mobility and access. The City's transportation network should provide adequate accessibility to jobs, services, amenities, open space, and entertainment, and maintain acceptable levels of mobility for all those who live, work, travel, or move goods in Los Angeles. Attainment of this goal necessitates a comprehensive program of physical infrastructure improvements, traffic systems management techniques, and land use and behavioral changes that reduce vehicle trips. An emphasis should be placed on providing for and supporting a variety of travel modes, including walking, bicycling, public transit, and driving.

- The Proposed Plan enhances mobility by focusing future growth in areas well-served by transit and by establishing pedestrian-oriented development standards for new development in order to encourage transit ridership, walking, and bicycling. Mixed-use development around Metro L Line stations and transit corridors offers residents, employees and visitors mobility choices that enable them to reduce the number and length of vehicle trips.

Identify a hierarchy of commercial Districts and Centers. The Framework Element provides an overall structure and hierarchy for the City's commercial areas. This hierarchy, which includes Neighborhood Districts, Community Centers, Regional Centers, and Mixed-Use Boulevards, has helped shape the development and urban form of the City and will continue to do so in the future. Understanding this hierarchy helps us better understand the roles that these different types of "activity centers" play within our communities so that their unique characteristics can be enhanced.

- The Proposed Plan primarily directs additional development opportunities around transit stations and along mixed-use corridors with bus lines in areas proposed to be designated Community Center. Less intense commercial areas are being maintained as neighborhood serving places with mostly low-rise buildings.

Provide land and supporting services for the retention of existing and attraction of new industries. The Framework Element includes policies to preserve industrial land for the retention and expansion of existing industrial uses and for the attraction of new industrial uses, both of which provide job opportunities for the City's residents. It also includes policies to limit the introduction of new commercial and other non-industrial

uses in existing commercial manufacturing zone to uses which support the primary industrial function of the area.

- The consistency analysis regarding the retention of industrial land applies. Under the Proposed Plan, the area along the Los Angeles River and rail corridor will be designated as Light Industrial, which will facilitate cleaner industrial uses and discourage new hazardous or toxic heavy industrial uses. Areas south of Pico Boulevard between Soto Avenue and Grande Vista, south of Union Pacific Avenue between Grande Vista and Indiana, and the northwest corner of the CPA, are proposed to remain as industrial. Areas of the CPA near the L Line rail stations will undergo zone changes and plan amendments to accommodate additional housing near transit. One of these transit nodes is the area surrounding the Pico/Aliso Station generally bounded by First Street and Third Street to the north and south, Mission Road on the west, and Utah Street on the east. The Proposed Plan would redesignate this area from industrial to Community Center, which would allow commercial and residential uses, including incentives for affordable housing units. New industrial uses would be prohibited. Allowing new residential uses in this limited portion of the CPA may be in partial conflict with the Framework Element policies related to protection of industrial land, including the policy to preserve industrial lands for the retention and expansion of existing and attraction of new industrial uses that provide job opportunities for the City's residents. However, these policies were not adopted for the purpose of avoiding or mitigating an environmental effect, but instead for protecting jobs, which is a socio-economic impact. To the extent that the conflict results in a loss of industrial uses that were displaced resulting in secondary impacts from industrial uses relocating elsewhere, it would be highly speculative where the uses would relocate and whether impacts would result. Redesignating this transit node next to the Pico/Aliso L Line station from industrial to Community Center is consistent with the Framework Element's policies related to growing strategically in high-intensity commercial and mixed-use centers in proximity to transit. It is consistent with strategically placing future growth in walkable and transit-oriented areas to reduce reliance on vehicles.

In summary, the Proposed Plan would improve the link between the locations of land use and transportation in a manner that is consistent with the City's Framework Element. As previously discussed, implementation of the Proposed Plan would direct growth to transit hubs and corridors, away from low density neighborhoods. The Proposed Plan would accommodate a variety of housing and commercial opportunities near the Metro Gold Line rail stations and along major corridors with bus lines and would preserve established residential neighborhoods and existing employment centers in light and heavy industrial areas. A vision of concentrated and mixed-use development adjacent to transit areas is promoted in order to conserve resources, protect existing stable residential neighborhoods and improve air quality

by reducing vehicle-reliance. Therefore, the Proposed Plan would be consistent with the Framework Element of the City's General Plan.

Adelante-Eastside Redevelopment Plan. The Redevelopment Plan was adopted in 1999 and subsequently amended in 2003 to merge the Adelante-Eastside Redevelopment Project Area/Plan with the existing Whiteside Redevelopment Project Area/Plan. As of 2013, the Redevelopment Plan has been implemented and enforced by the Designated Local Authority (DLA). The land use related plans and functions of the Redevelopment Plan transferred to the City in November 2019. The main goal of the Adelante-Eastside Redevelopment Plan, which will sunset in 2030, is to remove blight and preserve and increase employment, job training, and business and investment opportunities through redevelopment programs. The Redevelopment Plan identifies redevelopment funding sources for rehabilitation of existing residential, commercial, and industrial buildings. Section 500 of the Redevelopment Plan includes policies for land uses permitted in the Project Area. These policies include policies for commercial, residential, and industrial uses; commercial uses within residential areas and industrial areas; residential uses within commercial areas; as well as open space and other public uses. The Proposed Plan seeks to preserve industrial land for jobs, while also improving the compatibility between industrial land and residential neighborhoods. The Proposed Plan also includes policies to preserve existing housing stock while providing opportunities for gentle infill, directing future housing growth to transit served areas and provides tools to create more affordable housing. Therefore, the Proposed Plan would be generally consistent with the Adelante Eastside Redevelopment Plan in terms of its broad goals and policies related to land use. While the Redevelopment Plan does not include regulations or numerical caps for floor area ratio, height, or residential density, it does include design standards for new signs and billboards, and for new wireless telecommunication facilities. The Proposed Plan does not include specific design standards for signs, billboards, or wireless telecommunication facilities because it would defer to set regulations in Article 4 (Development Standards) in the New Zoning Code. The Proposed Plan does not support carrying forward the Redevelopment Plan's design standards because they would already be regulated by the zoning code. This may arguably result in the Proposed Plan conflicting with the Redevelopment Plan since the Proposed Plan would not be incorporating the Redevelopment Plan's design standards and the standards included in the zoning code may be different than those in the Redevelopment Plan. However, under the terms of the Redevelopment Plan, the City's plans and zoning are intended to control in any conflict between the two, and as such, as a legal matter there cannot be a conflict between the CRA plan and the Proposed Plan in relation to land use plans or zoning requirements. (See Section 1100 of the Adelante Eastside Redevelopment Plan).

Adelante Eastside Redevelopment Plan – Mitigation Measures. Some of the policies in the Redevelopment Plan that will conflict with the Proposed Plan are those that may have been incorporated

into the Redevelopment Plan from mitigation measures. To the extent that they were mitigation measures from the original CEQA Clearance prepared for the adoption of the Redevelopment Plan in 1999, the City finds they are infeasible or not necessary. Mitigation measures from prior EIRs or MNDs may be deleted or modified provided the lead or responsible agency prepares a new environmental clearance, which demonstrates the agency considered the continuing need for the mitigation measure, states the reason for the change to the mitigation measure, and supports the decision to remove or modify the mitigation measure with substantial evidence, and analyzes any significant impacts resulting from deletion or modification of the mitigation measure. To the extent the City is responsible for implementing any mitigation measures as a land use related plan or function that transferred to the City, the City's rationale and evidence for deleting or modifying the mitigation measures in the CEQA Clearance for the Adelante Eastside Redevelopment Plan as well as all other mitigation measures, and the analysis of impact resulting from deleting or modifying those mitigation measures, are provided in **Appendix G, CRA Mitigation Measures**, to this Draft EIR. As discussed in **Appendix G** to this Draft EIR, the deletion or modification of the mitigation measures is not anticipated to result in any new or more severe significant impacts from those identified in this EIR as the City analyzed impacts from the reasonably anticipated development in the Plan Area, including in the Redevelopment Program Area, without consideration of the mitigation measures.

Housing Element. The Housing Element (i.e., The Plan to House LA) embodies the City's housing goals and policies and identifies the more detailed strategies the City will implement to achieve them. One of the primary goals of the Housing Element is to encourage a range of housing opportunities for all income groups. The Proposed Plan accommodates housing opportunities for a range of income levels, including mixed-income and affordable housing. The Proposed Plan would increase development potential in targeted areas, allowing the CPA to accommodate additional housing units pursuant to SCAG's RHNA allocation and growth projections, thereby implementing the goals of the Housing Element. Therefore, the Proposed Plan would be consistent with the City's Housing Element.

River Improvement Overlay District. The RIO District (Ordinance Nos. 183144 and 183145) is intended to help implement the vision and goals of the Los Angeles River Restoration Master Plan (LARRMP) by establishing additional requirements for properties along the riverfront or near the riverfront. These primarily include requirements pertaining to landscaping, fencing, exterior lighting, and ADA accessibility that serve to build a riverfront community and make the riverfront area a more welcoming environment to pedestrians and cyclists. The RIO District covers the western portion of the Boyle Heights CPA. Applicable development regulations and measures to protect sensitive biological resources in the RIO will be incorporated into Frontage Districts and development standards of the new zoning. In addition, the RIO will be amended to remove portions that are currently in the Boyle Heights CPA to avoid redundancy with

the New Zoning Code provisions. The Proposed Plan would accommodate a range of uses in the vicinity of the RIO District and includes zoning regulations that are generally consistent with those of the LARRMP. Therefore, the Proposed Plan would further the goals of the RIO.

Health, Wellness, and Equity Element. The Health Element (i.e., Plan for a Healthy Los Angeles) included a series of implementation programs, including Clean Up Green Up (CUGU). The CUGU Supplemental Use District (Ordinance 184246) established standards and regulations for heavy, noxious uses close to sensitive and/or residential uses. The Proposed Plan includes these regulations within the zoning instead of as an overlay, through Development Standards and Use District regulations in Industrial and Industrial Mixed Use Districts. Therefore, the Proposed Plan would be consistent with the regulations of CUGU.

Open Space Element. The Open Space Element (i.e., Open Space Plan) provides a guide for the identification, preservation, conservation, and acquisition of open space. The Proposed Plan includes goals and policies that support the creation of additional small parks and public plazas. Project within the CPA would be incentivized to provide a minimum amount of publicly accessible open space on the ground floor. Therefore, the Proposed Plan would be consistent with the Open Space Element.

Other Plans/Ordinances. See also **Section 4.1, Aesthetics; Section 4.2, Air Quality; Section 4.8, Hazards and Hazardous Materials; Section 4.9, Hydrology and Water Quality; Section 4.11, Noise and Vibration; and Section 4.14, Transportation and Traffic**, for discussions and/or consistency analysis of other elements of the City's General Plan and relevant regional plans, including MP 2035, Safety Element, Health Element, the Congestion Management Plan, the Noise Element and noise ordinance, the South Coast Air Quality Management District (SCAQMD) plan, and other City ordinances.

Based on all the above, including all other plan, regulation, and guideline consistency analysis in other sections of this EIR, the Proposed Plan would not conflict but would be consistent with applicable local and regional plans and policies. Thus, impacts related to conflicts with land use plans and policies would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.10.7 CUMULATIVE IMPACTS

The cumulative analysis for land use and planning considers the regional context. As discussed above, the Proposed Plan would be consistent with local and regional plans, policies, and regulations. In addition, the proposed land uses and future growth under the Proposed Plan would be compatible with the existing land uses in the CPA. The cumulative analysis for potential land use conflicts is localized. Since the Proposed Plan would not intensify development in single-family residential areas, and instead focuses growth along established commercial and transit corridors, any conflicts with existing land use policies would be minimal, and the Proposed Plan would not result in a substantial increased potential for land use conflicts and nuisance relationships between existing and future uses. Furthermore, future development occurring in areas where changes are proposed would be subject to use restrictions and development regulations tailored to that subarea. As discussed above, no significant land use and planning impacts are expected to result from implementation of the Proposed Plan. Therefore, impacts related to land use and planning would be less than significant and would not be cumulatively considerable.

4.11 NOISE AND VIBRATION

4.11.1 INTRODUCTION

This section evaluates noise and groundborne vibration impacts resulting from construction and operation of the Proposed Plan. Noise monitoring data and calculations are included in **Appendix 4.11, Noise,** of this Draft EIR. Topics addressed include short-term construction and long-term operational noise and vibration.

4.11.2 EXISTING ENVIRONMENTAL SETTING

Noise and Vibration Basics

Noise Principles and Descriptors

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air). Noise is generally defined as undesirable (i.e., loud, unexpected, or annoying) sound. Acoustics is defined as the physics of sound and addresses its propagation and control.[1] In acoustics, the fundamental scientific model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determine the sound level and characteristics of the noise perceived by the receiver.

Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement and reflects the way people perceive changes in sound amplitude. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 and 140 dB corresponding to the thresholds of feeling and pain, respectively. Pressure waves traveling through air exert a force registered by the human ear as sound.[2]

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude. When all of the audible frequencies of a sound are measured, a sound spectrum is plotted consisting of a range of frequencies spanning 20 to 20,000 Hz. The sound

1 California Department of Transportation. Technical Noise Supplement to the Traffic Noise Analysis Protocol. September 2013.

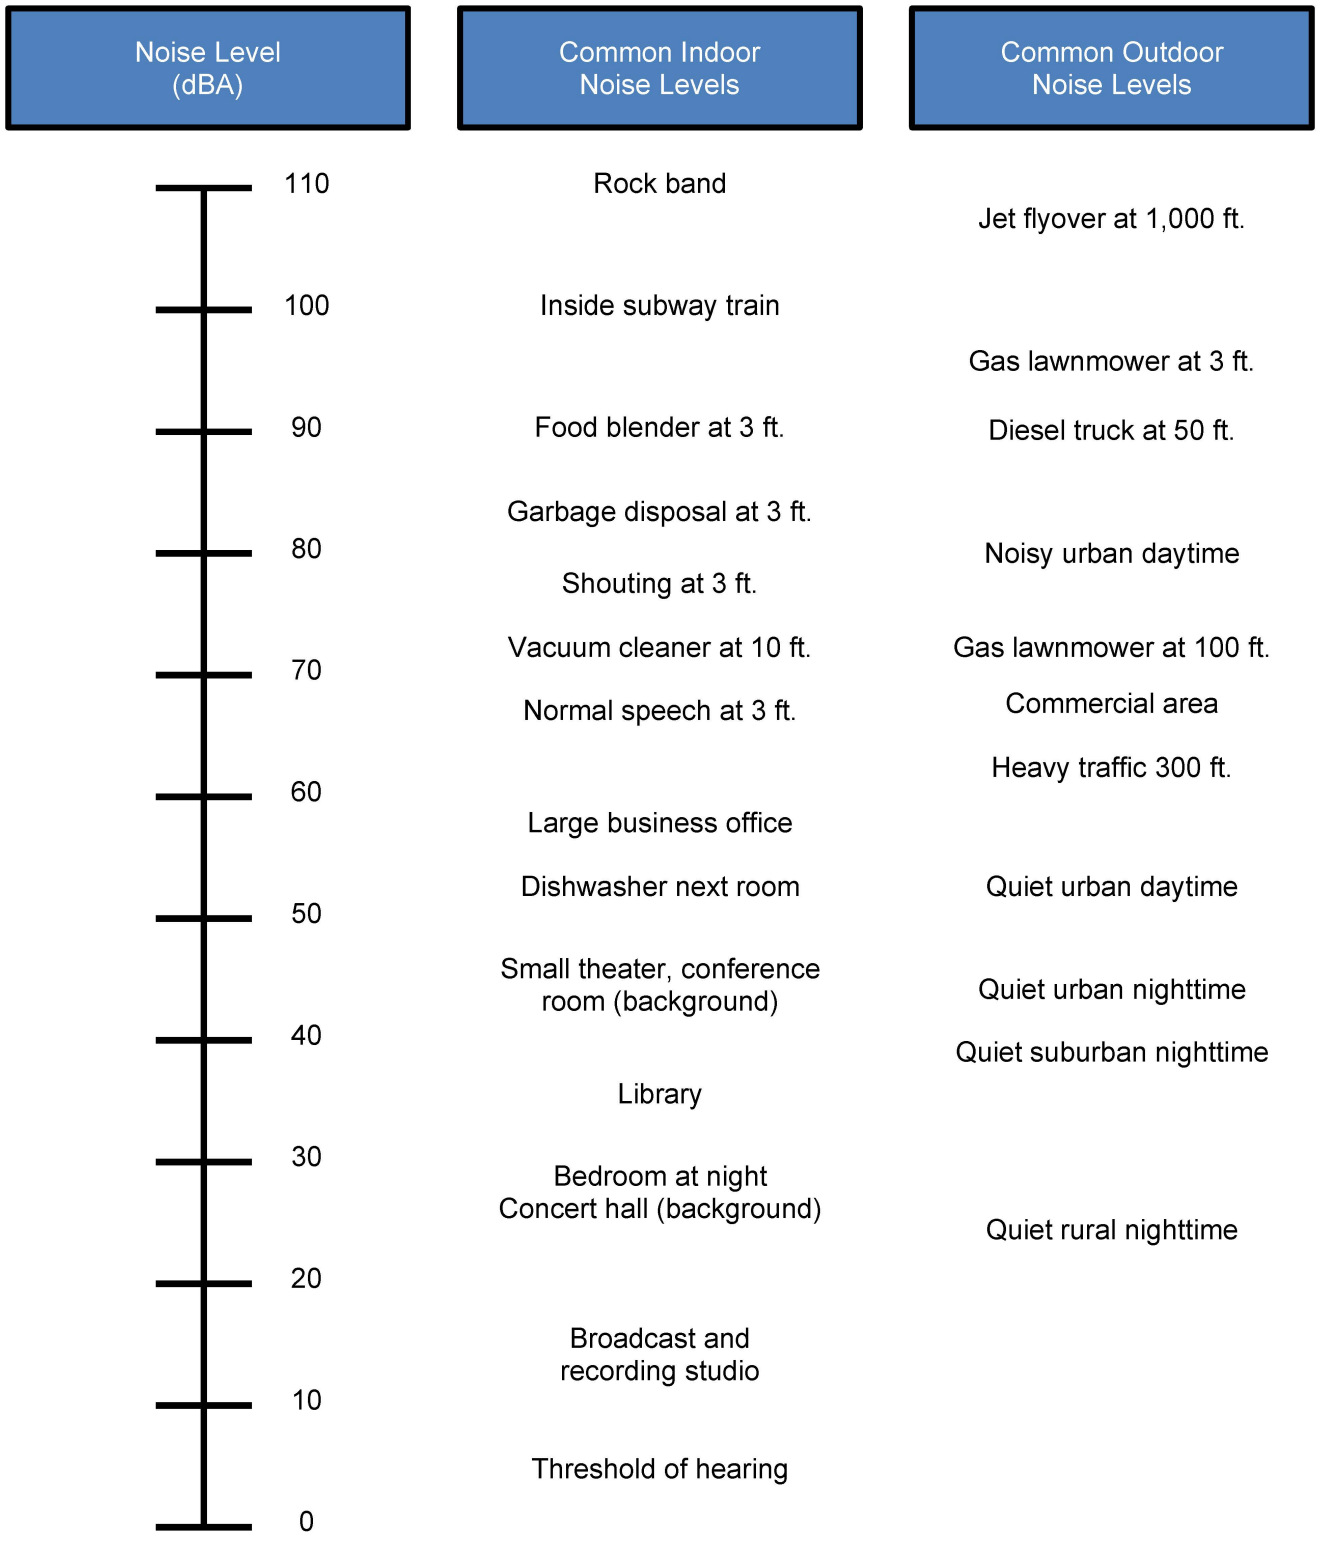
2 *Ibid*.

pressure level, therefore, constitutes the additive force exerted by a sound corresponding to the sound frequency/sound power level spectrum.[3]

The typical human ear is not equally sensitive to the frequency range from 20 to 20,000 Hz. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to these extremely low and extremely high frequencies. This method of frequency filtering or weighting is referred to as A-weighting, expressed in units of A-weighted decibels (dBA), which is typically applied to community noise measurements.[4] Some representative common outdoor and indoor noise sources and their corresponding A-weighted noise levels are shown in **Figure 4.11-1**.

Noise Exposure and Community Noise

Community noise exposure is typically measured over a period of time; a noise level is a measure of noise at a given instant in time. Community noise varies continuously over a period of time with respect to the sound sources contributing to the community noise environment. Community noise is primarily the product of many noise sources, which constitute a relatively stable background noise exposure, with many unidentifiable individual contributors. Single-event noise sources, such as aircraft flyovers, sirens, etc., may cause sudden changes in background noise level.[5] However, background noise levels generally change gradually throughout the day, corresponding with the addition and subtraction of distant noise sources, such as changes in traffic volume.



In an outdoor environment, sound energy attenuates through the air as a function of distance. Such attenuation is called "distance loss" or "geometric spreading" and is based on the type of source configuration (i.e., a point source or a line source). The rate of sound attenuation for a point source, such as a piece of mechanical or electrical equipment (e.g., air conditioner or bulldozer), is 6 dBA per doubling of distance from the noise source to the receiver over acoustically "hard" sites (e.g., asphalt and concrete surfaces) and 7.5 dBA per doubling of distance from the noise source to the receiver over acoustically "soft" sites (e.g., soft dirt, grass or scattered bushes and trees). For example, an outdoor condenser fan that generates a sound level of 60 dBA at a distance of 50 feet at an acoustically hard site would attenuate to 54 dBA at a distance of 100 feet from the point source and attenuate to 48 dBA at 200 feet from the point source.

FIGURE **4.11-1**

IMPACT SCIENCES

A-Weighted Decibel Scale

1264.003•06/2022

The rate of sound attenuation for a line source, such as a constant flow of traffic on a roadway, is 3 dBA per doubling of distance from the point source to the receiver for hard sites and 4.5 dBA per doubling of distance for soft sites.[6]

Receivers located downwind from a noise source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Atmospheric temperature inversion (i.e., increasing temperature with elevation) can increase sound levels at long distances. Other factors such as air temperature, humidity, and turbulence can, under the right conditions, also have substantial effects on noise levels (Caltrans 2013).

Structures (e.g., buildings and solid walls) and natural topography (e.g., hills and berms) that obstruct the line-of-sight between a noise source and a receiver further reduce the noise level if the receiver is located within the "shadow" of the obstruction, such as behind a sound wall. This type of sound attenuation is known as "barrier insertion loss." If a receiver is located behind the wall but still has a view of the source (i.e., the line-of-sight is not fully blocked), barrier insertion loss would still occur but to a lesser extent. In addition, a receiver located on the same side of the wall as a noise source may actually experience an increase in the perceived noise level as the wall can reflect noise back to the receiver, thereby compounding the noise. Noise barriers can provide noise level reductions ranging from approximately 5 dBA (where the barrier just breaks the line-of-sight between the source and receiver) to an upper range of 20 dBA with a larger barrier. Furthermore, structures with closed windows can further attenuate exterior noise by a minimum of 20 dBA to 30 dBA (Caltrans 2009).

Successive additions of sound to the community noise environment typically changes the community noise level from moment to moment, requiring the noise exposure to be measured over periods of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts. The following noise descriptors are used to characterize environmental noise levels over time (Caltrans 2013).

L_{eq}: The equivalent sound level over a specified period of time, typically, 1 hour (L_{eq}). The L_{eq} may also be referred to as the energy-average sound level.

L_{max}: The maximum, instantaneous noise level experienced during a given period of time.

L_{min}: The minimum, instantaneous noise level experienced during a given period of time.

L_x: The noise level exceeded a percentage of a specified time period. For instance, L50 and L90 represent the noise levels that are exceeded 50 percent and 90 percent of the time, respectively.

---

6 California Department of Transportation. Technical Noise Supplement. November 2009.

L_{dn}: The average A-weighted noise level during a 24-hour day, obtained after an addition of 10 dBA to measured noise levels between the hours of 10:00 p.m. and 7:00 a.m. to account for nighttime noise sensitivity. The L_{dn} is also termed the day-night average noise level (DNL).

CNEL: The Community Noise Equivalent Level (CNEL) is the time average A-weighted noise level during a 24-hour day that includes an addition of 5 dBA to measured noise levels between the hours of 7:00 p.m. and 10:00 p.m. and an addition of 10 dBA to noise levels between the hours of 10:00 p.m. and 7:00 a.m. to account for noise sensitivity in the evening and nighttime, respectively.

Effects of Noise On People

Noise is generally loud, unpleasant, unexpected, or undesired sound that is typically associated with human activity that is a nuisance or disruptive. The effects of noise on people can be placed into four general categories:

- Subjective effects (e.g., dissatisfaction and annoyance);
- Interference effects (e.g., communication, sleep, and learning interference);
- Physiological effects (e.g., startle response); and
- Physical effects (e.g., hearing loss).

Although exposure to high noise levels has been demonstrated to cause physical and physiological effects, the principal human responses to typical environmental noise exposure are related to subjective effects and interference with activities. Interference effects interrupt daily activities and include interference with human communication activities, such as normal conversations, watching television, telephone conversations, and interference with sleep. Sleep interference effects can include both awakening and arousal to a lesser state of sleep (Caltrans 2013).

The World Health Organization's (WHO) Guidelines for Community Noise details the adverse health effects of noise, which include hearing impairment, speech intelligibility, sleep disturbance, physiological functions (e.g., hypertension and cardiovascular effects), mental illness, performance of cognitive tasks, social and behavioral effects (e.g., feelings of helplessness and aggressive behavior), and annoyance.[7]

With regard to the subjective effects, an individuals' responses to similar noise events are diverse and influenced by many factors, including the type of noise, the perceived importance of the noise, the

[7] Berglund, Birgitta, Lindvall, Thomas, Schwela, Dietrich H & World Health Organization, Occupational and Environmental Health Team, Geneva: World Health Organization. Guidelines for Community Noise. 1999. Available at http://www.who.int/iris/handle/10665/66217, accessed November 2020.

appropriateness of the noise to the setting, the duration of the noise, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity. Overall, there is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction on people. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise. Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted (i.e., comparison to the ambient noise environment). In general, the more a new noise level exceeds the previously existing ambient noise level, the less acceptable the new noise level will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships generally occur:[8]

- Except in carefully controlled laboratory experiments, a change of 1 dBA in ambient noise levels cannot be perceived.
- Outside of the laboratory, a 3 dBA change in ambient noise levels is considered to be a barely perceivable difference.
- A change in ambient noise levels of 5 dBA is considered to be a readily perceivable difference.
- A change in ambient noise levels of 10 dBA is subjectively heard as doubling of the perceived loudness.

