DEPARTMENT OF CITY PLANNING

RECOMMENDATION REPORT

City Planning Commission

Date: Thursday March 27, 2025
Time: After 8:30 a.m.*
Place: Van Nuys City Hall, Council Chamber, 2nd Floor
1441 Sylvan Street
Van Nuys, CA 91401

And via Teleconference. Information will be provided no later than 72 hours before the meeting on the meeting agenda published at https://planning.lacity.org/about/commissions-boards-hearings and/or by contacting cpc@lacity.org.

Public Hearing: August 28, 2024
Appeal Status: Vesting Zone Change and Height District Change are appealable only by the applicant to the City Council in whole or in part. The Zoning Administrator's Determination and Zoning Administrator's Adjustment are appealable to City Council by any party.

Expiration Date: March 27, 2025
Multiple Approval: Yes

Case No.:	CPC-2023-1254-VZC-HD-ZAD-ZAA
CEQA No.:	ENV-2023-1255-MND
Related Cases:	VTT-84101-1A; CPC-2009-1477-CU-ZV-ZAA-SPR-PA1
Council No.:	12 - John Lee
Plan Area:	Canoga Park - Winnetka - Woodland Hills - West Hills
Specific Plan:	N/A
Certified NC:	West Hills
Existing Zones:	A1-1, RS-1, [Q]C1-1VL, and P1-1VL
Proposed Zones:	A1-1, RS-1(to remain on the Main Campus), and (T)(Q)C2-1 for the North Campus
Land Use Designation:	Very Low Residential, Low Residential, and Neighborhood Commercial
Applicant:	Robert S. Webb, Chaminade College Preparatory
Representative:	Jessica Pakdaman, Rosenheim & Associates, Inc.

PROJECT LOCATION: **7500 North Chaminade Avenue** (7500 North Chaminade Avenue, 23241 West Cohasset Street, 23260 West Saticoy Street, 23217-23255 West Saticoy Street 7619-7629 North Woodlake Avenue)

PROPOSED PROJECT: The project involves the expansion of an existing high school campus with no increase in student enrollment. The revised campus plan would include a total lot area of approximately 25.86 acres, inclusive of: 1) improvements to the existing campus (Main Campus) with a new three-story school building, updated parking areas, remodeled athletic fields, new student quads, and renovated classrooms, student service centers and offices and; 2) an expanded school campus area of approximately 4.83 acres located across Saticoy Street, proposed for new athletic fields, an aquatic center/outdoor swimming pool, accessory facilities/structures and associated surface parking facilities; and 3) a new pedestrian bridge across Saticoy Street. The revised campus plan for the high school would include a total of 196,468 square feet of floor area equating to a floor area ratio (FAR) of approximately 0.17:1 and will have 501 on-site vehicle parking spaces and 78 bicycle parking spaces.

REQUESTED ACTIONS:

1) Pursuant to CEQA Guidelines Section 15074(b), after consideration of the whole of the administrative record, including the Mitigated Negative Declaration, No. ENV-2023-1255-MND, and all comments received, with the imposition of mitigation measures, find that there is no substantial evidence that the Project will have a significant effect on the environment; find that the Mitigated Negative Declaration reflects the independent judgment and analysis of the City; find that the mitigation measures have been made enforceable conditions on the Project; and adopt the Mitigated Negative Declaration and the Mitigation Monitoring Program;

2) Pursuant to Los Angeles Municipal Code (LAMC) Sections 12.32 F and 12.32 Q, a Vesting Zone Change and Height District Change from the [Q]C1-1VL and P-1VL zones to the (T)(Q)C2-1 Zone on the new North Campus;

3) Pursuant to LAMC Section 12.24 X.7, a Zoning Administrator's Determination to allow for existing 8-foot-tall perimeter fences and vehicular gates to remain within the front yards (along Cohasset Street and Keswick Street) and for the construction of a new 8-foot-tall-fence and vehicular gate within the front yard (along Cohasset Street) on the Main Campus, in lieu of the maximum height of 6 feet otherwise permitted in the front yard of the A1 Zone pursuant to LAMC Sections 12.21 C1(g) and 12.22 C.20(f);

4) Pursuant to LAMC Section 12.24 X.22, a Zoning Administrator's Determination, to allow for new structures related to the sports facilities on the new North Campus, including, but not limited to, a score board, netting and netting poles, lights and a pedestrian bridge, ranging in height from approximately 25 to 90 feet, in lieu of the 25-foot, 33-foot and 61-foot Transitional Height Limitations permitted within 0-199 feet of lots zoned RW1 or more restrictive pursuant to LAMC Section 12.21.1 A.10;

5) Pursuant to LAMC Section 12.28, a Zoning Administrator's Adjustment to allow the following:

   a. A maximum building height of 48 feet for the new Multistory Building on the Main Campus, in lieu of 45 feet otherwise permitted in the A1 Zone pursuant to LAMC Section 12.21.1; and

   b. The encroachment of a proposed above-grade pedestrian bridge and associated support structures into the required front and side yard setbacks in the RS and A1 zones on the west side of Saticoy Street, and reduced setbacks along Cohasset Street (front yard) and along the easterly property lines (side yards) in the A1 Zone for existing encroaching structures (bleachers and buildings) to remain on the Main Campus, in lieu of the setbacks otherwise required pursuant to LAMC Sections 12.07.1 C and 12.05 C.

RECOMMENDED ACTIONS:

1) **Find**, pursuant to CEQA Guidelines Section 15074(b), after consideration of the whole of the administrative record, including the Mitigated Negative Declaration, No. ENV-2023-1255-MND, and all comments received, with the imposition of mitigation measures, there is no substantial evidence that the Project will have a significant effect on the environment; **find** the Mitigated Negative Declaration reflects the independent judgment and analysis of the City; **find** the mitigation measures have been made enforceable conditions on the project; and **adopt** the Mitigated Negative Declaration and the Mitigation Monitoring Program;

2) **Recommend** that the City Council **Approve** a Vesting Zone Change and Height District Change from the [Q]C1-1VL and P-1VL zones to the (T)(Q)C2-1 Zone on the new North Campus;

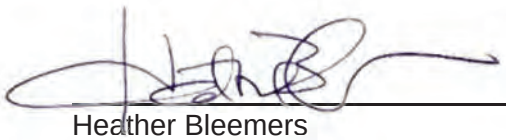
3) **Approve** a Zoning Administrator's Determination to allow for existing 8-foot-tall perimeter fences and vehicular gates to remain within the front yards (along Cohasset Street and Keswick Street) and for the construction of a new 8-foot-tall-fence and vehicular gate within the front yard (along Cohasset Street) on the Main Campus, in lieu of the maximum height of 6 feet otherwise permitted in the front yard of the A1 Zone pursuant to LAMC Sections 12.21 C.1(g) and 12.22 C.20(f);

4) **Approve** a Zoning Administrator's Determination, to allow for new structures related to the sports facilities on the new North Campus, including, but not limited to, a score board, netting and netting poles, lights and a pedestrian bridge, ranging in height from approximately 25 to 90 feet, in lieu of the 25-foot, 33-foot and 61- foot Transitional Height Limitations permitted within 0-199 feet of lots zoned RW1 or more restrictive pursuant to LAMC Section 12.21.1 A.10;

5) **Approve** a Zoning Administrator's Adjustment to allow the following:

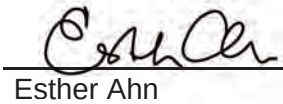
   a. A maximum building height of 48 feet for the new Multistory Building on the Main Campus, in lieu of 45 feet otherwise permitted in the A1 Zone pursuant to LAMC Section 12.21.1;

   b. The encroachment of a proposed above-grade pedestrian bridge and associated support structures into the required front and side yard setbacks in the RS and A1 zones on the west side of Saticoy Street, and reduced setbacks along Cohasset Street (front yard) and along the easterly property lines (side yards) in the A1 Zone for existing encroaching structures (bleachers and buildings) to remain on the Main Campus, in lieu of the setbacks otherwise required pursuant to LAMC Sections 12.07.1 C and 12.05 C; and



6) **Adopt** the attached Conditions of Approval;

7) **Adopt** the attached Findings;



8) **Advise** the applicant that, pursuant to California State Public Resources Code Section 21081.6, the City shall monitor or require evidence that mitigation conditions are implemented and maintained throughout the life of the project and the City may require any necessary fees to cover the cost of such monitoring; and

9) **Advise** the applicant that pursuant to State Fish and Game Code Section 711.4, a Fish and Game Fee and/or Certificate of Game Exemption is now required to be submitted to the County Clerk prior to or concurrent with the Environmental Notice of Determination (NOD) filing.

ADVICE TO PUBLIC: *The exact time this report will be considered during the meeting is uncertain since there may be several other items on the agenda. Written communications may be mailed to the *Commission Secretariat, Room 272, City Hall, 200 North Spring Street, Los Angeles, CA 90012* (Phone No. 213-978-1300). While all written communications are given to the Commission for consideration, the initial packets are sent to the week prior to the Commission's meeting date. If you challenge these agenda items in court, you may be limited to raising only those issues you or someone else raised at the public hearing agendized herein, or in written correspondence on these matters delivered to this agency at or prior to the public hearing. As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability, and upon request, will provide reasonable accommodation to ensure equal access to these programs, services and activities. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or other services may be provided upon request. To ensure availability of services, please make your request not later than three working days (72 hours) prior to the meeting by calling the Commission Secretariat at (213) 978-1299.

PROJECT ANALYSIS

PROJECT SUMMARY

The Chaminade College Preparatory, High School Project is located at 7500 North Chaminade Avenue within the West Hills neighborhood of the San Fernando Valley. The high school campus is located west of the 27 Highway (Topanga Canyon Boulevard), and north of the 101 Freeway. The revised campus plan would include a total lot area of approximately 25.86 acres, inclusive of: 1) a new three-story school building, updated parking areas, remodeled athletic fields, new student quads, and renovated classrooms, student service centers and offices on the existing campus of 21 acres; 2) an expanded school campus area of approximately 4.83 acres located across Saticoy Street, proposed for new athletic fields, an aquatic center/outdoor swimming pool, accessory facilities/structures and associated surface parking facilities; and 3) a new pedestrian bridge across Saticoy Street. The revised campus plan for the high school would include a total of 196,468 square feet of floor area equating to a floor area ratio (FAR) of approximately 0.17:1 and will have 501 on-site vehicle parking spaces and 78 bicycle parking spaces.

Chaminade College Preparatory has been operating the existing private high school campus on the project site (Main Campus) since the 1960s, and currently operates the existing campus under a Conditional Use Permit granted in 2009. Chaminade purchased the North Campus property, which is currently improved with a shopping center, in 2018 with the intent to expand the campus facilities.

The campus expansion plans and Plan Approval grant, under related Case No. CPC-2009-1477-ZV-CU-ZAA-SPR-PA1, facilitate a series of targeted improvements and operational updates aimed at modernizing and expanding the academic, athletic and parking facilities at Chaminade College Preparatory's Main Campus, ensuring its continued service to the community and alignment with contemporary educational and operational standards. While the aforementioned Plan Approval pertains to the Main Campus only, additional entitlements that apply to both the Main and North Campuses are requested under the subject Case No. CPC-2023-1254-VZC-HD-ZAD-ZAA, which involve a Vesting Zone Change and Height District Change specific to the North Campus only, as well as a Zoning Administrator Adjustment and Zoning Administrator Determination that cover both the Main Campus and North Campuses. These additional entitlements were requested through the subject case instead of through the Plan Approval case because they involve new legislative and discretionary actions beyond the scope of the existing Conditional Use Permit and beyond the Plan Approval action. In addition, related Case No. VTT-84101 was filed the merge and re-subdivide the project site into two ground lots. Key elements of the project include the construction of a new 3-story building with administrative, counseling, library, multi-purpose, classroom and laboratory areas, renovation of classrooms, offices and administrative buildings to include expanded student service programming and to incorporate advanced infrastructure and technology and new student quads. These updates will enhance academic offerings and provide improved support for students.

To address athletic and recreational needs, the project also proposes upgraded and new athletic fields and facilities, including efficient stadium lighting on the Main and North Campuses and a state-of-the-art PA system on the North Campus similar to the system currently used on the Main Campus. These upgrades are accompanied by sound and light mitigation measures to minimize impacts on neighboring properties. Sustainability plays a significant role in the project's design, with plans for solar panel installations, EV parking, permeable landscaping, and water-efficient vegetation. These features align with the city's environmental goals and contribute to the campus' overall eco-friendliness.

Additionally, a key objective of the project is to improve pedestrian safety and circulation, and separate pedestrian and vehicular areas internal to the Main Campus. A pedestrian bridge over Saticoy Street will connect the Main and North Campuses, ensuring safe transit for students, staff and visitors. Operational improvements include a revised Traffic Management Plan (TMP) to alleviate congestion during peak hours, with expanded parking facilities on-campus reducing dependence on adjacent streets. Community engagement is prioritized through measures such as appointing a Community Relations representative, operating a 24-hour hotline, and hosting regular updates for the West Hills Neighborhood Council. These initiatives aim to foster transparency and collaboration with local residents.

In summary, the proposed project supports the modernization of Chaminade's educational, athletic and parking facilities, enhances student and staff experiences, and reinforces the school's commitment to sustainability and community integration, ensuring its continued positive impact on the neighborhood. The proposed project's site plan can be seen in **Figure 1**, below.

Figure 1. *Rendering of proposed improvements to the existing Main Campus and new North Campus located to the northeast of Saticoy Street.*

PROJECT BACKGROUND

Project Site

The project site comprises two properties identified as the existing Main Campus and the proposed North Campus bifurcated by Saticoy Street. The Main Campus is comprised of three lots and has a total lot area of approximately 21 acres. The Main Campus has approximately 666 feet of frontage along the west side of Saticoy Street, approximately 273 feet of frontage along the south side of Keswick Street, approximately 636 feet of frontage along the east side of Chaminade Avenue, and approximately 808 feet of frontage along the north side of Cohasset Street. The proposed North Campus is comprised of three lots having a total lot area of approximately 4.83 acres. The proposed North Campus has 788 feet of frontage along the east

side of Saticoy Street and approximately 244 feet of frontage along the west side of Woodlake Avenue.

The existing high school is improved with facilities including, but not limited to, 37 classrooms, administrative and support offices, a library, a student center building that can accommodate 928 seats, a performing arts center with 360 seats, a fine arts building, a campus ministry building, a lighted football field with bleachers with 2,500 seats, a basketball gymnasium with bleachers with 1,000 seats, a baseball field with bleachers, and a pool. The existing buildings on the Main Campus total 156,768 square feet of floor area. In addition, the Main Campus currently provides 462 vehicular parking spaces.

In 2009, under Case No. CPC-2009-1477-CU-ZV-ZAA-SPR, Chaminade College Preparatory, High School received approval for various campus improvements, including the construction of 86,200 square feet of new facilities and the demolition of 40,911 square feet of existing structures. Key additions authorized under the grant included the performing arts center, an auxiliary athletic complex, and a library/student center, as well as the approval of an aquatic complex with a swimming pool. The aquatic complex and swimming pool, however, were never built.

The property on which the North Campus is proposed, is currently improved with a single-story, multi-tenant commercial mini-shopping center and surface parking lot, built between 1962 to 1964. The shopping center is currently occupied with retail, restaurant, dry cleaner, and grocery store tenants.

Surrounding Properties

Main Campus

Surrounding properties to the existing Main Campus are located within the RE11-1 and RS zones and are generally improved with single-family residential uses and a public park. The abutting properties located along the north side of the project site, along and across Keswick Street, and along Atron Avenue to the west, are zoned RE11-1 and improved with single-family residential homes. The properties located to the west of the project site, abutting and across Chaminade Avenue, are zoned RE11-1 and improved with single-family residential homes. The properties located to the south and across Cohasset Street are zoned RE11-1 and improved with a single-family residential homes and Four Oaks Park. The properties to the east and abutting, are zoned RS-1 and improved with single-family residential homes.

North Campus

Surrounding properties to the proposed North Campus are located within the RS-1, [Q]C1.5-1VL, (Q)RD5-1A1-1VL zones, and are generally improved with single-family residential uses and an automotive repair shop. The properties located to the north of the project site and abutting, are zoned RS-1 and improved with single-family residential uses. The properties located to the west and south of the project site across Saticoy Street, are zoned RS-1 and improved with single-family residential uses, as well as an academic building and a surface parking lot associated with the Main Campus. The property directly abutting to the south and east of the project site, at the northwest corner of Saticoy and Woodlake Avenue, is zoned [Q]C1.5-1VL and improved with an automotive repair shop. Finally, the properties located to the east and across Woodlake Avenue are zoned (Q)RD5-1 and A1-1VL and improved with single-family residential homes. An aerial view of the project site with both campuses can be seen in **Figure 2**, below.

Figure 2. *Aerial view of the Existing Main Campus and the Proposed North Campus and the surrounding properties.*

General Plan Land Use Designation and Zoning

The project site is located in the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan area, one of 35 Community Plans which form the land use element of the General Plan. The project site comprises two main parcels identified as the existing Main Campus and the proposed North Campus bifurcated by Saticoy Street. As shown in **Figure 3** below, the Main Campus is zoned A1-1 and RS-1 and is designated for Very Low and Low Residential land uses, respectively. The new North Campus is currently zoned [Q]C1-1VL and P-1VL and is designated for Neighborhood Commercial land uses. The project is requesting a Vesting Zone Change, under Related Case No. CPC-2023-1254-VZC-HD-ZAD-ZAA, to change the current [Q]C1-1VL and P-1VL zoning of the site of the North Campus to the (T)(Q)C2-1 Zone. The proposed (T)(Q)C2-1 Zone would be consistent with the underlying land use designation. The project site is not located within the boundaries of or subject to any other specific plan, community design overlay, or interim control ordinance. The current zoning of the proposed North Campus contains a permanent Qualified “Q” Condition that restricts development to a floor area ratio (FAR) of 0.5:1. The Vesting Zone Change would effectively remove the permanent Q-Condition, however, the proposed project FAR for the North Campus is approximately 0.05:1 well below the maximum 0.5:1 FAR established by the existing Q-Condition.

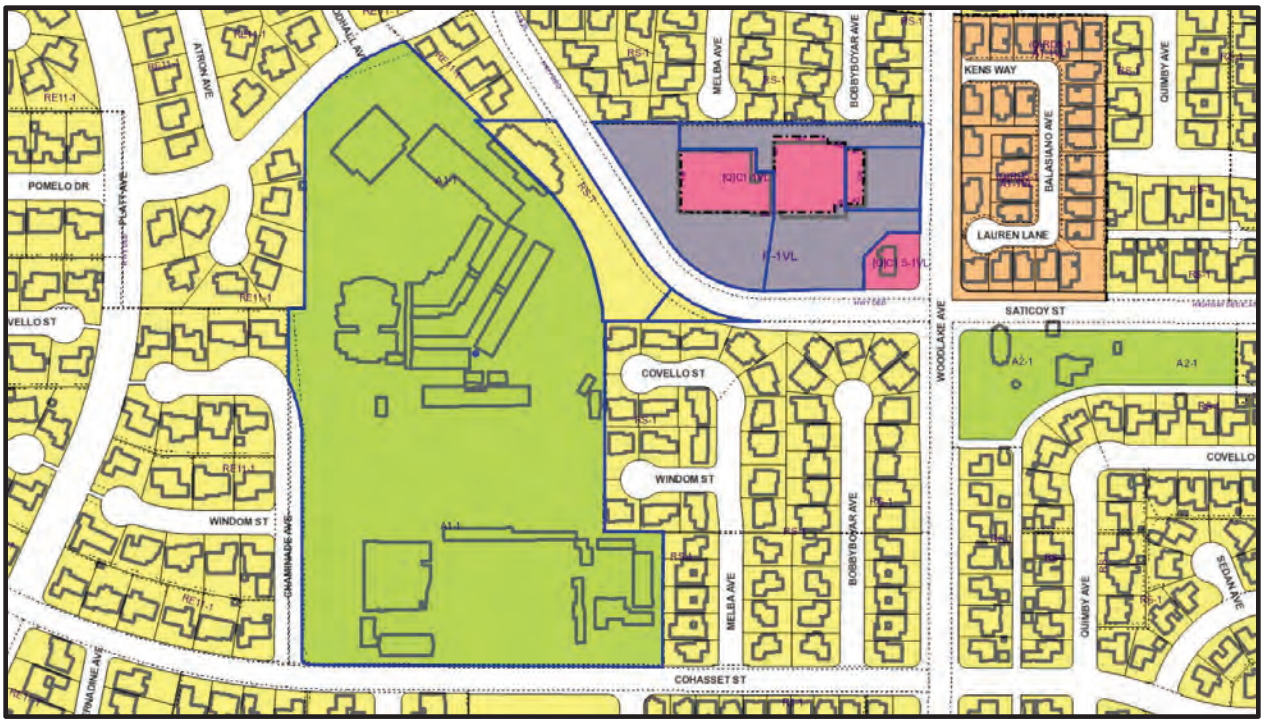

Figure 3. *Current zoning of the subject property.*

Streets

Chaminade Avenue, adjoining the subject property (Main Campus) to the west, is a Local Street – Standard, dedicated to a right-of-way width of 60 feet and is fully improved with asphalt roadway, concrete curb, gutter, and sidewalk.

Cohasset Street, adjoining the subject property (Main Campus) to the south, is a designated Collector Street, dedicated to a varying right-of-way width of 62 to 64 feet and is fully improved with asphalt roadway, concrete curb, gutter, and sidewalk.

Keswick Street, adjoining the subject property (Main Campus) to the northeast, is a designated Local Street – Standard, dedicated to a right-of-way width of 60 feet and is fully improved with improved with asphalt roadway, concrete curb, gutter, and sidewalk.

Saticoy Street, adjoining the subject property (Main Campus and North Campus) to the northeast, and west/south is a designated Avenue II, dedicated to a varying right-of-way width of 68 to 86 feet and is fully improved with improved with asphalt roadway, concrete curb, gutter, and sidewalk.

Woodlake Avenue, adjoining the subject property (North Campus) to the east, is a designated Avenue II, dedicated to a varying right-of-way width of 68 to 73 feet and is fully improved with improved with asphalt roadway, concrete curb, gutter, and sidewalk.

Proposed Improvements

Main Campus

The project proposes both improvements on the Main Campus as well as the addition of the new North Campus. New construction on the Main Campus includes the new Multistory Building, as shown in **Figure 4** below, at the new additional entrance off Saticoy Street, that will include administrative offices, counseling offices, library, multi-purpose room, classrooms, and labs. The

floor area contained within the proposed building totals approximately 60,760 square feet and has a building height of approximately 48 feet within three stories. In addition, the existing single-story buildings located at the southeast corner of the Main Campus will undergo renovation for administrative offices but will not increase in floor area or height. A new surface parking lot will be constructed in place of the existing paved driveway adjacent to the single-story building at the southeast corner of the Main Campus, fronting on Cohasset Street. Lastly, additional improvements to the Main Campus will include minor demolition and resurfacing of the existing baseball field along Cohasset Street, to be reutilized as a softball field, removal of the north surface parking lot, and resurfacing to create a new landscaped quad area adjacent to the current administrative building to be renovated for student service programming.

***Figure 4**. Rendering of the new Multistory Building on the Main Campus.*

North Campus

As shown in **Figure 5** below, improvements on the North Campus include a new athletic field to be used for baseball and soccer, outdoor swimming pool, and associated facilities with surface parking. The athletic field will feature 40-foot-high safety netting along part of the outfield perimeter and a 26-foot-high electric scoreboard located in left-center field along the northern property line, facing Saticoy Street. Additionally, single-story locker rooms, batting cages, and bullpens will be positioned along the first and third baselines. Home and visitor bleachers, accommodating approximately 350 seats, will be situated along both baselines and shaded by a continuous 19-foot-high structure. A 100-square-foot press box will be located behind home plate. The athletic field will be illuminated by eight stadium light standards ranging in height from 70 to 90 feet, with the 70-foot lights placed around the left and right outfields and the taller 80- and 90-foot standards situated along Saticoy Street and next to the new surface parking lot. To the west of the baseball field, a 1,540-square-foot, single-story concession and restroom building is proposed, along with an 86-stall surface parking lot and access to the pedestrian bridge.

To the east of the baseball field, a 25-meter by 25-yard in-ground outdoor pool is proposed, accompanied by four light standards – Two 40-foot-tall lights on to the east and two 50-foot-tall lights on the west. The pool area will also feature a 6,094-square-foot, single-story pool house standing 19 feet tall, along with 15 surface parking stalls. Bleachers will be positioned to the west of the pool, providing seating for approximately 126 spectators. The current four ingress/egress points along Saticoy Street will be reduced to two access points, and the two existing access

points along Woodlake Avenue will be consolidated into a single driveway at the approximate location of the current northern access point.

***Figure 5**. Aerial rendering of the proposed North Campus.*

Pedestrian Bridge

As shown in **Figure 6** below, the proposed pedestrian bridge is a significant feature designed to improve safety and connectivity between the Main Campus and the new North Campus, which are separated by Saticoy Street. This bridge will provide a grade-separated crossing, eliminating the need for students, staff and visitors to cross the busy street at ground level, enhancing pedestrian safety during school hours and large events. The bridge will be constructed with sufficient clearance to allow for vehicular traffic on Saticoy Street, adhering to Los Angeles Department of Transportation (LADOT) standards. It will not only serve to safely connect the two campuses but also improve traffic flow by reducing the number of pedestrian crossings at street level. A revocable permit will be necessary for the pedestrian bridge as it will encroach over the public-right of-way, with the encroaching structure subject to Bureau of Engineering approval and the design of the structure subject to approval by the Department of Cultural Affairs, including the Cultural Affairs Commission.

Figure 6. *A rendering of the pedestrian bridge that would cross over Saticoy Street.*

Landscaping

The total landscaped area for the project will cover approximately 417,146 square feet of lot area, accounting for approximately 37 percent of the overall site area across both the Main and North Campuses. The Main Campus will feature 297,170 square feet of landscaped area. These areas will be concentrated around the building perimeters, parking lots, and along the street frontages. Trees, shrubs, and understory plantings will provide shaded outdoor spaces for students and staff. As shown in **Figure 7** below, the North Campus will feature 119,976 square feet of landscaping, primarily surrounding the new athletic fields, the outdoor pool, and parking areas.

The planting palette consists of a variety of shrubs, perennials, and trees that are intended to provide shading where needed, reduce surface temperatures, as well as maintain compatibility with adjacent residential uses. Trees provide shade and serve as natural buffers around the parking lots and playfields, whereas shrubs and perennials will be used as understory planting to complement the trees and create a natural environment for students and staff to enjoy outdoor spaces. The landscaping plan aims to reduce the urban heat island effect and promote permeable surfaces in parking lots and other hardscaped areas.

Landscaped areas will also be integrated into the main pedestrian entryways, helping to create shaded and welcoming spaces. Student quads and gathering areas will also be enhanced with greenery, offering students outdoor spaces for recreation and interaction. The project will feature landscaping along street frontages and the site's perimeter, with existing landscaping to remain along the Main Campus and new landscaping proposed along the North Campus) to provide visual buffers between the school and nearby residences. These buffers will help mitigate noise and improve privacy for both the school and its neighbors.

The project site, including the existing Main Campus and the proposed North Campus, currently has a total of 364 non-protected significant trees (8 inches or greater in DBH). No protected trees are located on the property. Of 364 non-protected trees on site, 324 trees will be retained, while 40 trees will be removed and replaced 1:1 due to construction impacts. Additionally, 33 street

trees are present, with 32 to be retained and one (1) street tree to be removed and replaced 2:1 due to the installation of the pedestrian bridge. With the 40 new trees to replace those significant trees to be removed, 324 significant trees to remain, and an additional 101 on-site trees with less than 8 inches in DBH to remain, the project will result in a total of 465 trees on the property after completion.

***Figure 7**. North Campus Landscape Plan*

School Operation and Hours

The Chaminade College Preparatory High School Project involves the continued operation and expansion of the existing high school campus, which will serve up to 1,360 students in grades 9 through 12. The project will not increase the current maximum student enrollment but will improve facilities and enhance campus operations.

The proposed hours of operation for Chaminade College Preparatory's new facilities on the North Campus are structured to balance school use and community access while minimizing neighborhood impact. The athletic fields and stadium will operate Monday through Friday from 7:00 a.m. to 9:00 p.m. (with an exception for overtime/extra inning play), with Saturday hours from 8:00 a.m. to 9:00 p.m., and Sunday use limited to 9:00 a.m. to 8:00 p.m. on no more than 15 Sundays per year.

The aquatic complex, which will host swim practices and competitions, will have more restrictive hours, operating Monday through Friday from 8:00 a.m. to 8:00 p.m., and on Saturdays from 10:00 a.m. to 7:00 p.m. No operations will take place on Sundays.

The batting cages on the North Campus will be further restricted and will operate Monday through Saturday from 9:00 a.m. to 7:00 p.m., with no Sunday use permitted.

Community-based athletic organizations' access to the facilities on the North Campus is further restricted, with athletic field rentals limited to 36 days per year, Monday through Saturday from

8:00 a.m. to 6:00 p.m., and no Sunday or holiday rentals. Community-based organizations will have access to aquatic complex limited to daylight hours, ending by 7:00 p.m. on weekdays and 5:00 p.m. on Saturdays. Community member swim hours will be limited to 8:00 a.m. to 6:00 p.m. No community use of the athletic facilities is allowed on Sundays or holidays.

The Chaminade College Preparatory, High School Project includes both the maintenance of the existing public address (PA) system on the Main Campus and the installation of a new PA system for the North Campus. The existing PA system on the Main Campus will continue to be used for daily announcements, event coordination, and emergency communications. As part of the North Campus development, a new PA system will be integrated to provide seamless communication between the two campuses, covering the athletic fields, outdoor areas, and other key locations. This new system will include sound control measures to minimize noise impacts on surrounding residential areas and will have restricted hours of use, particularly for outdoor events.

As part of the updated campus plan, an updated Traffic Management Plan (TMP) will be introduced to address the revised student loading and unloading procedures. Vehicle drop-off and pick-up will continue to take place on-site along the westerly property line of the Main Campus, while bus drop-off and pick-up will remain along the west side of Saticoy Street, adjacent to the campus. Additionally, the project proposes a new passenger loading zone along the north side of Cohasset Street for additional student drop-off and pick-up. Driving students will continue to park in designated lots on the Main Campus, while a new parking lot on the North Campus, located on the westerly side, will be designated for senior and staff parking. Student drop-off and pick-up will not occur on the North Campus.

Access, Circulation, and Parking

The Chaminade College Preparatory Project includes a comprehensive circulation plan for both pedestrian and vehicular access, aimed at enhancing safety, connectivity, and operational efficiency between the Main Campus and the North Campus.

The Main Campus will retain its existing vehicular access points from Cohasset Street, Chaminade Avenue, Keswick Street, and Saticoy Street, which currently serve as the main entrances for staff, students, and visitors. On-site vehicle parking will be distributed across both campuses, with the Main Campus retaining most of its existing parking areas and some areas being reconfigured or resurfaced. Additionally, new surface parking lots will be constructed on the North Campus. In total, the project will provide 501 on-site parking spaces across the Main Campus and the North Campus. The Main Campus will have 400 parking spaces, while the North Campus will provide 101 spaces, with 86 stalls in the west parking area adjacent to the proposed athletic field and 15 stalls in the east parking area near the pool. The project will also provide a total of 78 bicycle parking spaces, including 76 short-term spaces and 2 long-term spaces. To facilitate efficient vehicular circulation, a key component of the project involves maintaining and enhancing access to both campuses from surrounding streets. The TMP will be implemented to streamline drop-off and pick-up operations, minimize traffic disruptions during peak hours, and ensure smooth traffic flow around the school.

A prominent feature of the project is the construction of an approximately 2,650-square-foot pedestrian bridge over Saticoy Street, which will connect the Main Campus to the North Campus. The bridge is designed to improve pedestrian safety by providing a secure route for students, staff, and visitors between the two campuses without needing to cross Saticoy Street, a busy thoroughfare, at street level. The bridge will have stairs and an elevator tower at the east end and will land at grade level on the west end, ensuring accessibility for all users, including those with disabilities. The bridge will also be secured with gates and fencing to control pedestrian access and maintain campus security. As part of the development process, the applicant will also need

to obtain approval from the Bureau of Engineering in the form of a revocable permit because the bridge structure is located over a public right-of-way and will need to ensure that the pedestrian bridge complies with necessary regulations and standards

Overall, the project integrates improved vehicular and pedestrian circulation, as shown in **Figure 8** below, ensuring safe and efficient access to both campuses while enhancing connectivity and reducing traffic conflicts.

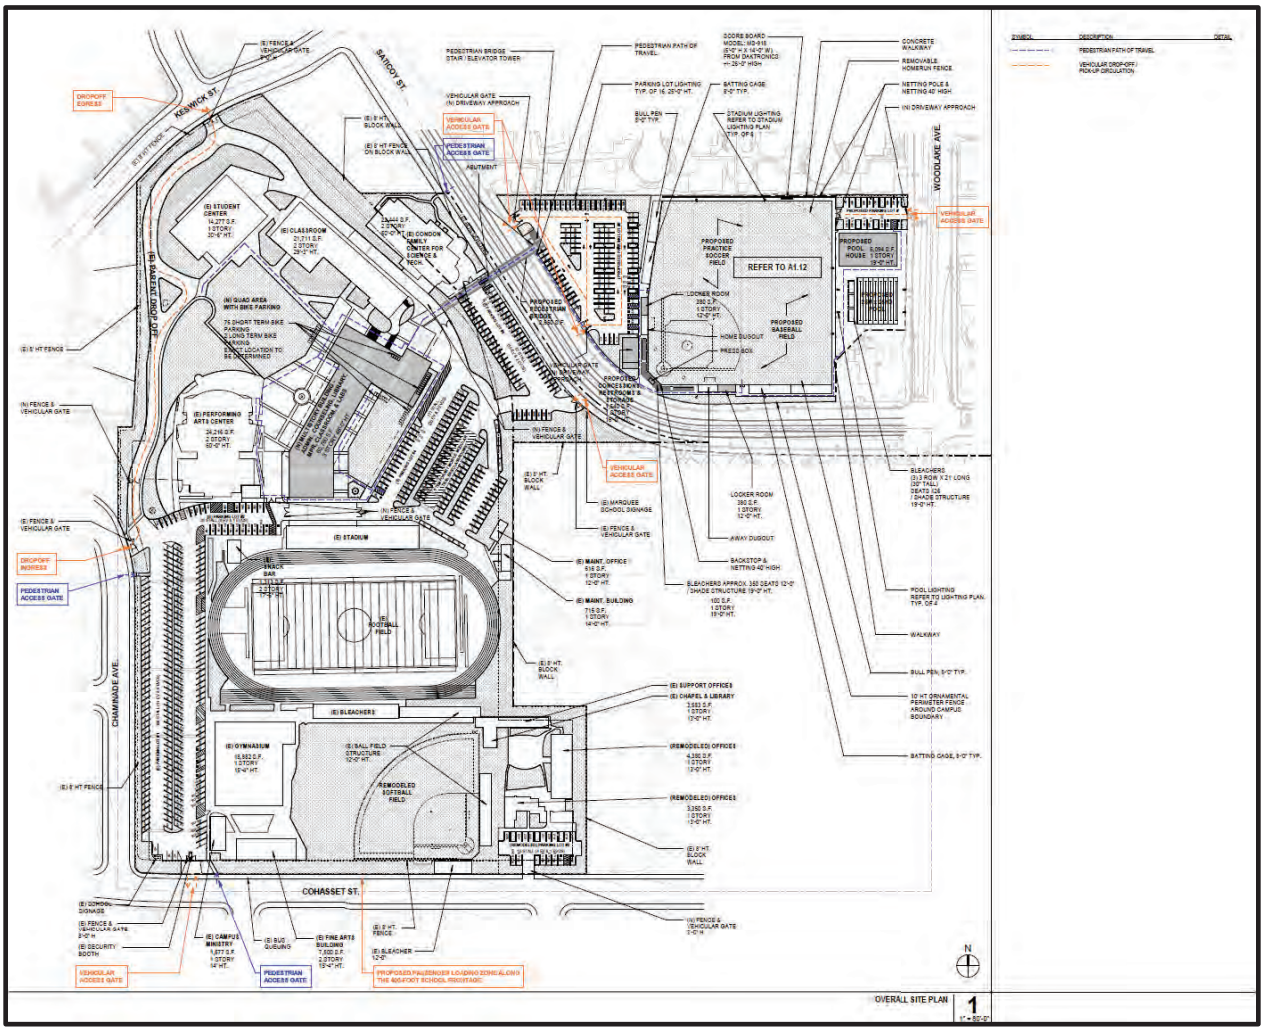

Figure 8. *Proposed Access and Circulation for Main and North Campuses*

Measure JJJ

Per Measure JJJ and per LAMC Section 11.5.11, in order to be eligible for a General Plan amendment, or any zone change or height district change that results in increased allowable residential floor area, density or height, or allows a residential use where previously not allowed, projects with 10 or more residential dwelling units shall be required to provide affordable housing options. The project, however, involves the expansion of an existing private high school campus. The project does not propose any residential uses, and thus, is not subject the requirements under Measure JJJ.

Relevant Cases on the Project Site

Case No. CPC-2009-1477-CU-ZV-ZAA-SPR-PA1 – On February 22, 2023, the applicant filed a Plan Approval application to allow the continued use and operation of an existing high school in the A1 and RS zones and to modify Condition No. 1, 2, 3, 5, 6, 7, 8, 11, 15, 16, 23, 24, 25 and 26 of the original Conditional Use grant under Case No. CPC-2009-1477-CU-ZV-ZAA-SPR.

Case No. VTT-84101 – On September 18, 2024, the Deputy Advisory Agency approved Lots 1 and 2 and denied Lot 3 of Vesting Tentative Tract Map No. 84101, allowing for the merger and re-subdivision of the project site into two (2) ground lots: one for the Main Campus (Lot 1) and one for the North Campus (Lot 2); approved a haul route approval for the export of approximately 17,800 cubic yards from the Main Campus and the export of approximately 720 cubic yards from the North Campus; and approved a Modification of Requirements in conjunction with a Vesting Tentative Tract Map for the waiver of required dedications and street improvements along Cohasset Street.

Case No. CPC-2009-1477-CU-ZV-ZAA-SPR – On November 17, 2009, the City Planning Commission approved a Conditional Use, Variances, an Adjustment and Site Plan Review for Chaminade College Preparatory, High School (Main Campus), located at 7500 Chaminade Avenue, to modernize the school's student center and athletic facilities, allowing for the demolition of existing floor area and construction of new floor area (including a new performing arts center, aquatic complex, student center and associated structures), in conjunction with the continued use and maintenance of the existing school.

Case No. CPC-2000-1301-CU – At its meeting on September 28, 2000, the City Planning Commission approved a Conditional Use Permit, pursuant to LAMC Section 12.24.1, to permit the proposed construction, use and maintenance of a new 25,120 sq. ft., two-story classroom building with 65 surface parking spaces on an undeveloped 1.5 net acre parcel (in conjunction with the continued use and maintenance of the existing total approximate 21.3 acre Chaminade College Preparatory campus), subject to the attached modified Conditions of Approval.

Other Relevant Cases Within 1,500 Feet of the Project Site

There are no relevant cases within 1,500 feet of the project site.

PUBLIC HEARING

A joint public hearing with the Deputy Advisory Agency and Hearing Officer for the proposed project was held on Wednesday, August 28, 2024, via Zoom teleconference. More information on the public hearing is in the Public Hearing and Communications section, on Page P-1.

PROFESSIONAL VOLUNTEER PROGRAM

The proposed project was reviewed by the Urban Design Studio's Professional Volunteer Program (PVP) on December 12, 2023. The resulting comments and suggestions detailed in the following section, Issues and Considerations, focus primarily on the site layout, building design, access and circulation, lighting, and landscaping.

ISSUES AND CONSIDERATIONS

These were either identified during Urban Design Studio's Office Hours, the design review process by PVP, in discussions with the applicant, or in communications with members of the public before, during, or after the public hearing held on August 28, 2024.

Site Layout

Planning staff requested improvements to pedestrian circulation between the Main Campus and the newly expanded North Campus. It was suggested that the project consider utilizing an on-ground pedestrian crossing instead of the proposed pedestrian bridge across Saticoy Street to create a more active street front, accommodate larger event crowds, and reduce isolation of campus areas. The applicant responded that the pedestrian bridge design was chosen primarily for safety reasons, allowing students to cross safely above the busy street. They also noted that the bridge landing will connect directly to essential North Campus facilities, with designated pedestrian paths.

The proposed pedestrian bridge will undergo review by the Bureau of Engineering (BOE) and, if approved, will be authorized through a revocable permit. It must adhere to all applicable design and safety standards to the satisfaction of both BOE and the Department of Transportation (LADOT). Additionally, as part of the revocable permit process, the design of the bridge will undergo review and evaluation by the Department of Cultural Affairs and will be presented to the Cultural Affairs Commission.

Additionally, staff proposed reprogramming the North Campus layout to bring the pool and athletic field closer to the primary circulation routes, improving proximity to key functions like classrooms. The applicant acknowledged the recommendation but indicated that reconfiguring the layout posed practical difficulties due to site constraints.

Building Design

While the overall design of the new buildings was generally praised, PVP members and staff raised concerns regarding the impact of the stadium lights and bleachers on the surrounding residential neighborhoods. They recommended incorporating measures to minimize light spillover and noise impacts, particularly from the North Campus athletic fields. In response, the applicant provided a Technical Lighting Analysis, confirming that the proposed lighting design stays within acceptable thresholds for spillover and intensity. Furthermore, the bleacher locations were selected to maintain distance from nearby homes adjacent to the north.

Concerns about the facade articulation of the proposed Multistory Building on the Main Campus were also raised. Staff recommended better alignment of the building with surrounding open space to create a cohesive quad. The applicant responded by refining facade details, materials, and colors to improve the aesthetic integration with surrounding buildings.

Pedestrian and Vehicular Access and Circulation

Planning staff emphasized the importance of enhancing pedestrian connections on both campuses, particularly regarding safe access from Saticoy Street. Suggestions included the use of varied hardscape materials to visually distinguish pedestrian paths from vehicle routes, especially in parking areas. In respond, the applicant further delineated the locations of proposed paths on the plans to ensure that safe and clear pedestrian routes across both campuses have been incorporated.

Staff also questioned the necessity of the large parking areas, considering the availability of school buses. It was suggested that the parking area could be reduced to enhance pedestrian access and site efficiency. The applicant noted that the parking layout would be largely maintained due to operational needs. The applicant also expressed that the proposed increase in on-site parking is an important objective for area residents and neighbors of the school who have

expressed desires to deter students, faculty, staff or visitors of the school from parking in the surrounding residential streets.

Lighting

There was a strong focus on preventing nighttime light pollution, particularly from the new athletic field lighting on the North Campus. Planning staff and PVP members emphasized the need to protect nearby residential areas from excessive light and ensure compliance with all relevant regulations. The applicant assured that the project would adhere to all standards and that the lighting design had been refined to minimize spillover into adjacent properties.

Landscaping

Planning staff encouraged the inclusion of native trees and landscaping features that could provide shade, year-round habitat, and enhance the stormwater management system. They suggested the addition of permeable paving, bioswales, and other stormwater retention features to comply with the LID Ordinance. The applicant confirmed that applicable LID standards will be followed for stormwater treatment and retention, refined the preliminary landscape plans with additional details on proposed plantings and water usage, and advised that additional landscaping details will be provided on the final landscape plans prior to the issuance of any building permits.

The applicant was also asked to add street trees along Saticoy Street. However, based on previous discussions with Urban Forestry, it was determined that space constraints along the sidewalk made it impractical to include these trees.

The applicant's team addressed many of the key concerns raised by the Urban Design Studio and PVP by refining building designs, and refining the project plans to show internal pathways for safe pedestrian trave, additional landscape details and proposed locations of solar zones for the proposed Multistory Building. Although certain layout changes, such as eliminating the pedestrian bridge, were not adopted, the applicant demonstrated flexibility in project design where possible, and addressed light and noise concerns in response to community feedback.

CONCLUSION

Based on evaluation of the project and information submitted, and the proposed project's compliance with the Canoga Park - Winnetka – Woodland Hills – West Hills Community Plan, the Department of City Planning recommends the City Planning Commission recommend for approval by the City Council the requested Vesting Zone Change and Height District Change; and that the City Planning Commission approve the Zoning Administrator's Determination and Zoning Administrator's Adjustment. Approval of the requests herein will enable improvements to, and the expansion of an existing private high school campus that has operated in the West Hills neighborhood since the early 1960s.

CONDITIONS FOR EFFECTUATING TENTATIVE (T) CLASSIFICATION REMOVAL

Pursuant to LAMC Section 12.32 G, the (T) Tentative Classification shall be removed by posting of guarantees through the B-permit process of the City Engineer to secure the following without expense to the City of Los Angeles, with copies of any approval or guarantees provided to the Department of City Planning for attachment to the subject planning case file.

Dedication(s) and Improvement(s). Prior to the issuance of any building permits, the following public improvements and dedications for streets and other rights of way adjoining the subject property shall be guaranteed to the satisfaction of the Bureau of Engineering, Department of Transportation, Fire Department (and other responsible City, regional and federal government agencies, as may be necessary).

Responsibilities/Guarantees:

Dedications and Improvements herein contained in these conditions which are in excess of street improvements contained in either the Mobility Element 2035 or any future Community Plan amendment or revision may be reduced to meet those plans with the concurrence of the Department of Transportation and the Bureau of Engineering:

1. As a part of early consultation, plan review, and/or project permit review, the applicant/developer shall contact the responsible agencies to ensure that any necessary dedications and improvements are specifically acknowledged by the applicant/developer.

2. **Dedications and Improvements.** Prior to issuance of sign offs for final site plan approval and/or project permits by the Department of City Planning, the applicant/developer shall provide written verification to the Department of City Planning from the responsible agency acknowledging the agency's consultation with the applicant/developer. The required dedications and improvements may necessitate redesign of the project. Any changes to project design required by a public agency shall be documented in writing and submitted for review by the Department of City Planning.

    a. That, a revised map be submitted for information purposes only, prior to the submittal of the final map not showing proposed Lot 3 over the Saticoy Street public right-of-way and the delineation of all required street dedications and easements. This map will be used for final map checking purposes.

    b. No dedications or street improvements shall be required along the subject property’s street frontage on the north side of Cohasset Street.

    c. That, along the west side of Saticoy Street adjoining the subdivision, a 20-foot wide future street be accepted by the final map.

    d. That, additional sidewalk easements be provided across the driveways to comply with ADA requirements along Chaminade Avenue and Keswick Street adjoining the subdivision.

    e. That, the subdivider obtain a revocable permit with the Valley District Office of BOE for the proposed pedestrian bridge over Saticoy Street.

f. That the subdivider make a request to the Valley District Office of BOE to determine the capacity of existing sewers in this area.

Notes: Broken curb and/or gutter includes segments within existing score lines that are depressed or upraised by more than ¼ inch from the surrounding concrete work or are separated from the main body of the concrete piece by a crack through the entire vertical segment and greater than 1/8 inch at the surface of the section.

Non-ADA compliant sidewalk shall include any sidewalk that has a cross slope that exceeds 2% and/or is depressed or upraised by more than ¼ inch from the surrounding concrete work or has full concrete depth cracks that have separations greater than 1/8 inch at the surface. The sidewalk also includes that portion of the pedestrian path of travel across a driveway.

All new sidewalk curb and gutter shall conform to the Bureau of Engineering Standard Plans S410-2, S440-4, S442-5 and S444-0.

Install tree wells with root barriers and plant street trees satisfactory to the City Engineer and the Urban Forestry Division of the Bureau of Street Services. Some tree removal in conjunction with the street improvement project may require Board of Public Works approval. The applicant should contact the Urban Forestry Division for further information (213) 847-3077.

Trees: That Board of Public Works approval shall be obtained prior to the issuance of the Certificate of Occupancy of the development project for the removal of any tree in the existing or proposed public right-of-way. The Bureau of Street Services, Urban Forestry Division is the lead agency for obtaining Board of Public Works approval for the removal of such trees.

Removal of street trees is required in conjunction with the street widening for this project. Please include the tree removal issue in your public hearing notice for this application. Street lighting improvements may be required satisfactory to the Bureau of Street Lighting (BSL). The applicant should contact BSL for further information 213-847-1551.

The Department of Transportation (LADOT) may have additional requirements for dedication and improvements. The applicant should contact LADOT for further information regarding traffic signals, signs, and equipment at 213-482-7024.

Regarding any conflicts with any power poles, the applicant should contact the Department of Water and Power at 213-367-2715.

Regarding any conflicts with fire hydrants, the applicant should contact the Fire Department Hydrants and Access Unit at 213-482-6543.

3. **Street Trees.**

a. Project shall preserve all healthy mature street trees whenever possible. All feasible alternatives in project design should be considered and implemented to retain healthy mature street trees. A permit is required for the removal of any street tree and shall be replaced 2:1 as approved by the Board of Public Works and Urban Forestry Division.

b. When street dedications are required and to the extent possible, the project shall provide larger planting areas for existing street trees to allow for growth and planting of larger stature street trees. This includes and is not limited to parkway installation and/or enlargement of tree wells and parkways.

c. Plant street trees at all feasible planting locations within dedicated streets as directed and required by the Bureau of Street Services, Urban Forestry Division. All tree plantings shall be installed to current tree planting standards when the City has previously been paid for tree plantings. The sub divider or contractor shall notify the Urban Forestry Division at: (213) 847-3077 upon completion of construction for tree planting direction and instructions.

Note: Removal of street trees requires approval from the Board of Public Works. All projects must have environmental (CEQA) documents that appropriately address any removal and replacement of street trees. Contact Urban Forestry Division at: (213) 847-3077 for tree removal permit information.

4. **Street Lighting.** Prior to the recordation of the final map or issuance of the Certificate of Occupancy (C of O), street lighting improvement plans shall be submitted for review and the owner shall provide a good faith effort via a ballot process for the formation or annexation of the property within the boundary of the development into a Street Lighting Maintenance Assessment District. Construct new street lights: one (1) on Cohasset St, and one (1) on Keswick St. If street widening per BOE improvement conditions, relocate and upgrade street lights: four (4) on Cohasset St, three (3) on Chaminade Ave, seven (7) on Saticoy St, two (2) on Woodlake Ave.

Notes:

The quantity of street lights identified may be modified slightly during the plan check process based on illumination calculations and equipment selection.

Conditions set: 1) in compliance with a Specific Plan, 2) by LADOT, or 3) by other legal instrument excluding the Bureau of Engineering conditions, requiring an improvement that will change the geometrics of the public roadway or driveway apron may require additional or the reconstruction of street lighting improvements as part of that condition.

QUALIFIED (Q) CONDITIONS

Pursuant to LAMC Section 12.32 G, the following limitations are hereby imposed upon the use of the subject property (North Campus only), subject to the Qualified (Q) Classification:

1. **Site Development.** Except as modified herein, the project shall be in substantial conformance with the plans and materials stamped Exhibit “A” and attached to the subject case file. No change to the plans will be made without prior review by the Department of City Planning, and written approval by the Director of Planning, with each change being identified and justified in writing. Minor deviations may be allowed in order to comply with provisions of the Municipal Code, the subject conditions, and the intent of the subject permit authorization.

DEVELOPMENT “D” LIMITATIONS

Pursuant to Section 12.32 G.4 of the Municipal Code, the following limitations are hereby imposed upon the use of the subject property (North Campus only), subject to the “D” Development Limitation:

1. **Height.** The maximum permitted height of structures shall be in substantial conformance with the plans and materials stamped Exhibit “A” and attached to the subject case file.

CONDITIONS OF APPROVAL

Pursuant to Sections 12.24 and 12.28 of the Los Angeles Municipal Code, the following conditions are hereby imposed upon the use of the subject property:

Operational Conditions

1. Hours of Operation Shall Observe the Following Limitations, unless otherwise permitted elsewhere in the conditions.

    a. For daytime classroom instruction: 6:30 a.m. to 6:00 p.m., Monday through Friday. Evening classes, occurring no more than four times weekly is to conclude by 10:00 p.m. Saturday classroom instruction is limited to the hours of 8:00 a.m. to 6:00 p.m. No classroom instruction is permitted on Sunday.

    b. For gymnasium use: 6:30 a.m. to 10:00 p.m., Monday through Friday; 8:30 a.m. to 10:00 p.m. on Saturday; and 8:30 a.m. to 8:00 p.m. on Sunday. No Saturday game or practice session shall begin prior to 8:30 a.m. No congregating on the school site for the purpose of these activities shall occur prior to 8:30 a.m. on Saturdays and Sundays. An instructor or school staff member shall be present at the subject site at least one half hour prior to the designated start times to monitor student activities/arrivals to assure that noise impacts on the adjacent neighbors are minimized.

    c. For Athletic Field/Stadium use: Main Campus: Shall have hours of 7:00 a.m. to 10:00 p.m., Monday through Friday; Saturday use is limited to 8:00 a.m. to 9 p.m., and; 9:00 a.m. to 8:00 p.m. on Sunday. No more than 15 Sundays per year will be allowed. North Campus: Shall have the same hours as the Main Campus, except the end time shall be 9:00 p.m. (instead of 10:00 p.m.) on Monday through Friday, with an exception for overtime/extra inning play. Both Campuses: Athletic use is not permitted on national holidays. No congregating on the site for the purpose of these activities shall occur before the permitted hours. An instructor/school staff member shall be present at the subject site at least one-half hour prior to the designated start times to monitor student activities/arrivals to assure that noise impacts on the adjacent neighbors are minimized.

    d. For Aquatic Complex/Pool use: Shall have hours of 8:00 a.m. to 8:00 p.m., Monday through Friday. Saturday use is limited to 10:00 a.m. to 7:00 p.m. Athletic use is not permitted on Sundays or national holidays.

    e. Batting Cages. The batting cages shall be restricted to the sole use of Chaminade students and staff. Main Campus: Shall be limited to 8:00 a.m. to 8:00 p.m., Monday through Saturday. North Campus: Shall be limited to 9:00 a.m. to 7:00 p.m., Monday through Saturday. Both Campuses: No use of the batting cages is permitted on Sundays and national holidays.

    f. Teacher preparations, normal school maintenance, parent conferences with teachers, school board meetings and similar customary school activities cumulatively limited to 451 vehicles on the property at one time, consistent with the minimum parking required per the Conditional Use under Case No. CPC-2009-1477-CU-ZV-ZAA-SPR, or cumulatively limited to 501 vehicles on the property at one time upon full buildout of

the Project approved pursuant to this subject case and Case No. CPC-2023-1254-VZC-HD-ZAD-ZAA, may extend beyond the hours set forth above.

g. Motorized sweeping of the parking lots and driveways and motorized landscape maintenance shall occur only between the hours of 8:00 a.m. and 6:00 p.m., Monday through Saturday.

2. Parking.

a. At least 451 permanent, striped parking spaces shall be provided on the site at all times consistent with the Conditional Use under Case No. CPC-2009-1477-CU-ZV-ZAA-SPR. Upon full buildout of the Project approved pursuant to this subject case and Case No. CPC-2009-1477-CU-ZV-ZAA-SPR-PA1, at least 501 permanent, striped parking spaces shall be provided on-site between the Main Campus and North Campus, consistent with Exhibit "A".

b. The school shall inform parents, students, faculty and staff in writing on an annual basis of all rules regulating school traffic and parking. A copy shall be mailed to the City Planning Department at the same time. The school shall maintain a progressive disciplinary system of enforcement of the involved student(s) from school. The school administration shall maintain a list of license plate numbers of all staff and students permitted to park on campus and shall issue a parking tag to all families to be used when parents visit the school site.

c. Except during special events, all faculty, administrators, other employees and visitors shall be instructed by persons acting on behalf of the school to park on-site at designated locations.

d. Special Event Parking

i. If a special event at the property is expected to attract more than 451 vehicles, or more than 501 vehicles after full buildout of the Project approved pursuant to this subject case and Case No. CPC-2009-1477-CU-ZV-ZAA-SPR-PA1, then off-site parking for vehicles in excess of the 451st vehicle (or in excess of the 501st vehicle after full Project buildout) shall be provided at the West Hills Hospital (located at 7300 Medical Center Drive) and/or other locations which the school may secure, to the satisfaction of the City Planning Department. Those persons attending the event shall be instructed to park in such off-site parking locations (unless playing field parking is allowed on the campus). Note: In the event that the school secures another off-site parking facility in lieu of the existing site, the applicant must notify the City Planning Department, the West Hills Neighborhood Council, the Council Office, and residents within a 500-foot radius, in writing at least 90 days in advance.

ii. A free shuttle bus system shall be used between the off-site parking area(s) and the subject property. Shuttle vehicles shall be of a number and carrying capacity to facilitate the transport of persons to and from the property expeditiously. The use of temporary signage will be used to inform parents, students and visitors to park within the designated off-site area(s) and to use the shuttle system. Note: Text-only temporary signs are permitted for use during the day of the special event, and will be posted and removed at least one half hour prior to the event and removed one half hour after the conclusion of the event.

e. Construction Parking. In the event that construction staging takes place within the parking areas, and if at least 20 spaces are encumbered for construction purposes, Chaminade shall provide an equal number of temporary off-site parking spaces at a secondary site. Off-site parking will not be permitted along adjacent streets. If the secondary site is not immediately adjacent to the campus, a shuttle shall be provided to transport students, staff, and visitors to and from the school.

f. For all games, competitions and swim meets on the North Campus:

i. All Chaminade students, faculty and staff shall be directed to park on the Main Campus.

ii. In advance of each game day, written notice shall be provided to all visiting teams to indicate that vehicles must park on campus (either on the North Campus or across the street on the Main Campus), and that street parking on Keswick Street and other residential streets is not permitted.

3. Traffic Management Program. The school shall implement the updated Traffic Management Program, dated May 4, 2023, to encourage carpooling amongst parents and students, bicycling, the use of school buses, and the use of public transit to reduce vehicular trips to school, and to improve the efficiency of the drop-off and pick-up operations and help minimize any disruptions to non-school traffic flow in the vicinity of the school. A copy of the updated Traffic Management Program shall be provided to the Department of City Planning and the Council Office prior to the issuance of a new certificate of occupancy. A copy shall also be available on-site in the Facilities Office, posted online, sent by email, or regular mail to staff, students, and parents. Components of such efforts shall include:

a. Appointing adult traffic monitors for the program, distribution of literature explaining the program, and maintaining a system to encourage and enable parents to form and participate in carpools.

b. For each day that school is in session and for special events, parking monitors shall be required to be posted at each vehicular access driveway in order to direct traffic and minimize queuing of school visitor, student, and staff vehicles on adjacent residential streets, from blocking the public rights-of-way, private driveways, or otherwise adversely affecting traffic circulation for residents. Likewise they will discourage excessive noise from car horns, car radios, car alarms and loud voices, and to maintain smooth ingress to and egress from the parking areas.

c. Traffic monitors shall be at the school for: (1) 30 minutes prior to the start of school through such time at which the gates are to be closed or have a security guard stationed at the gates; (2) One-half hour prior to the end of school through such time at which the primary gates are to be closed or guarded, and; (3) One hour prior to the beginning of special events through such time at which the primary gates to the campus are to be closed or guarded.

d. Once parking has reached capacity, traffic monitors shall direct traffic away from residential streets, and utilize cones and temporary signage wherever necessary, to re-direct traffic, discourage spillover traffic and parking on adjacent residential streets, and to direct drivers to the secondary parking area (West Hills Hospital), where the free shuttle will transport visitors back to the school. Note: In the event that the school secures another off-site parking facility in lieu of the existing site, the applicant must

notify the City Planning Department, the West Hills Neighborhood Council, the Council Office, and residents within a 500-foot radius, in writing at least 90 days in advance.

e. Provide a safe and secure area for bicycle parking.

f. There shall be no school drop-off or pick-up on the North Campus.

4. The property shall be internally secured when not in use.

a. All driveway gates shall be closed 15 minutes after the morning bell rings and opened 15 minutes before the dismissal bell rings.

b. A security guard or school employee shall be posted at or near the Saticoy Street driveways to monitor student arrival and departure during regular school days when the North Campus gate(s) are open, to ensure use of the pedestrian bridge and control street-level crossing.

c. There shall be a 24/7 security camera monitoring and burglar alarm system.

5. Main Campus: The athletic field lights shall be turned off no later than 11:00 p.m. on contest nights, and no later than 9:00 p.m. on practice nights. North Campus: The athletic facility lights shall be turned off no later than 9:00 p.m. on practice and contest nights, with an exception for overtime/extra inning play. Both Campuses: On nights when the field is not in use, only low-level security lighting shall be permitted.

6. Noise mitigation:

a. An outdoor public address system shall be utilized for emergency purposes, special announcements, and sporting events only. The use of the outdoor public address system shall not be used after 6:00 p.m., unless to notify students, staff, and visitors of emergency purposes, or during sporting events occurring after 6:00 p.m.

b. The existing solid masonry walls at the adjoining property lines, where the school abuts a residence, shall be maintained at the site.

c. Except where designated elsewhere in this determination (special events, marching band practice, etc.), amplified music or loud non-amplified music is not permitted outside.

d. The gymnasium shall contain no operable windows. No doors shall be oriented to the adjacent residences, unless where required by law.

e. Compressors and other equipment which may introduce noise impacts beyond any property line shall be enclosed or otherwise attenuated so as to be inaudible off-site.

f. No exterior bells are permitted outside the hours of daytime classroom instruction detailed under Condition No. 6(a). No exterior bells are permitted on Saturdays or Sundays.

g. Noise levels including, but not limited to, activities such as the use of outdoor public address system or speakers and announcements during sporting events, use of batting cages, and other activities will be subject to the local noise ordinance. All amplified noise must comply with LAMC Section 112.01.

h. Batting cages on the North Campus shall incorporate noise baffling measures.

7. Use Restrictions.

a. Rental or lease of the batting cage facilities or athletic fields located on the school campus is not permitted for any purpose, except as permitted under Condition 5.e. Rental or lease of other on-site facilities is limited to activities solely to the general educational purpose of the institution. [The term "rental of the facilities" is not dependent upon the payment of a fee].

b. Parking on-site shall not be utilized for events or uses occurring at off-site locations, unless the off-site event occurs on a weekend, in the summer, and does not coincide with a Special Event at the school.

c. Filming exclusively for commercial purposes and without active student participation, shall be prohibited on the property. All filming shall be limited between the hours of 8:00 a.m. to 8 p.m., Monday through Friday. The use of artificial light is prohibited.

d. No incidental gaming activities as defined in Section 12.21-A,13, shall be permitted on the site.

e. North Campus Only: The rental or lease of the athletic and parking facilities, and associated structures, for non-Chaminade activities are restricted to the following:

Athletic Fields. Use by community-based organizations shall be limited to 36 days per year, Monday through Saturday, from 8 a.m. to 6 p.m. Use is not permitted on Sundays and national holidays. The rental or lease of the batting cages is not permitted at any time.