These relationships between change in noise level and human hearing response occur in part because of the logarithmic nature of sound and the dB scale. Because the dBA scale is based on logarithms, two noise sources do not combine in a simple additive fashion, but rather logarithmically. Under the dBA scale, a doubling of sound energy corresponds to a 3 dBA increase. In other words, when two sources are each producing sound of the same loudness, the resulting sound level at a given distance would be approximately 3 dBA higher than one of the sources under the same conditions. For example, if two identical noise sources produce noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA. Under the dB scale, three sources of equal loudness together produce a sound level of approximately 5 dBA louder than one source, and ten sources of equal loudness together produce a sound level of approximately 10 dBA louder than the single source.[9]

Vibration Fundamentals

Vibration can be interpreted as energy transmitted in waves through the ground or man-made structures, which generally dissipate with distance from the vibration source. Vibration is an oscillatory motion

8 California Department of Transportation. Technical Noise Supplement to the Traffic Noise Analysis Protocol. September *2013*.

9 *Ibid*.

through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Since energy is lost during its transfer from one particle to another, vibration becomes less perceptible with increasing distance from the source.

As described in the Federal Transit Administration's (FTA) Transit Noise and Vibration Impact Assessment Manual, groundborne vibration can be a serious concern for nearby neighbors of a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard.[10] In contrast to airborne noise, groundborne vibration is not a common environmental problem, as it is unusual for vibration from sources such as rubber-tired buses and trucks to be perceptible, even in locations close to major roads. Some common outdoor sources of groundborne vibration are trains, heavy trucks traveling on rough roads, and certain construction activities, such as blasting, pile-driving, and operation of heavy earth-moving equipment[11] Groundborne vibration generated by man-made activities (e.g., road traffic, construction operations) typically weakens with greater horizontal distance from the source of the vibration. By comparison, most perceptible indoor vibration is caused by sources within buildings such as operation of mechanical equipment, movement of people, or the slamming of doors.

Several different methods are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal in inches per second (in/sec) and is most frequently used to describe vibration impacts to buildings. The root mean square (RMS) amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to express RMS vibration velocity amplitude. The relationship of PPV to RMS velocity is expressed in terms of the "crest factor," defined as the ratio of the PPV amplitude to the RMS amplitude. PPV is typically a factor of 1.7 to 6 times greater than RMS vibration velocity; FTA uses a crest factor of 4. The decibel notation VdB acts to compress the range of numbers required to describe vibration. Typically, groundborne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include buildings where vibration would interfere with operations within the building or cause damage (especially older masonry structures), locations where people sleep, and locations with vibration sensitive equipment.[12]

Typical human reactions to vibration are summarized in **Table 4.11-1**. The vibration velocity level threshold of perception for humans is approximately 65 VdB. A vibration velocity of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels for many people.

---

10 Federal Transit Administration. Transit Noise and Vibration Impact Assessment. September 2018.

11 *Ibid*.

12 *Ibid*.

The range of interest is from approximately 50 VdB, which is the typical background vibration velocity level, to 90 VdB, which is the general threshold where minor damage can occur in fragile buildings.

Table 4.11-1
Human Response to Different Levels of Groundborne Vibration

Vibration Velocity Level	Minimum Recorded Time Averaged Ambient Sound Level (dBA, L_{eq})
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between the barely perceptible and distinctly perceptible. Many people find that transportation vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.

Note: VdB = decibel notation (i.e., vibration velocity amplitude)
Source: Federal Transit Administration. Transit Noise and Vibration Impact Assessment. September 2018.

Groundborne noise specifically refers to the rumbling noise emanating from the motion of building room surfaces due to the vibration of floors and walls; it is perceptible only inside buildings. The relationship between groundborne vibration and groundborne noise depends on the frequency of the vibration and the acoustical absorption characteristics of the receiving room. For typical buildings, groundborne vibration that causes low frequency noise (i.e., the vibration spectrum peak is less than 30 Hz) results in a groundborne noise level that is approximately 50 decibels lower than the velocity level. For groundborne vibration that causes mid-frequency noise (i.e., the vibration spectrum peak is 30 to 60 Hz), the groundborne noise level will be approximately 35 to 37 decibels lower than the velocity level (FTA 2018). Therefore, for typical buildings, the groundborne noise decibel level is lower than the groundborne vibration velocity level.

Sensitive Receivers

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. According to the City's General Plan Noise Element, the following land uses are considered noise-sensitive: single-family and multi-unit dwellings, long-term care facilities (including convalescent and retirement facilities), dormitories, motels, hotels, transient lodgings and other residential uses, houses of worship, hospitals, libraries, schools, auditoriums, concert halls, outdoor theaters, nature and wildlife preserves, and parks.[13]

13 City of Los Angeles. Noise Element of the General Plan. 1999.

Vibration-sensitive receivers, which are similar to noise-sensitive receivers, include residences and institutional uses, such as hospitals, schools, and churches. However, vibration-sensitive receivers also include buildings where vibrations may interfere with vibration-sensitive equipment that is affected by vibration levels that may be well below those associated with human annoyance (e.g., recording studio s or medical facilities with sensitive equipment). Historic buildings can also be particularly sensitive to vibration.

Existing Setting

Noise Sources

The Community Plan Area (CPA) is affected by a variety of noise sources, including mobile and stationary sources. Mobile noise in the CPA is primarily generated by automobiles and trucks. Mobile-source noises generally affect numerous receptors along lengths of roadways. Stationary source noise is primarily generated by industrial and commercial land uses; however, all land uses can generate some type of noise. No public use airports are located within two miles of the CPA.

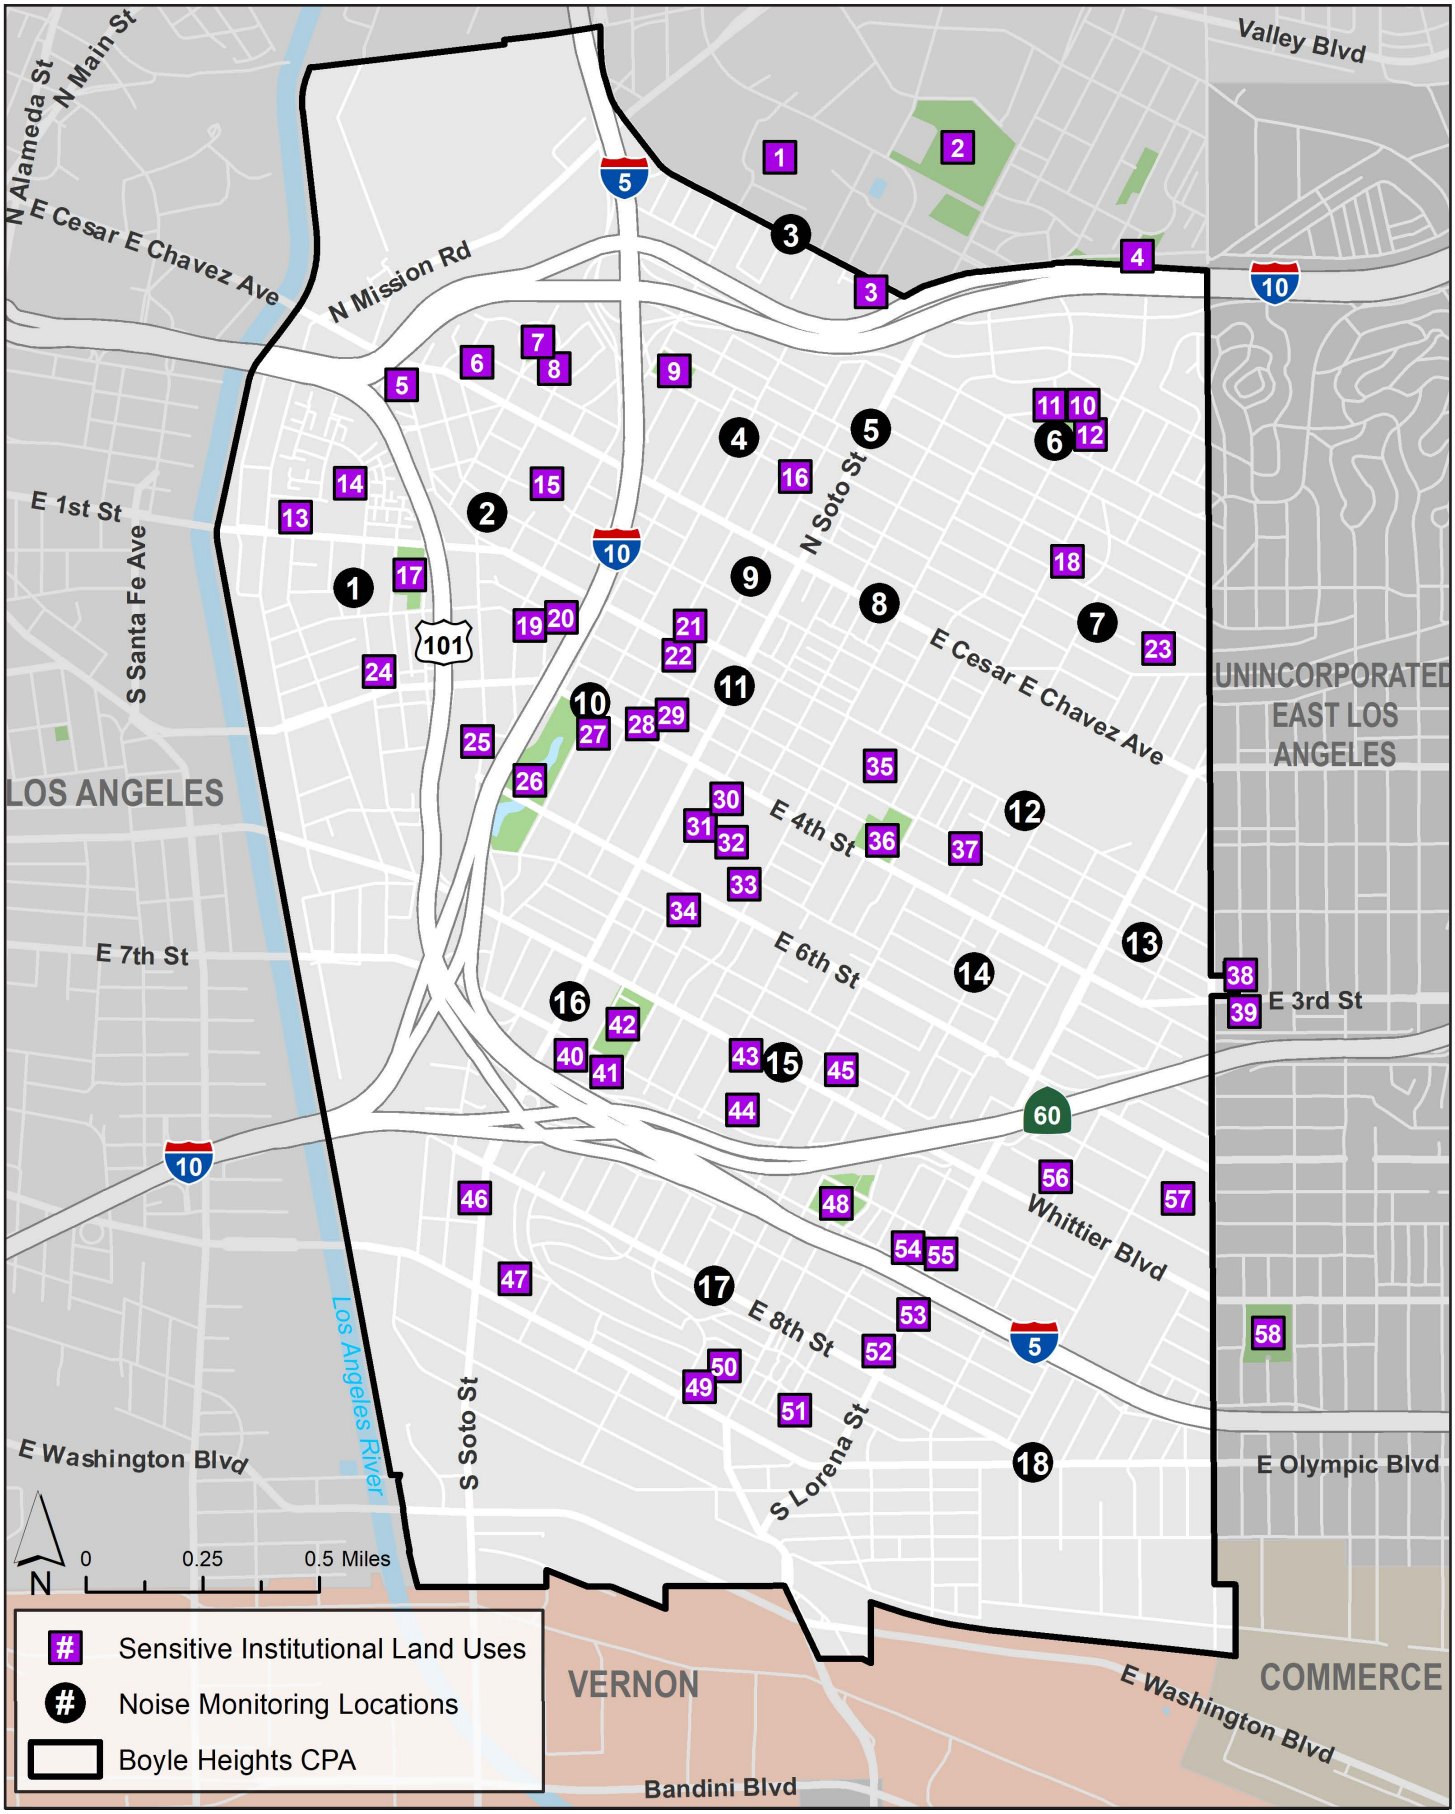
Existing Noise Levels

A series of exterior daytime sound measurements were taken on January 29, 2019, and January 30, 2019 to characterize existing conditions in the CPA.[14] The monitoring occurred between 9:30 a.m. and 3:00 p.m. Sound measurements were taken using a SoundPro DL Sound Level calibrated before and after the measurements. Noise monitoring locations are shown in **Figure 4.11-2**, and the monitor was typically placed on the property line adjacent to the public right-of-way. The locations were selected to represent a wide variety of noise conditions in the CPA, including residential neighborhoods, commercial corridors, schools, and parks as these are the uses considered most sensitive to noise. **Table 4.11-2** shows that the existing ambient noise levels within the CPA range between 55.6 and 70.9 dBA L_{eq}. Existing ambient noise levels by type of land use are shown in **Table 4.11-3**. Sources of noise included automobiles and common urban activities.

Vibration Sources

Common sources of vibration within the CPA include heavy vehicles on rough roads and construction activities (e.g., earth-moving equipment and pile driving). In addition, commercial or industrial activities may generate vibration (e.g., businesses that recycle construction debris and use heavy equipment).

[14] The 2019 noise measurements are representative of typical noise conditions and present the existing noise environment prior to the atypical noise condition associated with COVID-19 traffic changes, and would reasonably represent baseline conditions, including for the 2016 baseline year.



Vibration was not monitored in the CPA for the Draft EIR. The FTA estimates that, at 50 feet, the typical background vibration in urban areas is 52 VdB, the vibration from buses and trucks is 63 VdB, and the vibration from bulldozers is 93 Vdb.[15]

The City's presumed noise levels in **Table 4.11-7** should be used in cases where actual measured ambient conditions are not known.

Sensitive Receptors

Noise and vibration sensitive land uses are locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Sensitive uses typically include residences, transient lodgings, schools (both public and private), libraries, churches, hospitals, playgrounds, and parks. Historic structures are particularly sensitive to vibration. The Boyle Heights CPA encompasses approximately 4,271 acres of land (6.67 square miles) immediately east of Downtown Los Angeles. The Boyle Heights CPA is predominantly residential, which accounts for 1,278 acres or 43 percent of the CPA. Sensitive receptors were identified within the CPA and within 500 feet of the CPA boundary. There are approximately 27 LAUSD public schools, 7 charter schools, three libraries, and approximately 16 parks and recreational facilities within the CPA, and two Hospitals and Medical Centers. **Figure 4.11-2** shows the location of these sensitive receptors.

Also, refer to **Section 4.4, Cultural Resources,** for a discussion of historic properties, which may be sensitive to increases in noise and vibration levels.

4.11.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Noise at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Occupational Safety and Health Act of 1970
- Noise Control Act of 1972
- Federal Transit Administration Vibration Standards
- Office of Planning and Research Guidelines for Noise Compatible Land Use
- Caltrans Vibration/Groundborne Noise Standards
- Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan
- Los Angeles Municipal Code
- City of Los Angeles General Plan Noise Element

Federal

Occupational Safety and Health Act of 1970. Under the Occupational Safety and Health Act of 1970 (29 U.S.C. §1919 et seq.), the Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure. These regulations list permissible noise level exposure as a function of the amount of time during which the worker is exposed. The regulations further specify a hearing conservation program that involves monitoring noise to which workers are exposed, ensuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation.[16]

Noise Control Act of 1972. Under the authority of the Noise Control Act of 1972, the United States Environmental Protection Agency (U.S. EPA) established noise emission criteria and testing methods published in Parts 201 through 205 of Title 40 of the Code of Federal Regulations (CFR) that apply to some transportation equipment (e.g., interstate rail carriers, medium trucks, and heavy trucks) and construction equipment. In 1974, U.S. EPA issued guidance levels for the protection of public health and welfare in residential areas of an outdoor L_{dn} of 55 dBA and an indoor L_{dn} of 45 dBA. These guidance levels are not standards or regulations and were developed without consideration of technical or economic feasibility. There are no federal noise standards that directly regulate environmental noise related to the construction or operation of the Project. Moreover, the federal noise standards are not reflective of urban environments that range by land use, density, proximity to commercial or industrial centers, etc. As such, for purposes of determining acceptable sound levels to determine and evaluate intrusive noise sources and increases, this document utilizes the City of Los Angeles Noise Regulations, discussed below.

16 United States Department of Labor. OSH Act of 1970. https://www.osha.gov/laws-regs/oshact/completeoshact. Accessed May, 2021.

Federal Transit Administration Vibration Standards. There are no federal vibration standards or regulations adopted by any agency that are applicable to evaluating vibration impacts from land use development projects such as the Proposed Plan. However, the Federal Transit Administration (FTA) has adopted vibration criteria for use in evaluating vibration impacts from construction activities. The vibration damage criteria adopted by the FTA are shown in **Table 4.11-4, Construction Vibration Damage Criteria.**

Table 4.11-4
Construction Vibration Damage Criteria

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: FTA, Transit Noise and Vibration Impact Assessment Manual, 2018.

The FTA has also adopted standards associated with human annoyance for determining the groundborne vibration and noise impacts from ground-borne noise on the following three off-site land-use categories: Vibration Category 1 – High Sensitivity, Vibration Category 2 – Residential, and Vibration Category 3 – Institutional.[17] The FTA defines Category 1 as buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment but that still potentially involve activities that could be disturbed by vibration. The vibration thresholds associated with human annoyance for these three land-use categories are shown in **Table 4.11-5, Groundborne Vibration and Groundborne Noise Impact Criteria for General Assessment**. No thresholds have been adopted or recommended for commercial or office uses.

17 Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, Table 6-1, page 124, 2018.

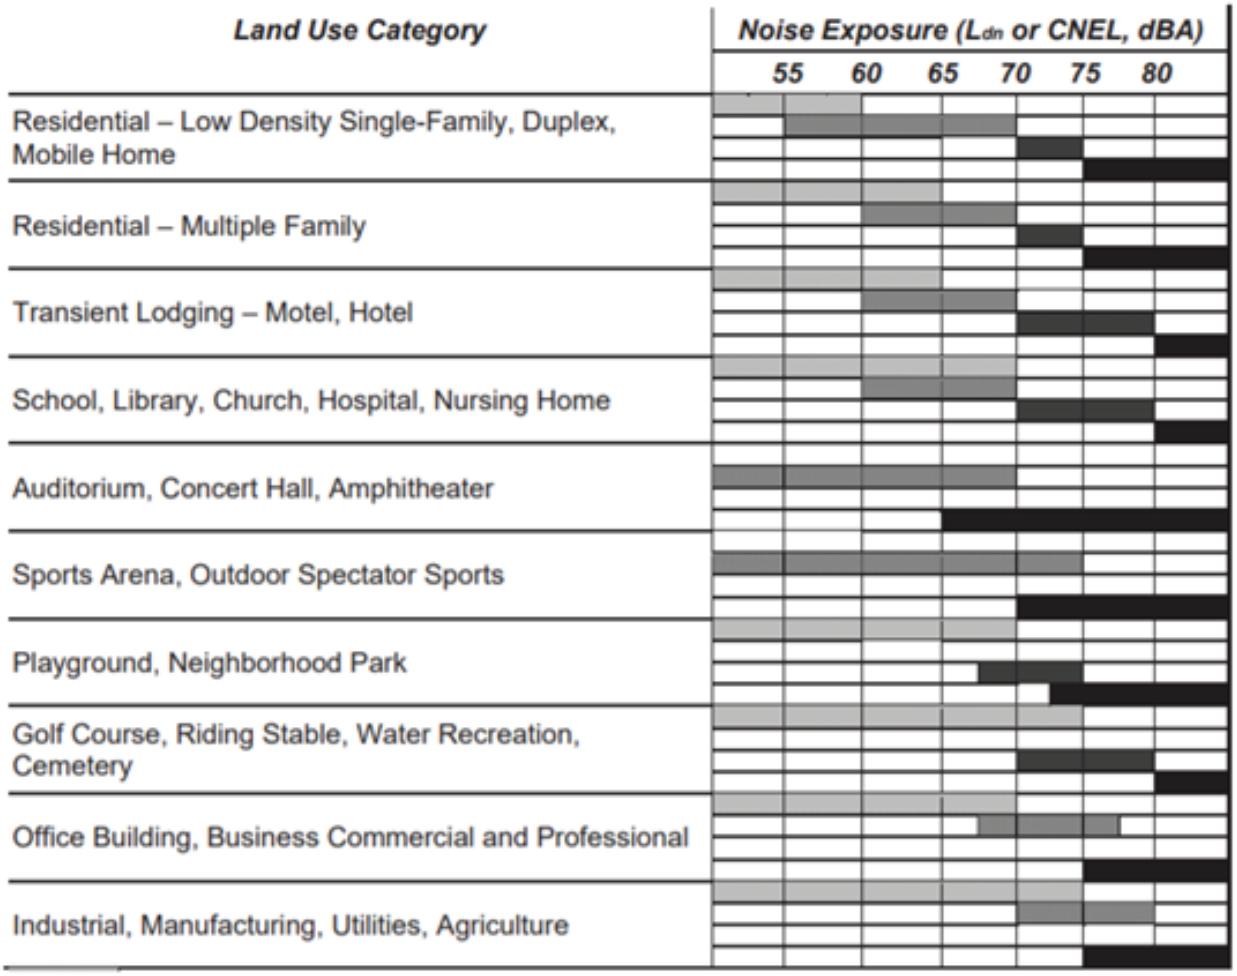

Table 4.11-5
Groundborne Vibration and Groundborne Noise Impact Criteria for General Assessment

Land Use Category	Frequent Events[a]	Occasional Events[b]	Infrequent Events[c]
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB[d]	65 VdB[d]	65 VdB[d]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB

a "Frequent Events" is defined as more than 70 vibration events of the same source per day.
b "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
c "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.
d This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.
Source: FTA, Transit Noise and Vibration Impact Assessment Manual, 2018.

State

Office of Planning and Research Guidelines for Noise Compatible Land Use. The State of California has not adopted statewide standards for environmental noise, but the Governor's Office of Planning and Research (OPR) has established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure, as presented in **Figure 4.11-3, Guidelines for Noise Compatible Land Use**. The purpose of these guidelines is to maintain acceptable noise levels in a community setting for different land use types. Noise levels are divided into four general categories, which vary in range according to land use type: "normally acceptable," "conditionally acceptable," "normally unacceptable," and "clearly unacceptable." The City has developed its own compatibility guidelines in the Noise Element of the General Plan based in part on OPR Guidelines. California Government Code Section 65302 requires each county and city in the State to prepare and adopt a comprehensive long-range general plan for its physical development, with Section 65302(f) requiring a noise element to be included in the general plan. The noise element must: (1) identify and appraise noise problems in the community; (2) recognize Office of Noise Control guidelines; and (3) analyze and quantify current and projected noise levels.

SOURCE: State of California, General Plan Guidelines, Governor's Office of Planning and Research, 2003; Esri 2022

FIGURE **4.11-3**

IMPACT SCIENCES

Guidelines for Noise Compatible Land Use

The State has established noise insulation standards for new multi-family residential units, hotels, and motels. These requirements are collectively known as the California Noise Insulation Standards (Title 24, California Code of Regulations). The noise insulation standards set forth an interior standard of 45 dBA CNEL in any habitable room. The standards require an acoustical analysis demonstrating that dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to exterior noise levels greater than 60 dBA CNEL. Title 24 standards are typically enforced by local jurisdictions through the building permit application process.

Caltrans Vibration/Groundborne Noise Standards. The State of California has not adopted Statewide standards or regulations for evaluating vibration or groundborne noise impacts from land use development projects such as the Proposed Plan. Although the State has not adopted any vibration standard, Caltrans in its *Transportation and Construction Vibration Guidance Manual* (Caltrans 2020) recommends the following vibration thresholds that are more practical than those provided by the FTA.

The state noise and vibration guidelines are to be used as guidance with respect to planning for noise, not standards and/or regulations to which the City of Los Angeles must adhere.