Aquatic Complex/Pool. Use by community-based organizations, which shall travel to and from the North Campus by bus, shall be limited to daylight hours only, and to end no later than 7:00 p.m., Monday through Friday, and no later than 5:00 p.m. on Saturdays, with no use of outdoor lighting other than low-level security lighting. For community member swim activities, use hours shall be limited to Monday-Saturday, 8:00 a.m. to 6:00 p.m. Use is not permitted on Sundays and national holidays. A lifeguard must be on duty any time the pool is in use.

For purposes of the above conditions, “community-based organization” shall mean any educational or athletic institution, group or league. “Daylight hours” shall mean hours illuminated by the natural light of day, or from dawn to dusk, year-round, but further limited by the times noted herein.

8. **Plan Approval.** Any deviations from the terms of these conditions or changes to the site plan for the school will require the property owner to file a Plan Approval application and payment of associated fees together with mailing labels for all property owners and tenants within 300 feet of the property. The matter shall be set for public hearing with appropriate notice. The purpose of the Plan Approval shall be to review the effectiveness of, and the level of compliance with, the terms and conditions of this grant, including the effectiveness of the carpool program, the management of circulation impacts of parking associated with special events and any documented noise impacts from parking operations and athletic activities on the surrounding residential properties. Upon review of the effectiveness of and compliance with the conditions, the Director of Planning shall issue a determination. Such determination

may modify the existing terms and conditions, add new terms and conditions or delete one or more of them, all as deemed appropriate. The City Planning Commission may also require one or more subsequent Plan Approval applications, if deemed necessary.

Development Conditions

9. The total development of the new structures shall be limited to the following approximate maximum floor areas as also noted in Exhibit "A":
   On the North Campus:
   Pool House: 6,094 square feet
   Concessions, Restrooms and Storage: 1,540 square feet
   Locker Room (west of new athletic field) 380 square feet
   Locker Room (south of new athletic field) 380 square feet
   Press Box: 100 square feet
   Pedestrian Bridge connecting the Main and North Campuses: 2,650 square feet, also subject to Revocable Permit approval

10. **Building Façade/Materials.** A variety of high-quality exterior building materials, in substantial conformance to the approved Exhibit "A" plans, shall be used. Substitutes of an equal quality shall be permitted, to the satisfaction of the Department of City Planning.

11. **Height of New Buildings and Structures.**

    a. The new Multistory Building located on the Main Campus shall be permitted a maximum building height of 48 feet.

    b. The pedestrian bridge connecting the Main Campus to the North Campus and associated bridge structures shall be permitted a maximum height of 45 feet on the North Campus, subject to Revocable Permit approval.

    c. The pedestrian bridge shall have a minimum clearance above Saticoy Street consistent with the requirement imposed in the revocable permit, subject to LADOT standards for vehicular clearance and pedestrian safety.

    d. The light standards for the stadium/field lighting around the athletic field shall not exceed 90 feet. The eight (8) light standards will range in height from 70 to 90 feet, with the 70-foot standards located along the northern and eastern perimeter of the field, and the taller 80- and 90-foot standards positioned along the southern and eastern perimeter of the field along Saticoy Street and adjacent to the western parking lot.

    e. The light standards for the lighting around the swimming pool shall not exceed 40 feet along the eastern perimeter of the pool along Woodlake Avenue, and shall not exceed 50 feet along the western perimeter of the pool.

    f. The netting, poles and backstop for the athletic field shall be permitted a maximum height of 40 feet.

    g. The parking lot lights shall be permitted a maximum height of 22 feet in the eastern parking lot and 25 feet in the western parking lot.

    h. The scoreboard shall be permitted a maximum height of 26 feet.

12. **Perimeter/Security Fences and Gates.** On the Main Campus, existing (to remain) and new perimeter fences and vehicular gates shall be permitted a maximum height of 8 feet within the front yards (along Cohasset Street and Keswick Street) on the Main Campus. On the North Campus, the perimeter fences and vehicular gates shall be permitted a maximum height of 10 feet.

13. **Setbacks on Main Campus.**

    a. The proposed pedestrian bridge and associated support structures shall be permitted to encroach into the required front and side yard setbacks in the RS and A1 Zones on the west side of Saticoy Street.

    b. Reduced setbacks shall be permitted along Cohasset Street (front yard) and along the eastern property lines (side yards) for the existing encroaching structures (bleachers and buildings) to remain in the A1 Zone as depicted in the plans in Exhibit “A.

14. **Setbacks on North Campus.** No setbacks are required on the North Campus, except as prescribed below.

    a. No new buildings or structures may be located within 15 feet of the northern property line, except for the following as shown on the plans (Exhibit “A”):

        i. 10-foot-tall perimeter fence, with a minimum setback of approximately 1-foot, 4 inches;

        ii. 40-foot-tall poles and netting, with a minimum setback of approximately 2 feet, 10 inches;

        iii. 22-foot-tall to 25-foot-tall parking lot lights, with minimum setbacks of approximately 3 feet, 4 inches and 6 feet-6 inches, respectively;

        iv. A 26-foot-tall score board, with a minimum setback of approximately 6 feet, 8 inches;

        v. 70-foot-tall stadium lights, with a minimum setback of 8 feet, 4 inches; and

        vi. 8-foot-tall bull pen, with a minimum setback of 10 feet.

    b. Along the Woodlake Avenue frontage, pool lights shall be set back a minimum of 12 inches from the property line.

15. **Sustainability**

    a. **Electric Vehicle Parking.** All electric vehicle charging spaces (EV Spaces) and electric vehicle charging stations (EVCS) shall comply with the regulations outlined in Sections 99.04.106 and 99.05.106 of the LAMC.

    b. **Solar Energy Infrastructure.** The Project shall comply with the Los Angeles Municipal Green Building Code, Section 99.05.211, to the satisfaction of the Department of Building and Safety.

16. **Signage.** New on-site signs shall comply with the Municipal Code. Signage entitlements have not been granted as a part of this approval.

Environmental Conditions

17. **Department of Toxic Substances Control.** Property owners shall satisfy any requirements from either the Los Angeles County Fire Department Site Mitigation Unit or the State Department of Toxic Substances Control (DTSC) in relation to potential contamination on the subject site. Prior to the issuance of any clearances by the Department of City Planning (DCP), property owners shall provide to DCP written confirmation from either the County Fire Department or DTSC that establishes the agency's satisfaction that the subject site currently meets the agency's requirements for the proposed use or, alternatively, that establishes the agency's satisfaction with the property owner's contamination testing plan for the proposed use.

Air Quality

18. **MM-AQ-1:** All off-road diesel-powered construction equipment shall meet, at a minimum, USEPA Tier 4 Interim off-road emissions standards, or if such equipment is not commercially available for lease or short-term rental within 50 miles of the Project Site, USEPA Tier 3 off-road emissions standards.

Geology and Soils

19. **MM-GEO-1:** The Project Applicant shall implement the following best practices with respect to paleontology:

    a. **Retain a Qualified Professional Paleontologist:** The Project Applicant shall retain a Qualified Professional Paleontologist (Project Paleontologist), who meets or exceeds the SVP standards, to oversee all regulatory compliance measures and protocols related to paleontological resources.

    b. **Conduct Worker Training:** The Project Paleontologist should develop a Worker Environmental Awareness Program (WEAP) to train the construction crew on the legal requirements for preserving fossil resources, as well as the procedures to follow in the event of a fossil discovery. This training program would be given to the crew before ground-disturbing work commences and would include handouts to be given to new workers as needed.

    c. **Monitor for Paleontological Resources:** Ground disturbances greater than or equal to 3 feet below ground surface with the potential to impact late to middle Pleistocene old alluvial fan deposits (Qof) and/or late Miocene Modelo Formation (Tm) should be monitored full-time. Monitoring should be reduced or ceased once over-excavations into the underlying previously undisturbed deposits have been completed, or if Recent to late Holocene artificial fill (Qaf) is the only geologic units encountered during earthwork activities. Ground disturbances in previously disturbed sediments should not be monitored, regardless of depth.

       Monitoring should be conducted by a paleontological monitor who meets the standards of the SVP (2010) working under the supervision of the Project Paleontologist. The Project Paleontologist may periodically inspect construction activities to adjust the level of monitoring in response to subsurface conditions. In consultation with the lead agency and the Project Applicant, monitoring efforts can be increased, reduced, or ceased entirely if determined adequate by the Project Paleontologist. Paleontological monitoring should include inspection of exposed sedimentary units during active

excavations within sensitive geologic sediments. The monitor should have authority to temporarily divert activity away from exposed fossils to evaluate the significance of the find and, should the fossils be determined significant, professionally and efficiently recover the fossil specimens and collect associated data. Paleontological monitors should record pertinent geologic data and collect appropriate sediment samples from any fossil localities.

d. **Prepare a Paleontological Resources Monitoring Report:** Upon conclusion of ground-disturbing activities, the Project Paleontologist overseeing paleontological monitoring should prepare a final Paleontological Resources Monitoring Report (PRMR) that documents the paleontological monitoring efforts for the Project and describes any paleontological resources discoveries observed and/or recorded during the life of the Project. If paleontological resources are curated, the final PRMR and any associated data pertinent to the curated specimen(s) should be submitted to the designated repository. A copy of the final PRMR should be filed with the lead agency.

Hazards and Hazardous Materials

20. **MM-HAZ-1:** Prior to the issuance of a grading permit, the shallow PCE-impacted soil vapor shall be remediated using soil vapor extraction (SVE) as the primary means of remediation. An SVE remediation system shall be installed consisting of 17 vapor extraction wells. Each vapor extraction well would have a 10-foot screened interval, from five to 15 feet below ground surface, and the wells would be connected to the SVE unit via sub-grade PVC-piping. The soil vapor shall be remediated to the satisfaction of the Los Angeles Fire Department and the Department of Building and Safety.

Noise

21. **MM-NOI-1:** For construction activities occurring on the North Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield 23309 Saticoy Street Residences, Melba Street Cul-de-Sac Residences, and Bobbyboyar Avenue Cul-de-Sac Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

22. **MM-NOI-2:** For construction activities occurring on the Main Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield Atron Avenue Cul-de-Sac Residences, Covello Street Cul-de-Sac Residences, and Chaminade Avenue Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

23. **MM-NOI-3:** Amplified sound systems for the Project's baseball field/bleachers and outdoor aquatics facility/bleachers shall be acoustically engineered with the following design and performance standards:

    a. Amplified sound levels, as measured at the northern property line of the North Campus, shall not exceed 50 dBA.

    b. Amplified sound systems shall not be operated outside the operational hours established for the North Campus facilities.

c. Speakers shall be directional and oriented away from the northern property line of the North Campus.

d. Non-Chaminade users of the facilities shall not be permitted to utilize the facilities' amplified sound systems.

Transportation

24. **MM-TRANS-1:** Prior to the start of construction, a Construction Traffic Management Plan (CTMP) shall be submitted to LADOT for review and approval. The CTMP will include a Worksite Traffic Control Plan, which will facilitate traffic and pedestrian movement, and minimize the potential conflicts between construction activities, street traffic, bicycles, and pedestrians. The CTMP will include, but not limited to, the following measures:

    a. Maintaining access for land uses in the vicinity of the Project Site during construction.

    b. Schedule construction materials deliveries during off-peak periods to the extent practical.

    c. Organize deliveries and staging of all equipment and materials in the most efficient manner possible, and on-site where possible, to avoid an impact to surrounding roadways.

    d. Coordinate deliveries to ensure trucks do not wait to unload or load and impact surrounding roadways, and if needed, utilize an off-site staging area.

    e. Control truck and vehicle access to the Project Site with flagmen.

    f. Limit lane closures to the maximum extent possible and avoid peak period hours to the extent possible. Where such closures are necessary, the Worksite Traffic Control Plan will identify the location of lane closures and identify all traffic control measures, signs, delineators, and work instructions to be implemented by the construction contractor through the duration of demolition and construction activity.

    g. Parking for construction workers will be provided either on-site or at off-site, off-street locations.

25. **PDF-TRANS-1:** The Project will adhere to the construction sequence shown in Table 3-2, except:

    a. Construction of the new surface parking lot on the North Campus and construction of the pedestrian bridge may interchange in the overall sequence of construction activities, but shall not overlap with each other; and

    b. Demolition of parking lots on the Main Campus and demolition of classroom buildings on the Main Campus may interchange in the overall sequence of construction activities, but shall not overlap with each other.

26. **PDF-TRANS-2:** The Project will prepare a Traffic Management Plan (TMP) to establish operational procedures for traffic flow around the school related to self-driving students and student drop-off and pick-up operations. The purpose of the plan will be to establish operational procedures to improve traffic circulation utilizing the enhanced access points and

parking areas, improve student safety, maximize the efficiency of drop-off and pick-up operations, and reduce delays during those time periods.

Tribal Cultural Resources

27. **MM-TCR-1:** Prior to commencing any ground disturbance activities at the Project Site, the Applicant, or its successor, shall retain one (1) tribal monitor that is qualified to identify subsurface tribal cultural resources. Ground disturbance activities shall include excavating, digging, trenching, plowing, drilling, tunneling, quarrying, grading, leveling, removing peat, clearing, driving posts, augering, backfilling, blasting, stripping topsoil or a similar activity at the Project Site. The qualified tribal monitor shall be approved by the Fernandeño Tataviam Band of Mission Indians.

    If cultural resources are discovered during Project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be retained by the Applicant, or its successor, to assess the find. A qualified archaeologist/archaeological monitor shall be identified as principal personnel who must meet the Secretary of the Interior's Standards and Guidelines for Archeology and have a minimum of 10 years of experience as a principal investigator working with Native American archaeological sites in Southern California. The archaeologist shall ensure that all other personnel associated with and hired for the archaeological monitoring are appropriately trained and qualified. Work on the portions of the Project outside of the buffered area may continue during this assessment period. The Fernandeño Tataviam Band of Mission Indians shall be contacted about any pre-contact and/or post-contact finds and be provided information after the archaeologist makes their initial assessment of the nature of the find, to provide Tribal input with regards to significance and treatment.

28. **MM-TCR-2:** The Lead Agency and/or Applicant shall, in good faith, consult with the Fernandeño Tataviam Band of Mission Indians on the disposition and treatment of any Tribal Cultural Resource encountered during all ground disturbing activities.

29. **MM-TCR-3:** If human remains or funerary objects are encountered during any activities associated with the Project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code shall be enforced for the duration of the Project.

Administrative Conditions

30. **Approvals, Verification and Submittals**. Copies of any approvals, guarantees or verification of consultations, reviews or approval, plans, etc., as may be required by the subject conditions, shall be provided to the Department of City Planning for placement in the subject file.

31. **Building Plans.** A copy of the first page of this grant and all Conditions and/or any subsequent appeal of this grant and its resultant Conditions and/or letters of clarification shall be printed on the building plans submitted to the Development Services Center and the Department of Building and Safety for purposes of having a building permit issued.

32. **Notations on Plans.** Plans submitted to the Department of Building and Safety for the purpose of processing a building permit application shall include all of the Conditions of Approval herein attached as a cover sheet and shall include any modifications or notations required herein.

33. **Final Plans.** Prior to the issuance of any building permits for the project by the Department of Building and Safety, the applicant shall submit all final construction plans that are awaiting issuance of a building permit by the Department of Building and Safety for final review and approval by the Department of City Planning. All plans that are awaiting issuance of a building permit by the Department of Building and Safety shall be stamped by Department of City Planning staff "Final Plans". A copy of the Final Plans, supplied by the applicant, shall be retained in the subject case file.

34. **Code Compliance.** All area, height and use regulations of the zone classification of the subject property shall be complied with, except wherein these conditions explicitly allow otherwise.

35. **Covenant.** Prior to the issuance of any permits relative to this matter, an agreement concerning all the information contained in these conditions shall be recorded in the County Recorder's Office. The agreement shall run with the land and shall be binding on any subsequent property owners, heirs or assign. The agreement must be submitted to the Department of City Planning for approval before being recorded. After recordation, a copy bearing the Recorder's number and date shall be provided to the Department of City Planning for attachment to the file.

36. **Corrective Conditions.** The authorized use shall be conducted at all times with due regard for the character of the surrounding district, and the right is reserved to the City Planning Commission, or the Director pursuant to Section 12.27.1 of the Municipal Code, to impose additional corrective conditions, if, in the Commission's or Director's opinion, such conditions are proven necessary for the protection of persons in the neighborhood or occupants of adjacent property.

37. **Definition.** Any agencies, public officials or legislation referenced in these conditions shall mean those agencies, public offices, legislation or their successors, designees or amendment to any legislation.

38. **Enforcement.** Compliance with these conditions and the intent of these conditions shall be to the satisfaction of the Department of City Planning and any designated agency, or the agency's successor and in accordance with any stated laws or regulations, or any amendments thereto.

39. **Expedited Processing Section.** Prior to the clearance of any conditions, the applicant shall show proof that all fees have been paid to the Department of City Planning, Expedited Processing Section.

40. **Indemnification and Reimbursement of Litigation Costs**

    Applicant shall do all of the following:

    a. Defend, indemnify and hold harmless the City from any and all actions against the City relating to or arising out of, in whole or in part, the City's processing and approval of this entitlement, including but not limited to, an action to attack, challenge, set aside, void, or otherwise modify or annul the approval of the entitlement, the environmental review of the entitlement, or the approval of subsequent permit decisions, or to claim personal property damage, including from inverse condemnation or any other constitutional claim.

b. Reimburse the City for any and all costs incurred in defense of an action related to or arising out of, in whole or in part, the City's processing and approval of the entitlement, including but not limited to payment of all court costs and attorney's fees, costs of any judgments or awards against the City (including an award of attorney's fees), damages, and/or settlement costs.

c. Submit an initial deposit for the City's litigation costs to the City within 10 days' notice of the City tendering defense to the Applicant and requesting a deposit. The initial deposit shall be in an amount set by the City Attorney's Office, in its sole discretion, based on the nature and scope of action, but in no event shall the initial deposit be less than $50,000. The City's failure to notice or collect the deposit does not relieve the Applicant from responsibility to reimburse the City pursuant to the requirement in paragraph (b).

d. Submit supplemental deposits upon notice by the City. Supplemental deposits may be required in an increased amount from the initial deposit if found necessary by the City to protect the City's interests. The City's failure to notice or collect the deposit does not relieve the Applicant from responsibility to reimburse the City pursuant to the requirement in paragraph (b).

e. If the City determines it necessary to protect the City's interest, execute an indemnity and reimbursement agreement with the City under terms consistent with the requirements of this condition.

The City shall notify the applicant within a reasonable period of time of its receipt of any action and the City shall cooperate in the defense. If the City fails to notify the applicant of any claim, action, or proceeding in a reasonable time, or if the City fails to reasonably cooperate in the defense, the applicant shall not thereafter be responsible to defend, indemnify or hold harmless the City.

The City shall have the sole right to choose its counsel, including the City Attorney's office or outside counsel. At its sole discretion, the City may participate at its own expense in the defense of any action, but such participation shall not relieve the applicant of any obligation imposed by this condition. In the event the Applicant fails to comply with this condition, in whole or in part, the City may withdraw its defense of the action, void its approval of the entitlement, or take any other action. The City retains the right to make all decisions with respect to its representations in any legal proceeding, including its inherent right to abandon or settle litigation.

For purposes of this condition, the following definitions apply:

"City" shall be defined to include the City, its agents, officers, boards, commissions, committees, employees, and volunteers.

"Action" shall be defined to include suits, proceedings (including those held under alternative dispute resolution procedures), claims, or lawsuits. Actions include actions, as defined herein, alleging failure to comply with any federal, state or local law.

Nothing in the definitions included in this paragraph are intended to limit the rights of the City or the obligations of the Applicant otherwise created by this condition.

FINDINGS

General Plan/Charter Findings (Charter Section 556)

1. Charter Section 556: The action is in substantial conformance with the purposes, intent, and provisions of the General Plan.

a. **General Plan Land Use Designation.** The subject property is located within the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan area which was adopted by the City Council on August 17, 1999. The Community Plan designates the Main Campus for Very Low and Low Residential land uses corresponding to the RE20, RA, RE15, and RE11 zones, and the RE9, RS, R1, RU, and RD6 zones, respectively. The Main Campus is zoned A1-1 and RS-1 and is thus consistent with General Plan's land use designation for the site. The Community Plan designates the site of the new North Campus for Neighborhood Commercial land uses, corresponding to the C1, C1.5, C2, C4, RAS3, and RAS4 zones. The project is requesting a Vesting Zone Change to change the current [Q]C1-1VL and P-1VL zoning of the North Campus to the (T)(Q)C2-1 Zone. The proposed (T)(Q)C2-1 Zone would thus be consistent with the underlying land use designation. The subject property is not located within the boundaries of or subject to any other specific plan, community design overlay, or interim control ordinance. The current zoning of the proposed North Campus contains a permanent Qualified "Q" Condition that restricts development to a floor area ratio (FAR) of 0.5:1. The Vesting Zone Change would effectively remove the permanent Q-Condition, however, the proposed project FAR for the North Campus is well below the maximum 0.5:1 FAR established by existing Q-Condition at approximately 0.05:1.

b. **Land Use Element.** The proposed project complies with applicable provisions of the Los Angeles Municipal Code and the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan. There are twelve elements of the General Plan. Each of these elements establishes policies that provide for the regulatory environment in managing the City and for addressing environmental concerns and problems. The majority of the policies derived from these Elements are in the form of Code requirements of the Los Angeles Municipal Code.

The Land Use Element of the City's General Plan is divided into 35 Community Plans. As previously stated, the subject property is located within the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan, which designates the existing Main Campus for Very Low, and Low Residential land uses and the proposed North Campus for Neighborhood Commercial land uses. Both the current A1-1 and RS-1 zoning of Main Campus and the proposed (T)(Q)C2-1 Zone for the new North Campus are consistent with the land use designation for the site.

The proposed project is consistent with the following objective and policy of the **Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan:**

Objective 6-2: Maximize the use of local schools for community use and local open space and parks for school use.

Policy 6-2.1: Encourage the siting of community facilities (libraries, parks, schools and auditoriums) together.

The project enhances the overall functionality and cohesion of Chaminade's High School campus by expanding its facilities in a way that maximizes their use for both educational and extracurricular purposes. The addition of new athletic fields, an aquatic center, and open spaces on the North Campus creates a well-rounded environment that supports the school's sports programs and recreational activities. These new facilities are carefully designed to integrate with the existing Main Campus, providing modern amenities that enhance student experience while utilizing available open space to its fullest potential. By improving connectivity and safety with the proposed pedestrian bridge, the project allows for seamless movement between the two campuses, ensuring that the school's resources are easily accessible.

The project also promotes efficient land use by concentrating new sports and recreational structures in one area, directly adjacent to the Main Campus, which reinforces the sense of a unified educational environment. The location of the new facilities across Saticoy Street connected via the pedestrian bridge ensures that the school maintains a compact, cohesive layout. This thoughtful design supports the school's goal of creating an improved space for both academic and extracurricular activities, making the campus a more desirable place for students and faculty. Therefore, the project is consistent with and will further the achievement of the Community Plan's objective and policy.

The **Framework Element** of the General Plan (Framework Element) was adopted by the City of Los Angeles in December 1996 and re-adopted in August 2001. The Framework Element provides guidance regarding policy issues for the entire City of Los Angeles, including the project site. The Framework Element also sets forth a Citywide comprehensive long-range growth strategy and defines Citywide polices regarding such issues as land use, housing, urban form, neighborhood design, open space, economic development, transportation, infrastructure, and public services. While the Framework Element references the City's participation in working with the Los Angeles Unified School District in the planning and coordination of public schools, it does not specifically address efforts with private schools. To that end, however, allowing the continued use and expansion of a private high school campus, would be consistent with a several important goals, objectives, and policies of the Framework Element, including:

GOAL 9N: Public schools that provide a quality education for all of the city's children, including those with special needs, and adequate school facilities to serve every neighborhood in the city.

Objective 9.32: Work constructively with LAUSD to promote the siting and construction of adequate school facilities phased with growth."

Policy 9.32.1: Work with the Los Angeles Unified School District to ensure that school facilities and programs are expanded commensurate with the City's population growth and development."

The project supports Goal 9N by modernizing and enhancing educational facilities that provide a high-quality learning environment for students. While Chaminade High School is not part of the Los Angeles Unified School District (LAUSD), the project demonstrates a commitment to offering adequate facilities that serve the broader educational needs of the West Hills neighborhood, and the City as a whole. The development of a cohesive, pedestrian-friendly campus, including updated classrooms, athletic fields, and student-centered amenities, reflects an investment in creating a safe, functional, and inclusive environment conducive to learning.

The project aligns with Objective 9.32 by incorporating thoughtful planning to phase the construction and development of facilities in line with community needs and growth patterns. Through careful site design and collaboration with stakeholders, the project ensures that new facilities enhance the existing educational function of the site without overburdening the surrounding residential neighborhood. The addition of modernized buildings and infrastructure ensures that the campus can adequately accommodate its current student body while maintaining compatibility with local growth trends.

The project supports Policy 9.32.1, by expanding school facilities in proportion to community growth and development. The project does not propose an increase in student enrollment, thereby ensuring that the intensity of use remains consistent with the established character of the area. New facilities, such as the multistory classroom building and athletic fields, are scaled and designed to blend harmoniously with the surrounding residential environment. Furthermore, strategic landscaping and thoughtful positioning of buildings minimize potential impacts, such as noise and visual disruption, to neighboring properties.

By addressing the educational and operational needs of the school while respecting the residential context, the project contributes to the City's broader goals of providing accessible, high-quality educational infrastructure. Therefore, the Vesting Zone Change and Height District Change are consistent with the Distribution of Land Use goals, objectives and policies of the General Plan Framework Element.

Zone Change, Height District Change, and "T" and "Q" Classification Findings

2. Pursuant to Section 12.32 C of the LAMC, the zone change and height district change is in conformance with the public necessity, convenience, general welfare, and good zoning practice.

The proposed project involves the expansion and modernization of the existing high school campus in the West Hills neighborhood of the Canoga Park - Winnetka – Woodland Hills – West Hills Community Plan area. The project involves improvements of facilities, including a new three-story multistory building on the Main Campus, as well as the development of new athletic fields, an outdoor swimming pool, and other facilities on the North Campus, located across Saticoy Street. A pedestrian bridge will connect the North and Main Campuses, improving safety and accessibility for students and staff. The project enhances the school's academic and athletic infrastructure while maintaining the current student enrollment capacity of 1,360 students, aiming to modernize facilities and improve campus connectivity without increasing the school's population.

The proposed Vesting Zone Change and Height District Change for the Chaminade High School Project are crucial to meeting the school's evolving educational and recreational needs while ensuring alignment with public necessity, convenience, general welfare, and good zoning practices. These changes specifically involve rezoning the site of the proposed North Campus from the current [Q]C1-1VL and P-1VL zones to the (T)(Q)C2-1 Zone, thereby allowing the school to expand its facilities in a thoughtful and organized manner.

Public Necessity

The expansion facilitated by the Vesting Zone Change and Height District Change addresses the public necessity by providing modern, high-quality educational and athletic facilities to support the current and future needs of Chaminade College Preparatory students. The proposed development will include a 25-meter by 25-yard swimming pool, baseball and soccer fields, and supporting facilities such as locker rooms, bleachers, batting cages, and a

concession stand. These additions are necessary for the school's athletic programs to thrive, helping students engage in physical education and competitive sports while fostering a well-rounded educational experience.

By locating these facilities on the North Campus, the project reduces the need for off-campus travel for sports events, which minimizes traffic and logistical issues. The new on-site facilities ensure that students can practice and compete safely within the school's grounds, meeting a clear public need for better and more integrated facilities.

Convenience

The proposed Vesting Zone Change and Height District Change enhances convenience for students, faculty, and visitors by consolidating Chaminade's facilities into a single, unified campus. The integration of the North and Main Campuses through a proposed pedestrian bridge over Saticoy Street will allow students to move safely between academic and athletic areas, reducing travel time and the risks associated with crossing busy streets. The bridge and newly organized parking areas also streamline drop-offs and pick-ups, improving traffic flow and reducing congestion on nearby streets such as Saticoy Street and Woodlake Avenue.

Furthermore, the reduction in ingress/egress points along Saticoy Street and Woodlake Avenue will simplify access to the campus and contribute to a safer and more efficient traffic system around the school. This consolidation is key to ensuring that the expanded facilities do not negatively impact traffic patterns or create inconvenience for the surrounding residential areas.

General Welfare

The project is designed to enhance the well-being of the surrounding community by replacing an older commercial development with modernized athletic facilities for an existing high school that has been operating in the West Hills neighborhood since the early 1960s. The redevelopment will improve the neighborhood by introducing landscaped open spaces and modern facilities that result in a less intensive use. The project not only serves Chaminade students but also benefits local residents by creating a more attractive and inviting environment. In addition, Chaminade proposes the limited rental or lease of the facilities on the North Campus to the community, including community-based organization.

The proposed project also integrates environmentally friendly designs and infrastructure, including noise mitigation measures, and upgraded landscaping which further supports the community's welfare. These improvements will help ensure that the school's expansion is not disruptive to the nearby residential neighborhoods and instead contributes positively to the local environment.

Good Zoning Practice

The proposed Vesting Zone Change and accompanying Height District Change will result in a site that has unified zoning which reflect good zoning practices by facilitating the development of essential educational and recreational facilities within a residential neighborhood. These changes allow for the construction of necessary elements, such as 70–90-foot light poles for the sports fields, which are vital for the safety and functionality of the campus. The design and scale of these structures are intended to support the new athletic facilities while minimizing their visual impact on the surrounding area, ensuring that the project aligns with the local context.

Additionally, the project's design emphasizes minimizing the impact on neighboring properties by ensuring appropriate setbacks, managing noise, and adhering to all traffic safety requirements. By implementing these measures, the Vesting Zone Change and Height District Change serve as a responsible approach to balancing the school's expansion with the needs of the community.

Tentative "T" and Qualified "Q" Classifications:

The current action, as recommended, has been made contingent upon compliance with new "T" and "Q" conditions of approval imposed herein for the proposed project. As recommended, the Zone Change has been placed in temporary "T" and "Q" Classifications in order to ensure consistency with the General Plan. The "T" Conditions are necessary to ensure the identified dedications, improvements, and actions are undertaken to meet the public's needs, convenience, and general welfare served by the actions required. These actions and improvements will provide the necessary infrastructure to serve the proposed community at this site. The "Q" Conditions limit the scale and scope of future development on the site and require that the applicant adhere to various development, design, and operational considerations; these are all necessary to protect the best interests of the community and to assure a development more compatible with surrounding properties and the overall pattern of development in the community, to secure an appropriate development in harmony with the General Plan, and to prevent or mitigate the potential adverse environmental effects of the subject recommended action. Therefore, the imposition of the included "T" and "Q" Conditions herein are in conformance with the public necessity, convenience, general welfare, and good zoning practice.

Under the concurrent Vesting Tentative Tract Map (Case No. VTT-84101), the project has been granted a waiver of required street dedications and improvements along the frontage of Cohasset Street, meaning no additional changes or expansions to the street are required as part of the project. This decision supports the existing street infrastructure and helps maintain the character of the neighborhood. Additionally, the project has been conditioned to obtain a Revocable Permit from the Bureau of Engineering for the proposed pedestrian bridge over Saticoy Street. The Revocable Permit ensures that while the bridge can function for the school's needs, the city retains control over the public airspace, allowing for future adjustments if traffic conditions, safety concerns, or development needs change.

Therefore, the granting of the requested Vesting Zone Change and Height District Change are in conformity with public necessity, convenience, general welfare, and good zoning practice.

Zoning Administrator's Determination Findings

3. The project will enhance the built environment in the surrounding neighborhood or will perform a function or provide a service that is essential or beneficial to the community, city or region.

The proposed project involves the expansion and modernization of Chaminade High School in the West Hills neighborhood of the Canoga Park - Winnetka – Woodland Hills – West Hills Community Plan area. The project involves improvements of facilities, including a new three-story multistory building on the Main Campus, as well as the development of new athletic fields, an outdoor swimming pool, and other facilities on the North Campus, located across Saticoy Street. A pedestrian bridge will connect the North and Main Campuses, improving safety and accessibility for students and staff. The project enhances the school's academic and athletic infrastructure while maintaining the current student enrollment capacity of 1,360

students, aiming to modernize facilities and improve campus connectivity without increasing the school's population.

The proposed project involves a request for a Zoning Administrator's Determination to allow existing 8-foot-tall perimeter fences and vehicular gates along Cohasset and Keswick Streets, as well as a new 8-foot-tall fencing and gates along Cohasset Street, to remain and be constructed respectively on the Main Campus in lieu of the maximum height of 6 feet otherwise permitted in the front yard of the A1 Zone. Additionally, the applicant is seeking a Zoning Administrator's Determination to allow for new structures related to the sports facilities on the new North Campus, including, but not limited to, a score board, netting and netting poles, lights and a pedestrian bridge, ranging in height from approximately 25 to 90 feet, in lieu of the 25-foot, 33-foot and 61- foot Transitional Height Limitations permitted within 0-199 feet of lots zoned RW1 or more restrictive.

The request for increased fence height, along the project's street frontages is intended to provide adequate security for the school, as well as to provide added privacy to neighboring residents. Although the project is requesting 8-foot high fencing in lieu of the maximum 6 feet otherwise permitted, the proposed fences and gates will be primarily of a decorative wrought-iron material, which will provide transparency and security and will enhance the street frontages of the subject property, consistent with similar requests relating to schools in residential neighborhoods. Additionally, these fences help to clearly define the campus boundaries, contributing to the overall aesthetic order and safety of the neighborhood. This enhanced security and thoughtful design contribute positively to the welfare of the local community, ensuring that the school can function safely while integrating seamlessly into the neighborhood. The fencing and gates, therefore, perform a crucial function by providing both physical security and aesthetic continuity, which are beneficial not only to the school but also to the city and region as they support a safe, well-maintained educational institution.

The Zoning Administrator's Determination to allow taller structures for the North Campus sports facilities, including scoreboards, netting poles, lights, and a pedestrian bridge enhances the school's functionality and provides benefits to the surrounding community. The taller, modern light poles are essential for safe evening sports activities, and will minimize glare, spread, and spillover, protecting nearby residences.

The 30-foot pedestrian bridge, with a stair/elevator tower up to 45 feet on the North Campus side of Saticoy Street, improves safety by allowing students and staff to cross Saticoy Street without interacting with traffic, enhancing pedestrian and traffic safety. These features are essential for the safe and efficient movement between the Main and North Campuses, supporting the school's operations and ensuring secure connectivity for students, faculty, staff, and visitors. Overall, these structures are key to ensuring safety, improving connectivity, and providing community services, benefiting both the school and the neighborhood. As such, the project and the grants herein will enhance the built environment in the surrounding neighborhood or will perform a function or provide a service that is essential and beneficial to the community.

4. The project's location, size, height, operations and other significant features will be compatible with and will not adversely affect or further degrade adjacent properties, the surrounding neighborhood, or the public health, welfare and safety.

The requested grants to allow over-in-height fences and gates on the Main Campus as well as height deviations for accessory structures on the North Campus as previously referenced, will be compatible with and will not negatively impact adjacent properties, the surrounding neighborhood, or public health, welfare, and safety of the community. The granted height deviations will rather enhance safety and security for students, visitors, faculty, and staff, as

well as for the surrounding community and drivers along Saticoy Street.

On the Main Campus, the existing and proposed 8-foot-tall perimeter fences and gates will provide added security for students, faculty, staff, and visitors. Since the existing fences have been in place for several years, the requested Zoning Administrator Determination will not negatively affect adjacent properties. The new fences and gates along Cohasset Street will be designed to match the existing ones, maintaining consistency and compatibility with current campus features. These additions will not degrade the surrounding properties or neighborhood.

On the North Campus, the scoreboard will be one foot taller than the 25-foot transitional height limit, but it will be set back from the northern property line, where the nearest single-family homes are located, and will face south toward Saticoy Street. The proposed lights will also be set back from this property line, and a lighting plan has been developed to prevent any spillover or glare onto nearby homes. Additionally, restrictions on the duration and timing of the lights will be enforced through conditions of approval. The lighting is necessary for evening events and security on the athletic fields, while the netting and netting poles will prevent soccer balls and baseballs from entering neighboring streets or properties. The pedestrian bridge will enhance the safety of both pedestrians crossing the street and drivers on Saticoy Street, promoting public health and safety. Moreover, as part of the Mitigated Negative Declaration for the project, mitigation measures will ensure that any aesthetic or lighting impacts are reduced to a less-than-significant level.

In summary, the project's location, size, height, and operations will be carefully implemented and managed to ensure these features do not adversely impact or degrade the surrounding area, and will, in fact, enhance the safety and functionality of the campus and its relationship with the neighborhood.

5. The project substantially conforms with the purpose, intent and provisions of the General Plan, the applicable community plan, and any specific plan.

The subject property is located within the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan area which is one of the 35 Community Plans that make up the Land Use Element of the General Plan. The Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan Area Map designates the existing Main Campus for Very Low, and Low Residential land uses and the proposed North Campus for Neighborhood Commercial land uses. Both the current A1-1 and RS-1 zoning of the Main Campus and the proposed (T)(Q)C2-1 Zone for the new North Campus are consistent with the land use designations for the site. The property is not located within the boundaries of or subject to any other specific plan, community design overlay, or interim control ordinance. The current zoning of the proposed North Campus contains a permanent Qualified “Q” Condition that restricts development to a floor area ratio (FAR) of 0.5:1. The Vesting Zone Change would effectively remove the permanent Q-Condition, however, the proposed project FAR for the North Campus is well below the maximum 0.5:1 FAR established by current Q-Condition at approximately 0.05:1.

The proposed project is consistent with the following objective and policy of the **Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan:**

Objective 6-2: Maximize the use of local schools for community use and local open space and parks for school use.

Policy 6-2.1: Encourage the siting of community facilities (libraries, parks, schools and auditoriums) together.

The project enhances the overall functionality and cohesion of Chaminade's High School campus by expanding its facilities in a way that maximizes their use for both educational and extracurricular purposes. The addition of new athletic fields, an aquatic center, and open spaces on the North Campus creates a well-rounded environment that supports the school's sports programs and recreational activities. These new facilities are carefully designed to integrate with the existing Main Campus, providing modern amenities that enhance student experience while utilizing available open space to its fullest potential. By improving connectivity and safety with the proposed pedestrian bridge, the project allows for seamless movement between the two campuses, ensuring that the school's resources are easily accessible.

The project also promotes efficient land use by concentrating new sports and recreational structures in one area, directly adjacent to the Main Campus, which reinforces the sense of a unified educational environment. The location of the new facilities across Saticoy Street connected via the pedestrian bridge ensures that the school maintains a compact, cohesive layout. This thoughtful design supports the school's goal of creating an improved space for both academic and extracurricular activities, making the campus a more desirable place for students and faculty.

The Zoning Administrator's Determination request for the new structures, including netting poles, scoreboards, and lights that exceed standard height limitations, is essential for the project's functionality. These structures support the enhanced athletic facilities, ensuring they meet safety and operational standards, such as preventing sports equipment from reaching nearby residential areas and allowing evening events. By exceeding transitional height limitations, the project enhances community accessibility to these athletic spaces, while ensuring compatibility with the surrounding environment.

The project is further consistent with other elements of the General Plan, including the **Framework Element.** The Framework Element was adopted by the City of Los Angeles in December 1996 and re-adopted in August 2001 and provides guidance regarding policy issues for the entire City of Los Angeles, including the project site. The Framework Element also sets forth a Citywide comprehensive long-range growth strategy and defines Citywide polices regarding such issues as land use, housing, urban form, neighborhood design, open space, economic development, transportation, infrastructure, and public services. While the Framework Element references the City's participation in working with the Los Angeles Unified School District in the planning and coordination of public schools, it does not specifically address efforts with private schools. To that end, however, allowing the continued use and expansion of a private high school campus, would be consistent with a several important goals, objectives, and policies of the Framework Element, including:

GOAL 9N: Public schools that provide a quality education for all of the city's children, including those with special needs, and adequate school facilities to serve every neighborhood in the city.

Objective 9.32: Work constructively with LAUSD to promote the siting and construction of adequate school facilities phased with growth."

Policy 9.32.1: Work with the Los Angeles Unified School District to ensure that school facilities and programs are expanded commensurate with the City's population growth and development."

The project supports **Goal 9N** by modernizing and enhancing educational facilities that

provide a high-quality learning environment for students. While Chaminade High School is not part of the Los Angeles Unified School District (LAUSD), the project demonstrates a commitment to offering adequate facilities that serve the broader educational needs of the West Hills neighborhood, and the City as a whole. The development of a cohesive, pedestrian-friendly campus, including updated classrooms, athletic fields, and student-centered amenities, reflects an investment in creating a safe, functional, and inclusive environment conducive to learning.

The project aligns with **Objective 9.32** by incorporating thoughtful planning to phase the construction and development of facilities in line with community needs and growth patterns. Through careful site design and collaboration with stakeholders, the project ensures that new facilities enhance the existing educational function of the site without overburdening the surrounding residential neighborhood. The addition of modernized buildings and infrastructure ensures that the campus can adequately accommodate its current student body while maintaining compatibility with local growth trends.

The project supports **Policy 9.32.1**, by expanding school facilities in proportion to community growth and development. The project does not propose an increase in student enrollment, thereby ensuring that the intensity of use remains consistent with the established character of the area. New facilities, such as the multistory classroom building and athletic fields, are scaled and designed to blend harmoniously with the surrounding residential environment. Furthermore, strategic landscaping and thoughtful positioning of buildings minimize potential impacts, such as noise and visual disruption, to neighboring properties.

By addressing the educational and operational needs of the school while respecting the residential context, the project contributes to the City's broader goals of providing accessible, high-quality educational infrastructure.

In conclusion, the requested Zoning Administrator's Determination supports the project's alignment with the overarching goals of the General Plan and community plan, ensuring that the new facilities not only meet operational needs but also enhance the safety, functionality, and accessibility of the campus as a whole.

Zoning Administrator's Adjustment Findings

6. **While site characteristics or existing improvements make strict adherence to the zoning regulations impractical or infeasible, the project nonetheless conforms with the intent of those regulations**.

The proposed project involves the expansion and modernization of Chaminade High School in the West Hills neighborhood within the Canoga Park - Winnetka - Woodland Hills - West Hills Community Plan area. The project includes improvements to the Main Campus, such as a new three-story Multistory Building, as well as the development of the North Campus with athletic fields, an aquatic center, additional surface parking, and other facilities, connected by a pedestrian bridge over Saticoy Street. These enhancements aim to improve the school's academic, athletic, and parking infrastructure while maintaining the current student enrollment capacity of 1,360 students, ensuring modernized facilities and campus connectivity without increasing population density.

In conjunction with the project, the applicant is requesting a Zoning Administrator's Adjustment for: 1) a maximum building height of 48 feet for the new Multistory Building on the Main Campus, exceeding the 45-foot height limit in the A1 Zone; 2) the encroachment of a pedestrian bridge and its support structures into the required front and side yard setbacks in the RS and A1 zones; and 3) reduced setbacks for existing encroaching structures, such as

bleachers and buildings, along the front yard on Cohasset Street and the side yards along the eastern property lines, deviating from LAMC Sections 12.07.1 C and 12.05 C.

The requested height adjustment for the 48-foot Multistory Building is necessary due to the site's existing improvements and its irregular layout. The building is located in the northern portion of the Main Campus near the performing arts building and football field, surrounded by taller structures, such as the 60-foot-tall Performing Arts Building and the 50-foot-tall Condon Family Center. The slight height increase is consistent with the scale of the existing campus structures and maintains compatibility with the surrounding built environment. Moreover, the building's placement, away from single-family homes, minimizes any visual or operational impacts on neighboring properties. Adhering strictly to the 45-foot height limit would hinder the efficient use of the site by reducing the building's functionality and capacity to support the school's educational mission.

The requested setback encroachments for the pedestrian bridge across Saticoy Street are similarly justified by the project's need to address site-specific safety and operational challenges. The irregular shape of the property and the separation of the Main and North Campuses necessitate the construction of a grade-separated crossing to ensure safe passage for students, faculty, and visitors. Strict adherence to setback regulations would make the bridge's construction impractical, as its support structures require placement within the setback areas for stability and functionality. The bridge's location and design minimize disruption to neighboring properties while significantly enhancing safety and campus connectivity.

The reduced setbacks requested for existing structures on the Main Campus, such as bleachers and maintenance buildings, are also justified by the site's characteristics and longstanding improvements. These structures, located along Cohasset Street and the eastern property line, have been in place for decades and serve essential school functions. Their continued use within the setback areas avoids unnecessary relocation or reconstruction, which would impose undue burdens on the school without offering significant benefits to the surrounding community. Given the established nature of these improvements, their retention is both practical and compatible with the surrounding area.

In conclusion, the requested adjustments for height and setback encroachments are necessary to accommodate the project's modernization efforts while addressing the unique characteristics and existing improvements of the site. The irregular lot shape, separation of the campuses, and longstanding use of certain structures make strict adherence to zoning regulations impractical. Nonetheless, the project conforms to the intent of these regulations by ensuring compatibility with the surrounding neighborhood, maintaining public safety, and enhancing the functionality of the campus. These adjustments will allow the school to continue serving its students and the community effectively without adversely impacting neighboring properties.

7. The project's location, size, height operations and other significant features will be compatible with and will not adversely affect or further degrade adjacent properties, the surrounding neighborhood, or the public health, welfare, and safety.

The project site encompasses two distinct properties: the Main Campus and the North Campus, separated by Saticoy Street. The Main Campus, covering approximately 21 acres across three lots, currently includes, but is not limited to, 37 classrooms, administrative offices, a library, a student center, a performing arts center, a fine arts building, a campus ministry, a gymnasium, a lighted football field with seating, a baseball field, and surface parking. With a total building area of 156,768 square feet and 462 parking spaces, the Main Campus serves as the primary hub for the school's academic and extracurricular activities. The North Campus,

spanning 4.83 acres, is presently occupied by a commercial shopping center built in the 1960s. The shopping center includes retail shops, restaurants, and a grocery store but will be converted into new athletic and parking facilities under the proposed project.

The project proposes several major improvements. A new 48-foot-tall Multistory Building will be constructed on the Main Campus, adding approximately 60,760 square feet of space for classrooms, administrative offices, and other school functions. Although exceeding the 45-foot height limit, this building is centrally located on the campus, away from nearby single-family homes, to minimize visual and noise impacts on the surrounding residential neighborhood. The height increase is consistent with existing campus structures such as the Performing Arts Building (60 feet in height) and the Condon Family Center (50 feet in height). This new facility is designed to enhance the school's educational offerings without increasing the student population, which remains capped at 1,360.

A pedestrian bridge will be constructed to connect the Main Campus and the North Campus, providing a safe, above-grade crossing over Saticoy Street. The bridge, with a maximum height of 30 feet and with an elevator tower rising to 45 feet on the North Campus side, will eliminate the need for at-grade pedestrian crossings, significantly improving safety for students, staff, and visitors. The bridge will require setback encroachments into the RS and A1 zones; however these adjustments are necessary to ensure the structural stability of the bridge and elevator tower. Additionally, the bridge will help ease vehicular traffic along Saticoy Street by reducing the number of pedestrians crossing at street level during school hours and large events.

On the North Campus, the commercial shopping center will be replaced with athletic facilities, including soccer and baseball fields, an outdoor swimming pool, and support buildings. These new facilities will support the school's extracurricular activities without increasing enrollment. To minimize impacts on the surrounding neighborhood, the fields will during limited hours as prescribed in related Case No. CPC-2009-1477-CU-ZV-ZAA-SPR-PA1. Noise levels will be managed in accordance with local ordinances, with sound systems and stadium operations designed to limit disruptions to nearby residences.

The project also involves maintaining existing structures within reduced setback areas on the Main Campus, including bleachers, offices, and maintenance buildings. These structures, which have been in place for decades, serve essential school functions and will remain compatible with the surrounding residential area. Keeping these facilities in their current locations avoids unnecessary disruptions to campus operations while maintaining the school's functionality.

Extensive landscaping will be incorporated along the perimeter of the new North Campus and maintained along the existing Main Campus to serve as visual and noise buffers, enhancing privacy for neighboring properties while creating a pleasant environment for students and staff. The project also provides 501 parking spaces and 78 bicycle parking spaces across both campuses, ensuring adequate parking capacity without causing congestion on nearby streets.

The project includes comprehensive mitigation measures, such as noise and light management plans, to address potential impacts on the surrounding community. These measures, combined with thoughtful campus design, ensure that the project remains compatible with the neighborhood.

The requested Zoning Administrator's Adjustment, including the increased height and setback encroachments, is necessary to enhance the campus's functionality while minimizing potential disruptions to the surrounding area. The design, scale, and operations of the project have

been carefully planned to integrate seamlessly with the existing campus and neighborhood environment, maintaining public health, safety, and welfare.

8. The project is in substantial conformance with the purpose, intent and provisions of the General Plan, the applicable community plan, and any specific plan.

The General Plan is the City's roadmap for future growth and development. The General Plan Elements establish goals, policies, purposes, and programs that provide for the regulatory environment in managing the City, and for addressing environmental concerns and problems. The majority of the policies derived from these elements are implemented in the form of Municipal Code requirements. The General Plan is comprised of the Framework Element, seven state-mandated elements, and four additional elements. The Framework Element establishes the broad overall policy and direction for the General Plan.

The subject property is located within the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan area which is one of the 35 Community Plans that make up the Land Use Element of the General Plan. The Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan Area Map designates the existing Main Campus for Very Low, and Low Residential land uses and the proposed North Campus for Neighborhood Commercial land uses. Both the current A1-1 and RS-1 zoning of the Main Campus and the proposed (T)(Q)C2-1 Zone for the new North Campus are consistent with the land use designations for the site. The property is not located within the boundaries of or subject to any other specific plan, community design overlay, or interim control ordinance. The current zoning of the proposed North Campus contains a permanent Qualified "Q" Condition that restricts development to a floor area ratio (FAR) of 0.5:1. The Vesting Zone Change would effectively remove the permanent Q-Condition, however, the proposed project FAR for the North Campus is well below the maximum 0.5:1 FAR established by the current Q-Condition at approximately 0.05:1.

The proposed project is consistent with the following objective and policy of the **Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan:**

Objective 6-2: Maximize the use of local schools for community use and local open space and parks for school use.

Policy 6-2.1: Encourage the siting of community facilities (libraries, parks, schools and auditoriums) together.

The project enhances the functionality and cohesion of Chaminade's High School campus by expanding its facilities to support both educational and extracurricular purposes. New athletic fields, an aquatic center, and open spaces on the North Campus will enhance the school's sports programs and recreational activities. These facilities integrate seamlessly with the Main Campus, providing modern amenities and utilizing available space efficiently. The proposed pedestrian bridge improves connectivity and safety, enabling easy movement between the two campuses and ensuring the school's resources are accessible and cohesive.

The Zoning Administrator's Adjustment grant allows for the construction of a 48-foot Multistory Building, exceeding the 45-foot height limit in the A1 Zone. This modest height increase supports the school's need for expanded academic facilities without overwhelming the surrounding environment, which includes existing multi-story buildings. Additionally, the adjustment permits encroachments into required setbacks for the pedestrian bridge and existing structures, including bleachers and buildings, to remain on the Main Campus. These adjustments facilitate the project's goal of maintaining a unified, compact campus layout that promotes efficient land use and improved safety for students and staff.

The project is further consistent with other elements of the General Plan, including the **Framework Element.** The Framework Element was adopted by the City of Los Angeles in December 1996 and re-adopted in August 2001 and provides guidance regarding policy issues for the entire City of Los Angeles, including the project site. The Framework Element also sets forth a Citywide comprehensive long-range growth strategy and defines Citywide polices regarding such issues as land use, housing, urban form, neighborhood design, open space, economic development, transportation, infrastructure, and public services. While the Framework Element references the City's participation in working with the Los Angeles Unified School District in the planning and coordination of public schools, it does not specifically address efforts with private schools. To that end, however, allowing the continued use and expansion of a private high school campus, would be consistent with a several important goals, objectives, and policies of the Framework Element, including:

GOAL 9N: Public schools that provide a quality education for all of the city's children, including those with special needs, and adequate school facilities to serve every neighborhood in the city.

Objective 9.32: Work constructively with LAUSD to promote the siting and construction of adequate school facilities phased with growth."

Policy 9.32.1: Work with the Los Angeles Unified School District to ensure that school facilities and programs are expanded commensurate with the City's population growth and development."

The project supports **Goal 9N** by modernizing and enhancing educational facilities that provide a high-quality learning environment for students. While Chaminade High School is not part of the Los Angeles Unified School District (LAUSD), the project demonstrates a commitment to offering adequate facilities that serve the broader educational needs of the West Hills neighborhood, and the City as a whole. The development of a cohesive, pedestrian-friendly campus, including updated classrooms, athletic fields, and student-centered amenities, reflects an investment in creating a safe, functional, and inclusive environment conducive to learning.

The project aligns with **Objective 9.32** by incorporating thoughtful planning to phase the construction and development of facilities in line with community needs and growth patterns. Through careful site design and collaboration with stakeholders, the project ensures that new facilities enhance the existing educational function of the site without overburdening the surrounding residential neighborhood. The addition of modernized buildings and infrastructure ensures that the campus can adequately accommodate its current student body while maintaining compatibility with local growth trends.

The project supports **Policy 9.32.1**, by expanding school facilities in proportion to community growth and development. The project does not propose an increase in student enrollment, thereby ensuring that the intensity of use remains consistent with the established character of the area. New facilities, such as the multistory classroom building and athletic fields, are scaled and designed to blend harmoniously with the surrounding residential environment. Furthermore, strategic landscaping and thoughtful positioning of buildings minimize potential impacts, such as noise and visual disruption, to neighboring properties.

By addressing the educational and operational needs of the school while respecting the residential context, the project contributes to the City's broader goals of providing accessible,

high-quality educational infrastructure. In conclusion, the requested Zoning Administrator's Adjustment supports the project's alignment with the overarching goals of the General Plan and Framework Element, ensuring that the new facilities enhance safety, functionality, and accessibility while preserving neighborhood compatibility. For the reasons stated above and as conditioned herein, the project substantially conforms with the purpose, intent, and provisions of the General Plan and Community Plan.

No Net Loss of Housing Element Sites Findings

9. Pursuant to California Government Code section 65863(b)(2), the LADBS / LACP finds the following:

The proposed project (North Campus – 23217-23255 Saticoy Street and 7619-7629 Woodlake Avenue) is located on parcels identified in the Inventory of Sites prepared for the 2021-2029 Housing Element, which was anticipated to accommodate 0.22 Lower Income units. The proposed project does not include any residential dwelling units. Therefore, the proposed project would result in fewer units by income category than those identified in the Housing Element. Since the project will result in less units than the Housing Element anticipates, the City must make written findings supported by substantial evidence of both of the following:

(A) The reduction is consistent with the adopted general plan, including the housing element.

Pursuant to Government Code (GC) Section 65863(b)(1)(A), the City finds the reduced density is consistent with the adopted general plan, including the housing element. The City's 2021-2029 Housing Element took the approach of identifying a wide array of sites with potential for housing development in its Inventory of Adequate Sites for Housing (Appendix 4.1). The capacity methodology used to determine the number of units by income category resulted in an anticipated development potential for each site that is well below its zoned capacity, as there was found to be an extremely low likelihood of redevelopment into housing on each site. In addition, there are many factors which make it difficult to identify precisely which sites will develop with housing over the 8-year period. The description of this approach in Chapter 4 of the Housing Element clearly anticipates that not all sites identified using this model will redevelop with their identified development potential; "rather, the much more likely outcome is that a smaller number of sites are developed with their expected build out" (page 154). As a result, the Housing Element's Inventory or Sites includes a total of just 42,764 new units anticipated on these sites over 8 years, distributed over 198,139 potential sites. Redevelopment below expected capacities (and non-development within the planning period) is fully anticipated by the Housing Element given the large number of sites and low capacities assigned to each. This created a significant "buffer" for compliance with Government Code Sec. 65863 that was anticipated to be sustained by the continued availability for redevelopment on other sites that far exceeds stated capacities, as further evidenced by section (B) below.

(B) The remaining sites identified in the housing element are adequate to meet the requirements of Section 65583.2 and to accommodate the jurisdiction's share of the regional housing need pursuant to Section 65584. The finding shall include a quantification of the remaining unmet need for the jurisdiction's share of the regional housing need at each income level and the remaining capacity of sites identified in the housing element to accommodate that need by income level.

Pursuant to Government Code (GC) Section 65863(b)(2), the City finds that while the proposed project would result in fewer units by income category than those identified in the Inventory of Sites prepared for the 2021-2029 Housing Element, the remaining sites identified in the Housing Element of the General Plan are adequate to meet the requirements of GC Section 65583.2 and to accommodate the jurisdiction's share of the regional housing need pursuant to GC Section 65584. Based on the sites inventory and inventory of candidate sites included in the 2021-2029 Housing Element of the General Plan, as well as the most recent Annual Progress Report on the Housing Element submitted to the California Department of Housing and Community Development (HCD) as of May 1, 2024, the City's remaining RHNA Allocation for the 2021-2029 Planning period is as follows: 111,247 Very Low Income Units, 65,133 Low Income Units, 74,766 Moderate Income Units, and 153,459 Above-Moderate Income Units. As of April 1, 2024, the City has a remaining capacity of 111,247 Very Low Income Units, 65,133 Low Income Units, 74,766 Moderate Income Units, and 153,459 Above-Moderate Income Units. The excess Above-Moderate Income Unit capacity may accommodate both Moderate and Above-Moderate Unit RHNA Allocations. Therefore, the City finds that there are adequate remaining sites in the Housing Element to accommodate the remaining RHNA Allocation for the planning period, and in compliance with the requirements of GC 65583.2.

Environmental Findings

10. **Environmental Finding.** Pursuant to CEQA Guidelines Section 15074(b), after consideration of the whole of the administrative record, including the Mitigated Negative Declaration, No. ENV-2023-1255-MND ("Mitigated Negative Declaration"), and all comments received, with the imposition of mitigation measures, there is no substantial evidence that the project will have a significant effect on the environment.

11. **Flood Insurance.** The National Flood Insurance Program rate maps, which are a part of the Flood Hazard Management Specific Plan adopted by the City Council by Ordinance No. 172,081, have been reviewed and it has been determined that this project is located in Zone C, areas of minimal flooding.

PUBLIC HEARING AND COMMUNICATIONS

A joint public hearing for the Chaminade College Preparatory, High School Project was held on Wednesday, August 28, 2024, via Zoom teleconference. The hearing was conducted in two parts: the Deputy Advisory Agency addressed the Vesting Tentative Tract Map (Case No. VTT-84101), while the Hearing Officer received public testimony on behalf of the City Planning Commission for the related cases, CPC-2023-1254-VZC-HD-ZAD-ZAA and CPC-2009-1477-CU-ZV-ZAA-SPR-PA1. The joint hearing allowed for public testimony and discussion of the project under both sets of cases.

1. Attendees

   Between 40 to 50 individuals attended the virtual public hearing, including the applicant, the applicant's representatives, the applicant's environmental consultants, various members of the public including local residents, and labor union members, as well as representatives from the Council Office and West Hills Neighborhood Council. Agency representatives from Bureau of Engineering, Bureau of Street Lighting, and the Department of Recreation and Parks were also in attendance for the Deputy Advisory Agency portion of the hearing.

2. Applicant Testimony

   The applicant's team presented the proposed project via PowerPoint and discussed the following:

   - The project aims to modernize and update existing facilities, improve educational experiences, and focus on enhancing student wellness by creating new athletic and counseling facilities.
   - Efforts to modernize classrooms, multi-use buildings, and the gymnasium on the main campus are central to the plan.
   - Conversion of the existing baseball field into a girls' softball field and renovation of adjacent parking lots and office spaces are included.
   - A new multi-story building will be constructed to include a Counseling Center, library, classrooms, labs, and administrative offices.
   - New outdoor quads and a campus courtyard will provide additional open spaces.
   - Across Saticoy Street, the new North Campus will house athletic facilities such as multi-purpose athletic fields, and an aquatic center with a pool and associated buildings (restrooms, bleachers, concessions).
   - The plan includes two new parking lots providing 101 parking spaces along Saticoy Street and Woodlake Avenue.
   - A pedestrian bridge over Saticoy Street will connect the North Campus with the main campus to ensure safe pedestrian movement and security.
   - Overall, the campus will provide 501 parking spaces, exceeding the 451 spaces required under the existing Conditional Use Permit.
   - During construction, six temporary classrooms will be installed, displacing 39 parking spaces temporarily. However, these spaces will be provided by the new parking lot across the street before the temporary classrooms are installed.
   - The school will always maintain at least 451 parking spaces during the construction phase, adhering to existing requirements.
   - Despite the physical expansion, the applicant confirmed that there would be no increase in the school's maximum student enrollment.

- Project renderings were presented showing the proposed multi-story building, North Campus, and the pedestrian bridge.
- Feedback from the community and the Cultural Affairs Commission led to design updates for the pedestrian bridge, including a warmer design that pays homage to West Hills.
- The applicant's request for a Vesting Tentative Tract Map including a request for an airspace lot for the pedestrian bridge. The airspace lot would provide permanent authorization for the bridge, allowing for safer student crossings.
- The applicant was initially opposed to the alternative of obtaining a revocable permit for the bridge as it could lead to the removal of the bridge in the future by the city.
- The applicant requested waivers for some street improvements and dedications, including the removal of the requirement for new street lights along Keswick Street and Cohasset Street, as these improvements would impose financial and logistical burdens without being essential to the project.
- Extensive community outreach was conducted, including two community open houses and eight presentations and meetings with the West Hills Neighborhood Council and local residents.
- The project has received 127 support letters and 169 petition signatures from the local community, showing substantial backing for the project.
- The applicant emphasized that the project is designed to enhance student safety, improve educational facilities, and beautify the neighborhood.
- The applicant noted the school's commitment to academic excellence and community engagement, with the goal of improving the surrounding area while maintaining the school's mission.

3. Public Testimony

- Approximately 20 to 30 members of the public spoke at the public hearing, including both supporters and opponents of the Chaminade high school expansion project. Speakers included local residents, parents and alumni of Chaminade High School, labor union members, as well as representatives from the Council Office and West Hills Neighborhood Council.

- A Council Office representative (Dan Rosales) contributed testimony in support of the project, stating that the applicant and their representatives conducted extensive community outreach. Mr. Rosales stated that the applicant worked with the West Hills Neighborhood Council on the modified conditions of approval, which the Council Office is comfortable with. He also expressed the importance of the pedestrian bridge for safety and security. No testimony was given by identified members of the West Hills Neighborhood Council during the public hearing itself. However, there were references to extensive meetings and coordination with the West Hills Neighborhood Council which were held prior to the hearing. These meetings contributed to shaping the conditions proposed by the applicant, which were then submitted for review.

Support:

- Chaminade parents and alumni expressed strong support for the project, praising the school's educational values and commitment to student development. They emphasized that the expanded facilities would enhance students' overall experience and reduce the need for students to leave campus for sporting events, which could help mitigate traffic and noise.

- Some local residents and community leaders expressed optimism about the project, believing that the new facilities would improve the neighborhood's aesthetics and property values. Several supporters highlighted the environmental sustainability measures, such as the school's efforts to mitigate noise and incorporate greener designs.

Opposition:

- Several residents living near the school expressed concerns about increased traffic on Woodlake Avenue and Keswick Street. Some residents believe that the project will exacerbate already significant traffic congestion during school drop-off and pick-up periods. Noise from the proposed swimming pool and athletic fields was also cited as a major issue, with suggestions for additional sound walls or enclosures.

- Several residents cited concerns about the accuracy of the data used in the applicant's traffic studies and indicated that the traffic estimates provided by the applicant may be underreported.

- Representatives from CREED LA, spoke in opposition, emphasizing that the Mitigated Negative Declaration Report prepared for the project was insufficient under CEQA. They argued that the project would result in significant environmental impacts, particularly with regard to noise pollution during construction and soil contamination.

- Representatives from other various labor groups such as Local 433 Ironworkers and Plumbers and Pipefitters Local 761 expressed disappointment that the project did not include commitments to hire local workers or offer union wages. They urged the Planning Commission to reject the project unless guarantees for local hiring and fair wages were included.

4. Applicant Response

The applicant's team responded to public comments made during the hearing by addressing several key concerns:

- **Traffic and Noise Concerns**: The applicant clarified that traffic data used in their study was accurate and based on local surveys from the local shopping center. The applicant's team acknowledged concerns expressed by members of the community about noise from athletic events and construction and explained that phased construction and noise mitigation plans would be in place to reduce the impact. Demolition and construction phases would be carefully planned to avoid overlapping activities that could increase noise levels.

- **Construction Phasing**: In response to concerns about the impact of construction on parking availability, the applicant assured that during construction, parking would remain above the required minimum of 451 spaces. Temporary classrooms displacing some parking spaces would be offset by the new parking lots across the street. The applicant emphasized that construction would be phased to minimize disruption, with specific measures in place to control traffic and noise during each stage of development.

- **Soil Contamination**: Regarding environmental concerns, the applicant reassured the public that soil vapor mitigation would be handled through a plan approved by the LA County Fire Department's site mitigation unit, ensuring safety standards are met. The

team reassured the public that remediation efforts for any detected contaminants would be closely monitored and completed in accordance with expert recommendations.

The applicant concluded by reiterating their commitment to ensuring the project is developed in a way that minimizes disruption to the surrounding community.

5. Closing Comments

The Hearing Officer asked the applicant's team to provide additional details regarding the potential soil contamination at the proposed North Campus site, which had previously housed a gas station and auto repair shop. Additionally, the Hearing Officer asked for more information about the project's haul route procedures and construction staging to ensure minimal disruption to the surrounding community.

Additional Communications

Approximately 20 individuals emailed staff requesting to be placed on the interested parties list, and to receive a copy of the project's Mitigated Negative Declaration Report.

Planning Staff received over 290 letters and petitions signatures in support of the proposed project. These letters/petitions came from various individuals, including Chaminade alumni and parents, local residents, and local business owners. The supporters expressed enthusiasm for the proposed modernization and expansion of the school's facilities, highlighting the improvements in educational infrastructure, athletic facilities, parking, and pedestrian safety. Additionally, many of the project's supporters emphasized the long-term benefits to the community, particularly the proposed pedestrian bridge and enhanced security measures.

Planning staff received a letter from the West Hills Neighborhood Council dated September 21, 2023, addressed to the applicant. In the letter, the West Hills Neighborhood Council (WHNC) states that many constituents would support an expansion of classrooms and library to the North campus if done appropriately with respect for the surrounding neighborhood but would prefer new athletic facilities and operations to be limited to the Main Campus. The letter also cites concerns with increased noise, traffic, and environmental impacts as a result of the proposed project. WHNC raised issues with the accuracy of the traffic analysis, noise from extended facility hours, and the height of proposed lighting structures. The WHNC recommended limiting operating hours, enforcing stricter noise and lighting regulations, and maintaining adequate setbacks from residential properties to minimize the project's negative impact on the community.

Planning staff received a letter from the West Hills Neighborhood Council dated April 19, 2024, addressed to the applicant, Chaminade College Preparatory. The letter addressed several key concerns of the community, including environmental hazards and health risks, lighting, noise, traffic and parking, as well as construction operations. Additionally, the letter provided several conditions recommended by the West Hills Neighborhood Council to be incorporated into the Staff Recommendation Report to the City Planning Commission.

Staff received a WHNC Response Letter dated July 12, 2024 to the project's Mitigated Negative Declaration Report. The Response Letter cites key objections by the WHNC with regard to the following: the project's lighting and setbacks, traffic and parking, Noise, air quality and hazardous waste, as well as the proposed construction timeline and operations.

Planning staff received a final letter from the WHNC dated August 28, 2024 stating that after extensive examination of the proposal and careful study of best practices to ensure due regard for the character of the surrounding community and quality of life for the adjoining residents, the

WHNC voted to support the project proposal with conditions, at a Special Zoning & Planning meeting held on August 22, 2024. The conditions were attached to the letter. The letter acknowledges that numerous meetings were held with the WHNC Zoning & Planning Committee, a Zoning sub-committee, Council District 12, community members and Chaminade over the past year regarding the expansion of Chaminade high school.

Planning staff did not receive any written communications from the Council Office leading up to the CPC meeting.

A5.2

ESTIMATED EARTHWORK QUANTITY

ESTIMATED CUT = 18,764 CY
ESTIMATED FILL = 964 CY
NET VOLUME = 17,800 CY (EXPORT)

NOTES:

1. ESTIMATED EARTHWORK ABOVE IS BASED ON DESIGN FINISH GRADES TO EXISTING GRADES IN SURVEY. THE ESTIMATED EARTHWORK DOES NOT CONSIDER THE THICKNESS OF EACH PAVEMENT MATERIAL OR THE REMOVAL OF ANY UNSUITABLE MATERIAL.
2. THE ESTIMATED EARTHWORK QUANTITIES DO NOT INCLUDE SHRINKAGE FACTORS DUE TO COMPACTION.
3. THE CONTRACTOR SHALL CALCULATE HIS OWN EARTHWORK QUANTITIES NECESSARY FOR HIS BID AND WORK. VCA IS NOT RESPONSIBLE AND LIABLE FOR THE CONTRACTOR'S EARTHWORK CALCULATIONS.
4. ESTIMATED EARTHWORK QUANTITIES ABOVE ASSUME THAT ALL ON-SITE MATERIALS ARE SUITABLE FOR BACKFILLING. HOWEVER, ACTUAL EXISTING ON-SITE MATERIALS AND IMPORTED MATERIALS MUST FIRST BE APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO INSTALLATION, REMOVAL, OR REPLACEMENT.
5. CONTRACTOR SHALL REFER TO GEOTECHNICAL REPORT ALL OTHER REQUIREMENTS THAT MAY BE REQUIRED IN ORDER TO CALCULATE THE CUT AND FILL QUANTITIES.

SHEET NOTES:

1. ALL GRADING SHALL BE PERFORMED IN ACCORDANCE WITH THE REQUIREMENTS OF THE JURISDICTIONAL AGENCIES.
2. PROVIDE A HAUL ROUTE AS REQUIRED BY THE JURISDICTIONAL AGENCIES.
3. NO GRADING WORK SHALL BE PERFORMED AT ANY TIME WITHOUT AN EROSION CONTROL SYSTEM APPROVED BY ENGINEER. BETWEEN NOVEMBER 1 AND APRIL 15, ANY GRADING WORK SHALL BE PERFORMED WITH AN EROSION CONTROL SYSTEM APPROVED BY THE ENGINEER AND THE JURISDICTIONAL DISTRICT.
4. CONSTRUCT DESIGN GRADES SHOWN ON PLAN. CONSTRUCT STRAIGHT GRADES BETWEEN INDICATED ELEVATIONS UNLESS INTERRUPTED BY A GRADE CHANGE LINE. ANY DEVIATIONS FORM THE GRADING PLAN MUST HAVE PRIOR APPROVAL OF THE ARCHITECT.
5. CONTRACTOR SHALL RECOMPACT THE TOP 12" OF THE PAVING SUB GRADE TO 95% MAXIMUM RELATIVE DENSITY.
6. THE CONTRACTOR SHALL NOT BEGIN THE PAVING OPERATION UNTIL THE SUB GRADE HAS BEEN APPROVED BY THE DISTRICT RETAINED GEOTECHNICAL ENGINEER AND IOR.
7. THE CONTRACTOR IS ADVISED THAT THE APPROVAL OF THIS PLAN DOES NOT WAIVE THE REQUIREMENTS FOR EXCAVATIONS CONTAINED IN THE STATE CONSTRUCTION SAFETY ORDERS ENFORCED BY THE STATE DIVISION OF INDUSTRIAL SAFETY.
8. NO FILL TO BE PLACED, UNTIL THE GEOTECHNICAL ENGINEER OR IOR HAS INSPECTED AND APPROVED THE BOTTOM OF EXCAVATION.
9. ALL FILL OR BACK FILL SHALL BE COMPACTED BY MECHANICAL MEANS TO A MINIMUM 95% RELATIVE COMPACTION AS DETERMINED BY THE ASTM D-1557. ALL FILL INSTALLATION SHALL REQUIRE CERTIFICATION BY THE GEOTECHNICAL ENGINEER PRIOR TO FOUNDATION INSTALLATION.

LANDSCAPE LEGEND

PROPOSED IMPROVEMENTS

TREES	QUANTITY	BOTANICAL NAME	COMMON NAME	WATER NEEDS
COURTYARD TREE	27	MID-LARGE SIZE CANOPY TREE FOR SHADING OF PEDESTRIAN AREAS. INCLUDES A MIX OF DECIDUOUS AND EVERGREEN TREES WITH POTENTIAL FOR SEASONAL INTEREST SUCH AS:		
		ULMUS PARVIFLORA	CHINESE EVERGREEN ELM	MODERATE
		GEIJERA PARVIFLORA	AUSTRALIAN WILLOW	LOW
		FRAXINUS ANGUSTIFOLIA 'RAYWOOD'	RAYWOOD ASH	MODERATE
		PISTACHIA CHINENSIS	CHINESE PISTACHE	MODERATE
		SEARSOA LANCEA	AFRICAN SUMAC	LOW
ACCENT TREE	7	SMALL SCALE TREES WITH SEASONAL INTEREST AND FORM SUCH AS:		
		LAGERSTROMEIA SPECIES	CRAPE MYRTLE	MODERATE
		CERCIS OCCIDENTALIS	WESTERN REDBUD	LOW
		ARBUTUS 'MARINA'	STRAWBERRY TREE	LOW
		CHIONANTHUS RETUSUS	CHINESE FRINGE TREE	MODERATE
SPECIMEN TREE	3	LARGE SCALE TREE FOR SHADING OF PEDESTRIAN AREAS SUCH AS:		
		QUERCUS SUBER	CORK OAK	LOW
		TIPUANA TIPU	TIPU TREE	LOW
		PINUS PINEA	ITALIAN STONE PINE	LOW
		AFROCARPOS FALCATUS	FERN PINE	MODERATE
BUFFER/ PARKING LOT TREE	47	MID-LARGE SIZE CANOPY TREES FOR SCREENING AND SHADING VEHICULAR AREAS SUCH AS		
		ULMUS PARVIFLORA	CHINESE EVERGREEN ELM	MODERATE
		TIPUANA TIPU	TIPU TREE	LOW
		SEARSOA LANCEA	AFRICAN SUMAC	LOW

UNDERSTORY PLANTING	BOTANICAL NAME	COMMON NAME	
COURTYARD	DROUGHT TOLERANT SHRUBS AND GROUNDCOVERS WITH SEASON INTEREST FOR USE IN HIGH TRAFFIC PEDESTRIAN AREAS, SUCH AS:		
	ACHILLEA MILLEFOLIUM	YARROW	LOW
	ARCTOSTAPHYLOS 'HOWARD MCMINN'	HOWARD MCMINN MANZANITA	LOW
	BACCHARIS PILULARIS	COYOTE BRUSH	LOW
	LOMANDRA LONGIFOLIA	DWARF MAT RUSH	LOW
	PENNISETUM SPECIES	FOUNTAIN GRASS	LOW
	SALIVA SPECIES	SAGE	LOW
	TRACHELOSPERMUM JASMINOIDES	STAR JASMINE	MODERATE
	WESTRINGIA 'MUNDI'	LOW COAST ROSEMARY	LOW
	VERBENA 'DE LA MINA'	VERBENA LILACINA 'DE LA MINA'	LOW
ENTRY/ ACCENT	DROUGHT TOLERANT SHRUBS, GROUNDCOVERS AND ORNAMENTAL GRASSES WITH FLOWERING ACCENT, COLOR, TEXTURE AND STRUCTURED FORM SUCH AS:		
	ALOE SPECIES	ALOE	LOW
	BOUGAINVILLEA SPECIES	BOUGAINVILLEA	LOW
	CHONDROPETALUM TECTORUM	SMALL CAPE RUSH	LOW
	FESTUCA MAIREI	ATLAS FESCUE	LOW
	KECKIELLA CORDIFOLIA	CLIMBING PENSTEMON	LOW
	PENSTEMON SPECTABILIS	SHOWY PENSTEMON	LOW
	ROSEMARINUS SPECIES	ROSEMARY	LOW
	SALVIA SPECIES	SAGE	LOW
BUFFER SCREENING/ PARKING LOT	DROUGHT TOLERANT EVERGREEN SHRUBS AND GROUNDCOVERS FOR USE AS BACKGROUND PLANTING AND/OR SCREENING OF VEHICULAR AND SERVICE AREAS, SUCH AS:		
	BACCHARIS PILULARIS	COYOTE BRUSH	LOW
	CARRISSA MACROCARPA	NATAL PLUM	LOW
	DURANTA ERECTA 'GOLD MOUND'	GOLD MOUND DURANTA	MODERATE
	MYRICA CALIFORNICA	PACIFIC WAX MYRTLE	LOW
	RAHMNUS 'EVE CASE'	COFFEEBERRY	VERY LOW
NATURAL TURF			
GRASSCRETE	LOW WATER, SHORT ORNAMENTAL GRASSES, SUCH AS:		
	CAREX DIVULSA	GRASSLAND SEDGE	LOW
	FESTUCA RUBRA 'MOLATE'	CREEPING RED FESCUE	HIGH
	NASSELLA PULCHRA	PURPLE NEEDLE GRASS	VERY LOW

PROPOSED IMPROVEMENTS

1. VEHICULAR PAVING
2. PEDESTRIAN PAVING
3. SECURITY FENCE
4. PEDESTRIAN GATE
5. VEHICULAR GATE
6. SHADE STRUCTURE
7. FIRE ACCESS
8. BUILDING TO BE RENOVATED
9. NEW BUILDING
10. PARKING LOT RESTRIPING AND RENOVATION
11. NEW PARKING
12. NEW STAIRS
13. ARTIFICIAL TURF ATHLETIC FIELDS
14. PROPOSED LOADING AREA

CITY HALL 200 NORTH SPRING STREET LOS ANGELES CA 90012

Mitigated Negative Declaration

Chaminade College Preparatory, High School Project

Case Number: ENV-2023-1255-MND

Project Location: 7500 North Chaminade Avenue, 23241 West Cohasset Street, 23260 West Saticoy Street, 23217-23255 West Saticoy Street, and 7619-7629 North Woodlake Avenue, West Hills, CA 91304

Community Plan Area: Canoga Park – Winnetka – Woodland Hills – West Hills

Council District: 12—Lee

Project Description: The Project Applicant proposes to update and expand the existing high school campus with a revised campus plan located at 7500 North Chaminade Avenue, 23241 West Cohasset Street, 23260 West Saticoy Street, 23217-23255 West Saticoy Street, and 7619-7629 North Woodlake Avenue in West Hills (the Project Site). The revised campus plan (the Project) would include a total lot area of approximately 25.86 acres, inclusive of: 1) a new three-story school building (Multistory Building), updated parking areas, remodeled athletic fields, new student quads, and renovated classrooms, student service centers and offices on the existing campus located on approximately 21.03 acres in the A1-1 and RS-1 zones, at 7500 North Chaminade Avenue, 23241 West Cohasset Street, and 23260 West Saticoy Street (Main Campus); 2) an expanded school campus area of approximately 4.83 acres located across Saticoy Street, at 23217-23255 West Saticoy Street and North 7619-7629 Woodlake Avenue, proposed for new athletic fields, an aquatic center/outdoor swimming pool, accessory facilities/structures and associated surface parking facilities, in the proposed C2-1 Zone (the North Campus); and 3) a new pedestrian bridge across Saticoy Street. No increase in the maximum permitted student enrollment (1,360 students) is proposed. Upon Project completion, the revised campus plan for the high school would include a total of approximately 196,468 square feet of floor area equating to a floor area ratio (FAR) of 0.17:1 and will have 501 on-site vehicle parking spaces and 78 bicycle parking spaces (76 short-term spaces and 2 long-term spaces). Grading for the North Campus would require approximately 720 cubic yards of soil export, and grading for the Main Campus would require approximately 17,800 cubic yards of soil export.

1 INTRODUCTION

An application for the proposed Chaminade College Preparatory, High School Project (Project) has been submitted to the City of Los Angeles (City) Department of City Planning for discretionary review. The Department of City Planning, as Lead Agency, has determined that the Project is subject to the California Environmental Quality Act (CEQA) and that the preparation of an Initial Study and Mitigated Negative Declaration (IS/MND) is required. Thus, this document has been prepared in compliance with the relevant provisions of CEQA and the State CEQA Guidelines as implemented by the City. Based on the analysis provided in this IS/MND, the City has concluded that with implementation of the identified mitigation measures, the Project would not result in any significant environmental impacts. The IS/MND is an informational document and is required to be adopted by the decision maker prior to Project approval by the City.

1.1 PURPOSE OF AN INITIAL STUDY

CEQA was enacted in 1970 with several basic purposes, including: (1) to inform governmental decision makers and the public about the potential significant environmental effects of proposed projects; (2) to identify ways that environmental damage can be avoided or significantly reduced; (3) to prevent significant, avoidable damage to the environment by requiring changes in projects through the use of feasible alternatives or mitigation measures;[1] and (4) to disclose to the public the reasons behind a project's approval even if significant environmental effects are anticipated.

An Initial Study is a preliminary analysis conducted by the Lead Agency, in consultation with other agencies (responsible or trustee agencies, as applicable), to determine whether there is substantial evidence that a project may have a significant effect on the environment. If the Initial Study shows that there is no substantial evidence, in light of the whole record before the agency, that the project may have a significant effect on the environment, the Lead Agency shall prepare a Negative Declaration. If the Initial Study identifies potentially significant effects but revisions have been made by or agreed to by the applicant that would avoid the effects or mitigate the effects to a point where clearly no significant effects would occur, a Mitigated Negative Declaration is appropriate. If the Initial Study concludes that neither a Negative Declaration or Mitigated Negative Declaration is appropriate, an Environmental Impact Report (EIR) is normally required.[2]

[1] The study of alternatives to a project is only required as part of an Environmental Impact Report.

[2] State CEQA Guidelines Section 15063(b)(1) identifies the following three options for the Lead Agency when there is substantial evidence that the project may cause a significant effect on the environment: "(A) Prepare an EIR, or (B) Use a previously prepared EIR which the Lead Agency determines would adequately analyze the project at hand, or (C) Determine, pursuant to a program EIR, tiering, or another appropriate process, which of a project's effects were adequately examined by an earlier EIR or negative declaration.

1.2 CEQA PROCESS

In compliance with the State CEQA Guidelines, the City, as the Lead Agency for the Project, will provide opportunities for the public to participate in the environmental review process. Throughout the CEQA process, an effort will be made to inform, contact, and solicit input on the Project from various government agencies and the general public, including stakeholders and other interested parties.

At the onset of the environmental review process, the City has prepared this Initial Study to determine whether the Project may have a significant effect on the environment. The analysis contained herein determined that with mitigation, the Project would not have a significant effect on the environment. Therefore, an IS/MND was determined to be the appropriate CEQA document.

1.3 ORGANIZATION OF THE IS/MND

This IS/MND is organized into four sections as follows:

1 INTRODUCTION

Describes the purpose and content of the IS/MND and provides an overview of the CEQA process.

2 EXECUTIVE SUMMARY

Provides Project information, identifies key areas of environmental concern, and includes a determination as to whether the Project may have a significant effect on the environment.

3 PROJECT DESCRIPTION

Provides a description of the Project and its environmental setting, including specific characteristics of the Project and a list of discretionary actions.

4 EVALUATION OF ENVIRONMENTAL IMPACTS

Contains the completed Initial Study Checklist and discussion of the environmental factors that would be potentially affected by the Project. This Section also includes mitigation measures that will be implemented to reduce impacts to less than significant levels. In accordance with Public Resources Code Section 21064.5 and CEQA Guidelines Sections 15064(f)(2) and 15070(b), the mitigation measures contained in Section 4 have been agreed to by the Applicant.

2 EXECUTIVE SUMMARY

PROJECT DESCRIPTION

See Section 3. PROJECT DESCRIPTION.

ENVIRONMENTAL SETTING

See Section 3. PROJECT DESCRIPTION.

OTHER PUBLIC AGENCIES WHOSE APPROVAL IS REQUIRED

(e.g. permits, financing approval, or participation agreement)

The Project may need additional discretionary and ministerial permits and approvals that may be deemed necessary, including, but not limited to, temporary street closure permits; haul route; demolition, grading, and building permits; street tree removal permits; and sign permits.

CALIFORNIA NATIVE AMERICAN CONSULTATION

Yes.

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Greenhouse Gas Emissions	☐ Public Services
☐ Agriculture & Forestry Resources	☐ Hazards & Hazardous Materials	☐ Recreation
☐ Air Quality	☐ Hydrology / Water Quality	☐ Transportation
☐ Biological Resources	☐ Land Use / Planning	☐ Tribal Cultural Resources
☐ Cultural Resources	☐ Mineral Resources	☐ Utilities / Service Systems
☐ Energy	☐ Noise	☐ Wildfire
☐ Geology / Soils	☐ Population / Housing	☐ Mandatory Findings of Significance

DETERMINATION

(To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions on the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Trevor Martin	City Planner
PRINTED NAME	**TITLE**
Trevor Martin	6/7/2024
SIGNATURE	**DATE**

EVALUATION OF ENVIRONMENTAL IMPACTS

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of a mitigation measure has reduced an effect from "Potentially Significant Impact" to "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analysis," as described in (5) below, may be cross referenced).

5) Earlier analysis must be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR, or negative declaration. Section 15063 (c)(3)(D). In this case, a brief discussion should identify the following:

    a) Earlier Analysis Used. Identify and state where they are available for review.

    b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

    c) Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated

7) Supporting Information Sources: A sources list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whichever format is selected.

9) The explanation of each issue should identify:

    a) The significance criteria or threshold, if any, used to evaluate each question; and

    b) The mitigation measure identified, if any, to reduce the impact to less than significance.

3 PROJECT DESCRIPTION

3.1 PROJECT SUMMARY

The Project Applicant, Chaminade College Preparatory, proposes to update and expand the existing high school campus with a revised campus plan located at 7500 North Chaminade Avenue, 23241 West Cohasset Street, 23260 West Saticoy Street, 23217-23255 West Saticoy Street, and 7619-7629 North Woodlake Avenue in West Hills (the Project Site). The revised campus plan (the Project) would include a total lot area of approximately 25.86 acres, inclusive of: 1) a new three-story school building (Multistory Building), updated parking areas, remodeled athletic fields, new student quads, renovated classrooms, student service centers, and offices on the existing campus located on approximately 21.03 acres in the A1-1 and RS-1 zones, at 7500 North Chaminade Avenue, 23241 West Cohasset Street, and 23260 West Saticoy Street (Main Campus); 2) an expanded school campus area of approximately 4.83 acres located across Saticoy Street, at 23217-23255 West Saticoy Street and 7619-7629 North Woodlake Avenue, proposed for new lighted athletic fields, bleachers, an outdoor swimming pool, accessory facilities/structures, and associated surface parking facilities, in the proposed C2-1 Zone (the North Campus); and 3) a new pedestrian bridge connecting the Main Campus and North Campus across Saticoy Street. No increase in the maximum permitted student enrollment (1,360 students) is proposed. Upon Project completion, the Project would include a total of approximately 196,468 square feet of floor area equating to a floor area ratio (FAR) of 0.17:1 and will have 501 on-site surface vehicle parking spaces and 78 bicycle parking spaces (76 short-term spaces and 2 long-term spaces).

3.2 ENVIRONMENTAL SETTING

3.2.1 Project Location

The Project Site is located in the northwest San Fernando Valley in the West Hills community of the City of Los Angeles. The Project Site, which includes the Main Campus (Assessor Parcel Numbers (APNs) 2027-005-002 and -009) and North Campus (APNs 2027-005-005, -006 and -007) as described above, is bifurcated by Saticoy Street and comprised of six parcels which total approximately 25.86 acres of lot area. The Main Campus is approximately 21.03 gross acres in lot area with approximately 666 feet of frontage along the west side of Saticoy Street, approximately 273 feet of frontage along the south side of Keswick Street, approximately 636 feet of frontage along the east side of Chaminade Avenue, and approximately 808 feet of frontage along the north side of Cohasset Street. The North Campus is approximately 4.83 gross acres in lot area with approximately 788 feet of frontage along the east side of Saticoy Street and approximately 244 feet of frontage along the west side of Woodlake Avenue. The Main Campus is currently improved with a range of single-story and multiple story buildings within the existing high school campus, inclusive of academic and administrative buildings, and sports fields and

facilities. The proposed North Campus is currently improved with a one-story, multi-tenant commercial shopping center and surface parking lot, built between 1962 to 1964. The shopping center is currently occupied with retail, restaurant, and grocery store tenants.

The Main Campus is located within the A1-1 and RS-1 zones with a General Plan land use designation of Very Low Residential and Low Residential, and the North Campus is currently located in the [Q]C1-1VL and P-1VL zones with a land use designation of Neighborhood Commercial. Chaminade College Preparatory was established over 70 years ago, and its high school has been operating at the Main Campus location since the 1960s.

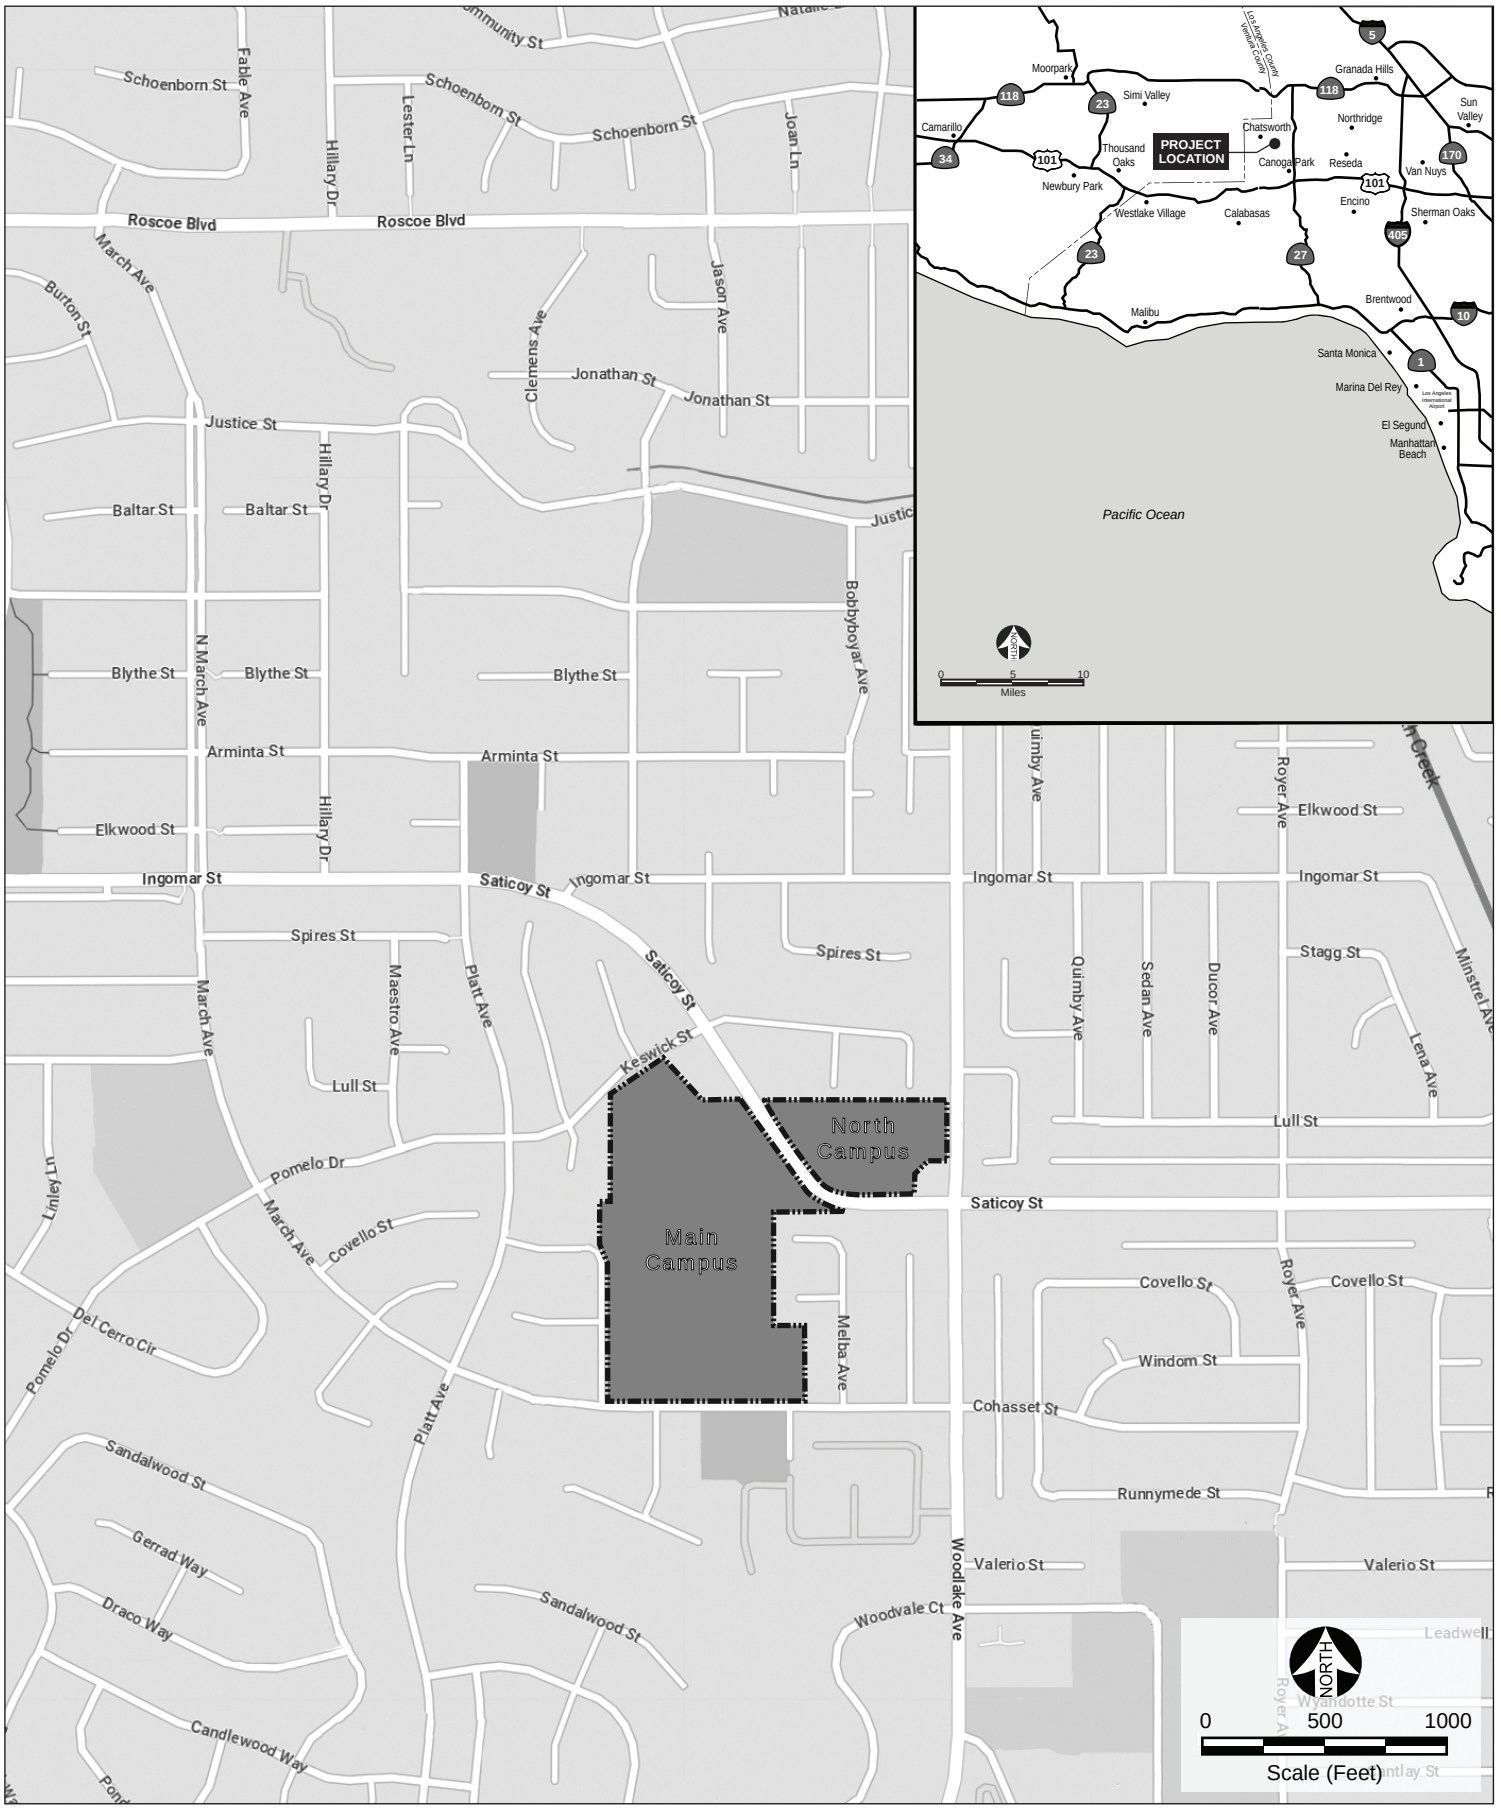
3.2.2 Surrounding Land Uses

The following provides a summary of the uses surrounding the Project Site:

Main Campus

Surrounding properties to the existing Main Campus are located within the RE11-1 and RS-1 zones and are generally improved with single-family residential uses and a public park. The abutting properties located along the north side of the Project Site, along and across Keswick Street, and along Atron Avenue to the west, are zoned RE11-1 and improved with single-family residential homes. The properties located to the west of the Project Site, abutting and across Chaminade Avenue, are zoned RE11-1 and improved with single-family residential homes. The properties located to the south and across Cohasset Street are zoned RE11-1 and improved with a single-family residential homes and Four Oaks Park. The properties to the east and abutting, are zoned RS-1 and improved with single-family residential homes.

North Campus



Surrounding properties to the proposed North Campus are located within the RS-1, [Q]C1.5-1VL, (Q)RD5-1A1-1VL Zones, and are generally improved with single-family residential uses and an automotive repair shop. The properties located to the north of the Project Site and abutting, are zoned RS-1 and improved with single-family residential uses. The properties located to the west and south of the Project Site across Saticoy Street, are zoned RS-1 and improved with single-family residential uses, as well as an academic building and a surface parking lot associated with the Main Campus. The property directly abutting to the south and east of the Project Site, at the northwest corner of Saticoy and Woodlake Avenue, is zoned [Q]C1.5-1VL and improved with an automotive repair shop. Finally, the properties located to the east and across Woodlake Avenue are zoned (Q)RD5-1 and A1-1VL and improved with single-family residential homes.

3.2.3 Transit Services

Within a 0.25-mile radius of the Project Site, transit services in the Project area are provided by the Los Angeles County Metropolitan Transportation Authority (Metro). Metro operates local bus routes 152, 162, 165, and 169 in the vicinity of the Project Site.

3.2.4 Existing Facilities

The existing high school encompasses approximately 21.03 acres on the Main Campus, with facilities including 37 classrooms, administrative and support offices, a library, a student center building that can accommodate 928 seats, a performing arts center with 360 seats, a fine arts building, a campus ministry building, a lighted football field with bleachers with 2,500 seats, a basketball gymnasium with bleachers with 1,000 seats, a baseball field with bleachers, and a pool. The existing buildings on the Main Campus total 156,768 square feet of floor area. In addition, the Main Campus currently provides 462 parking spaces.

3.3 PROJECT DESCRIPTION

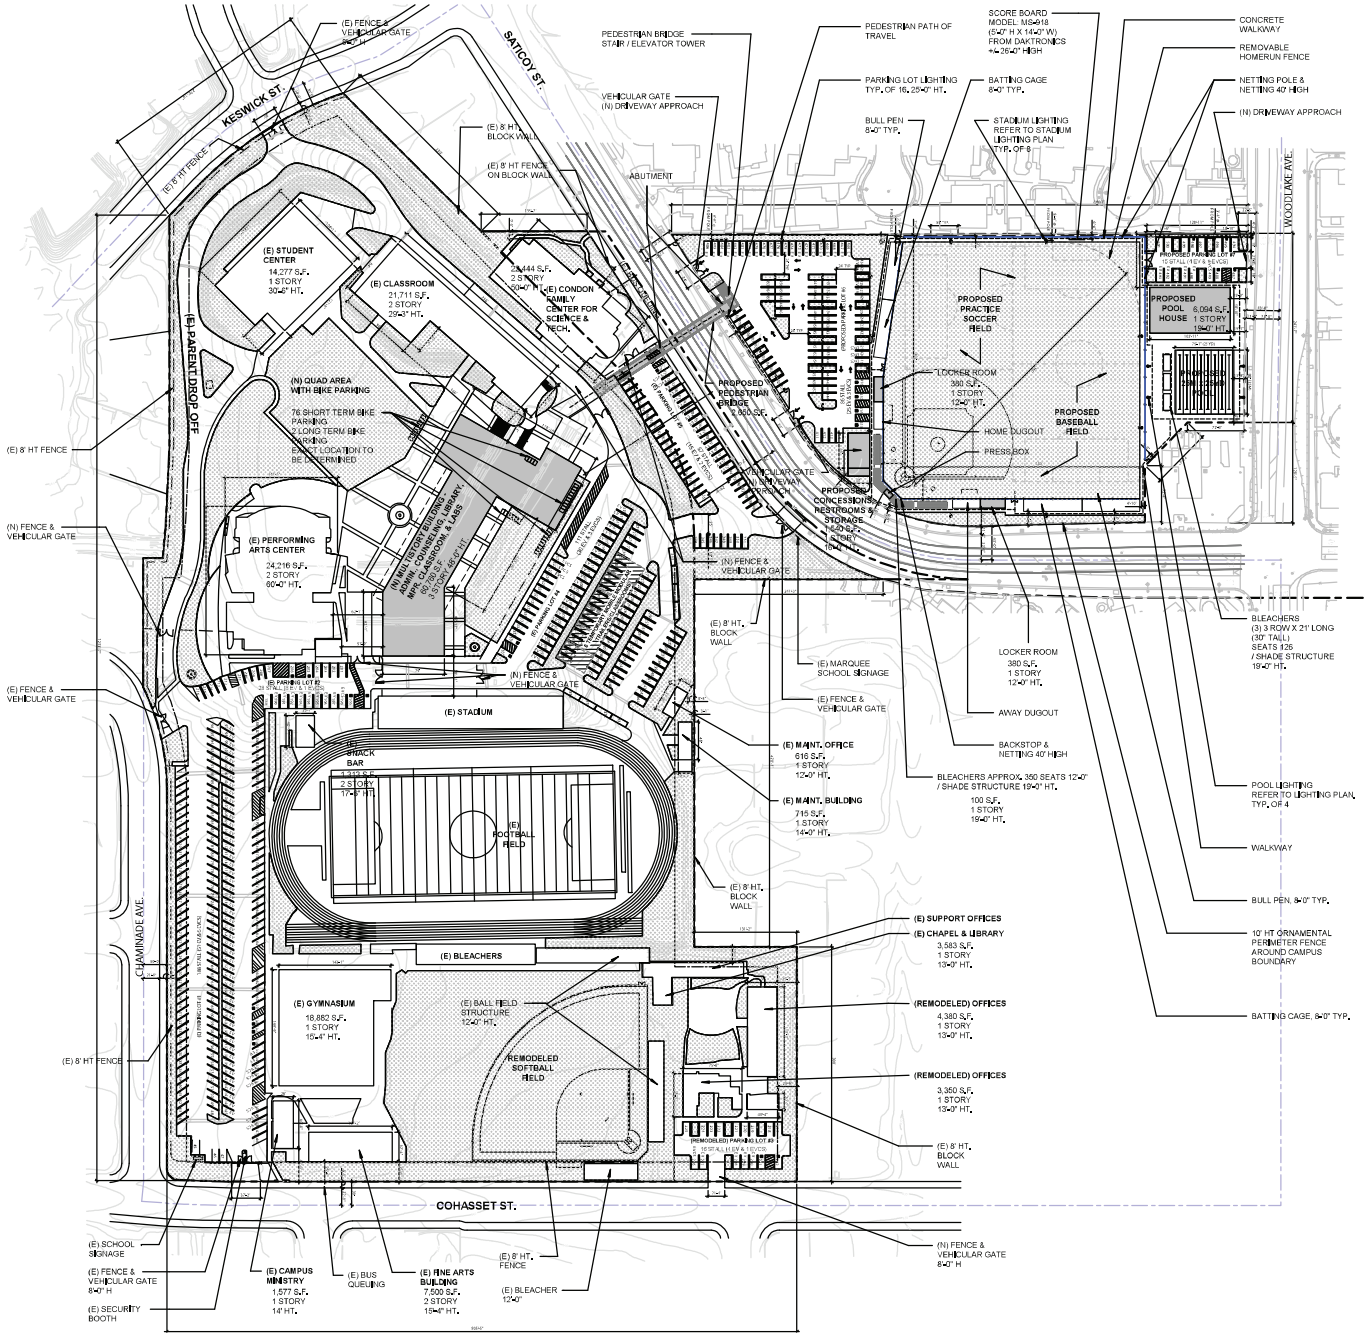
3.3.1 Project Overview

The Project is an updated, comprehensive, and cohesive revised campus plan for the existing high school, integrating both the existing Main Campus and the new North Campus area. The revised campus plan is designed to establish a new entrance for the campus from Saticoy Street, create a cohesive campus outdoor gathering area, improve upon the safety and security of the campus, modernize student service facilities, modernize classrooms including the technology serving the classrooms, provide for an enhanced sports program, and improve campuswide connectivity and circulation. The Project includes changes to the existing Main Campus and the integration of the new North Campus. The changes to the Main Campus include a partial demolition of existing surface parking lots, the demolition of approximately 32,204 square feet of existing classroom buildings (17 classrooms), including the removal of existing portable buildings, and the addition of approximately 60,760 square feet of new floor area within the new Multistory Building to include new administrative, counseling, library, multi-purpose, classroom and laboratory areas with 19 new classrooms (for a net increase of 2 classrooms), renovation of existing offices, and the addition of EV parking and charging stations within most of the existing surface parking lots. It should be noted that six mobile modular trailers/classrooms will be temporarily located on the Main Campus during construction, until the construction of the new Multistory Building is completed.

The expansion of the high school to the North Campus on the east side of Saticoy Street includes the demolition of the existing commercial structures on-site totaling approximately 53,929 square feet of floor area and the demolition of the existing surface parking lot. The expansion to the North Campus includes the development of approximately 8,494 square feet of floor area within a proposed pool house, locker rooms, and structures to house covered bleachers, restrooms, concessions, and storage. The balance of the North Campus site would include proposed new lighted athletic fields, a new outdoor pool, and two new proposed surface parking lots.

3.3.2 New Construction and Campus Changes

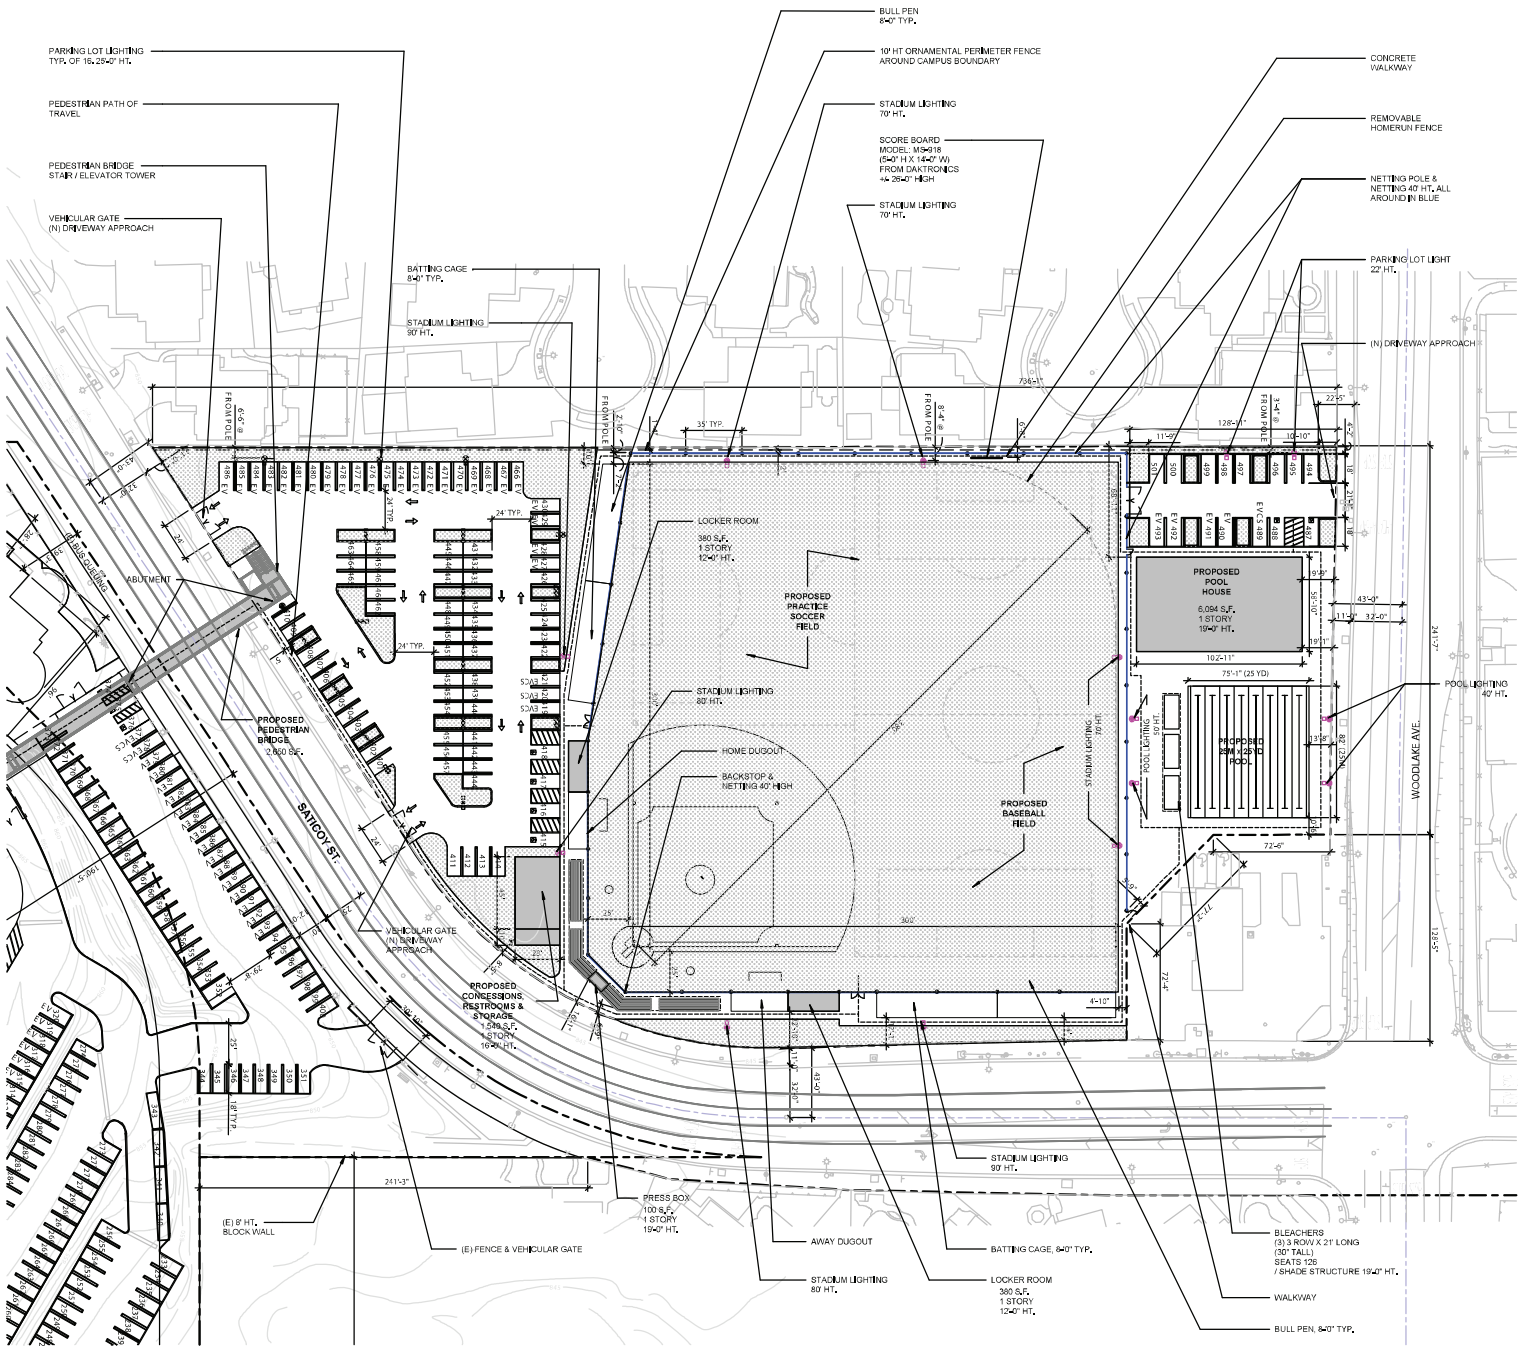
New construction on the Main Campus includes the new Multistory Building at the new additional entrance off Saticoy Street, that would include administrative offices, counseling offices, library, multi-purpose room, classrooms, and labs. The floor area contained within the proposed building totals approximately 60,760 square feet and has a height of approximately 48 feet within three stories. In addition, the existing single-story buildings located at the southeast corner of the Main Campus would undergo renovation for administrative offices but would not increase in floor area or height. A new surface parking lot would be constructed in place of the existing paved driveway adjacent to the single-story building at the southeast corner of the Main Campus, fronting on Cohasset Street. Finally, additional improvements to the Main Campus would include minor demolition and resurfacing of the existing baseball field along Cohasset Street, to be reutilized as a softball field, removal of the north surface parking lot, and resurfacing to create a new



landscaped quad area adjacent to the current administrative building to be renovated for student service programming.

To facilitate the construction of the new Multistory Building, six existing classrooms will be removed and relocated into six temporary double-wide mobile modular trailers located in the parking lot south of the proposed location of the new Multistory Building. These temporary classrooms will be installed upon completion of the first phase of North Campus construction and remain in use until occupancy of the new Multistory Building, at which time they will be removed. Parking spaces displaced by these temporary classrooms will be available in the new surface parking lot on the North Campus, prior to the installation of the modular trailers.

Improvements on the North Campus include new athletic fields, outdoor swimming pool, associated facilities, and surface parking. The new athletic fields, to be used for baseball and soccer, would have a 40-foot-high safety netting along a portion of the outfield perimeter and a 26-foot-high electric scoreboard facing Saticoy Street located in left-center outfield, both along the northern property line. There would also be single-story locker rooms, batting cages, and bull pens located along the first and third base lines. Home and visitor bleachers would be along the first base line and third base line, providing approximately 350 seats with a continuous shade structure reaching 19 feet in height, and a press box of approximately 100 square feet would be located behind home plate. Eight stadium light standards ranging in height from 70 to 90 feet are proposed, with the 70-foot light standards located along the perimeter of left and right outfields, with 80- and 90-foot light standards along Saticoy Street and adjacent to the new surface parking lot. To the west of the baseball field is a proposed 1,540 square foot single-story concession and restroom building (16 feet in height) as well as an 86-stall surface parking lot and entrance to the pedestrian bridge. To the east of the baseball field is a proposed 25-meter x 25-yard, in-ground outdoor pool, with four 40-foot-high light standards, a single-story (19-foot tall), 6,094-square foot pool house and 15 surface parking stalls. Bleachers are proposed west of the pool providing approximately 126 seats. Additionally, there would be a public address system on the new North Campus, similar to the public address system currently used on the Main Campus. Figures 3-3 and 3-4 provide the Project site plans, Figure 3-5 provides a rendering of the new Multistory Building on the Main Campus, Figure 3-6 provides renderings of the new North Campus, and Figure 3-7 provides a rendering of the high school campus upon completion of the Project.



A new 2,650-square-foot pedestrian bridge is proposed over Saticoy Street, to connect the North Campus on the east side of Saticoy Street to the Main Campus on the west side of Saticoy Steet. The bridge would allow students, student athletes, faculty, staff, and visitors a safe pedestrian access and connection to the North Campus sports facilities. The North Campus would be secured with gates and fencing along the Saticoy Street frontage and around the campus perimeter to prevent pedestrians from crossing Saticoy Street to access the North Campus. Pedestrians would access the pedestrian bridge at the new surface parking lot on the North Campus and at the new entrance to the high school located on the west side of Saticoy Street on the Main Campus. A stair and elevator tower associated with the pedestrian bridge is proposed on the North Campus side of the bridge (east side of Saticoy Street). The Main Campus side of

the bridge (west side of Saticoy Street) would have an ornamental pedestrian gate for access at ground level on the Main Campus. The bridge abutments and gate landings would be located entirely on-site (on the Main and North Campuses) and out of the public right-of-way. The elevator tower on the North Campus would reach a maximum height of 45 feet as measured from lowest adjacent grade on the North Campus. The bridge itself, however, would reach a maximum height of 30 feet (as measured from lowest adjacent grade on the North Campus and as measured from the street) and a maximum height of 12 feet as measured from lowest adjacent grade on the Main Campus (as the bridge landing on the Main Campus is at a higher elevation and grade than grade level at the North Campus). Minimum vehicular clearance under the pedestrian bridge will be as required by the City of Los Angeles. Figures 3-8 and 3-9 provide elevations and renderings, respectively, of the proposed pedestrian bridge.

3.3.3 Floor Area

The Project would result in a total proposed floor area of approximately 196,468 square feet, representing a net increase of 28,556 square feet of floor area on the Main Campus (from the existing developed structures). Overall, however, the Project would result in a net decrease of approximately 14,229 square feet of floor area, including the demolition of the existing commercial structures on the site of the new North Campus as well as demolition of existing school structures on the Main Campus. It is important to note that although the physical expansion would result in a net increase of lot area with the addition of the 4.83-acre North Campus, the maximum permitted student enrollment of 1,360 students would remain the same. Table 3-1, below, provides a summary of the existing and proposed floor area.

Table 3-1
Floor Area Summary

Use	Size
Main Campus	
Existing high school campus floor area	156,768 sf
Existing floor area to be demolished [a]	(32,204 sf)
New floor area to be added [b]	60,760 sf
Net Total	185,324 sf (increase of 28,556 sf)
New North Campus	
Existing commercial floor area (all to be demolished)	(53,929 sf)
New Project floor area [c]	8,494 sf
Net Total	Reduction of 45,435 sf
Pedestrian Bridge	
New Project floor area	2,650 sf
Total Net Project Floor Area	196,468 sf (reduction of 14,229 sf)

Notes:
[a] Floor area to be demolished on the Main Campus includes 17 classrooms, including the removal of existing portable buildings.
[b] Floor area to be added on the Main Campus includes a new Multistory Building to include new administrative, counseling, library, multi-purpose, classroom, and laboratory areas with 19 new classrooms (for a net increase of 2 classrooms). This does not include six temporary mobile modular trailers/classrooms that will be located on the Main Campus until the Multistory Building is ready for occupancy.
[c] Floor area to be added on the new North Campus includes a pool house, locker rooms, and structures to house restrooms, bleachers, concessions, and storage.
[d] No increase in the maximum permitted student enrollment (1,360 students) is proposed.

3.3.4 Vehicle Access

The Main Campus is currently accessible from Cohasset Street, Chaminade Avenue, Keswick Street, and Saticoy Street. The Project would maintain these access points for the Main Campus. For the North Campus, there are currently six access points for the existing commercial center,

which would be reduced to three access points for the Project as follows: four existing access points along Saticoy Street would be reduced to two access points for the Project; and two access points along Woodlake Avenue would be reduced to one access point at the approximate location of the existing north access point.

3.3.5 Vehicle and Bicycle Parking

There are currently 462 vehicle parking stalls on the existing Main Campus, and after development of the Project, the total number of vehicle parking stalls would increase to approximately 501 stalls within the surface parking lots across both campuses. The Main Campus will include 400 parking stalls and the North Campus will include 101 stalls with 86 stalls in a north parking area and 15 stalls in a parking lot adjacent to the swimming pool area. The Project would also provide 78 bicycle parking spaces, including 76 short-term spaces and 2 long-term spaces.

3.3.6 Trees

As discussed in greater detail in Section 4 of this IS/MND, a tree report was prepared by a certified arborist in accordance with the City's Tree Preservation Ordinance No. 186,873, and this report is included as Appendix C-1 to this IS/MND. The tree report identified the following: 1) 33 parkway street trees; 2) 364 non-protected significant trees with eight-inch diameter at breast height (DBH) or greater on the Project Site; and 3) 108 non-protected non-significant trees (less than eight inches DBH) on the Project Site. None of these trees are protected species as defined by the City's Protected Tree Ordinance. The Project would result in the removal of 40 non-protected significant trees and seven non-protected non-significant trees from the Project Site, and would retain the remaining on-site trees. The Project would also retain the parkway street trees, with the exception of one tree (Street Tree No. 489), which would be removed to construct the pedestrian bridge. The existing significant trees that would be removed as part of the Project would be replaced according to the Urban Forestry Division requirements (the non-significant trees that would be removed would not require replacement).

3.3.7 Lighting

Light is regularly generated on the Main Campus, including from lighted sporting events (e.g., athletic meets and games, etc.) and vehicle travel (e.g., student pick-up/drop-off). The existing Conditional Use Permit requires existing athletic lighting on the Main Campus to be turned off by 11:00 PM on game nights and by 9:00 PM for practices. Low-level security lighting is provided on all nights. No changes are proposed to the existing lighting on the Main Campus, and the allowable hours for the existing lighting for athletic events would also remain unchanged.

On the North Campus, eight stadium light standards ranging in height from 70 to 90 feet are proposed, with the 70-foot light standards located along the perimeter of left and right outfields, with 80- and 90-foot light standards along Saticoy Street and adjacent to the new surface parking lot. In addition, four 40-foot-high light standards would be placed near the outdoor pool. The lighting for the North Campus would be subject to the same restrictions as the existing lighting on

the Main Campus. Therefore, the new lights on the North Campus would be turned off by 11:00 PM on game nights and by 9:00 PM for practices. Low-level security lighting would also be provided on all nights.

3.3.8 Fencing

The Main Campus would retain the existing eight-foot-tall fence, gates, and block wall currently securing the campus perimeter. In addition, new fencing and vehicular gates, to be located along the northwest drive aisle and parent drop-off area along Chaminade Avenue and at the southeastern access point along Cohasset Street, would be provided on the Main Campus to complete the perimeter security. A new 10-foot-high ornamental fence and gates would be provided around the perimeter of the North Campus to secure the campus and prevent pedestrian crossing across Saticoy Street.

3.3.9 School Operations

The new facilities will service existing students, faculty, staff, and visitors. No increase in permitted enrollment is requested, nor would the Project require additional faculty or staff. Sports programming will remain substantially similar to existing programs with some activities/games that currently occur on the Main Campus shifting to the North Campus, except that the new outdoor pool will allow an expanded swim program including practices, classes, and meets, and would be made available on a limited basis to the local community. The following provides a summary of new activities at the North Campus (not including existing school events that would shift from the Main Campus to the North Campus):

- 10 high school swim competitions per year
- 10 middle school swim competitions per year
- Swim practice for other schools (limited to February through April)
- Swim lessons and water exercise classes daily
- Local community swimming (if there are no other activities at the pool)
- Local non-school athletic groups (limited to May through December)

The hours of operation for the North Campus would be more restrictive than the usage hours allowed by the school's current Conditional Use Permit for the Main Campus. The North Campus hours of operations would be:

- Athletic fields/stadium: Monday – Friday, 7:00 AM – 9:00 PM (with exception for overtime/extra inning play); Saturday, 8:00 AM – 9:00 PM; and Sunday, 9:00 AM – 8:00 PM (no more than 15 Sundays per year).

- Aquatic complex/pool: Monday – Friday, 8:00 AM – 8:00 PM; and Saturday 10:00 AM – 7:00 PM. No use is permitted on Sundays.

- Batting cage: Monday – Saturday, 7:00 AM – 8:00 PM. No use is permitted on Sundays.

Rental or lease of the North Campus athletic facilities would be subject to more restrictive day and hour limitations:

- Athletic fields/stadium: Use by community-based athletic organizations shall be limited to 36 days annually, Monday through Saturday, 8:00 AM – 6:00 PM. Use is not permitted on Sundays and national holidays. The rental or lease of the batting cages is not permitted at any time.

- Aquatic complex/pool: Use by community-based organizations, which shall travel to and from the North Campus by bus, shall be limited to daylight hours and end no later than 7:00 PM, Monday through Friday, and no later than 5:00 PM on Saturdays. For community member swim activities, use hours shall be limited to Monday through Saturday, 8:00 AM – 6:00 PM. Use is not permitted on Sundays and national holidays.

Additional parking is provided to enhance on-site parking, especially for the expanded swim program, and to improve circulation. No changes are proposed to the existing school transportation program, which includes school busses and facilitation of carpooling for siblings and neighbors. Existing overflow parking for special events (currently provided at West Hills Hospital) will continue as needed.

As discussed above, lighting at the North Campus will be used for night practices and night games and meets. The lighting for the North Campus would be subject to the same restrictions as the existing lighting on the Main Campus. Therefore, the new lights on the North Campus would be turned off by 11:00 PM on game nights and by 9:00 PM for practices. There would be no change to the lighting on the Main Campus.