Table 4.11-6
Guideline Vibration Damage Potential Threshold Criteria

Structure and Condition	Maximum PPV (inch/sec)	
	Transient Sources[1]	Continuous/Frequent Intermittent Sources[2]
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old buildings	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial buildings	2.00	0.50

Source: Table 19, Transportation and Construction Vibration Guidance Manual (Caltrans 2020).
1 Transient sources create a single, isolated vibration event, such as blasting or drop balls.
2 Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Regional

Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan. In Los Angeles County the Regional Planning Commission has the responsibility for acting as the Airport Land Use Commission and for coordinating the airport planning of public agencies within the county. The Airport Land Use Commission coordinates planning for the areas surrounding public use airports. The Comprehensive Land Use Plan provides for the orderly expansion of Los Angeles County's public use airports and the area surrounding them. It is intended to provide for the adoption of land use measures that will minimize the public's exposure to excessive noise and safety hazards. In formulating the Comprehensive Land Use Plan, the Los Angeles County Airport Land Use Commission has established provisions for safety, noise insulation, and the regulation of building height within areas adjacent to each of the public airports in the County.

Local

Los Angeles Municipal Code. The City of Los Angeles Noise Regulations are provided in Chapter XI of the Los Angeles Municipal Code (LAMC). LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of "offending" noise sources. In accordance with the LAMC, a noise source that causes a noise level increase of 5 dBA over the existing average ambient noise level as measured at an adjacent property line creates a noise violation. This standard applies to radios, television sets, air conditioning, refrigeration, heating, pumping and filtering equipment, powered equipment intended for repetitive use in residential areas, and motor vehicles driven on-site. To account for people's increased tolerance for short-duration noise events, the Noise Regulations provide a 5 dBA allowance for a noise source that causes noise lasting more than 5 but less than 15 minutes in any one-hour period, and an additional 5 dBA allowance (for a total of 10 dBA) for a noise source that causes noise lasting 5 minutes or less in any one-hour period.[18]

The LAMC provides that in cases where the actual ambient conditions are not known, the City's presumed daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) minimum ambient noise levels as defined in LAMC Section 111.03 should be used. The presumed ambient noise levels for these areas where the actual ambient conditions are not known as set forth in the LAMC Sections 111.03 are provided in **Table 4.11-7, City of Los Angeles Presumed Ambient Noise Levels**. For example, for residential-zoned areas, the presumed ambient noise level is 50 dBA during the daytime and 40 dBA during the nighttime.

[18] Los Angeles Municipal Code, Chapter XI, Article I, Section 111.02-(b). Accessed May, 2021.

Table 4.11-7
City of Los Angeles Presumed Ambient Noise Levels

Zone	Daytime Hours (7 A.M. to 10 P.M.) dBA (L_{eq})	Nighttime Hours (10 P.M. to 7 A.M.) dBA (L_{eq})
Residential (A1, A2, RA, RE, RS, RD, RW1, RW2, R1, R2, R3, R4, and R5)	50	40
Commercial (P, PB, CR, C1, C1.5, C2, C4, C5, and CM)	60	55
Manufacturing (M1, MR1 and MR2)	60	55
Heavy Manufacturing (M2 and M3)	65	65

Source: LAMC Section 111.03.

LAMC Section 112.02 limits increases in noise levels from air conditioning, refrigeration, heating, pumping and filtering equipment. Such equipment may not be operated in such manner as to create any noise which would cause the noise level on the premises of any other occupied property, or, if a condominium, apartment house, duplex, or attached business, within any adjoining unit, to exceed the ambient noise level by more than 5 dB.

LAMC Section 112.04 prohibits the operation of any lawn mower, backpack blower, lawn edger, riding tractor, or any other machinery equipment, or other mechanical or electrical device, or any hand tool that creates a loud, raucous or impulsive sound, within any residential zone or within 500 feet of any residence between 10:00 PM and 7:00 AM. Section 113.01 prohibits rubbish and garbage collection within 200 feet of any residence between 9:00 PM and 6:00 AM.

LAMC Section 112.05 sets a maximum noise level for construction equipment of 75 dBA at a distance of 50 feet when operated within 500 feet of a residential zone. Compliance with this standard shall not apply where compliance therewith is technically infeasible. LAMC Section 41.40 prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 a.m. to 9:00 p.m.; and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m.). In general, the City's Department of Building and Safety enforces Noise Ordinance provisions relative to equipment and the Los Angeles Police Department (LAPD) enforces provisions relative to noise generated by people.

LAMC Section 41.40 prohibits construction between the hours of 9:00 PM and 7:00 AM Monday through Friday, 6:00 PM and 8:00 AM on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 AM to 9:00 PM; and Saturdays and national holidays between 8:00 AM to 6:00

PM). In general, the City's Department of Building and Safety enforces Noise Ordinance provisions relative to equipment and the Los Angeles Police Department (LAPD) enforces provisions relative to noise generated by people.

LAMC Section 113.01 prohibits collecting or disposing of rubbish or garbage, operating any refuse disposal truck, or collecting, loading, picking up, transferring, unloading, dumping, discarding, or disposing of any rubbish or garbage, as such terms are defined in LAMC Section 66.00, within 200 feet of any residential building between the hours of 9:00 p.m. and 6:00 a.m. of the following day, unless a permit therefore has been duly obtained beforehand from the Board of Police Commissioners.

LAMC Section 114.03 prohibits the loading or unloading of any vehicle, operation of any dollies, carts, forklifts, or other wheeled equipment, which causes any impulsive sound, raucous or unnecessary noise within 200 feet of any residence between 10:00 PM and 7:00 AM.

LAMC Section 91.1206 establishes noise insulation performance standards to protect persons within new hotels, motels, dormitories, residential care facilities, apartment houses, dwellings, private schools, and places of worship from the effects of excessive noise, including but not limited to, hearing loss or impairment and interference with speech and sleep. According to Subsection 91.1206.14.1, these structures shall be designed to prevent the intrusion of exterior noise beyond prescribed levels when located in noise critical areas, such as proximity to highways, country roads, city streets, railroads, airports, and commercial or industrial areas. Proper design shall include, but shall not be limited to, orientation of the structure, setbacks, shielding, and sound insulation of the building itself. Specifically, Subsection 91.1206.14.2 limits interior noise levels attributable to exterior sources to 45 dBA L_{dn} or CNEL in any habitable room. Worst-case noise levels, either existing or future, are to be used as the basis for determining compliance with this requirement. Future noise levels are to be predicted for a period of at least ten years from the time of building permit application. Furthermore, according to Subsection 91.1206.14.3, structures identified under Subsection 91.1206.1 that are exposed to airport noise greater than 60 dBA L_{dn} or CNEL, shall require an acoustical analysis showing that the proposed design will achieve the allowable interior noise level.

Section 91.1207.14.2 prohibits interior noise levels attributable to exterior sources from exceeding 45 dBA in any habitable room. The noise metric shall be either the day-night average sound level (L_{dn}) or the CNEL, consistent with the noise element of the local general plan.

City of Los Angeles General Plan Noise Element. The Noise Element of the City's General Plan policies include the CNEL guidelines for land use compatibility as shown in **Table 4.11-8** and includes a number of goals, objectives, and policies for land use planning purposes. The overall purpose of the Noise Element is to guide policymakers in making land use determinations and in preparing noise ordinances that would

limit exposure of citizens to excessive noise levels.[19] The following policies and objectives from the Noise Element apply to the Proposed Plan.

Objective 2: **Non-Airport.** Reduce or eliminate non-airport related intrusive noise, especially relative to noise sensitive uses.

Policy 2.2: Enforce and/or implement applicable city, state, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.

Objective 3: **Land Use Development.** Reduce or eliminate noise impact associated with proposed development of land and changes in land use.

Policy 3.1: Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

The Noise Element of the City's General Plan policies include the CNEL guidelines for land use compatibility, as shown in **Table 4.11-8**. The Noise Element also addresses noise mitigation regulations, strategies, and programs, and delineates the authority of federal, State, and City bodies in regulating automotive, rail, aircraft, and nuisance noise. The Noise Element does not include any mandatory standards for land use planning or quantitative thresholds for construction or operational groundborne vibration.

19 City of Los Angeles. General Plan, Noise Element adopted February 3, 1999. Pages 1.1-2.4. https://planning.lacity.org/odocument/b49a8631-19b2-4477-8c7f-08b48093cddd/Noise_Element.pdf. Accessed May, 2021.

Office Building, Business, Commercial, Professional	A	A	A	A/C	C	C/N	N
Agriculture, Industrial, Manufacturing, Utilities	A	A	A	A	A/C	C/N	N

A = Normally acceptable. Specified land use is satisfactory, based upon assumption buildings involved are conventional construction, without any special noise insulation.	N = Normally acceptable. New construction or development generally should be discouraged. A detailed analysis of noise reduction requirements must be made and noise insulation features included in the design of a project.
C = Conditionally acceptable. New construction or development only after a detailed analysis of noise mitigation is made and needed noise insultation features are included in project design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, normally will suffice.	U = clearly unacceptable. New construction or development generally should not be undertaken.

Note: Based on the Governor's Office of Planning and Research, "General Plan Guidelines," 1990. To help guide determination of appropriate land use and mitigation measures vis-à-vis existing or anticipated ambient noise levels.

4.11.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to noise if it would:

- Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Plan in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

- Result in generation of excessive groundborne vibration or groundborne noise levels.
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.

4.11.5 METHODOLOGY

The City relies on the questions in Appendix G of the *State CEQA Guidelines* as the thresholds of significance. The first threshold addresses consistency with standards, and noise associated with permanent traffic increases, long-term operation and construction; the second threshold addresses construction vibration; and the third threshold addresses noise associated with airports/airstrips. Below are the methods and criteria used by the City to analyze and answer those questions:

Construction (Temporary) Noise

Construction noise is assessed in context of the provisions of the LAMC discussed in the Regulatory Framework, including allowable hours of construction and maximum equipment noise levels. Redevelopment in urban infill locations is very common and usual within urban locations, such as the City and the CPA, and the associated short-term construction activities and noise created by those activities are typically found in urban environments, such as the CPA. Construction noise from typical projects is intermittent throughout the day during the duration of construction activity. Construction noise levels may fluctuate dependent on the type of equipment being used, construction phase, or equipment location. Although some individuals may find construction noise of any kind or of any duration very disturbing, as a general matter, typical construction, including with the imposition of the regulatory measures described in the Regulatory Setting, does not result in and would not be considered a significant impact.

Projects on urban infill sites are not likely to result in substantial construction noise impacts because construction activities, such as the number of pieces of equipment, at these sites are inherently limited by the size of the project site. As shown in **Table 4.11-10**, the loudest equipment such as pile drivers and cranes are also the largest. The size of urban infill project sites typically limits the use of the largest (i.e., noisiest) pieces of heavy-duty equipment. The size of a project site also typically limits the size of the development and the related duration of construction activities. Therefore, while urban infill projects that meet the following criteria could result in disturbance to residents and employees at adjacent properties, resulting noise levels are not considered to be potentially significant physical impacts to the overall environment:

- One subterranean level or less (approximately 20,000 cubic yards of material);
- Construction durations of 18 months or less (excluding interior finishing);

- Equipment rated 300 horsepower or less, typically small and medium backhoes, bulldozers, etc.; and
- No impact pile driving.

Larger projects that require extended construction or heavy-duty equipment could expose sensitive uses and users in the surrounding environment to more continuous and/or louder noise impacts and result in significant short-term noise exposure. When noise-sensitive land uses (e.g., residences, schools, libraries, hospitals) are located within 500 feet of a project site, projects that meet one or more of the following characteristics are considered to have the potential to result in significant impacts:

- Two subterranean levels or more (approximately 20,000 cubic yards of material);
- Construction durations (excluding interior finishing) of 18 months or more;
- Use of large, heavy-duty equipment rated 300 horsepower or greater; or
- The potential for impact pile driving.

Construction noise levels are based on example equipment levels provided in standard technical references. Construction noise levels are also identified for various phases of construction activity based on the same sources.

Operational (Permanent) Noise

The following thresholds take into account incremental changes in 24-hour noise levels, as well as potential regular occurrences of single event, impulsive noise. As noted above, LAMC defines impulsive sound as sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Such single event noise generating activities could be of short duration but permanently reoccurring depending on the source and associated land use (e.g., movie studios). The Proposed Plan would have significant impact on noise levels from operations if:

- Permanent ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.10-4**, or any 5 dBA CNEL or more increase in noise level.

The land use and noise compatibility guidelines in the Noise Element are not adopted standards relevant to determining the significance of incremental increased in permanent noise levels. Exhibit I of the Noise Element includes criteria or general guidance associated with incremental increases in noise. Exhibit I is shown in **Table 4.11-9**. This Exhibit was developed in 1990 to help guide determination of appropriate land use and mitigation measures related to existing or anticipated ambient noise levels. This guidance is applicable to assessing if a land use is compatible with the existing noise environment (i.e. impact of the

environment on a project) but is not useful alone for assessing if a project would significantly increase existing noise levels. This is particularly true in urban environments like the CPA, where existing noise levels often exceed the guidelines shown in **Table 4.11-9**. In addition, sound transmission control requirements are included in the International Building Code, which are the basis for the 2016 California Building Standards Code (CCR Title 24) and which in turn are incorporated into the City of Los Angeles Building Code (LAMC Section 91). Section 1207.4 of CCR Title 24 provides noise insulation standards. The standards require that intrusive noise not exceed 45 dB in any habitable room.

Mobile source noise levels are estimated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) that accounts for traffic volumes, roadway width, speeds, and vehicle mix. The analysis also discusses operational mechanical equipment noise (e.g., heating, ventilation, and air conditioning [HVAC]), land use compatibility, and operational vibration.

This discussion of noise addresses impacts in the CPA and any properties bordering the CPA. Noise levels are a direct function of both mobile sources (traffic in the CPA), stationary sources (such as HVAC equipment and other similar equipment), other operational sources (such as recreational activities, schools, parking lots, rooftop entertainment spaces, manufacturing and industrial uses) throughout the CPA.

Construction and Operational Vibration

Consistent with FTA *Transit Noise and Vibration Impact Assessment Manual*, vibration impacts associated with human annoyance would be significant if:

- Vibration caused by new development occurring because of implementation of the Proposed Plan exceeds 85 VdB, which is the vibration level that is considered to be acceptable only if there are an infrequent number of events per day;[21] and/or

- Groundborne vibration caused by new development occurring because of implementation of the Proposed Plan exceeds the FTA vibration damage threshold of approximately 98 VdB for engineering concrete and masonry building, 94 VdB for fragile buildings (i.e., non-engineered timber and masonry buildings) and approximately 90 VdB for extremely fragile historic buildings (i.e., buildings extremely susceptible to vibration damage).[22]

Construction vibration levels are based on example equipment levels provided in standard technical references. Construction vibration levels are also identified for various phases of construction activity

21 FTA. Transit Noise and Vibration Impact Assessment. September 2018.

22 *Ibid*.

based on the same sources. Construction vibration levels are based on example equipment levels provided in FTA's Transit Noise and Vibration Impact Assessment guidance document.[23]

4.11.6 IMPACTS

Threshold 4.11-1 **Would implementation of the Proposed Plan result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Plan in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

This impact would be significant and unavoidable for temporary impacts related to construction; less than significant for permanent operational impacts.

Construction (Temporary) Noise

Future construction activity occurring in the CPA would result in temporary increases in ambient noise levels on an intermittent basis. Noise levels would fluctuate depending on the construction phase, equipment type and duration of use, distance between the noise source and receptor, and presence or absence of noise attenuation barriers. Construction activities typically require the use of a variety of noise-generating equipment. Typical noise levels at 50 feet from various types of equipment that may be used during construction are listed in **Table 4.11-10**. The loudest noise levels are typically generated by impact equipment (e.g., pile drivers) and heavy-duty equipment (e.g., scrapers and graders). Construction noise would occur intermittently throughout construction and, in some instances, multiple pieces of equipment may operate simultaneously, generating overall noise levels that are incrementally higher than what is shown in **Table 4.11-10**.

23 *Ibid.*

Construction activities occurring in the CPA are subject to the Regulatory Compliance Measures adopted pursuant to the City's noise ordinances. These measures include:

- Compliance with the Noise Ordinance No. 161.574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible.

- Compliance with LAMC Section 41.40, which restricts construction activities to the hours of 7:00 a.m. to 9:00 p.m. Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturday and federal holidays, and prohibits activities on Sundays.

- Compliance with the City's Building Regulations Ordinance No. 178.048, which requires a construction site notice to be provided that includes the following information: job site address, permit number, name and phone number of the contractor and owner or owner's agent, hours of construction allowed by code or any discretionary approval for the site, and City's telephone numbers where violations can be reported. The notice shall be posted and maintained at the construction site prior to the start of construction and displayed in a location that is readily visible to the public and approved by the Los Angeles Department of Building and Safety (LADBS).

- LAMC Chapter 41.40, Section 112.05 establishes performance standards for powered equipment or tools. The maximum allowable noise level for most construction equipment within 500 feet of any residential zone is 75 dBA measured at 50 feet from the noise source. This restriction holds unless compliance is not technically feasible even with the use of noise "mufflers, shields, sound barriers, and/or other noise reduction devices or techniques."

Sensitive receptors are located throughout the CPA and could be exposed to noise associated with construction activities related to reasonably anticipated development from the Proposed Plan. Residential uses are the primary sensitive receptors located within the CPA. Other sensitive receptors that could potentially be affected by construction noise are shown in **Table 4.11-12**. Sensitive receptors were identified within the CPA Boundary and within 500 feet of the CPA boundary.

In addition to the above identified sensitive receptors, various parks and recreational uses, churches or other places of assembly, hospitals, and long-term care facilities are located intermittently throughout the CPA.

As discussed in the Methodology section, individual projects that could result in significant construction noise impacts include those located on relatively large sites. These projects tend to include relatively lengthy construction durations (longer than 18 months), use heavier equipment, and generally include noisier activities. Such larger projects are not considered usual and could potentially result in significant noise impacts. When noise-sensitive land uses are located within 500 feet of the project site (e.g., residences, schools, hospitals, and parks), projects that meet one of the characteristics below would have the potential to result in disruptive impacts to ambient noise levels that would be potentially significant:

- Two subterranean levels or more (approximately 20,000 cubic yards of material);
- Construction durations of 18 months or more (excluding interior finishing);
- Use of large, heavy-duty equipment rated 300 horsepower or greater; and
- Impact pile driving.

Because specific development projects have not yet been determined at individual sites, this analysis assumes that sensitive receptors could be as close as 50 feet from where construction would take place. As shown in **Table 4.11-12**, sensitive receptors would experience maximum noise levels ranging from about 71 to 107 dBA. Construction noise levels would vary depending on the type of equipment, the duration of

use, and the distance to receptors. Engine noise reduction technology, including mufflers, continues to improve, but heavy construction equipment remains noisy.

It is difficult to determine whether or not construction noise levels at various sensitive land uses would result in significant noise impacts without an understanding of the size and location of potential projects and undertaking a detailed noise analysis. The above criteria can serve as guidelines in determining whether or not a significant impact could occur based upon the type and size of project being constructed. Based on the allowed uses in the Proposed Plan, it is reasonably foreseeable that there would be some construction projects that would exceed the criteria above. A review of the City's published CEQA documents for the years 2016 to 2021 indicates that, in the Boyle Heights Community Plan Area, Mitigated Negative Declarations (MNDs) were prepared for six projects, no EIRs were prepared, and one Sustainable Communities Environmental Assessments (SCEAs) was prepared. Of the six MNDs that were prepared, five determined that construction noise would result in a less-than-significant impact with compliance with the City's noise ordinance, and one MND required mitigation for construction noise. Although noise levels generated by construction typically do not vary greatly from project to project, the proximity of sensitive receivers and the overall duration of construction are key factors in determining whether construction-related noise is significant. It is reasonable to anticipate that one or two projects per year would require a level of construction duration or equipment activity that could result in significant construction noise impacts to nearby sensitive receptors. Therefore, impacts related to construction noise associated with reasonably anticipated development under the Proposed Plan are ***potentially significant*** because its unknown if there would be projects of the size necessary to cause a significant impact in proximity to sensitive receptors.

Operational (Permanent) Noise

Operational Stationary Noise

Regarding operational noise, the Proposed Plan would accommodate new residential and commercial development at increased intensity and density primarily along transit corridors and around the Metro L Line stations. For the residential and commercial land uses anticipated, typical noise sources include stationary mechanical equipment and on-site vehicle movement (e.g., parking structure activity, loading/unloading, and trash pick-up). Certain commercial uses with outdoor space, may also include outdoor activities and use of amplified sound systems. A substantial permanent increase in noise would result if the ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories, as shown in **Table 4.11-8**, or any 5 dBA CNEL or more increase in noise.

Mechanical Equipment

For mechanical equipment, residential and most commercial uses are generally limited to HVAC and pool equipment. Industrial and manufacturing land uses can contain significant sources of stationary mechanical equipment noise. Noise levels from commercial rooftop HVAC systems typically range from about 60 to 70 dBA L_{eq} at a distance of 15 feet from the source.[24] At 50 feet, an HVAC system that generates a noise level of 70 dBA L_{eq} would be approximately 59.5 dBA L_{eq}. HVAC systems are typically placed on rooftops and are a part of the urban environment. Typically, HVAC noise is not audible above existing traffic noise and other urban sources of noise. Ambient noise levels in the CPA were measured to range from 52.4 dBA L_{eq} to 74.7 dBA L_{eq} (see **Table 4.11-2**). In quieter areas, HVAC noise may result in increases in ambient noise, but is rarely above 5 dBA. Furthermore, the design of mechanical equipment must comply with LAMC Section 112.02, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise level on the premises of other occupied properties by more than 5 dBA. In addition, nighttime noise limits would apply to any equipment required to operate between the hours of 10:00 p.m. and 7:00 a.m. (e.g., HVAC units, exhaust fans, etc.). Further, noise increases would be incremental given the already urbanized nature of the CPA, where ambient noise levels range from 52.4 and 74.7 dBA L_{eq} (see **Table 4.11-2**). As described above, sources of stationary noise are generally well-regulated. As such, the potential for any individual site to include a source of stationary noise that would exceed established thresholds is unlikely and would be speculative to address. Therefore, noise impacts related to mechanical equipment would be ***less than significant***.

Vehicle Activity (Loading/Unloading, Trash Hauling, Parking)

Future CPA development would increase the number of delivery and trash hauling trucks traveling through the CPA and to individual development sites. Increased delivery and trash hauling trucks along roadways could impact various sensitive receptors located intermittently throughout the CPA. Section 23130 of the California Motor Vehicle Code establishes maximum sound levels of 86 dBA L_{eq} at 50 feet for trucks operating at speeds less than 35 miles per hour. Noise at this level generally exceeds ambient noise levels throughout the CPA (see **Table 4.11-2**); therefore, individual truck pass-bys and/or loading or trash pick-up operations would likely be audible at nearby properties. However, truck-related noise would be an intermittent noise source that would not increase the 24-hour CNEL by 3 dBA or more. Moreover, California Code of Regulations Title 13 Section 2485 prohibits trucks from idling for longer than five minutes. In addition, per the LAMC, truck loading/unloading activity is prohibited between the hours of 10:00 p.m. and 7:00 a.m. when located within 200 feet of a residential land use. Because trash and delivery

[24] Illingworth & Rodkin, Inc. Cannery Park Project Environmental Noise Assessment. 2015.

trucks would be required to comply with LAMC standards and would be subject to state regulations, impacts would be ***less than significant***.

Parking areas/garages are the other potential source of vehicular noise. Typical noise sources associated with parking lots include tire squealing, door slamming, car alarms, horns, and engine start-ups. **Table 4.11-13** shows typical sound levels at this distance from various noise sources on parking lots.

Table 4.11-13
Maximum Noise Levels from Parking Activity

Noise Source	Noise Level at 50 Feet (dBA, L_{eq})
Automobiles at 14 miles per hour	50.0
Car Alarm Signal	69.0
Car Alarm Chirp	54.0
Car Horns	69.0
Door Slams or Radios	64.0
Talking	36.0
Tire Squeals	66.0

Note: Estimates are based on actual measurements taken at various parking lots.
Source: Atkins. Collier Park Renovations Project Technical Report. 2012.

Parking areas are typically located in commercial areas. Intermittent noise associated with parking could reach an estimated 69 dBA L_{eq}, which would not exceed ambient noise levels in areas where parking lots and structures would likely be located (which, as shown in **Table 4.11-2**, range from about 71.1 to 74.7 dBA L_{eq}). Subterranean parking lots would not generate noise at the street level and would not audibly increase noise levels at adjacent sensitive land uses. All parking facilities, including those that are at and above grade, would be designed per the provisions of LAMC Section 12.21 and the Parking Design Standards of the LADBS. Per the requirements of LAMC, parking structures would require a solid wall be constructed at least five feet in height encasing every public and private parking area, except under certain circumstances outlines under LAMC Section 12.21 6(d). Walls around the perimeter of parking structures would reduce noise levels. When possible, parking would be encased by the building, which would reduce noise levels at any adjacent sensitive uses. Parking structure and surface parking lot noise would be greater than subterranean parking facilities, however, they would not present an unusual noise source within the urban environment. Because parking lot/garage design and placement would be required to comply with LAMC and LADBS standards and requirements, impacts would be ***less than significant***.

Outdoor Activity Areas

The Proposed Plan encourages projects that increase pedestrian activity through the use of setbacks that act as an extension of the sidewalk, This increase in pedestrian areas at the street level may result in new noise generated by day to day pedestrian activity. Other outdoor uses, such as parks, would also add to ambient noise levels. Reference noise levels for outdoor patios are based on noise levels from a certified EIR for the Citrus Heights City Hall and Medical Office Building, which included an outdoor patio area that would have on average 25 people conversing. Noise level associated with this typical large outdoor public patio area was 50.0 dBA L_{eq} at a distance of 50 feet.[25, 26] To provide a conservative analysis, this analysis assumes that 50 people would be conversing in an outdoor area in a development accommodated by the Proposed Plan. Based on the logarithmic scale, a doubling of sound energy is equivalent to an increase of 3 dBA. Therefore, it is assumed that an outdoor activity area with an average of 50 people conversing would have an estimated noise level of 53 dBA L_{eq} at a distance of 50 feet. Other outdoor activity areas, such as parks and outdoor school uses generally produce the same level of noise as the primary source of noise is people conversing and interacting.