3.3.10 Construction Assumptions

Full Project implementation is estimated by 2035, and there is currently no exact schedule or sequence of construction activities or phasing, though it would be necessary for some activities to occur before others. Certain Project elements may be phased. For example, grading of the North Campus would have to occur before construction of the new North Campus athletic and pool facilities, demolition of existing classroom buildings would have to occur before construction of the new Multistory Building on the Main Campus, etc. Table 3-2, below, presents a sequence of the Project's construction activities showing which construction activities/phases may overlap. Project Design Feature 1 (PDF 1), provided later in this section, incorporates the construction sequence shown in Table 3-2.

Table 3-2
Construction Sequence

Construction Activity	Sequence									
	1	2	3	4	5	6	7	8	9	10
North Campus – Demolition†	X									
North Campus – Grading†		X								
North Campus – Construction of new surface parking lot			X							
North Campus – Construction of pedestrian bridge				X						
North Campus – Construction of new athletic fields and ancillary facilities†					X	X	X	X

Main Campus – Parking Lot Demolition†					X					
Main Campus – Classroom Demolition†						X				
Main Campus – Multistory Building Grading†							X			
Main Campus – Multistory Building Construction†								X	X	X
Main Campus – Construction of upper-level student quad									X	
Main Campus – Renovation of surface parking lot along Cohasset Street									X	
Main Campus – Renovations to existing athletics facilities, classroom buildings, and administrative offices.								X	X	X

† Denotes construction activities chosen for detailed construction emissions modeling.
Source: Project Applicant.

Grading for the North Campus would require approximately 720 cubic yards of export, and grading for the Main Campus would require approximately 17,800 cubic yards of export. Therefore, a Haul Route would be required as part of the City's permit process. The haul route would likely be as follows, subject to Los Angeles Department of Transportation (LADOT) approval:

- Loaded trucks leaving the Project Site would travel west on Saticoy Street, west on Ingomar Street, south on Valley Circle Boulevard, and west on Long Valley Road to the Ventura Freeway (US 101) on-ramps.

- Empty trucks returning to the Project Site would exit the Ventura Freeway at Mulholland/Valley Circle Boulevard, travel east on Calabasas Road, north on Valley Circle Boulevard, east on Ingomar Street, and east on Saticoy Street.

3.3.8 Project Design Features

The following Project Design Features (PDFs) are included as part of the Project:

PDF-1 The Project will adhere to the construction sequence shown in Table 3-2, except:

- Construction of the new surface parking lot on the North Campus and construction of the pedestrian bridge may interchange in the overall sequence of construction activities, but shall not overlap with each other; and

- Demolition of parking lots on the Main Campus and demolition of classroom buildings on the Main Campus may interchange in the overall sequence of construction activities, but shall not overlap with each other.

PDF-2 The Project will prepare a Traffic Management Plan (TMP) to establish operational procedures for traffic flow around the school related to self-driving students and student drop-off and pick-up operations. The purpose of the plan will be to establish operational procedures to improve traffic circulation utilizing the enhanced access points and parking areas, improve student safety, maximize the efficiency of drop-off and pick-up operations, and reduce delays during those time periods.

3.4 REQUESTED PERMITS AND APPROVALS

The list below includes the anticipated requests for approval of the Project. The Mitigated Negative Declaration will analyze impacts associated with the Project and will provide environmental review sufficient for all necessary entitlements and public agency actions associated with the Project. The discretionary entitlements, reviews, permits and approvals required to implement the Project include, but are not necessarily limited to, the following:

1. Pursuant to Los Angeles Municipal Code (LAMC) Sections 12.32 F and 12.32 Q, a Vesting Zone Change and Height District Change from the [Q]C1-1VL and P-1VL zones to the (T)(Q)C2-1 Zone on the new North Campus;

2. Pursuant to LAMC Section 12.24 X.7, a Zoning Administrator's Determination to allow for existing 8-foot-tall perimeter fences and vehicular gates to remain within the front yards (along Cohasset Street and Keswick Street) and for the construction of a new 8-foot-tall fence and vehicular gate within the front yard (along Cohasset Street) on the Main Campus, in lieu of the maximum height of 6 feet otherwise permitted in the front yard of the A1 Zone pursuant to LAMC Section 12.22 C.20(f);

3. Pursuant to LAMC Section 12.24 X.22, a Zoning Administrator's Determination, to allow for new structures related to the sports facilities on the new North Campus, including, but not limited to, a score board, netting and netting poles, lights and a pedestrian bridge, ranging in height from approximately 25 to 90 feet, in lieu of the 25-foot, 33-foot and 61-foot Transitional Height Limitations permitted within 0-199 feet of lots zoned RW1 or more restrictive pursuant to LAMC Section 12.21.1 A.10;

4. Pursuant to LAMC Section 12.28, a Zoning Administrator's Adjustment to allow the following:

    a. A maximum building height of 48 feet for the new Multistory Building on the Main Campus, in lieu of 45 feet otherwise permitted in the A1 Zone pursuant to LAMC Section 12.21.1; and

    b. The encroachment of a proposed above-grade pedestrian bridge and associated support structures into the required front and side yard setbacks in the RS and A1 zones on the west side of Saticoy Street, and reduced setbacks along Cohasset Street (front yard) and along the easterly property lines (side yards) in the A1 Zone for existing encroaching structures (bleachers and buildings) to remain on the Main Campus, in lieu of the setbacks otherwise required pursuant to LAMC Sections 12.07.1 C and 12.05 C;

5. Pursuant to LAMC Sections 17.03 and 17.15, a Vesting Tentative Tract Map for the merger and re-subdivision of the project site into two (2) ground lots: one for the Main Campus (Lot 1) and one for the North Campus (Lot 2); and one (1) airspace lot (Lot 3) for the vacation of a portion of public right-of-way along Saticoy Street to allow for the construction of a pedestrian bridge connecting the Main Campus to the North Campus;

6. Pursuant to LAMC Section 17.13, a haul route approval for the export of approximately 17,800 cubic yards from the Main Campus and the export of approximately 720 cubic yards from the North Campus;

7. Pursuant to LAMC Section 17.11, a Modification of Requirements in conjunction with a Vesting Tentative Tract Map for the waiver of required dedications and street improvements along Cohasset Street, and for the waiver of a requirement to remove existing driveways and construct new ADA compliant driveways on the Main Campus;

8. Pursuant to LAMC Section 12.24 M, a Plan Approval to allow the continued use and operation of an existing High School in the A1 and RS zones and the expansion of the High School to the property located across the street (North Campus), and to modify certain conditions of the original Conditional Use grant under Case No. CPC-2009-1477-CU-ZV-ZAA-SPR; and

9. Other discretionary and ministerial permits and approvals that may be deemed necessary, including, but not limited to, demolition permits, temporary street closure permits, grading permits, excavation permits, foundation permits, building permits, street tree removal permits, and haul route permits.

3.5 RELATED PROJECTS

In this IS/MND, cumulative impact analyses are provided for each environmental issue discussed in Section 4 (Environmental Impact Analysis) and can be found in each respective subsection of Section 4. As stated in the Transportation Assessment prepared for the Project (included in Appendix H-1 of this IS/MND), according to LADOT, no related projects have been identified within one-half mile of the Project Site.

4 ENVIRONMENTAL IMPACT ANALYSIS

I. AESTHETICS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099 would the project:				
a. Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c. In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

The analysis in this section is based in part on the following, which is included in Appendix A of this IS/MND:

- Technical Lighting Analysis, HLB Lighting Design, September 27, 2023.

a. Have a substantial adverse effect on a scenic vista?

Less Than Significant Impact. A significant impact would occur if a project introduced incompatible scenic elements within a field of view containing a scenic vista or substantially block views of an existing scenic vista. As described in the City of Los Angeles CEQA Thresholds Guide, panoramic views or vistas provide visual access to a large geographic area, for which the field of view can be wide and extend into the distance. Panoramic views are usually associated with vantage points looking out over a section of urban or natural area, which provide a geographical orientation not commonly available. Examples of panoramic views might include an urban skyline,

valley, mountain range, the ocean, or other water bodies. The Project Site is located in an urbanized portion of Los Angeles, in an area containing residential, commercial, and institutional uses. Views in the vicinity of the Project Site are largely constrained by the existing structures on the Project Site and structures on adjacent parcels, although views of mountains to the north are currently available from some vantage points. With respect to height, the new Multistory Building proposed at 48 feet tall, as measured from the lowest adjacent grade located 5 feet from the proposed building, or "Grade (Adjacent Ground Level)" as defined in Los Angeles Municipal Code (LAMC) Section 12.03, would be compatible with the existing buildings on the Main Campus and would be shorter than the two tallest existing buildings, which are the Performing Arts Center with a height of 60 feet and the Condon Family Center for Science and Technology which has a height of 50 feet. The new building structures proposed on the North Campus would be one-story and would range in height from 12 feet to 19 feet, with associated necessary structures (i.e. lights, score board, netting poles, etc.) proposed at taller heights, ranging from 26 feet to 90 feet, all as measured from lowest adjacent grade. The pedestrian bridge is proposed to reach a maximum height of 30 feet, as measured from lowest adjacent grade on the North Campus and as measured from the street, and a maximum height of 12 feet as measured from lowest adjacent grade on the Main Campus (as the bridge landing on the Main Campus is at a higher elevation and grade than grade level at the North Campus). The top of the elevator tower proposed on the east side of Saticoy Street will reach a maximum height of 45 feet, as measured from lowest adjacent grade on the North Campus. While the Project would add new buildings to both the Main Campus and the North Campus, the height of the new buildings would be compatible with the existing buildings on the Project Site and in the surrounding area, and views of the mountains to the north would continue to be available in the Project area. In addition, while the pedestrian bridge and associated structures on the North Campus (lights, score board, and netting poles) would be taller than some of the existing and proposed buildings, these structures would not be of such a size as to block views of the mountains to the north. Therefore, Project impacts with respect to scenic vistas would be less than significant.

b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. A significant impact would occur only where scenic resources within a state scenic highway would be damaged or removed by a project. The Project Site is not located within a state scenic highway.[1] The nearest state designated scenic highway is Topanga Canyon Boulevard (State Route 27), which is approximately 1.6 miles from the Project Site. Therefore, no impact would occur.

[1] California Department of Transportation, List of Eligible and Officially Designated State Scenic Highways, https://dot.ca.gov/-/media/dot-media/programs/design/documents/desig-and-eligible-aug2019_a11y.xlsx, accessed June 15, 2023.

c. In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The Project Site is located within an urbanized area, and thus, the following analysis will focus on whether the Project will conflict with any applicable zoning and/or other regulations governing scenic quality. As discussed below under "Land Use," the Project Site is located within the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan Area and the Project would be consistent with the existing land use designations for both the Main Campus (Very Low Residential and Low Residential) and North Campus (Neighborhood Commercial). A portion of the Community Plan Area is subject to the Mulholland Scenic Parkway Specific Plan. However, the Project is not located within the boundaries of this Specific Plan and would not conflict with this plan. The Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan does not contain any other policies with regard to scenic quality.

With respect to zoning, the North Campus is currently located in the [Q]C1-1VL and P-1VL zones, and the Applicant is proposing a Vesting Zone Change and Height District Change on the North Campus to the C2-1 Zone, which corresponds to the existing Neighborhood Commercial land use designation of the North Campus. The private school use is permitted by-right within the C2 Zone and approval of the Zone Change would allow the expansion of the existing high school, which has been operating at its current location for over six decades, to integrate additional area for athletic facilities that are needed to serve the existing student population. However, the Zone Change would not result in any impacts with respect to scenic quality. Therefore, the Project would not conflict with any applicable zoning or other regulations governing scenic quality, and this impact would be less than significant.

d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. A significant impact may occur if a project were to introduce new sources of light or glare on or from the Project Site which would be incompatible with the area surrounding the Project Site, or which pose a safety hazard to motorists utilizing adjacent streets.

Existing Conditions

Project Site

The Main Campus is currently developed with a private high school campus containing educational, athletic, performing arts, administrative, and religious facilities. Light is regularly generated by the daily use of these facilities, including from lighted sporting events (e.g., athletic meets and games, etc.) and vehicle travel (e.g., student pick-up/drop-off). The existing Conditional Use Permit requires existing athletic lighting on the Main Campus to be turned off by

11:00 PM on game nights and by 9:00 PM for practices. Low-level security lighting is provided on all nights.

The North Campus is developed with a shopping center that contains a grocery store, restaurants, and other commercial uses, as well as surface parking for these uses. Light associated with these uses include parking light lighting, car lights from patrons, and trucks.

Light-Sensitive Receptors

The Main Campus and North Campus sites are surrounded by predominantly residential uses, many of which directly abut the two sites. For example, single-family homes are located directly north of the North Campus site along Saticoy Street, Melba Street, and Bobbyboyar Avenue. Single-family homes are also located directly west of the Main Campus along Woodhall Avenue, Keswick Street, and Atron Avenue.

A map showing the location of the Project and the nearby residential uses is included in Appendix G of this IS/MND.

Project Impacts

Artificial Light

An adverse impact would occur if a project created a substantial new source of artificial light that would adversely affect the surrounding area. Artificial light may be generated from individual (i.e., point) sources as well as from indirect sources of reflected light. Uses such as residences, hospitals, and hotels are considered light sensitive since they are typically occupied by persons who are subject to disturbance by bright light sources during evening hours.

The North Campus portion of the Project will include new lighting for the athletic fields and supporting facilities and parking areas, to include eight stadium light standards ranging in height from 70 to 90 feet, with the 70-foot light standards located along the perimeter of left and right outfields, and with 80- and 90-foot light standards along Saticoy Street and adjacent to the new surface parking lot. In addition, four 40-foot-high light standards would be placed near the outdoor pool. The lighting for the North Campus would be subject to the same restrictions as the existing lighting on the Main Campus. Therefore, the new lights on the North Campus would be turned off by 11:00 PM on game nights and by 9:00 PM for practices. Low-level security lighting would be provided on all nights.

As discussed above, light is regularly generated on the Main Campus, including from lighted sporting events (e.g., athletic meets and games, etc.) and vehicle travel (e.g., student pick-up/drop-off). The existing Conditional Use Permit requires existing athletic lighting on the Main Campus to be turned off by 11:00 PM on game nights and by 9:00 PM for practices. Low-level security lighting is provided on all nights. No changes are proposed to the existing lighting on the

Main Campus, and the allowable hours for the existing lighting for athletic events would also remain unchanged.

A Technical Lighting Analysis (included in Appendix A of this IS/MND) was prepared to assess the lighting impacts associated with the new athletic fields and supporting facilities on the proposed North Campus. As discussed in the Technical Lighting Analysis, the existing uses on the proposed North Campus site currently emit very low light levels with minimum light spill onto immediately adjacent residential properties and greater spill into adjacent public rights-of-way.

The following thresholds are used in the Technical Lighting Analysis to determine the impacts of the proposed improvements on the North Campus:

- Maximum Intensity: Section 93.0117 of the Los Angeles Municipal Code (LAMC), "Lighting Impacting Residential Property," states that "No person shall construct, establish, create, or maintain any stationary exterior light sources that may cause [property containing a residential unit] to...receive direct glare from the light source." Direct glare is defined as glare "resulting from high luminance or insufficiently shielded light sources that is in the field of view." There is an exemption from the above restriction for tennis court exterior lighting provided that the luminaire has a light intensity of less than 25,000 cd/m2. Because the LAMC does not contain a metric for any other sports facility, the Technical Lighting Analysis applies the cutoff metric of 25,000 cd/m2 to the Project's sporting field and facilities.

- Light Spill: Section 93.0117 of the LAMC states that "Light Sources shall be designed and maintained so as to produce not more than two footcandles of illumination as measured at the property line of the nearest residentially zoned property..."

Lighting design analysis for the proposed sport field and adjacent pool was conducted by the proposed lighting manufacturer. The proposed lighting design for the sports field calls for eight poles supporting sport lighting equipment surrounding the recreational field. These poles would range in height from 70 feet to 90 feet and contain between five and ten directional luminaires per pole. These luminaires are mounted at varying heights and range from 500 watts to 1,430 watts. Additionally, four smaller poles are proposed to be located at the exterior pool. These poles would range in height from 40 feet to 50 feet and contain three luminaires each. These luminaires range in wattage from 400 watts to 580 watts. All proposed luminaires are light emitting diode (LED) with a standard 5700K color temperature, 75CRI, and estimated lifespan of L90 >120,000hrs.

Maximum intensity was calculated by the manufacturer to capture potential brightness and glare. Calculation points were placed along Saticoy Street, which bounds the North Campus property to the south and west, with the points specifically located on the sidewalk across the right-of-way and closest to the existing residential uses. Calculation points were also placed along the north property line of the North Campus, abutting the existing residential properties. The maximum intensity values for the proposed design are 11,448 candelas (cd) and 24,736 cd at the Saticoy

Street and northern property lines, respectively. These values both fall below the established threshold of significance for maximum intensity of 25,000cd/m2.

The anticipated illuminance, both horizontal and vertical, along the various property lines was reported by the manufacturer to capture potential spill light. Additionally, horizontal illuminance calculation points were placed extending beyond the property line to the north to capture potential spill light onto the adjacent residential properties. These calculation points were placed at grade with a spacing of five feet by five feet, extending approximately 160 feet to the north of the property line. The maximum spill light value along Saticoy Street is 0.72 footcandles (fc), whereas the maximum light spill to the north of the Project Site is 1.9 fc. These values fall below the threshold of significance of 2.0 fc of illumination at the property line of the nearest residentially-zoned property.

In conclusion, the proposed sports lighting design for the North Campus does demonstrate an increase in both spill light and maximum intensity in comparison to the existing lighting conditions at the North Campus. However, the proposed design does not exceed the threshold of significance outlined for maximum intensity nor does it exceed the threshold for spill light for the land immediately adjacent to the North Campus property lines. In addition, as discussed above, there would be no changes to the existing sports lighting on the Main Campus. Therefore, Project impacts with respect to lighting would be less than significant.

Glare

An adverse impact would occur if a project created a substantial new source of glare that would adversely affect day or nighttime views in the area. Glare is a common phenomenon in the Southern California area due mainly to the occurrence of a high number of days per year with direct sunlight and the highly urbanized nature of the region, which results in a large concentration of potentially reflective surfaces. Potential reflective surfaces in the Project vicinity include automobiles traveling and parked on streets or in surface parking lots, exterior building windows, and surfaces of brightly painted buildings. Glare currently exists at the Project Site from windows of the existing buildings as well as automobiles parked in the surface parking lots. The Project would provide a similar amount of glare as currently exists at the Project Site (from the windows of the new buildings as well as automobiles parked in the proposed surface parking lots). In addition, all exterior windows and glass used on Project building surfaces would be non-reflective or treated with an anti-reflective coating to minimize glare. Therefore, glare from the Project Site would be similar to the existing uses, and the Project would not create a substantial new source of glare, and this impact would be less than significant.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. However, like the Project, any other development projects would be subject to applicable development standards, which results in individual review of the visual character of each project, to ensure consistency with design standards and that individual projects are compatible with existing land uses.

Therefore, although development of the Project in combination with other development projects could result in a general intensification of land uses in an already urbanized area of the City, the Project would not combine with any other development projects to generate a significant cumulative impact with respect to scenic vistas, views, or visual character.

As it relates to light and glare, development of the Project in combination with other development projects could result in an intensification of land uses in an already urbanized area of the City that currently maintains an elevated level of ambient light and glare. As such, the Project and any other development projects could contribute to ambient light levels within the surrounding area. However, this is a heavily urbanized area and the presence of additional nighttime illumination resulting from the Project or any other development projects would not represent a substantial alteration to the existing nighttime visual environment. For these reasons, cumulative aesthetics impacts would be less than significant.

II. AGRICULTURE AND FORESTRY RESOURCES

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d. Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. A significant impact may occur if a project were to result in the conversion of State-designated agricultural land from agricultural use to another non-agricultural use. The California Department of Conservation, Division of Land Protection, lists Prime Farmland, Unique Farmland, and Farmland of Statewide Importance under the general category of "Important Farmland" in California. While the existing high school campus is zoned A1-1 and RS-1, the high school has been at its current location on the Main Campus since the 1960s. In addition, the North Campus is currently zoned [Q]C1-1VL and P-1VL and is developed with a shopping center and associated surface parking. The Site is designated Urban and Built-up Land and is not included in the Prime Farmland, Unique Farmland, or Farmland of Statewide Importance category.[2] Therefore, no impact would occur.

b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. A significant impact may occur if a project were to result in the conversion of land zoned for agricultural use or under a Williamson Act Contract from agricultural use to non-agricultural use. The Williamson Act of 1965 allows local governments to enter into agreements with local landowners with the purpose of trying to limit specific parcels of land to agricultural or other related open space use.[3] No Williamson Act contract applies to the Project Site. While the Main Campus is zoned A1-1 and RS-1, the high school has operated on this Site since the 1960s. The North Campus is zoned [Q]C1-1VL and P-1VL. Therefore, no impact would occur.

c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. A significant impact may occur if a project were to cause the rezoning of forest land or timberland. The Project Site is currently zoned A1-1 and RS-1 (Main Campus) and [Q]C1-1VL and P-1VL (North Campus) and is not zoned for forest land or timberland. Therefore, no impact would occur.

d. Result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. A significant impact may occur if a project were to result in the loss of forest land or the conversion of forest land to a non-forest use. The Project Site is currently zoned A1-1 and

[3] State of California Department of Conservation, Williamson Act Program, website: http://www.conservation.ca.gov/dlrp/lca/Pages/index.aspx, accessed June 2, 2023.

RS-1 (Main Campus) and [Q]C1-1VL and P-1VL (North Campus) and is developed with the existing high school campus and shopping center with associated surface parking. The Project Site is not used as forest land, and therefore, the Project would not result in the loss of forest land or conversion of forest land to non-forest use, and no impact would occur.

e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact. A significant impact may occur if a project results in the conversion of farmland to another non-agricultural use or conversion of forest land to non-forest use. The Project Site is in an urbanized area of the City and the Project Site is currently developed with the existing high school campus (Main Campus) and shopping center (North Campus). The Project Site does not contain any agricultural or forest land. As such, the Project would not result in the conversion of farmland to a non-agricultural use or the conversion of forest land to a non-forest use, and no impact would occur.

Cumulative Impacts

As described above, the Project would not result in any impacts related to agricultural and forestry resources, and the Project area is developed with urban land uses. In addition, no related projects have been identified within one-half mile of the Project Site. Therefore, no cumulative impacts would occur with respect to agricultural and forestry resources.

III. AIR QUALITY

Where available, the significance criteria established by the South Coast Air Quality Management District (SCAQMD) may be relied upon to make the following determinations.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c. Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☐	☒

The analysis in this section is based on the following, which is included in Appendix B of this IS/MND:

- Air Quality and Greenhouse Gas Emissions Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023.

Regulatory Framework

Federal

Clean Air Act

The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, the United States Environmental Protection Agency (USEPA) is responsible for implementing some portions of the CAA (e.g., certain mobile source and other requirements). Other portions of the CAA (e.g., stationary source requirements) are implemented by state and local agencies. In California the California Clean Air Act (CCAA) is administered by the California Air Resources Board (CARB) at the state level and by the air quality management districts and air pollution control districts at the regional and local levels.

The CAA governs the establishment, review, and revision, as appropriate, of the National Ambient Air Quality Standards (NAAQS), which provide protection for the nation's public health and the environment. NAAQS are based on quantitative characterizations of exposures and associated risks to human health and the environment. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress towards attainment and the incorporation of additional sanctions for failure to attain or to meet interim milestones. NAAQS have been established for seven major air pollutants: carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), $PM_{2.5}$ (particulate matter, 2.5 microns), PM_{10} (particulate matter, 10 microns), sulfur dioxide (SO_2), and lead (Pb).

The CAA requires USEPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant based on whether the NAAQS have been achieved. The federal standards are shown in Table III-1. USEPA has classified the Los Angeles County portion of the South Coast Air Basin (Basin) as a nonattainment area for O_3, $PM_{2.5}$, and lead.

Table III-1
State and Federal Ambient Air Quality Standards and Attainment for L.A. County

Pollutant	Averaging Period	California		Federal	
		Standard	Attainment Status	Standard	Attainment Status
Ozone – O_3	1-hour	0.09 ppm (180 µg/m^3)	Non-attainment	-	-
	8-hour	0.070 ppm (137 µg/m^3)	Non-attainment	0.070 ppm (137 µg/m^3)	Non-attainment
Respirable Particulate Matter – PM_{10}	24-hour	50 µg/m^3	Non-attainment	150 µg/m^3	Attainment
	Annual Arithmetic Mean	20 µg/m^3	Non-attainment	-	-
Fine Particulate Matter – $PM_{2.5}$	24-hour	-	-	35 µg/m^3	Non-attainment
	Annual Arithmetic Mean	12 µg/m^3	Non-attainment	12 µg/m^3	Non-attainment
Carbon Monoxide – CO	1-hour	20 ppm (23 mg/m^3)	Attainment	35 ppm (40 mg/m^3)	Attainment
	8-hour	9.0 ppm (10 mg/m^3)	Attainment	9 ppm (10 mg/m^3)	Attainment
Nitrogen Dioxide – NO_2	1-hour	0.18 ppm (338 µg/m^3)	Attainment	100 ppb (188 µg/m^3)	Attainment
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	Attainment	53 ppb (100 µg/m^3)	Attainment

Table III-1
State and Federal Ambient Air Quality Standards and Attainment for L.A. County

Pollutant	Averaging Period	California		Federal	
		Standard	Attainment Status	Standard	Attainment Status
Sulfur Dioxide – SO_2	1-hour	0.25 ppm (655 µg/m^3)	Attainment	75 ppb (196 µg/m^3)	Attainment
	24-hour	0.04 ppm (105 µg/m^3)	Attainment	-	-
Lead – Pb	30-day average	1.5 µg/m^3	Attainment	-	-
	Calendar Quarter	-	-	0.15 µg/m^3	Non-attainment

State

California Clean Air Act

In addition to being subject to the requirements of the CAA, air quality in California is also governed by more stringent regulations under the CCAA. In California the CCAA is administered by CARB at the state level and by the air quality management districts and air pollution control districts at the regional and local levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for meeting the state requirements of the CAA, administering the CCAA, and establishing the California Ambient Air Quality Standards (CAAQS). The CCAA, as amended in 1992, requires all air districts in the State to achieve and maintain the CAAQS. CAAQS are generally more stringent than their corresponding NAAQS and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. CAAQS define clean air: they represent the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment.

The CCAA requires CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS thresholds have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the non-desert Los Angeles County portion of the Basin is designated as a nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The State standards and attainment/non-attainment are also shown in Table III-1, above.

California Air Toxics Program

CARB's Air Toxics Program was established in 1983 in response to the adoption of AB 1807, the Toxic Air Contaminant Identification and Control Act. AB 1807 directs CARB and the State Office of Environmental Health Hazard Assessment (OEHHA) to identify toxic air contaminants (TACs) and determine whether any regulatory action is necessary to reduce their risks to public health. Substances formally identified as TACs include diesel particulate matter and environmental tobacco smoke.

Air Quality and Land Use Handbook

Released by CARB in 2005, the *Air Quality and Land Use Handbook: A Community Health Perspective* provides recommendations regarding the siting of new sensitive land uses near potential sources of TACs (e.g., freeways, distribution centers, rail yards, ports, refineries, chrome plating facilities, dry cleaners, and gas stations), as well as the siting of new TAC sources in proximity to existing sensitive land uses.[4] The recommendations are advisory and should not necessarily be interpreted as defined "buffer zones"; if a project or sensitive land uses are within the siting distance, CARB recommends further analysis.

Regional

South Coast Air Quality Management District

The Project Site is located within the 6,745-square-mile South Coast Air Basin (Basin). The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. It is bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east; and the San Diego County line to the south. The South Coast Air Quality Management District (SCAQMD) is the agency principally responsible for air pollution control in the Basin. Specifically, SCAQMD is responsible for planning, implementing, and enforcing programs designed to attain and maintain CAAQS established by CARB and NAAQS established by the USEPA. All projects in the SCAQMD jurisdiction are subject to SCAQMD rules and regulations, including, but not limited to, the following:

- Rule 401 Visible Emissions: This rule prohibits air discharge that results in a plume that is as dark as or darker than what is designed as No. 1 Ringelmann Chart by the United States Bureau of Mines for an aggregate of three minutes in any one hour.

- Rule 402 Nuisance: This rule prohibits the discharge of "such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of people or the public, or which endanger the comfort, repose, health or safety of

[4] CARB, Air Quality and Land Use Handbook, A Community Health Perspective, April 2005.

any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."

- Rule 403 Fugitive Dust: This rule mandates that projects reduce the amount of particulate matter entrained in the ambient air as a result of fugitive dust sources by requiring actions to prevent, reduce, or mitigate fugitive dust emissions from any active operation, open storage pile, or disturbed surface area.

2022 Air Quality Management Plan

The 2022 Air Quality Management Plan (2016 AQMP) was adopted in December 2022 and represents the most updated regional blueprint for achieving federal air quality standards. It relies on emissions forecasts based on demographic and economic growth projections provided by the Southern California Association of Governments' (SCAG) 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020-2045 RTP/SCS).

Southern California Association of Governments

SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties that is tasked with addressing regional issues relating to transportation, the economy, community development, and the environment. As the federally designated Metropolitan Planning Organization (MPO) for the six-county Southern California region, SCAG is required by law to ensure that transportation activities conform to, and are supportive of, regional and state air quality plan goals to attain NAAQS. Additionally, SCAG is a co-producer, along with the SCAQMD, of the transportation strategy and transportation control measure sections of the Basin's AQMP. The 2020-2045 RTP/SCS (Connect SoCal), SCAG's latest long-range plan, continues to recognize that transportation investments and future land use patterns are inextricably linked, and acknowledges how this relationship can help the region make choices that sustain existing resources while expanding efficiency, mobility, and accessibility for people across the region. In short, the 2020-2045 RTP/SCS offers a blueprint for how Southern California can grow more sustainably. To this end, the 2020-2045 RTP/SCS land use pattern continues the trend of focusing new housing and employment in the region's High Quality Transit Areas (HQTAs) and aims to enhance and build out the region's transit network. At the time of the 2016-2040 RTP/SCS, HQTAs accounted for just 3 percent of total land in the SCAG region, but they are projected to accommodate 46 percent of the region's future household growth and 55 percent of the region's future employment growth by 2040.[5] HQTAs are a cornerstone of land use planning best practice in the SCAG region, and studies by the California Department of Transportation, the USEPA, and the Metropolitan Transportation Commission have found that

[5] SCAG, Final 2016-2040 RTP/SCS, April 2017. HQTAs are defined as areas within one-half mile of a fixed guideway transit stop or a bus transit corridor where buses pick up passengers at a frequency of every 15 minutes or less during peak commuting hours.

focusing development in areas served by transit can result in local, regional, and statewide benefits including reduced air pollution and energy consumption.

Local

City of Los Angeles General Plan Air Quality Element

The City's General Plan Air Quality Element identifies policies and strategies for advancing the City's clean air goals. The Air Quality Element acknowledges the interrelationships among transportation and land use planning in meeting the City's mobility and air quality goals. The Air Quality Element includes six key goals:

Goal 1: Good air quality in an environment of continued population growth and healthy economic structure.

Goal 2: Less reliance on single-occupant vehicles with fewer commute and non-work trips.

Goal 3: Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand management techniques.

Goal 4: Minimize impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality.

Goal 5: Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels and the implementation of conservation measures including passive measures such as site orientation and tree planting.

Goal 6: Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution.

Pollutants and Effects

State and Federal Criteria Pollutants

Air quality is measured by the ambient air concentrations of seven pollutants that have been identified by the USEPA due to their potentially harmful effects on public health and the environment. These "criteria air pollutants" include carbon monoxide, ground-level ozone, nitrogen dioxide, sulfur dioxide, particulate matter ten microns or less in diameter, particulate matter 2.5 microns or less in diameter, and lead. The following descriptions of each criteria air

pollutant and their health effects are based on information provided by the USEPA and the SCAQMD.[6,7]

Carbon Monoxide – CO

CO is a colorless and odorless gas that is released when something is burned. Outdoors, the greatest sources of CO are cars, trucks, and other vehicles or machinery that burn fossil fuels. Unvented kerosene and gas space heaters, leaking chimneys and furnaces, and gas stoves can release CO and affect air quality indoors. Breathing air with elevated concentrations of CO reduces the amount of oxygen that can be transported via the blood stream and can lead to weakened heart contractions; as a result, CO inhalation can be particularly harmful to people with chronic heart disease. At moderate concentrations, CO inhalation can cause nausea, dizziness, and headaches. High concentrations of CO may be fatal; however, such conditions are not likely to occur outdoors.

Ozone – O_3

O_3 is a colorless gas that is formed when volatile organic compounds (VOCs) and nitrogen oxides (NO_X) undergo slow photochemical reactions in the presence of ultraviolet sunlight. The greatest source of VOC and NO_X emissions is automobile exhaust. O_3 concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperatures are favorable to its formation. Elevated levels of O_3 irritate the lungs and airways and may cause throat and chest pain, as well as coughing, thereby increasing susceptibility to respiratory infections and reducing the ability to exercise. Effects are more severe in people with asthma and other respiratory ailments. Long-term exposure may lead to the scarring of lung tissue and reduced lung efficiency.

Nitrogen Dioxide – NO_2

NO_2 is primarily a byproduct of fossil fuel combustion and is therefore emitted by automobiles, power plants, and industrial facilities. The principal form of nitrogen oxide produced by fossil fuel combustion is nitric oxide (NO), which reacts quickly to form NO_2, creating the mixture of NO and NO_2 commonly called NO_X. NO_2 absorbs blue light and results in reduced visibility and a brownish-red cast to the atmosphere. NO_2 also contributes to the formation of PM_{10}. Nitrogen oxides irritate the nose and throat and increase susceptibility to respiratory infections, especially in people with asthma. Longer exposures to elevated concentrations of NO_2 may even contribute to the development of asthma. The principal concern of NO_X is as a precursor to the formation of ozone.

[6] USEPA, Criteria Air Pollutants, www.epa.gov/criteria-air-pollutants.

[7] SCAQMD, Final 2012 Air Quality Management Plan, February 2013.

Sulfur Dioxide – SO_2

Sulfur oxides (SO_X) are compounds of sulfur and oxygen molecules. SO_2 is the pre-dominant form found in the lower atmosphere and is a product of burning sulfur or sulfur-containing materials. Major sources of SO_2 include power plants, large industrial facilities, diesel vehicles, and oil-burning residential heaters. SO_2 may aggravate lung diseases, especially bronchitis. It also constricts breathing passages, especially in asthmatics and people involved in moderate to heavy exercise. SO_2 may cause wheezing, shortness of breath, and coughing. High levels of particulates appear to worsen the effect of SO_2, and long-term exposure to both pollutants leads to higher rates of respiratory illnesses.

Particulate Matter (PM_{10} and $PM_{2.5}$)

The human body naturally prevents the entry of larger particles into itself. However, smaller particles less than 10 microns (PM_{10}) or even less than 2.5 microns ($PM_{2.5}$) in diameter can enter the body and become trapped in the nose, throat, and upper respiratory tract. Here, these particulates may aggravate existing heart and lung diseases, affect the body's defenses against inhaled materials, and damage lung tissue. Those most sensitive to PM_{10} and $PM_{2.5}$ include children, the elderly, and those with chronic lung and/or heart disease.

Lead – Pb

Airborne lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Smelting and other metal processing activities are the primary sources of lead emissions. The lead effects most commonly encountered in current populations are neurological effects in children and cardiovascular effects in adults (e.g., high blood pressure and heart disease). Infants and young children are especially sensitive to even low levels of lead, which may contribute to behavioral problems, learning deficits, and lowered IQ.

Toxic Air Contaminants

Toxic air contaminants (TACs) refer to a diverse group of "non-criteria" air pollutants that can affect human health but have not had ambient air quality standards established for them. This is not because they are fundamentally different from the pollutants discussed above, but because their effects tend to be local rather than regional. CARB and OEHHA determine if a substance should be formally identified, or "listed," as a TAC in California. A complete list of these substances is maintained on CARB's website.[8] SCAQMD has not set regulatory guidance for TACs concerning construction sites or established localized or regional thresholds for their emissions.

One key TAC is diesel particulate matter (diesel PM), which is emitted in diesel engine exhaust. Released in 2021 by the SCAQMD, the Multiple Air Toxics Exposure Study V (MATES V) determined that about 88 percent of the carcinogenic risk from air toxics in the Basin is attributable

[8] CARB, Toxic Air Contaminant Identification List, www.arb.ca.gov/toxics/id/taclist.htm, last reviewed by CARB July 18, 2011.

to mobile source emissions. Of the three carcinogenic TACs that constitute the majority of the known health risk from motor vehicle traffic – diesel PM from primarily trucks, and benzene and 1,3-butadiene from passenger vehicles – diesel PM is responsible for the greatest potential cancer risk from vehicle traffic.[9] Overall, diesel PM was found to account for, on average, about 50 percent of the air toxics risk in the Basin.[10] In addition to its carcinogenic potential, diesel PM also may contribute to increased respiratory and cardiovascular hospitalizations, worsened asthma and other respiratory symptoms, decreased lung function in children, and premature death for people already with heart or lung disease. Those most vulnerable to the non-cancer health effects of diesel PM are children whose lungs are still developing and the elderly who may have other chronic health problems.[11]

Volatile Organic Compounds

Volatile organic compounds (VOCs) are typically formed from the combustion of fuels and/or released through the evaporation of organic liquids. Some VOCs are also classified by the state as toxic air contaminants, though there are no VOC-specific ambient air quality standards. Once emitted, VOCs can mix in the air with other pollutants (e.g. NO_X, CO, SO_2…) and contribute to the formation of photochemical smog.

Existing Conditions

As discussed earlier, the Project is located within the 6,745-square-mile South Coast Air Basin that includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. Air quality within the Basin is influenced by a wide range of emissions sources, such as dense population centers, heavy vehicular traffic, and industry. These sources in addition to the topography and climate of Southern California combine to make the Basin an area of high air pollution potential. Particularly, ambient pollution concentrations recorded in the Los Angeles County portion of the Basin are among the highest in the four counties comprising the Basin. The USEPA has classified Los Angeles County as a nonattainment area for O_3, $PM_{2.5}$, and lead, meaning that the Basin does not meet NAAQS for these pollutants. Additionally, this portion of the Basin also does not meet CAAQS for O_3, PM_{10}, and $PM_{2.5}$. Table III-1, above, summarizes State and National Ambient Air Quality Standards and the attainment status for Los Angeles County with respect to each criteria pollutant.

Air Quality Monitoring Data

The SCAQMD monitors air quality conditions at 38 source receptor areas (SRAs) throughout the Basin. The Project is located in SCAQMD's SRA No. 6, "West San Fernando Valley." Table III-2 shows pollutant levels, State and federal standards, and the number of exceedances recorded in

[9] CARB, Air Quality and Land Use Handbook: A Community Health Perspective, April 2005.

[11] CARB, Overview: Diesel Exhaust & Health, ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health.

SRA No. 6 from 2019 through 2021. As shown, the one-hour State standard for O_3 was exceeded 6 times during this three-year period, and the federal standard was exceeded 11 times. CO, NO_2, and $PM_{2.5}$ levels did not exceed their respective CAAQS or NAAQS during this period. Data for PM_{10}, SO_2, and lead is not available for this period.

Table III-2
Ambient Air Quality Data – SRA No. 6 "West San Fernando Valley"

Pollutants and State and Federal Standards	Maximum Concentrations and Frequencies of State/Federal Standards Exceedance		
	2019	2020	2021
Ozone – O_3			
Maximum 1-hour Concentration (ppm)	0.101	0.142	0.110
Days > 0.09 ppm (State 1-hour standard)	1	14	4
Days > 0.070 ppm (Federal 8-hour standard)	6	49	31
Carbon Monoxide – CO			
Maximum 1-hour Concentration (ppm)	2.6	2.0	2.6
Days > 20 ppm (State 1-hour standard)	0	0	0
Maximum 8-hour Concentration (ppm)	2.2	1.7	1.9
Days > 9.0 ppm (State 8-hour standard)	0	0	0
Nitrogen Dioxide – NO_2			
Maximum 1-hour Concentration (ppb)	0.0644	0.0572	0.0542
Days > 0.18 ppm (State 1-hour standard)	0	0	0
PM_{10}			
Maximum 24-hour Concentration (µm/m^3)	N/A	N/A	N/A
Days > 50 µg/m^3 (State 24-hour standard)	N/A	N/A	N/A
$PM_{2.5}$			
Maximum 24-hour Concentration (µg/m^3)	30.00	27.60	55.50
Days > 35 µg/m^3 (Federal 24-hour standard)	0	0	3
Sulfur Dioxide – SO_2			
Maximum 24-hour Concentration (ppb)	N/A	N/A	N/A
Days > 0.04 ppm (State 24-hour standard)	N/A	N/A	N/A
Lead - Pb			
Maximum Monthly Average Concentration (µg/m^3)	N/A	N/A	N/A
Maximum 3-Month Rolling Averages (µg/m^3)	N/A	N/A	N/A

N/A = data not available
ppm = parts per million of air, by volume
µg/m^3 = micrograms per cubic meter

Existing Health Risk

The Multiple Air Toxics Exposure Study V (MATES V) is the latest air toxics monitoring and evaluation study conducted in the Air Basin. In short, MATES V is a modeling effort to characterize

risk from air toxics across the Air Basin. Based on the MATES V model, the calculated cancer risk from air toxics in the Project's zip code (91304) is approximately 301 in one million, which is lower than the Air Basin's average risk of 454 per one million. The air toxics risk in the Project's zip code is less than it is for 84.0% of the population with the air basin.[12]

The OEHHA, on behalf of the California Environmental Protection Agency (CalEPA), provides a screening tool called CalEnviroScreen that identifies which California communities are disproportionately burdened by, and vulnerable to, multiple sources of pollution. The tool ranks census tracts in California based on potential exposures to pollutants, adverse environmental conditions, socioeconomic factors, and prevalence of certain health conditions. According to the Draft CalEnviroScreen 4.0, the Main Campus' census tract is ranked 39th percentile. The tract's pollution-specific burden, irrespective of other factors, is ranked 48th percentile. The North Campus' census tract is ranked 35th percentile, while its pollution-specific burden is ranked 32nd percentile.[13]

Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. Generally speaking, sensitive land uses, or sensitive receptors, are those where sensitive individuals are most likely to spend time. Individuals most susceptible to poor air quality include children, the elderly, athletes, and those with cardiovascular and chronic respiratory diseases. As a result, land uses sensitive to air quality may include schools (i.e., elementary schools or high schools), child care centers, parks and playgrounds, long-term health care facilities, rehabilitation facilities, convalescent facilities, retirement facilities, residences, and athletic facilities. For the purposes of CEQA analyses, the SCAQMD considers a sensitive receptor to be a receptor such as a residence, hospital, or convalescent facility where it is possible that an individual could remain for 24 hours. The SCAQMD does not consider commercial and industrial facilities to be sensitive receptors because employees do not typically remain onsite at such facilities for 24 hours, but are present for shorter periods (such as eight hour shifts). However, the SCAQMD suggests that localized significance thresholds (LSTs) based on shorter averaging periods, such as the NO_2 and CO LSTs, may also be applied to receptors such as commercial and industrial facilities since it is reasonable to assume that workers at these sites may be present for up to eight hours.[14] The Project is located in a residential neighborhood and is surrounded by numerous residential land uses, many of which abut the Main Campus and North Campus sites. For example, single-family homes are located directly north of the North Campus site along Saticoy Street, Melba Street, and

Bobbyboyar Avenue. Single-family homes are also located directly west of the Main Campus along Woodhall Avenue, Keswick Street, and Atron Avenue.

Existing Project Site Emissions

The Main Campus site is currently developed with a private high school campus containing educational, athletic, performing arts, administrative, and religious facilities. The North Campus site is developed with an approximately 53,929 square foot commercial building that contains a grocery store, restaurants, and other commercial uses, as well as surface parking for these uses. Existing emissions related to these uses have been estimated for informational purposes and are shown in Table III-3.

Table III-3
Existing Project Site Regional and Localized Operational Emissions

Emissions Source	Emissions in lbs per day					
	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$

Total Existing Localized Emissions:	**7.46**	**0.09**	**10.38**	**<0.01**	**0.01**	**0.01**

Notes:

[A] "Shopping Plaza with Supermarket" land use assumed the following land use types and sizes in CalEEMod:

- Supermarket – 27,000 square feet
- Strip Mall – 26,929 square feet
- Parking Lot – 3.59 acres

[B] "Private High School" land use assumed the following land use and size in CalEEMod:

- High School – 21.3 acres, 185,324 building square feet.

[C] Some figures may not add up properly due to rounding.

a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. The following analysis assesses the Project's consistency with the SCAQMD 2022 AQMP and SCAG's latest 2020-2045 RTP/SCS. As discussed earlier, the 2022 AQMP's projections for achieving state and federal air quality goals are based on population, housing, and employment trend assumptions in the previous 2020-2045 RTP/SCS, which are themselves largely based on growth forecasts from local governments like the City of Los Angeles; therefore a project is consistent with the 2022 AQMP, in part, if it is consistent with the population, housing, and employment assumptions and smart growth policies that were used in the formation of the AQMP.

The Project's development would not exceed the growth assumptions of the 2020-2045 RTP/SCS and therefore would not result in emissions that are unaccounted for by the 2022 AQMP. This is mainly due to the following key factors. First, the Project would not result in an increase in student enrollment or a substantial change in the operations of the school, as described in greater detail in Section 3, Project Description, of this IS/MND. In addition, due to the removal of the existing supermarket and other commercial uses located on the North Campus property, the Project would result in a net reduction of 1,355 daily trips.[15] Because of this significant reduction in site-related daily trips, the Project would result in a net decrease in operational emissions as compared to existing site uses. This reduction would ultimately aid in the region's attainment of ambient air quality standards. Therefore, the Project would be consistent with the air quality attainment goals of the 2022 AQMP.

City of Los Angeles Policies

In addition to the 2022 AQMP and 2020-2045 RTP/SCS, the City of Los Angeles General Plan Air Quality Element also identifies policies and strategies for advancing the City's clean air goals. As shown below in Table III-4, the Project would be consistent with the applicable policies of the Air Quality Element.

[15] Armen Hovanessian Transportation Consulting, Chaminade College Preparatory School Transportation Assessment Report. April 18, 2023.

Table III-4
Project Consistency with City of Los Angeles General Plan Air Quality Element

Strategy	Project Consistency
Policy 1.3.1 – Minimize particulate emissions from construction sites.	**Consistent.** The Project would minimize particulate emissions during construction through best practices and/or SCAQMD rules.
Policy 1.3.2 – Minimize particulate emissions from unpaved roads and parking lots associated with vehicular traffic.	**Consistent.** The Project would not include the development of any unpaved roads or parking lots. Unpaved areas exposed during grading would comply with SCAQMD fugitive dust regulations to minimize particulate emissions.
Policy 2.1.1 – Utilize compressed work weeks and flextime, telecommuting, carpooling, vanpooling, public transit, and improve walking/bicycling related facilities in order to reduce vehicle trips and/or VMT as an employer and encourage the private sector to do the same to reduce work trips and traffic congestion.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT.
Policy 2.1.2 – Facilitate and encourage the use of telecommunications (i.e., telecommuting) in both the public and private sectors in order to reduce work trips.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips, which would substantially contribute to the Air Quality Element's goals of reducing emissions from vehicle travel.
Policy 2.2.1 – Discourage single-occupant vehicle use through a variety of measures such as market incentive strategies, mode-shift incentives, trip reduction plans, and ridesharing subsidies.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips, which would substantially contribute to the Air Quality Element's goals of reducing emissions from vehicle travel.
Policy 2.2.2 – Encourage multi-occupant vehicle travel and discourage single-occupant vehicle travel by instituting parking management practices.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips, which would substantially contribute to the Air Quality Element's goals of reducing emissions from vehicle travel.
Policy 2.2.3 – Minimize the use of single-occupant vehicles associated with special events or in areas and in times of high levels of pedestrian activities.	**Not Applicable.** The Project would not include any facilities for the types of special events referenced by this policy (e.g., concerts, professional sports, and other ticketed events with large attendance).
Policy 3.2.1 – Manage traffic congestion during peak hours.	**Consistent.** The Project is not estimated to cause or materially contribute to substantial traffic congestion during peak hours. According to the Project's transportation study (included in Appendix H-1 of this IS/MND), during the A.M. peak hour, the Project would result in a net reduction of 2 trips. During the P.M. peak hour, the Project would result in a net increase of 292 trips, but this would not have a substantial effect on level of services and delays at surrounding intersections. Overall, the Project would result in a net reduction of 1,355 daily trips.
Policy 4.1.1 – Coordinate with all appropriate regional agencies on the implementation of strategies for the integration of land use, transportation, and air quality policies.	**Consistent.** The Project is being entitled through the City of Los Angeles, which coordinates with SCAG, Metro, and other regional agencies on the management of land use, air quality, and transportation policies.
Policy 4.1.2 – Ensure that project level review and approval of land use development remains at the local level.	**Consistent.** The Project would be entitled and environmentally cleared at the local City level.

Table III-4
Project Consistency with City of Los Angeles General Plan Air Quality Element

Strategy	Project Consistency
Policy 4.2.3 – Ensure that new development is compatible with pedestrians, bicycles, transit, and alternative fuel vehicles.	**Consistent.** As discussed in the Transportation Assessment (contained in Appendix H-1 of this IS/MND), the Project would not conflict with any bicycle or transit infrastructure. In addition, the Project would include approximately 137 EV spaces and 17 electric vehicle charging stations (EVCS), in addition to other EV infrastructure, and would also provide 78 bicycle parking spaces. Finally, the Project includes the pedestrian bridge over Saticoy Street to connect the North Campus to the Main Campus, allowing students, faculty, staff, and visitors or those parking on the Main Campus for sporting events a safe pedestrian access to the North Campus athletic facilities.
Policy 4.2.4 – Require that air quality impacts be a consideration in the review and approval of all discretionary projects.	**Consistent.** The Project's air quality impacts are analyzed in this document, and as provided herein, all Project impacts with respect to air quality would be less than significant.
Policy 4.2.5 – Emphasize trip reduction, alternative transit and congestion management measures for discretionary projects.	**Consistent.** The Project would result in a net reduction in daily traffic from the Project Site and would be consistent with this policy.
Policy 5.3.1 – Support the development and use of equipment powered by electric or low-emitting fuels.	**Consistent.** The Project would be designed to meet the applicable requirements of the State's Green Building Standards Code and the City's Green Building Code and would include approximately 137 EV spaces and 17 electric vehicle charging stations (EVCS),
Source: Noah Tanski Environmental Consulting (NTEC), May 2023.	

Conclusion

To summarize the analysis in response to Threshold (a): (1) operation of the Project would result in a net reduction of site-related emissions and therefore would not result in new emissions that are unaccounted for by the 2022 AQMP; (2) the Project would result in a substantial net reduction of 1,355 daily trips; and (3) as further discussed under Threshold (b) below, pollutant emissions associated with the Project's construction and operation would neither exceed nor contribute to any exceedance of ambient air quality standards and thresholds, nor would they interfere with the AQMP's attainment of air quality standards or interim emissions reductions. As a result, the Project would not conflict with or obstruct the implementation of any applicable air quality plans, and its impact with respect to Threshold (a) would be less than significant.

b. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Less Than Significant Impact. The Project would contribute to local and regional air pollutant emissions during its construction (short-term) and operations (long-term). However, construction and operation of the Project would not result in exceedances of SCAQMD daily thresholds for project-specific impacts that could subsequently cause cumulatively considerable increases in emissions of pollutants for which the Basin is designated as non-attainment.

Methodology

Construction

Construction of the Project could affect local and regional air quality due to the use of gasoline and diesel-powered construction equipment, as well as the generation of construction vehicle trips. Demolition, grading, and any site preparation activities would also result in fugitive dust emissions. It is important to consider that construction emissions can vary substantially from day to day depending on levels of construction activity, the specific types of construction activities taking place, and the types of vehicles/equipment in use. For dust, the prevailing weather conditions can influence emissions.

Based on the criteria set forth in the SCAQMD CEQA Air Quality Handbook, a project would have the potential to violate an air quality standard or contribute substantially to an existing violation and result in a significant impact with regard to construction emissions if its regional emissions from both direct and indirect construction sources would exceed the threshold levels shown in Table III-5.

SCAQMD localized significance thresholds (LSTs) for one and two-acre project sizes are also included below in Table III-5. To be discussed in greater detail below, the Project would involve a variety of construction activities, some of which would take place on construction footprints that are greater than one acre. Depending on the construction footprint of the specific activity, different LSTs would apply. For example, grading for the North Campus may involve up to one-acre of soil disturbance per day, and the one-acre LST would apply. Demolition of classrooms and a parking lot on the Main Campus would be spread over a 2.75-acre parcel, and the two-acre LST would apply. Additional discussion regarding construction activities and applicable LSTs is included throughout this analysis. LSTs represent the maximum emissions from a project that would not be expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards. LSTs are developed based on the ambient concentrations of a given pollutant for a source receptor and distances to the nearest sensitive receptor. The SCAQMD provides LSTs for NO_X, CO, PM_{10}, and $PM_{2.5}$. The SCAQMD does not provide a LST for SO_2 because land use development projects typically result in negligible construction and long-term operational emissions of this pollutant. Additionally, because VOCs are not a criteria

pollutant, there is no ambient standard or SCAQMD LST for VOCs. However, due to the role that VOCs play in O_3 formation and their classification as a precursor pollutant, a regional emissions threshold has been established. LSTs for the Project were obtained via the SCAQMD's mass rate look-up tables, which are used to determine whether or not a project may generate significant adverse localized air quality impacts.[16] The construction analysis compares the Project's localized emissions with LSTs for one and two-acre project sizes, depending on the construction phase.

Construction emissions were estimated using CalEEMod version 2022. Because the SCAQMD's regional and localized significance thresholds for construction emissions are representative of maximum daily emissions that would not be expected to cause or contribute to an exceedance of the most stringent NAAQS or CAAQS for pollutants, the objective of the analysis is to determine whether the Project's maximum single-day construction emissions would have the potential to exceed these thresholds. The CalEEMod analysis for the Project relies on conservative construction and phasing/overlap assumptions in an effort to conclusively rule out the possibility that threshold exceedances could occur. Construction is a dynamic process and day-to-day emissions can vary widely, even within the same construction phase or subphase. This modeling approach therefore minimizes the potential for inadvertently underestimating daily construction emissions, which are the basis of SCAQMD's air pollutant thresholds.

The modeling also accounts for SCAQMD Rule 403 for fugitive dust, which is a regulatory compliance measure applicable to the Project. SCAQMD Rule 403 contains general requirements applicable to all fugitive dust sources that involve minimizing visible emissions and reducing trackout from site driveways. SCAQMD Rule 403(d)(2) requires all sources to implement "best available control measures" (BACMs) for fugitive dust. The BACMs, which are included in Table 1 of the regulation, require sources to adopt measures such as pre-watering soils prior to cut and fill activities, stabilizing soils during and after cut and fill activities, and stabilizing disturbed soils with water or other stabilizing agents to prevent the generation of visible dust plumes.

[16] SCAQMD, Final LST Methodology, Revised July 2008.

Table III-5
SCAQMD Construction Emissions Thresholds

Criteria Pollutant	Construction Emissions (lbs per day)		
	Regional	Localized[A]	
		1 acre	2 acres
Volatile Organic Compounds – VOCs	75	-	-
Nitrogen Oxides - NO_X	100	103	147
Carbon Monoxide – CO	550	426	644
Sulfur Oxides - SO_X	150	-	-
Respirable Particulates – PM_{10}	150	4	6
Fine Particulates – $PM_{2.5}$	55	3	4

[A] Localized significance thresholds assumed the following:

- 25-meter (82-foot) receptor distance. This is the shortest distance used for analysis in the LST guidance document, and it results in the most stringent emissions thresholds.
- The Project is located in SRA No. 6, "West San Fernando Valley."

Sources: SCAQMD, Air Quality Significance Thresholds, revised March 2023; and, SCAQMD, LST Methodology Appendix C – Mass Rate LST Look-Up Table, October 2009.

Operation

The SCAQMD has also established significance thresholds to evaluate potential impacts associated with long-term project operations. Regional thresholds and LSTs for Project operations are shown below in Table III-6. The analysis utilizes LSTs for a five-acre project size, which is the largest project size utilized for the LST methodology.[17] Operational emissions for the Project were also calculated using CalEEMod version 2022.

Table III-6
SCAQMD Operational Emissions Thresholds

Criteria Pollutant	Operational Emissions (lbs per day)	
	Regional	Localized[A]
Volatile Organic Compounds - VOCs	55	-
Nitrogen Oxides - NO_X	55	221
Carbon Monoxide – CO	550	1,158
Sulfur Oxides - SO_X	150	-
Respirable Particulates – PM_{10}	150	3
Fine Particulates – $PM_{2.5}$	55	2

[A] Localized significance thresholds assumed the following:

- 5-acre project size.
- 25-meter (82-foot) receptor distance. This is the shortest distance used for analysis in the LST guidance document, and it results in the most stringent emissions thresholds.
- The Project is located in SRA No. 6, "West San Fernando Valley."

[17] SCAQMD, Final LST Methodology, Revised July 2008.

Toxic Air Contaminants (Construction and Operation)

Potential TAC impacts are evaluated by conducting a qualitative analysis consistent with the CARB Handbook, followed by a more detailed analysis (i.e., dispersion modeling), as necessary. The qualitative analysis consists of reviewing the Project to identify any new or modified TAC emissions sources. If the qualitative evaluation does not rule out significant impacts from a new source, or modification of an existing TAC emissions source, a more detailed analysis is conducted.

The Office of Environmental Health Hazard Assessment (OEHHA) provides guidance related to the preparation of health risk assessments (HRAs) in the State. However, no guidance has been adopted by the OEHHA which would be applicable to the Project. The OEHHA's latest guidance on this issue was released in February 2015, Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments ("2015 Guidance Manual"). The 2015 Guidance Manual was prepared to assist local air districts in the formulation of their own rules and guidelines surrounding the preparation of HRAs. As stated in the manual's introduction: "The intent in developing [the 2015 Guidance Manual] is to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of existing, new, or modified stationary sources." It notes "The Hot Spots Act requires that each local Air Pollution Control District or Air Quality Management District (hereinafter referred to as District) determine which facilities will prepare an HRA." It acknowledges that "local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation." The Project's construction would not be subject to SCAQMD permitting decisions. Therefore, the OEHHA and its guidance as contained in the 2015 Guidance Manual do not apply concerning whether the Project is obligated to provide a HRA. The decision to require an HRA is at the discretion of the SCAQMD, and the SCAQMD has not published any requirements, recommendations, or guidance endorsing the 2015 Guidance Manual's use for CEQA analysis of potential construction impacts.

Construction

The Project may not be fully implemented until 2035, and there is currently no exact sequence of construction activities or phasing, though it would be necessary for some activities to occur before others. For example, grading of the North Campus would have to occur before construction of the new North Campus athletic and pool facilities, and demolition of existing classroom buildings would have to occur before construction of the new Main Campus Multistory Building.

Table III-7 (which is the same as Table 3-2 in Section 2, Project Description) presents a sequence of the Project's construction activities showing which construction activities/phases may overlap.

The Project would include Project Design Feature 1 (PDF 1), which incorporates this construction sequence.

Table III-7

† Denotes construction activities chosen for detailed construction emissions modeling.
Source: Project Applicant.

The following construction activities are evaluated in detail below in the modeling analysis, on the basis that these represent the most intense activities with the greatest probability of creating emission impacts:

North Campus - Demolition

North Campus - Grading

North Campus – Construction of new athletic fields and ancillary facilities

North Campus - Construction of new pool facilities

Main Campus – Classroom and parking lot demolition (addressed together)

Main Campus – Multistory Building grading

Main Campus – Multistory Building construction

Pollutant emissions for these construction activities were modeled to ascertain the Project's potential to exceed SCAQMD daily regional and localized construction emissions thresholds. The modeled construction activities were chosen because they are the activities that would generate the most pollutant emissions from diesel-powered equipment usage, haul trips, application of architectural coatings, demolition, and fugitive dust.

An exact construction activity schedule or phasing plan has not yet been determined for the Project. Therefore, to achieve a conservative analysis, the construction activities were all modeled with a start date of January 1, 2024. This is a conservative approach as CalEEMod assumes that construction equipment emissions become cleaner over time due to the increased penetration of newer cleaner equipment into statewide fleets. By assuming that all activities begin on January 1, 2024, the modeling does not assume that emissions would benefit from future, cleaner construction equipment.[18] Given the scope of the Project, it is very likely that the majority of construction activities would occur after 2024.

Analysis

North Campus - Demolition

Demolition of existing North Campus improvements would last approximately one month and would require construction equipment such as bulldozers, excavators, and skid steer loaders. As shown in Table III-7, this phase would not overlap with any other construction phases or activities. Unmitigated maximum daily regional and localized emissions from this construction phase are shown in Table III-8 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a one-acre project size, which is the smallest project size used for analysis in the LST guidance document and results in the most stringent emissions thresholds. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and also results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional

[18] For example, according to CARB, Tier 0 (uncontrolled), Tier 1, and Tier 2 off-road diesel vehicles make up one third of the statewide fleet reported to CARB but contributed to 60 percent of NO_X and PM emissions in 2022. CARB's 2022 Amendments to the In-Use Off-Road Diesel-Fueled Fleets Regulations would prohibit this equipment in large fleets by 2028, medium fleets by 2030, and small fleets by 2032, substantially reducing NO_X and PM emissions.

significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

North Campus – Grading

Grading of the North Campus could occur in stages. For example, grading for the proposed surface parking lot, pedestrian bridge abutments/landing, and athletic field facilities may occur prior to grading for the new pool facilities. However, the modeling conservatively assumes that grading of the entire North Campus would occur at once, and that this would last approximately one month. Grading would utilize construction equipment such as graders, excavators, loaders, bulldozers, and rollers.

As shown in Table III-7, grading of the North Campus would not overlap with any other construction phases or activities. Unmitigated maximum daily regional and localized emissions from this construction phase are shown in Table III-9 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a one-acre project size, which is the smallest project size used for analysis in the LST guidance document and results in the most stringent emissions thresholds. Use of this project size is also consistent with the SCAQMD's "Fact Sheet for Applying CalEEMod to Localized Significance Thresholds" document, which concerns the selection of appropriate LSTs for grading activities. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and also results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

Table III-9
North Campus – Grading
Maximum Regional and Localized Daily Construction Emissions (Unmitigated)

Source: Air Quality Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, included in Appendix B of this IS/MND.