Based on a noise level of 53 dBA L_{eq} and due to the urbanized nature of the CPA with ambient noise levels in the 68.6 to 70.6 dBA L_{eq} range in non-residential areas (see **Table 4.11-2**), noise generated by outdoor pedestrian spaces and other outdoor uses such as parks and plazas would not exceed ambient noise levels or result in a 3 dBA increase above ambient levels. Further, amplified noise would be required to comply with LAMC Section 115.02, which prohibits amplified noise within 500 feet of a residential zone and restricts amplified noise to between 7:00 a.m. – 10:00 p.m. in commercial zones. Outdoor activity noise, such as noise generated by people conversing, and all amplified noise would be required to comply with LAMC standards. Therefore, noise impacts related to outdoor activity areas would be ***less than significant***.

Operational Mobile Noise

The traffic analysis, on which the noise analysis is based, evaluates reasonably anticipated development that is expected to occur by 2040 as a result of the Proposed Plan. The reasonably anticipated development is based on the acreage of land designated for each type of land use, allowable densities and intensities for each land use designation, reasonably expected levels of development through the life of the Proposed Plan. Actual noise levels that could result under the Proposed Plan may not be as high as noise levels calculated in this EIR.

---

25 City of Citrus Heights. Medical Office Building and City Hall Project EIR. 2015.

26 Although the noise study was not conducted within the Boyle Heights CPA, the results of the study are relevant and represent typical noise levels associated with outdoor uses which may be developed within the CPA.

Primary objectives of the Proposed Plan include: 1) accommodating population, housing, and employment growth and focus growth into Framework identified centers and corridors located near transit; 2) Reducing greenhouse gas emissions and promoting enhanced multi-modal transportation opportunities for bicyclists, pedestrians and transit users; 3) Maintaining existing affordable housing units and promoting the creation of more affordable housing units for residents with incomes below the Area Median Income (AMI), centering housing growth near transit; 4) Promoting vibrant mixed-use areas near transit that encourage a strong jobs/housing balance and support increased ridership, and walkability: 5) Preserving community character and neighborhood identity by strengthening and maintaining traditional character of notable residential and commercial neighborhoods; 6) Promoting a mix of compatible land uses that foster sustainability, equity, and healthy living; and 7) Supporting sustainable urban design strategies that positively contribute to an urban tree canopy across the entire plan area, and supports publicly accessible open space as the area evolves.

For mobile sources, an analysis was completed to determine if implementation of the Proposed Plan would significantly increase mobile noise levels in the CPA compared to existing (2016) conditions. **Table 4.11-14** shows predicted peak hour mobile source noise levels for the existing, future (2040) No Project, and future (2040) with Proposed Plan traffic scenarios. Roadway segments were selected to represent a wide variety of noise conditions in the CPA (e.g., busy roadways and residential neighborhoods). Conservatively, assuming the entire increase in noise in the future would be attributable to the Proposed Plan, the ambient noise level as a result of the Proposed Plan would increase. The highest incremental noise level increase would occur on Cesar Chavez Avenue from Saint Louis Street to Mott Street. At this street segment, future mobile noise levels would increase by 2.5 dBA CNEL when compared to existing conditions.

Commercial uses within the CPA would not be exposed to excessive noise levels. Ambient noise levels in these areas would not reach the "normally unacceptable" category based on noise level/land use compatibility standards in the City's General Plan Noise Element. Residential uses would continue to be exposed to ambient noise that is in the "normally unacceptable" range. This condition already exists under existing (2016) conditions. The Proposed Plan would not incrementally increase noise levels by 3 dBA or more along any roadway segment and would not push residential uses into the "clearly unacceptable" category (noise levels above 75 dBA CNEL). New development as a result of the Proposed Plan would not increase noise by a significant level, and new development would be required by CCR Title 24 to incorporate methods to reduce interior noise levels to below 45 dBA CNEL. Therefore, mobile noise impacts would be ***less than significant***.

Table 4.11-14
Operational Mobile Source Noise Levels

Roadway Segment	Estimated dBA, CNEL at 50 feet				
	Existing (2016)	Future (2040) No Project/Existing Plan	Future (2040) with Project	Future (2040) with Project Compared to Existing	Future (2040) No Project Compared to Future (2040) with Proposed Plan

Operational Noise Summary

The Proposed Plan would not increase operational stationary and mobile noise levels by 3 dBA CNEL or more to or within the "normally unacceptable" or clearly unacceptable" categories, or by 5 dBA or more. Therefore, impacts related to operational noise levels would be ***less than significant*** with implementation of the Proposed Plan.

Mitigation Measures

Construction (Temporary) Noise

MM-NOI-1 The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. Power construction equipment (including combustion engines), fixed or mobile, shall be equipped with noise shielding and muffling devices consistent with manufacturers' standards or the Best Available Control Technology. All equipment shall be properly maintained, and the applicant or owner shall require any construction contractor to keep documentation on-site during any earthwork or construction activities demonstrating that the equipment has been maintained in accordance with manufacturer's specifications.

MM-NOI-2 The following is required for any project whose earthwork and construction activities involve the use of construction equipment and require a permit from LADBS. Driven (impact) pile systems shall not be used, except in locations where the underlying geology renders drilled piles, sonic, or vibratory pile drivers infeasible, as determined by a soils or geotechnical engineer and documented in a soils report.

MM-NOI-3 The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. All outdoor mechanical equipment (e.g., generators, compressors) shall be enclosed or visually screened. The equipment enclosure or screen shall be impermeable (i.e., solid material with minimum weight of 2 pounds per square feet) and break the line of sight between the equipment and any off-site Noise-Sensitive Uses.

MM-NOI-4 The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS. Construction staging areas shall be located as far from Noise-Sensitive Uses as reasonably possible and technically feasible in consideration of site boundaries, topography, intervening roads and uses, and operational constraints. The burden of proving what constitutes 'as far as possible' shall be upon the Applicant or Owner, in consideration of the above factors.

MM-NOI-5 The following is required for any project whose earthwork and construction activities involve the use of construction equipment and require a permit from LADBS; and whose construction activities are located within a line of sight to and within 500 feet of Noise-Sensitive Uses, with the exception of projects limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses. Noise barriers, such as temporary

walls (minimum ½-inch thick plywood) or sound blankets (minimum STC 25 rating),[27] that are a minimum of eight feet tall, shall be erected between construction activities and Noise-Sensitive Uses as reasonably possible and technically feasible in consideration of site boundaries, topography, intervening roads and uses, and operational constraints. The burden of proving that compliance is technically infeasible shall be upon the applicant or owner. Technical infeasibility shall mean that noise barriers cannot be located between construction activities and Noise-Sensitive Uses due to site boundaries, topography, intervening roads and uses, and/or operational constraints.

MM-NOI-6 The following is required for any project whose earthwork or construction activities involve the use of construction equipment and require a permit from LADBS; are located within 500 feet of Noise-Sensitive Uses; and have one or more of the following characteristics:

- Two or more subterranean levels
- 20,000 cubic yards or more of excavated material;
- Simultaneous use of five or more pieces of construction equipment;
- Construction duration (excluding architectural coatings) of 18 months or more; or
- Any project whose construction activities involve pile driving or the use of 300 horsepower equipment.

A Noise Study, prepared by a qualified noise expert shall be required and prepared prior to obtaining any permit by LADBS. The Noise Study shall characterize expected sources of earthwork and construction noise that may affect identified noise-sensitive uses, quantify expected noise levels at these noise-sensitive uses, and recommend measures to reduce noise exposure to the extent noise reduction measures are available and feasible, and to demonstrate compliance with any noise requirements in the Los Angeles Municipal Code. Specifically, the Noise Study shall identify noise reduction devices or techniques to reduce noise levels in accordance with accepted industry practices and in compliance with LAMC standards. Noise reduction devices or techniques shall include but not be limited to: mufflers, shields, sound barriers, and time and place restrictions on equipment and activities. The Noise Study shall identify anticipated noise reductions at Noise-Sensitive

27 At a Sound Transmission Class (STC) rating of 25, soft speech can be heard and understood.

Uses associated with the noise reduction measures. Applicants and owners shall be required to implement and comply with all measures identified and recommended in the Noise Study. The Noise Study and copies of any contractor agreements shall be maintained pursuant to the proof of compliance requirements and a copy of all records documenting compliance shall be maintained for a minimum of five years after the Certificate of Occupancy is issued.

Operation

No mitigation measures are required.

Significance after Mitigation

Construction (Temporary) Noise

Mitigation Measure **MM-NOI-1** requires the implementation of mufflers, shields, sound barriers and/or any other available noise reduction device or techniques. Mitigation Measure **MM-NOI-2** requires the use of drilled piles or vibratory pile drivers, with exception of locations where underlying geology renders these equipment infeasible. Mitigation Measure **MM-NOI-3** requires that outdoor mechanical equipment such as generators and compressors be enclosed or visually screen to break the line of sight between the equipment and any off-site noise sensitive uses. Mitigation Measure **MM-NOI-4** requires that construction staging areas be located as far from Noise Sensitive Uses as reasonably possible. Mitigation Measure **MM-NOI-5** requires the use of temporary noise barriers when construction activities would be located within 500 feet of Noise Sensitive uses, with the exception of projects limited to the construction of 2,000 square feet or less of floor area dedicate to residential uses. Mitigation Measure **MM-NOI-6** requires completion of a noise study for all discretionary projects in the CPA located within 500 feet of a noise-sensitive land use that includes one of four characteristics associated with substantial construction activity levels. However, because the nature, size and location of future projects is unknown and because compliance with all City standards cannot be assured for all construction projects, construction noise at sensitive land uses is considered to be a significant impact.

With all of the mitigation measures and existing regulatory compliance measures it is not anticipated that the noise levels would cause hearing loss or other types of direct physical changes, but that as discussed above, WHO says there can be health effects for some at lower levels and based on the subjective experience of the receptor. In consideration of the related health effects of significant construction noise impacts from reasonably anticipated development from the Proposed Plan, it is reasonable to anticipate that one or two projects per year would require a level of construction duration or equipment activity that could result in significant construction noise impacts to nearby sensitive receptors. As detailed under *Health Effects of*

Environmental Noise, human health effects range from annoyance to hearing loss and physiological effects, but response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise, the amount of background noise present before the intruding noise, and the nature of work or human activity that is exposed to the noise source. It is not feasible to determine a specific number of persons that could experience health effects from significant construction noise impacts since such effects would depend on the intensity and duration of noise, the distance between noise sources and receivers, and whether noise barriers are present between sources and receivers, but it is likely that individuals in the CPA will experience varying levels of disturbance related to construction noise with or without implementation of the Proposed Plan. This impact is considered ***significant and unavoidable***.

Operational (Permanent) Noise

Impacts related to operational (permanent) noise were determined to be ***less than significant***

Threshold 4.11-2 **Would the Proposed Plan result in generation of excessive ground-borne vibration or ground-borne noise levels?**

This impact would be significant and unavoidable.

Construction Vibration

Construction activity can result in varying degrees of ground vibration depending on the equipment and methods employed. Operation of construction equipment causes vibrations that spread through the ground and diminish in strength with distance. Buildings founded on the soil in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibrations at moderate levels, and slight damage at the highest levels.

Table 4.11-15 shows construction equipment vibration levels based on various reference distances. Construction vibration is a localized event and is typically only perceptible to a receptor that is in close proximity to the vibration source. High-rise buildings and development on sites with certain geologic conditions may require pile driving. Construction equipment would typically generate vibration levels up to 87 VdB at 25 feet, although pile driving could generate a vibration level of 112 VdB at 25 feet. Heavy equipment could potentially operate within 25 feet of nearby buildings.

Caisson drilling, loaded trucks, jackhammers, and bulldozers would not exceed the 90 VdB threshold for extremely fragile buildings. However, the vibration levels associated with pile driving could exceed the

thresholds for each of the identified sensitive building types: 98 VdB for engineering concrete and masonry buildings, 94 VdB for fragile buildings, and 90 VdB for extremely fragile buildings. The City's Office of Historic Resources has recorded Historic-Cultural Monuments (HCMs) in the CPA (see **Section 4.4, Cultural Resources**, for a detailed list of HCMs). In addition to designated HCMs, other historic uses and fragile buildings may exist within the Proposed Plan area due to the general age of buildings and early development of the area. Therefore, impacts related to construction vibration under anticipated development associated with the Proposed Plan would be ***potentially significant*** because its unknown if there would be projects of the size necessary to cause a significant impact adjacent to fragile buildings.

Table 4.11-15
Vibration Source Levels for Construction Equipment

Equipment	25 Feet	50 Feet	75 Feet	100 Feet
Pile Driver (Impact)	112	106	102	100
Pile Driver (Sonic)	105	96	91	87
Caisson Drilled Piles	87	81	77	75
Large Bulldozer	87	81	77	75
Loaded Trucks	86	80	76	74
Jackhammer	79	73	69	67

Source: FTA. Transit Noise and Vibration Impact Assessment. September 2018.

Operational Vibration

It is not anticipated that new development within the CPA would involve activities that would result in substantial vibration levels (e.g., blasting operations). Operational groundborne vibration in the vicinity of new development associated with the Proposed Plan would be primarily generated by vehicular travel on local roadways. According to the FTA *Transit Noise and Vibration Impact Assessment* guidance document, rubber tires and suspension systems dampen vibration levels from trucks to a level that is rarely perceptible.[28] Accounting for additional vehicle trips that would be accommodated by the Proposed Plan, traffic vibration levels would be similar to existing conditions and would not be perceptible by sensitive receptors. Therefore, impacts related to operational vibration under the Proposed Plan would be ***less than significant***.

28 FTA. Transit Noise and Vibration Impact Assessment. September 2018.

Mitigation Measures

Construction

MM-NOI-7 The following is required for any project, with the exception of project limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses, whose earthwork or construction activities: (1) involve the use of construction equipment, including Heavy Construction Equipment, that produces 0.12 PPV or more of vibration at a distance of 25 feet; (2) require a permit from LADBS; and (3) which occur:

- Within 25 feet of any building extremely susceptible to vibration damage, including unreinforced masonry buildings, tilt-up concrete wall buildings, wood-frame multi-story buildings with soft, weak or open front walls, and non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources Survey; or

- Within 15 feet of non-engineered timber and masonry buildings.

Or any project whose construction activities involve the use of pile drivers within 135 feet of any building extremely susceptible to vibration damage, including existing unreinforced masonry buildings, existing tilt-up concrete wall buildings, existing wood-frame multi-story buildings with soft, weak or open front walls, and existing non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources Survey.

Required standard: Prior to demolition, grading/excavation, or construction, a Qualified Structural Engineer shall prepare a survey establishing baseline structural conditions of potentially affected structures and a Vibration Control Plan, which shall include methods to minimize vibration, including, but not limited to:

- A visual inspection of the potentially affected structures to document (by video and/or photography) the apparent physical condition of the building (e.g., cracks, broken panes, etc.).

- A shoring design to protect the identified structures from potential damage;

- Use of drilled piles or a sonic vibratory pile driver rather than impact pile driving, when the use of vibrating equipment is unavoidable;
- Use of rubber-tired equipment rather than metal-tracked equipment; and
- Avoiding the use of vibrating equipment when allowed by best engineering practice.

MM-NOI-8 The following is required for any project, with the exception of projects limited to the construction of 2,000 square feet or less of floor area dedicated to residential uses, whose earthwork or construction activities: (1) involve the use of construction equipment, including Heavy Construction Equipment, that produces 0.12 PPV or more of vibration at a distance of 25 feet; (2) require a permit from LADBS; and (3) which occur:

- Within 25 feet of any building extremely susceptible to vibration damage, including unreinforced masonry buildings, tilt-up concrete wall buildings, wood-frame multi-story buildings with soft, weak or open front walls, and non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources survey; or
- Within 15 feet of non-engineered timber and masonry buildings.

Or any project whose construction activities involve the use of pile drivers within 135 feet of any building extremely susceptible to vibration damage, including existing unreinforced masonry buildings, existing tilt-up concrete wall buildings, existing wood-frame multi-story buildings with soft, weak or open front walls, and existing non-ductile concrete buildings, or a building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic resources Survey.

Required standard: In the event of damage to any non-historic building due to construction vibration, as verified by the Qualified Structural Engineer, a letter describing the damage to the impacted building(s) and recommendations for repair shall be prepared by the Qualified Structural Engineer within 60 days of the time when damage occurred. Repairs shall be undertaken and completed, at the owner's or applicant's expense, in conformance with all applicable codes.

In the event of vibration damage to any building that is designated or determined to be a historic resource pursuant to local or state law or that is determined to be potentially eligible for historic designation in a Historic Resources survey, a letter describing the damage to the impact building(s) and recommendations for repair shall be prepared by the Qualified Historian within 60 days of the time when damage occurred. Repairs shall be undertaken and completed, at the owner's or applicant's expense, in conformance with the California Historical Building Code (Title 24, Part 8) as well as the Secretary of the Interior's Standards for the Treatment of Historic Properties and associated guidelines, as applicable and as determined by the Qualified Historian.

Operation

No mitigation measures are required.

Significance after Mitigation

Construction

Development projects in the City of Los Angeles typically do not result in vibration damage even though vibration generating equipment is typically utilized for urban infill construction. Although most construction activities located in the CPA are not anticipated to have significant vibration impacts, it is possible that a small number of development projects in the CPA could have significant vibration impacts during construction. This would most commonly occur when a development project would be located next to building that are extremely susceptible to vibration damage such as a historical resource constructed of fragile building materials or unreinforced masonry buildings, which are more sensitive to vibration damage, than structures that were built based on more recent building codes. Mitigation Measures **MM-NOI-7** would require the preparation of a survey to establish baseline structural conditions of potentially affected structures and a Vibration Control Plan by a Qualified Structural Engineer when sensitive structures would be located within one of the specified distances. The survey would note the physical condition of potentially affected structures and the vibration control plan would specify measures to be taken to protect the structure from vibration damage. **MM-NOI-8** would require the repair of buildings in the event of vibration damage. However, it is difficult to quantify the vibration reduction associated with Mitigation Measure **MM-NOI-7** without knowing the specifics of a development project, including the distance from the equipment to the historical resource. Implementing caisson drilling instead of impact pile driving would reduce vibration levels from 112 VdB at 25 feet to approximately 87 VdB at 25 feet. The unmitigated analysis also concludes that vibration levels could exceed 98 VdB significance threshold for engineered concrete and masonry buildings without plaster (e.g., typical urban development), causing

building damage (including potentially to historical resources) or substantial human annoyance. Vibration is an unavoidable byproduct of construction activity. In an urban environment, vibration from construction equipment is related to the weight and movements of equipment. In the absence of specific development projects with detailed construction requirements and known adjacent uses, there is no way to determine specific potential for impact and feasible, appropriate mitigation to control equipment weight and movements from construction activity associated with each infill project.

It is anticipated that Mitigation Measure **MM-NOI-7** would document the physical condition of potentially affected structures and substantially reduce/control construction vibration. In addition, Mitigation Measure **MM-NOI-8** would provide a process for repair of vibration damage in the event it occurs . However, in the absence of construction details associated with specific projects and without knowing the proximity of construction activities to specific receptors, it is anticipated that construction vibration levels at certain particularly fragile adjacent buildings could exceed the thresholds of significance. Therefore, because its unknown if there would be projects of the size necessary to cause a significant vibration impact adjacent to fragile buildings this impact is considered ***significant and unavoidable***.

Operational

Impacts related to operational vibration were determined to be ***less than significant without mitigation***.

Thresholds 4.11-3 **Would the Proposed Plan be located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Proposed Plan expose people residing or working in the project area to excessive noise levels?**

No Impact would occur.

The CPA is not located within the vicinity of a private airstrip, an airport land use plan or within two miles of an airport.[29] New development would not expose people residing or working in the CPA to excessive noise related to airstrip or airport operations. Therefore, the Proposed Plan would have ***no impact*** related to airstrip or airport noise, and no further analysis of this issue is required.

Mitigation Measures

No mitigation measures are required.

[29] Los Angeles County Airport Land Use Commission, *Airport Influence Areas*, May 13, 2003.

Significance after Mitigation

No Impact.

4.11.7 CUMULATIVE ANALYSIS

For construction impacts, only the immediate area surrounding a specific development site is included in the cumulative context as the immediate area would be the most affected by construction noise. Typically, if a development site is 500 feet or more away from another site, then noise levels would have attenuated to a point that they would not combine to produce a cumulative noise impact. For operational/roadway related impacts, the context is the reasonably foreseeable development of the Proposed Plan, including existing and reasonably foreseeable future development within and outside the CPA. Noise is by definition a localized phenomenon and is significantly reduced in magnitude as distance from the source increases.

Construction -- Temporary Increase in Ambient Noise Levels

Construction noise impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of construction noise, the cumulative setting is development in the CPA and areas immediately adjacent to the CPA. Construction of future development projects in the city would produce temporary noise impacts. Cumulative development in the city, however, is not likely to result in the exposure of on-site or off-site sensitive receptors to excessive construction noise due to the localized nature of noise impacts, and the fact that all construction would not occur at the same time and at the same location. Therefore, only sensitive receptors located in close proximity to each construction site would be potentially affected by each construction activity.

Construction activities associated with reasonably anticipated development projects from the CPA may overlap for some time with construction activities for other development projects that are adjacent to, or within, the CPA. Typically, if a development site is 500 feet or more away from another site, then noise levels would have attenuated to a point that they would not combine to produce a cumulative noise impact. Therefore, construction noise levels would typically become cumulative if two development sites were to have construction occurring within 500 feet of each other.

Per LAMC, construction activities would be prohibited between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturdays and national holidays, and on Sundays. However, as discussed above, larger, or more unusual projects could result in significant short-term increases in noise levels. These projects could combine together, or combine with smaller projects, to substantially increase noise levels at specific land uses. Therefore, the significant and unavoidable construction noise impacts of the Proposed Plan could add to construction noise impacts associated with

cumulative development, especially on the periphery of the CPA where receptors could be exposed to noise sources from within and outside the CPA. The impact of the Proposed Plan is considered significant and unavoidable and therefore the incremental effect of the Proposed Plan related to construction noise would be cumulatively considerable.

Operational -- Permanent Increase in Ambient Noise Levels

Stationary Noise

Stationary noise impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for stationary noise sources, the cumulative setting is development in the CPA and areas immediately adjacent to the CPA. Future development in the City would include mechanical equipment, loading, trash pick-up, and other noise-generating activities. However, such activities would be typical of the urban environment within the City and any on-site activities would be required to comply with applicable provisions of the LAMC. Sources of stationary noise are generally well-regulated. The potential for any individual site to include a source of stationary noise that would be significant is unlikely and would be speculative to address, similarly the potential for overlapping of such sources is unlikely and would be speculative to address. Therefore, the incremental effect of the Proposed Plan with respect to stationary noise sources would not be cumulatively considerable**.**

Mobile Noise

The cumulative setting for mobile noise impacts is the City and adjacent communities because, as detailed in **Section 4.14, Transportation and Traffic,** the traffic associated with Proposed Plan and its alternatives was modeled with future forecasts using the City of Los Angeles Travel Demand Forecasting model. The traffic analysis presented herein considers the combined effect of project-generated traffic, existing traffic volumes and pass-through future traffic from areas both within and outside the CPA. **Table 4.11-14** presents the cumulative increase in future mobile source noise levels. The transportation analysis approach used in this analysis applied established traffic forecasting tools that have been empirically proven and previously accepted under CEQA. However, these forecasting tools may prove to be conservative if some of the recent trends (prior to the pandemic) in travel persist. It is not clear what direction the trends will take at this point. Vehicle miles traveled (VMT) per capita has been generally dropping since around 2004, increased for many decades prior, and has now begun to climb again since January 2014. Trends in the City are also pulling in multiple directions. If the trends toward higher levels of walking, bicycling, and transit use exceed what is forecast in this analysis, this could result in fewer driving related impacts than the Proposed Plan conservatively accounts for in this analysis. What drives mobile noise levels is changes in hourly or daily volumes along a particular road segment. Although VMT may be going up overall, it may

be because trips are longer, which does not necessarily translate to increased noise at a singular road segment.

As shown in **Table 4.11-14**, future mobile noise levels including reasonably anticipated development from the Proposed Plan would potentially increase noise levels by 3 dBA CNEL or more at one of the analyzed roadway segments when compared to existing conditions. Ambient noise levels at commercial uses within the CPA would not reach the "normally unacceptable" category based on noise level/land use compatibility standards in the City's General Plan Noise Element. However, residential uses would be exposed to ambient noise that is in the "normally unacceptable" range with implementation of the Proposed Plan. Many roadway segments are less than 1 dBA CNEL from this condition under existing (2016) conditions. The Proposed Plan would not incrementally increase noise levels by 3 dBA or more along any roadway segment and would not push residential uses into the "clearly unacceptable" category (noise levels above 75 dBA CNEL). Therefore, the cumulative impact is not significant and the incremental effect of the Proposed Plan on mobile source noise levels would not be cumulatively considerable.

Construction Vibration

Construction vibration impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of construction vibration, the cumulative setting is development in the CPA and areas immediately adjacent to the CPA. Construction of future development projects in the city would produce temporary vibration impacts. Cumulative development in the city is not likely to result in the exposure of on-site or off-site sensitive receptors to excessive ground-borne noise and vibration due to the localized nature of vibration impacts and the fact that all construction would not occur at the same time and at the same location. Therefore, only sensitive receptors located in close proximity to each construction site would be potentially affected by each individual activity.

Construction activities associated with reasonably anticipated development projects from the Proposed Plan may overlap for some time with construction activities for other development projects, which are adjacent to, or within the CPA. However, for the combined vibration impact from simultaneous construction projects to reach cumulatively significant levels, intense construction from these projects would have to occur simultaneously in close proximity to a sensitive receptor. Proposed Plan construction-related vibration would not result in additive vibration in combination with cumulative development in most areas of the city. However, individual development projects near the periphery of the CPA could potentially be constructed concurrently with other development adjacent to, but outside the CPA, such that intense construction from two or more projects would simultaneously occur in close proximity to existing sensitive receptors. Therefore, the significant and unavoidable construction vibration impacts from the Proposed Plan could add to vibration impacts associated with cumulative development on the periphery

of the CPA. The impact of the Proposed Plan is considered significant and unavoidable and therefore the incremental effect of the Proposed Plan on temporary vibration levels would be cumulatively considerable.