North Campus – Construction of new athletic fields and ancillary facilities

This phase would involve installation of field turf and facilities that are ancillary to the athletics field (i.e., bleachers, dugout, batting cage, etc.). Installation of these features could partially overlap. Therefore, the modeling conservatively assumes that all activities associated with the installation of these features would occur simultaneously and last approximately one month. Construction would require equipment such as forklifts, loaders, a roller, and a truck-mounted crane. Unmitigated maximum daily regional and localized emissions from this phase are shown in Table III-10 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a two-acre project size, which is less than the approximately 2.4-acre area in which improvements would occur, and which presents a conservative analysis. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

As shown in Table III-7, this construction phase may overlap with Main Campus demolition, Main Campus grading, and construction of the multistory buildings on the Main Campus. Analysis pertaining to these overlapping phases is included below. As demonstrated, these overlapping construction phases would not generate the necessary emissions to cause exceedances of regional thresholds or LSTs.

Table III-10
North Campus – Construction of New Athletic Fields and Ancillary Facilities

Main Campus –Parking Lot and Classroom Demolition

Parking lot and classroom demolition would occur sequentially (see Table III-7 and PDF 1), but the modeling conservatively assumes that all demolition would occur at once, and that this would last approximately three weeks. Demolition would utilize construction equipment such as bulldozers, excavators, and skid steer loaders. Unmitigated maximum daily regional and localized emissions from this demolition phase are shown in Table III-11 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a two-acre project size, which is less than the 2.75-acre area in which demolition would occur, and which presents a conservative analysis. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

As shown in Table III-7, Main Campus demolition may overlap with the construction of athletic fields and ancillary facilities on the North Campus. Table III-12 demonstrates that overlapping worst-case emissions from Main Campus demolition and construction of athletic fields and ancillary facilities on the North Campus would be well below SCAQMD regional thresholds and LSTs for even the smallest, most conservative one-acre project size.

Main Campus – Multistory Building Grading

Grading for the proposed Multistory Building would last approximately one month and would require construction equipment such as bulldozers, excavators, and skid steer loaders.

Unmitigated maximum daily regional and localized emissions from this grading phase are shown in Table III-13 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a two-acre project size, which is less than the 2.75-acre area in which grading would occur, and which presents a conservative analysis. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

As shown in Table III-7, Main Campus grading may overlap with the construction of athletic fields and ancillary facilities on the North Campus. Table III-14 demonstrates that overlapping worst-case emissions from Main Campus grading and construction of athletic fields and ancillary facilities on the North Campus would be well below SCAQMD regional thresholds and LSTs for even the smallest, most conservative one-acre project size.

Main Campus – Multistory Building Construction

Construction of the proposed Multistory Building would last approximately 18 months, including six months of overlapping architectural coatings activities, which have been incorporated into the modeling. Diesel-fueled construction equipment would include cranes, forklifts, skid steer loaders, welders, and air compressors. Unmitigated maximum daily regional and localized emissions from this building construction and overlapping application of architectural coatings are shown in Table III-15 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a one-acre project size, which is less than the approximately 1.39-acre footprint of the proposed Multistory Building, and which presents a conservative analysis. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

As shown in Table III-7, construction of the Multistory Building may overlap with the construction of athletic fields and ancillary facilities on the North Campus. Table III-16 demonstrates that overlapping worst-case emissions from Main Campus Multistory Building construction and construction of athletic fields and ancillary facilities on the North Campus would be well below

SCAQMD regional thresholds and LSTs for even the smallest, most conservative one-acre project size.

Construction of the Multistory Building may also overlap with construction of the upper-level student quad, renovation of a small surface parking lot along Cohasset Street, and other campus improvements that involve repurposing the existing baseball field as a softball field and renovating administrative offices and buildings. However, these activities would require minimal use of diesel-powered equipment compared to the overlap scenario addressed in Table III-16 and therefore would generate less pollutant emissions. As shown in Table III-16, worst-case overlapping emissions associated with construction of the Multistory Building and the athletic fields would be over 50 percent below the SCAQMD's most stringent regional thresholds and LSTs. Therefore, it is estimated that emissions associated with this second overlap scenario would also be well below SCAQMD thresholds.

Emissions associated with the overlap of Multistory Building construction and the construction of pool facilities on the North Campus are discussed in the following section.

North Campus – Pool Facility Construction

Construction of the proposed pool facility would require approximately two weeks of grading activities followed by seven months of building construction, including one week of overlapping paving activities and two weeks of overlapping architectural coatings activities. Diesel-fueled construction equipment would include bulldozers, skid steer loaders, excavators, rollers, cranes, forklifts, and various paving equipment. Emissions, including overlapping emissions, have been modeled for each of these subphases. Unmitigated maximum daily regional emissions associated with this phase, as well as localized emissions from its subphases, are shown in Table III-17 along with the applicable regional thresholds and LSTs. LSTs for this phase reflect a one-acre project size, which is the smallest project size used for analysis in the LST guidance document and results in the most stringent emissions thresholds. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and also results in the most stringent emissions thresholds. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$.

As noted earlier and shown in Table III-7, construction of the North Campus pool facility may overlap with construction of the Multistory Building on the Main Campus. Construction may also overlap with other Main Campus improvements, such as renovations to existing administrative offices and the conversion of the existing baseball field to a softball field. Table III-18 presents the emissions that may result from overlapping pool facility and Multistory Building construction along with SCAQMD regional thresholds and LSTs. As shown, unmitigated regional construction emissions would not exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions also would not exceed SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$. In addition, the following should be noted. Even though construction of the North Campus pool facility and the Main Campus Multistory Building would occur at two separate locations separated by approximately 700 feet, and even though the construction footprint of these phases would total 2.1 acres, LSTs shown in Table III-18 conservatively reflect a one-acre project size, which, as explained throughout this analysis, results in the most stringent emissions thresholds. A receptor distance of 25 meters (approximately 82 feet) was utilized, which is the shortest distance used for analysis in the LST guidance document and also results in the most stringent emissions thresholds. The fact that the combined localized emissions from construction of the North Campus pool facility and the Main Campus Multistory Building would not exceed these minimum thresholds is conclusive evidence that their overlapping construction would not result in significant localized air quality impacts. Whether construction occurs over one acre, two acres, or ten acres, localized emissions that are less than the SCAQMD's most stringent LSTs for the smallest project size and the smallest receptor distance would result in less than significant impacts. Other renovations occurring at the same time as overlapping North Campus pool facility and Main Campus Multistory Building construction activities would not result in materially greater localized pollutant emissions. For example, as explained earlier, renovations to administrative

offices and buildings would utilize mostly hand tools and electric power tools. Fugitive dust emissions associated with these activities would be nominal, as there would be limited demolition or soil disturbance.

Construction Emissions – Impact Summary and Recommended Mitigation

As demonstrated by the preceding analysis, the Project's unmitigated construction emissions would not exceed SCAQMD regional thresholds or LSTs. As a result, the Project's construction-related emissions impacts on regional and localized air quality would be less than significant.

Despite this less than significant impact, Mitigation Measure AQ-1 is recommended, which would require the use of construction equipment that meets or exceeds the equivalent emissions performance of USEPA Tier 4 Interim standards for off-road engines to the extent such equipment is commercially available. Use of construction equipment that does not meet or exceed the equivalent emissions performance of USEPA Tier 3 standards would be prohibited.

MM AQ-1 All off-road diesel-powered construction equipment shall meet, at a minimum, USEPA Tier 4 Interim off-road emissions standards, or if such equipment is not

commercially available for lease or short-term rental within 50 miles of the Project Site, USEPA Tier 3 off-road emissions standards.

The following Tables III-19 through III-29 show the Project's estimated construction emissions after the implementation of Mitigation Measure AQ-1 and reflect the use construction equipment that meets USEPA Tier 4 Interim off-road emissions standards.

Operation

To ascertain the Project's potential to result in exceedances of SCAQMD regional thresholds or LSTs for operation, emissions associated with operation of the following improvements were estimated:

- 60,760 square feet of net new building area associated with the proposed Multistory Building on the Main Campus;
- 8,494 square feet of net new building area associated with the proposed pool and athletic facilities on the North Campus;
- 4.83 acres of net new campus area associated with the North Campus; and
- North Campus parking lot, pool facility parking lot, and new administrative offices parking lot.

Table III-30 presents the emissions that would result from the operation of these improvements along with SCAQMD regional thresholds and LSTs. As shown, emissions would be far below SCAQMD regional thresholds for VOC, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$. Localized emissions also would be far below SCAQMD LSTs for NO_X, CO, PM_{10}, or $PM_{2.5}$. Emissions from the Project's other improvements (such as the pedestrian bridge, converted softball field, and campus renovations) would be marginal – far less than emissions associated with the aforementioned

improvements that are shown in Table III-30. Therefore, Project operations would not result in exceedances of SCAQMD regional or localized thresholds, and impacts would be less than significant.

Table III-30
Regional and Localized Operational Emissions

Emissions Source	Emissions in lbs per day					
	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Proposed Additions						
Area[A]	2.21	0.03	3.27	<0.01	<0.01	0.01
Energy[B]	0.02	0.38	0.32	<0.01	0.03	0.03
Mobile Sources[C]	3.79	3.47	33.0	0.07	2.21	0.39
Regional Emissions:	6.02	3.88	36.59	0.07	2.24	0.43
Regional Daily Thresholds	55	55	550	150	150	55
Exceed Thresholds?	**No**	**No**	**No**	**No**	**No**	**No**
Localized Emissions:	2.21	0.03	3.27	<0.01	<0.01	<0.01
Localized Significant Thresholds	-	221	1,158	-	3	2
Exceed Threshold?	**-**	**No**	**No**	**-**	**No**	**No**

Notes:

[A] "Area" emissions are those associated with the on-site use of powered equipment.

[B] "Energy" emissions are those associated with electricity and natural gas use for space heating and cooling, water heating, energy consumption, and lighting.

[C] "Mobile Source" emissions are those associated with a project's related vehicle travel. For this Project, mobile source emissions reflect emissions that would be generated by the Project's gross trip generation, namely trips associated with the proposed pool facility. Conservatively, this analysis does not consider the fact that the Project would actually result in a net reduction of 1,355 daily trips.

Source: Air Quality Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, included in Appendix B of this IS/MND.

c. Would the project expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact.

Construction

As discussed above, there is no threshold or guidance on how to evaluate TAC impacts from a single construction project. In general, a review of the SCAQMD emissions thresholds is used, plus a qualitative analysis of potential for risk. The Project's construction emissions would not exceed the SCAQMD's regional significance thresholds. Construction emissions also would not exceed SCAQMD LSTs, meaning that nearby sensitive receptors (located within 25 meters from

the Project) would not be exposed to substantial criteria pollutant concentrations that would present a public health concern.

The primary TAC that would be generated by construction activities is diesel PM, which would be released from the exhaust pipes of diesel-powered construction vehicles and equipment. Health risks from carcinogenic air toxics such as diesel PM are usually quantified in terms of individual cancer risk, which is the likelihood that a person exposed to concentrations of TACs over a 30-year period every day would contract cancer based on standard risk-assessment methodology. The following considerations support that the Project would result in less than significant health risk impacts related to diesel PM emissions. First, construction of the Project would not expose any individual to TAC concentrations every day for 30 years. Buildout of the Project would require approximately three years of construction activities. Further, the Project's most intensive construction phases – i.e., those that would involve the highest utilization of diesel-powered vehicles emitting PM emissions – would be limited in duration. For example, North Campus demolition would last approximately one month, as would North Campus grading. Demolition for the Multistory Building would last approximately three weeks, and grading for this building would last approximately one month.

In addition, the Project's construction activities would be spread across the 25.86 acres that comprise the Main Campus and North Campus sites. This would substantially dilute concentrations of diesel PM at surrounding receptors. As shown earlier, the Project's maximum daily PM emissions, which include exhaust PM, would not exceed applicable regional thresholds and LSTs and will be further reduced by the recommended mitigation to Tier 4 Interim equipment (see Mitigation Measure AQ-1). Further, the maximum daily construction emissions are conservative estimates that are not anticipated every day for the entire duration of construction.

Given these considerations, TAC emissions from the Project's construction equipment would not result in significant health risks.

Operation

As also discussed previously, the Project's operational emissions would not exceed SCAQMD regional significance thresholds or LSTs. Additionally, the Project does not propose typical sources of acutely and chronically hazardous TACs, such as industrial manufacturing processes, automotive repair facilities, or warehouse distribution facilities. As a result, the Project's operations would not warrant the need for a health risk assessment, and this impact would be less than significant.

Regarding CO hotspots, the Project would result in a net reduction of 1,355 daily trips and therefore would not contribute to the levels of traffic congestion and emissions necessary to trigger a potential CO hotspot. Therefore, the Project's potential to expose sensitive receptors to substantial CO concentrations as a result of CO hotspots would be less than significant.

d. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

No Impact. The Project would not result in activities that create objectionable odors and would not include any land uses typically associated with unpleasant odors and local nuisances (e.g., rendering facilities, dry cleaners). The Project would result in the continued operation of the existing high school. As a result, no impact with respect to odors would occur as a result of the Project.

Cumulative Impacts

SCAQMD recommends that any construction-related emissions and operational emissions from individual development projects that exceed the project-specific mass daily emissions thresholds identified above also be considered cumulatively considerable.[19] Individual projects that would not generate emissions in excess of SCAQMD's significance thresholds would not contribute considerably to any potential cumulative impact. SCAQMD neither recommends quantified analyses of the emissions generated by a set of cumulative development projects nor provides thresholds of significance to be used to assess the impacts associated with these emissions. As shown above, the Project's emissions would not exceed any of the SCAQMD's regional or localized significance thresholds. Therefore, the Project's contribution to cumulative air quality impacts would be less than significant.

IV. BIOLOGICAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?	☐	☐	☐	☒
c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

The analysis in this section is based in part on the following, which are included in Appendix C of this IS/MND:

- Protected Tree Report, The Tree Resource, December 7, 2023.
- Biological Technical Memorandum, SWCA Environmental Consultants, January 20, 2023.

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

No Impact. A significant impact would occur if a project would remove or modify habitat for any species identified or designated as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the State or federal regulatory agencies cited above. The Project Site is located in an urbanized and developed area of the City, and is currently developed with a high school (Main Campus) and shopping center and associated surface parking (North Campus). The Project Site does not contain any natural open spaces, act as a wildlife corridor, nor possess any areas of significant biological resource value.[20] No hydrological features are present on the Site and there are no sensitive habitats present. Due to the urbanized nature of the Project Site and surrounding area, the Project Site does not support habitat for candidate, sensitive, or special status species identified in local plans, policies, or regulations by the California Department of Fish and Wildlife (CDFW), the California Native Plant Society (CNPS), or the U.S. Fish and Wildlife Service (USFWS).[21] Therefore, no impact would occur.

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

No Impact. A significant impact would occur if riparian habitat or any other sensitive natural community identified locally, regionally, or by the State and federal regulatory agencies cited would be adversely modified by a project. As discussed above, the Project Site and surrounding area are located in an urbanized setting. No riparian areas or other sensitive natural communities are located on the Project Site. Thus, implementation of the Project would not result in any adverse effect on riparian habitat or other sensitive natural communities, and no impact would occur.

c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. A significant impact would occur if federally protected wetlands, as defined by Section 404 of the Clean Water Act, would be modified or removed by a project. A review of the National

[20] NavigateLA, Significant Ecological Area layer: http://navigatela.lacity.org/navigatela/, accessed June 12, 2023.

[21] Biological Technical Memorandum, SWCA Environmental Consultants, January 30, 2023 (included in Appendix C-2 of this IS/MND).

Wetlands Inventory identified no wetlands or water features on the Project Site. Therefore, no impact would occur.[22]

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant Impact. A significant impact would occur if a project would interfere or remove access to a migratory wildlife corridor or impede the use of native wildlife nursery sites. The Project Site is currently developed with a high school (Main Campus) and shopping center and associated surface parking (North Campus), and does not interfere substantially with the movement of any native resident or migratory birds. The Project Site is located within an urban area that is highly disturbed and does not contain any major water bodies that would contain or support habitat for native resident or migratory bird species. According to the tree report prepared for the Project Site (included as Appendix C-1 of this IS/MND and discussed in greater detail below), the Project would result in the removal of 40 non-protected significant trees and seven non-protected non-significant trees from the Project Site. During Project construction activities, the removal of these trees would comply with the Migratory Bird Treaty Act (MBTA), which regulates vegetation removal during the nesting season to ensure that significant impacts to migratory birds would not occur. To the extent that vegetation removal activities must occur during the nesting season (generally January 15 through August 31), a biological monitor would be present during the removal activities to ensure that no active nests would be impacted. If any active nests are detected, the area would be flagged with a buffer (ranging between 25-50 feet for songbirds and 100 feet for raptors, as determined by the monitoring biologist), and the area would be avoided until the nesting cycle has been completed or the monitoring biologist has determined that the nest is vacated, juveniles have fledged, and there is no second nesting attempt. With compliance with existing regulatory requirements, impacts to nesting and migratory birds would be less than significant.

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance (e.g., oak trees or California walnut woodlands)?

Less Than Significant Impact. A significant adverse impact would occur if a project were inconsistent with local regulations pertaining to biological resources. Local ordinances protecting biological resources are limited to the City of Los Angeles Protected Tree Ordinance, as modified by Ordinance No. 177404. The amended Protected Tree Ordinance provides guidelines for the preservation of all Oak trees indigenous to California (excluding the Scrub Oak or *Quercus dumosa*) as well as the following tree species: Southern California Black Walnut *(Juglans californica var. californica)*; Western Sycamore *(Platanus racemosa)*; and California Bay

[22] U.S. Fish & Wildlife Service, National Wetlands Inventory: http://www.fws.gov/wetlands/data/mapper.HTML, accessed June 12, 2023.

(Umbellularia californica).[23] In addition, in December 2020, Mexican Elderberry (*Sambucus Mexicana*) and Toyon (*Heteromeles arbutifolia*) were added to the class of "protected trees" (Ordinance No. 186873). The tree report prepared for the Project Site (included as Appendix C-1 of this IS/MND) identified the following: 1) 33 parkway street trees; 2) 364 non-protected significant trees with eight-inch diameter at breast height (DBH) or greater on the Project Site; and 3) 108 non-protected non-significant trees (less than eight inches DBH) on the Project Site. None of these trees are protected species as defined by the City's Protected Tree Ordinance. The Project would result in the removal of 40 non-protected significant trees and seven non-protected non-significant trees from the Project Site, and would retain the remaining on-site trees. The Project would also retain the parkway street trees, with the exception of one tree (Street Tree No. 489), which would be removed to construct the pedestrian bridge. The existing significant trees that would be removed as part of the Project would be replaced according to the Urban Forestry Division requirements (the non-significant trees that would be removed would not require replacement). As none of the trees located on the Project Site are protected trees, a less than significant impact would occur.

f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. A significant impact would occur if a project would be inconsistent with policies in any draft or adopted conservation plan. The Project Site is located in an urbanized area of the City, and is currently developed with a high school (Main Campus) and shopping center and associated surface parking (North Campus). There are no identified Significant Ecological Areas (SEAs) within the vicinity of the Project Site,[24] and the Site is not subject to a Habitat Conservation Plan, a Natural Community Conservation Plan, or other such plan.[25] Thus, the Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional, or state habitat conservation plan, and no impact would occur.

Cumulative Impacts

The Project Site is located in an urbanized area that does not contain significant biological resources, such as candidate, sensitive or special status species, riparian habitat, or sensitive natural communities. Further, the Project area is not part of a wildlife corridor or SEA or subject to a Habitat Conservation Plan, a Natural Community Conservation Plan, or other such plan. No related projects have been identified within one-half mile of the Project Site. However, it is assumed that like the Project, any other development projects would also be required to comply with the requirements of the MBTA as well as the City's Protected Tree Ordinance and the City's requirements regarding street tree removal and replacement. Because the Project would not

[23] City of Los Angeles, Ordinance No. 177404, effective April 23, 2006.

[24] NavigateLA, Significant Ecological Area layer: http://navigatela.lacity.org/navigatela/, accessed June 12, 2023.

[25] City of Los Angeles General Plan Conservation Element, Exhibit B2.

result in any impacts related to biological resources, the Project does not have the potential to contribute to any cumulative biological resources impacts. Therefore, cumulative impacts related to biological resources would be less than significant.

V. CULTURAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	☐	☐	☐	☒
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	☐	☒	☐	☐
c. Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☒	☐	☐

The analysis in this section is based in part on the following, which are included in Appendix D of this IS/MND:

- Phase I Historic Assessment, Teresa Grimes Historic Preservation, September 6, 2023.
- Archaeological Resources Technical Memorandum, SWCA Environmental Consultants, March 9, 2023.

a. Cause a substantial adverse change in the significance of a historical resource pursuant to State CEQA Guidelines §15064.5?

No Impact. State CEQA Guidelines Section 15064.5 defines a historical resource as: 1) a resource listed in or determined to be eligible by the State Historical Resources Commission for listing in the California Register of Historical Resources; 2) a resource listed in a local register of historical resources or identified as significant in a historical resource survey meeting certain state guidelines; or 3) an object, building, structure, site, area, place, record or manuscript which a lead agency determines to be significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California, provided that the lead agency's determination is supported by substantial evidence in light of the whole record. A project-related significant adverse effect would occur if a project were to adversely affect a historical resource meeting one of the above definitions.

As the Project involves the demolition of buildings over 45 years of age on both the Main Campus and the North Campus, a Phase I Historic Assessment was prepared (included in Appendix D-1 of this IS/MND) to determine whether the Project would result in any impacts to historical resources. The Phase I Historic Assessment reviewed available sources to determine that none of the existing buildings on either the Main Campus or North Campus are currently listed in the National Register of Historic Places, the California Register of Historical Resources, or as a City

of Los Angeles Historic-Cultural Monument. In addition, none of the existing buildings were identified by SurveyLA as appearing eligible to be designated as a historic resource or otherwise requiring further historic preservation review.

The Phase I Historic Assessment then evaluated the Main Campus and the North Campus to determine whether any buildings had the potential to meet eligibility standards in the *Los Angeles Citywide Historic Context Statement* (*LACHCS*) for listing under federal, state, and local landmark or historic district programs.

Main Campus

The current Main Campus was founded in 1961 (relocated from the school's original site in Cheviot Hills) with buildings constructed in 1961 and 1964, including an administration building, a library, a classroom building, a lab building, a multipurpose building, and a cafeteria. The original buildings on the Main Campus were designed by architects Barker and Ott.

Most of the buildings and structures on the Main Campus are less than 50 years of age and include: a telescope house (later converted into the Fine Arts Building) constructed in 1975; a locker room building constructed in 1975; a classroom building constructed in 1978; the Uribe Sports Center constructed in 1981; bleacher seating constructed in 1988; Marian Hall, a classroom building, constructed 1992; Mundy's, a merchandise sales and storage building, constructed in 1997; the Condon Family Center for Science and Technology constructed in 2005; and the Tutor Family Center for Performing Arts constructed in 2012.

The significance of a property must be evaluated within its historic context(s). Historic contexts are those patterns or trends in history by which a specific property is understood. The *Los Angeles Citywide Historic Context Statement* (*LACHCS*) was used to identify the relevant contexts for judging the significance of the Main Campus. The *LACHCS* is organized into nine broad contexts that cover the period from 1850 to 1980 and are specific to Los Angeles. The most relevant context for the evaluation of the Main Campus is Public and Private Institutional Development. The property's potential to meet the eligibility standards for the associated theme and subthemes within this context is discussed below.

Parochial school campuses may be eligible in the Public and Private Institutional Development Context, in the Education Theme, and in the Educational Development and Campus Planning Subthemes. A narrative for these two subthemes has not been developed yet. According to the Archdiocese of Los Angeles Administrative Handbook, the Catholic school system in Southern California was developed by Bishop Thomas J. Conaty (1847-1915); originating with 19 parochial schools and five academies in 1903 with a total enrollment of 2,895. Founded in 1952, Chaminade College Preparatory does not represent an important aspect of educational development in Los Angeles because it was not among the earliest high schools established. Additionally, it is not significant for an association with West Hills. It was originally located in Cheviot Hills and only moved to West Hills for more space. Furthermore, the campus does not retain the essential physical features from the period of significance, which would be the 1960s when the school

moved to West Hills. Most of the buildings and structures were constructed over the last 50 years. Thus, the campus does not convey a visual sense of an historic environment. For the reasons outlined above, the Main Campus does not meet the eligibility standards for the Educational Development Subtheme.

Likewise, the Main Campus does not meet the eligibility standards for the Campus Planning Subtheme. There appears to have been a master plan for the Main Campus at one time. However, after the first buildings were constructed in 1961 the master plan appears to have been abandoned. Henceforth, buildings and structures were constructed as needed and as funds were available. Therefore, the Main Campus does not possess a significant concentration of buildings and structures united historically or aesthetically by a master plan. Additionally, the individual buildings were not designed in prominent architectural styles of the period and are not important examples of the work of master architects. Barker and Ott was a partnership between Merl Lee Barker (1888-1970) and G. Lawrence Ott (1895- 1975). The partnership began in the 1930s and the Catholic church was a primary client. Other examples of the firm's work include the Mount Carmel High School (1934-35, demolished) and St. Charles Borromeo Church (1937-38); Congregational Church of the Messiah (1953); St. Bernadette Roman Catholic Church (1961), and St. John Baptist de la Salle Church (1969). Barker and Ott may have designed a few noteworthy buildings, but no information was found that they could be considered master architects, which is defined by the National Register as a figure of generally recognized greatness in the field and by the Los Angeles Cultural Heritage Ordinance as a person whose individual genius influenced his or her age.

North Campus

The North Campus is occupied by the West Hills Shopping Center, which includes a main building that was constructed in stages between 1962 and 2004 and surface parking lots. The building is one story in height and is mostly covered by a flat roof surrounded by raised parapets. The most relevant context from the *LACHCS* for the evaluation of the North Campus is Commercial Development. The property's potential to meet the eligibility standards for the associated theme and subtheme within this context is discussed below.

Shopping centers may be eligible in the Commercial Development Context in the Neighborhood Commercial Development Theme and in the Post WWII Neighborhood Shopping Centers Subtheme. The North Campus property, however, does not meet the eligibility standards for this subtheme because it was not originally designed as a shopping center. It was designed as a market and did not evolve into a true shopping center until long after the period of significance (1936-1965) for the subtheme. The building is set back from the street and oriented toward the surface parking lot, but that is true of most commercial buildings from the period.

For most of its history, the property was owned by the Walter H. Leimert Company. While the company played a significant role in the residential development, and to a lesser extent the commercial development, of Los Angeles, the property is not significant for this association. Mere

association is not in and of itself to qualify, the association must be important. The property appears to be one of many developed and owned by the company since its founding in Oakland in 1902. In 1926, Leimert moved the company to Southern California and developed Bellhurst Park in Glendale. The company is best known for the development of Leimert Park in 1928 and would go on to develop Beverlywood, Cheviot Knolls, and Rancho Malibu among other subdivisions. The company was prolific, and the building is not an important example of their work.

Additionally, the property does not meet the eligibility standards for the Markets Subtheme in the Neighborhood Commercial Development Theme. The original portion of the building was constructed as a market during the period of significance (1910-1975) for the subtheme and includes a surface parking lot, but it does not exhibit quality of design through distinctive features that would make it a good example of a type, period, or method of construction. The name of the original architect, if any, is unknown.

The Alpha Beta Acme Market may have been the original tenant; however, the building is not significant for an important association with this company. Alpha Beta Food Markets incorporated in 1929, but the first store opened in Pomona in 1917. In 1961, the company merged with American Stores, operators of Acme Markets on the East Coast, and assumed the name Alpha Beta Acme Markets. As the building does not appear to have been constructed by the company, it is not an example of the store design from the 1960s. When Alpha Beta Acme closed at this location is unclear. The name does not appear at this address in available City Directories after 1965.The demise of the Alpha Beta Acme name began with the 1988 merger of American Stores with Lucky Stores. It has been occupied by West Hills Market, later called Fields Market, since the early 2000s.

The Commercial Merchants, Leaders, and Builders Theme in the Commercial Development Context pertains to people who played a significant role in the commercial history of Los Angeles. Several steps are involved in determining whether a property is significant under this theme. First, the person must be significant within the context commercial development. Second, the property must be associated with the person's productive life. Finally, the property must be compared with other associated properties to identify the best representation of the person's historic contributions. Walter H. Leimert Jr. served as president of the Walter H. Leimert Company from 1960 until his death in 2004. Initially with his father, who died in 1970, and then on his own, Leimert developed Beverly Highlands in the Hollywood Hills, Saint Hubert Wood and Sierra Park in Orange County, and Cambria Pines near Hearst Castle. Leimert Jr. may be significant in the context of residential development but not commercial development. Even if he was, the building does not represent his productive life.

Finally, the Filming Locations Associated with the Motion Picture and Television Broadcasting Industries Theme in the Entertainment Industry Context provides guidance for the evaluation of filming locations as potential historical resources. The existing market on the North Campus has been used as a filming location since the 1990s. The first known film shoot was for the television show ”Seventh Heaven” in 1994. Others have included “Desperate Housewives,” “Criminal

Minds," "NCIS," and "Bones." As properties generally need to achieve significance more than 50 years ago to be considered potential historical resources, the period of significance for the *LACHCS* ends in 1980. Properties associated with events and activities that have occurred since 1973 would need to be of exceptional importance to qualify as historical resources. The North Campus property does not meet the eligibility standards for this theme. It was not an important filming location for an early motion picture; it was not the long-term filming location for any television show, significant or otherwise; it is not an iconic film location; and it has not played an integral role in shaping the narrative of a significant film with a specific influence on the plot or structure.

Conclusion

According to the Phase I Historic Assessment, neither the Main Campus nor the North Campus qualify as historic resources. None of the existing buildings on either the Main Campus or North Campus are currently listed in the National Register of Historic Places, the California Register of Historical Resources, or as a City of Los Angeles Historic-Cultural Monument. In addition, none of the existing buildings were identified by SurveyLA as appearing eligible to be designated as a historic resource or otherwise requiring further historic preservation review. Finally, the properties have no potential to meet the relevant eligibility standards in the LACHCS for listing under federal, state, and local landmark or historic district programs due to a lack of significance and/or integrity. As such, the Project would result in no impact with respect to historic resources.

b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines §15064.5?

Less Than Significant with Mitigation Incorporated. State CEQA Guidelines Section 15064.5 defines significant archaeological resources as resources that meet the criteria for historical resources or resources that constitute unique archaeological resources. A project-related significant impact could occur if a project would significantly affect archaeological resources that fall under either of these categories. According to the archaeological resources technical memorandum (included in Appendix D-2 of this IS/MND), archival research indicated that beginning at least in the mid-1940s, the Project Site (both the Main and proposed North Campuses) was a plowed field associated with agricultural activities. The parcels were graded sometime after 1959 for the construction of the existing high school (Main Campus) and shopping center (North Campus). Archaeological remains associated with prehistoric or historic Native Americans can occur below paved surfaces within developed urban settings. While the California Historic Resources Information System (CHRIS) records search results did not identify any such archaeological resources within the Project Site or vicinity, most of the Project Site was not inspected for archaeological resources before being developed. SWCA (the preparer of the archaeological resources technical memorandum) considers the greater region of the Project Site as having moderate sensitivity for prehistoric or historic Native American archaeological resources. However, the Project Site consists of a comparatively small area within the greater region and has been subject to multiple episodes of ground disturbances. As a result,

archaeological materials once located on the surface or in shallow deposits are very unlikely to have been preserved within the Project Site, and though more deeply buried deposits could exist, SWCA considers the sensitivity for prehistoric and historic Native American archaeological resources to decrease within the Project Site, compared with the surrounding area.

Based on the above considerations, SWCA finds a low potential for encountering prehistoric and Historic period Native American archaeological resources within the Project Site, which is supported by the surficial geology of the Project Site. The likelihood of encountering any cultural resources is further decreased due to the compromised integrity of the physical setting as a result of plowing, as evidenced by past agricultural activities as seen on historic aerial imagery, and the development of the school campus and commercial property. For these reasons, SWCA finds the Project Site has a low sensitivity for containing Historic period (non-Native American) archaeological resources.

The City has established a standard condition of approval to address the inadvertent discovery of archaeological resources. Should archaeological resources be inadvertently encountered, this condition of approval provides for temporarily halting construction activities near the encounter so that the find can be evaluated. An archaeologist shall then assess the discovered material(s) and prepare a survey, study, or report evaluating the impact. The Applicant shall then comply with the recommendations of the evaluating archaeologist, and a copy of the archaeological survey or report shall be submitted to the Department of City Planning. Ground-disturbing activities may resume once the archaeologist's recommendations have been implemented to the satisfaction of the archaeologist. In accordance with the condition of approval, all activities would be conducted in accordance with regulatory requirements. In addition, as discussed further below under "Tribal Cultural Resources," the Project would implement Mitigation Measures MM-TCR-1 through MM-TCR-3 regarding the inadvertent discovery of such resources. With implementation of the City's established condition of approval to address any inadvertent discovery of archaeological resources, as well as MM-TCR-1 through MM-TCR-3, Project impacts would be less than significant.

c. Disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant with Mitigation Incorporated. A project-related significant adverse effect could occur if grading or excavation activities associated with the Project would disturb previously interred human remains. The Project Site is located in an urbanized area, and is developed with an existing high school (Main Campus) and shopping center and associated surface parking (North Campus). No human remains are known to exist at the Project Site, and although unlikely due to the presence of artificial fill soils at the Project Site, there is a possibility that human remains could be encountered during excavation and grading activities. Should human remains inadvertently be encountered, the Project would comply with the City's standard condition of approval for inadvertent discovery of human remains, which states the following:

Human Remains Inadvertent Discovery. In the event that human skeletal remains are encountered at the Project Site during construction or the course of any ground disturbance activities, all such activities shall halt immediately, pursuant to State Health and Safety Code Section 7050.5, which requires that no further ground disturbance shall occur until the County Coroner has made the necessary findings as to the origin and disposition pursuant to California Public Resources Code Section 5097.98. In the event human skeletal remains are discovered during construction or during any ground disturbance activities, the following procedures shall be followed:

Stop immediately and contact the County Coroner:
1104 N. Mission Road
Los Angeles, CA 90033
323-343-0512 (8 a.m. to 5 p.m. Monday through Friday) or
323-343-0714 (After Hours, Saturday, Sunday, and Holidays)

- If the remains are determined to be of Native American descent, the Coroner has 24 hours to notify the Native American Heritage Commission (NAHC).
- The NAHC will immediately notify the person it believes to be the most likely descendent of the deceased Native American.
- The most likely descendent has 48 hours to make recommendations to the owner, or representative, for the treatment or disposition, with proper dignity, of the human remains and grave goods as provided in Public Resources Code Section 5097.98. If the Applicant does not accept the descendant's recommendations, the owner or the descendent may request mediation by the NAHC.

In addition, as discussed further below under "Tribal Cultural Resources," the Project would implement Mitigation Measures MM-TCR-1 through MM-TCR-3 regarding the inadvertent discovery of such resources, including human remains. Compliance with the City's standard condition of approval described above, as well as implementation of MM-TCR-1 through MM-TCR-3, would ensure appropriate treatment of any potential human remains discovered during Project construction activities. Therefore, the Project's impacts on human remains would be less than significant.

Cumulative Impacts

As discussed above, the Project would not result in indirect or direct impacts to any significant historical resource. Thus, the Project would not have the potential to contribute toward any significant cumulative impacts related to historic resources. Impacts related to archaeological resources and human remains are site-specific and are assessed on a site-by-site basis. The Project would implement standard City conditions of approval and would comply with State regulations related to the inadvertent discovery of any archaeological resources and/or human remains, if necessary. In addition, no related projects have been identified within one-half mile of the Project Site. For these reasons, cumulative impacts related to historical resources,

archaeological resources, and human remains would not be cumulatively considerable and less than significant.

VI. ENERGY

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

a. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant. This analysis relies on Appendix F of the CEQA Guidelines, which was prepared in response to the requirement in Public Resources Code Section 21100(b)(3), which states that an EIR shall include a detailed statement setting forth "[m]itigation measures proposed to minimize significant effects of the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy."

In addition, with regard to potential impacts to energy, the *L.A. CEQA Thresholds Guide* states that a determination of significance shall be made on a case-by case basis, considering the following factors:

- The extent to which the project would require new (off-site) energy supply facilities and distribution infrastructure; or capacity-enhancing alterations to existing facilities;
- Whether and when the needed infrastructure was anticipated by adopted plans; and
- The degree to which the project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements.

In accordance with Appendix G and the *L.A. CEQA Thresholds Guide,* the following eight factors will be considered in determining whether this threshold of significance is met:

1. The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed;

2. The effects of the project on local and regional energy supplies and on requirements for additional capacity;

3. The effects of the project on peak and base period demands for electricity and other forms of energy;

4. The degree to which the project complies with existing energy standards;

5. The effects of the project on energy resources;

6. The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives;

7. The degree to which the project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements; and

8. Whether the project conflicts with adopted energy conservation plans.

Each of these factors is discussed in detail below, under "Project Impacts."

Project Impacts

1) The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed.

Construction

Electricity

The Project would have short-term construction impacts, as construction activities would consume relatively minor quantities of electricity to supply and convey water for dust control and, on a limited basis, may be used to power lighting, electronic equipment, and other construction activities necessitating electrical power. This electricity would be supplied to the Project Site by the Los Angeles Department of Water and Power (LADWP) and would be obtained from the existing electrical lines that connect to the Project Site. Where power poles are available, electricity from power poles and/or solar-powered generators rather than temporary diesel or gasoline generators would be used during construction. Moreover, construction electricity usage would replace the electricity usage associated with the existing buildings that would be demolished. Overall, construction activities associated with the Project would require limited electricity generation that would not be expected to have an adverse impact on available electricity supplies.

Natural Gas

Construction activities, including the construction of new buildings, typically do not involve the consumption of natural gas. Accordingly, natural gas would not be supplied to support Project construction activities, and thus there would be no natural gas demand during construction of the Project.

Transportation Energy

Transportation fuels, primarily gasoline and diesel, would be provided by local or regional suppliers and vendors. Project construction contractors would comply with applicable CARB regulations governing the accelerated retrofitting, repowering, or replacement of heavy-duty diesel on- and off-road equipment. CARB has adopted an Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter and other TACs. This measure prohibits diesel-fueled commercial vehicles greater than 10,000 pounds from idling for more than five minutes at any given time. CARB has also approved the Truck and Bus regulation (CARB Rules Division 3, Chapter 1, Section 2025, subsection (h)) to reduce NO_X, PM_{10}, and $PM_{2.5}$ emissions from existing diesel vehicles operating in California; this regulation will be phased in with full implementation by 2023.[26] In addition to limiting exhaust from idling trucks, CARB recently promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower. The regulation aims to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or repowering of older, dirtier engines with newer emission-controlled models. Implementation began January 1, 2014, and the compliance schedule requires that best available control technology turnovers or retrofits be fully implemented by 2023 for large and medium equipment fleets and by 2028 for small fleets. Compliance with the above anti-idling and emissions regulations would result in efficient use of construction-related energy and the minimization or elimination of wasteful and unnecessary consumption of energy. Idling restrictions and the use of newer engines and equipment would result in less fuel combustion and energy consumption, as would use of haul trucks with larger capacities.

Energy Conservation

The Project would utilize construction contractors who demonstrate compliance with applicable CARB regulations governing the accelerated retrofitting, repowering, or replacement of heavy-duty diesel on- and off-road equipment. CARB has adopted an Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter and other TACs. This measure prohibits diesel-fueled commercial vehicles greater than 10,000 pounds from idling for more than five minutes at any given time. CARB has also approved the Truck and Bus regulation (CARB Rules Division 3, Chapter 1, Section 2025,

[26] California Air Resources Board, Final Regulation Order, Amendments to the Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use On-Road Diesel-Fueled Vehicles, http://www.arb.ca.gov/msprog/onrdiesel/documents/tbfinalreg.pdf.

subsection (h)) to reduce NO_X, PM_{10}, and $PM_{2.5}$ emissions from existing diesel vehicles operating in California; this regulation will be phased in with full implementation by 2023.[27] In addition to limiting exhaust from idling trucks, CARB recently promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower. The regulation aims to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or repowering of older, dirtier engines with newer emission-controlled models. Implementation began January 1, 2014, and the compliance schedule requires that best available control technology turnovers or retrofits be fully implemented by 2023 for large and medium equipment fleets and by 2028 for small fleets. Compliance with the above anti-idling and emissions regulations would result in efficient use of construction-related energy and the minimization or elimination of wasteful and unnecessary consumption of energy. Idling restrictions and the use of newer engines and equipment would result in less fuel combustion and energy consumption, as would use of haul trucks with larger capacities.

Operation

During operation of the Project, energy would be consumed for multiple purposes, including, but not limited to HVAC, lighting (including sports lighting for the pool and athletic fields on the North Campus), pool equipment, and the use of electronics, equipment, and machinery. Energy would also be consumed during Project operations related to water usage, solid waste disposal, and vehicle trips. Table VI-1 shows the Project's demand for electricity and Table VI-2 shows the Project's demand for natural gas.

Electricity

Buildout of the Project would result in an increase in the on-site demand for electricity totaling approximately 651,256 kWh per year (refer to Table VI-1). In addition, by 2020, LADWP was required to procure at least 33 percent of their energy portfolio from renewable sources. SB 350 further required 50 percent renewables by 2030. The current sources procured by LADWP include wind, solar, and geothermal sources. These sources accounted for 34.9 percent of LADWP's overall energy mix in 2020.[28] This represents the available off-site renewable sources of energy that would meet the Project's energy demand. Furthermore, the Project would incorporate active energy conservation strategies, such as LED lighting with day-lighting controls and dimming capabilities, and Energy Star light bulbs.

Based on LADWP's 2017 SLTRP, LADWP forecasts that its total energy sales in the 2035-2036 fiscal year (encompassing the Project's 2035 buildout year) is estimated to be approximately

[27] California Air Resources Board, Final Regulation Order, Amendments to the Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use On-Road Diesel-Fueled Vehicles, http://www.arb.ca.gov/msprog/onrdiesel/documents/tbfinalreg.pdf.

[28] LADWP, Power Content Label, https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-power/a-p-powercontentlabel;jsessionid=Ld1LvpwPXtpwfKpfn65sQcnmchNvlX5xNm13hS5WRDKJjWLhY2Vn!455318738?_afrLoop=937924243040778&_afrWindowMode=0&_afrWindowId=null#%40%3F_afrWindowId%3Dnull%26_afrLoop%3D937924243040778%26_afrWindowMode%3D0%26_adf.ctrl-state%3D2q0qi6hk_4, accessed June 6, 2022.

26,320 GWh of electricity[29] As such, the Project-related increase in annual electricity consumption of 651,256 kWh per year would represent approximately 0.0025 percent of LADWP's projected sales in 2035.

Table IV-1
Estimated Project Electricity Demand

Land Use	Size	Total (kw-h/yr)[1]
High School	69,254 sf	489,673
Parking Lot	1.39 acres	53,040
	Subtotal	542,713
	20% Contingency[2]	108,543
	Total	**651,256**

sf = square feet. kw-h = kilowatt-hour yr = year
1 Calculated via CalEEMod. Refer to Appendix B of this IS/MND.
2 A 20 percent contingency factor has been added to account for the pool equipment and the lighting for the new pool and athletic fields on the North Campus.

Natural Gas

Buildout of the Project would result in an increase in the on-site demand of natural gas totaling approximately 1,407,774 kBTU per year (see Table IV-2), or approximately 3,857 cf per day.[30] Based on the 2022 California Gas Report, the California Energy and Electric Utilities estimates natural gas consumption within SoCalGas's planning area will be approximately 1,973 million cf per day in 2035 (the Project's buildout year).[31] The Project would account for approximately 0.0002 percent of the forecasted 2035 consumption in SoCalGas's planning area. In addition, the Project would incorporate a variety of energy conservation measures as required under the City's Green Building Code to reduce energy usage.

[29] 2017 Power Strategic Long-Term Resource Plan, December 2017, LADWP, Appendix A.

[30] Assuming 1 kBTU = 1 cf.

[31] California Gas and Electric Utilities, 2022 California Gas Report, p. 186.

Table IV-2
Estimated Project Natural Gas Demand

Land Use	Size	Total (kBTU/yr)[1]
High School	69,254 sf	1,407,774
Parking Lot	1.39 acres	0
	Total	**1,407,774**

sf = square feet kBTU = 1,000 British Thermal Units yr = year
[1] Calculated via CalEEMod. Refer to Appendix B of this IS/MND. It is not anticipated that natural gas would be required for the pool equipment of lighting for the pool and athletic fields on the North Campus.

Transportation Energy

During operation, Project-related traffic would result in the consumption of petroleum-based fuels related to vehicular travel to and from the Project Site. As noted previously, while the Project includes physical improvements to the existing high school, it would not increase student enrollment beyond the currently permitted maximum student enrollment. In addition, with the removal of the existing shopping center for expansion of the high school into the North Campus, the Project results in the reduction of 1,355 daily trips, which reduce VMT and related GHG emissions.

During Project operations, vehicles traveling to and from the Project Site are also assumed to comply with Corporate Average Fuel Economy (CAFÉ) fuel economy standards. Project-related vehicle trips would also comply with Pavley and Low Carbon Fuel Standards, which are designed to reduce vehicle GHG emissions but would also result in fuel savings in addition to CAFE standards. It is anticipated that the future Project-related vehicle trips are expected to comply with CAFE standards and CARB's Advanced Clean Cars Program, which would ultimately reduce non-renewable transportation fuel consumption. Project-related vehicles would require a negligible fraction of the total state's transportation fuel consumption. The Project would also include approximately 137 EV spaces and 17 EVCS which would encourage the use of alternative-fueled, electric, and hybrid vehicles by students, faculty, and visitors to the Project Site, which would serve to reduce the Project's consumption of gasoline and diesel. Therefore, Project operations would not result in wasteful, inefficient, and unnecessary consumption of energy.

2) The effects of the project on local and regional energy supplies and on requirements for additional capacity.

Construction

As discussed above, electricity would be intermittently consumed during the conveyance of the water used to control fugitive dust, as well as to provide electricity for temporary lighting and other general construction activities. The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease

upon completion of construction. When not in use, electric equipment would be powered off to avoid unnecessary energy consumption. As energy consumption during Project construction activities would be relatively negligible, the Project would not likely affect regional energy consumption in years during the construction period.

Operation

As stated above, the Project-related increase in annual electricity consumption would represent approximately 0.0025 percent of LADWP's projected sales in 2035-2036. Also, the Project's estimated increase in demand for natural gas would account for approximately 0.0002 percent of the forecasted 2035 consumption in SoCalGas's planning area. In summary, energy consumption during Project operations would be negligible, and energy requirements would be within LADWP's and SoCalGas's service provisions.

3) The effects of the project on peak and base period demands for electricity and other forms of energy.

Electricity demand during construction and operation of the Project would have a negligible effect on the overall capacity of LADWP's power grid and base load conditions. With regard to peak load conditions, LADWP's power system experienced an all-time high peak of 6,432 MW on August 31, 2017.[32] LADWP also estimates a peak load based on two years of data known as base case peak demand to account for typical peak conditions. Based on LADWP estimates for 2017, the base case peak demand for the power grid is 5,854 MW.[33] In comparison to the LADWP power grid base peak load of 5,854 MW in 2017, the Project would represent approximately 0.0011 percent of the LADWP base peak load conditions. In addition, LADWP's annual growth projection in peak demand of the electrical power grid of 0.4 percent would be enough to account for future electrical demand by the Project.[34] Therefore, Project electricity consumption during operational activities would have a negligible effect on peak load conditions of the power grid.

4) The degree to which the project complies with existing energy standards.

Although Title 24 requirements typically apply to energy usage for buildings, construction equipment would also comply with Title 24 requirements where applicable. Electricity and natural gas usage during Project operations presented on Tables VI-1 and VI-2 would comply with Title 24 standards and CalGreen Code requirements, as well as the City's Green Building Code. Therefore, Project construction and operational activities would comply with existing energy standards with regards to electricity and natural gas usage.

[32] LADWP, 2017 Retail Electric Sales and Demand Forecast. p. 6.

[33] LADWP, 2017 Retail Electric Sales and Demand Forecast. p. 6.

[34] LADWP, 2017 Retail Electric Sales and Demand Forecast. p. 6.

With regard to transportation fuels, trucks, and equipment used during proposed construction activities, the Project would comply with CARB's anti-idling regulations as well as the In-Use Off-Road Diesel-Fueled Fleets regulation. Although these regulations are intended to reduce criteria pollutant emissions, compliance with the anti-idling and emissions regulations would also result in efficient use of construction-related energy. During Project operations, vehicles traveling to and from the Project Site are assumed to comply with CAFÉ fuel economy standards. Project-related vehicle trips would also comply with Pavley and Low Carbon Fuel Standards, which are designed to reduce vehicle GHG emissions but would also result in fuel savings in addition to CAFE standards. Therefore, Project construction and operational activities would comply with existing energy standards with regards to transportation fuel consumption.

5) Effects of the Project on Energy Resources

As discussed above, LADWP's electricity generation is derived from a mix of non-renewable and renewable sources such as coal, natural gas, solar, geothermal, wind, and hydropower. LADWP's 2017 SLTRP identifies adequate resources (natural gas, coal) to support future generation capacity.

Natural gas supplied to the Southern California is mainly sourced from out of state with a small portion originating in California. Sources of natural gas for the Southern California region are obtained from locations throughout the western United States as well as Canada. According to the U.S. Energy Information Administration (EIA), as of January 2019, the United States currently has about 84 years of natural gas reserves.[35] Compliance with energy standards is expected to result in more efficient use of natural gas (lower consumption) in future years. Therefore, Project construction and operational activities would have a negligible effect on natural gas supply.

Transportation fuels (gasoline and diesel) are produced from crude oil, which is imported from various regions around the world. Based on current proven reserves, crude oil production would be sufficient to meet over 50 years of consumption.[36] The Project would also comply with CAFE fuel economy standards, which would result in more efficient use of transportation fuels (lower consumption). Project-related vehicle trips would also comply with Pavley and Low Carbon Fuel Standards, which are designed to reduce vehicle GHG emissions but would also result in fuel savings in addition to CAFE standards. In addition, based on the removal of existing uses, the Project would result in the reduction of 1,355 daily vehicle trips. Therefore, Project construction and operational activities would have a negligible effect on the transportation fuel supply.

Due to the Project Site location, most on-site renewable energy sources would not be feasible to install on-site as there are no local sources of energy from the following sources: biodiesel, biomass hydroelectric and small hydroelectric, digester gas, fuel cells, landfill gas, municipal solid

[35] U.S. Energy Information Administration, Frequently Asked Questions, www.eia.gov/tools/faqs/faq.php?id=58&t=8, accessed November 15, 2021.

[36] BP Global, https://www.bp.com/en/global/corporate/energy-economics/statistical-review-of-world-energy/oil.html, accessed November 15, 2021.

waste, ocean thermal, ocean wave, and tidal current technologies, or multi- fuel facilities using renewable fuels. Additionally, wind-powered energy is not viable on the Project Site due to the lack of sufficient wind in the Los Angeles basin. Specifically, based on a map of California's wind resource potential, the Project Site is not identified as an area with wind resource potential.[37]

6) The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

Approximately 616,121 thousand barrels of crude oil (approximately 25.9 billion gallons) were supplied to California refineries in 2019.[38] Assuming the same supply of crude oil is provided to California, the Project's estimated consumption would be a small fraction of one percent of available fuel reserves. In addition, while the Project includes physical improvements to the existing high school and to North Campus for the expansion of athletic and surface parking facilities, it would not increase student enrollment beyond the currently permitted maximum student enrollment. Further, as described in Section XVII (Transportation), the Project would result in the reduction of 1,355 daily vehicle trips when compared to the existing uses at the Project Site, thereby the Project's transportation energy use. The Project would also include approximately 137 EV spaces and 17 EVCS. Alternative-fueled, electric, and hybrid vehicles, to the extent these types of vehicles would be utilized by students, faculty, and visitors to the Project Site would further reduce the Project's transportation energy use.

7) The degree to which the project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements

The City's current Green Building Code requires compliance with the CalGreen Code and California's Building Energy Efficiency Standards (Title 24). The Project would be required to comply with the City's Green Building Code. The City has also adopted several plans and regulations to promote the reduction, reuse, recycling, and conversion of solid waste going to disposal systems. These regulations include the City of Los Angeles Solid Waste Management Policy Plan, the RENEW LA Plan, and the Exclusive Franchise System Ordinance (Ordinance No. 182,986). These solid waste reduction programs and ordinances help to reduce the number of trips associated with hauling solid waste, thereby reducing the amount of petroleum-based fuel consumed. Furthermore, recycling efforts indirectly reduce the energy necessary to create new products made of raw material, which is an energy-intensive process. Thus, through compliance with the City's solid waste recycling programs, the Project would contribute to reduced fuel-related energy consumption.

---

8) Whether the Project conflicts with adopted energy conservation plans.

The Project would comply with applicable regulatory requirements for the design of new buildings, the new pool, and the new lights on the North Campus, including the provisions set forth in the CalGreen Code and California's Building Energy Efficiency Standards, which have been incorporated into the City's Green Building Code. In addition, the athletic lighting on the North Campus for the pool and athletic fields would all be light-emitting diode (LED), which is more energy efficient than incandescent lighting. With regard to transportation energy uses, the Project would reduce VMT based on the reduction in daily trips when compared to the existing uses and would also encourage the use of alternative modes of transportation by providing approximately 137 EV spaces and 17 EVCS. As discussed previously, the 2020-2045 RTP/SCS focuses on reducing fossil fuel use by decreasing VMT, reducing building energy use, and increasing use of renewable sources. The Project would therefore be consistent with the energy efficiency policies emphasized in the 2020-2045 RTP/SCS. The 2020-2045 RTP/SCS would result in an estimated 8 percent decrease in VMT by 2020 and a 19 percent decrease in VMT by 2035. By meeting and exceeding the SB 375 targets for 2020 and 2035, the 2020-2045 RTP/SCS is expected to fulfill and exceed its portion of SB 375 compliance with respect to meeting the state's GHG emission reduction goals. Thus, consistent with the 2020-2045 RTP/SCS, the Project would reduce VMT and associated petroleum-based fuel. As such, based on the above, the Project would be consistent with adopted energy conservation plans.

Conclusion

As demonstrated in the analysis of the eight criteria discussed above, the Project would not result in any wasteful, inefficient, or unnecessary consumption of energy during construction or operation. The Project's energy requirements would not significantly affect local and regional supplies or capacity. The Project's energy usage during peak and base periods would also be consistent with electricity and natural gas future projections for the region. Electricity generation capacity, and supplies of natural gas and transportation fuels, would also be sufficient to meet the needs of Project-related construction and operations. During operation, the Project would comply with the City's existing energy efficiency requirements under the City's Green Building Code. In summary, the Project's energy demands would not significantly affect available energy supplies and would comply with existing energy efficiency standards. Therefore, Project impacts related to energy use would be less than significant during construction and operation.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. The energy conservation plans and policies relevant to the Project include, but are not limited to, the California Title 24 energy standards, the 2022 CALGreen building code, and the City of Los Angeles Green Building Code. As these conservation policies are mandatory under the City of Los Angeles Building Code, the Project would not conflict with or obstruct implementation of applicable plans for renewable energy or

efficiency. In addition, the Project would implement sustainability measures to exceed Title 24 energy efficiency requirements.

With regard to transportation related energy usage, the Project would comply with the goals of SCAG's 2020-2045 RTP/SCS, which incorporates VMT targets established by SB 375. The Project's reduction in daily trips would serve to reduce VMT and associated transportation fuel usage within the region. In addition, vehicle trips generated during Project operations would comply with CAFÉ fuel economy standards. Based on the above, the Project would not conflict with adopted energy conservation plans, or violate State or federal energy standards. Therefore, Project impacts associated with regulatory consistency would be less than significant.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, the following provides a general discussion of cumulative impacts.

Electricity

The Project, in conjunction with any other development projects, could result in an increased demand for electricity supplies. LADWP's 2017 SLTRP serves as a comprehensive 20-year plan to supply reliable electricity to the City in an environmentally responsible and cost-effective manner. The 2017 SLTRP considers a 20-year planning horizon to guide LADWP as it executes major new and replacement projects and programs. Based on the projections and strategies within the 2017 SLTRP, energy efficiency and solar savings are expected to increase in the future and significantly reduce electricity demands, Thus, LADWP anticipates that it can meet the future demands of cumulative growth within its service area with implementation of regulatory and reliability initiatives and strategic initiatives.

LADWP will continue to pursue and implement energy efficiency programs per SB 350, which has an adopted goal of achieving 50 percent renewable energy sources by 2030. Furthermore, in accordance with current building codes and construction standards, both the Project and any other development projects would be required to comply with the energy conservation standards established in Title 24 of the California Administrative Code and the City's Green Building Code. Compliance with Title 24 energy conservation standards, City's Green Building Code, and other energy conservation programs on the local level will further reduce cumulative energy demands. As such, cumulative development would not result in related to potentially significant environmental impacts due to wasteful, inefficient, and unnecessary use of electricity. Therefore, cumulative impacts related to electricity would be less than significant.

Natural Gas

The Project, in conjunction with any other development projects, could result in an increased demand for natural gas supplies. As a public utility provider, SoCalGas continuously analyzes increases in natural gas demands resulting from projected population and employment growth in

its service area and it is anticipated that it would be able to meet the needs of future development within the region. Both the Project and any other development projects would be reviewed on a case-by-case basis to determine SoCalGas's ability to serve each project. Additionally, compliance with energy conservation standards pursuant to Title 24 would reduce cumulative demand for natural gas resources. As such, cumulative development would not result in related to potentially significant environmental impacts due to wasteful, inefficient, and unnecessary use of natural gas. Therefore, cumulative impacts related to natural gas would be less than significant.

Transportation Energy

The Project, in conjunction with any other development projects, could result in a net increased demand for transportation energy. As discussed previously, the NHTSA and CARB have implemented several policies, rules, and regulations to improve vehicle efficiency, increase the use of alternative fuels, and decrease the reliance on fossil fuels. It is anticipated that the future vehicle trips are expected to comply with CAFE standards and CARB's Advanced Clean Cars Program, which would ultimately reduce non-renewable transportation fuel consumption. Also, the Project and any other development projects are located in a transit-rich area of the City and as such, provide opportunities for alternative sources of transportation. Thus, cumulative development would not result in related to potentially significant environmental impacts due to wasteful, inefficient, and unnecessary use of transportation energy. Therefore, cumulative impacts related to transportation energy would be less than significant.

VII. GEOLOGY AND SOILS

In 2015, the California Supreme Court in the California Building Industry Association v. Bay Area Air Quality Management District (62 Cal.4th 369 [Case No. S213478]) (CBIA v. BAAQMD), held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of the project. The City's revised thresholds are intended to comply with this decision. Specifically, the decision held that an impact from the existing environment to the project, including future users and/or residents, is not an impact for purposes of CEQA. However, if the project physically exacerbates existing conditions that already exist, that impact must be assessed, including how it might affect future users and/or residents of the project. Thus, in accordance with Appendix G of the State CEQA Guidelines and the CBIA v. BAAQMD decision, the Project would have a significant impact related to geology and soils if it would result in any of the following impacts to future residents or users.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii. Strong seismic ground shaking?	☐	☐	☒	☐
iii. Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv. Landslides?	☐	☐	☒	☐
b. Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c. Be located on a geologic unit that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☒	☐
d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒
f. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

The analysis in this section is based on the following items, which are included as Appendix E of this IS/MND:

- Geotechnical Investigation, Geocon West, January 12, 2023
- Response to Soils Report Review Letter, Geocon West, May 8, 2023.
- Soils Report Approval Letter, Los Angeles Department of Building and Safety, June 27, 2023.
- Paleontological Resources Technical Memorandum, SWCA Environmental Consultants, December 15, 2022.

a. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. Fault rupture occurs when movement on a fault deep within the earth breaks through to the surface. Based on criteria established by the California Geological Survey (CGS), faults can be classified as active, potentially active, or inactive. Active faults are those having historically produced earthquakes or shown evidence of movement within the past 11,000 years (during the Holocene Epoch). Potentially active faults have demonstrated displacement within the last 1.6 million years (during the Pleistocene Epoch) while not displacing Holocene Strata. Inactive faults do not exhibit displacement more recently than 1.6 million years before the present. In addition, there are buried thrust faults, which are faults with no surface exposure. Due to their buried nature, the existence of buried thrust faults is usually not known until they produce an earthquake.

The CGS establishes regulatory zones around active faults, called Alquist-Priolo Earthquake Fault Zones (previously called Special Study Zones). These zones, which extend from 200 to 500 feet on each side of the known fault, identify areas where a potential surface fault rupture could prove hazardous for buildings used for human occupancy. Development projects located within an Alquist-Priolo Earthquake Fault Zone are required to prepare special geotechnical studies to characterize hazards from any potential surface ruptures. In addition, the City designates Fault Rupture Study Areas along the sides of active and potentially active faults to establish areas of potential hazard due to fault rupture.

According to the Geotechnical Investigation prepared for the Project (included in Appendix E of this IS/MND), the Project Site is not located within an Alquist-Priolo Earthquake Fault Zone and no Holocene-active or pre-Holocene faults with the potential for surface fault rupture are known to pass directly beneath the Project Site, and thus the possibility of surface fault rupture at the Project Site is considered to be low.[39] As such, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the Alquist-Priolo Special Studies Zone Map issued by the State Geologist in 2014 for the area or based on other substantial evidence of a known fault on the Project Site.

Additionally, given that no active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the Project Site, the Project would not exacerbate existing fault rupture conditions. Construction of the Project would be subject to compliance with existing state and local regulations, including the California Building Code (CBC) and the Los Angeles Building Code (LABC) and with the recommendations contained in the final geotechnical report prepared for the Project by a licensed engineer and approved by the City of Los Angeles Department of Building and Safety (LADBS). The CBC and LABC, with which the Project would be required to comply, contain construction requirements to ensure that structures are built to a level such that they can withstand acceptable seismic risk. Therefore, the Project would not cause potential substantial adverse effects as a result of a known earthquake fault in or around the Project Site, and Project impacts with respect to fault rupture would be less than significant.

ii. Strong seismic ground shaking?

Less Than Significant Impact. The Project Site is located in the seismically active Southern California region. However, the Project does not include the types of activities, such as mining operations, boring of large areas, the extraction or injection of oil or groundwater, horizontal drilling, or other activities that would cause or exacerbate substantial adverse effects involving strong seismic ground shaking. Given the Project Site's location in a seismically active region, the Project Site could experience seismic ground shaking in the event of an earthquake.

[39] Geotechnical Investigation, Geocon West, January 12, 2023, page 7.