Operational Vibration

Operational ground-borne vibration impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of operational ground-borne vibration, the cumulative setting is development in the CPA and areas immediately adjacent to the CPA. Ground-borne vibration could conceivably be generated by the operation of future development projects within the City. It is not anticipated that new development within the CPA would include substantial sources of operational ground-borne vibration. It is reasonable to assume that other projects outside the CPA would have similar characteristics. Therefore, the incremental effect of the Proposed Plan related to operational vibration would not be cumulatively considerable.

Public Airports / Private Airstrips

Aircraft-related noise impacts occur only in the vicinity of airports or airstrips. Although Citywide growth could increase the number of people who are exposed to aircraft-related noise impacts, such impacts would be localized in nature. In addition, new development associated with the Proposed Plan would not increase aircraft-related noise impacts. Because no portion of the CPA is located in the vicinity of a public airport or private airstrip, the Proposed Plan would have no contribution to any cumulative impact related to these hazards. Therefore, the incremental effect of the Proposed Plan related to airport and air strip noise would not be cumulatively considerable.

4.12 POPULATION, HOUSING, AND EMPLOYMENT

4.12.1 INTRODUCTION

This section provides an overview of existing population, housing, and employment in the Boyle Heights CPA and evaluates impacts associated with the Proposed Plan. Topics addressed include the amount of population, housing, and employment growth expected and the potential displacement of existing residents resulting from implementation of the Proposed Plan. The section uses information from a variety of public agencies including the City of Los Angeles Department of City Planning (DCP), the United States Census Bureau (U.S. Census), the Southern California Association of Governments (SCAG), and the California Department of Finance (DOF).

In accordance with *CEQA Guidelines* Section 15131, the analysis is limited to those socioeconomic issues that could result in a direct change on the physical environment. Considering the effect of the Proposed Plan on property values and their economic effect on surrounding businesses are not considered environmental issues, and therefore are not analyzed.

4.12.2 EXISTING ENVIRONMENTAL SETTING

2016 Baseline Conditions

CEQA requires an EIR to compare existing physical conditions (baseline) to the physical conditions after implementation of a project. For purposes of the Proposed Plan, which plans for growth and development, there is no expected direct effect from the Proposed Plan (such as for a construction project), but there are expected indirect effects from the reasonably expected development that is anticipated to occur. To assess the impacts of the Proposed Plan requires determining reasonably expected development and identifying the current conditions. Both determinations rely in part on estimates of the current population, housing, and employment, and the forecasted growth in population, housing, and employment.

CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a proposed project as they exist at the time the NOP is published. The NOP for this EIR was published on September 2, 2016. Thus, the Draft EIR uses 2016 as the baseline existing conditions.[1] While SCAG's 2020-2045 RTP/SCS (adopted in September 2020) is the most recently adopted RTP, this document relies on the 2016-2040 RTP/SCS as the 2016-2040 RTP/SCS was the RTP/SCS available at the time of the NOP publication and scoping. Further, the most up to date and validated Los Angeles

1 For more information on SCAG's forecasting methodology and assumptions, see the Demographics & Growth Forecast Appendix of the 2016-2040 RTP/SCS website, http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_DemographicsGrowthForecast.pdf.

Transportation Demand Forecasting (TDF) model contains data and information from the 2016-2040 RTP/SCS; this model and its outputs are used in various sections of this Draft EIR and therefore, the 2016 RTP/SCS is utilized as the analysis baseline throughout this document.

For the 2016 RTP/SCS, SCAG utilized demographic data (households, population, and employment) from a baseline year of 2012 and made projections for 2040. To address the time gap between 2012 and 2016, the demographic data from 2012 were interpolated to estimate 2016 existing conditions. SCAG's estimated 2016 population for the Boyle Heights CPA was 86,504 persons. Annual demographics data are not immediately available and there is usually a lag time in the data release. Therefore, the interpolated population numbers using an annual average growth rate represented the most reasonable estimate available in 2016. During the preparation of this EIR, SCAG adopted Connect SoCal (2020-2045 RTP/SCS) in 2020, which shows similar growth patterns within the Boyle Heights CPA as the 2016 RTP/SCS. The latest adopted RTP/SCS used a baseline year of 2016. For the Boyle Heights CPA, SCAG utilized a 2016 estimated population of 83,487 persons. As noted in the table below, this difference is approximately a three percent reduction from the Proposed Plan's EIR baseline. Further, in comparing baseline conditions for households and employment, the difference between the 2016 RTP and 2020 RTP is marginal (less than five percent). Since 2016, there has not been a substantial increase in either dwelling units or jobs within the CPA that would necessitate a different baseline value.[2]

Population

Table 4.12-1 presents Citywide and CPA population data for 2010, 2016, and 2020. The variation in population estimates is attributed to the use of different forecasts models by the U.S. Census, the California Department of Finance, and SCAG. As shown in the table, Citywide population increased from approximately 3,790,000 residents in 2010 to 3,944,000 residents in 2016, resulting in a net population growth of 154,000 residents and a population increase of four percent. In comparison, the Boyle Heights CPA had approximately 85,000 residents in 2010 and increased to approximately 86,000 residents in 2016, resulting in a net population growth of approximately 1,000 residents or a 1.2% increase between 2010 and 2016. The change in population growth within the CPA was much smaller than Citywide population growth.

2 See **Appendix B, Methodology**, for more information regarding the use of the 2016-2040 RTP/SCS for the baseline and supplemental data from the 2020-2045 RTP/SCS.

Table 4.12-1
Population in the Boyle Heights Community Plan Area*

Planning Area	2010 Census	2016 (Baseline)	2020 Census	2020 RTP	Percent of Citywide Existing Population	Net Population Change 2010-2016	Percent Change in Population [1]
Citywide	3,790,000	3,944,000	3,899,000	3,933,800	100%	154,000	4%
Boyle Heights*	85,000	86,000	82,000	83,000	2%	1,000	1%

Notes: Numbers are rounded to the nearest thousand, and percentages are calculated from the rounded values. *"% Change in Population" is the sum of "Net Population Change" divided by "2010 Census".*

Housing

The CPA contains approximately 1,258 acres of land designated for residential use, approximately 42% of the land area within the CPA.

Multi-family land consists of 98% of all residential land uses within the CPA. The denser multi-family residential within Boyle Heights is concentrated around the core of the CPA surrounding the intersection of Cesar E. Chavez Avenue and Soto Street to the south and west, and the area between Cesar E. Chavez Avenue and 1st Street, on either side of Soto Street. Lower density multi-family residential can be found along the edges of the CPA and between freeway boundaries south of Interstate 10 (I-10) and north of State Route 60 (SR-60) along city limits with unincorporated Los Angeles County.

Single-family residential land uses make up the remaining 2% of residential land use in Boyle Heights. These existing low-density areas can be found in three small clusters near the edges of the CPA: south of Los Angeles County/USC Medical Center; tucked within the northeast corner of the CPA south of the I-10 and west of the city limits; and just south of SR-60 along the city limits boundary.

Table 4.12-2 presents Citywide and CPA housing data for 2010 and 2016. As shown therein, the number of housing units Citywide increased from approximately 1,414,000 housing units in 2010 to 1,453,000 housing units in 2016, resulting in a net growth of approximately 39,000 housing units and an increase of 3%. In comparison, the CPA had approximately 23,000 housing units in 2010 and 22,000 housing units in 2016, showing a net loss of 1,000 housing units and a decrease of -4.4%. Housing units can be accounted for in

different ways by providers of demographic data. As noted above, the variation in housing estimates is attributed to the use of different forecasts models. SCAG accounts for housing units by providing only an estimate of the number of households, or occupied housing units, meaning that vacant units are excluded. Other demographic data sources, such as the 2010 Census and the Department of Finance, provide the total housing unit number, including both occupied units and vacant units. Historically, the Citywide vacancy rate has been approximately 5 percent, although recent housing trends have reduced the vacancy rate making for a tight housing market.

Table 4.12-2
Housing Inventory in the Boyle Heights Community Plan Area*

Planning Area	2010 Census	2016 (Baseline)	2020 Census	2020 RTP	Percent of Citywide Existing 2016 Housing	Net Housing Change 2010-2016	Percent Change in Housing 2010-2016
Citywide	1,414,000	1,453,000	1,496,000	1,367,000	100%	39,000	3%
Boyle Heights*	23,000	22,000	24,000	22,000	2%	-1,000	-4%

** City of Los Angeles Department of City Planning.*
Notes: Numbers are rounded to the nearest thousand, and percentages are calculated from the rounded values. For conservative purposes, this forecast assumes there are no vacant units and all forecasted units are occupied.

The housing market is driven by supply and demand and can be influenced by population growth, income, housing unit cost, and housing locations. Age distribution is also a key market characteristic because housing demand within the CPA can be influenced by the housing preference of certain age groups due to limited income. In many cases, the majority of the young adult population (20 to 34 years old) tends to occupy apartments and smaller single-family units. The population in the 35- to 65-year-old age bracket occupies a range of housing types, including larger single-family homes and apartments, based on income, household sizes, and occupancy. Housing demand for the elderly population would also fall into this category as well as assisted living homes and nursing homes. Affordability of housing is increasingly a concern in the CPA as well as the City as a whole and may continue to be a challenge in 2040 based on current trends.

Employment

Table 4.12-3 shows Citywide and CPA employment trends for 2010, 2016, and 2020. As previously discussed, the variation in employment estimates is attributed to the use of different forecasts models by the U.S. Census, the California Department of Finance, and SCAG. As shown below, Citywide employment increased from approximately 1,605,000 jobs in 2010 to 1,823,000 jobs in 2016, resulting in a net increase of approximately 218,000 jobs and a 14% increase in employment. In comparison, CPA employment increased from approximately 21,000 jobs in 2010 to 26,000 jobs in 2016, resulting in a 24% increase in employment. Based on the table below, employment within the CPA accounts for approximately 1.3% of the Citywide employment. Jobs-to-housing unit ratio is a general measure of the total number of jobs and housing units in a defined geographic area, without regard to economic constraints or individual preferences.[3]

Table 4.12-3
Employment Trends in the Boyle Heights Community Plan Area*

Planning Area	2010 Census	2016 (Baseline)	2020 RTP	Percent of Citywide Existing 2016 Employment	Net Employment Change 2010-2016	Percent Change in Employment 2010-2016
Citywide	1,605,000	1,823,000	1,848,300	100%	218,000	14%
Boyle Heights*	21,000	26,000	27,000	1%	5,000	24%

4.12.3 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Population, Housing, and Employment at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Comprehensive Housing Affordability Study (CHAS)

3 Job-to-housing ratio is determined by dividing employment by housing.

- Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Relocation Act)
- California Housing Element Law: California Government Code Section 65583 and 65584(a)(1)
- Fair Employment and Housing Act (FEHA)
- The Unruh Civil Rights Act
- Senate Bill 2
- Senate Bill 9
- Senate Bill 375
- Housing Crisis Act of 2019 – (SB 330, Skinner)
- Density Bonus Incentives (Government Code Section 65915)
- Relocation Assistance: California Government Code Section 7261(a)
- Assembly Bill (AB 2222)
- State Accessory Dwelling Unit (ADU) Laws
- California Housing Accountability Act
- Homeowners and Private Property Protection Act (Proposition 99)
- Southern California Association of Governments
- Regional Transportation Plan/Sustainable Communities Strategy
- Regional Housing Needs Assessment
- Measure H
- City of Los Angeles General Plan
- Los Angeles Municipal Code
- Affordable Housing and Labor Standards Initiative (Proposition JJJ)
- Transit Oriented Communities (TOC) Affordable Housing Incentive Program
- Affordable Housing Linkage Fee (AHLF) Ordinance
- Affordable Housing Trust Fund
- Density Bonus Ordinance

- Homelessness Reduction and Prevention, Housing, and Facilities Bond (Proposition HHH)
- Residential Hotel Unit Conversion and Demolition Ordinance
- Rent Stabilization Ordinance
- City of Los Angeles Accessory Dwelling Units (Ordinance No. 186481)
- Green New Deal
- Development Guidelines and Controls for City Center and Central Industrial Redevelopment Project Areas
- The Housing Authority of the City of Los Angeles (HACLA) Year 2018 Agency Plan (Agency Plan)
- City of Los Angeles Consolidated Plan (2013-2017)
- Plan for a Healthy LA (General Plan Health, Wellness and Equity Element)

Federal

Comprehensive Housing Affordability Study (CHAS). CHAS was enacted by the Cranston-Gonzalez National Affordable Housing Act of 1990 and was run by the U.S. Department of Housing and Urban Development (HUD). The primary purpose of the CHAS data is to demonstrate the number of households in need of housing assistance. This is estimated by the number of households that have certain housing problems and have income low enough to qualify for HUD's programs (primarily 30, 50, and 80 percent of median income). CHAS also considers the prevalence of housing problems among different types of households, such as the elderly, disabled, minorities, and different household types. The CHAS data provide counts of the numbers of households that fit these HUD-specified characteristics in HUD-specified geographic areas.

In addition to estimating low-income housing needs, the CHAS data contribute to a more comprehensive market analysis by documenting issues such as lead paint risks, affordability mismatch, and the interaction of affordability with variables such as age of homes, number of bedrooms, and type of building.

Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Relocation Act). The Uniform Relocation Act (Public Law 91-646) provides important protections and assistance for people affected by federally funded projects. This law was enacted by Congress to ensure that people whose real property is acquired, or who move as a result of projects receiving federal funds, will be treated fairly and equitably and will receive assistance in moving from the property they occupy.

State

California Housing Element Law: California Government Code Section 65583 and 65584(a)(1). Section 65583 of the California Government Code requires cities and counties to prepare a housing element, as one of the state-mandated elements of the General Plan, with specific direction on its content. Pursuant to Section 65584(a)(1) the California Department of Housing and Community Development (HCD) is responsible for determining the regional housing needs assessment (segmented by income levels) for each region's planning body known as a "council of governments" (COG), the Southern California Association of Governments (SCAG) being the COG serving the Southern California area. HCD prepares an initial housing needs assessment and then coordinates with each COG in order to arrive at the final regional housing needs assessment. To date, there have been four previous housing element update "cycles." California is now in its fifth "housing-element update cycle." The SCAG Regional Housing Needs Assessment (RHNA) and the City's General Plan Housing Element are discussed further below.

Fair Employment and Housing Act (FEHA). The FEHA of 1959 (Government Code Section 12900 et seq.) prohibits housing discrimination on the basis of race, color, religion, sexual orientation, marital status, national origin, ancestry, familial status, disability, or source of income.

The Unruh Civil Rights Act. The Unruh Civil Rights Act of 1959 (Civ. Code Section 51) prohibits discrimination in "all business establishments of every kind whatsoever." The provision has been interpreted to include businesses and persons engaged in the sale or rental of housing accommodations.

Senate Bill 2. California SB 2, adopted in 2007 and effective January 2008, amended the HAA and the State Housing Element Law to require local governments to take specific zoning actions to encourage the development of emergency shelters and transitional and supportive housing. It also clarifies that under the HAA, a jurisdiction cannot deny applications for such types of housing and shelter without making specific evidence-based findings.

Senate Bill 9. On September 16, 2021 Governor Newson signed Senate Bill (SB) 9, the California Housing Opportunity and More Efficiency (HOME) Act,[4] which facilitates the process for building two dwelling units on a single-family residential lot or splitting a single-family residential lot into two lots (urban lot split), allowing for a total of up to four units on the two lots, by ministerial approval, if the housing development meets certain requirements. When a lot is subdivided into two, one parcel shall not be smaller than 40 percent of the lot area of the original parcel and both parcels may not be smaller than 1,200 square

4 State of California Office of Governor Newsom, *Governor Newsom Signs Historic Legislation to Boost California's Housing Supply and Fight the Housing Crisis,* September 2021. Available online at: https://www.gov.ca.gov/2021/09/16/governor-newsom-signs-historic-legislation-to-boost-californias-housing-supply-and-fight-the-housing-crisis/. Accessed November 23, 2021.

feet each. The owner will need to sign an affidavit stating they intend to occupy one of the units from the urban lot split as their primary residence for at least three years.[5]

To be eligible for SB 9, the single-family lot must not be located within a historic district, included on the State Historic Resources Inventory, or designated or listed as a city or county landmark or historic property or district. Housing that is 1) subject to a recorded covenant, ordinance, or law that restricts rents to levels affordable to persons and families of moderate, low, or very low income or 2) has been occupied by a tenant in the last three years may not be demolished or altered. In addition, the parcel has to satisfy the requirements specified in subparagraphs (B) to (K), inclusive, of paragraph (6) of subdivision (a) of Section 65913.4.[6] Paragraph (6) subparagraphs (B) to (K) of Section 65913.4 excludes development that are located on specific types of hazard or protected sites, including prime farmland or farmland of statewide importance, wetlands, within a very high fire hazard severity zone, designated hazardous waste sites, special flood hazard areas subject to 100-year floods.[7]

Senate Bill 375. Senate Bill (SB) 375 focuses on aligning transportation, housing, and other land uses to achieve regional greenhouse gas (GHG) emission reduction targets established under the California Global Warming Solutions Act, also known as Assembly Bill (AB) 32. SB 375 requires Metropolitan Planning Organizations (MPO) to develop a Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP), with the purpose of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. As set forth in SB 375, the SCS must: (1) identify the general location of land uses, residential densities, and building intensities within the region; (2) identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period; (3) identify areas within the region sufficient to house an eight-year projection of the regional housing need; (4) identify a transportation network to service the regional transportation needs; (5) gather and consider the best practically available scientific information regarding resource areas and farmland in the region; (6) consider the state housing goals; (7) establish the land use development pattern for the region that, when integrated with the transportation network and other transportation measures and policies, will reduce GHG emissions from automobiles and light-duty trucks to achieve GHG emission reduction targets set by the California Air Resources Board

6 Senate Bill 9 (Published 09/17/21). https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=202120220SB9. Accessed November 23, 2021.

7 Government Code Section 65913.4. https://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?sectionNum=65913.4.&lawCode=GOV. Accessed November 23, 2021.

(CARB), if there is a feasible way to do so; and (8) comply with air quality requirements established under the Clean Air Act.

Existing law requires local governments to adopt a housing element as part of their general plan and update the housing element as frequently as needed and no less than every five years. Under SB 375, this time period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the RTP, to encourage closer coordination between housing and transportation planning. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program that set forth a five-year schedule to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period and requires that each action have a timetable for implementation. SB 375 also requires that the schedules for the regional transportation plan (RTP) and RHNA processes be synchronized and requires the RHNA to allocate housing units within the region in a manner consistent with the development pattern adopted by the SCS.

As discussed further below, on September 3, 2020, SCAG adopted its Connect SoCal: The 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020-2045 RTP/SCS), which is an update to the previous 2016 RTP/SCS. Using growth forecasts and economic trends, the RTP/SCS provides a vision for transportation throughout the region for the next 25 years that achieves the statewide reduction targets; and in so doing identifies the amount and location of growth expected to occur within the region.

Housing Crisis Act of 2019 (SB 330, Skinner). On October 9, 2019, the Governor signed into law the Housing Crisis Act of 2019 (SB 330). SB 330 seeks to speed up housing production in the next half decade by eliminating some of the most common entitlement impediments to the creation of new housing, including delays in the local permitting process and cities enacting new requirements after an application is complete and undergoing local review—both of which can exacerbate the cost and uncertainty that sponsors of housing projects face. In addition to speeding up the timeline to obtain building permits, the bill prohibits local governments from reducing the number of homes that can be built through down-planning or down-zoning or the introduction of new discretionary design guidelines. The bill is in effect as of January 1, 2020, but is temporary in nature as the bill's provisions expire on January 1, 2025.

Density Bonus Incentives (Government Code Section 65915). The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with (1) at least 10 percent housing for lower income households; (2) at least five percent of the housing for very low-income households; (3) a senior citizen housing development or mobile home park restricted to older persons; and (4) at least 10 percent of the total dwelling units in

common interest development for moderate-income families or persons. AB 1763, effective January 1, 2020, amends the State Density Bonus Law (Section 65915) to allow for taller and denser 100 percent affordable housing developments, especially those near transit, through the creation of an enhanced affordable housing density bonus.

Relocation Assistance: California Government Code Section 7261(a). Section 7261(a) of the California Government Code requires that programs or projects undertaken by a public entity shall be planned in a manner that (1) recognizes, at an early stage in the planning of the programs or projects and before the commencement of any actions which will cause displacements, the problems associated with the displacement of individuals, families, businesses, and farm operations, and (2) provides for the resolution of these problems in order to minimize adverse impacts on displaced persons and to expedite program or project advancement and completion. The head of the displacing agency shall ensure the relocation assistance advisory services are made available to all persons displaced by the public entity. If the agency determines that any person occupying property immediately adjacent to the property where the displacing activity occurs is caused substantial economic injury as a result thereof, the agency may make the advisory services available to the person.

Assembly Bill (AB) 2222. On September 27, 2014, the governor signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222 requires that density bonus projects resulting in a loss of existing affordable and otherwise locally-regulated (i.e., rent-stabilized) housing units replace those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units. Several other clarifications of the existing law are also included but did change current City policy.

State Accessory Dwelling Unit (ADU) Laws. Accessory Dwelling Units (ADU) are a valuable form of housing and an essential component of the state's housing supply as declared by the California Legislature and are allowed in zones that allow single-family and multi-family housing, in Government Code Section 65852.150. An ADU is an accessory dwelling unit with complete independent living facilities for one or more persons and has several forms, meaning it can be detached from the primary structure, attached to the primary structure, or be converted existing space Updated ADU laws became effective on January 1, 2021 that further reduce barriers, streamline approval processes, and accommodate the development of ADUs and junior accessory dwelling units (JADUs). A JADU is converted existing space that is contained entirely within a single-family residence. The state's ADU law is the statutory minimum requirement and

local governments may go beyond the statutory minimum and adopt local ADU ordinances, but in consistency with Section 65852.150.[8]

California Housing Accountability Act. The Housing Accountability Act (HAA; SB 167) is a California state law designed to promote infill development by speeding housing approvals. The HAA was passed in 1982 in recognition that the lack of housing, including emergency shelter, is a critical statewide problem. The HAA empowers the State of California to limit the ability of local government to restrict the development of new housing.

Homeowners and Private Property Protection Act (Proposition 99). In 2008, California voters approved Proposition 99, the Homeowners and Private Property Protection Act, which amended the California Constitution so that local governments are prohibited from using eminent domain authority to acquire an owner-occupied residence for the purposes of conveying it to a private recipient, with limited exceptions. Proposition 99 applies only to owner-occupied residences. Cities may still use eminent domain authority to convey multi-family and non-residential property to other private parties.

Regional

Southern California Association of Governments. The City of Los Angeles is located within the jurisdiction of SCAG, a Joint Powers Agency established under California Government Code Section 6502 et seq. Pursuant to federal and State law, as discussed above, SCAG serves as a Council of Governments, a Regional Transportation Planning Agency, and the (Metropolitan Planning Organization (MPO) for Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial Counties. SCAG's mandated responsibilities include developing plans and policies with respect to the region's population growth, transportation programs, air quality, housing, and economic development. Specifically, SCAG is responsible for preparing the RTP/SCS and RHNA, in coordination with other State and local agencies. These documents include population, employment, and housing projections for the region and its 15 subregions. The City of Los Angeles is located within the Los Angeles Subregion.

SCAG is tasked with providing demographic projections for use by local agencies and public service and utility agencies in determining future service demands. Projections in the SCAG RTP/SCS serve as the basis for demographic estimates in this analysis of Project consistency with growth projections. The findings regarding growth in the region are consistent with the methodologies prescribed by SCAG and reflect SCAG goals and procedures.

---

8 Accessory Dwelling Unit Handbook, California Department of Housing and Community Development. https://www.hcd.ca.gov/policy-research/docs/adu_december_2020_handbook.pdf. Accessed November 23, 2021.

SCAG data is periodically updated to reflect changes in development activity and actions of local jurisdictions (e.g., zoning changes). Through these updates, public agencies have advance information regarding changes in growth that must be addressed in planning for their provision of services. Changes in the growth rates are reflected in the new projections for service and utilities planning through the long-term time horizon.

Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Pursuant to Government Code Section 65080(b)(2)(B), SCAG must prepare a RTP/SCS which (1) identifies the general location of uses, residential densities, and building intensities within the region; (2) identify areas within the region sufficient to house all the population of the region over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth; (3) identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Government Code Section 65584; (4) identify a transportation network to service the transportation needs of the region; (5) gather and consider the best practically available scientific information regarding resource areas and farmland in the region; and (6) consider the state housing goals specified in Sections 65580 and 65581, (7) set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the GHG emissions from automobiles and light trucks to achieve the GHG reduction targets approved by the state board, and (8) allow the RTP to comply with air quality conformity requirements under the federal Clean Air Act.

On September 3, 2020, SCAG's Regional Council adopted the Connect SoCal 2020–2045 RTP/SCS. On October 30, 2020, CARB accepted SCAG's determination that the SCS would achieve GHG emission reduction targets. The 2020-2045 RTP/SCS meets federal and state requirements and is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS contains baseline socioeconomic projections that serve as the basis for SCAG's transportation planning. It includes projections of population, households, and employment forecasted for the years 2020, 2030, 2035, and 2045 at the regional, county, and local jurisdictional levels, and Traffic Analysis Zones (TAZ) that provide small area data for transportation modeling.[9] However, TAZ-level

[9] Southern California Association of Governments, 2020 RTP/SCS, Demographics & Growth Forecast Appendix, https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_demographics-and-growth-forecast.pdf Accessed May 16, 2022.

projections are utilized by SCAG for regional modeling purposes and are not adopted as part of Connect SoCal nor included as part of the Forecasted Regional Development Pattern.[10]

Regional Housing Needs Assessment. SCAG prepares the RHNA mandated by State law so that local jurisdictions can use this information during their periodic update of the General Plan Housing Element. The RHNA identifies the housing needs for very low income, low income, moderate income, and above moderate-income groups, and allocates these targets among the local jurisdictions that comprise SCAG. The RHNA addresses existing unmet needs and future housing needs. The need for new housing is distributed among income groups so that each community moves closer to the regional average income distribution. The most recent RHNA allocation, the "6th Cycle RHNA Allocation Plan," was adopted by SCAG's Regional Council on March 22, 2021.[11] The City of Los Angeles was assigned a RHNA of 456,643units, of which 184,721 units must be affordable to lower income households (Very Low and Low levels) for the October 2021 to October 2029 planning period. Local jurisdictions are required by State law to update their General Plan Housing Elements based on the most recently adopted RHNA allocation.