However, as with any new development in the State of California, building design and construction for the Project would be required to conform to the current seismic design provisions of the CBC. The CBC would preclude the Project from employing techniques or methods which would directly or indirectly initiate or worsen seismic ground shaking as part of the normal construction and operations. The CBC incorporates the latest seismic design standards for structural loads and materials as well as provisions from the National Earthquake Hazards Reduction Program to mitigate losses from an earthquake and provide for the latest in earthquake safety. Additionally, construction of the Project would be required to adhere to the seismic safety requirements contained in the LABC, as well as the applicable recommendations provided in the geotechnical investigations required by the City to minimize seismic-related hazards. Adherence to current building codes and engineering practices would ensure that the Project would not expose people, property, or infrastructure directly or indirectly to seismically induced ground shaking hazards that are greater than the average risk associated with locations in the Southern California region, and would minimize the potential to expose people or structures to substantial risk, loss, or injury. Based on the above, development of the Project would not exacerbate seismic conditions on the Project Site. With compliance with existing building codes, Project impacts associated with seismic ground shaking would be less than significant.

iii. Seismic-related ground failure, including liquefaction?

Less Than Significant Impact. Liquefaction is a form of earthquake-induced ground failure that occurs primarily in relatively shallow, loose, granular, water-saturated soils. Liquefaction can occur when these types of soils lose their shear strength due to excess water pressure that builds up during repeated seismic shaking. A shallow groundwater table, the presence of loose to medium dense sand and silty sand, and a long duration and high acceleration of seismic shaking are factors that contribute to the potential for liquefaction. Liquefaction usually results in horizontal and vertical movements from lateral spreading of liquefied materials.

According to the Geotechnical Investigation prepared for the Project Site, the State of California Seismic Hazard Zone Map for the Calabasas Quadrangle indicates that the southern portion of the Main Campus and the entire North Campus are located in an area designated as having a potential for liquefaction. Consequently, the proposed pool, pool house, and pedestrian bridge are located within areas designated as having a potential for liquefaction.[40]

According to the Geotechnical Investigation and Geotechnical Investigation Corrections Response Letter (both included in Appendix E of this IS/MND), the pedestrian bridge and Main Campus structures can be founded on relatively shallow bedrock using deepened foundations extending through the potentially liquefiable materials. Since the structures would be supported on bedrock, it is the opinion of Geocon West that the potential for liquefaction and associated ground deformation to impact the bridge and Main Campus structures is considered very low.

[40] Geotechnical Investigation, Geocon West, January 12, 2023, page 11.

The North Campus is underlain by artificial fill, potentially liquefiable alluvium, and further underlain by Monterey formation bedrock. The depth of the bedrock ranges from 12 feet on the west portion of the property, to 42 feet on the east side of the property. Due to the depth of bedrock on the east side of the North Campus, deepened foundations are not considered economically feasible for the construction of the North Campus pool house improvements. Therefore, a liquefaction analysis was performed to represent both the worst-case liquefaction potential and the lowest liquefaction potential for the North Campus, and the Geotechnical Investigation and associated corrections letter provided design recommendations for the proposed foundation system for the North Campus.

Construction of the Project would not involve the injection of water or any other liquid into the ground. In addition, construction of the Project would be subject to the LABC requirements and recommendations included in the final geotechnical report, including recommendations with respect to liquefaction. Based on the above, development of the Project would not directly or indirectly cause or exacerbate geologic hazards, including seismic-related liquefaction, and Project impacts with respect to liquefaction would be less than significant.

iv. Landslides?

Less Than Significant Impact. While the topography at the Project Site slopes to the south with 42 feet of elevation difference, the Project Site is not identified by ZIMAS as being within a landslide hazard zone. According to the CGS, the Project Site is not located within an area identified as having a potential for seismic slope instability, and there are no known landslides near the Project Site, nor is the Project Site in the path of any known or potential landslides.[41] Therefore, Project impacts with respect to landslides would be less than significant.

b. Result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. A significant impact may occur if a project exposes large areas to the erosional effects of wind or water for a protracted period of time. The Project Site is currently completely developed with the existing high school (Main Campus) and shopping center and associated surface parking (North Campus) and does not contain any topsoil. During the Project's construction phase, activities such as excavation for utilities, grading, and site preparation could leave soils at the Project Sites susceptible to soil erosion. The Project Applicant would be required to comply with SCAQMD Rule 403 – Fugitive Dust to minimize wind and water-borne erosion at the Site, as well as prepare and implement a Stormwater Pollution Prevention Plan (SWPPP), in accordance with the National Pollutant Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Associated with Construction Activity and Land Disturbance Activities. The site-specific SWPPP would be prepared prior to earthwork activities and would be implemented during Project construction. The SWPPP would include best management practices (BMPs) and erosion control measures to prevent pollution in storm water discharge. Typical BMPs

[41] Geotechnical Investigation, Geocon West, January 12, 2023, page 13.

that could be used during construction include good-housekeeping practices (e.g., street sweeping, proper waste disposal, vehicle and equipment maintenance, concrete washout area, materials storage, minimization of hazardous materials, proper handling and storage of hazardous materials, etc.) and erosion/sediment control measures (e.g., silt fences, fiber rolls, gravel bags, storm water inlet protection, and soil stabilization measures, etc.). The SWPPP would be subject to review and approval by the City for compliance with the City's Development Best Management Practices Handbook, Part A, Construction Activities.

Additionally, all Project construction activities would comply with the City's grading permit regulations, which require the implementation of grading and dust control measures, including a wet weather erosion control plan if construction occurs during rainy season, as well as inspections to ensure that sedimentation and erosion is minimized. Through compliance with these existing regulations, the Project would not result in any significant impacts related to soil erosion during the construction phase. Further, during the Project's operational phase, the Project Site would be developed with impervious surfaces or landscaping, and all stormwater flows would be directed to storm drainage features and would not come into contact with bare soil surfaces. Therefore, with compliance with applicable regulatory requirements, development of the Project would not cause or exacerbate soil erosion or loss of topsoil and impacts regarding soil erosion or the loss of topsoil would be less than significant.

c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Less Than Significant Impact. Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. As discussed in the Geotechnical Investigation, the majority of the Project Site is underlain by shallow bedrock that is not susceptible to subsidence.[42]

While the topography at the Project Site slopes to the south with 42 feet of elevation difference, the Project Site is not identified by ZIMAS as being within a landslide hazard zone. According to the CGS, the Project Site is not located within an area identified as having a potential for seismic slope instability, and there are no known landslides near the Project Site, nor is the Project Site in the path of any known or potential landslides. Based on these considerations, the potential for slope stability hazards to impact the Project is low. [43]

With respect to liquefaction, as discussed previously, while the southern portion of the Main Campus and the entire North Campus are located in an area designated as having a potential for liquefaction. construction of the Project would be subject to the LABC requirements and

[42] Geotechnical Investigation, Geocon West, January 12, 2023, page 14.

[43] Geotechnical Investigation, Geocon West, January 12, 2023, page 13.

recommendations included in the final geotechnical report, including recommendations with respect to liquefaction. Therefore, Project impacts with respect to liquefaction would be less than significant.

According to the Geotechnical Investigation, the Project Site is underlain by artificial fill, Holocene age alluvium and colluvium, and the northern portion of the Main Campus is underlain by shallow sedimentary bedrock of the Monterey Formation, also called the Modelo Formation.[44] The Project Applicant would be required by the LADBS, as part of the permitting process, to submit a final geotechnical report that would address the building standards and recommendations that shall be followed in order to construct the proposed structure in accordance with CBC and LABC building standards that apply to buildings within the types of soils found at the Project Site, including areas prone to geologic or soil instability. Through compliance with the CBC and LABC, and with recommendations included in the final geotechnical report, impacts related to geologic and soil instability would be less than significant. Based on the above, development of the Project would not cause or exacerbate geologic hazards by being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and Project impacts would be less than significant.

d. Be located on expansive soil, as defined in Table 18 1 B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant Impact. Based on the Geotechnical Investigation prepared for the Project Site, soils at the Project Site are considered to have a low to medium expansive potential and are classified as "expansive" in accordance with the 2022 CBC Section 1803.5.3.[45] Construction of the Project would be required to adhere to the CBC and LABC, as well as the applicable recommendations provided in the geotechnical investigation required by the City to minimize impacts with respect to expansive soils. Adherence to current building codes and engineering practices would ensure that the Project would not cause or exacerbate geologic hazards, and impacts with respect to expansive soils would be less than significant.

e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No Impact. The Project Site is located within a community served by existing sewage infrastructure. The Project would connect to the City's existing sewer system and would not require the use of septic tanks or alternative wastewater disposal systems. Thus, the Project would not result in any impacts related to soils that are incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available

[44] Geotechnical Investigation, Geocon West, January 12, 2023, page 4.

[45] Geotechnical Investigation, Geocon West, January 12, 2023, page 18.

for the disposal of wastewater. Therefore, no impacts related to this issue would occur as a result of the Project.

f. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less Than Significant with Mitigation Incorporated. A project-related significant adverse effect could occur if grading or excavation activities associated with the Project would disturb paleontological resources or geologic features which presently exist within the Project Site. According to the paleontological resources technical memorandum (included in Appendix E of this IS/MND), SWCA (the preparer of the technical memorandum) determined the paleontological potential of the geologic units underlying the Project area. Recent to late Holocene artificial fill likely exists within the Project area as a thin veneer, overlying previously undisturbed sedimentary deposits. Artificial fill has the potential to yield paleontological resources; however, any such fossil has been removed from its original stratigraphic context (provenance). Therefore, artificial fill has a low paleontological sensitivity based on Society of Vertebrate Paleontology (SVP) (2010) guidelines. Based on SVP (2010) guidelines and definition of significant paleontological resources, late to middle Pleistocene old alluvial fan deposits and late Miocene Modelo Formation, which both underlie the artificial fill at unknown, but likely very shallow depths, have a high paleontological sensitivity. In summary, the overall Project area has a low paleontological sensitivity in the uppermost disturbed sediments and a high paleontological sensitivity in the underlying, previously undisturbed sediments. The depth to the previously undisturbed sediments within the Project area is likely very shallow based on the local topography of the existing built environment.

The changes to the Main Campus include a partial demolition of existing structures and the addition of a new administrative, multi-purpose, and classroom building, as well as the renovation of existing offices and the addition of electric vehicle parking and charging stations. The expansion to the North Campus includes the development of a proposed athletic field pool house, locker rooms, and proposed building to house restrooms and concessions. The balance of the North Campus site would include a proposed new soccer and baseball field, a new pool, and two new proposed surface parking lots. Based on the features of the Project, substantial ground-disturbing activities are anticipated to impact previously undisturbed sediments underlying the artificial fill present as a veneer across the Project Site. The depth to the underlying, previously undisturbed sediments is unknown, but likely very shallow (e.g., three feet below ground surface). Project-related ground-disturbing activities are likely to exceed the depth of the artificial fill and impact the underlying previously undisturbed geologic units of high paleontological sensitivity. Therefore, fossils may be encountered during the ground-disturbing activities. Should significant fossils be encountered, they would be at risk for damage or destruction from construction activities, which would constitute a significant impact. Therefore, the Project would be required to implement Mitigation Measure GEO-1, which would ensure that impacts with respect to paleontological resources are less than significant.

Mitigation Measure

GEO-1 The Project Applicant shall implement the following best practices with respect to paleontology:

- **Retain a Qualified Professional Paleontologist:** The Project Applicant shall retain a Qualified Professional Paleontologist (Project Paleontologist), who meets or exceeds the SVP standards, to oversee all regulatory compliance measures and protocols related to paleontological resources.

- **Conduct Worker Training:** The Project Paleontologist should develop a Worker Environmental Awareness Program (WEAP) to train the construction crew on the legal requirements for preserving fossil resources, as well as the procedures to follow in the event of a fossil discovery. This training program would be given to the crew before ground-disturbing work commences and would include handouts to be given to new workers as needed.

- **Monitor for Paleontological Resources:** Ground disturbances greater than or equal to 3 feet below ground surface with the potential to impact late to middle Pleistocene old alluvial fan deposits (Qof) and/or late Miocene Modelo Formation (Tm) should be monitored full-time. Monitoring should be reduced or ceased once over-excavations into the underlying previously undisturbed deposits have been completed, or if Recent to late Holocene artificial fill (Qaf) is the only geologic units encountered during earthwork activities. Ground disturbances in previously disturbed sediments should not be monitored, regardless of depth.

  Monitoring should be conducted by a paleontological monitor who meets the standards of the SVP (2010) working under the supervision of the Project Paleontologist. The Project Paleontologist may periodically inspect construction activities to adjust the level of monitoring in response to subsurface conditions. In consultation with the lead agency and the Project Applicant, monitoring efforts can be increased, reduced, or ceased entirely if determined adequate by the Project Paleontologist. Paleontological monitoring should include inspection of exposed sedimentary units during active excavations within sensitive geologic sediments. The monitor should have authority to temporarily divert activity away from exposed fossils to evaluate the significance of the find and, should the fossils be determined significant, professionally and efficiently recover the fossil specimens and collect associated data. Paleontological monitors should record pertinent geologic data and collect appropriate sediment samples from any fossil localities.

- **Prepare a Paleontological Resources Monitoring Report:** Upon conclusion of ground-disturbing activities, the Project Paleontologist overseeing paleontological monitoring should prepare a final Paleontological Resources Monitoring Report

(PRMR) that documents the paleontological monitoring efforts for the Project and describes any paleontological resources discoveries observed and/or recorded during the life of the Project. If paleontological resources are curated, the final PRMR and any associated data pertinent to the curated specimen(s) should be submitted to the designated repository. A copy of the final PRMR should be filed with the lead agency.

Cumulative Impacts

Geotechnical impacts related to future development in the City involve site-specific soil conditions, erosion, and ground-shaking during earthquakes. The impacts on each site are specific to that site and its users and would not be in common or contribute to (or shared with, in an additive sense) the impacts on other sites. While no related projects have been identified within one-half mile of the Project Site, development on each site is subject to uniform site development as well as CBC and LABC construction standards that are designed to protect public safety. Like the Project, it is assumed that any other development projects would be required to comply with CBC and LABC construction standards and requirements. Impacts with respect to paleontological resources are also assessed on a site-by-site basis. All development in the City (including the Project and any other development projects) that includes ground-disturbing activities is required to adhere to existing State and City regulations and/or any required mitigation measures related to the discovery of paleontological resources. For these reasons, cumulative impacts related to geology and soils would be less than significant.

VIII. GREENHOUSE GAS EMISSIONS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

The analysis in this section is based on the following, which is included in Appendix B of this IS/MND:

- Air Quality and Greenhouse Gas Emissions Technical Modeling, Noah Tanski Environmental Consulting, May 2023.

Climate Change Background

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation, and storms. Global warming, a related concept, is the observed increase in average temperature of Earth's surface and atmosphere. One identified cause of global warming is an increase of GHG emissions in the atmosphere. GHG emissions are those compounds in Earth's atmosphere that play a critical role in determining Earth's surface temperature.

Earth's natural warming process is known as the "greenhouse effect." It is called the greenhouse effect because Earth and the atmosphere surrounding it are similar to a greenhouse with glass panes in that the glass allows solar radiation (sunlight) into Earth's atmosphere but prevents radiative heat from escaping, thus warming Earth's atmosphere. Some levels of GHG emissions keep the average surface temperature of Earth close to a hospitable 60 degrees Fahrenheit. However, it is believed that excessive concentrations of anthropogenic GHG emissions in the atmosphere can result in increased global mean temperatures, with associated adverse climatic and ecological consequences.

GHG Emissions Background

GHG emissions include CO_2, methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3).[46] Carbon dioxide is the most abundant GHG. Other GHG emissions are less abundant but have greater global warming potential than CO_2. Thus, emissions of other GHGs are frequently expressed in their equivalent mass of CO_2, denoted as CO_2e. Forest fires, decomposition, industrial processes, landfills, and the consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions.

Regulatory Framework

There are any number of agreements, strategies, policies, regulations, and standards that relate to GHG emissions – from international climate accords to local climate action plans (CAPs). Below is a discussion of (1) the plans, policies, and regulations (collectively, the "Applicable GHG Regulations") that are fundamental to determining whether the Project would have a significant impact on GHG emissions, and (2) the existing conditions under the Applicable GHG Regulations.

State

The State legislature, executive office, and administrative agencies have promulgated several rules that govern GHG emissions. Below is a timeline thereof, followed by explanations of each:

- June 2005: Executive Order S-3-05 (EO S-3-05)
- September 2005: Assembly Bill 32 (AB 32) (codified EO S-3-05)
- August 2007: Senate Bill 97 (SB 97)
- September 2008: Senate Bill 375 (SB 375)
- December 2008: CARB adopts Climate Change Scoping Plan (the "AB 32 Scoping Plan")
- August 2011: CARB adopts Supplemental Functional Equivalent Document to the Climate Change Scoping Plan (the "Supplemental FED")
- May 2014: CARB adopts First Update to the Climate Change Scoping Plan: Building on the Framework (the "First Update")
- April 2015: Executive Order B-30-15 (EO B-30-15)
- September 2016: Senate Bill 32 (SB 32) (codified EO B-30-15)
- November 2017: CARB adopts the 2017 Climate Change Scoping Plan Update: The Strategy for Achieving California's 2030 Greenhouse Gas Target (the "2017 Scoping Plan")
- September 2018: Executive Order B-55-18 (EO B-55-18)
- September 2022: Assembly Bill 1297 (AB 1297) (codified EO B-55-18)

[46] As defined by California Assembly Bill (AB) 32 and Senate Bill (SB) 104.

- November 2022: CARB adopts the 2022 Scoping Plan for Achieving Carbon Neutrality (the "2022 Scoping Plan")

Other regulations would also have an indirect effect on the Project's GHG emissions. The Project's relation to the following regulations would not be determinative of its CEQA significance. Nevertheless, explanations of these regulations are also provided below for informational purposes:

- SB 350, the Clean Energy and Efficiency Act of 2015
- Cap-and-Trade Program

EO S-3-05

In June 2005, Governor Arnold Schwarzenegger signed EO-S-3-05, which had the goal of reducing the State's GHG emissions to 2000 levels by 2010, to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.

AB 32

In September 2005, Governor Arnold Schwarzenegger signed the California Global Warming Solutions Act of 2006, AB 32, into law. AB 32 committed the State to achieving the following:

- By 2010, reduce statewide GHG emissions to 2000 levels.[47]
- By 2020, reduce statewide GHG emissions to 1990 levels.

AB 32 required CARB to adopt rules and regulations that achieve the maximum technologically feasible and cost-effective GHG emissions reductions. The State achieved its 2020 GHG emissions target of returning to 1990 levels four years earlier than mandated by AB 32.

SB 97

Passed in August 2007, SB 97 required the State Office of Planning and Research (OPR) to prepare and develop CEQA guidelines for the effects and/or mitigation of GHG emissions, including effects associated with transportation and energy consumption. Subsequently, the Draft Guidelines Amendments for Greenhouse Gas Emissions (the "Guidelines Amendments") were adopted in December 2009 to address the specific obligations of public agencies when analyzing GHG emissions to determine a project's effect on the environment, as pursuant to CEQA.

The Guidelines Amendments do not provide thresholds of significance or any specific mitigation measures; rather, they require a lead agency to make a good-faith effort to describe, calculate, or estimate the amount of GHG emissions that would result from a project, to the extent possible based on scientific and factual data. The Guidelines Amendments give discretion to the lead

[47] The 2010 target to reduce GHG emissions to 2000 levels was not met.

agency whether to (1) use a model or methodology to quantify GHG emissions resulting from a project, and which model or methodology to use, or (2) rely on a qualitative analysis or performance-based standards. Additionally, three factors that should be considered in the evaluation of the significance of GHG emissions are identified:

(1) The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The administrative record for the Guidelines Amendments also clarifies "that the effects of greenhouse gas emissions are cumulative and should be analyzed in the context of CEQA's requirements for the cumulative impact analysis."[48]

The California Natural Resources Agency is required to periodically update the Guidelines Amendments to incorporate new information or criteria established by CARB pursuant to AB 32. SB 97 applies to any environmental impact report (EIR), negative declaration, mitigated negative declaration, or other document requirement by CEQA.

SB 375

In September 2008, Governor Schwarzenegger signed SB 375, the Sustainable Communities and Climate Protection Act of 2008, to align regional planning for housing and transportation with the GHG reduction goals outlined by AB 32. SB 375 requires each Metropolitan Planning Organization (MPO) to adopt a Sustainable Community Strategy (SCS) encouraging compact development that reduces passenger VMT and trips, all for the purpose of meeting CARB-determined regional GHG emissions reduction targets.

EO B-30-15

In April 2015, Governor Brown promulgated EO B-30-15, which had the goal of reducing the State's GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050.

[48] Letter from Cynthia Bryant, Director of the Governor's Office of Planning and Research, to Mike Chrisman, California Secretary for Natural Resources, dated 13 April 2009.

SB 32

Signed in September 2016 by Governor Jerry Brown, SB 32 updates AB 32 to include an emissions reduction goal for the year 2030. Specifically, SB 32 requires CARB to ensure that statewide GHG emissions are reduced to 40 percent below the 1990 level by 2030. New goals outlined in SB 32 update AB 32's scoping plan requirement and involve increasing renewable energy use, imposing tighter limits on the carbon content of gasoline and diesel fuel, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

EO B-55-18

On September 10, 2018, Governor Jerry Brown issued EO B-55-18, which established a target for California to achieve carbon net neutrality by 2045. EO B-55-18 identifies the statewide goal to achieve and maintain carbon neutrality as soon as possible, and no later than 2045.

AB 1297

Governor Gavin Newsom codified the goals outlined in EO-B-55-18 in September 2022 when he signed AB 1279. It requires the state to reduce statewide anthropogenic GHG emissions to at least 85 percent below 1990 levels and to maintain net negative GHG emissions thereafter. AB 1279 tasks CARB with monitoring and regulating GHG emissions to achieve this goal. AB 1297 represents the State's latest – and most stringent – GHG reduction target.

SB 350

SB 350, signed October 7, 2015, is the Clean Energy and Pollution Reduction Act of 2015. The objectives of SB 350 are: (1) to increase the procurement of electricity from renewable resources from 33 percent to 50 percent by 2030, and (2) to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.[49]

Cap-and-Trade Program

The Scoping Plans identify the Cap-and-Trade Program as one of the strategies California will employ to reduce GHG emissions. Under Cap-and-Trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap are able to trade permits to emit GHGs. CARB designed and adopted the California Cap-and-Trade Project pursuant to its authority under AB 32.

Climate Change Scoping Plans

The Scoping Plan is a GHG reduction roadmap developed and updated by CARB at least once every five years, as required by AB 32. It lays out the transformations needed across various

[49] Senate Bill 350 (2015-2016 Re. Session) Stats 2015, ch. 547.

sectors to reduce GHG emissions and reach the State's climate targets. CARB published the 2022 Scoping Plan Update in November 2022, as the third update to the initial plan that was adopted in 2008. The initial 2008 Scoping Plan laid out a path to achieve the AB 32 target of returning to 1990 levels of GHG emissions by 2020, a reduction of approximately 15 percent below business as usual activities. The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan Update (adopted in 2014) assessed progress toward achieving the 2020 target and made the case for addressing short-lived climate pollutants (SLCPs). The 2017 Scoping Plan Update shifted focus to the newer SB 32 goal of a 40 percent below 1990 levels by 2030 by laying out a detailed cost-effective and technologically feasible path to this target, and also assessed progress towards achieving the AB 32 goal of returning to 1990 GHG levels by 2020. The 2020 goal was ultimately reached in 2016, four years ahead of the schedule called for under AB 32.

The 2022 Scoping Plan is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve the aforementioned targets, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. The 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the 2022 Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the 2022 Scoping Plan also includes discussion for the first time of the natural and working lands sectors as sources for both sequestration and carbon storage, and as sources of emissions as a result of wildfires.

Table VIII-1
Estimated Statewide GHG Emissions Reductions in the 2022 Scoping Plan

Emissions Scenario	GHG Emissions ($MMTCO_2e$)
2019	
2019 State GHG Emissions	404
2030	
2030 BAU Forecast	312
2030 GHG Emissions without Carbon Removal and Capture	233
2030 GHG Emissions with Carbon Removal and Capture	226
2030 Emissions Target Set by AB 32 (i.e., 1990 level by 2030)	260
Reduction below BAU necessary to achieve 1990 levels by 2030	52 (16.7%)[A]
2045	
2045 BAU Forecast	266
2045 GHG Emissions without Carbon Removal and Capture	72
2045 GHG Emissions with Carbon Removal and Capture	(3)
Notes:	

$MMTCO_2e$ = million metric tons of carbon dioxide equivalents; parenthetical numbers represent negative values.

[A] 312 – 260 = 52. 52 / 312 = 16.7%

Source: CARB, Final 2022 Climate Change Scoping Plan, November 2022.

The 2022 Scoping Plan Update reflects existing and recent direction in the Governor's Executive Orders and State Statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan.

Table VIII-2 provides a summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan.

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
Assembly Bill 1279 (AB 1279) (Muratsuchi, Chapter 337, Statutes of 2022) *The California Climate Crisis Act*	AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that the Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies. This bill is reflected directly in the 2022 Scoping Plan Update.
Senate Bill 905 (SB 905) (Caballero, Chapter 359, Statutes of 2022) *Carbon Capture, Removal, Utilization, and Storage Program*	SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology. The bill requires CARB, on or before January 1, 2025, to adopt regulations creating a unified state permitting application for approval of CCUS and CDR projects. The bill also requires the Secretary of the Natural Resources Agency to publish a framework for governing agreements for two or more tracts of land overlying the same geologic storage reservoir for the purposes of a carbon sequestration project. The 2022 Scoping Plan Update modeling reflects both CCUS and CDR contributions to achieve carbon neutrality.
Senate Bill 846 (SB 846) (Dodd, Chapter 239, Statutes of 2022) *Diablo Canyon Powerplant: Extension of Operations*	SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant. The 2022 Scoping Plan Update explains the emissions impact of this legislation.
Senate Bill 1020 (SB 1020) (Laird, Chapter 361, Statutes of 2022) *Clean Energy, Jobs, and Affordability Act of 2022*	SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040. It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified requirements. This bill requires the CPUC, California Energy Commission (CEC), and CARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability. The bill also modifies the requirement for CARB to hold a portion of its Scoping Plan workshops in regions of the state with the most significant exposure to air pollutants by further specifying that this includes communities with minority populations or low-income communities in areas designated as being in extreme federal non-attainment. The 2022 Scoping Plan Update describes the implications of this legislation on emissions.
Senate Bill 1137 (SB 1137) (Gonzales, Chapter 365, Statutes of 2022) *Oil & Gas Operations: Location Restrictions: Notice of Intention: Health protection zone: Sensitive receptors*	SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires CARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.
Senate Bill 1075 (SB 1075) (Skinner, Chapter 363, Statutes of 2022) *Hydrogen: Green Hydrogen: Emissions of Greenhouse Gases*	SB 1075 requires CARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen, and specifically the use of green hydrogen, in California; a description of strategies supporting hydrogen infrastructure, including identifying policies that promote the reduction of GHGs and short-lived climate pollutants; a description of other forms of hydrogen to achieve emission reductions; an analysis of curtailed electricity; an estimate of GHG and emission reductions that could be achieved through deployment of green hydrogen through a variety of scenarios; an analysis of the potential for opportunities to integrate hydrogen production and applications with drinking water supply

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	treatment needs; policy recommendations for regulatory and permitting processes associated with transmitting and distributing hydrogen from production sites to end uses; an analysis of the life-cycle GHG emissions from various forms of hydrogen production; and an analysis of air pollution and other environmental impacts from hydrogen distribution and end uses. This bill would inform the production of hydrogen at the scale called for in the 2022 Scoping Plan Update.
Assembly Bill 1757 (AB 1757) (Garcia, Chapter 341, Statutes of 2022) *California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands*	AB 1757 requires the California Natural Resources Agency (CNRA), in collaboration with CARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience. This bill also requires CARB to develop standard methods for state agencies to consistently track GHG emissions and reductions, carbon sequestration, and additional benefits from natural and working lands over time. These methods will account for GHG emissions reductions of CO2, methane, and nitrous oxide related to natural and working lands and the potential impacts of climate change on the ability to reduce GHG emissions and sequester carbon from natural and working lands, where feasible. This 2022 Scoping Plan Update describes the next steps and implications of this legislation for the natural and working lands sector.
Senate Bill 1206 (SB 1206) (Skinner, Chapter 884, Statutes of 2022) *Hydrofluorocarbon gases: sale or distribution*	SB 1206 mandates a stepped sales prohibition on newly produced high- global warming potential (GWP) HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires CARB to develop regulations to increase the adoption of very low-, i.e., GWP < 10, and no-GWP technologies in sectors that currently rely on higher-GWP HFCs.
Senate Bill 27 (SB 27) (Skinner, Chapter 237, Statutes of 2021) *Carbon Sequestration: State Goals: Natural and Working Lands: Registry of Projects*	SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires CARB to establish specified CO2 removal targets for 2030 and beyond as part of its Scoping Plan. Under SB 27, CNRA is to establish and maintain a registry to identify projects in the state that drive climate action on natural and working lands and are seeking funding. CNRA also must track carbon removal and GHG emission reduction benefits derived from projects funded through the registry.

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	This bill is reflected directly in the 2022 Scoping Plan Update as CO2 removal targets for 2030 and 2045 in support of carbon neutrality.
Senate Bill 596 (SB 596) (Becker, Chapter 246, Statutes of 2021) *Greenhouse Gases: Cement Sector: Net- zero Emissions Strategy*	SB 596 requires CARB, by July 1, 2023, to develop a comprehensive strategy for the state's cement sector to achieve net-zero-emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. The bill establishes an interim target of 40 percent below the 2019 average GHG intensity of cement by December 31, 2035. Under SB 596, CARB must: • Define a metric for GHG intensity and establish a baseline from which to measure GHG intensity reductions. • Evaluate the feasibility of the 2035 interim target (40 percent reduction in GHG intensity) by July 1, 2028. • Coordinate and consult with other state agencies. • Prioritize actions that leverage state and federal incentives. • Evaluate measures to support market demand and financial incentives to encourage the production and use of cement with low GHG intensity. The 2022 Scoping Plan Update modeling is designed to achieve these outcomes.
Executive Order N-82-20	Governor Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed CARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy. CO2 Executive Order N-82-20 also calls on the CNRA, in consultation with other state agencies, to establish the California Biodiversity Collaborative (Collaborative). The Collaborative shall be made up of governmental partners, California Native American tribes, experts, business and community leaders, and other stakeholders from across the state. State agencies will consult the Collaborative on efforts to: • Establish a baseline assessment of California's biodiversity that builds upon existing data and can be updated over time. • Analyze and project the impact of climate change and other stressors in California's biodiversity.

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	• Inventory current biodiversity efforts across all sectors and highlight opportunities for additional action to preserve and enhance biodiversity. CNRA also is tasked with advancing efforts to conserve biodiversity through various actions, such as streamlining the state's process to approve and facilitate projects related to environmental restoration and land management. The California Department of Food and Agriculture (CDFA) is directed to advance efforts to conserve biodiversity through measures such as reinvigorating populations of pollinator insects, which restore biodiversity and improve agricultural production. The Natural and Working Lands Climate Smart Strategy informs the 2022 Scoping Plan Update.
Executive Order N-79-20	Governor Newsom signed Executive Order N-79-20 in September 2020 to establish targets for the transportation sector to support the state in its goal to achieve carbon neutrality by 2045. The targets established in this Executive Order are: • 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035. • 100 percent of medium- and heavy-duty vehicles will be zero-emission by 2045 for all operations where feasible, and by 2035 for drayage trucks. • 100 percent of off-road vehicles and equipment will be zero-emission by 2035 where feasible. The Executive Order also tasked CARB to develop and propose regulations that require increasing volumes of zero- electric passenger vehicles, medium- and heavy-duty vehicles, drayage trucks, and off-road vehicles toward their corresponding targets of 100 percent zero-emission by 2035 or 2045, as listed above. The 2022 Scoping Plan Update modeling reflects achieving these targets.
Executive Order N-19-19	Governor Newsom signed Executive Order N-19-19 in September 2019 to direct state government to redouble its efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy. This Executive Order instructs the Department of Finance to create a Climate Investment Framework that: • Includes a proactive strategy for the state's pension funds that reflects the increased risks to the economy and physical environment due to climate change. • Provides a timeline and criteria to shift investments to companies and industry sectors with greater growth potential based on their focus of reducing carbon emissions and adapting to the impacts of climate change.

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	• Aligns with the fiduciary responsibilities of the California Public Employees' Retirement System, California State Teachers' Retirement System, and the University of California Retirement Program. Executive Order N-19-19 directs the State Transportation Agency to leverage more than $5 billion in annual state transportation spending to help reverse the trend of increased fuel consumption and reduce GHG emissions associated with the transportation sector. It also calls on the Department of General Services to leverage its management and ownership of the state's 19 million square feet in managed buildings, 51,000 vehicles, and other physical assets and goods to minimize state government's carbon footprint. Finally, it tasks CARB with accelerating progress toward California's goal of five million ZEV sales by 2030 by: • Developing new criteria for clean vehicle incentive programs to encourage manufacturers to produce clean, affordable cars. • Proposing new strategies to increase demand in the primary and secondary markets for ZEVs. • Considering strengthening existing regulations or adopting new ones to achieve the necessary GHG reductions from within the transportation sector. The 2022 Scoping Plan Update modeling reflects efforts to accelerate ZEV deployment.
Senate Bill 576 (SB 576) (Umberg, Chapter 374, Statutes of 2019) *Coastal Resources: Climate Ready Program and Coastal Climate Change Adaptation, Infrastructure and Readiness Program*	Sea level rise, combined with storm-driven waves, poses a direct risk to the state's coastal resources, including public and private real property and infrastructure. Rising marine waters threaten sensitive coastal areas, habitats, the survival of threatened and endangered species, beaches, other recreation areas, and urban waterfronts. SB 576 mandates that the Ocean Protection Council develop and implement a coastal climate adaptation, infrastructure, and readiness program to improve the climate change resiliency of California's coastal communities, infrastructure, and habitat. This bill also instructs the State Coastal Conservancy to administer the Climate Ready Program, which addresses the impacts and potential impacts of climate change on resources within the conservancy's jurisdiction.
Assembly Bill 65 (AB 65) (Petrie-Norris, Chapter 347, Statutes of 2019) *Coastal Protection: Climate Adaption: Project Prioritization: Natural Infrastructure: Local General Plans*	This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change. The bill requires the conservancy to provide information to the Office of Planning and Research on any projects funded pursuant to the above provision to be considered for inclusion into the clearinghouse for climate

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	adaptation information. The bill authorizes the conservancy to provide technical assistance to coastal communities to better assist them with their projects that use natural infrastructure.
Executive Order B-55-18	Governor Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter. Policies and programs undertaken to achieve this goal shall: a. Seek to improve air quality and support the health and economic resiliency of urban and rural communities, particularly low-income and disadvantaged communities. b. Be implemented in a manner that supports climate adaptation and biodiversity, including protection of the state's water supply, water quality, and native plants and animals. This Executive Order also calls for CARB to: • Develop a framework for implementation and accounting that tracks progress toward this goal. • Ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The 2022 Scoping Plan Update is designed to achieve carbon neutrality no later than 2045 and the modeling includes technology and fuel transitions to achieve that outcome.
Senate Bill 100 (SB 100) (De León, Chapter 312, Statutes of 2018) *California Renewables Portfolio Standard Program: emissions of greenhouse gases*	Under SB 100, the CPUC, CEC, and CARB shall use programs under existing laws to achieve 100 percent clean electricity. The statute requires these agencies to issue a joint policy report on SB 100 every four years. The first of these reports was issued in 2021. The 2022 Scoping Plan Update reflects the SB 100 Core Scenario resource mix with a few minor updates.
Assembly Bill 2127 (AB 2127) (Ting, Chapter 365, Statutes of 2018) *Electric Vehicle Charging Infrastructure: Assessment*	This bill requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of GHGs to 40 percent below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure. This bill supports the deployment of ZEVs as modeled in the 2022 Scoping Plan Update.
Senate Bill 30 (SB 30) (Lara, Chapter 614, Statutes of 2018)	This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote

Table VIII-2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
Insurance: Climate Change	investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure. The bill requires the policies recommended to address specified questions.
Assembly Bill 2061 (AB 2061) (Frazier, Chapter 580, Statutes of 2018) *Near-zero-emission and Zero-emission Vehicles*	Existing state and federal law set specified limits on the total gross weight imposed on the highway by a vehicle with any group of two or more consecutive axles. Under existing federal law, the maximum gross vehicle weight of that vehicle may not exceed 82,000 pounds. AB 2061 authorizes a near-zero-emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds. This bill supports the deployment of cleaner trucks as modeled in the 2022 Scoping Plan Update.

The 2022 Scoping Plan scenario identifies the need to accelerate AB 32's 2030 target, from 40 percent to 48 percent below 1990 levels. Cap-and-Trade regulation continues to play a large factor in the reduction of near-term emissions for meeting the 2030 reduction target. Every sector of the economy will need to begin to transition in this decade to meet these GHG reduction goals and achieve carbon neutrality no later than 2045. The 2022 Scoping Plan approaches decarbonization from two perspectives, managing a phasedown of existing energy sources and technologies, as well as increasing, developing, and deploying alternative clean energy sources and technology. The Scoping Plan scenario is summarized in Table 2-1 (starting on page 72) of the 2022 Scoping Plan. It includes references to relevant statutes and Executive Orders, although it is not comprehensive of all existing new authorities for directing or supporting the actions described. Table 2-1 identifies actions related to a variety of sectors such as: smart growth and reductions in VMT; light-duty vehicles (LDV) and zero-emission vehicles (ZEV); truck ZEVs; reduce fossil energy, emissions, and GHGs for aviation, ocean-going vessels, port operations, freight and passenger rail, oil and gas extraction; and petroleum refining; improvements in electricity generation; electrical appliances in new and existing residential and commercial buildings; electrification and emission reductions across industries such as for food products, construction equipment, chemicals and allied products, pulp and paper, stone/clay/glass/cement, other industrial manufacturing, and agriculture; retiring of combined heat and power facilities; low carbon fuels for transportation, business, and industry; improvements in non-combustion methane emissions, and introduction of low GWP refrigerants.

Achieving the targets described in the 2022 Scoping Plan will require continued commitment to and successful implementation of existing policies and programs, and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians. The Scoping Plan acknowledges that the path forward is not dependent on one agency, one state, or even one country. However, the State can lead by engaging Californians and demonstrating how actions at the state, regional, and local levels of governments, as well as action at community and individual levels, can contribute to addressing the challenge.

Aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in the 2022 Scoping Plan is identified as critical to achieving the statutory targets for 2030 and 2045. The 2022 Scoping Plan discusses the role of local governments in meeting the State's GHG reductions goals. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment – the two largest GHG emissions sectors over which local governments have authority. The City has taken the initiative in combating climate change by developing programs and regulations such as:

- Green New Deal
- Green Building Code
- City of Los Angeles All-Electric Buildings
- General Plan Housing Element (Housing Needs Assessment)
- Mobility Plan 2035

These programs and regulations are discussed below under the section for local GHG regulatory framework.

Regional

2020-2045 Regional Transportation Plan/Sustainable Communities Strategy

In September 2008 Governor Arnold Schwarzenegger signed the Sustainable Communities and Climate Protection Act of 2008, also known as SB 375, to align regional planning for housing and transportation with the GHG emissions reduction goals outlined by AB 32. SB 375 requires each MPO to adopt an SCS encouraging compact development that reduces passenger VMT and trips, all for the purpose of meeting CARB-determined regional GHG emissions reduction targets.

SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development, and the environment. As the federally designated MPO for the six-county Southern California region, SCAG is required by law to ensure that transportation activities conform to, and are supportive of, regional and state air quality plan goals to attain NAAQS. SCAG is also a co-producer, with the SCAQMD, of the transportation strategy and transportation control measure sections of the Basin's AQMP.

CARB set GHG emissions reduction targets of 8 percent by 2020 and 19 percent by 2035 (compared with 2005 levels) for the SCAG region, effective as of October 1, 2018. Adopted on September 3, 2020, SCAG's long-range plan, the 2020-2045 RTP/SCS serves as the roadmap to fulfilling the region's compliance with these latest GHG reduction targets. To this end, the 2020-2045 RTP/SCS recognizes that transportation investments and future land use patterns are inextricably linked and acknowledges how this relationship can help the region make choices that sustain existing resources while expanding efficiency, mobility, and accessibility for people across the region.

The 2020-2045 RTP/SCS land use pattern continues the trend of focusing new housing and employment growth in the region's high quality transit areas (HQTAs) and aims to enhance and build out the region's transit network. At the time of the previous 2016-2040 RTP/SCS, HQTAs accounted for just 3 percent of total land in the SCAG region, but they are projected to accommodate 46 percent of the region's future household growth and 55 percent of the region's future employment growth by 2040.[50] HQTAs are a cornerstone of land use planning best practice in the SCAG region, and studies by the California Department of Transportation, the US Environmental Protection Agency (USEPA), and the Metropolitan Transportation Commission have found that focusing development in areas served by transit can result in local, regional, and statewide benefits including reduced air pollution and energy consumption. In addition, HQTAs concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability. As a result, HQTAs are vital to the

[50] SCAG, Final 2016-2040 RTP/SCS, April 2017. HQTAs are defined as areas within one-half mile of a fixed guideway transit stop or a bus transit corridor where buses pick up passengers at a frequency of every 15 minutes or less during peak commuting hours.

attainment of regional GHG emissions reduction targets: successful implementation of the 2020-2045 RTP/SCS would result in more complete communities with a variety of transportation and housing choices, reducing automobile use and, crucially, associated GHG emissions.

The SB 375 GHG reduction targets for the SCAG region correspond with reductions in regional VMT per capita. OPR has recommended that achieving 15 percent lower per capita (residential) or per employee (commercial) VMT than existing development is generally feasible and is supported by evidence that connects these reductions to the state's emissions goals.

South Coast Air Quality Management District CEQA Guidance

The City of Los Angeles is located in the South Coast Air Basin (Basin). The South Coast Air Quality Management District (SCAQMD) is responsible for air quality planning in the Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished through air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.[51] A GHG Significance Threshold Working Group was formed to further evaluate potential GHG significance thresholds.[52] The SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 $MTCO_2e$ per year. Under this proposal, commercial/residential projects that emit fewer than 3,000 $MTCO_2e$ per year would be assumed to have a less than significant impact on climate change. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold of 10,000 $MTCO_2e$ per year for stationary source/industrial projects where the SCAQMD is the lead agency. However, the SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects). The Working Group has been inactive since 2011, and SCAQMD has not formally adopted any GHG significance thresholds for other jurisdictions.

Local

City of Los Angeles Green New Deal

In 2007 the City addressed the issue of global climate change by releasing *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* ("LA Green Plan/Climate LA"). This document

[51] SCAQMD, Board Meeting, December 5, 2008. Agenda No. 31, http://www3.aqmd.gov/hb/2008/081231.a.thm. Accessed June 23, 2022.

[52] SCAQMD, Greenhouse Gases CEQA Significance Thresholds, http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds. Accessed June 23, 2022.

outlined various goals and actions that the City established to reduce the generation and emissions of GHGs from both public and private activities.

In April 2019, the City released the *Green New Deal* (also referred to as the *Sustainable City Plan 2019*). This program contains actions designed to create sustainability-based performance targets through 2050 that are themselves intended to advance economic, environmental, and equity objectives. It is the first four-year update to the City's first "Sustainable City pLAn" that was released in 2015. It augments, expands, and elaborates the City's vision for a sustainable future and tackles climate change with accelerated targets and new aggressive goals.

Though the *Green New Deal* is not a plan adopted solely to reduce GHG emissions, it lists "Climate Mitigation" (i.e., GHG reduction) as one of eight explicit benefits that help define its strategies and goals. Goals that are directly or indirectly linked to climate mitigation include:

- Reduce potable water use per capita by 22.5 percent by 2025; 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.
- Reduce building energy use per square feet for all building types by 22 percent by 2025; 34 percent by 2035; and 44 percent by 2050 (from a baseline of 68mBTU/sf in 2015).
- All new buildings will be net zero carbon by 2030 and 100 percent of buildings will be net zero carbon by 2050.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; 75 percent by 2050.
- Increase the percentage of all trips made by walking, biking, micro-mobility/matched rides, or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.
- Reduce VMT per capita by at least 13 percent by 2025; 39 percent by 2035; and 45 percent by 2050.
- Increase the percentage of electric and zero emission vehicles in the city to 25 percent by 2025; 80 percent by 2035; and 100 percent by 2050.
- Increase landfill diversion rate to 90 percent by 2025; 95 percent by 2035; and 100 percent by 2050.

- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 pounds of waste generated per capita per day in 2011).

- Eliminate organic waste going to landfills by 2028.

- Reduce the urban/rural temperature differential by at least 1.7 degrees by 2025; and 3 degrees by 2035.

- Ensure the proportion of Angelenos living within ½ mile of a park or open space is at least 65 percent by 2025; 75 percent by 2035; and 100 percent by 2050.

City of Los Angeles Green Building Code

In December 2019, the Los Angeles City Council approved Ordinance No. 186,488, which amended Chapter IX of the Los Angeles Municipal Code (LAMC), referred to as the Los Angeles Green Building Code, by adding a new Article 9 to incorporate various provisions of the 2019 CALGreen Code. Projects filed on or after January 1, 2020, must comply with the provisions of the Los Angeles Green Building Code.

City of Los Angeles All-Electric Buildings

Chapter IX of the LAMC requires that all new buildings be all-electric buildings, with few exceptions. Equipment typically powered by natural gas such as space heating, water heating, cooking appliances, and clothes drying would need to be powered by electricity for new construction. Exceptions are made for commercial restaurants, laboratories, and research and development uses. The LAMC is consistent with 2022 Title 24 goals of encouraging all-electric development which requires new residential uses to be electric-ready (wiring installed for all-electric appliances). Buildings in Los Angeles account for 43 percent of greenhouse gas emissions – more than any other sector in the City. These LAMC requirements ensure that new buildings being constructed are built to leverage the increasingly clean electric grid, which is anticipated to be carbon-free by 2035, rather than relying on fossil fuels.

City of Los Angeles General Plan Housing Element (Housing Needs Assessment)

The Housing Element of the City's General Plan is prepared pursuant to state law and provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides an array of programs the City intends to implement to create and preserve sustainable, mixed-income neighborhoods across the City.

The Housing Needs Assessment chapter of the Housing Element discusses the City's population and housing stock to identify housing needs for a variety of household types across the City. The

current RHNA goal for affordable housing within the City is approximately 40 percent of new construction. However, the City's projections show affordable housing comprising 20 percent of new construction, which falls short of the 40 percent RHNA goal. In order to address this shortfall in affordable housing, the Housing Element provides measures to streamline and incentivize development of affordable housing. Such measures include revising density bonuses for affordable housing; identifying locations which are ideal for funding programs to meet low-income housing goals; and rezoning areas to encourage low-income housing. With implementation of such measures to increase affordable housing, the Housing Element predicts a significant increase in housing production at all income ranges compared to previous cycles.

The Housing Element also promotes sustainability and resilience, and environmental justice through housing, as well as the need to reduce displacement. It encourages the utilization of alternatives to current parking standards that lower the cost of housing, support GHG and VMT goals and recognize the emergence of shared and alternative mobility. The Element also identifies housing strategies for energy conservation, water conservation, alternative energy sources and sustainable development which support conservation and reduce demand.

Mobility Plan 2035

In August 2015, the City Council adopted the Mobility Plan 2035, which serves as the City's General Plan circulation element. The City Council has adopted several amendments to the Mobility Plan since its initial adoption, including the most recent amendment in September 2016. The Mobility Plan incorporates "complete streets" principles and lays the foundation for how the City's residents interact with their streets. While the Mobility Plan 2035 mainly relates to transportation, certain components would serve to reduce VMT and mobile source GHG emissions. One component of the Mobility Plan is a GHG emission tracking program to establish compliance with SB 375, AB 32, and the region's Sustainable Community Strategy.

Existing Conditions

Existing Statewide GHG Emissions

CARB reports that in 2019, emissions from GHG emissions statewide were 404 $MMTCO_2e$, 27 $MMTCO_2e$ below the state's 2020 GHG limit of 431 $MMTCO_2e$. The transportation sector was the largest source of GHG emissions, accounting for approximately half of the state's GHG inventory when including upstream transportation emissions from the refinery and oil and gas industrial sectors. The commercial and residential sectors accounted for approximately 10 percent of GHG emissions. Agriculture accounted for approximately 8 percent, and electricity generation accounted for approximately 20 percent. Remaining emissions came from sectors such as non-transportation fuel-related industrial sources, recycling and waste management, and from high global warming potential gases.

In 2021, approximately 52 percent of electricity generation serving California came from renewable and zero-carbon resources (e.g., solar and wind).

Existing Project Site Emissions

The Main Campus site is currently improved with the existing high school and includes educational, athletic, performing arts, administrative, and religious facilities. The North Campus site is developed with a shopping center that contains a grocery store, restaurants, and other commercial uses, as well as surface parking for these uses. Existing GHG emissions related to these uses have been estimated for informational purposes. It is estimated that the high school generates approximately 3,563 $MTCO_2e$ of annual GHG emissions and that the North Campus existing uses generate approximately 3,847 $MTCO_2e$ of annual GHG emissions, for a combined total of 7,410 $MTCO_2e$ of annual GHG emissions.

Thresholds of Significance

The City has adopted the thresholds set forth in Appendix G of the CEQA Guidelines as project-specific thresholds of significance. Pursuant to the Appendix G thresholds, the Project would have a significant impact with respect to GHG emissions if it would:

a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

CEQA Guidelines Section 15064.4 recommends that lead agencies quantify GHG emissions of projects and consider several other factors that may be used in the determination of significant of GHG emissions from a project: the extent to which the project may increase or reduce GHG emissions; whether the project exceeds an applicable significant threshold; and the extent to which the project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs.

Section 15064.4 does not establish a threshold of significance. Lead agencies have the discretion to establish significance thresholds for their respective jurisdictions, and in establishing those thresholds, a lead agency may appropriately look to thresholds developed by other public agencies, or suggested by other experts, such as the California Air Pollution Control Officers Association (CAPCOA), as long as any threshold chosen is supported by substantial evidence (see CEQA Guidelines Section 15064.7(c)). The CEQA Guidelines also clarify that the effects of GHG emissions are cumulative and should be analyzed in the context of CEQA's requirements for cumulative impact analysis (see CEQA Guidelines Section 15130(f)). It is noted that the CEQA Guidelines were amended in response to SB 97. In particular, the CEQA Guidelines were amended to specify that compliance with a GHG emissions reduction plan renders a cumulative impact less than significant.

Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved

plan or mitigation program that provides specific requirements that would avoid or substantially lessen the cumulative problem within the geographic area of the project. To qualify, such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency. Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plans [and] plans or regulations for the reduction of GHG emissions." Put another way, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of less than significant for GHG emissions if a project complies with adopted programs, plans, policies, and/or other regulatory strategies to reduce GHG emissions.[53]

In the absence of any applicable adopted numeric threshold, the significance of the Project's GHG emissions is evaluated consistent with CEQA Guidelines Section 15064.4(b) by considering whether the Project is consistent with applicable regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. For this Project, as a land use development project, the most directly applicable adopted regulatory plan to reduce GHG emissions is the 2020-2045 RTP/SCS, which is designed to achieve regional GHG reductions from the land use and transportation sectors as required by SB 375 and the State's long-term climate goals. This analysis also considers qualitative consistency with regulations or requirements adopted by the 2022 Scoping Plan Update, as well as the City's Green New Deal.

SCAQMD Thresholds

SCAQMD has an interim GHG significance threshold of 10,000 $MTCO_2e$ per year for stationary source/industrial projects where SCAQMD is the lead agency. This SCAQMD interim GHG significance threshold is not applicable to the Project as the Project is not a stationary source or industrial project and the City of Los Angeles is the Lead Agency.

2006 L.A. CEQA Thresholds Guide

The *L.A. CEQA Thresholds Guide* does not identify any factors to evaluate GHG emissions impacts. Thus, the potential for the Project to result in impacts from GHG emissions is based on the Appendix G thresholds.

For the reasons set forth above, to answer both of the above Appendix G thresholds, the City will consider whether the Project is consistent with AB 1279 – the State's latest and most stringent

[53] See for example: San Joaquin Valley Air Pollution Control District, CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation, APR – 2030 (June 25, 2014), in which the SJVAPCD "determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…" Further, the SCAQMD has taken this position in CEQA documents it has produced as a lead agency. The SCAQMD has prepared three Negative Declarations and one Draft Environmental Impact Report that demonstrate the SCAQMD has applied its 10,000 $MTCO_2e$ per year significance threshold in such a way that GHG emissions covered by the Cap-and-Trade Program do not constitute emissions that must be measured against the threshold.

GHG reduction regulation – through demonstration of conformance with the 2020-2045 RTP/SCS, the 2022 Scoping Plan Update, and the Green New Deal.

Methodology

Amendments to CEQA Guidelines Section 15064.4 were adopted to assist lead agencies in determining the significance of the impacts of GHG emissions. Consistent with existing CEQA practice, Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. If a qualitative analysis is used, in addition to quantification, this section recommends certain qualitative factors that may be used in the determination of significance (i.e., the extent to which the project may increase or reduce GHG emissions compared to the existing environment; whether the project exceeds an applicable significance threshold; and the extent to which the project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs).

The City has not adopted a numerical significance threshold for assessing impacts related to GHG emissions and has not formally adopted a local plan for reducing GHG emissions. In addition, neither SCAQMD, OPR, CARB, CAPCOA, nor any other state or regional agency has adopted a numerical significance threshold for assessing GHG emissions that is applicable to the Project. Since there is no applicable adopted or accepted numerical threshold of significance for GHG emissions, the methodology for evaluating the Project's impacts related to GHG emissions focuses on its consistency with statewide, regional, and local plans adopted for the purpose of reducing and/or mitigating GHG emissions. This evaluation of consistency with such plans is the sole basis for determining the significance of the Project's GHG-related impacts on the environment.

For informational purposes, the analysis also estimates the amount of GHG emissions that would be attributable to the Project using recommended air quality models, as described below. The primary purpose of quantifying the Project's GHG emissions is to satisfy the State CEQA Guidelines Section 15064.4(a), which calls for a good-faith effort to describe and calculate emissions. However, the significance of the Project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the Project.

Consistency with Plans

The Project's GHG impacts are evaluated by assessing the Project's consistency with applicable statewide, regional, and local GHG reduction strategies. As discussed previously, the Project will be evaluated for consistency with the 2020-2045 RTP/SCS, the 2022 Scoping Plan Update, and the Green New Deal.

OPR encourages lead agencies to make use of programmatic mitigation plans and programs from which to tier when they perform individual project analyses. On a statewide level, the 2022 Scoping Plan Update provides measures to achieve the State's GHG reduction targets. On a regional level, SCAG's 2020-2045 RTP/SCS contains measures to achieve VMT reductions (and

corresponding GHG reductions) required under SB 375. The City does not have a programmatic mitigation plan to tier from, such as a GHG Emissions Reduction Plan as recommended in the relevant amendments to the CEQA Guidelines. However, the City has the Green New Deal and Green Building Code that encourage and require applicable projects to implement energy efficiency measures. The Green New Deal is a mayoral initiative and not an adopted plan. However, it includes short-term and long-term aspirations pertaining to climate change. This analysis addresses consistency with the Green New Deal's strategies and goals. Thus, if the Project is designed in accordance with the 2020-2045 RTP/SCS, the 2022 Scoping Plan Update, and the Green New Deal, the Project would result in a less than significant impact, because it would be consistent with the overarching State regulations on GHG reduction (i.e., SB 375 for the 2020-2045 RTP/SCS and AB 1279 for the 2022 Scoping Plan Update). A consistency analysis is provided and describes the Project's compliance or conflict with performance-based standards included in the applicable portions of the 2020-2045 RTP/SCS, the 2022 Scoping Plan Update, and the Green New Deal.

2022 Scoping Plan Update

Appendix D, Local Actions, of the 2022 Scoping Plan Update includes "recommendations intended to building momentum for local government actions that align with the State's climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action planning) and approval of new land use development projects, including through environmental review under CEQA.

The State encourages local governments to adopt a CEQA-qualified CAP addressing the three priority areas (transportation electrification, VMT reduction, and building decarbonization). However, the State recognizes that almost 50 percent of jurisdictions do not have an adopted CAP, among other reasons because they are costly, requiring technical expertise, staffing, and funding. Additionally, CAPs need to be monitored and updated as State targets change and new data is available. Jurisdictions that wish to take meaningful climate action (such as preparing a non-CEQA qualified CAP or as individual measures) aligned with the State's climate goals in the absence of a CEQA-qualified CAP are advised to look to the three priority areas when developing local climate plans, measures, policies, and actions. According to Appendix D, "By prioritizing climate action in these three priority areas, local governments can address the largest sources of GHGs within their jurisdiction."

The State also recognizes in Appendix D, Local Actions, of the 2022 Scoping Plan that each community or local area has distinctive situations and local jurisdictions must balance the urgent need for housing while demonstrating that a project is in alignment with the State's climate goals. The State calls for the climate crisis and the housing crisis to be confronted simultaneously. Jurisdictions should avoid creating targets that are impossible to meet as a basis to determine significance. Ultimately, targets that make it more difficult to achieve statewide goals by prohibiting or complicating projects that are needed to support the State's climate goals, like infill development, low-income housing or solar arrays, are not consistent with the State's goals. The

State also recognizes the lead agencies' discretion to develop evidence-based approaches for determining whether a project would have a potentially significant impact on GHG emissions.

Quantification of Project GHG Emissions

The California Emissions Estimator Model (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a variety of land use projects. CalEEMod was developed in collaboration with the air districts of California, which provided data (e.g., emissions factors, trip lengths, meteorology, source inventory, etc.) to account for local requirements and conditions. The model is considered by the SCAQMD to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.

A fundamental difficulty in the analysis of GHG emissions is the global nature of existing and cumulative future conditions. Changes in GHG emissions can be difficult to attribute to a particular planning program or project because the planning effort or project may cause a shift in the locale for some type of GHG emissions, rather than causing "new" GHG emissions. As a result, there is frequently an inability to conclude whether a project's GHG emissions represent a net global increase, reduction, or no change in GHGs that would existing if the project were not implemented. For example, if a multi-family residential project replaces an existing supermarket, GHG emissions associated with the existing supermarket would not be totally eliminated because former patrons of the supermarket would still drive and get groceries somewhere else, which would continue to generate associated GHG emissions. GHG emissions associated with the new multi-family residential project would not be totally new, because many residents will have presumably moved there from other housing. Their GHG emissions would be shifted to their new housing, not created from thin air. But, if the new multi-family residential project has access to high quality transit and walkable destinations, then there is a strong likelihood that the residents' GHG per capita would be reduced on average by their move to the new project. Notwithstanding these complexities, the analysis of the Project's GHG emissions is conservative because it assumes all the Project's direct and indirect GHG emissions would be new additions to the atmosphere.

Construction

The Project's construction emissions were estimated using CalEEMod Version 2022. Details regarding modeling assumptions are provided in the appendix to this report. CalEEMod calculates emissions from sources such as off-road equipment usage and on-road vehicle travel associated with hauling, delivery, and construction worker trips. GHG emissions during construction were estimated based on the assumptions provided in the appendix. GHG emissions generated by the Project's construction activities reflect the types and quantities of construction equipment that would be used to demolish existing buildings, grade the Project Site, and construct the Project.

In accordance with the SCAQMD's guidance, GHG emissions from construction were amortized (i.e., averaged annually) over the lifetime of the Project, assumed to be 30 years. As impacts from construction activities occur over a relatively short-term period of time, they contribute a relatively small portion of the overall lifetime project GHG emissions. Additionally, GHG emission reductions measures for construction equipment are relatively limited. Therefore, the SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime, so that any GHG reduction measures will address construction GHG emissions as part of operational GHG reduction strategies. Thus, total construction GHG emissions were divided by 30 and then added to the Project's annual operational GHG emissions inventory.

Operation

Similar to construction, CalEEMod Version 2022 was used to estimate potential direct and indirect GHG emissions generated by the Project's operations. Details regarding modeling assumptions are also provided in the appendix**.** The analysis addresses GHG emissions from the following sources:

- Area Sources: Emissions associated with the on-site use of powered equipment.
- Energy Sources: Emissions associated with a project's electricity and natural gas use for space heating and cooling, water heating, energy consumption, and lighting.
- Mobile Sources: Emissions associated with a project's related vehicle travel.
- Water/Wastewater Sources: Emissions associated with energy used to pump, convey, delivery, and treat water.
- Solid Waste Sources: Emissions associated with the disposal of solid waste into landfills.
- Refrigerant Sources: Emissions associated with fugitive GHG emissions associated with building air conditioning and refrigeration equipment.

Analysis of Project Impacts

The Appendix G thresholds questions concerning GHG emissions are addressed together in the following analysis:

a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Plan Consistency

Less Than Significant Impact. As described above, compliance with applicable GHG emissions reduction plans would result in a less than significant Project-level and cumulative impact. The following section describes the extent the Project complies with or exceeds the performance-based standards included in the 2020-2045 RTP/SCS, the 2022 Scoping Plan Update, and the Green New Deal. As demonstrated below, the Project would be consistent with these applicable GHG reduction plans and policies, and its GHG impact would therefore be less than significant.

2020-2045 RTP/SCS

SCAG's latest 2020-2045 RTP/SCS (Connect SoCal) is expected to help the SCAG region, and in turn California, reach its latest GHG reduction goals. Implementation of the 2020-2045 RTP/SCS is projected to reduce per capita vehicle GHG emissions by 19 percent by 2035, thus enabling the region to fulfill its portion of SB 375 compliance. Implementation is also projected to reduce daily VMT per capita by 5 percent by 2045.

The 2020-2045 RTP/SCS has limited applicability to the Project, but the Project would aid in the attainment of its VMT-related GHG reduction goals by reducing overall traffic generation. While the Project would result in a net increase of 292 trips during the PM peak hour, with the elimination of the existing shopping center, the Project results in a reduction of 1,355 net trips per day, which would reduce VMT associated with the Project Site. In addition, Table VIII-3, below, provides a comparison of the Project against the GHG-related performance measures of the 2020-2045 RTP/SCS and confirms that the Project would not conflict with the applicable GHG-related policies.

Table VIII-3
Consistency with the 2020-2045 RTP/SCS

Objectives	Consistency Analysis[a]
Increase percentage of region's total household growth occurring within HQTAs.	**Not Applicable.** The Project includes the update and expansion of an existing high school, and would not result in any household growth. Therefore, this objective would not be applicable to the Project.
Increase percent of the region's total employment growth occurring within HQTAs.	**Not Applicable.** The Project does not include any employment growth. In fact, with demolition of the existing commercial structures, employment on the Project Site is decreased. Therefore, this objective would not be applicable to the Project.
Decrease total acreage of greenfield or otherwise rural land uses converted to urban use.	**Consistent.** The Project represents an infill development that would not be built on greenfield or rural land, thereby reducing the demand for sprawl development on greenfield or rural areas on the fringes of Southern California.
Decrease daily vehicle miles driven per person.	**Consistent.** While the Project would result in a net increase of 292 trips during the PM peak hour, with

Table VIII-3
Consistency with the 2020-2045 RTP/SCS

Objectives	Consistency Analysis[a]
	the elimination of the existing shopping center, the Project results in a reduction of 1,355 net trips per day, which would reduce VMT associated with the Project Site.
Decrease average daily distance traveled for work and non-work trips (in miles)	**Consistent.** The Project does not include any employment growth and therefore, the length of work trips would not change as a result of the Project. In addition, the Project does not propose any changes to student enrollment, and therefore, the average daily distance traveled by students would remain unchanged as a result of the Project. For other non-work trips, the Project would result in approximately 292 new PM peak hour trips as a result of the expanded swim program on the North Campus (although the Project as a whole would still result in the reduction of 1,355 daily trips when taking into account the removal of the existing shopping center). Some of the uses at the new pool allow for limited community use of the pool, for people residing within one mile of the Project Site. Therefore, the Project would likely decrease the distance traveled for these trips, based on the requirement that people live within a one-mile radius.
Increase percentage of work and non-work trips which are less than 3 miles in length.	**Consistent.** The Project does not include any employment growth and therefore, the length of work trips would not change as a result of the Project. In addition, the Project does not propose any changes to student enrollment, and therefore, the length of trips for students to reach the Project Site would remain unchanged as a result of the Project. For other non-work trips, the Project would result in approximately 292 new PM peak hour trips as a result of the expanded swim program on the North Campus (although the Project as a whole would still result in the reduction of 1,355 daily trips when taking into account the removal of the existing shopping center). Some of the uses at the new pool allow for limited community use of the pool, for people residing within one mile of the Project Site.

Table VIII-3
Consistency with the 2020-2045 RTP/SCS

Objectives	Consistency Analysis[a]
	Therefore, the Project would increase the percentage of non-work trips which are less than three miles in length.
Increase share of short trip lengths for commute purposes.	**Not Applicable.** The Project does not include any employment growth and the commutes for the existing employees would not change as a result of the Project. Therefore, this objective would not be applicable to the Project.
Increase percentage of trips that use transit (work and all trips)	**Consistent.** The Project does not include any employment or student growth, and as discussed in Section 3, Project Description, approximately 20% of the students arrive by school bus. The Project's location near existing transit, including Metro local bus routes 152, 162, 165, and 169 would help increase the potential that visitors to the Project Site would use transit to access the Project Site.
Decrease average travel time to work (all modes)	**Not Applicable.** The Project does not include any employment growth and the travel time for the existing employees would not change as a result of the Project. Therefore, this objective would not be applicable to the Project.
Increase percentage of trips using either walking or biking (by trip type)	**Consistent.** The new pedestrian bridge would allow for people to safely walk between the Main Campus and North Campus, rather than drive. The Project would also include 78 bicycle parking spaces to support student and staff biking.
Reduce per capita GHG emissions (from 2005 levels)	**Consistent.** The Project represents an infill development to expand and update an existing school campus that will reduce GHG emissions. With the elimination of the existing shopping center, the Project results in a reduction of 1,355 net trips per day, which would reduce VMT and associated GHG emissions associated with the Project Site. As such, it is consistent with AB 32, SB 32, SB 375, and other initiatives designed to reduce per capita GHG emissions from 2005 levels.
Increase percentage of trips using a travel mode other than single occupancy vehicle (SOV)	**Consistent.** The Project will continue to implement the existing school transportation program, which includes school buses and facilitation of carpooling for siblings and neighbors. The Project would also include 78 bicycle parking spaces to support student and staff use of bicycle transportation.

Table VIII-3
Consistency with the 2020-2045 RTP/SCS

Objectives	Consistency Analysis[a]
	In addition, the new pedestrian bridge would encourage walking by providing a safe pedestrian connection between the Main Campus and North Campus.
Objectives from Table 5.1, Connect SoCal Performance Measures & Results, of SCAG's 2020-2045 RTP/SCS.	

2022 Scoping Plan Update

As discussed previously, jurisdictions that want to take meaningful climate action should look to the following three priority areas: transportation electrification, VMT reduction, and building decarbonization. An assessment of the goals, plans, and policies implemented by the City which would support GHG reduction strategies in the three priority areas is provided below.

Transportation Electrification

The priority GHG reduction strategies for local government climate action related to transportation electrification are discussed below and would support the Scoping Plan action to have 100 percent of all new passenger vehicles be zero-emission by 2035.

- **Convert local government fleets to zero-emission vehicles (ZEV)**

CARB approved the Advanced Clean Cars II rule which codifies Executive Order N-79-20 and requires 100 percent of new cars and light trucks sold in California to be zero-emission vehicles by 2035. The State has also adopted AB 2127, which requires the CEC to analyze and examine charging needs to support California's EVs in 2030. This report would help decision-makers allocate resources to install new EV chargers where they are needed most.

The City of LA Green New Deal (Sustainable City pLAn 2019) identifies a number of measures to reduce VMT and associated GHG emissions. Such measures that would support the local reduction strategy include converting all city fleet vehicles to zero emission where technically feasible by 2028. Starting in 2021, all vehicle procurement followed a "zero emission first" policy for City fleets. The Green New Deal also establishes a target to increase the percentage of zero emission vehicles to 25 percent by 2025, 80 percent by 2035, and 100 percent by 2050. In order to achieve this goal, the City would build 20 Fast Charging Plazas throughout the City. The City would also install 28,000 publicly available chargers by 2028 to encourage adoption of ZEVs.

The City's goals of converting the municipal fleet to zero emissions and installation of EV chargers throughout the City would be consistent with the Scoping Plan goals of transitioning to EVs. Although this measure mainly applies to City fleets, the Project would not conflict with these goals. The Project would support transition to ZEVs through its inclusion of approximately 137 EV

spaces and 17 EV charging stations (EVCS), consistent with City of Los Angeles Green Building Code requirements.

- **Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (such as building standards that exceed state building codes, permit streamlining, infrastructure siting, consumer education, preferential parking policies, and ZEV readiness plans.**

The State has adopted AB 1236 and AB 970, which require cities to adopt streamlined permitting procedures for EV charging stations. As a result, the City updated Section IX of the LAMC, which requires most new construction to designate 30 percent of new parking spaces as capable of supporting future electric vehicle supply equipment (EVSE). This would exceed the CALGreen 2022 requirements of 20 percent of new parking spaces as EV capable. The ordinance also requires new construction to install EVSE at 10 percent of total parking spaces. This requirement also exceeds the CALGreen 2022 requirements of installing EVSE for 25 percent of EV capable parking spaces which is approximately five percent of total parking spaces. The City has also implemented programs to increase the amount of EV charging on city streets, EV carshare, and incentive programs for apartments to be retrofitted with EV chargers.

The City's goals of installing EV chargers throughout the City would be consistent with the Scoping Plan's goals of transitioning to EVs. The Project would support this goal, as well. As noted, the Project would support transition to ZEVs through its inclusion of approximately 137 EV spaces and 17 EVCS, consistent with City of Los Angeles Green Building Code requirements.

VMT Reduction

The priority GHG reduction strategies for local government climate action related to VMT reduction are discussed below and would support the Scoping Plan action to reduce VMT per capita 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045.

- **Reduce or eliminate minimum parking standards in new developments.**
- **Implement parking pricing or transportation demand management pricing strategies.**

The City of Los Angeles Mobility Plan 2035, which is the Transportation Element of the City's General Plan, contains measures and programs related to VMT reduction throughout the City. With regard to parking standards, the implementation of Mobility Plan Programs and AB 2097 reduce or eliminate parking requirements for certain types of development near transit (within half a mile). These reduction strategies and TDM programs would serve to reduce minimum parking standards and reduce vehicle trips through the City, but they would not apply to the Project. Nevertheless, the Project would not interfere with implementation of these strategies.

- **Implement Complete Streets policies and investments, consistent with general plan circulation element requirements.**

The City of Los Angeles Mobility Plan 2035 established a "Complete Streets" planning framework which resulted in the City of Los Angeles Complete Streets Design Guide in 2015, consistent with the State's Complete Streets Act of 2008. A supplemental update to the Complete Streets Design Guide was adopted in 2020.

The Complete Streets Design Guide provides a number of measures to increase public access to electric shuttles, car sharing, and other active transportation modes. The Design Guide establishes guidelines for establishing on-street parking for car sharing. The City has also established BlueLA, which is a car sharing network consisting of more than 100 electric vehicles located throughout the City. In addition, under the Green New Deal, the City would install 28,000 publicly available chargers by 2028 and introduce 135 new electric DASH buses.

The Project would not conflict with the City's Complete Streets policies and circulation strategies. The Project proposes the expansion of an existing high school, with no changes to student enrollment. The Project's net reduction of 1,355 daily vehicle trips would also lead to substantial reductions in site-related VMT.

- **Increase access to public transit by increasing density of development near transit, improving transit service by increasing service frequency, creating bus priority lanes, reducing or eliminating fares, microtransit, etc.**
- **Increase public access to clean mobility options by planning for and investing in electric shuttles, bike share, car share, and walking.**
- **Amend zoning or development codes to enable mixed-use, walkable, transit-oriented, and compact infill development (such as increasing the allowable density of a neighborhood).**
- **Preserve natural and working lands by implementing land use policies that guide development toward infill areas and do not convert "greenfield" land to urban uses (e.g., green belts, strategic conservation easements).**

These reduction strategies are supported through implementation of SB 375, which requires integration of planning processes for transportation, land-use and housing and generally encourages jobs/housing proximity, promote transit-oriented development, and encourages high-density residential/commercial development along transit corridors.

To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020-2045 RTP/SCS, also referred to as Connect SoCal. The 2020-2045 RTP/SCS's "Core Vision" prioritizes the maintenance and management of the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets.

On a local level, the City has developed the Complete Streets Design Guide, which provides a number of reduction strategies to increase public access to electric shuttles, car sharing and walking, continues to build out networks in the Mobility Plan for pedestrians, bicyclists, and transit users, has implemented an EV car sharing network, and is working towards increasing publicly available chargers, and introducing new electric DASH buses.

As explained, the Project would not conflict with the 2020-2045 RTP/SCS or the City's Complete Streets strategies.

Building Decarbonization

The priority GHG reduction strategies for local government climate action related to electrification are discussed below and would support the Scoping Plan actions regarding meeting increased demand for electrification without new fossil gas-fired resources and all electric appliances beginning in 2026 (residential) and 2029 (commercial).

- **Adopt all-electric new construction reach codes for residential and commercial uses.**

California's transition away from fossil fuel-based energy sources will bring the Project's GHG emissions associated with building energy use down to zero as the State's electric supply becomes 100 percent carbon free. California has committed to achieving this goal by 2045 through SB 100, the 100 Percent Clean Energy Act of 2018. SB 100 strengthened the State's RPS Standard by requiring that 60 percent of all electricity provided to retail users in California come from renewable sources by 2030 and that 100 percent come from carbon-free sources by 2045. The land use sector will benefit from RPS because the electricity used in buildings will be increasingly carbon-free, but implementation does not depend (directly, at least) on how buildings are designed and built.

The City has updated the LAMC with requirements for all new buildings, with some exceptions, to be all-electric, which will reduce GHG emissions related to natural gas combustion. Space heating, water heating, and cooking for non-restaurant uses would be required to be powered by electricity. In future years, LADWP will be required to increase the amount of renewable energy in the power mix to comply with SB 100 requirements. The combination of all-electric LAMC regulations and increasing availability of renewable energy will serve to reduce GHG emissions from sources traditionally powered by natural gas.

The Project would be required to comply with the City's LAMC for the new buildings and would not include natural gas uses in the new buildings except where allowable for laboratory and cafeteria/food stand uses.

- **Adopt policies and incentive programs to implement energy efficiency retrofits for existing buildings, such as weatherization, lighting upgrades, and replacing energy-**

intensive appliances and equipment with more efficient systems (such as Energy Star-rated equipment and equipment controllers).

This reduction strategy would support the Scoping Plan action regarding electrification of appliances in existing residential buildings. The City and LADWP have established rebate programs to promote use of energy-efficient products and home upgrades. Under LADWP's Consumer Rebate Program, residential customers would receive rebates for energy-efficient upgrades such as Cool Roofs, Energy Star Windows, HVAC upgrades, pool pumps and insulation upgrades. Such upgrades would serve to reduce wasteful energy and water use and associated GHG emissions. As part of the Project, the existing single-story buildings located at the southeast corner of the Main Campus would undergo renovation for administrative offices. This renovation would include upgrades to existing lighting and replacement of existing windows with more efficient systems.

Green New Deal

The Green New Deal provides information as to what the City will do with buildings and infrastructure in its control, and it provides aspirational targets related to housing and development, as well as mobility and transit, that are related to GHG reduction. For example, targets include reducing VMT per capita five percent by 2025 and increasing trips made by walking, biking, or transit 35 percent by 2025. The Green New Deal has also established increased renewables requirements for LADWP. Regarding housing, the Green New Deal aspires that 75 percent of new housing units are built within 1,500 feet of transit by 2035.

The Project would not conflict with the City's aspirational targets in the Green New Deal. The Project, which proposes the expansion of school facilities with no change in enrollment, would have no measurable effect on VMT per capita of employees, students, or other users, though it would result in a net reduction of 1,355 daily vehicle trips, which would reduce site-related VMT. Regarding energy use, the Project would be built according to the City's Green Building Code and would benefit from the Green New Deal's increased renewables targets for LADWP.

Consistency Analysis - Conclusion

In summary, the Project's location, land use characteristics, and design would not conflict with 2020-2045 RTP/SCS, 2022 Scoping Plan Update, and Green New Deal efforts and strategies to reduce GHG emissions in accordance with the latest and most stringent AB 1279 and SB 375 targets. As a result, the Project's impacts related to GHG emissions and climate change would be less than significant.

Project GHG Emissions

As discussed above, compliance with applicable GHG emissions reductions plans renders a Project's impact less than significant. In support of the consistency analysis provided above, the

following quantitative estimates of the Project's GHG emissions are provided. The Project would result in direct and indirect GHG emissions generated by the following emissions sources:

- Construction: emissions associated with construction-related equipment and vehicle use.
- Area Sources: emissions associated with the on-site use of powered equipment.
- Energy Sources: emissions associated with the Project's electricity and natural gas use for space heating and cooling, water heating, energy consumption, and lighting.
- Mobile Sources: emissions associated with the Project's related vehicle travel.
- Water/Wastewater: emissions associated with energy used to pump, convey, deliver, and treat water.

Construction

As described previously, the Project may not be fully implemented until 2035. GHG emissions associated with the Project's most intensive construction phases were modeled, which are as follows:

- North Campus – Demolition
- North Campus – Grading
- North Campus – Construction of new athletic fields and ancillary facilities
- North Campus – Construction of new pool facilities
- Main Campus – Classroom and parking lot demolition
- Main Campus – Multistory Building grading
- Main Campus – Multistory Building construction

As shown in Table VIII-4, these construction phases are estimated to generate approximately 1,164 $MTCO_2e$. The Project would also involve the construction of a pedestrian bridge connecting the North Campus to the Main Campus, construction of new surface parking lots on the North Campus, construction of a new upper level student quad on the Main Campus, renovation of a small surface parking lot along Cohasset Street, and campus-wide renovations to existing athletics facilities, classroom buildings, and administrative offices. For a number of reasons, these phases/activities would generate substantially less GHG emissions than the previously listed phases. For example, renovations to classroom buildings and administrative offices would utilize mostly hand tools and electric power tools. Paving activities for the new surface parking lots would not last more than several workdays at each site. None of these activities/phases would require a substantial number of haul trips. Notwithstanding, to ensure that the Project's estimated construction-related GHG emissions are not underestimated, the Project's modeled GHG emissions estimate has been increased 20% to reflect GHG emissions that may be generated by these activities/phases. This results in an estimated 1,397 $MTCO_2e$ of construction-related GHG emissions. As recommended by the SCAQMD, the total construction-related GHG emissions

were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's annual operational emissions) in order to determine the Project's annual GHG emissions inventory.[54] This results in annual Project construction emissions of approximately 46.6 $MTCO_2e$.

Table VIII-4
Construction-Related GHG Emissions

Phase	Emissions ($MTCO_2e$)
North Campus – Demolition	110
North Campus – Grading	45
North Campus – Construction of Athletic Fields and Ancillary Facilities	35
North Campus – Construction of Pool Facilities	138
Main Campus – Classroom and Parking Lot Demolition	52
Main Campus – Multistory Building Grading	186
Main Campus – Multistory Building Construction	598
Subtotal:	1,164
20% Adjustment for Other Activities/Phases	233
Total	1,397
Amortized over 30 years	46.6
Source: Greenhouse Gas Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, contained in Appendix B of this IS/MND.	

Operation

GHG emissions associated with the Project's major improvements were modeled to estimate the Project's GHG emissions from operations. The major improvements used in the modeling represent the largest sources of emissions from new facilities. Other campus improvements are renovations of existing facilities which will include upgraded and more energy efficient components. Therefore, the modeling accounted for:

- 69,254 new square feet of building area (Multistory Building, pool facilities, ancillary athletics buildings, etc.)
- 1.39 acres of new surface parking lot (North Campus surface parking lot, pool facility surface parking lot, renovated parking lot along Cohasset Street)
- 6,150 square foot new swimming pool

[54] SCAQMD Governing Board Agenda Item 31. December 5, 2008.

- 0.23 acres of new paved area
- New LED sports lighting

Table VIII-5 shows the Project's estimated GHG emissions from these improvements, including the Project's annualized construction-related GHG emissions. As shown, operation of the Project at buildout is estimated to result in approximately 1,430 $MTCO_2e$ per year.

Table VIII-5
Operations-Related GHG Emissions at Project Buildout

Source	Annual Emissions ($MTCO_2e$)
Area	1.53
Energy	246
Mobile	1,088
Solid Waste	39.0
Water/Wastewater	9.33
Construction	46.6
Total Emissions	1,430
Source: Greenhouse Gas Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, contained in Appendix B of this IS/MND.	

Conclusion

The emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. The consequences of that climate change can cause adverse environmental effects. A project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. The State has mandated goals of reducing statewide emissions to 1990 levels, even though statewide population and commerce is predicted to continue to expand. In order to achieve this goal, CARB has adopted various plans and regulations to reduce statewide GHG emissions.

Consistent with CEQA Guidelines Section 15064(h)(3), the City as Lead Agency has determined that the Project's contribution to cumulative GHG emissions and global climate change would be less than significant if the Project is consistent with the applicable regulatory plans and policies to reduce GHG emissions. Given the Project's consistency with the applicable plans, the Project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. In the absence of adopted standards and established significance thresholds, and given this consistency, it is concluded that the Project's impacts are cumulatively less than significant.

IX. HAZARDS AND HAZARDOUS MATERIALS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☒	☐	☐
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☒

The analysis in this section is based in part on the following item, which is included as Appendix F of this IS/MND:

- Phase I Environmental Site Assessment and Limited Soil Vapor Survey, Dudek, January 2018.

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. A significant impact may occur if a project would involve the use or disposal of hazardous materials as part of its routine operations or would have the potential to generate toxic or otherwise hazardous emissions that could adversely affect the public or the environment. Construction of the Project would not use a significant amount of hazardous materials, and the types of hazardous materials that would be used during construction of the Project would be typical of those hazardous materials necessary for construction of similar commercial buildings (e.g., paints, solvents, fuel for construction equipment, building materials, etc.). While construction of the Project would require the temporary transport, use, and disposal of hazardous waste, construction activities associated with the Project would be required to comply with all applicable federal, state, and local regulations governing such activities. As the Project would not use a significant amount of hazardous materials during construction, it would not create a significant hazard to the public or the environment, and this impact would be less than significant.

The Project includes the partial demolition of existing surface parking lots and classroom buildings from the Main Campus, and the demolition of the shopping center and associated surface parking from the North Campus, and then the construction of new school uses, including a new Multistory Building on the Main Campus and athletic fields, pool, and pool house on the North Campus. The types of hazardous materials that would be found on the Project Site during the Project's operational phase would be those typically associated with a school use – paints, cleaning supplies, and small amounts of petroleum products. Such use of these materials would be consistent with the use of these materials currently occurring on the Project Site. The use of these materials would comply with all applicable federal, state, and local regulations, which may include the Resource Conservation and Recovery Act, California Hazardous Waste Control Law, Federal and State Occupational Safety and Health Acts, SCAQMD rules, and permits and associated conditions issued by LADBS. Therefore, the Project would not require the routine transport, use, or disposal of hazardous materials that would create a significant hazard to the public or the environment, and this impact would be less than significant.

b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less Than Significant with Mitigation Incorporated. A significant impact may occur if a project could potentially pose a hazard to the public or the environment by releasing hazardous materials into the environment through accident or upset conditions. The following provides a summary of observations from the Phase I Environmental Site Assessment and Limited Soil Vapor Survey (Phase I and II ESA) prepared by Dudek, which is included in Appendix F of this IS/MND).

The Phase I ESA identified the following recognized environmental conditions (RECs) in connection with the Project Site:

- The long-term presence of a dry cleaner at the Project Site with known solvent releases;
- The known release of hydrocarbons to soil and groundwater from the adjacent gas station;
- Potential vapor intrusion concerns from the dry cleaner and adjacent former gas station; and
- Former agricultural use from before 1928 until sometime after 1959.

As a result of the identification of these RECs, a limited Phase II ESA was performed related to the dry cleaner, adjacent former gas station, and former agricultural use of the Project Site. The results of the limited Phase II ESA are included in Appendix F of this IS/MND, and based on these results, the shallow perchloroethylene (PCE)-impacted soil vapor shall be remediated to mitigate potential vapor intrusion risk. This remediation is formally required as Mitigation Measure HAZ-1, provided below. With implementation of Mitigation Measure HAZ-1, Project impacts with respect to vapor intrusion would be less than significant. The results of the limited Phase II ESA also indicate that the former agricultural use of the Project Site is unlikely to present a risk to human health and is therefore considered to be de minimis.

The existing buildings were built between 1962 and 1964. Therefore, there is the potential for asbestos-containing materials (ACM) to be in the building materials. ACMs, which are carcinogenic and can cause lung disease, are derived from naturally occurring fibrous minerals that have been mined for their useful properties in built structures, such as thermal insulation, chemical and thermal stability, and high tensile strength. When left intact and undisturbed, these materials do not pose a health risk to building occupants. There is, however, a potential for exposure when the material becomes damaged to the extent that asbestos fibers become airborne and are inhaled. The principal federal government agencies that regulate asbestos exposure at the Occupational Safety and Health Administration (OSHA) and the US EPA, both of which began regulating asbestos exposure in the early 1970s. Additional regulation and oversight is provided by the SCAQMD.

Removal of asbestos in a building is not unusual and can be readily accomplished. In accordance with existing City, State, and federal rules and regulations, including the federal EPA's National Emission Standards for Hazardous Air Pollutants (NESHAP) regulation (40 Code of Federal Regulations 61 Subpart M), the federal regulations under the Occupational Safety and Health Act (29 Code of Federal Regulations Section 1926.1101) California Occupational Safety and Health Administration (CAL-OSHA) regulations (California Code of Regulations, title 8, Sections 341.15, 1529), and SCAQMD Rule 1403, all materials, which are identified as ACM, would be removed by a trained and licensed asbestos abatement contractor. Generally, asbestos removal is a low risk operation. When following asbestos-related regulations, the possibility of exposure to airborne asbestos fibers from asbestos removal projects is limited. The removal and disposal of ACMs

from the Project Site in accordance with existing regulations would ensure that the Project would not create a significant hazard to the public or the environment through accident or upset conditions, and the Project's impact would be less than significant.

As the existing buildings were constructed between 1962 and 1964, it is likely that they also contain lead-based paint (LBP). Demolition of the existing buildings could therefore release LBP present in the structures. In order to ensure minimal exposure to sensitive receptors and workers, LBP found in the buildings would be removed and disposed of as recommended by a qualified Department of Health Services lead consultant and in accordance with applicable federal, State, and City regulations, including the federal regulations under the Occupational Safety and Health Act (29 Code of Federal Regulations Section 1926 et seq.), CAL-OSHA regulations (California Code of Regulations, title 8, Sections 1532.1 and 35001 *et seq.*). The removal and disposal of LBP from the Project Site in accordance with existing regulations would ensure that the Project would not create a significant hazard to the public or the environment through accident or upset conditions, and the Project's impact would be less than significant.

Mitigation Measure

HAZ-1 Prior to the issuance of a grading permit, the shallow PCE-impacted soil vapor shall be remediated using soil vapor extraction (SVE) as the primary means of remediation. An SVE remediation system shall be installed consisting of 17 vapor extraction wells. Each vapor extraction well would have a 10-foot screened interval, from five to 15 feet below ground surface, and the wells would be connected to the SVE unit via sub-grade PVC-piping. The soil vapor shall be remediated to the satisfaction of the Los Angeles Fire Department and the Department of Building and Safety.

c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less Than Significant Impact. A significant adverse effect may occur if a project site is located within one-quarter mile of an existing or proposed school site and is projected to release toxic emissions which pose a health hazard beyond regulatory thresholds. Pomelo Community Charter School is located approximately one-quarter mile west of the Main Campus and Justice Street Academy Charter School is located approximately one-quarter mile north of the North Campus. The types of hazardous materials that would be used during construction of the Project would be typical of those hazardous materials necessary for construction (e.g., paints, solvents, fuel for construction equipment, building materials, etc.), which could emit hazardous emissions. However, the use of these materials would comply with all applicable federal, state, and local regulations. In addition, there are intervening structures and roadways between the schools and the Project Site, and the distance between the Project Site and the nearest schools would ensure that the Project's use of these materials would not pose a hazard to these schools.

While the Project would be operational during school hours as it is also a school, to the extent that the Project would require the use of hazardous materials, such use would be in accordance

with existing local, state, and federal regulations. In addition, there are intervening structures and roadways between the schools and the Project Site. Therefore, the Project would not pose a significant risk involving the routine transport, use, and disposal of hazardous materials or the accidental release of hazardous materials, and impacts associated with the emission of hazardous materials near an existing or proposed school would be less than significant.

d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less Than Significant Impact. California Government Code Section 65962.5 requires various state agencies, including but not limited to, the Department of Toxic Substances Control (DTSC) and SWRCB, to compile lists of hazardous waste disposal facilities, unauthorized releases from underground storage tanks, contaminated drinking water wells and solid waste facilities where there is known migration of hazardous waste and submit such information to the Secretary for Environmental Protection on at least an annual basis, commonly referred to as the "Cortese List." A significant impact may occur if a project site is included on any of the above lists and poses an environmental hazard to surrounding sensitive uses. According to the Phase I ESA (included in Appendix F of this IS/MND), the Project Site does not appear on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and therefore, this impact would be less than significant.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. A significant impact may occur if a project is located within an airport land use plan, or within two miles of a public airport or public use airport, and would subject people residing or working in the area to a safety hazard or excessive noise levels. The Project Site is not located within an airport land use plan or within two miles of a public airport or public use airport. Thus, implementation of the Project would not have the potential to exacerbate current environmental conditions as to result in a safety hazard or excessive noise for people residing or working in the area of the Project Site, and no impact would occur.

f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. A significant impact may occur if a project were to interfere with roadway operations used in conjunction with an emergency response plan or emergency evacuation plan or would generate traffic congestion that would interfere with the execution of such a plan. While it is expected that the majority of construction activities for the Project would be confined to the Project Site, temporary and limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially affect emergency access adjacent to the Project Site. Access to the Project Site and surrounding area

during construction of the Project would be maintained in accordance with standard construction management plans that would be implemented to ensure adequate circulation and emergency access (Mitigation Measure TRANS-1 provides the requirement for a Construction Traffic Management Plan). Furthermore, prior to the issuance of a building permit, the Project Applicant would be required by the Los Angeles Fire Department (LAFD) and the Department of Building and Safety to develop an emergency response plan for the Project in consultation with the LAFD and the Los Angeles Department of Transportation (LADOT). The emergency response plan shall include but not be limited to the following: mapping of emergency exits, evacuation routes for vehicles and pedestrians, location of nearest hospitals, and fire departments. Preparation and implementation of the Project-specific emergency response plan as required by City regulations would ensure that Project impacts related to emergency response would be less than significant.

g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

No Impact. A significant impact may occur if a project is located in proximity to wildland areas and poses a potential fire hazard, which could affect persons or structures in the area in the event of a fire. The Project Site is not located in a Very High Fire Hazard Severity Zone.[55] Therefore, no impact regarding this topic would occur.

Cumulative Impacts

The geographic extent of the Project's environmental impacts is limited to the Project Site and would not contribute to any other potential environmental impact that may occur beyond the Project Site boundaries. In addition, no related projects have been identified within one-half mile of the Project Site. As stated previously, the Project would not result in any significant impacts related to hazards and hazardous materials. Therefore, cumulative impacts related to hazards and hazardous materials would be less than significant.

[55] City of Los Angeles, ZIMAS Parcel Profile Report, website: http://zimas.lacity.org, June 12, 2023.

X. HYDROLOGY AND WATER QUALITY

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i. Result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	☐	☐	☒	☐
iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv. Impede or redirect flood flows?	☐	☐	☐	☒
d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☐	☒

a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant Impact. A significant impact may occur if a project discharges water which does not meet the quality standards of agencies that regulate surface water quality and water discharge into stormwater drainage systems. Significant impacts would also occur if a project does not comply with all applicable regulations with regard to surface water quality as governed

by the State Water Resources Control Board (SWRCB). During construction of the Project, particularly during the grading and excavation phases, stormwater runoff from precipitation events could cause exposed and stockpiled soils to be subject to erosion and convey sediments into municipal storm drain systems. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff. Pollutant discharges relating to the storage, handling, use and disposal of chemicals, adhesives, coatings, lubricants, and fuel could also occur. Thus, a significant impact could occur if a project discharges water that does not meet the quality standards of agencies that regulate surface water quality and water discharge into storm water drainage systems or would not comply with all applicable regulations as governed by the Los Angeles Regional Water Quality Control Board (LARWQCB).

The Project would be required to comply with the NPDES General Construction Permit, which satisfies the LARWQCB water quality standards, including the preparation of a SWPPP and implementation of BMPs, required to minimize soil erosion and sedimentation from entering the storm drains during the construction period. In addition, the Project would be subject to the City's Stormwater and Urban Runoff Pollution Control regulations (Ordinance No. 172,176 and No. 173,494) to ensure pollutant loads from the Project Site would be minimized for downstream receiving waters. Compliance with the NPDES and implementation of the SWPPP and BMPs, as well as the City's discharge requirements, would ensure that the Project complies with the LARWQCB standards and therefore that construction stormwater runoff would not violate water quality and/or discharge requirements.

Stormwater runoff generated during operation of the Project has the potential to introduce small amounts of pollutants (e.g., typical commercial cleaning products, landscaping pesticides, and vehicle petroleum products) into the stormwater system. Stormwater runoff from precipitation events could carry urban pollutants into municipal storm drains. However, during operation, the Project would be required to comply with the City's Low Impact Development (LID) Ordinance. The LID Ordinance applies to all development and redevelopment projects in the City that require a building permit. LID plans are required to include a site design approach and BMPs that address runoff and pollution at the source. Further, to comply with LID Ordinance, the Project would be required to capture and treat the first 3/4-inch of rainfall in accordance with established stormwater treatment protocols. Regulatory compliance with the LID Ordinance would reduce the amount of surface water runoff leaving the Project Site as compared to the current conditions. Regulatory compliance with the LID Plan and Standard Urban Stormwater Mitigation Plan (SUSMP), including the implementation of BMPs, would ensure that operation of the Project would not violate water quality standard and discharge requirements or otherwise substantially degrade water quality.

Compliance with these regulations would ensure construction and operational activities of the Project would not violate water quality standards, waste discharge requirements, or otherwise substantially degrade water quality, and Project impacts related to water quality would be less than significant.

b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less Than Significant Impact. A significant impact may occur if a project includes deep excavations resulting in the potential to interfere with groundwater movement or includes withdrawal of groundwater or paving of existing permeable surfaces important to groundwater recharge. During a storm event, stormwater runoff flows to the adjacent roadways where it is directed into the City's storm drain system. As such, the Project Site is not a source of groundwater recharge. Following redevelopment of the Project Site, groundwater recharge would remain negligible, similar to existing conditions.

According to the Geotechnical Investigation conducted for the Project Site (refer to Appendix E-1 of this IS/MND), based on the reported historic high groundwater levels in the Project Site vicinity, the depth to groundwater encountered in the borings advanced as part of the Geotechnical Investigation, and the depth of proposed construction, static groundwater is not expected to be encountered during construction or to have a detrimental effect on the Project.[56] Therefore, it is not likely that any temporary dewatering would be required during construction. Finally, all water consumption associated with the Project would be supplied by LADWP and not from any groundwater beneath the Project Site. Thus, Project impacts with respect to groundwater would be less than significant.

c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i. Result in substantial erosion or siltation on- or off-site;

Less Than Significant Impact. A significant impact may occur if a project results in a substantial alteration of drainage patterns that would result in a substantial increase in erosion or siltation. The Project Site is located in an urbanized area of the City, and there are no natural watercourses on the Project Site. The North Campus is currently developed with a shopping center and associated surface parking lot, and is almost entirely impervious. The Project would increase the amount of pervious surface on the North Campus as a new soccer and baseball field would be constructed on the North Campus. Current stormwater runoff flows to the local storm drain system. Under the post-Project condition, the Project Site would contain more pervious surface, based on the changes to the North Campus site. In addition, the Project Applicant would be required to prepare a SWPPP and implement BMPs to reduce runoff and preserve water quality during construction of the Project. While grading and construction activities may temporarily alter the existing drainage patterns of the Project Site, BMPs would be implemented to minimize soil erosion impacts during Project grading and construction activities. In addition, the Project

[56] Geotechnical Investigation, Geocon West, January 12, 2023, page 6.

Applicant would be required to implement a LID Plan (during operation), which would reduce the amount of surface water runoff leaving the Project Site after a storm event. Specifically, the LID Plan would require the implementation of stormwater BMPs to retain or treat the runoff from a storm event producing 3/4-inch of rainfall in a 24-hour period. Therefore, the Project would not result in substantial erosion or siltation on- or off-site, impacts would be less than significant.

ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

Less Than Significant Impact. A significant impact may occur if a project results in increased runoff volumes during construction or operation of the project that would result in flooding conditions affecting the Project Site or nearby properties. Grading and construction activities on the Project Site may temporarily alter the existing drainage patterns and change off-site flows. However, construction and operation of the Project would not result in a significant increase in site runoff or any changes in the local drainage patterns that would result in flooding on- or off-site. The North Campus is currently developed with a shopping center and associated surface parking lot, and is almost entirely impervious. The Project would increase the amount of pervious surface on the North Campus as a new soccer and baseball field would be constructed on the North Campus. The Project would also be required to prepare a SWPPP and implement BMPs to reduce runoff and preserve water quality during construction of the Project. Regulatory compliance with the LID Ordinance would also reduce the amount of surface water runoff leaving the Project Site as compared to the current conditions. Project impacts would therefore be less than significant.

iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Less Than Significant Impact. A significant impact may occur if a project would increase the volume of stormwater runoff to a level that exceeds the capacity of the storm drain system serving the Project Site, or if a project would substantially increase the probability that polluted runoff would reach storm drains. Runoff from the Project Site flows to the adjacent roadways where it is directed into the City's storm drain system. Three general sources of potential short-term construction-related stormwater pollution associated with the Project are: 1) the handling, storage, and disposal of construction materials containing pollutants; 2) the maintenance and operation of construction equipment; and 3) earth moving activities which, when not controlled, may generate soil erosion and transportation, via storm runoff or mechanical equipment. Pursuant to City policy, stormwater retention would be required as part of the LID/SUSMP implementation features (despite an increase in pervious surfaces on the North Campus). Any contaminants gathered during routine cleaning of construction equipment would be disposed of in compliance with applicable stormwater pollution prevention permits. During construction, the Applicant will be required to demonstrate compliance with NPDES permitting, and will implement all applicable and mandatory BMPs in accordance with the approved LID Plan and the SWPPP. These "good-

housekeeping" practices would ensure that short-term construction-related activities would not result in polluted stormwater leaving the site.

Pollutants resulting from Project operation, including petroleum products associated with the Project's parking and circulation areas, would be subject to the requirements and water quality standards and wastewater discharge BMPs set forth by the City, the SWRCB, and the Project's approved LID Plan. Further, the Project would be required to comply with the NPDES and applicable LID Ordinance requirements. Accordingly, the Project would be required to demonstrate compliance with LID Ordinance standards and retain or treat the first three-quarters inch of rainfall in a 24-hour period. Thus, the Project would not create or contribute surface runoff that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Therefore, Project impacts related to storm drain capacity and water quality would be less than significant.

iv. Impede or redirect flood flows?

No Impact. The Project Site is not located near any bodies of water, rivers, or streams that are subject to flooding. Thus, the Project would not have the potential to impede or redirect flood flows and no impact related to this issue would occur.

d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

No Impact. A seiche is an oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, lake, or storage tank. A tsunami is a great sea wave, commonly referred to as a tidal wave, produced by a significant disturbance undersea, such as a tectonic displacement of sea floor associated with large, shallow earthquakes. Mudflows occur as a result of downslope movement of soil and/or rock under the influence of gravity. The Project Site is not located within a 100-year flood zone, as mapped by the Federal Emergency Management Agency (FEMA, Flood Insurance Rate Map number 06037C1275F).[57] Further, the City of Los Angeles 2018 Local Hazard Mitigation Plan does not map the Project Site as being located within an area potentially affected by a tsunami.[58] Therefore, the Project would not expose people or structures to a significant risk of loss, injury, or death involving inundation by seiche, tsunami, or mudflow, and no impact would occur.

e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. The Project is within the jurisdiction of the LARWQCB, and grading, excavation, and other construction activities associated with the implementation of the

[57] FEMA Flood Map Service Center, Search by Address, website: https://msc.fema.gov/portal/search#searchresultsanchor, accessed June 14, 2023.

[58] City of Los Angeles, 2018 Local Hazard Mitigation Plan, Figures 12-1 and 12-2.

Project could impact water quality due to erosion resulting from exposed soils that may be transported from the Project Site in stormwater runoff. Compliance with the NPDES program would ensure that stormwater pollutants would not substantially degrade water quality. Further, the Project would be required to comply with the City's SUSMP requirements. Compliance with these regulations would ensure that Project impacts with respect to a water quality control plan or groundwater management plan would be less than significant.

Cumulative Impacts

The Project would be located in an urbanized area where most of the surrounding properties are already developed. The existing storm drainage system serving this area has been designed to accommodate runoff from an urban built-out environment. Although no related projects have been identified within one-half mile of the Project Site, when new construction occurs, it generally does not lead to substantial additional runoff, since new developments are required to control the amount and quality of stormwater runoff coming from their respective sites. All new development in the City, such as the Project and any other development projects, is required to comply with the City's LID Ordinance and incorporate appropriate stormwater pollution control measures into the design plans to ensure that water quality impacts are minimized. Therefore, cumulative impacts related to hydrology and water quality would be less than significant.

XI. LAND USE AND PLANNING

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Physically divide an established community?	☐	☐	☐	☒
b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

a. Physically divide an established community?

No Impact. A significant impact may occur if a project is sufficiently large enough or otherwise configured in such a way as to create a physical barrier within an established community (a typical example would be a project which involved a continuous right-of-way such as a roadway which would divide a community and impede access between parts of the community). The Project Site is located in an urbanized area of the City. The Main Campus site has been developed with the existing high school for over six decades. The North Campus site has been developed with a commercial shopping center. The Project includes the expansion of the existing school to include the North Campus site, to provide additional athletic and parking facilities to serve the existing student population. Overall, the Project would be compatible with and complement the existing uses in the surrounding area and would not be of a density, scale, or height to constitute a physical barrier separating an established community. Thus, no impact would occur.

b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact. A project is considered consistent with the provisions and general policies of an applicable City or regional land use plans and regulations if it is consistent with the overall intent of the plans and would not preclude the attainment of its primary goals.[59] More specifically, according to the ruling in *Sequoyah Hills Homeowners Association v. City of Oakland*, state law does not require an exact match between a project and the applicable general plan. Rather, to be "consistent," the project must be "compatible with the objectives, policies, general land uses, and programs specified in the applicable plan," meaning that a project must be in "agreement or harmony" with the applicable land use plan to be consistent with that plan.

Various local and regional plans and regulatory documents guide development of the Project Site. The following discussion addresses the Project's consistency with the requirements and policies

[59] Sequoyah Hills Homeowners Association v. City of Oakland (1993) 23 Cal.App.4th 704, 719.

of SCAG's RTP/SCS, the City's General Plan (including the Framework Element), the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan, and the LAMC, to the extent that various goals, objectives, and policies of these plans have been adopted for the purpose of avoiding or mitigating an environmental effect.

As discussed below, the Project would be substantially consistent with all of the applicable plans, policies, and regulations adopted for the purpose of avoiding or mitigating an environmental effect associated with development of the Project Site. Therefore, Project impacts related to land use and planning would be less than significant, as further described below.

Regional

SCAG's 2020-2045 RTP/SCS

SB 375 requires MPOs such as SCAG to revise and update their RTPs and SCS' periodically. On September 3, 2020, SCAG's Regional Council formally adopted the 2020-2045 RTP/SCS (also known as Connect SoCal). The 2020-2045 RTP/SCS is a long-range visioning plan that builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. It charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians.

The 2020-2045 RTP/SCS outlines more than $638 billion in transportation system investments through 2045 and was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. The 2020-2045 RTP/SCS includes strategies for accommodating projected population, household, and employment growth in the SCAG region by 2045 as well as a transportation investment strategy for the region. These land use strategies are directly tied to supporting related GHG emissions reductions through increasing transportation choices with a reduced dependence on automobiles and an increase growth in walkable, mixed-use communities and HQTAs and by encouraging growth near destinations and mobility options, promoting diverse housing choices, leveraging technology innovations, supporting implementation of sustainability policies, and promoting a green region.

Project Consistency Discussion

As discussed on Table XI-1, the Project would be substantially consistent with the goals and principles contained in the 2020-2045 RTP/SCS.

Table XI-1
Project Consistency with the 2020-2045 RTP/SCS

Goals and Guiding Principles	Consistency Assessment
Goal 1 Encourage regional economic prosperity and global competitiveness.	**Not Applicable.** This goal is directed towards SCAG and the City and does not apply to the Project.
Goal 2 Improve mobility, accessibility, reliability, and travel safety for people and goods.	**Consistent.** The Project Site is located in an urbanized area of the City and involves the expansion and upgrade of an existing high school. The Project improves vehicular and pedestrian circulation with new access points and a pedestrian bridge. The Project also would be subject to the site plan review requirements of the City and would be required to coordinate with LADOT, the Department of Building and Safety and the Los Angeles Fire Department to ensure that all access points, driveways, and parking areas would not create a design hazard to local roadways. Therefore, the Project would allow for mobility, accessibility, reliability, and travel safety for people and goods.
Goal 3 Enhance the preservation, security, and resilience of the regional transportation system.	**Not Applicable.** This goal is directed toward SCAG and other jurisdictions that are responsible for developing, maintaining, and improving the regional transportation system.
Goal 4 Increase person and goods movement and travel choices within the transportation system.	**Consistent.** The Project includes the expansion and upgrade of an existing high school. With the removal of the existing uses on the North Campus, the Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT. In addition, the Project would provide approximately 137 EV spaces and 17 EVCS, as well as 78 bicycle parking spaces.
Goal 5 Reduce greenhouse gas emissions and improve air quality.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT and associated GHG and other pollutant emissions.
Goal 6 Support healthy and equitable communities.	**Consistent.** The Project includes development of additional recreational facilities, including a baseball/soccer field and pool, which would be made available on a limited basis to the community. In addition, the Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT and associated GHG and other pollutant emissions.
Goal 7 Adapt to a changing climate and support an integrated regional development pattern and transportation network.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT and associated mobile-source GHG emissions. In addition, the Project would provide approximately

Table XI-1
Project Consistency with the 2020-2045 RTP/SCS

Goals and Guiding Principles	Consistency Assessment
	137 EV spaces and 17 EVCS, as well as 78 bicycle parking spaces.
Goal 8 Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	**Not Applicable.** This goal is directed toward SCAG and other jurisdictions that are responsible for developing, maintaining, and improving the regional transportation system.
Goal 10 Promote conservation of natural and agricultural lands and restoration of habitats.	**Consistent.** The Project is an infill development on a previously fully developed site that would not affect any natural or agricultural lands or restoration of habitats.
Guiding Principle 1 Base transportation investments on adopted regional performance indicators and MAP-21/FAST Act regional targets.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that are responsible for developing, maintaining, and improving the regional transportation system.
Guiding Principle 2 Place high priority for transportation funding in the region on projects and programs that improve mobility, accessibility, reliability and safety, and that preserve the existing transportation system.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that are responsible for developing, maintaining, and improving the regional transportation system.
Guiding Principle 3 Assure that land use and growth strategies recognize local input, promote sustainable transportation options, and support equitable and adaptable communities.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that are responsible for developing and implementing growth strategies.
Guiding Principle 4 Encourage RTP/SCS investments and strategies that collectively result in reduced non-recurrent congestion and demand for single occupancy vehicle use, by leveraging new transportation technologies and expanding travel choices.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that are responsible for developing, maintaining, and improving the regional transportation system.
Guiding Principle 5 Encourage transportation investments that will result in improved air quality and public health, and reduced greenhouse gas emissions.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that have control over transportation investments.
Guiding Principle 6 Monitor progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies.	**Not Applicable.** This principle is directed toward SCAG that has the responsibility of monitoring the progress of Connect SoCal.
Guiding Principle 7 Regionally, transportation investments should reflect best-known science regarding climate change vulnerability, in order to design for long term resilience.	**Not Applicable.** This principle is directed toward SCAG and other jurisdictions/agencies that have control over transportation investments.

Local

City of Los Angeles General Plan

The City's General Plan, adopted December 1996 and re-adopted August 2001, provides general guidance on land use issues for the entire City. The General Plan consists of a Framework Element (including chapters pertaining to Land Use and Urban Form and Neighborhood Design), a Land Use Element (comprising 35 community plans prepared for distinct geographic areas of the City), and 10 Citywide elements.

Framework Element

The Framework Element of the General Plan serves as guide for the City's overall long-range growth and development policies and serves as a guide to update the community plans and the Citywide elements. The Citywide elements address functional topics that cross community boundaries, such as transportation, and address these topics in more detail than is appropriate in the Framework Element, which is the "umbrella document" that provides the direction and vision necessary to bring cohesion to the City's overall general plan. The Framework Element provides a conceptual relationship between land use and transportation and provides guidance for future updates to the various elements of the General Plan but does not supersede the more detailed community and specific plans. The Land Use chapter of the Framework Element contains Long Range Land Use Diagrams that depict the generalized distribution of centers, districts, and mixed-use boulevards throughout the City, but the community plans determine the specific land use designations. The Land Use Element of the General Plan is contained within 35 community plans. The Project Site is located in the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan (Community Plan) Area, discussed further below.

Project Consistency Analysis

As discussed on Table XI-2, the Project would be substantially consistent with policies contained in the Framework Element.

Table XI-2
Project Consistency with Applicable Policies of the Framework Element

Objective	Project Consistency
Framework Element: Land Use Chapter	
Goal 3A A physically balanced distribution of land uses that contributes towards and facilitates the • City's long-term fiscal and economic viability, • Revitalization of economically depressed areas, • Conservation of existing residential neighborhoods, • Equitable distribution of public resources, • Conservation of natural resources, • Provision of adequate infrastructure and public services, • Reduction of traffic congestion and improvement of air quality, • Enhancement of recreation and open space opportunities, • Assurance of environmental justice and a healthful living environment, and • Achievement of the vision for a more livable city.	**Consistent.** The Project includes the expansion and upgrade of an existing high school. The school is an educational resource that serves the community. The new North Campus would replace an existing shopping center and will provide additional sports facilities with a swimming pool available on a limited basis to the community. In addition, the improvements to the Main Campus would modernize the existing facilities. Finally, the Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT and associated GHG and other pollutant emissions.
Objective 3.2 Provide for the spatial distribution of development that promotes an improved quality of life by facilitating a reduction of vehicular trips, vehicle miles traveled, and air pollution.	**Consistent.** The Project would result in a net reduction of 1,355 daily trips and therefore would contribute to significant reductions in VMT.
Framework Element: Urban Form & Neighborhood Design Chapter	
Policy 5.4.1 Encourage the design of existing and new schools for multiple functions, including, but not limited to, the following: a. Design of school yards to be used as parks accessible to the surrounding neighborhoods; b. Design of school libraries to be used as community libraries, where feasible; and c. Design of school auditoriums to be used as community meeting rooms.	**Consistent.** This policy is aimed at public schools. However, the existing private high school currently allows the community to utilize certain school facilities. It is anticipated that the new facilities included in the Project, including the swimming pool, will also be available on a limited basis to the local community.
Framework Element: Open Space and Conservation Chapter	
Policy 6.4.11 Seek opportunities to site open space adjacent to existing public facilities, such as schools, and encourage the establishment of mutually beneficial development agreements that make privately-owned open space accessible to the public. For example, encourage the improvement of scattered small open spaces for public access in private projects with small branch libraries, child care centers, or decentralized schools.	**Consistent.** The existing private high school currently allows the community to utilize certain school facilities. It is anticipated that the new facilities included in the Project, including the swimming pool, will also be available on a limited basis to the local community.

Table XI-2
Project Consistency with Applicable Policies of the Framework Element

Objective	Project Consistency
Framework Element: Infrastructure and Public Services Chapter	
Objective 9.33 Maximize the use of local schools for community use and local open space and parks for school use.	**Consistent.** This policy is aimed at public schools. However, the existing private high school currently allows the community to utilize certain school facilities. It is anticipated that the new facilities included in the Project, including the swimming pool, will also be available on a limited basis to the local community.
Source: City of Los Angeles General Plan Framework Element.	

Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan

The Community Plan is one of 35 Community Plans established for different areas of the City that are intended to implement the policies of the General Plan Framework. Together, the plans make up the Land Use Element of the General Plan. The Community Plan is intended to promote an arrangement of land uses, streets, and services, which will encourage and contribute to the economic, social, and physical health, safety, and welfare of the people who live and work in the community. The Community Plan is also intended to guide development in order to create a healthful and pleasing environment. The community plans coordinate development among the various communities of Los Angeles and adjacent municipalities in a fashion both beneficial and desirable to the residents of the community.

Project Consistency Discussion

The Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan objectives and guidelines related to school uses are:

- Policy 6.1.1: Explore creative alternatives for providing new school sites in the City, where appropriate.
- Objective 6.2: Maximize the use of local schools for community use and local open space and parks for school use.
- Policy 6.2.1: Encourage the siting of community facilities (libraries, parks, schools, and auditoriums) together.

The Project would be substantially consistent with these objectives and policies contained in the Community Plan. Specifically, the Project Applicant has the opportunity to expand the existing private high school facilities to a property located across the street (North Campus), to provide additional recreational and athletic programming opportunities and options for its students, in addition to additional surface parking, in close proximity to the existing campus (Main Campus). The Main Campus is also located in very close to Four Oaks Park, which is located across

Cohasset Street, to the south. The close proximity of the Main Campus to the proposed new North Campus and to Four Oaks Park allows for the Project to implement the objective to site community facilities together.

The Project would allow the expansion of an existing school in a residential neighborhood, following and keeping with the current land use pattern while expanding athletic and parking facilities. In addition, the existing private high school currently allows the community to utilize certain school facilities. It is anticipated that the new facilities included in the Project, including the swimming pool, will also be available on a limited basis to the local community. For these reasons, the Project substantially conforms with the purposes, intent, and provisions of the General Plan and the applicable community plan (Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan).

City of Los Angeles Zoning Code

Use

The Main Campus is within the A1-1 and RS-1 zones, and the North Campus is currently located in the [Q]C1-1VL and P-1VL zones. The Applicant is proposing a Vesting Zone Change and Height District Change on the North Campus to the C2-1 zone. The proposed C2 zone corresponds to the existing Neighborhood Commercial land use designation of the North Campus and by re-zoning it entirely to C2-1, it eliminates the outdated “footprint” zoning. In addition, the private school use is permitted by-right within the C2 zone. Approval of the Zone Change would allow the existing high school, which has been operating at its current location for over six decades, to integrate additional area for athletic facilities that are needed to serve the existing student population.

Floor Area

The update and expansion of the high school would result in a total proposed floor area of approximately 196,468 square feet, representing a net increase of 28,556 square feet of floor area on the Main Campus (from the existing developed structures). Overall, however, the Project would result in a net decrease of approximately 14,229 square feet of floor area, including the demolition of the existing commercial structures on the site of the new North Campus as well as demolition of existing school structures on the Main Campus. It is important to note that although the physical expansion would result in a net increase of lot area with the addition of the 4.83-acre North Campus, the maximum permitted student enrollment of 1,360 students per the current Conditional Use Permit (CUP) would remain the same. Furthermore, the current CUP permits a maximum floor area of 203,896 square feet on the Main Campus, which is more than the approximately 196,458 square feet of total floor area proposed at Project completion (including the Main and North Campuses as well as the pedestrian bridge).

Cumulative Impacts

Given the built-out conditions of the greater Los Angeles region, including the Project area, cumulative development likely would convert existing underutilized properties in the Los Angeles area to revitalized higher-density developments to respond to the need for housing, sources of employment, and associated retail land uses. As discussed previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, like the Project, any other development projects would be subject to the same City development standards and requirements. As discussed above, the Project's impacts with respect to land use and planning would be less than significant, and cumulative impacts would also be less than significant.

XII. MINERAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. A significant impact may occur if the Project Site is located in an area used or available for extraction of a regionally-important mineral resource, or if the Project would convert an existing or future regionally-important mineral extraction use to another use, or if the Project would affect access to a site used or potentially available for regionally-important mineral resource extraction. The Project Site is not located in a City-designated Mineral Resource Zone 2 Area (MRZ-2). Therefore, the Project would have no impact with respect to the loss of availability of a known regionally-important mineral resource, and no impact would occur.

b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact. A significant impact may occur if a project is located in an area used or available for extraction of a locally-important mineral resource extraction, and if the project converted an existing or potential future locally-important mineral extraction use to another use, or if the project affected access to a site used or potentially available for locally-important mineral resource extraction. Government Code Section 65302(d) states that a conservation element of the general plan shall address “minerals and other natural resources.” According to the Conservation Element of the City of Los Angeles General Plan, sites that contain potentially significant sand and gravel deposits which are to be conserved follow the Los Angeles River flood plain, coastal plain, and other water bodies and courses and lie along the flood plain from the San Fernando Valley through Downtown Los Angeles. The Project Site is not located within a City-designated Mineral Resource Zone where significant mineral deposits are known to be present. Furthermore, the Project Site is developed and located in an urbanized area. Development of the Project would therefore not result in impacts associated with the loss or availability of a known mineral resource that would be of value to the region and the residents of the state, and no impact would occur.

Cumulative Impacts

As discussed above, the Project would not result in any impacts related to mineral resources and no related projects have been identified within one-half mile of the Project Site. Therefore, no cumulative impacts related to mineral resources would occur.

XIII. NOISE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project result in:				
a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☒	☐	☐
b. Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

The analysis in this section is based on the following, which are included in Appendix G of this IS/MND:

- Noise Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023.
- Chaminade High School North Campus Athletic Facilities – Technical Memorandum, NTEC, April 2024.

Existing Conditions

Project Site

The Project Site is composed of the Main Campus property and the North Campus property. The Main Campus is currently developed with a private high school campus containing educational, athletic, performing arts, administrative, and religious facilities. Noise is regularly generated by the daily use of these facilities, including from events (e.g., athletic meets, etc.) and vehicle travel (e.g., student pick-up/drop-off). The North Campus is developed with a shopping center that contains a grocery store, restaurants, and other commercial uses, as well as surface parking for these uses. Noise associated with these uses include parking noises from patrons, delivery noises from trucks, and mechanical noises from rooftop heating, ventilation, and air conditioning (HVAC) equipment.

Noise-Sensitive Receptors

The Main Campus and North Campus sites are surrounded by predominantly residential uses, many of which directly abut the two sites. For example, single-family homes are located directly north of the North Campus site along Saticoy Street, Melba Street, and Bobbyboyar Avenue. Single-family homes are also located directly west of the Main Campus along Woodhall Avenue, Keswick Street, and Atron Avenue.

A map showing the location of the Project and the nearby residential uses is included in Appendix G of this IS/MND.

Existing Ambient Noise Conditions

On Thursday, August 18, 2022, noise measurements were obtained at multiple locations surrounding the Main Campus and North Campus sites to aid in the characterization of daytime ambient noise conditions at nearby sensitive receptors. The measured noise levels are shown in Table XIII-1, below. Descriptions of noise sources are also included for each noise measurement.

Table XIII-1
Existing Noise Levels

Noise Measurement Location	Noise Sources	Sound Level (dBA L_{eq})
1. Intersection of Keswick St. and Woodhall Ave.	Traffic along Woodhall Ave. and Saticoy St.	57.5
2. Intersection of Saticoy St. and Keswick St.	Traffic along Saticoy St.	64.1
3. Melba Street – End of Cul-de-sac	Shopping center to south, including delivery, mechanical, and parking noises. Traffic along Saticoy St.	53.9
4. Saticoy Street – Near 23309 Saticoy St. Residence	Traffic along Saticoy St.	66.3
5. Woodlake Ave. – S of Kens Way	Traffic along Woodlake Ave.	67.2
6. Intersection of Saticoy St. and Woodlake Ave.	Traffic along Saticoy St. and Woodlake Ave.	69.1
7. Saticoy Street – Near Main Campus Driveway	Traffic along Saticoy St.	68.6
8. Covello St. – End of Cul-de-sac	Traffic along Saticoy St.	49.5
9. Cohasset St. – Near Baseball Field	Traffic along Cohasset St.	62.4
10. Chaminade Ave. – Near Cul-de-sac	Traffic along Chaminade Ave., school parking lot	51.9
11. Atron Ave – End of Cul-de-sac	Traffic along Keswick St.	48.6

Source: Noise Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, included in Appendix G of this IS/MND. (Appendix G).

Methodology

On-Site Construction Activities

The Project's construction noise impact associated with its on-site construction activities was determined by identifying the noise levels of construction equipment with the greatest potential to disrupt nearby sensitive receptors and assessing the noise increases that could result from their operations. Reference equipment noise levels were derived from the Federal Highway Administration's Roadway Construction Noise Model, version 2.0 (FHWA RCNM 2.0).

Off-Site Construction Activities

The Project's off-site construction noise impact from construction trucks was evaluated by using the FHWA's Traffic Noise Model version 2.5 (TNM 2.5). This noise prediction software uses traffic volumes, vehicle mix, average speeds, roadway geometry, and other inputs to calculate average noise levels along roadway segments. The Project's noise levels from its maximum construction trip generation were estimated with TNM 2.5 and then compared with existing ambient noise conditions along surrounding roadways to determine significance.

On-Site Operational Noise Sources

The Project's potential to result in significant noise impacts from on-site operational noise sources was assessed by identifying likely on-site noise sources and considering the impacts they could produce given the nature of the source (i.e., loudness and/or whether noise would be generated during daytime or more-sensitive nighttime hours), distances to nearby noise-sensitive receptors, surrounding ambient noise levels, the presence of similar noise sources in the vicinity, and maximum allowable noise levels permitted by the LAMC. The analysis also reviewed noise levels that were documented as part of studies for similar athletics facilities projects to aid in the characterization and prediction of noise impacts that would result from the Project's athletics activities. A more-detailed discussion of this methodology, including source documentation, is included in Appendix G of this IS/MND.

Off-Site Operational Noise Sources

The Project would result in a net-reduction in vehicle trips when compared to existing uses and therefore would not contribute to traffic-related noise increases.

Construction Vibration Sources

The Project's potential to generate damaging levels of groundborne vibration was analyzed by identifying construction vibration sources and estimating the maximum vibration levels that they

could produce at nearby buildings, all based on the principles and guidelines recommended by the Federal Transit Administration (FTA) in its 2018 Transit Noise and Vibration Impact Assessment manual. Vibration levels were then compared with the manual's suggested damage criteria for various building categories.

Operational Vibration Sources

Significant sources of operational vibration are generally limited to heavy equipment or industrial operations. The Project proposes to construct educational and athletics facilities, and no such operations would take place.

a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant with Mitigation Incorporated.

Construction

On-Site Construction Activities

5 dBA L_{eq} Threshold Analysis

The Project may not be fully implemented until 2035, and there is currently no exact sequence of construction activities or phasing, though it would be necessary for some activities to occur before others. For example, grading of the North Campus would have to occur before construction of the new North Campus athletic and pool facilities, demolition of existing classroom buildings would have to occur before construction of the new Main Campus Multistory Building, etc.

Table XIII-2 (which is the same as Table 3-2 in Section 2, Project Description) presents a sequence of the Project's construction activities showing which construction activities/phases may overlap. The Project would include Project Design Feature 1 (PDF 1), which incorporates this construction sequence.

Table XIII-2
Construction Sequence

Construction Activity	Sequence									
	1	2	3	4	5	6	7	8	9	10
North Campus – Demolition†	X									
North Campus – Grading†		X								
North Campus – Construction of new surface parking lot			X							
North Campus – Construction of pedestrian bridge†				X						
North Campus – Construction of new athletic fields and ancillary facilities					X	X	X	X

Main Campus – Renovations to existing athletics facilities, classroom buildings, and administrative offices.								X	X	X

† Denotes construction activities chosen for detailed construction noise modeling.
Source: Project Applicant.

During all construction phases, noise-generating activities would be permitted to occur at the Project Site between the hours of 7:00 A.M. and 9:00 P.M. Monday through Friday, in accordance with Section 41.40(a) of the LAMC. On Saturdays, construction activities would be permitted to occur between 8:00 A.M. and 6:00 P.M. Although the Project is anticipated to utilize a five-day work week, it is anticipated that certain construction activities that have the potential to impact school operations may take place on Saturdays.

Some construction activities would result in greater noise impacts than others. For example, demolition and grading activities for the North Campus would require a variety of heavy-duty, diesel-powered earthmoving vehicles such as excavators and bulldozers, while renovations to the

administrative office would require mostly electric-powered hand tools. Noise impacts for the following construction activities were modeled to ascertain the Project's potential to exceed the threshold criteria, which is a 5 dBA L_{eq} increase over baseline ambient noise levels. The following modeled construction activities were chosen because they are the activities that would have the greatest potential to result exceedances of this threshold criteria, due to considerations such as noise levels from construction equipment, distances from sensitive receptors, potential for overlap, and ambient noise levels at sensitive receptors.