Measure H. Measure H is a county sales tax measure that was passed by Los Angeles County voters in March 2017. Through ¼-cent sales tax, Measure H is expected to generate $355 million a year for 10 years in funding dedicated to fighting homelessness. The five-year goal is to provide permanent housing for 45,000 families and individuals, while preventing homelessness for 30,000 others. In June 2017, the Board of Supervisors approved funding allocations for each of the Measure H-eligible Homeless Initiative strategies and detailed implementation plans were developed for new strategies and those that are significantly expanded and/or enhanced with Measure H funding.

Local

City of Los Angeles General Plan (Framework Element, Housing Element, Land Use Element). The City General Plan was prepared pursuant to State law to guide future development and to identify the community's environmental, social, and economic goals. The General Plan sets forth goals, objectives, and programs to provide a guideline for day-to-day land use policies and to meet the existing and future needs and desires of the community, while at the same time integrating a range of State-mandated elements including Transportation, Noise, Safety, Housing, Open Space/Conservation, and Environmental Justice.

10 Southern California Association of Governments, 2020 RTP/SCS, Demographics & Growth Forecast Appendix, page 27 https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_demographics-and-growth-forecast.pdf Accessed May 16, 2022.

11 SCAG 6th Cycle Final RHNA Allocation Plan. https://scag.ca.gov/sites/main/files/file-attachments/6th-cycle-rhna-final-allocation-plan.pdf?1625161899. Accessed November 24, 2021.

The General Plan also includes the General Plan Framework Element (General Plan Framework), discussed below, and the Community Plan, which guides land use at the level of the community plan area.

Framework Element. The General Plan Framework sets forth a Citywide comprehensive long-range growth strategy and defines Citywide policies regarding land use, housing, urban form, neighborhood design, open space and conservation, economic development, transportation, infrastructure, and public services.[12] General Plan Framework land use policies are implemented at the community level through the City's Community Plans and Specific Plans.

The General Plan Framework also includes population, housing, and employment projections to guide future Community Plan amendments. However, the General Plan Framework makes clear that its population forecasts are estimates for guiding amendments: "… it [Framework Element] is not dependent upon these population levels or distributions for its implementation. It does not mandate specific levels of growth for any specific area (neither minimums nor caps)."[13]

The General Plan Framework housing chapter states that housing production has not kept pace with the demand for housing. According to the General Plan Framework, the City has insufficient vacant properties to accommodate the projected population growth and the supply of land zoned for residential development is constrained.[14] The Housing Chapter states that new residential development will require the recycling and/or intensification of existing developed properties.[15] The General Plan Framework states that the City must strive to meet the housing needs of the population in a manner that contributes to stable, safe, and livable neighborhoods, reduces conditions of overcrowding, and improves access to jobs and neighborhood services, particularly by encouraging future housing development near transit corridors and stations.[16] The Housing Chapter includes goals, objectives and policies to guide future development.[17] In particular, Policy 4.1.1 states that the City should "[p]rovide sufficient land use and density to accommodate an adequate supply of housing units by type and cost within each City subregion to meet the 20-year projections of housing needs." Objective 4.2 "[e]ncourage[s] the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within

some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods."

Housing Element. The Housing Element of the General Plan is prepared pursuant to State law and provides planning guidance in meeting the housing needs identified in SCAG's RHNA. The Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides the array of programs the City intends to implement to create sustainable, mixed-income neighborhoods. The State requires that the Housing Element include a detailed analysis of the City's demographic, economic and housing characteristics; a comprehensive analysis of constraints to producing and preserving housing; a review of the City's progress in implementing current housing policies and programs; an identification of goals, objectives, and policies, in addition to a full list of program that will implement the vision of the plan; and a list of sites that could accommodate new housing, demonstrating the City's ability to meet its RHNA allocation.[18]

The 2021-2029 Housing Element, an update to the previous 2013-2021 Housing Element that is based on the updated 2021 RHNA, was adopted by the City Council on November 24, 2021 with additional targeted amendments being adopted on June 14, 2022.[19] Policies include Policy 1.1.2, which states that the City should "[p]lan for appropriate land use designations and density to accommodate an ample supply of housing units by type, cost, and size within the City to meet housing needs, according to Citywide Housing Priorities and the City's General Plan."[20] Also, Policy 1.1.6, states that the City should "[a]llocate citywide housing targets across Community Plan areas in a way that seeks to address patterns of racial and economic segregation, promote jobs/housing balance, provide ample housing opportunities, and affirmatively further fair housing."[21] The Housing Element carries forward the goals of the Framework Element Housing chapter to encourage the development of livable neighborhoods and preservation of the housing supply.

Further, Chapter 1, Housing Needs Assessment, identifies the City's share of the housing needs established in the RHNA. In particular, Table 1.27, City of Los Angeles Regional Housing Needs Assessment

Allocation, indicates that the City's needs assessment allocation includes 456,643housing units.[22] Of that total number, approximately 40 percent of the units (184,732 units) must be affordable to Very Low- and Low-income households. The identified housing needs represent targets to be met and do not establish development caps. The allocation of 456,643 housing units represents one-third of the total need of 1,341,827 housing units identified for the six-county SCAG region. The percentage significantly increased from the previous housing needs cycle (5th cycle) and City proportion, which was approximately one-fifth of the regional need for the same types of units. As previously stated, there is a significant increase because the current housing needs cycle includes existing unmet housing needs in the allocation number. The City's 2021-2029 Housing Element identified an anticipated shortfall and the need for a Rezoning Program, which "prioritizes additional housing capacity, particularly lower-income capacity, in Higher Opportunity Areas, promotes housing near transit, and protects environmentally sensitive areas."[23]

Land Use Element/Community Plans. The Land Use Element of the City's General Plan includes 35 community plans. Community plans are intended to provide an official guide for future development and propose approximate locations and dimensions for land use. The community plans establish standards and criteria for the development of housing, commercial uses, and industrial uses, as well as circulation and service systems. The community plans implement the City's General Plan Framework at the local level. The community plans consist of both text and an accompanying generalized land use map. The community plans' texts express goals, objectives, policies, and programs to address growth in the community. The community plans' maps depict the desired arrangement of land uses as well as street classifications and the locations and characteristics of public service facilities. Per State law, each community plan must be consistent with the other elements and components of the General Plan and, thus, incorporates information from these plans. The Community Plan includes residential, commercial, and industrial objectives and policies that establish a development concept for its neighborhoods and districts.

Los Angeles Municipal Code. Zoning regulations provide for the types and densities of commercial, institutional, industrial, and residential uses permitted in each of the City's zones. Zoning in the City establishes the maximum allowable development in a zone. Zoning also includes height limitations and other development standards which together regulate setbacks, building heights, floor area ratios (FAR), open space and parking for each parcel within the City, as applicable.

The LAMC is currently undergoing a comprehensive update to all Zoning Code sections as part of the re:code LA effort. re:code LA, which started in 2013, will update the Zoning Code to make the Code more

streamlined, visual, and easy to use. The existing Zoning Code will continue to be located in Chapter 1 of the Los Angeles Municipal Code, while the New Zoning Code will be located in a new Chapter 1A of the Los Angeles Municipal Code.

Affordable Housing and Labor Standards Initiative (Proposition JJJ). Proposition JJJ, approved on November 8, 2016, is a measure to impose affordable housing and local labor hiring requirements on new development projects, as well as set a minimum wage for hired construction workers. The measure included a number of key provisions. All development projects that include 10 or more residential units and require changes to the General Plan or other zoning are required to make a percentage of the units affordable to low-income and working residents or pay a fee to fund affordable housing and enforce laws that protect renters. Developers are required to make as much as 20 percent of the units in a project affordable for low-income and working renters. That number can be as high as 40 percent for homes that are for sale.

Developers of any such residential projects are required to hire contractors who:

- Are licensed according to city and state law;
- Guarantee to offer at least 30 percent of work-hours to city residents, with 10 percent coming from those living within five miles of the project;
- Pay standard wages for the area; and
- Employ members of apprenticeship training programs and workers with real-world experience.

Moreover, projects planned around public transit within a half mile of significant public transit stops are encouraged through an incentive program that applies only to projects that include affordable housing and require contractors to comply with the restrictions laid out in the bulleted list above.

Transit Oriented Communities (TOC) Affordable Housing Incentive Program. Pursuant to the voter-approved Measure JJJ, LAMC Section 12.22 A.31 was added to create the Transit Oriented Communities (TOC) Affordable Housing Incentive Program (TOC Program). The program provides incentives for developers to build affordable housing located within a one-half mile radius of major transit stops; see **Section 4.10, Land Use and Planning**, for more information. All development projects that include 10 or more residential units and involve a zone change, general plan amendment, or height district change would be subject to the new requirements.

Affordable Housing Linkage Fee (AHLF) Ordinance. The City Council adopted the AHLF Ordinance on December 13, 2017 and became effective on February 17, 2018, with a phased-in fee structure. The AHLF

Ordinance places a fee on certain new market-rate residential and commercial developments to generate local funding for affordable housing. The fee amount is based on the fee schedule in effect at the time the building permit for a project is issued, and the market area within which it is located. Fees will be adjusted annually for inflation beginning July 1, 2019, using the Consumer Price Index (CPIU). The market areas may be updated by City Council every five years beginning July 1, 2023.

Affordable Housing Trust Fund. The City created and administers the Affordable Housing Trust Fund (Fund), which is codified in the LAMC. The Fund establishes a special fund for the purposes of receiving and disbursing monies to address the affordable housing needs of the City. The Fund requires 25 percent of the received initial and continuing net revenue of the 2001 business tax and payroll expense tax amnesty program and the revenue program of the Revenue and Taxation Code Section 1955.1 (Assembly Bill 63) be allocated to the Fund.

Density Bonus Ordinance. The purpose of the City's Density Bonus Ordinance, codified as LAMC Section 12.22 A.25, is to establish procedures for implementing State Density Bonus requirements, as set forth in California Government Code Sections 65915-65918, and to increase the production of affordable housing, consistent with City policies. Subject to the provisions of LAMC Section 12.22 A.25, housing development projects that include an affordable housing component and senior citizen housing development projects may be granted a density bonus, allowing for a density increase over the otherwise maximum allowable residential density under the applicable zoning ordinance and/or specific plan. The density bonus is determined based on the percentage and type of restricted affordable housing units provided and shall not exceed 35 percent. The amount of parking required for these projects may also be reduced. In addition, a housing development project that qualifies for a density bonus may be granted incentives set forth in the ordinance that allow for modification to a City development standard or requirement.

Homelessness Reduction and Prevention, Housing, and Facilities Bond (Proposition HHH). Proposition HHH, approved on November 8, 2016, is a $1.2 billion general obligation bond to finance the construction of supportive and affordable housing for homeless people in the City. The purpose of the bond is to provide safe, clean affordable housing for the homeless and for those in danger of becoming homeless, such as battered women and their children, veterans, seniors, foster youth, and the disabled; and provide facilities to increase access to mental health care, drug and alcohol treatment, and other services.

Residential Hotel Unit Conversion and Demolition Ordinance. The Residential Hotel Unit Conversion and Demolition Ordinance (RHO) prohibits conversion or demolition of dwelling units in a residential hotel without approval from the Housing + Community Investment Department (HCIDLA). The ordinance adds Article 7.1 to Chapter IV of the LAMC and amends Sections 91.106.4.1, 151.06, and 151.09 (City of Los

Angeles 2008). The ordinance seeks to preserve dwelling units provided by residential hotels, which often serve as affordable housing for the very low income, elderly, and disabled (HCIDLA 2018).

Rent Stabilization Ordinance. The City's RSO was established in response to the shortage of affordable housing in Los Angeles and went into effect May 1, 1979. The RSO's purpose is to regulate rents so as to safeguard tenants from excessive rent increases, while at the same time providing landlords with just and reasonable returns from their rental units. The RSO addresses allowable rent increases, the registration of rental units, legal reasons for eviction, and the causes for eviction requiring relocation assistance payment to the tenant. Properties subject to the RSO are those that are within the City limits, contain two or more units, and have a Certificate of Occupancy prior to October 1, 1978, as well as replacement units under LAMC Section 151.28. A complaint can be filed by any tenant who believes that an owner, manager, or agent has committed a violation of the RSO. The Housing and Community Investment Department oversees and enforces the RSO. The RSO comprises Chapter XV of the LAMC.

In 2017, two ordinances amending the RSO went into effect. The "Ellis Amendments" (Ordinance No. 184873) amended the RSO requirements for demolition or permanent withdrawal of RSO units. The amendments provide clarification on the applicability of RSO to both vacant and occupied units, the unit withdrawal process, and relocation service requirements. In addition, the amendments require that property owners file annual status reports on withdrawn properties and allow landlords to qualify for an exemption on newly constructed units where RSO units are demolished by providing a certain amount of affordable housing. The second amendment (Ordinance No. 184822) addresses relocation assistance for unpermitted rental units and requires that eviction notices must list one of the permitted RSO eviction reasons.

City of Los Angeles Accessory Dwelling Units (Ordinance No. 186481). The City Council adopted Ordinance No. 186481 on December 19, 2019 (CF 16-1468), which provides for the creation of Accessory Dwelling Units (ADU) and Junior Accessory Dwelling Units (JADU) consistent with California Code Sections 65852.2 and 65852.22.[24] "The ADU Ordinance incorporates state ADU provisions and further regulates the size and form of ADUs in relation to the main home, requires additional standards for construction of new ADUs in certain hillside neighborhoods, and allows for Movable Tiny Houses to be used as ADUs."[25] The ordinance specifies the development standards and requirements for the different types of ADUs and JADUs permitted in the City. ADUs are generally not permitted on lots that are designated as both a Very High Fire Hazard Severity Zone and a Hillside Area, unless specific development

25 Department of City Planning. https://planning.lacity.org/plans-policies/initiatives-policies/housing. Accessed on November 23, 2021.

standards are met. The ordinance also has parking standards of generally one parking space per ADU, although there are exemptions available under certain conditions, such as if the ADU is within one-half mile walking distance of public transit. The Department of City Planning issued a memo on February 27, 2020 regarding the implementation of the City's ADU Ordinance and the State ADU law, summarizing key provisions applicable to detached ADUs and Movable Tiny Houses and key provisions applicable to attached ADUs and JADUs.[26]

Green New Deal. In April 2019, Mayor Eric Garcetti released the Green New Deal (Sustainable City pLAn 2019), a program of actions designed to create sustainability-based performance targets through 2050 in order to advance economic, environmental, and equity objectives.[27] L.A.'s Green New Deal is a mayoral initiative rather than an adopted plan and is the first four-year update to the City's first Sustainable City pLAn that was released in 2015. It augments, expands, and elaborates in even more detail L.A.'s vision for a sustainable future and it tackles the climate emergency with accelerated targets and new aggressive goals. The Housing & Development Chapter of the Green New Deal includes the following targets for the number of new housing units to be provided within the City:

- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; and 75 percent by 2035.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Create or preserve 50,000 income-restricted affordable housing units by 2035 and increase stability for renters.

The Housing Authority of the City of Los Angeles (HACLA) Year 2018 Agency Plan (Agency Plan). The Agency Plan sets forth the Housing Authority's primary goals, as well as policies to support those goals. Goals include financing the redevelopment and rehabilitation of public housing assets, improve the public housing community environment through a public safety approach, and maintain comprehensive economic development and self-sufficiency opportunities for extremely-low, very-low, and low income

residents and program participants.[28] The Plan also reports on the status of existing public housing initiatives.

City of Los Angeles Consolidated Plan (2018-2022). The 2018-2022 Consolidated Plan (ConPlan) is the City's strategic plan for leveraging annual allocations of federal funds granted by HUD (e.g., Community Development Block Grant, Emergency Solutions Grant, HOME Investment Partnerships Program (HOME), and Housing Opportunities for Persons with AIDS). The City's 2018-2022 ConPlan represents the nation's first transit-oriented ConPlan and integrates transit, community, economic, and housing development investments. The ConPlan identifies the City's fiscal and policy challenges, establishes goals, and projected five-year goal outcomes to be achieved with federal funds. The Five-Year Plan in turn informs an Annual Plan prepared by the City each year that provide action plans for implementing projects and programs funded with federal grants.[29]

Plan for a Healthy LA (General Plan Health, Wellness and Equity Element). In 2015, the City adopted the Plan for a Healthy Los Angeles as an Element of the General Plan. The development of the Plan built on the Health Atlas for the City of Los Angeles (2013), which provided a data-driven methodology for identifying and addressing key health issues and community vulnerabilities in Los Angeles and helped inform the Plan's outreach efforts, policies, and goals. On November 24, 2021, the City Council approved targeted amendments to the Plan for a Healthy LA that address environmental justice (Senate Bill 1000); the Plan for a Healthy LA is the document that houses the City's environmental justice goals, policies, and implementation programs.[30] The Plan for a Healthy LA identifies housing as a key component of building a healthier and more just city. Several of the policies in the element speak to housing, such as Policy 1.6 "Reduce the debilitating impact that poverty has on individual, familial, and community health and well-being by: promoting cross-cutting efforts and partnerships to increase access to income; safe, healthy, and stable affordable housing options; and attainable opportunities for social mobility."

Redevelopment Plans/Project Areas. Redevelopment Plans outline a community vision and revitalization opportunities within specific neighborhoods across the City. Each Redevelopment Project Area has a unique set of land use restrictions designed specifically to enhance the quality of life for the community.

The Boyle Heights CPA contains one active redevelopment project area that was managed by the Community Redevelopment Agency of the City of Los Angeles (CRA/LA). Prior to 2012, the CRA/LA was the agency in charge of developing, implementing and overseeing CRA projects in the City. The passage of AB1x-26 and the California Supreme Court's decision in California Redevelopment Association v. Matosantos in 2012 effectively abolished redevelopment agencies in the State. Since the dissolution of the CRA/LA, activities in the redevelopment project areas have been administered through the Designated Local Authority (DLA). The CPA contains one redevelopment project area (the Adelante Eastside Redevelopment Project Area), which expires March 24, 2030.

The Adelante Eastside Redevelopment Project Area is located immediately east of downtown Los Angeles along the eastern side of the Los Angeles River. The Redevelopment Project Area, comprises approximately 2,164 acres, is an irregularly shaped area zoned predominately for commercial and industrial uses in portions of Boyle Heights Community Plan, and the Northeast LA Community Plan (in consisting of the El Sereno and Lincoln Heights neighborhoods). Generally, the Project Area boundaries include the industrial areas located south of Olympic Boulevard to the Los Angeles City boundary; east of the Los Angeles River to Soto Street; the Golden State and Santa Ana Freeways and Mission Road, north to the San Bernardino Freeway to Main Street; and along Alhambra Road and Valley Boulevard from Soto Street on the west to the City of Los Angeles/City of Alhambra boundary. The Project Area also includes commercial/mixed-use frontages along the major east-west thoroughfares within the Boyle Heights CPA. The principal thrust of the project is the preservation of industrial and commercial uses to promote a stable industrial base to provide jobs for the community, as well as enhancing the existing commercial areas.

4.12.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to population and housing if it would:

- Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) and

- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

4.12.5 METHODOLOGY

This analysis considers reasonably anticipated population, housing unit, and employment growth that would occur with implementation of the Proposed Plan, and whether this growth is within local or regional

forecasts, whether it can be considered substantial with respect to growth projections Citywide, and whether it would result in the displacement of housing or people which could then result in the need for replacement housing.

For **Threshold 4.12.1**, the following criteria related to growth inducement are considered relevant to the Proposed Plan:

- The degree to which the project would cause growth (i.e., new housing or employment generators) or accelerate development in an undeveloped area that exceeds projected/planned levels for the year of project occupancy/build out, and that would result in an adverse physical change in the environment;
- Whether the project would introduce unplanned infrastructure that was not previously evaluated in the adopted Community Plan or General Plan; and
- The extent to which growth would occur without implementation of the Proposed Plan.

Although CEQA requires an EIR to consider its growth-inducing impacts, CEQA provides that the EIR "should not assume that growth is necessarily beneficial, detrimental, or of little significance."

For **Threshold 4.12.2,** the determination of significance related to displacement takes into consideration the following factors that are considered relevant to the Proposed Project:

- The total number of residential units to be demolished, converted to market rate, or removed through other means as a result of the Proposed Plan, in terms of net loss of market-rate and affordable units;
- The current and anticipated housing demand and supply of market rate and affordable housing units in the area;
- The land use and demographic characteristics of the area and the appropriateness of housing in the area; and
- Whether the Proposed Plan is consistent with adopted City and regional housing policies such as the Framework and Housing Elements, HUD Consolidated Plan and CHAS policies, and the adopted Redevelopment Plans, Rent Stabilization Ordinance, and the RTP/SCS.

For a detailed discussion of the impacts related to consistency with adopted city and regional housing policies, please refer to **Section 4.10, Land Use and Planning**.

Loss of affordable housing and displacement of low-income renters is a social and economic impact, which is not a CEQA impact unless it results in an indirect physical impact.[31] Based on this, an impact from loss of affordable housing and displacement in this EIR will be an impact if it results in a physical impact to the environment, such as construction of new housing elsewhere. It may also be from transportation or other impacts related to people driving a farther distance. The *CEQA Guidelines* require a lead agency to consider the reasonably foreseeable indirect environmental consequences of a project's economic or social impacts. To require an analysis of the indirect physical impacts, the social and economic impacts must be supported by substantial evidence. An EIR would be required to analyze reasonably foreseeable, not speculative impacts, resulting from social and economic impacts.[32] SCAG data on population, housing, and employment projections are used as a benchmark to guide the local planning process. The analysis below compares reasonably anticipated population, housing, and employment to the 2016 baseline and SCAG's 2040 projections. If implementation of the Proposed Plan would result in a net decrease in residential units (market-rate or affordable) and require construction of replacement housing built elsewhere, the impacts associated with the replacement housing may be considered significant.

Table 4.12-4
Comparison of Reasonably Anticipated Development within the Boyle Heights Community Plan Area

	2016 Baseline	Proposed Plan 2040	No Project (2040)	SCAG 2040 Forecast
Population	86,000	115,000	98,000	93,000
Housing[1,2]	22,000	33,000	28,000	27,000
Employment	26,000	39,000	32,000	35,000

4.12.6 IMPACTS

Threshold 4.12-1 **Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**

This impact would be less than significant.

The Proposed Plan does not entitle specific development projects; rather the Proposed Plan's policies and land use designations establish the basis for where, how, and what type of development can occur through 2040. With adoption of the Proposed Plan, land use designations and intensities within the CPA would be revised to accommodate anticipated population growth and housing and employment demand projected by SCAG through the year 2040. Consistent with sustainable growth policies of the RTP/SCS and the General Plan Framework Element, the purpose and primary objectives of the Proposed Plan is to accommodate reasonably anticipated future growth in the CPA by strategically guiding expected development to urbanized areas and in a manner that improves the quality of life of existing and future residents. The Plan's proposed general plan amendments and zoning changes consider community preferences, housing demand, leveraging investment in infrastructure, opportunities for economic development, and the potential for environmental impacts.

A significant impact for purposes of this threshold is if the Proposed Plan induces unplanned growth into an area. The underlying purpose of the Proposed Plan to accommodate forecasted Citywide growth, growth in the Plan Area is not a significant impact if it can be accommodated by existing or planned facilities and services and would not require construction of new facilities resulting in physical impacts, and is consistent with the City's Framework Element, as well as state and regional policies and regulations. Note, this threshold recognizes that it is not a significant adverse impact for the City to put more growth into any community plan area than projected by SCAG. SCAG forecasts are expressly not mandates to local agencies and are not made based upon a local agency's capacity to provide services. As discussed below and in **Chapter 3.0, Project Description,** and **Appendix B**, **Methodology**, the City accommodates Citywide growth consistent with Framework Element and SCS policies, among others. However, as discussed in Utilities and Public Services, the City's services and utilities are planned and provided for the City, not by community plan areas.

The State of California requires that cities plan for changes in population, housing, and employment. If growth is projected, each city must accommodate a share of anticipated regional growth. SCAG is responsible for producing socio-economic estimates and projections at multiple geographic levels. The socio-economic estimates and projections are used for federal and state mandated long-range planning

efforts, such as the RTP/SCS. In preparing the RTP/SCS, SCAG prepares population, housing, and employment projections in consultation with jurisdictions in the region. These projections are derived from a combination of sources and consider factors such as birth rates; migration rates; historical trends; household size; market and economic projections; existing and planned land uses; and consistency with relevant adopted local, regional, and state land use policies and growth strategies. The development of the growth forecast is driven by collaboration between SCAG and local jurisdictions. The integration of the regional and local forecasts is achieved through collaboration among the various contributors.[33] The 2016-2040 RTP/SCS is used for baseline (2016) analysis; the most recent adopted regional transportation plan is the 2020-2045 RTP/SCS.[34]

DCP allocates the City's projected population and employment to the City's 35 community plans consistent with the City's General Plan Framework Element and other City policies. The City accommodates for the projected levels of population, housing, and employment growth through its Community Plan updates. With implementation of the Proposed Plan, the land use designations, intensities, and densities of the CPA would be revised to accommodate population growth, housing, and employment demand projected by SCAG through the year 2040, as well as to meet the other project objectives, including locating growth in transit centers and along transit corridors. The development growth assumptions for the Proposed Plan are based on the acreage of land designated for each type of land use; allowable densities and intensities in each designation; anticipated levels of development in the life of the Proposed Plan; and development constraints, such as topography, land acquisition and construction costs, and historic preservation regulations (as described in **Appendix B, Methodology**).

Although CEQA does not require the environmental analysis to directly compare the Proposed Plan to the No Project (2040 condition), this comparison is provided for informational purposes to highlight how the Proposed Plan updates the population, housing, and employment in the context of reasonably anticipated development in the CPA and shows the development that would be expected in the CPA in the absence of the Proposed Plan. **Table 4.12-5** compares existing conditions (2016) and the No Project and Proposed Plan's reasonable development potential. As discussed in further detail below, the Proposed Plan would increase reasonably anticipated housing, population, and employment as compared to the No Project. The Proposed Plan will accommodate SCAG's 2040 population, housing, and employment projections based on the amount of development that can reasonably be expected to occur during the life of the Proposed Plan, given the Proposed Plan's land use designations and policies.

** Rounded to the nearest hundred*

Population

As shown in **Table 4.12-6**, SCAG RTP/SCS growth projections for the City of Los Angeles identify population increases from approximately 3,944,000 residents in 2016 to approximately 4,609,000 residents by 2040, resulting in a population increase of approximately 17 percent. Based on SCAG's forecast, the population in the CPA is expected to increase from approximately 86,000 residents in 2016 to approximately 93,000 residents in 2040, resulting in an approximately 8% increase in population. The No Project (2040) would result in approximately 98,000 residents and the Proposed Plan's reasonably anticipated development is 115,000 residents.

Table 4.12-6*
Boyle Heights Proposed Plan Population

Planning Area	2016 (Baseline)	2040 Proposed Plan	2040 No Project	2040 SCAG Projection	Percent Projected Increase (SCAG 2016-2040)
Citywide	3,944,000	N/A	N/A	4,609,000	17%
Boyle Heights	86,000	115,000	98,000	93,000	8%

** Rounded to the nearest whole number.*

Note: SCAG = Southern California Association of Governments

Housing

As shown in **Table 4.12-7**, the City had a housing supply of approximately 1,453,000 housing units in 2016 that, according to SCAG forecasts, is expected to increase to approximately 1,690,000 occupied housing units by 2040, resulting in an approximately 16% increase in the housing supply. According to SCAG f, the CPA currently has approximately 22,000 housing units and is expected to increase to approximately 27,000 housing units by 2040, resulting in a 23% increase in the housing supply. Under the No Project, approximately 28,000 housing units can be accommodated within the CPA and the Proposed Plan can accommodate 33,000 housing units by 2040.

Employment

As shown in **Table 4.12-8**, the City had approximately 1,823,000 jobs in 2016 and, according to SCAG forecasts, is expected to increase to approximately 2,169,000 jobs by 2040, resulting in a 19% increase of jobs in the City. According to SCAG, the CPA had approximately 26,000 jobs in 2016 and is expected to increase to approximately 35,000 jobs by 2040, resulting in a 35% increase of jobs within the CPA. Under the No Project, jobs within the CPA are expected to increase to approximately 32,000 jobs and under the Proposed Plan jobs are expected to increase to 39,000 by 2040.

Table 4.12-8
SCAG Employment Projections*

Planning Area	2016 (Baseline)	2040 Proposed Plan	2040 No Project	SCAG 2040	Percent Projected Increase (SCAG 2016-2040)
Citywide	1,823,000	N/A	N/A	2,169,000	19%
Boyle Heights	26,000	39,000	32,000	35,000	35%

**Rounded to the nearest whole number.*
Source: City of Los Angeles, 2017; SCAG 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy; Boyle Heights Community Plan, 1998. Available online at: https://planning.lacity.org/odocument/2521b2cd-efa6-41a9-ac8a-4b50c67c047c/Boyle_Heights_Community_Plan.pdf
Note: SCAG = Southern California Association of Governments

As discussed in **Appendix B**, **Methodology**, the reasonably anticipated development and associated growth in population, housing, and employment anticipated to occur with the Proposed Plan is based on assumptions about the level of development that can be reasonably expected to occur during the life of the Proposed Plan (through the horizon year 2040), given the Proposed Plan's land use designations, zoning, and policies and using the best professional judgment of City of Los Angeles planners. Past building data demonstrates that not all sites will be built to the maximum densities permitted by the Proposed Plan for a variety of reasons including economic conditions, market trends, financial lending practices, construction and land acquisition costs, physical site constraints, and other General Plan policies or regulations. For this reason, 100% development to maximum allowable densities and intensities is a theoretical scenario that is not analyzed, but rather a more realistic reasonable anticipated development is used to guide and analyze the potential environmental impacts of those changes.

Population and Housing Growth

As described in **Chapter 3.0, Project Description**, the Proposed Plan emphasizes development along transit corridors consistent with City, and SCAG policy direction. The corridor-focused approach to concentrating new development is also consistent with State policy aimed at meeting housing needs while reducing vehicle trips and improving air quality. As a result, the Proposed Plan would better accommodate projected population and housing demand with the proposed land use and zoning changes in place. The City has discretion in how it allocates growth across the City to meet other objectives and has historically allocated more growth to certain plan areas than SCAG, consistent with the City's General Plan Framework vision for each CPA, in particular those areas with high transit accessibility and connectivity are generally targeted for more growth. This allocation is also consistent with SCAG's 2016-2040 RTP/SCS's goal of

reducing vehicle miles traveled (VMT) by accommodating a majority of new housing and jobs in areas within half a mile of major transit stops or high-quality transit corridors, as well as SCAG's objective of generally directing future growth to High Quality Transit Areas (HQTAs).

The proposed changes would result in a pattern of land use that directs future growth in the CPA to already urbanized areas where growth can be supported by existing transportation infrastructure and where different types of land uses can be intermingled to reduce the length and incidence of vehicle trips, in line with state mandates to achieve sustainability targets. The intermingling or co-locating of different types of land uses reduces the length and incidence of vehicle trips by allowing people to trip chain, grouping two or more trip purposes into one single trip. Specifically, the CPA includes four Metro L Line Stations and a network of Metro and other buses that anchor and support neighborhood-serving businesses and housing along these corridors. There are no plans for additional Metro stations. The Metro L Line, and Metro bus lines in the CPA could accommodate additional riders from the projected growth of the Proposed Plan.

The Proposed Plan would expand the development capacity of the CPA in a manner consistent with SCAG projections and the vision for the area. Therefore, the Proposed Plan would not induce substantial population growth, either directly or indirectly, and impacts would be ***less than significant***.

Employment Growth

As described the **Section 4.12.2**, **Existing Environmental Setting**, the Proposed Plan accommodates the employment forecast by SCAG for the CPA, accommodating approximately 39,000 jobs. The projected increase in jobs resulting under the Proposed Plan would support new employment opportunities but would not include employment-generating uses that would result in unanticipated or unplanned for growth in population. Specifically, the Proposed Plan emphasizes maintaining the existing types of employment uses that are currently in the CPA and does not include opportunities for new large-scale employment centers such as distribution centers or other new uses beyond what currently exists in the CPA. The Proposed Plan generally directs growth to areas identified by SCAG as HQTA. Job growth in the area will be directed to the transit corridors and nodes in the CPA, which are well served by public transportation – both high-frequency Metro rail and local bus routes. The proximity of these jobs to transit will result in fewer vehicle trips as commuters travel to and from home to work daily. As shown in **Table 4.12-8**, SCAG's RTP/SCS forecast shows 35,000 jobs in the CPA while the Proposed Plan anticipates slightly more jobs at 39,000. As discussed above, the Proposed Plan is consistent with SCAG's policies regarding co-location of jobs and housing. While the Proposed Plan does anticipate slightly more jobs than SCAG, such growth would not be substantial and is not unplanned. The Proposed Plan would expand the development capacity of the CPA in a manner consistent with SCAG projections and the vision for the area.

As such, implementation of the Proposed Plan would not cause unplanned employment growth in the CPA.

Conclusion

The Proposed Plan would not introduce new infrastructure or the extension of roads, but instead would plan for growth in a sustainable manner by creating additional housing and employment opportunities in close proximity to transit, both Metro rail and bus routes. The Proposed Plan would not induce substantial unplanned growth in population through employment-generating uses and would be consistent with State, regional, and local policies to locate new development close to transit. While reasonably anticipated development would exceed SCAG's forecasts for the Boyle Heights CPA, the development would be consistent with SCAG's citywide growth projections, and with City, regional, and State policies for housing, economic development, air quality, and sustainability, as well as other adopted housing growth policies and would not exceed planned City growth. Therefore, impacts related to inducing substantial unplanned growth under the Proposed Plan would be ***less than significant***.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

Threshold 4.12-2 Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

This impact would be less than significant.

The Proposed Plan would allow for new development and redevelopment projects in the CPA. Moreover, no property owner would be required to redevelop a property. The Proposed Plan does not require any existing housing to be demolished or reduced in order to be consistent with the Proposed Plan's land use designations and zoning. In effect, existing development on the ground could be maintained and established uses could continue to operate. Future development would be subject to the Proposed Plan once it is effective. That said, the CPA currently has approximately 22,000 housing units and is expected to increase to approximately 33,000 housing units by 2040, reasonably anticipated development from the Proposed Plan is anticipated to result in redevelopment that would likely result in the displacement of some existing housing units and residents, including homeless residents, during construction. However,

the number of displaced units and residents and locations of any replacement housing, if needed, would be speculative.

The Proposed Plan aims to add to the inventory of housing stock. However, in limited instances, the Proposed Plan could potentially cause a temporary reduction in housing stock as new buildings are built in place of older ones or as existing buildings are renovated or expanded. This can be the case if individual property owners choose to demolish an existing residential building and redevelop to a more intense or dense development than existing currently. For example, an owner could decide to demolish an existing single-family house and build a four-plex on a parcel that allows for low-density multi-family residential housing. It would be speculative to attempt to identify which units and people, how many units and people might be displaced, and what the lag time, if any, might be. In addition, as discussed under Impact 4.12-1 and further below, implementation of the Proposed Plan is projected to substantially increase the overall housing stock in the CPA. Finally, the City has adopted a number of policies, including new policies in the Proposed Plan itself, that are specifically aimed at providing affordable housing in association with new housing development and reducing homelessness. As such, the Proposed Plan would not necessitate the construction of replacement housing elsewhere.

Concerns about indirect displacement of people, including those with lower incomes, have been raised in Boyle Heights, other CPAs, and citywide. The rising cost of housing is currently a concern throughout the City, reflective of the shortage of housing in the City and the region as a whole. As population growth continues to outpace the production of housing units, the existing supply of housing is in higher demand which leads to higher rents/prices. Many renters are experiencing financial strain as average rents rise, and would-be homeowners watch as neighborhoods where home prices may have once been within their reach grow prohibitively expensive. This occurrence may result in displacement of renters and may result in the need for people that live in the CPA to move outside the CPA or potentially outside of the City. But there is no substantial evidence that there is a reasonable method to predict how many people may potentially be displaced in the CPA over the Plan horizon, including from new investment through redevelopment allowed or sought by the Proposed Plan. Additionally, there is no industry standard methodology available to forecast transportation, air, noise, or other impacts associated with people who have moved out of the CPA. The City has adopted several citywide responses to help relieve pressures on the housing supply (e.g., Affordable Housing Linkage Fee, Accessory Dwelling Units Ordinance, Unapproved Dwelling Unit Ordinance, TOC, etc.) and the State of California has recently passed several state laws to

address the housing crisis. Recent state laws such as AB 1482, also set forth requirements for landlords to have a "just cause" in order to terminate a tenancy and limits to annual rent increases.[35]

As discussed in **Section 4.12.3, Regulatory Framework**, the City has adopted regulations and policies that require or incentivize the provision of affordable housing in new development projects that apply citywide. As discussed in the **Section 4.12.3, Regulatory Framework**, these policies include the Density Bonus Ordinance (LAMC Section 12.22 A.25) and affordable housing mandates included in Proposition JJJ. The Density Bonus Ordinance would incentivize the provision of affordable and/or senior housing units in new development projects by offering projects that provide these units additional floor area ratios. Proposition JJJ includes a measure requiring new development projects requesting a zone change or general plan amendment in the City to designate a certain percentage of condos and apartments in new residential buildings for low-income tenants. Per the AHLF Ordinance, certain new market-rate residential and commercial developments are required to pay a fee that goes towards funding affordable housing.

Further, the Proposed Plan includes affordable housing incentives through the community benefit program. Incentives for affordable housing are proposed at designated transit nodes and corridors which allow development to qualify for up to 3:1 or 4:1 FAR when mixed income housing units are included, and additional FAR when a development provides 100% affordable housing. Refinements to zoning regulations are proposed along both transit nodes and corridors to enable more opportunities for mixed income and affordable housing developments within walking distance of transit and commercial uses.

As properties are redeveloped in the CPA, there could be temporary displacement of housing units due to the separation of time between removal and replacement of housing. Recent state laws such as SB330 and SB8 also require a right of first refusal for existing lower income tenants, when units are demolished for construction of a new housing project. The City's Rent Stabilization Ordinance (RSO) would cap increases in rental rates for the dwelling units built on or before October 1, 1978 as well as replacement units under LAMC Section 151.28, so that residents of these units in the CPA would not be displaced if increased development and improvements to the CPA raise property values. Furthermore, the Proposed Plan includes policies and programs aimed at reducing displacement of people and housing such as Program 16– No Net Loss Program, which would explore the creation of a program to minimize displacement through preservation of affordable housing, covenanted or not, or production of new affordable housing. This impact would be temporary, is expected to be spread over the timeframe of the Proposed Plan and would be offset by overall increases in housing development under the Proposed Plan.

---

35 City of Los Angeles, Housing Department. AB 1482 – State Rent Control. Available at: https://housing.lacity.org/residents/ab-1482.

The Proposed Plan is specifically aimed at accommodating current and anticipated housing demand as well as changing demographics in the CPA. Although the number of existing units (including affordable units) that might be displaced by future development cannot be predicted with any degree of certainty, the Proposed Plan would increase the overall availability of housing in the CPA by 50% (11,000 units) and includes policies to support the provision of housing to meet a range of economic and social needs. To that end, it would implement relevant City and regional housing policies as well as those of the RTP/SCS. Future development projects in the CPA would also be incentivized or required to provide affordable units. Moreover, displacement of housing units likely to occur due to the time lag between demolished units and construction of new units would be temporary and would be offset by the overall net increase in housing under the Proposed Plan. Therefore, the Proposed Plan is not anticipated to result in the net loss or displacement of housing, necessitating the construction of replacement housing elsewhere. The impact would be **less than significant**.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than significant.

4.12.7 CUMULATIVE IMPACTS

The cumulative context for population, housing, and employment growth is within the City of Los Angeles and surrounding jurisdictions. The City of Los Angeles, and Boyle Heights in particular, is substantially built-out and most future development in the City is anticipated to occur as infill on vacant or underutilized parcels. Future projects under the Proposed Plan would be developed consistent with the planned growth in the General Plan.

Population, Housing, and Employment Growth

Implementation of the Proposed Plan would be anticipated to result in an increase in population, housing, and employment growth. As analyzed in the tables above, growth between 2016 to 2040 within the Boyle Heights CPA would represent approximately 1.1% of citywide population growth, 2.1% of citywide housing growth, and 2.9% of job growth.

The Proposed Plan is intended to accommodate City population, housing, and employment growth projected by SCAG for the year 2040 by allowing for more development in certain locations as previously discussed, particularly in proximity to transit, which would increase housing opportunities. Incentives for

affordable housing are proposed near transit stations and along corridors which would allow development to qualify for 3:1 or 4:1 FAR when mixed income housing units are included, and additional FAR when development provides 100% affordable housing. Refinements to zoning regulations are proposed along both transit nodes and corridors to enable more opportunities for mixed income and affordable housing developments within walking distance of transit and commercial uses. There is no basis to find that the Proposed Plan would contribute to inducing unplanned growth to the City or to the SCAG region.

Displacement of Housing and People

As discussed above, the Proposed Plan does not propose the demolition, conversion to market rate, or removal of any existing residential units. The Proposed Plan is expected to result in a net increase of housing over existing conditions and would allow a variety of new housing types. Therefore, it is not expected to result in permanent displacement of housing and people. Implementation of the Proposed Plan would primarily increase residential development compared to existing housing, with a focus on coupling affordable housing incentives along transit nodes and corridors. The Proposed Plan could potentially result in some temporary displacement of housing units and people due to the separation of time between removal and replacement of housing. This temporary displacement would be relatively minor spread over the timeframe for implementation of the Proposed Plan and would be offset by increases in housing implemented as part of the Proposed Plan. Therefore, such temporary impacts would not add to other impacts resulting from redevelopment of sites outside the CPA.

Based on the information above, the cumulative impact of the Proposed Plan would be ***less than significant*** and would not be cumulatively considerable.

4.13 PUBLIC SERVICES AND RECREATION

4.13.1 INTRODUCTION

This section provides an overview of public services, including recreation, provided in the Boyle Heights Community Plan Area (CPA) and evaluates potential impacts resulting from the Proposed Plan. Topics addressed in this section include fire protection and emergency services (**Section 4.13.2**), police protection services (**Section 4.13.3**), public schools (**Section 4.13.4**), libraries (**Section 4.13.5**), and parks and recreation (**Section 4.13.6**).

The impacts of the Proposed Plan to public services are based on the adequacy of existing and planned facilities and personnel to meet additional demand incurred from the Proposed Plan.

4.13.2 FIRE PROTECTION AND EMERGENCY SERVICES

4.13.2.1 Existing Environmental Setting

Fire prevention, protection, and emergency medical services within the CPA are provided by the Los Angeles Fire Department (LAFD). LAFD is a full-spectrum life safety agency that provides essential emergency and non-emergency services throughout the 469-square mile jurisdiction within the City.[1] LAFD consists of 3,435 uniformed fire personnel that provide fire prevention, firefighting, emergency medical care, technical rescue, hazardous materials, disaster response, public education, and community service.[2] LAFD also consists of 381 civilian support staff that provides technical and administrative support to the LAFD. A total of 1,018 uniformed firefighters, in addition to 270 firefighter/paramedics are on active-duty citywide serving at 114 neighborhood fire stations.[3] In January 2015, the LAFD service areas were re-structured into four geographic bureaus that align with the Los Angeles Police Department (LAPD) geographic boundaries: Central, Valley, West, and South Bureaus. With this updated approach, the LAFD, LAPD, and the City's Emergency Management Department have developed a more unified effort to respond to emergencies. Each designated Bureau Commander is responsible for all LAFD activities in the respective bureaus. In addition, the LAFD has implemented a new emergency medical dispatch card system, known as the Tiered Dispatch System, to reduce call-processing times; and the LAFD Automatic Vehicle Location System, to ensure the nearest emergency resource is dispatched during calls.[4]

The CPA is located within the LAFD Central Bureau service area, which encompasses the central and eastern portions of Los Angeles and includes Battalions 1, 2, and 11. As presented in **Table 4.13-1** and shown in **Figure 4.13-1**, **LAFD Fire Stations Serving the Community Plan Area,** the CPA is located within the Battalion 1 service area and is served by Fire Stations 2, 4, 17, and 25.[5] Emergency Medical Services (EMS) is provided to the CPA through the Bureau of Emergency Medical Services and is dispatched from the same fire stations.

Table 4.13-1
LAFD Fire Stations Serving the Community Plan Area

Fire Station	Address	LAFD Community	Average Response Times (mins)[1,2]		Staffing	Service and Equipment
			Non-EMS	EMS		
2	1962 E. Cesar Chavez Ave Los Angeles, CA 90033	Boyle Heights	6:21	6:27	12	Task Force
4	450 E. Temple Street Los Angeles, CA 90012	Little Tokyo/Olvera Street/ Chinatown	6:10	6:27	11	Dispatch center, engine house, two paramedic ambulances
17	1601 S. Santa Fe Ave Los Angeles, CA 90021	Industrial Eastside	6:34	6:47	8	EMS team, part of Central Bureau
25	2927 E. Whittier Blvd. Los Angeles, CA 90023	South Boyle Heights	7:07	6:56	6	Provides community protection education

1 Average response metrics for January-December 2019.
2 Non-EMS = fire and other services; EMS = Emergency Medical Services

Service Performance Measures. The LAFD has response time goals consistent with the National Fire Protection Association (NFPA). NFPA 1710, Standard for the Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Career Fire Departments, establishes criteria that provide context for fire departments to evaluate their response times. According to NFPA 1710 criteria, call processing time should be 64 seconds or less for 90 percent of calls, or 106 seconds or less for 95 percent of calls; turnout time should be 80 seconds or less for fire incidents, and 60 seconds or less for EMS incidents; the first engine should arrive on scene within four minutes; and the second company should arrive on scene within six minutes.

5 Los Angeles Fire Department, Find Your Station. URL: https://www.lafd.org/fire-stations/station-results; accessed July 14, 2021.

Although NFPA 1710 provides essential benchmarks, fire departments often measure performance in terms of total response time, which is composed of call processing time, turnout time, and travel time[6]. Based on citywide response metrics from January through August 2020, the average LAFD call processing time was 64 seconds, the average turnout time was 51 seconds for both non-EMS and EMS incidents, and the average travel time was four minutes and 29 seconds for non-EMS incidents and four minutes and 37 seconds for EMS incidents. According to response metrics, the average operational response time is five minutes for structural fire incidents, five minutes and 42 seconds for critical advanced life support (ALS) incidents, six minutes and 18 seconds for non-EMS incidents, and six minutes and 43 seconds for EMS incidents (LAFD 2020).

LAFD's services continue to be based on the community's needs, as determined by on-going evaluations that consider the number of calls and other factors. These evaluations are used to determine the need for reallocation of existing equipment or personnel and/or the acquisition of new equipment, personnel, or new stations. As development occurs, the LAFD reviews EIRs and subdivisions applications for needed facilities. Where appropriate, construction of new facilities is required as a condition of development for individual projects (Los Angeles 2001).

Fire Flow and Response Distance. The adequacy of fire protection for a given area is based on required fire flow, response distance from existing fire stations, and the LAFD's judgment for needs in the area. Personnel and equipment needs for individual fire stations are determined based on the LAFD's review of the number of incidents within a station's service area. As the number of incidents increases, the LAFD assigns new staff and equipment as necessary to maintain acceptable service ratios and response times.

The fire flow (measured in gallons per minute from the local water system) necessary to contain a fire depends on the existing land use or combination of land uses and the density of the area being served. Consequently, the amount of water necessary for fire protection depends on various factors, including the type of development, risk of life, occupancy, and the level or intensity of a fire hazard. Response distance relates directly to the linear travel distance (i.e., miles between a station and a site) and the LAFD's ability to successfully navigate through an area's circulation system. The Fire Code specifies maximum response distances allowed between specific locations and engine/truck companies based upon land use and fire flow requirements, as shown in **Table 4.13-2**.

IMPACT SCIENCES

LAFD Fire Stations Serving the Community Plan Area

1264.03•05/2022

Table 4.13-2
Fire Flow and Response Distance Requirements

Land Use	Required Fire-Flow	Maximum Response Distance to LAFD Fire Station[1]	
		Engine Company[2]	Truck Company[2]
Residential			
Low Density Residential	2,000 gpm from three adjacent hydrants flowing simultaneously	1.5 miles	1.5 miles
High Density Residential and Commercial Neighborhood	4,000 gpm from four adjacent hydrants flowing simultaneously	1.5 miles	1.5 miles
Commercial and Industrial			
Industrial and Commercial	6,000 to 9,000 gpm from four hydrants flowing simultaneously	1.0 mile	1.5 miles
High Density Industrial and Commercial or Industrial (Principal Business Districts or Centers)	12,000 gpm available to any block (where local conditions indicate that consideration must be given to simultaneous fires, an additional 2,000 to 8,000 gpm will be required)	0.75 miles	1.0 mile

Source: Los Angeles Municipal Code, Chapter V – Public Safety and Protection, Article 7 – Fire Protection and Prevention (Fire Code), Section 57.09.06, Table 9-C. URL: https://codelibrary.amlegal.com/codes/los_angeles/latest/lamc/0-0-0-346894. Accessed: July 2021
Note: gpm = gallons per minute
[1] *The maximum response distance to LAFD fire stations pertains to areas outside the boundaries covered by the Hillside Ordinance (Ordinance Number 168,159). When a portion of any subdivision, as that term is defined in Section 17.02 of the Los Angeles Municipal Code, falls outside of the one and one-half mile distance requirement, automatic fire sprinklers will not be required in that portion whenever a review by the Chief has determined that no unacceptable increase in hazard to the public will result.*
[2] *The maximum response distances for both LAFD fire suppression companies (engine and truck) must be satisfied.*

When response distances exceed these requirements, plans for all new structures must be reviewed and various fire suppression equipment (e.g., automatic fire sprinkler systems, fire signaling systems, fire extinguishers, smoke removal systems, and any other fire protection devices) as deemed necessary by the Fire Chief are required to be incorporated in the plans prior to the approval of an occupancy permit. In addition to fire flow requirements, the LAFD requires different types of fire hydrants within a specified distance to deliver the required fire flow, which are shown in **Table 4.13-3**.

Table 4.13-3
Land Use and Required Fire Flow

Type of Land Development	Net Land Area Served Per Hydrant	Distance Between Hydrants on Roads and Fire Lanes	Type of Hydrant
Low-Density Residential	150,000 sq. ft.	600 ft.	2 1/2" x 4" Double Fire Hydrant
High-Density Residential & Neighborhood Commercial	100,000 sq. ft.	300-450 ft.	2 1/2" x 4" Double Fire Hydrant
Industrial & Commercial	80,000 sq. ft.	300 ft.	2 ½" x 4" Double Fire Hydrant or 4" x 4" Double Fire Hydrant
High-Density Industrial & Commercial	40,000 sq. ft.	300 ft.	4" x 4" Double Fire Hydrant

Source: City of Los Angeles Municipal Code, Chapter V – Public Safety and Protection, Article 7 – Fire Protection and Prevention (Fire Code), Section 57.507.3.2 and described in Table 57.507.3.2. URL: https://codelibrary.amlegal.com/codes/los_angeles/latest/lamc/0-0-0-346894. Accessed: July 2021.

[1] This figure will be systematically reduced where greater fire- flow is required due to restricted access, depth of lots, length of blocks, or additional hazards.

Response time relates to the physical linear travel distance (i.e., the number of miles between a fire station and a specific location) and the LAFD's ability to successfully navigate the given roadway network. Roadway congestion, intersection level of service (LOS), weather conditions, and construction traffic along the response route can affect the response distance in terms of travel time. Generally, multi-lane arterial roadways allow the emergency vehicles to travel at higher rates of speed and permit other traffic to maneuver out of the path of the emergency vehicle. Additionally, the LAFD in collaboration with Los Angeles Department of Transportation (LADOT) has developed a Fire Preemption System (FPS), a system that automatically turns traffic lights to green for emergency vehicles traveling on designated streets in the City. The City of Los Angeles has over 205 miles of major arterial routes that are equipped with FPS.[7]

The average Citywide LAFD response time in 2016 for non-emergency medical services (EMS) events was 6 minutes and 16 seconds.[8] The 2016 Citywide LAFD response time for EMS events was 6 minutes 30 seconds. The average response times for non-EMS and EMS events for the fire stations that serve the CPA are higher than Citywide average; with an average response time ranging from 6:07 to 6:14 for Non-EMS calls and 6:09 to 6:34 for EMS calls as provided in **Table 4.13-4**. The table also notes average response times for critical Advanced Life Support (ALS) and structure fires.

4.13.2.2 Regulatory Framework

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Fire Protection Public Services at the federal, state, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Emergency Management Act (FEMA)
- Disaster Mitigation Act of 2000
- Occupational Safety and Health Administration
- California Constitution Article XIII Section 35
- California Building and Fire Code
- California Governor's Office of Emergency Services (Cal OES)
- California Fire Service and Rescue Emergency Aid System
- California Vehicle Code
- City of Los Angeles Charter
- City of Los Angeles General Plan Framework Element
- City of Los Angeles General Plan Safety Element
- Los Angeles Municipal Code

- Los Angeles Fire Department Strategic Plan
- Propositions F and Q
- Measure J

Federal

Federal Emergency Management Act (FEMA). FEMA was established in 1979 via executive order and is an independent agency of the federal government. In March 2003, FEMA became part of the U.S. Department of Homeland Security with the mission to lead the effort in preparing the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

Disaster Mitigation Act of 2000. Disaster Mitigation Act (42 United States Code [U.S.C.] Section 5121) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. It amends the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. Section 5121-5207) by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need and creates incentives for state, tribal, and local agencies to closely coordinate mitigation planning and implementation efforts. This Act reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and the streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- Funding pre-disaster mitigation activities
- Developing experimental multi-hazard maps to better understand risk
- Establishing state and local government infrastructure mitigation planning requirements
- Defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP)
- Adjusting ways in which management costs for projects are funded

The mitigation planning provisions outlined in Section 322 of this Act establish performance-based standards for mitigation plans and require states to have a public assistance program (Advance Infrastructure Mitigation [AIM]) to develop county government plans. The consequence for counties that fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage

assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding 10-year period by the same type of event.

Occupational Safety and Health Administration. The Federal Occupational Safety and Health Administrations (OSHA) as well as California OSHA (Cal-OSHA) enforce the provisions of the federal and state Occupational Safety and Health Acts, respectively, which collectively require safety and health regulations for construction under Part 1926 of Title 29 Code of Federal Regulations (CFR). The fire-related requirements of the Federal Occupational Safety and Health Act are specifically contained in Subpart F, Fire Protection and Prevention, of Part 1926. Examples of general requirements related to fire protection and prevention include maintaining fire suppression equipment specific to construction on-site; providing a temporary or permanent water supply of sufficient volume, duration, and pressure; properly operating the on-site fire-fighting equipment; and keeping storage sites free from accumulation of unnecessary combustible materials.

Federal Fire Safety Act (FFSA). The FFSA of 1992 is different from other laws affecting fire safety as the law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government that houses at least 25 federal employees during their employment.

State

California Constitution Article XIII Section 35. Section 35 of Article XIII of the California Constitution at subdivision (a)(2) provides: "The protection of public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services." Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directs the proceeds of a 0.50-percent sales tax to be expended exclusively on local public safety services. California Government Code Sections 30051-30056 provide rules to implement Proposition 172. Public safety services include fire protection. Section 30056 mandates that cities are not allowed to spend less of their own financial resources on their combined public safety services in any given year compared to the 1992-93 fiscal year. Therefore, the City is required to use Proposition 172 to supplement its local funds used on fire protection services, as well as other public safety services. In *City of Hayward v. Trustee of California State University* (2015), the court found under Section 35 that, cities have "a constitutional obligation to provide adequate fire protection services."

California Building and Fire Code. The California Building Code (California Code of Regulations [CCR], Title 24, Part 2) is a compilation of building standards, including general fire safety standards for new

buildings, which are presented with more detail in the California Fire Code (CCR Title 24, Part 9). California Building Code standards are based on building standards that have been adopted by state agencies without change from a national model code; building standards based on a national model code that have been changed to address particular California conditions; and building standards authorized by the California legislature but not covered by the national model code. The 2019 edition of the California Building Code became effective on January 1, 2020.[9] The building standards in the California Building Code apply to all locations in California, except where more stringent standards have been adopted by state agencies and local governing bodies. Typical fire safety requirements of the California Fire Code include: the installation of fire sprinklers in all high-rise buildings; the establishment of fire resistance standards for fire doors, building materials, and particular types of construction; and the clearance of debris and vegetation within a prescribed distance from occupied structures within wildfire hazard areas. Specific California Fire Code fire safety regulations have been incorporated by reference in the Los Angeles Municipal Code (LAMC) with local amendments, as discussed below.[10]

California Governor's Office of Emergency Services (Cal OES). In 2009, the State of California passed legislation creating the Cal OES and authorized it to prepare a Standard Emergency Management System (SEMS) program (Gov. Code Section 8607; Title 19 CCR Section 2401 et seq.), which sets forth measures by which a jurisdiction should handle emergency disasters. In California, SEMS provides the mechanism by which local government requests assistance. Non-compliance with SEMS could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. Cal OES coordinates the state's preparation for, prevention of, and response to major disasters, such as fires, floods, earthquakes and terrorist attacks. During an emergency, Cal OES serves as the lead state agency for emergency management in the state. It also serves as the lead agency for mobilizing the state's resources and obtaining federal resources. Cal OES coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. Local jurisdictions first use their own resources and, as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system (see discussion of Mutual Aid Agreements, below). California Emergency Management Agency (Cal-EMA) maintains oversight of the state's mutual aid system.

---

9 California Building Code (CCR, Title 24, Part 2).

10 Los Angeles Fire Department, Mutual Aid Agreements/Disaster Declarations/Potential Fiscal Impacts, July 3, 2014, https://www.lafd.org/sites/default/files/pdf_files/lafdlafdreport186489186_07312014.pdf. Accessed March 19, 2019.

California Fire Service and Rescue Emergency Aid System. The LAFD participates in the California Fire Service and Rescue Emergency Mutual Aid System through which the California Governor's Office of Emergency Service (OES), Fire and Rescue Division is responsible for the development, implementation and coordination of the California Fire Service and Rescue Emergency Mutual Aid Plan (Mutual Aid Plan).[11] The Mutual Aid Plan outlines procedures for establishing mutual aid agreements at the local, operational, regional, and State levels, and divides the State into six mutual aid regions to facilitate the coordination of mutual aid. The LAFD is located in Region I. Through the Mutual Aid Plan, the OES is informed of conditions in each geographic and organizational area of the state, and the occurrence or imminent threat of disaster. All OES Mutual Aid Plan participants monitor a dedicated radio frequency for fire events that are beyond the capabilities of the responding fire department and provide aid in accordance with the management direction of the OES.[12]

California Vehicle Code. Section 21806 of the California Vehicle Code (CVC) pertains to emergency vehicles responding to Code 3 incidents/calls. This section of the (CVC) states the following:

> *Upon the immediate approach of an authorized emergency vehicle which is sounding a siren and which has at least one lighted lamp exhibiting red light that is visible, under normal atmospheric conditions, from a distance of 1,000 feet to the front of the vehicle, the surrounding traffic shall, except as otherwise directed by a traffic officer, do the following: (a) (1) Except as required under paragraph (2), the driver of every other vehicle shall yield the right-of-way and shall immediately drive to the right-hand edge or curb of the highway, clear of any intersection, and thereupon shall stop and remain stopped until the authorized emergency vehicle has passed. (2) A person driving a vehicle in an exclusive or preferential use lane shall exit that lane immediately upon determining that the exit can be accomplished with reasonable safety. (b) The operator of every street car shall immediately stop the street car, clear of any intersection, and remain stopped until the authorized emergency vehicle has passed. (c) All pedestrians upon the highway shall proceed to the nearest curb or place of safety and remain there until the authorized emergency vehicle has passed.*

Title 8 California Code of Regulations (CCR) Sections 1270 and 6773. In accordance with CCR, Title 8 Section 1270, "Fire Prevention," and Section 6773, "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration (Cal-OSHA) establishes minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hose sizing requirements, restrictions on the use of

compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code Section 13100-13135. California Health Safety Code Section 13100-13135 codifies regulations known as the "Regulations of the State Fire Marshal" and constitutes the Basic Building Design and Construction Standards of the State Fire Marshall. The regulations establish minimum standards for the preservation and protection of life and property against fire, explosion, and panic through requirements for fire protection and notification systems, fire protection devices, and fire suppression training.

Mutual Aid Agreements (EMMA System). Cal OES developed the Emergency Managed Mutual Aid (EMMA) System in response to the 1994 Northridge Earthquake. The EMMA System coordinates emergency response and recovery efforts along the coastal, inland, and southern regions of California. The purpose of EMMA is to provide emergency management personnel and technical specialist to afflicted jurisdictions in support of disaster operations during emergency events. Objectives of the EMMA Plan is to provide a system to coordinate and mobilize assigned personnel, formal requests, assignment, training and demobilization of assigned personnel; establish structure to maintain the EMMA Plan and its procedures; provide the coordination of training for EMMA resources, including SEMS training, coursework, exercises, and disaster response procedures; and to promote professionalism in emergency management and response. The EMMA Plan was updated in November 2012 and supersedes the 1997 EMMA Plan and November 2001 EMMA Guidance.

Local

City of Los Angeles Charter. Section 520 of the Los Angeles City Charter states that the LAFD's duty is to control and extinguish injurious or dangerous fires and to remove that which is liable to cause those fires. It also requires the LAFD to enforce all ordinances and laws relating to the prevention or spread of fires, fire control, and fire hazards within the City, as well as to conduct fire investigations and protect lives and property in case of disaster or public calamity.

City of Los Angeles General Plan Framework Element. The City of Los Angeles General Plan Framework Element (Framework Element), adopted in December 1996 and readopted in August 2001, sets forth general guidance regarding land use issues for the entire City of Los Angeles and defines citywide policies regarding land use, including infrastructure and public services. Goal 9J of the Infrastructure and Public

Services Chapter of the Framework Element specifies that every neighborhood should have the necessary level of fire protection service, emergency medical service, and infrastructure.[13]

Objective 9.16 calls for the demand for existing and projected fire facilities and service be monitored and forecasted. Objective 9.17 calls for all areas of the City have the highest level of fire protection and emergency medical service, at the lowest possible cost, to meet existing and future demand. Objective 9.18 calls for the development of new fire facilities be phased with growth. Further, Objective 9.19 calls for the maintenance of the LAFD's ability to assure public safety in emergency situations. Under the Framework Element, the City goal for response distance for emergency medical response and the distance of fire stations for engine companies from neighborhood land uses is 1.5 miles.[14] This is consistent with the specifications for response distances within the LAMC, discussed below.

Table 4.13-5
Relevant General Plan Fire Protection Goals, Objectives, and Policies
Framework Element – Infrastructure and Public Services

Goal 9J	Every neighborhood has the necessary level of fire protection service, emergency medical service (EMS) and infrastructure.
Objective 9.16	Monitor and forecast demand for existing and projected fire facilities and service.
Policy 9.16.1	Collect appropriate fire and population development statistics for the purpose of evaluating fire service needs based on existing and future conditions.
Objective 9.17	Assure that all areas of the City have the highest level of fire protection and EMS, at the lowest possible cost, to meet existing and future demand.
Policy 9.17.2	Identify areas of the City with deficient fire facilities and/or service and prioritize the order in which these areas should be upgraded based on established fire protection standards.
Policy 9.17.4	Consider the Fire Department's concerns and, where feasible adhere to them, regarding the quality of the area's fire protection and emergency medical services when developing General Plan amendments and zone changes, or considering discretionary land use permits.
Objective 9.19	Maintain the Los Angeles Fire Department's ability to assure public safety in emergency situations.
Policy 9.19.1	Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Policy 9.19.3	Maintain the continued involvement of the Fire Department in the preparation of contingency plans for emergencies and disasters.

City of Los Angeles General Plan Safety Element. The City of Los Angeles General Plan Safety Element (Safety Element), previously adopted on November 26, 1996, includes policies related to the City's response

13 City of Los Angeles General Plan Framework Element, Chapter 9: Infrastructure and Public Services.

14 City of Los Angeles General Plan Framework Element, Chapter 9: Infrastructure and Public Services, Status of Infrastructure System/Facilities, Fire.

to hazards and natural disasters, including fires. The updated Safety Element was adopted by the City Council on November 24, 2021. In particular, the Safety Element sets forth goals, objectives and policies related to requirements, procedures, and standards to facilitate effective fire suppression and emergency response capabilities. In addition, the City's Safety Element designates disaster routes.

Table 4.13-6
Relevant General Plan Fire Protection Goals, Objectives, and Policies
Safety Element

Goal 2	A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.
Objective 2.1	Develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City's comprehensive hazard mitigation and recovery plans and programs.
Policy 2.1.5	Response. Develop, implement and continue to improve the City's ability to respond to emergency events. Participate in regularly scheduled disaster exercises to better prepare Police, Fire, Public Works and other City employees with disaster responsibilities.
Policy 2.1.6	Standards/Fire. Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression and safety. A. Enforce peak water supply requirements. B. Enforce minimum roadway widths and clearances for evacuation and fire suppression. C. Maintain special fire-fighting units at the Port of Los Angeles, Los Angeles International Airport, and Van Nuys Municipal Airport capable of responding to special emergencies unique to the operations of those facilities. D. Coordinate with CALFIRE, local fire agencies, fire safe councils, private landowners, and other responsible agencies to identify the best method(s) of fuel modification to reduce the severity of future wildfires, including: Prescribed fire; Forest thinning; Grazing; Mechanical clearing; Hand clearing (piling, burning/chipping); Education; and Defensible space. E. Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Goal 3	A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.
Objective 3.1	Develop and implement comprehensive disaster recovery plans which are integrated with each other and with the City's comprehensive hazard mitigation and emergency response plans and programs.
Policy 3.1.1	Coordination. Coordinate between city departments, county and state agencies, local jurisdictions and with appropriate private and public entities prior to a disaster to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster.

Los Angeles Municipal Code. The Los Angeles Fire Code (LAMC Chapter V, Article 7) incorporates by reference portions of the California Fire Code and the International Fire Code. The City's Fire Code sets forth regulatory requirements pertaining to the prevention of fires; the investigation of fires and life safety hazards; the elimination of fire and life safety hazards in any building or structure (including buildings under construction); the maintenance of fire protection equipment and systems; and the storage, use, and

handling of hazardous materials. Specific regulations regarding fire prevention and protection are discussed below.

Section 57.106.5.2 provides that the Fire Chief shall have the authority to require drawings, plans, or sketches as may be necessary to identify: (1) occupancy access points; (2) devices and systems; (3) utility controls; (4) stairwells; and (5) hazardous materials/waste.

Section 57.107.6 requires that the installation, alteration, and major repair of the following be performed pursuant to a permit issued by the Department of Building and Safety: Fire Department communication systems, building communication systems, automatic elevators, heliports, emergency power systems, fire escapes, private fire hydrants, fire assemblies, fire protective signaling systems, pilot lights and warning lights for heat-producing equipment, refrigerant discharge systems, smoke detectors, emergency smoke control systems, automatic sprinkler systems, standpipe systems, and gas detection systems.

Section 57.118 establishes LAFD's fire/life safety plan review and LAFD's fire/life safety inspection for new construction projects.

Section 57.118.1.1 requires that all new high-rise buildings greater than 75 feet in height (measured from the lowest point with fire access) must include fire/life safety reviews by the Department of Building and Safety and LAFD.

Section 57.408 requires the preparation of an Emergency Plan that establishes dedicated personnel and emergency procedures to assist the LAFD during an emergency incident and establishes a drill procedure to prepare for emergency incidents. The Emergency Plan would also establish an on-site emergency assistance center and establish procedures to be followed during an emergency incident. The Emergency Plan must be submitted to the LAFD for approval prior to implementation and must be submitted annually (and revised if required by the LAFD).

Section 57.4704.4.3.1 of the LAMC requires that the Smoke detectors required by Chapter 9 of the LAMC (Building Code) be maintained in dependable operating condition and tested every six months or as required by the Fire Chief. An accurate record of such tests must be kept by the owner, manager, or person in charge of the property, and such records must be open to examination by the Fire Chief.

Section 57.4705.1.6 requires there must be at least one elevator which shall be available for fire EMS and shall have its controls designed so that key switches located in the building control station/fire command center will recall said elevator or elevators to the designated main floors.

Section 57.4705.4 requires each building to have a rooftop emergency helicopter landing facility in a location approved by the Chief.

Section 57.4705.1.6 requires at least one elevator in each bank of elevators to be available for fire emergency service and to have its controls designed so that key switches located in the building control station/fire command center will recall said elevator or elevators to the designated main floor. The elevator or elevators must be interconnected with the standby power.

Section 57.503.1.4 requires an approved, posted fire lane whenever any portion of an exterior wall is more than 150 feet from the edge of a roadway.

Section 57.507.3.1 establishes fire water flow standards, which vary from 2,000 gallons per minute (gpm) in low-density residential areas to 12,000 gpm in high-density commercial or industrial areas, with a minimum residual water pressure of 20 pounds per square inch (psi) remaining in the water system. Site-specific fire flow requirements are determined by the LAFD based on land use, life hazard, occupancy, and fire hazard level.

Section 57.507.3.2 addresses land use-based requirements for fire hydrant spacing and type. Regardless of land use, every first story of a residential, commercial, or industrial building must be within 300 feet of an approved hydrant. The site-specific number and location of hydrants would be determined as part of LAFD's fire/life safety plan review for each development.

Section 57.507.3.3 limits the maximum response distances to an LAFD station based on the type of land use. Applicable distances are based on LAFD's comment letter for each individual project.

LAMC Chapter V, Article 7, Section 57.512.1 provides that response distances, which are based on land use and fire flow requirements and range from 0.75 mile for an engine company to 2 miles for a truck company, shall comply with Section 57.507.3.3. Where a site's response distance is greater than permitted, all structures must have automatic fire sprinkler systems.

Los Angeles Fire Department Strategic Plan. The Los Angeles Fire Department Strategic Plan 2018–2020, A Safer City 2.0, is a collaborative effort between LAFD staff, city leaders, and community members to accomplish the LAFD's organizational vision. The Strategic Plan 2018–2020 builds upon the progress of the first Strategic Plan from 2015–2017, which resulted in the achievement of 70 percent of its goals. As provided in the Strategic Plan 2018–2020, five goals will guide the LAFD for the next three years: (1) Provide exceptional public safety and emergency service; (2) Embrace a healthy, safe and productive work environment; (3) Implement and capitalize on advanced technology; (4) Enhance LAFD sustainability and community resiliency; and (5) Increase opportunities for personal growth and professional development.

Propositions F and Q. Proposition F, the City of Los Angeles Fire Facilities Bond, was approved by voters in November 2000. This bond allocated $532.6 million of general obligation bonds to finance the construction and rehabilitation of fire stations and animal shelters. Under Proposition F, new regional fire stations to provide training and other facilities at or near standard fire stations must be designed and built on a single site of at least 2 acres. This is to ensure that firefighters in training remain in the service area and are available to respond to emergency calls. Proposition F allocated $378.6 million to build 19 new or replacement neighborhood Fire/Paramedic Stations and an Emergency Air Operations and Helicopter Maintenance Facility, for a total of 20 Proposition F projects. As of January 2017, all of the proposed projects have been completed.[15]

Proposition Q, the Citywide Public Safety Bond Measure, was approved by voters in March 2002. Proposition Q allocated $600 million to renovate, improve, expand and construct public safety (police, fire, 911, and paramedic) facilities. In March 2011, the program was expanded to include renovations to existing LAFD facilities throughout the City. A total of 80 renovation projects at LAFD facilities were scheduled. These renovation projects include the installation of diesel exhaust capture systems, upgrades to air filtration and electrical systems, re-roofing, remodeling, parking lot repair, painting, and other improvements. The fire renovation projects identified under this measure have been completed.[16]

Measure J. Measure J, which was approved by voters at the November 7, 2006 General Election, is a charter amendment and ordinance that involves technical changes to Proposition F. Measure J allows new regional fire stations funded by Proposition F to be located in densely developed areas to be designed and built on one or more properties equaling less than 2 acres. Components of a regional fire station can be built on two or more sites within close proximity, or the facility can be designed to fit on a single site of less than 2 acres. Components of a regional fire station can be built on two or more sites within close proximity, or the facility can be designed to fit on a single site of less than two acres.

4.13.2.3 Thresholds of Significance

In accordance with Appendix G of the *State CEQA Guidelines*, the Proposed Plan would have a significant impact related to fire protection if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, or the need for new or physically altered fire protection facilities, the

15 Los Angeles Fire Department, Los Angeles 2000 Prop F Fire Facilities Bond, Progress Report Feb-March 2016.

16 City of Los Angeles, A 2002 Proposition Q Citywide Safety Bond Program Progress Report – February/March 2016, http://www.lapropq.org/modules/fileUpload/files/Prop%20Q%20Monthly%20Feb%20Mar%202016%20Report.pdf. Accessed September 2020.

construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection.

4.13.2.4 Methodology

The need for, or deficiency in, adequate fire and emergency response services in and of itself is not a CEQA impact, but a social or economic impact (*City of Hayward v. B'd of Trustees* [2015]). To the extent that the Proposed Plan causes a need for additional fire and emergency response services that result in the construction of new facilities or additions to existing facilities and the impact from that construction results in a potential impact to the environment, that is a CEQA impact that needs to be assessed in this EIR. Any discussion in this EIR that relates solely to the level of fire and life safety services provided to the residents or users of the CPA and its surrounding community, including any existing or future needs and deficiencies, is relevant to the impact analysis only insofar as it indicates the demand and need for new or expanded fire protection facilities, but does not determine significance of the impact. The ultimate determination of whether there is a significant impact related to fire and emergency response services under this threshold is based on whether construction of new or expanded fire and emergency response facilities will cause a significant impact to the environment.

4.13.2.5 Impacts

Threshold 4.13-1 **Result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection.**

This impact would be less than significant.

The Proposed Plan provides a framework for development of the CPA through 2040 and includes changes to existing policy to enable higher-density development. Future growth under the Proposed Plan is anticipated to add about 29,000 persons (a 34% increase above 2016 baseline levels), 11,000 housing units (a 50% increase over 2016 baseline levels), and 13,100 jobs (50% increase over 2016 baseline levels) in the CPA by 2040 from 2016 baseline levels. The Proposed Plan also includes policies to improve pedestrian, bike, and public transit networks in the CPA and encourage use of alternative transportation modes and active transport. Impacts to fire protection services resulting from construction and operation of new development are discussed below.

Construction

The Proposed Plan would allow for increased development potential but would not constitute a commitment to any project-specific construction. Construction related to future development within the CPA, particularly along transit corridors and near transit stations, could result in the effects described below. Construction activities would have the potential to temporarily increase the existing demand on fire protection and emergency medical services. Construction activities could potentially expose combustible materials (e.g., wood, plastics, sawdust, coverings, and coatings) to fire risks from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings and lighted cigarettes. However, in compliance with Occupational Safety and Health Administration (OSHA) requirements, construction managers and personnel would be trained in emergency response and fire safety operations. Additionally, fire suppression equipment (e.g., fire extinguishers) specific to construction would be maintained on-site. Project construction would also comply with requirements and policies relating to fire safety practices.

Generally, road and lane closures due to construction activities related to individual projects have the potential to affect response times of fire and emergency services vehicles. Traffic delays caused by potential closures could impede the ability of emergency vehicles to efficiently move along roadways to their destination. Additionally, temporary road closures may also result in detours that impact response time. Any development project that will cause temporary road closures is required to submit a plan to LADOT for approval to ensure any impacts are minimized and, if necessary, proper signage and flagmen provided to avoid impacts. Additionally, large projects are required to develop a construction staging and traffic management plan, as necessary, to ensure emergency access is maintained, consistent with LAFD requirements. As discussed in **Section 4.8, Hazards and Hazardous Waste**, and **Section 4.14**, **Transportation and Traffic**, construction activities related to the Proposed Plan's reasonably anticipated development is not expected to result in significant impacts to emergency services or response times. Construction activities for reasonably anticipated development would not result in the need for expansion of existing fire stations or construction of new fire stations due to the temporary nature of construction.

Operation

A discussed in **Section 4.12, Population, Housing, and Employment**, under the Proposed Plan the CPA is projected to have approximately 115,000 residents by year 2040, which would be a population increase of approximately 29,000 residents compared to the estimated 2016 population. Under the Proposed Plan, the CPA would grow by approximately 11,000 additional housing units and approximately 39,000 employees by year 2040. These increases would take place over time, and the totals are not anticipated to be reached

until 2040 or beyond. As described above, the Proposed Plan does not constitute a commitment to any project-specific construction.

The increase in land use intensity and residential density in the CPA could cause roadway congestion in areas used by fire protection vehicles to access emergency sites. This may impact service standards. The ability of EMS and fire protection services to respond to calls in a timely manner depends primarily on the distance of the station to the incident and the speed at which the emergency vehicles are able navigate intervening roadways. While reasonably anticipated growth under the Proposed Plan would result in higher overall traffic volumes in the CPA, this would not impede emergency response, since California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. The LAFD, in collaboration with Los Angeles Department of Transportation (LADOT), has also developed a Fire Preemption System (FPS) that automatically turns traffic lights to green for emergency vehicles traveling on designated streets in the City. Therefore, EMS and fire protection services response times generally would not change substantially as the population of the Proposed Plan increases.

As discussed in **Section 4.14, Transportation and Traffic**, the Proposed Plan would have a less than significant impact in regard to emergency access. The Proposed Plan would not introduce new streets or otherwise alter the overall land use pattern within the CPA in a way that would affect emergency response routes. The CPA is an urbanized environment where there is sufficient street access for emergency response. Growth by 2040 is expected to worsen traffic conditions however, this growth will occur regardless of the Proposed Plan. Further, the average operational response time for Advanced Life Support (ALS) incidents from the four fire stations in the CPA remain under the nationwide standard. The City's average response time for emergency responders in urban settings of 8 minutes and 59 seconds and it is reasonably foreseeable that the City will continue to stay below this average throughout the Proposed Plan horizon.