North Campus – Demolition

North Campus – Grading

North Campus – Construction of pedestrian bridge

Main Campus – Parking Lot Demolition

Main Campus – Classroom Demolition

North Campus - Demolition

Demolition of existing North Campus improvements would last approximately one month. The majority of demolition activities would be characterized by excavators demolishing existing structures and placing the debris into dumpsters for removal. As excavators perform work across the approximately 4.83-acre North Campus site, their construction noise levels at sensitive receptors would fluctuate depending on these vehicles' distances from them. Noise levels would be greater when excavators are in proximity of sensitive receptors and lower when they are farther away. Most excavator activities would be concentrated near the footprint of the existing shopping center building, as demolition of this structure would be more intensive than removal of the asphalt parking lot, which would be accomplished with smaller and less-noisy equipment such as skid steer loaders. Given these considerations, the noise impact associated with the demolition of North Campus improvements has been evaluated by modeling noise levels that would result from two excavators demolishing a half-acre portion of the existing shopping center building in proximity to nearby sensitive receptors.

Table XIII-3 shows the estimated noise increases that would result from the Project's demolition activities on the North Campus. As shown, noise increases at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Residences could exceed the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period. Here, without mitigation, the Project's construction noise impacts from demolition activities could be significant. Impacts to other sensitive receptors would not exceed the 5 dBA L_{eq} threshold of significance.

As shown in Table XIII-2, demolition activities on the North Campus would not overlap with any other construction activities, meaning there is no potential for simultaneous construction activities to result in combined noise levels that exceed the values shown in Table XIII-3.

Table XIII-3
Construction Noise Levels – North Campus Demolition (Unmitigated)

Receptor	Construction Noise Level (dBA L_{eq})	Existing Ambient Noise Level (dBA L_{eq})	New Noise Level (dBA L_{eq})	Increase
23309 Saticoy Street Residence	65.2	66.3	68.8	2.5
Saticoy Street Residences – South of North Campus	58.8	68.6	69.0	0.4
Melba Street Cul-de-Sac Residences	69.1	53.9	69.3	15.4
Bobbyboyar Avenue Cul-de-Sac Residences	69.1	53.9	69.3	15.4
Woodlake Avenue Residences	59.9	67.2	67.9	0.7
Source: Noise Technical Modeling, Noah Tanski Environmental Consulting (NTEC), May 2023, contained in Appendix G of this IS/MND.				

North Campus - Grading

Grading of the North Campus would involve grading for the proposed surface parking lot, pedestrian bridge abutments/landing, and athletic field facilities. Some trenching would also be required to install utilities. Overall, daily activities would be rather limited due to the fact that the North Campus site is already relatively level. Grading would require only approximately 720 cubic yards of export and would result in less than four haul truck trips per day, on average. An excavator or backhoe may be utilized to trench for utility connections and baseball field dugouts. A grader may be utilized to establish proper slopes and drainages for the surface parking lot and athletic field. A roller may be utilized to compact soils. A bulldozer may assist in moving soils across the site. Overall, the loudest noise impacts would be associated with a grader “finish” grading the North Campus Site. Graders operate by driving across a site while utilizing a blade to form level surfaces. As a grader works across the approximately 4.83-acre North Campus site, its construction noise level at sensitive receptors would fluctuate depending on its distances from sensitive receptors. Noise levels would be greater when operating in proximity of sensitive receptors and lower when farther away. Given these considerations, the noise impact associated with grading of the North Campus has been evaluated by modeling noise levels that would result from a grader “finish” grading a half-acre parcel in proximity to nearby sensitive receptors.

Table XIII-4 shows the estimated noise increases that would result from the Project’s “finish” grading activities on the North Campus. As shown, noise increases at Melba Street Cul-de-Sac

Residences and Bobbyboyar Avenue Residences could exceed the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period. Here, without mitigation, the Project's construction noise impact from grading activities could be significant. Impacts to other sensitive receptors would not exceed the 5 dBA L_{eq} threshold of significance.

As shown in Table XIII-2, grading activities on the North Campus would not overlap with any other construction activities, meaning there is no potential for simultaneous construction activities to result in combined noise levels that exceed the values shown in Table XIII-4.

Table XIII-4
Construction Noise Levels – North Campus Grading (Unmitigated)

Receptor	Construction Noise Level (dBA L_{eq})	Existing Ambient Noise Level (dBA L_{eq})	New Noise Level (dBA L_{eq})	Increase
23309 Saticoy Street Residence	69.2	66.3	71.0	4.7

North Campus – Construction of Pedestrian Bridge

The loudest construction equipment associated with construction of the pedestrian bridge would be a bore/drill rig, which would be utilized to install foundations for the pedestrian bridge on either side of Saticoy Street. Daily activity by this equipment would be limited, as there are only three locations for the bridge's foundations. Noise impacts associated with operations of a bore/drill rig has been evaluated by modeling noise levels that would result from a bore/drill rig operating at the foundation location that is nearest to surrounding sensitive receptors.

Table XIII-5 shows the estimated noise increases that would result from bore/drill rig activities. As shown, noise increases at 23309 Saticoy Street Residence, Melba Street Cul-de-Sac Residences, and Bobbyboyar Avenue Cul-de-Sac Residences could exceed the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period. Here, without mitigation, the Project's construction noise impact from grading

activities could be significant. Impacts to other sensitive receptors would be far below the 5 dBA L_{eq} threshold of significance.

As shown in Table XIII-2, construction of the pedestrian bridge would not overlap with any other construction activities, meaning there is no potential for simultaneous construction activities to result in combined noise levels that exceed the values shown in Table XIII-5.

Table XIII-5
Construction Noise Levels – North Campus Construction of Pedestrian Bridge (Unmitigated)

Receptor	Construction Noise Level (dBA L_{eq})	Existing Ambient Noise Level (dBA L_{eq})	New Noise Level (dBA L_{eq})	Increase

Main Campus – Parking Lot Demolition

Demolition of the upper-level parking lot would utilize smaller equipment such as a skid steer loader or mini-excavator to remove asphalt, hardscape, and landscaping. These activities would last no more than several workdays. Noise impacts associated with demolition of the upper-level parking lot have been evaluated by modeling noise levels that would result from two skid steer loaders demolishing a half-acre portion of the parking lot in proximity to nearby sensitive receptors.

Table XIII-6 shows the estimated noise increases that would result from demolition of the upper-level parking lot. As shown, demolition of the upper-level parking lot could expose Atron Avenue Cul-de-Sac Residences to noise increases in excess of the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period. Without mitigation, this impact could be significant.

Main Campus – Classroom Demolition

Demolition of classroom buildings on the Main Campus would last up to three weeks and would utilize excavators to demolish approximately 30,284 square feet of classroom building area. Debris would be placed into dumpsters for removal. Noise impacts associated with demolition of the classroom buildings have been evaluated by modeling noise levels that would result from two excavators demolishing a half-acre portion of the classroom buildings in proximity to nearby sensitive receptors.

Table XIII-7 shows the estimated noise increases that would result from demolition of the classroom buildings. As shown, demolition of the classroom buildings could expose Atron Avenue Cul-de-Sac Residences, Covello Street Cul-de-Sac Residences, and Chaminade Avenue Residences to noise increases in excess of the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period. Without mitigation, this impact could be significant.

LAMC Section 112.05 Threshold Analysis

Section 112.05 of the LAMC establishes a noise limit of 75 dBA L_{eq} for powered equipment and hand tools operated within 500 feet of residential zones between the hours of 7:00 A.M. and 10:00 P.M. As the Project is located within 500 feet of numerous residential-zoned properties, this regulation would apply to the Project's construction noise levels. As shown in Table XIII-3 through Table XIII-7, construction of the Project would not expose nearby residential uses to noise levels in excess of 75 dBA L_{eq}. Therefore, the Project's construction noise levels would be consistent with the LAMC Section 112.05 noise limit, and this impact would be less than significant.

Construction Noise Mitigation Measures

To ensure that the Project's construction-related noise increases at sensitive receptors do not exceed the 5 dBA L_{eq} threshold of significance for daytime construction activities lasting more than 10 days in a three-month period, the following mitigation measures are required:

NOI-1 For construction activities occurring on the North Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield 23309 Saticoy Street Residences, Melba Street Cul-de-Sac Residences, and Bobbyboyar Avenue Cul-de-Sac Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

NOI-2 For construction activities occurring on the Main Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield Atron Avenue Cul-de-Sac Residences, Covello Street Cul-de-Sac Residences, and Chaminade Avenue Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

Construction Noise Impacts After Mitigation

<u>North Campus - Demolition</u>

Table XIII-8 shows the estimated noise increases that would occur at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences after implementation of Mitigation Measure NOI-1. As shown, implementation of noise barriers pursuant to Mitigation Measure NOI-1 would ensure that demolition-related noise increases at these receptors are below the 5 dBA L_{eq} threshold of significance. As a result, with mitigation, the Project's North Campus demolition-related noise impact from on-site construction sources would be less than significant.

Table XIII-8
Construction Noise Levels – North Campus Demolition (Mitigated)

Receptor	Construction Noise Level (dBA L_{eq})	Existing Ambient Noise Level (dBA L_{eq})	New Noise Level (dBA L_{eq})	Increase
Melba Street Cul-de-Sac Residences	54.1	53.9	57.0	3.1
Bobbyboyar Avenue Cul-de-Sac Residences	54.1	53.9	57.0	3.1

North Campus - Grading

Table XIII-9 shows the estimated noise increases that would occur at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences after implementation of Mitigation Measure NOI-1. As shown, implementation of noise barriers pursuant to Mitigation Measure NOI-1 would ensure that grading-related noise increases at these receptors are below the 5 dBA L_{eq} threshold of significance. As a result, with mitigation, the Project's North Campus grading-related noise impact from on-site construction sources would be less than significant.

Table XIII-9
Construction Noise Levels – North Campus Grading (Mitigated)

Receptor	Construction Noise Level (dBA L_{eq})	Existing Ambient Noise Level (dBA L_{eq})	New Noise Level (dBA L_{eq})	Increase
Melba Street Cul-de-Sac Residences	54.2	53.9	57.1	3.2
Bobbyboyar Avenue Cul-de-Sac Residences	54.2	53.9	57.1	3.2

North Campus – Construction of Pedestrian Bridge

Table XIII-10 shows the estimated noise increases that would occur at 23309 Saticoy Street Residence, Melba Street Cul-de-Sac Residences, and Bobbyboyar Avenue Cul-de-Sac Residences after implementation of Mitigation Measures NOI-1. As shown, implementation of noise barriers pursuant to Mitigation Measure NOI-1 would ensure that construction of the pedestrian bridge would not expose these receptors to noise increases that are in excess of the 5 dBA L_{eq} threshold of significance. As a result, with mitigation, this specific impact would be less than significant.

Table XIII-10
Construction Noise Levels – North Campus Construction of Pedestrian Bridge (Mitigated)

Main Campus – Parking Lot Demolition

Table XIII-11 shows the estimated parking lot demolition-related noise increases that would occur at Atron Avenue Cul-de-Sac Residences after implementation of Mitigation Measure NOI-2. As shown, implementation of noise barriers pursuant to Mitigation Measure NOI-2 would ensure that demolition would not expose these receptors to noise increases that are in excess of the 5 dBA L_{eq} threshold of significance. As a result, with mitigation, this specific impact would be less than significant.

Table XIII-11

Off-Site Construction Activities

Trucks and other construction-related vehicles would access the Project Site over the course of all construction phases. The Project's maximum truck trip generation would occur during grading for the Multistory Building on the Main Campus. During this one-month phase, up to 47 haul trucks per day (approximately 94 one-way trips) would remove approximately 18,764 cubic yards of cut soils from the Main Campus site for transportation to a regional landfill. This would translate to approximately six haul trucks per hour (12 one-way trips) over the course of a given workday. Haul trucks would immediately access Saticoy Street via existing driveways. Ultimately, this level of haul truck activity would have a minor effect on noise levels along Saticoy Street and other truck routes that would be utilized when accessing the freeway system. According to TNM 2.5 modeling, this level of haul truck activity would correlate with roadside noise levels of approximately 58 dBA L_{eq}. This is well below ambient noise levels along Saticoy Street and other major roadways that may be utilized by the Project's haul route. For example, daytime ambient noise levels east of the Project along Saticoy Street and Woodlake Avenue exceed 65 dBA L_{eq}. In these and similar ambient noise environments, noise increases related to the Project's maximum daily haul trips would be less than a 1 dBA L_{eq} increase, well below the 5 dBA L_{eq} threshold of significance and also indiscernible. Other construction phases would result in less trips haul trips. Therefore, the Project's noise impact from off-site construction sources would be less than significant.

Operation

On-Site Operational Noise

Prior to the impact analysis, it is important to discuss the City's threshold of significance for operational noise impacts, which is whether a project's operations would: (1) cause ambient noise levels to increase by 3 dBA CNEL or more to or within a sensitive receptor's "normally unacceptable" or "clearly unacceptable" noise and land use compatibility category, as defined by

the City's General Plan Noise Element; or (2) result in any 5 dBA $L_{eq\ (1\text{-}hour)}$ or CNEL noise increase to a sensitive receptor. CNEL is a 24-hour weighted average noise level that penalizes noise levels between 7:00 PM and 7:00 AM to account for people's increased noise sensitivity during these hours. L_{eq} represents the energy average noise level for a given time period, which for purposes of this operational impact analysis is a minimum of one hour. The Project's sensitive receptors for noise impact assessment are all single-family residential land uses. According to the General Plan Noise Element, noise levels between 70 and 75 dBA CNEL are considered "normally unacceptable" for these uses, and noise levels 75 dBA CNEL and above are considered "clearly unacceptable." Another way of understanding this threshold is that if the Project does not cause or contribute to noise levels of 70 dBA CNEL or greater at a sensitive receptor, then a 5 dBA CNEL increase is the appropriate threshold. If the Project may cause or contribute to noise levels of 70 dBA CNEL or greater at a sensitive receptor, then a 3 dBA CNEL increase is the appropriate threshold. Notwithstanding, any 5 dBA L_{eq} increase over an averaging period of one hour or more would also be considered significant.

The Project's potential on-site operational noise sources are identified and evaluated below:

Mechanical Equipment

The proposed Multistory Building on the Main Campus would be located over 200 feet from the nearest residential receptors. At these distances, noise from rooftop mechanical equipment would not be capable of increasing off-site noise levels by a discernable degree and are likely to be inaudible. Further, the existing classroom buildings contain mechanical equipment. Therefore, noise from mechanical equipment would not be a new source of noise at the location of the Multistory Building.

The proposed pool facilities on the North Campus would be located adjacent to Woodlake Avenue, over 50 feet from the nearest residential receptors. Given this location along a busy roadway, noise from rooftop mechanical equipment would also likely be inaudible at surrounding residential receptors. All pool equipment, including filtering and pumping equipment, would be enclosed in mechanical rooms located within the pool facility's building envelope and would not be audible at any surrounding receptors.

Parking-Related Activities

The Project would include the construction of two new surface parking lots – an 86-stall lot on the North Campus near the pedestrian bridge and a 15-stall lot on the North Campus supporting the pool facilities – as well the renovation of the existing parking lot on the southeast portion of the Main Campus, along Cohasset Street, to include 16 stalls. According to FTA equations for the prediction of parking facility noise impacts, a facility with an hourly activity of 86 vehicles (conservatively equal to the total capacity of the largest proposed parking lot) would result in a noise level of just 46 dBA L_{eq}. A facility with an hourly activity of 16 vehicles would result in a noise level of just 38 dBA L_{eq}. These noise levels are far below ambient noise conditions surrounding the proposed parking lots, which are in excess of 60 dBA L_{eq}. This demonstrates that parking-

related noises associated with the three new surfacing parking lots would have a nominal effect on surrounding noise conditions that is well below the minimum 3 dBA CNEL increase that would represent a significant impact.

Further, it is worth noting that the existing shopping center on the North Campus is associated with 2,307 daily trips, according to the Project's transportation study (contained in Appendix H of this IS/MND). This is far greater than the number of vehicles that would utilize the two North Campus parking lots on a daily basis. This suggests that parking-related noises associated with the North Campus site would likely decrease with implementation of the Project.

North Campus Athletics and Aquatic Facilities

The North Campus includes new athletics fields, to be used for soccer and baseball, and an outdoor swimming pool. Home and visitor bleachers would be located along the first and third base lines of the athletic field, providing approximately 350 seats. Bleachers are also proposed west of the pool, providing approximately 126 seats. Additionally, there would be a public address system on the new North Campus, similar to the public address system on the Main Campus.

Sports programming would remain substantially similar to existing programs with some activities/games that currently occur on the Main Campus shifting to the North Campus, except that the new outdoor pool would allow for an expanded swim program, including practices, classes, and meets, and would be made available on a limited basis to the local community. The following provides a summary of new activities at the North Campus (not including existing school events that would shift from the Main Campus to the North Campus):

- 10 high school swim competitions per year
- 10 middle school swim competitions per year
- Swim practice for other schools (limited to February through April)
- Swim lessons and water exercise classes daily
- Local community swimming (if there are no other activities at the pool)
- Local non-school athletic groups (limited to May through December)

The hours of operation for the North Campus would be more restrictive than the usage hours allowed by the school's current Conditional Use Permit for the Main Campus. The North Campus hours of operations would be:

- Athletic fields/stadium: Monday – Friday, 7:00 AM – 9:00 PM (with exception for overtime/extra inning play); Saturday, 8:00 AM – 9:00 PM; and Sunday, 9:00 AM – 8:00 PM (no more than 15 Sundays per year).

- Aquatic complex/pool: Monday – Friday, 8:00 AM – 8:00 PM; and Saturday 10:00 AM – 7:00 PM. No use is permitted on Sundays.

- Batting cage: Monday – Saturday, 7:00 AM – 8:00 PM. No use is permitted on Sundays.

Rental or lease of the North Campus athletic facilities would be subject to more restrictive day and hour limitations:

- Athletic fields/stadium: Use by community-based athletic organizations shall be limited to 36 days annually, Monday through Saturday, 8:00 AM – 6:00 PM. Use is not permitted on Sundays and national holidays. The rental or lease of the batting cages is not permitted at any time.

- Aquatic complex/pool: Use by community-based organizations, which shall travel to and from the North Campus by bus, shall be limited to daylight hours and end no later than 7:00 PM, Monday through Friday, and no later than 5:00 PM on Saturdays. For community member swim activities, use hours shall be limited to Monday through Saturday, 8:00 AM – 6:00 PM. Use is not permitted on Sundays and national holidays.

Studies show that the highest noise levels from baseball diamonds and soccr fields are associated with the amplified sound systems operated during games and not the individual sports activities/practices themselves. Similarly, the highest noise levels from aquatic facilities are associated with amplified sound systems during swim meets and not with regular pool activities like swimming. Given these considerations, the following analysis evaluates composite noise impacts that would result from a baseball game and swim meet held simultaneously on the North Campus. The composite noise levels shown in Table XIII-13 are based on individual swim meet and baseball game noise levels that were estimated in the technical memorandum included Appendix G to the IS/MND.[60] The selected receptors were chosen because they are the closest receptors to the athletic field and aquatic complex areas that would experience the most pronounced noise impacts from their operations. Table XIII-14 compares the composite noise levels estimated in Table XIII-13 with existing daytime noise levels at these receptors to determine the composite noise impact from a baseball game and swim meet held simultaneously. As shown in Table XIII-14, Melba Street Cul-de-Sac Residences could experience noise increases greater than 5 dBA L_{eq} during these occurrences.

[60] The batting cage would not be used while a baseball game is being played, so its usage does not figure into this analysis. However, batting cage noise levels were evaluated and that analysis can also be found in the technical memorandum included in Appendix G.

Table XIII-13
Composite Noise Levels – Swim Meet and Baseball Game (L_{eq} 1-hour)

Receptor	Swim Meet Noise Level (dBA L_{eq})	Baseball Game Noise Level (dBA L_{eq})	Composite Noise Level (dBA L_{eq})

Note A: Potential significant impacts are shown in **bold**. Source: Chaminade High School North Campus Athletic Facilities – Technical Memorandum, Noah Tanski Environmental Consulting (NTEC), April 2024, in Appendix G of this IS/MND.					

The composite noise levels and maximum hourly impacts shown in Table XIII-13 and Table XIII-14 are also insightful regarding the Project's potential effects on 24-hour CNELs at surrounding noise-sensitive receptors. Given that existing daytime ambient noise conditions at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences are below 55 dBA L_{eq},

it is clear that their 24-hour noise levels are below at least 65 dBA CNEL, meaning that the 5 dBA CNEL increase threshold would apply at these receptors.[61] The following analysis evaluates the potential that 5 dBA CNEL increases could occur at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences. As explained previously, the composite noise levels shown in Table XIII-13 and Table XIII-14 are representative of a worst-case scenario in which there is a simultaneous swim meet and baseball game. These events last no more than a few hours each. However, if one assumes a conservative scenario in which the worst-case composite noise levels would be generated from 3:00 PM to 9:00 PM[62], then the corresponding CNEL at Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences would be 53.5 dBA and 52.7 dBA, respectively, as shown in Table XIII-15. Measured ambient noise conditions and factors such as the urbanized nature of the neighborhood and proximity to roadways show that 24-hour noise levels for Melba Street Cul-de-Sac Residences and Bobbyboyar Avenue Cul-de-Sac Residences are between 50-55 dBA CNEL. Assuming a low-end 50 dBA CNEL value, the composite CNEL figures estimated in Table XIII-15 demonstrate that operational activities on the North Campus could result in a slight exceedance of the 5 dBA CNEL increase threshold at Melba Street Cul-de-Sac Residences, as shown in Table XIII-16.

Table XIII-15
24-Hour Noise Levels – Swim Meet and Baseball Game (dBA CNEL)

Receptor	Swim Meet Noise Level (dBA CNEL)	Baseball Game Noise Level (dBA CNEL)	Composite Noise Level (dBA CNEL)
Melba Street Cul-de-Sac Residences	48.1	52.0	53.5
Bobbyboyar Avenue Cul-de-Sac Residences	47.5	51.1	52.7
Source: Chaminade High School North Campus Athletic Facilities – Technical Memorandum, Noah Tanski Environmental Consulting (NTEC), April 2024, in Appendix G of this IS/MND.			

[61] In other words, it would take more than a 5 dBA CNEL increase for their 24-hour noise levels to exceed the 70 dBA CNEL "normally unacceptable" standard.

[62] Specifically, the assumes timed periods are 3:00 PM – 9:00 PM for baseball games and 3:00 PM – 8:00 PM for swim meets, consistent with their allowable usage hours.

Table XIII-16
24-Hour CNEL Noise Level Impact at Receptors

Receptor	Composite Noise Level From Table 6 (dBA CNEL)	Existing 24-Hour Noise Level (dBA CNEL)	New Noise Level (dBA CNEL)	Threshold (dBA CNEL)	Increase (dBA CNEL)[A]
Melba Street Cul-de-Sac Residences	53.5	50.0	55.1	5.0	**5.1**
Bobbyboyar Avenue Cul-de-Sac Residences	52.7	50.0	54.6	5.0	4.6

Note A: Potential significant impacts are shown in **bold**.

Source: Chaminade High School North Campus Athletic Facilities – Technical Memorandum, Noah Tanski Environmental Consulting (NTEC), April 2024, in Appendix G of this IS/MND.

With regard to the remaining receptors, 23309 Saticoy Street Residence, Saticoy Street Residences – South of North Campus, and Woodlake Avenue Residences: Table XIII-14 shows that worst-case hourly composite noise impacts at these receptors would be below 2 dBA. As such, there is no potential that corresponding 24-hour CNEL impacts at these receptors would exceed the minimum 3 dBA increase threshold.

Before discussing the recommended mitigation measure that would reduce hourly (i.e., 5 dBA L_{eq}) and 24-hour (i.e., 5 dBA CNEL) noise impacts at Melba Street Cul-de-Sac Residences, it is important to address LAMC Section 112.01 and the effect it would have on amplified baseball game and swim meet noise levels that are at the root of the potential noise impact affecting Melba Street Cul-de-Sac Residences (and to a less than significant degree, the other selected receptors, as well). LAMC Section 112.01(b) would prohibit any amplified noises from being audible at a distance greater than 150 feet from the North Campus property line, and compliance with this regulation would necessitate that the Project's amplified noise levels are much lower than the levels predicted by this analysis. For example, Table XIII-14 shows that composite swim meet and baseball game noise levels, which are mainly caused by amplified sounds at these events, would be as high as 56.9 dBA L_{eq} at Bobbyboyar Avenue Cul-de-Sac Residences. While this is shown to result in a less than significant 4.8 dBA L_{eq} hourly noise increase at Bobbyboyar Avenue Cul-de-Sac Residences, the 56.9 dBA L_{eq} noise level indicates that amplified sounds responsible for this noise level would be clearly audible over the receptor's 53.9 dBA L_{eq} ambient noise conditions. Therefore, despite the noise increase being less than significant with respect to the 5 dBA L_{eq} increase threshold of significance (as well as the 5 dBA L_{eq} increase limit established by LAMC Section 112.01(c)), the amplified sounds emanating from swim meets and baseball games held simultaneously would still need to be reduced to achieve compliance with the LAMC Section

112.01(b) audibility standard.[63] Without mitigation, this impact related to athletic operations on the North Campus could be significant.

On-Site Operational Noise Mitigation Measures

The Project's amplified sound systems can be designed in a way that achieves Project objectives (i.e., providing amplified sound for baseball games and swim meets) while complying with LAMC Section 112.01(b). For example, large outdoor music venues are often acoustically engineered to comply with similar noise standards, despite featuring much louder sound systems than the Project would employ. Acoustical design considerations commonly include techniques such as utilizing directional speakers rather than broadcast systems, mounting speakers low and oriented away from residential areas, and instituting maximum sound level limits. The facilities themselves may also be designed to aid noise control efforts. For example, bleachers may be located so that crowd-facing speakers are directed away from sensitive residential areas, and structures may be located in a way to buffer residential areas from noise sources. In fact, the Project's site plan already features some of these considerations. For example: the baseball field is oriented so that bleachers are located along Saticoy Street, not near the quieter residential neighborhood to the north; the batting cage is oriented so that batters would also be distanced from this neighborhood; and the aquatic complex is oriented so that the parking lot and athletic field/pool house provide a buffer between the pool and this neighborhood.

As shown above in Table XIII-14, maximum hourly noise impacts at Melba Street Cul-de-Sac Residences could be as high as a 5.3 dBA L_{eq} increase over existing daytime noise conditions, which would exceed the 5 dBA L_{eq} increase threshold of significance. As shown in Table XIII-16, 24-hour noise impacts at this same receptor could be as high as a 5.1 dBA CNEL increase, which would exceed the 5 dBA CNEL increase threshold of significance for this receptor, as well. Further, all amplified noise source operations would need to comply with the audibility standard established by LAMC Section 112.01(b). Noise reductions necessary to achieve compliance with LAMC Section 112.01(b) would also achieve the noise reductions necessary to reduce noise impacts at Melba Street Cul-de-Sac Residences to less than significant levels. The following mitigation measure to achieve compliance with LAMC Section 112.01(b), which would also reduce noise increases to a less than significant impact at Melba Street Cul-de-Sac Residences, is required:

NOI-3 Amplified sound systems for the Project's baseball field/bleachers and outdoor aquatics facility/bleacers shall be acoustically engineered with the following design and performance standards:

[63] In turn, this would reduce the noise increase experienced by Bobbyboyar Avenue Cul-de-Sac Residences.

- Amplified sound levels, as measured at the northern property line of the North Campus, shall not exceed 50 dBA.
- Amplified sound systems shall not be operated outside the operational hours established for the North Campus facilities.
- Speakers shall be directional and oriented away from the northern property line of the North Campus.
- Non-Chaminade users of the facilities shall not be permitted to utilize the facilities' amplified sound systems.

On-Site Operational Noise Impacts After Mitigation

Amplified sound systems designed in accordance with the design and performance standards required by Mitigation Measure NOI-3 would achieve the noise audibility standard established by LAMC Section 112.01(b) and would also reduce noise levels at Melba Street Cul-de-Sac Residences to below the applicable 5 dBA L_{eq} and 5 dBA CNEL thresholds of significance. As discussed above, the potentially significant impacts to this receptor were based on slight exceedances of these thresholds (0.3 dBA L_{eq} exceedance and 0.1 dBA CNEL exceedance). However, compliance with Mitigation Measure NOI-3 would ensure that amplified noise levels at this receptor do not exceed 50 dBA, which is substantially lower than the unmitigated 57.7 dBA figure estimated by this analysis. Accordingly, impacts to Melba Street Cul-de-Sac Residences would be reduced to well below the 5 dBA L_{eq} and 5 dBA CNEL noise-increase thresholds of significance. Therefore, after mitigation, this impact would be considered less than significant.

Off-Site Operational Noise

According to the Project's transportation study (contained in Appendix H of this IS/MND), the Project would result in a net reduction of 1,355 daily trips. Therefore, the Project would not result in traffic-related noise increases and this impact would be less than significant.

b. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact.

Construction

Construction of the Project would require the use of large earthmoving equipment and bore/drill rigs. Large earthmoving vehicles such as excavators and bulldozers can produce groundborne vibration levels up to 0.089 inches per second peak particle velocity (PPV) at a reference distance of 25 feet. Drill rigs can produce similar groundborne vibration levels.

On the North Campus site, excavators, bulldozers, and other similar earthmoving vehicles would be utilized extensively to demolish the existing shopping center and grade for the Project. Vehicles

operating up to 10 feet from homes to the north of this site could expose these structures to groundborne vibration levels up to 0.244 inches per second PPV, which is less than the FTA's 0.5 inches per second significance criteria for modern residential buildings. A bore/drill rig would operate over 70 feet from the nearest homes when installing foundations for the proposed pedestrian bridge. This would expose these structures to groundborne vibration levels no greater than 0.029 inches per second PPV, which is also below the significance criteria for modern residential buildings.

On the Main Campus site, earthmoving vehicles would operate over 100 feet from surrounding residential structures located along Atron Avenue, Chaminade Avenue, Windom Street, and other nearby roadways. Thus, groundborne vibration impacts would be even lower than the levels discussed above and similarly below significance criteria for modern residential buildings. The only potentially historic building in the general vicinity is the property located at 7572 Woodlake Avenue, which was identified in SurveyLA. However, this property is not located within the immediate vicinity of the Project Site and based on the distance from the Project Site to this building, there would be no potential for construction vibration to impact this building.

Given these considerations, the Project's construction-related groundborne vibration impacts would be less than significant.

Operation

The Project would not contain any significant stationary sources of groundborne vibration, such as heavy equipment or industrial operations. The Project's related vehicle travel would not be considered a significant source of vibration, as vehicle travel rarely generates perceptible groundborne vibration. Therefore, the Project's operations-related groundborne vibration impact would be less than significant.

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. The Project Site is not located within two miles of a public or public use airport and would not expose people residing or working in the project area to excessive noise levels from aircraft. Therefore, no impact would occur.

Cumulative Impacts

Construction

As discussed previously, the Project's construction activities would temporarily increase ambient noise levels at nearby sensitive receptors, but impacts would be considered less than significant after implementation of Mitigation Measures NOI-1 and NOI-2. Any other developments that are

built at the same time as the Project would contribute to additional increases in noise levels at sensitive receptors and result in cumulatively considerable impacts. This would occur if simultaneous construction noise from the Project and other nearby related projects results in ambient noise level increases in excess of 5 dBA L_{eq} at sensitive receptors. However, no related projects have been identified within one-half mile of the Project site. Therefore, there is no potential for nearby sensitive receptors to be exposed to potentially significant cumulative construction noise impacts.

Concerning vibration, the Project's construction activities would generate groundborne vibrations at surrounding structures that are below levels that the FTA associates with architectural or structural damages. Therefore, the Project's construction-related vibration impacts would be less than significant. As noted earlier, no related projects have been identified within one-half mile of the Project site. As such, there is no potential for related projects to expose nearby receptors to simultaneous construction-related groundborne vibrations capable of resulting in significant cumulative impacts.

Operation

The Project's on and off-site operational noise sources would have a minimal effect on surrounding ambient noise conditions that is below the minimum 3 dBA CNEL increase threshold of significance. Therefore, the Project's noise impact from operations would be less than significant. Because no related projects have been identified within one-half mile of the Project, there is no potential for on-site operational noise sources associated with the Project to be audible at sensitive receptors to any related projects (and vice versa). And because the Project would result in a net reduction of 1,355 daily trips, the Project would not contribute to increases in off-site traffic related noise levels, whether individually or cumulatively considered.

XIV. POPULATION AND HOUSING

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

No Impact. A significant impact may occur if a project would locate new development such as homes, businesses, or infrastructure, with the effect of substantially inducing population growth that would otherwise not have occurred as rapidly or in as great a magnitude.

Construction

The construction activities associated with the Project would create temporary construction-related jobs. Nevertheless, the work requirements of most construction activities are highly specialized, so that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Thus, construction workers would not be anticipated to relocate their residence to the Project Site area and would not induce unplanned population growth and/or require permanent housing. Therefore, the Project would result in no impact with respect to indirect unplanned population growth associated with construction activities.

Operation

The Project consists of the physical expansion of the existing high school campus. However, this expansion would serve the existing student population and would not result in an increase in the number of faculty or the maximum student enrollment. In addition, the removal of the existing commercial development on the North Campus portion of the Project Site substantially decreases employment overall. Therefore, the Project would not induce substantial population growth, either directly or indirectly, and no impact would occur.

b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. A significant impact may occur if a project would result in the displacement of a substantial number of existing housing units or residents, necessitating the construction of replacement housing elsewhere. The Project Site is currently developed with the existing high school (Main Campus) and shopping center and associated surface parking (North Campus). The Project would not displace any housing or residents, as there is no housing on the Project Site. Although there is no existing housing on site, the North Campus property is designated in the City's Housing Element Inventory of Sites as potentially providing a maximum of 93 housing units (Base Zoning) and a maximum of 356 housing units (Bonus Zoning). Therefore, prior to Project approval, the City must make a finding that the Housing Element's remaining sites have sufficient capacity to accommodate the remaining unmet regional housing need allocation (RHNA) by each income level. Due to the fact that the Housing Element Inventory of Sites sets a target capacity (or buffer) that is 10% higher than the RHNA for lower income units, and 15% higher than the RHNA for moderate income units, sufficient capacity remains in other Housing Element Inventory Sites, and no impact would occur.

Cumulative Impacts

As the Project includes the physical expansion of the existing school, but would not increase student enrollment, the Project would not result in unplanned growth. In addition, as discussed previously, no related projects have been identified within one-half mile of the Project Site. Thus, the Project would not have the potential to contribute to any cumulative impacts related to unplanned growth.

XV. PUBLIC SERVICES

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Fire protection?	☐	☐	☒	☐
b. Police protection?	☐	☐	☒	☐
c. Schools?	☐	☐	☐	☒
d. Parks?	☐	☐	☐	☒
e. Other public facilities?	☐	☐	☐	☒

a. Fire protection?

Less Than Significant Impact. A significant impact may occur if, as a result of LAFD not being able to adequately serve the Project with existing governmental facilities, there would be a need for a new or physically altered fire station to be constructed which would cause significant environmental impacts.[64] The need for, or deficiency in, adequate fire protection services as a result of the Project is not in and of itself is a potentially significant impact, but rather a social and/or economic impact for which CEQA does not require further analysis.[65] The ultimate determination of whether there is a significant impact to the environment related to fire protection from a project is determined by whether construction of new or expanded fire protection is a direct physical change or a reasonably foreseeable indirect change in the environment caused by the Project. To the extent the Project would result in a need for new or expanded fire facilities, based on existing zoning standards, past practices, and historical development of City fire facilities, the City makes the following assumptions: such facilities (1) would occur where allowed under the designated land use; (2) would be located on parcels that are infill opportunities on lots that are between 0.5 and 1 acre in size; and (3) would qualify for a categorical exemption under CEQA Guidelines Section 15301 or 15332 and/or a Mitigated Negative Declaration.

[64] City of Hayward v. Board of Trustees of California State University (2015) 242 Cal.App.4th 833, 847.

[65] City of Hayward v. Board of Trustees of California State University (2015) 242 Cal.App.4th 833, 847.

Construction

Construction and demolition activities associated with the Project could temporarily increase demand for fire protection. Such activities may also cause the occasional exposure of combustible materials, such as wood, plastics, sawdust, coverings and coatings, to heat sources from machinery and equipment sparking, exposed electrical lines, welding activities, and chemical reactions in combustible materials and coatings. Project construction activities would comply with all applicable federal, state, and City regulations related to fire safety, including federal regulations under the Occupational Safety and Health Acts (29 Code of Federal Regulations, Part 1926 Subpart F), the California Building Code (California Code of Regulations, Title 24), and the City's Fire Code (LAMC Chapter V, Article 7). To comply with California Department of Industrial Relations, Division of Occupational Safety and Health (Cal-OSHA) and Fire and Building Code requirements, construction managers and personnel will have training in fire prevention and emergency response, and fire suppression equipment specific to construction would be maintained on-site.[66] Project demolition and construction activities would comply with all applicable codes and ordinances related to the maintenance of mechanical equipment, handling and storage of flammable materials, and cleanup of spills of flammable materials. Construction is a regular activity in Los Angeles and, as demonstrated by past practice, the LAFD is equipped and prepared to deal with construction-related fire impacts should they occur, and no aspect of this Project raises the potential for unusual fire risks during construction to which the LAFD would be unable to respond.

Project construction could also potentially impact the provision of existing LAFD services to and within the vicinity of the Project Site as a result of construction impacts to the surrounding roadways. However, construction activity would be contained on-site (except as may be required for improvements to the adjacent sidewalks, if applicable, off-site utility connections, and for construction of the pedestrian bridge abutments/landings) and travel lanes would be maintained in each direction on all public streets around the Project Site throughout the construction period, and emergency access would not be impeded. Further, the Project would be required to implement a Construction Traffic Management Plan (formally required as Mitigation Measure TRANS-1), which would include traffic management strategies, and ensure that adequate and safe access for LAFD remains available within and near the Project Site during construction.

Construction activities would also generate traffic associated with the movement of construction equipment, the hauling of soil and construction materials to and from the Project Site, and construction worker traffic. Thus, although construction activities would be short-term and temporary for the area, Project construction activities could temporarily impact emergency access and response times. However, a Construction Traffic Management Plan would be implemented to minimize disruptions to through traffic flow and maintain emergency vehicle access to the Project Site and neighboring land uses. The majority of construction-related traffic, including deliveries, hauling activities, and construction worker trips, would occur outside the typical

[66] Cal. Code of Regs., tit. 8, § 1920.

weekday commuter AM and PM peak periods, thereby reducing the potential for traffic-related conflicts and the slowing of emergency response times. In addition, temporary traffic controls would be implemented to improve traffic flow around the Project Site during the construction period, and construction activity would be contained on-site (except as may be required for improvements to the adjacent sidewalks, if applicable, off-site utility connections, and for construction of the pedestrian bridge abutments/landings).

Furthermore, Section 21055 of the California Vehicle Code (CVC) exempts drivers of authorized emergency vehicles from adherence to the rules of the road, and Section 21806 of the CVC requires drivers to yield to emergency vehicles. Finally, construction is a temporary condition which would not itself require the construction of specific new governmental facilities to maintain adequate fire protection services.

The Project is similar to other construction projects, uses standard materials and construction practices similar to such projects, and as a result, LAFD possesses sufficient equipment, knowledge, and resources to addresses any concerns related to fire protection from the Project. Furthermore, as discussed above, the Project would comply with relevant regulations for workplace safety, best management practices for material use and storage, and ensuring emergency access to the site.

Based on the above, construction of the Project would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives related to fire protection. Therefore, impacts to fire protection during Project construction would be less than significant.

Operation

The Project involves the removal of the existing shopping center and the expansion of an existing high school use. The removal of the shopping center from the North Campus would decrease the need for fire protection services, and the types of fires that could potentially occur at the expanded high school would be similar to those that could occur at the existing high school campus and would be adequately suppressed with the fire equipment found at the fire stations nearest to the Project Site.

Compliance with applicable regulatory requirements, including LAFD’s fire/life safety plan review and LAFD’s fire/life safety inspection for new construction projects, would ensure that adequate fire prevention features that would reduce the demand on LAFD facilities and equipment resulting from the Project are implemented during Project operation. As such, compliance with Fire Code requirements would minimize the potential for incidents requiring an emergency response by LAFD and therefore reduce the need for a new fire station, or the expansion, consolidation, or relocation of an existing fire station.

The factors that the LAFD considers in determining whether fire protection services for a project are adequate include whether the project: (1) is within the maximum response distance for the land uses proposed; (2) complies with emergency access requirements; (3) complies with fire-flow requirements; and (4) complies with fire hydrant placement.

Pursuant to LAMC Section 57.09.07, the maximum response distance is 1.5 miles for an engine and truck company. If this maximum distance is exceeded, all structures shall be constructed with automatic fire sprinkler systems. LAFD Station No. 106, located at 23004 Roscoe Boulevard, which is approximately 0.68 miles from the North Campus and approximately 0.8 miles from the Main Campus, would serve the Project Site. Station No. 106 is equipped with a truck company and an engine company. As the Project Site is within 1.5 miles of this station, automatic fire sprinklers would not be required.

Emergency vehicle access to the Project Site would continue to be provided from local and major roadways (i.e., Chaminade Avenue, Cohasset Street, Keswick Street, Saticoy Street, and Woodlake Avenue) and would be maintained at all times during both Project construction and operation. All ingress/egress associated with the Project would be designed and constructed in conformance to all applicable City Department of Building and Safety and LAFD standards and requirements for design and construction.

Final fire-flow demands, fire hydrant placement, and other fire protection equipment would be determined for the Project during LAFD's plan check building permit process. Furthermore, significant impacts under CEQA consist of adverse changes in any of the physical conditions within the area of a project resulting from the construction or alteration of fire facilities, and the obligation to provide adequate fire protection is the responsibility of the City. The City meets this constitutional requirement by preparing for long-term growth and demographic changes. The City along with LAFD continue to monitor the demand for existing and projected fire facilities (refer to Objective 9.16 of the Framework Element, Policy 2.1.6 of the Safety Element, and Fire Protection Objective 6-1 of the Central City Community Plan), and coordinate the development of new fire facilities to be phased with growth (Objective 9.18 of the Framework Element). Further, LAFD has identified future strategies in their 2018-2020 Strategic Plan as critical goals to continue to provide excellent service and meet future needs. These strategies consist of better integration of technology in dispatch, vehicle location systems, and staffing as a key component of LAFD's strategy. LAFD is adapting more advanced technological strategies to deploy resources and address life safety issues, maximizing existing resources. LAFD continues to improve and provide for adequate fire protection services, and the Project would not trigger any requirements outlined which would necessitate the need for additional or expanded fire protection facilities. Based on this analysis, it is reasonable to conclude that Project operation would not require the addition of a new fire station or the expansion, consolidation, or relocation of an existing facility in order to maintain service; such services will be provided by a local jurisdiction, and would not inhibit LAFD emergency response.

In conclusion, as described above, the Project would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives related to fire protection. Therefore, impacts to fire protection during Project operation would be less than significant.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. Cumulative development requires the LAFD to continually evaluate the need for new or physically altered facilities in order to maintain adequate service ratios. Similar to the Project, any other development projects in the area would be subject to the Fire Code and other applicable regulations of the LAMC including, but not limited to, automatic fire sprinkler systems for high-rise buildings and/or projects located farther than 1.5 miles from the nearest LAFD Engine or Truck Company to compensate for additional response time, and other recommendations made by the LAFD to ensure fire protection safety. Through the process of compliance, the ability of the LAFD to provide adequate facilities to accommodate future growth and maintain acceptable levels of service would be ensured. Furthermore, the increased demands for additional LAFD staffing, equipment, and facilities would be funded via existing mechanisms (e.g., property taxes and government funding) to which the Project and any other development projects would contribute. Therefore, cumulative impacts related to fire protection services would be less than significant.

b. Police protection?

Less Than Significant Impact. A significant impact may occur if a project creates the need for new or physically altered police facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives.[67] The need for, or deficiency in, adequate police protection services as a result of the Project is not in and of itself is a potentially significant impact, but rather a social and/or economic impact for which CEQA does not require further analysis.[68] The ultimate determination of whether there is a significant impact to the environment related to police protection from a project is determined by whether construction of new or expanded police protection is a direct physical change or a reasonably foreseeable indirect change in the environment caused by the Project. To the extent the Project would result in a need for new or expanded police facilities, based on existing zoning standards, past practices, and historical development of City police facilities, the City makes the following assumptions: such facilities (1) would occur where allowed under the designated land use; (2) would be located on parcels that are infill opportunities on lots that are between 0.5 and 1 acre in size; and (3) would qualify for a

[67] City of Hayward v. Board of Trustees of California State University (2015) 242 Cal.App.4th 833, 847.

[68] City of Hayward v. Board of Trustees of California State University (2015) 242 Cal.App.4th 833, 847.

categorical exemption under CEQA Guidelines Section 15301 or 15332 and/or a Mitigated Negative Declaration.

Construction and operation of new buildings can result in additional calls for service from the Los Angeles Police Department (LAPD). The Project includes proposed construction methods and building uses currently widespread in the City of Los Angeles, which LAPD has sufficient specialized equipment and training with which to respond. LAPD dispatches resources dynamically, with officers responding from the field, patrols, or facilities depending on their location at the time. Due to the nature of dispatching police calls for service, facilities are not the limiting factor in responding to calls for service, but rather equipment and staffing as police are infrequently in one location for extended periods of time. LAPD continually evaluates their equipment and staff levels, making adjustments as necessary, with a focus towards advanced technology, operational efficiencies, community involvement, and advanced training to maximize current resources community involvement, as outlined in the LAPD Strategic Plan, *LAPD 2020 & Beyond.* [69] Due to the unpredictable nature of deploying resources, developments such as advanced equipment in vehicles, improved access to digital resources in vehicles, and advanced mobile phone capabilities all allow for a more mobile and dynamically deployed workforce. These advances, such as in car computers, mobile phone advancements, mapping and navigation improvements, and dispatch center advancements allow for resources to be deployed from the field rather than a static office or station.

The Project would not introduce physical obstructions, inhibiting the LAPD, nor would the uses contain novel activities that would require new police facilities to adequately ensure public safety. In addition, the Project involves the removal of the existing shopping center from the North Campus, which would decrease the need for police protection services, as the need for police protection services on the North Campus would be similar to the need already occurring for the existing high school on the Main Campus. Further, the Project would not increase the maximum student enrollment beyond what is currently permitted. The Project would also comply with relevant laws, as well as industry standards in securing the property during both construction and operation. The Project would include security measures during operation, such as secured access, closed circuit video surveillance, security alarm systems, and ample lighting. The Main Campus would retain the existing eight-foot tall fence, gates, and block wall currently securing the campus perimeter. In addition, new fencing and vehicular gates, to be located along the northwest drive aisle and parent drop-off area along Chaminade Avenue and at the southeastern access point along Cohasset Street, would be provided on the Main Campus to complete the perimeter security. A new 10-foot high ornamental fence would be provided around the perimeter of the North Campus. The Project would not constitute a novel arrangement of uses or use type which would require the construction of altered or new specialized facilities.

The Project Site is served by the City of Los Angeles Police Department's (LAPD) Valley Bureau, which oversees LAPD operations in the Devonshire, Foothill, Mission, North Hollywood, Topanga,

[69] http://lapd-assets.lapdonline.org/assets/pdf/Strategic%20Plan%202019-2021.pdf

Van Nuys, and West Valley areas, and would be served by the Topanga Community Police Station, located at 21501 Schoenborn Street.[70] The Valley Bureau service area is 226 square miles in size has approximately 1.8 million residents. LAPD has identified the need for more reserve officers in its Strategic Plan, and identifies staffing needs yearly during the budgeting process. New staffing is subject to approval by the City Council and is based on a complex set of socio-economic factors, which are outside the purview of CEQA. Changes in LAPD staffing levels do not typically result in substantial adverse physical impacts on the environment. The Project would not introduce population to an area not served by a police station or an area otherwise not currently served by existing police services, and would not result in an increase in maximum student enrollment beyond what is currently permitted. Therefore, the Project would not require new facilities or staffing requiring dedicated facilities.

Furthermore, the protection of the public safety is the responsibility of local government where local officials have an obligation to give priority to the provision of adequate public safety services. Based on this analysis, it is reasonable to conclude that Project operation would not require the addition of a new police station or the expansion, consolidation, or relocation of an existing facility in order to maintain service; such services will be provided by a local jurisdiction, and would not inhibit LAPD emergency response. In conclusion, as described above, the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for police protection. Therefore, Project impacts would be less than significant.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. Cumulative development requires the LAPD to continually evaluate the need for new or physically altered facilities in order to maintain adequate service ratios. Similar to the Project, any other development projects in the area would be subject to the site plan review and approval requirements, recommendations of the LAPD related to crime prevention features, and other applicable regulations of the LAMC. Through the process of compliance, the ability of the LAPD to provide adequate facilities to accommodate future growth and maintain acceptable levels of service would be ensured. Furthermore, the increased demands for additional LAPD staffing, equipment, and facilities would be funded via existing mechanisms (e.g., property taxes and government funding) to which the Project and any other development projects would contribute. Therefore, cumulative impacts related to police protection services would be less than significant.

[70] LAPD, Valley Bureau: http://www.lapdonline.org/valley_bureau

c. Schools?

No Impact. The Project includes the physical expansion and improvements to the existing high school. Thus, the Project would not result in the direct demand for school services. Additionally, pursuant to the California Government Code Section 65995, the Project Applicant would be required to pay school fees established by the Los Angeles Unified School District (LAUSD), payment of which in accordance with existing rules and regulations regarding the calculation and payment of such fees would, by law, provide full and complete mitigation for any potential direct and indirect impacts to schools as a result of the Project. Therefore, no impact would occur.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. In addition, the Project would not result in the demand for school services, as the Project involves the expansion of an existing high school. Regardless, and similar to the Applicant of the Project, the applicants of any other development projects would be required to pay the applicable school fees to the LAUSD to ensure that no significant impacts to school services would occur. Therefore, cumulative impacts to school services would be less than significant.

d. Parks?

No Impact. A significant impact to parks would occur if implementation of a project includes a new or physically altered park or creates the need for a new or physically altered park, the construction of which could cause substantial adverse physical impacts. The Project includes the physical expansion of the existing high school campus, including new athletic fields and an outdoor swimming pool, which would provide additional recreational space for students, but would not result in an increase in maximum student enrollment. Therefore, it is expected that the recreational needs of the students would be satisfied through the provision of on-site recreational facilities, and the Project would not result in additional demand for parks and recreational facilities. As such, no impact would occur.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. In addition, the Project would not result in the demand for parks and recreational facilities, as the Project includes new recreational space that would serve the needs of its students. Any other development projects that include residential uses could result in an increase demand for parks and recreational services, and the applicants of any such development projects would be required to meet LAMC open space requirements and would be subject to the park fees pursuant to LAMC Section 12.33, ensuring that any potential impacts to parks and recreational facilities would be less than significant. As stated previously, the Project would not result in any impacts related to parks and recreational facilities. Therefore, cumulative impacts to park and recreational facilities would be less than significant.

e. Other public facilities?

No Impact. The Project includes the physical expansion and improvements to the existing high school, and does not increase the maximum student enrollment beyond what is currently permitted. The Project would not create a residential population that could then create the need for additional library facilities. As the Project is a high school, students would be supplied with textbooks and other supplemental materials for their classes. In addition, students would have access to a new library contained within the new Multistory Building and it is also likely that the students would have individual access to internet service, which provides information and research capabilities that studies have shown to reduce demand at physical library locations.[71],[72] As such, the Project would not necessitate the need for a new library facility, and no impact would occur.

Cumulative Impacts

No related projects have been identified within one-half mile of the Project Site. In addition, the Project would not result in the demand for library facilities, as the Project includes a new library within the new Multistory Building. Any other development projects that include residential uses could result in an increase demand for library services. The anticipated revenue to the General Fund generated by any other development projects through business taxes and other revenue sources would help offset any increase in demand for library services and fund necessary library improvements. As such, the demand for library services created by any other development projects could be accommodated, and impacts would be less than significant. As stated previously, the Project would not result in any impacts related to library services. Therefore, cumulative impacts to library services would be less than significant.

XVI. RECREATION

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

a. Would the project Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?

No Impact. As discussed in response to Checklist Question XV(d) (Public Services – Parks), the Project includes physical upgrades to and the expansion of the existing high school campus, including new athletic fields, an outdoor swimming pool, and new parking facilities which would provide and allow for additional recreational space for students, but would not result in an increase in maximum student enrollment. Therefore, it is expected that the recreational needs of the students would be satisfied through the provision of on-site recreational facilities, and as such, no impact would occur.

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Less Than Significant Impact. A significant impact may occur if a project includes the construction or expansion of park facilities, the construction of which could have a significant adverse effect on the environment. While the Project includes the construction of new athletic fields and an outdoor swimming pool on the North Campus and the resurfacing of the existing baseball field on the Main Campus to be used as a softball field, as demonstrated throughout this IS/MND, the construction of these facilities would not have an adverse physical effect on the environment. Further, as the Project would not result in additional demand for parks and recreational facilities, the Project would not require the construction or expansion of recreational facilities, and this impact would be less than significant.

Cumulative Impacts

Refer to discussion of cumulative impacts related to parks and recreational facilities under response to Checklist Question XV(d) (Public Services – Parks). As discussed therein, cumulative impacts related to parks and recreational facilities would be less than significant.

XVII. TRANSPORTATION

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☐	☐	☒	☐
b. Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	☐	☐	☐	☒
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☒	☐	☐
d. Result in inadequate emergency access?	☐	☐	☒	☐

This section is based on the following items, which are included in Appendix H of this IS/MND:

- Transportation Assessment Report, Armen Hovanessian Transportation Consulting, May 4, 2023.
- Transportation Assessment Letter, Los Angeles Department of Transportation, May 16, 2023.

a. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less Than Significant Impact. A significant impact would occur if a project conflicts with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadways, bicycle, and pedestrian facilities. The Project would not conflict with the relevant City plans, policies, and programs and does not include any features that would preclude the City from completing and complying with these guiding documents and policy objectives. The Project will not conflict with any plans or policies that govern the public right-of-way, such as the Los Angeles Department of Transportation's (LADOT) Manual of Policy and Procedures (MPP) Section 321, Driveway Design. The Project has been found to be consistent with the GHG reduction targets forecasted in the SCAG RTP/SCS as it would result in a decrease of 1,355 net daily vehicle trips

when compared to existing conditions. Additionally, the Project has been found to be consistent with the transportation-related elements of the Plan for a Healthy Los Angeles (Healthy LA), Vision Zero, the Mobility Hubs Reader's Guide, the City's Walkability Checklist, and the Canoga Park – Winnetka – Woodland Hills – West Hills Community Plan. Therefore, the Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadways, bicycle, and pedestrian facilities, and the impact would therefore be less than significant.

b. Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3 subdivision (b)?

No Impact. This question was revised to address consistency with CEQA Guidelines Section 15064.3, subdivision (b), which relates to use of vehicle miles traveled (VMT) as the methodology for evaluating traffic impacts. The Los Angeles Department of City Planning (LADCP) and LADOT updated the Transportation Section of the City's CEQA Thresholds Guide to comply with and implement Senate Bill 743 (SB 743).

On September 27, 2013, Governor Brown signed SB 743. Under SB 743, the focus of transportation analysis pursuant to CEQA shifts from driver delay, or Level of Service (LOS), to reduction in VMT, reduction in GHG emissions, creation of multimodal networks, and promotion of mixed-use developments. In December 2018, the California Natural Resources Agency certified and adopted amendments to the CEQA Guidelines implementing SB 743 with a target implementation date of July 1, 2020. City staff presented the CEQA Appendix G environmental checklist update to the City Council, which led to the adoption of new VMT-based significance thresholds and its subsequent incorporation into the City's CEQA Threshold Guide. In the course of this update, LADOT has developed a VMT Calculator tool to "screen" projects to determine if a VMT analysis is required, and if so, then to estimate project specific daily household VMT per capita and daily work VMT per employee for land use development projects. This tool is intended to be used for the development projects within the City, and the VMT methodology is tailored to the Transportation Assessment Guidelines (TAG).

LADOT's VMT Calculator, version 1.3, was used to determine whether the Project would exceed any of the Transportation Impact Assessment criteria, which would require further transportation impact analysis. The VMT Calculator sheets are included in Appendix 5 of the Transportation Assessment Report (which is included as Appendix H-1 of this IS/MND) and demonstrate that the Project would result in a net decrease of daily vehicle trips when compared to existing conditions.[73] This reduction is the result of demolishing an existing shopping center which is a high trip-generating use and replacing it with athletic and ancillary facilities for a high school. Based on the results using the City's VMT Calculator, a formal VMT assessment is not required

[73] The VMT calculator sheets included in Appendix 5 of the Transportation Assessment Report show a decrease of 1,179 net daily trips, and the trip generation analysis provided in Table 8 of the Transportation Assessment Report show a decrease of 1,355 net daily trips.

to be performed because the Project does not exceed the daily trip threshold of 250 net new daily vehicle trips established as the screening criteria in the TAG. Accordingly, the Project would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), and no impact with respect to VMT would occur.

c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact with Mitigation. A significant impact may occur if a project were to include a new roadway design, introduce a new land use or project features into an area with specific transportation requirements and characteristics that have not been previously experienced in that area, or if project access or other features were designed in such a way as to create hazardous conditions.

Construction

Trucks and other construction-related vehicles would access the Project Site over the course of all construction phases. The Project's maximum truck trip generation would occur during grading and hauling operations for the Multistory Building on the Main Campus. During this one-month phase, up to 47 haul trucks per day (approximately 94 one-way trips) would remove cut soils for transportation to a regional landfill. The Project also requires a haul route approval for the export of approximately 17,800 cubic yards from the Main Campus and approximately 720 cubic yards of export from the North Campus. The proposed haul route would exit the school Project Site and travel west on Saticoy Street (which then turns into Ingomar Street), south on Valley Circle Boulevard, and west on Long Valley Road to the Ventura Freeway (US-101) on-ramps. Empty trucks returning to the Project Site would exit the Ventura Freeway at Mulholland/Valley Circle, travel east on Calabasas Road, north on Valley Circle Boulevard, east on Ingomar Street, and east on Saticoy Street. Saticoy is designated as an Avenue II Street generally improved to an 85-foot width with sufficient capacity for the haul trucks. Valley Circle Boulevard is a generally commercial street designated Avenue I in this location improved up to100 feet.

As part of the Project approvals, the Advisory Agency will approve the haul route for the haul trucks. In addition, LADOT requires implementation of worksite traffic control plans to ensure that any construction-related effects are minimized to the greatest extent possible. To be conservative, a Construction Traffic Management Plan (CTMP) will be implemented (see TRAN-MM-1), which would ensure that construction related traffic impacts are less than significant.

Operation

The Transportation Assessment Report (included in Appendix H-1 of this IS/MND) addresses traffic anticipated to be generated by the Project. As the Project would not increase student enrollment or faculty or staff, it would not result in any new trips as a result of students or employees traveling to and from the Project Site. However, new trips would be generated by new special events and activities associated with the new outdoor pool on the North Campus. The

following provides a summary of new events and activities at the North Campus (not including existing school events that would shift from the Main Campus to the North Campus):

- 10 high school swim competitions per year
- 10 middle school swim competitions per year
- Swim practice for other schools (limited to February through April)
- Swim lessons and water exercise classes daily
- Local community swimming (if there are no other activities at the pool)
- Local non-school athletic groups (limited to May through December)

When taking into account the removal of the existing shopping center on the North Campus portion of the Project Site, the Project would result in no net new AM peak hour trips, 292 net new PM peak hour trips, and a reduction of 1,355 daily trips. The net new PM peak hour trips would be generated by the activities at the North Campus that are listed above.

The Project would not substantially increase hazards due to a geometric design feature. Vehicular access to the Project Site would be provided via Chaminade Avenue, Cohasset Street, Keswick Street, Saticoy Street, and Woodlake Avenue. The Project would not add or shift any access points on the Main Campus. For the North Campus, there are currently four access points along Saticoy Street which would be reduced to the two access points for the Project. There are also currently two access points along Woodlake Avenue which would be reduced to one access point at the approximate location of the existing north access point. The Project driveways (existing and new) will meet the standards set forth by LADOT and BOE.

In addition, the Transportation Assessment Report (included as Appendix H-1 of this IS/MND) included an access, safety, and circulation evaluation to determine whether Project traffic would cause or substantially extend queueing at nearby intersections. As shown in Table 15 of the Transportation Assessment Report, with the addition of Project traffic, the queueing length would only increase by less than one car length. Further, the Project would include a Traffic Management Plan (TMP), formally provided as PDF-2 in Section 3, Project Description. The purpose of this plan is to establish operational procedures to improve traffic circulation, student safety, maximize the efficiency of drop-off and pick-up operations, and reduce delays during those time periods. Therefore, the Project would not create hazardous conditions and this impact would be less than significant.

Mitigation Measure

TRANS-1 Construction Traffic Management Plan

Prior to the start of construction, a Construction Traffic Management Plan (CTMP) shall be submitted to LADOT for review and approval. The CTMP will include a Worksite Traffic Control Plan, which will facilitate traffic and pedestrian movement, and minimize the potential conflicts between construction activities, street traffic, bicycles, and pedestrians. The CTMP will include, but not limited to, the following measures:

- Maintaining access for land uses in the vicinity of the Project Site during construction.
- Schedule construction materials deliveries during off-peak periods to the extent practical.
- Organize deliveries and staging of all equipment and materials in the most efficient manner possible, and on-site where possible, to avoid an impact to surrounding roadways.
- Coordinate deliveries to ensure trucks do not wait to unload or load and impact surrounding roadways, and if needed, utilize an off-site staging area.
- Control truck and vehicle access to the Project Site with flagmen.
- Limit lane closures to the maximum extent possible and avoid peak period hours to the extent possible. Where such closures are necessary, the Worksite Traffic Control Plan will identify the location of lane closures and identify all traffic control measures, signs, delineators, and work instructions to be implemented by the construction contractor through the duration of demolition and construction activity.
- Parking for construction workers will be provided either on-site or at off-site, off-street locations.

d. Result in inadequate emergency access?

Less Than Significant Impact. A significant impact would occur if a project would significantly impede emergency vehicle response times. Emergency vehicular access to the Project Site would be maintained from all Project driveways, and the Project's driveways and internal circulation would be designed to meet all applicable City Building Code and Fire Code requirements regarding site access, including providing adequate emergency vehicle access both during construction as well as after completion of the Project. Compliance with applicable City Building Code and Fire Code requirements, including emergency vehicle access and fire lanes, would be

confirmed as part of LAFD's fire/life safety plan review and inspection required in Section 57.118 of the LAMC. The Project also would not include the installation of barriers that could impede emergency vehicle access both during and operation. The Transportation Assessment Report (included in Appendix H-1 of this IS/MND) demonstrates that the Project would result in a decrease of daily vehicle trips when compared to existing conditions, and therefore Project traffic will not impact surrounding roadways or impede emergency vehicles from access adjacent streets. Emergency access to the Project Site and surrounding area would be maintained both during Project construction and operation. Therefore, the Project would not result in inadequate emergency access during construction or operation, and impacts to emergency access during construction and operation of the Project would be less than significant.

Cumulative Impacts

Pursuant to the TAG, each of the plans, programs, ordinances, and policies to assess potential conflicts with proposed projects should be reviewed to assess cumulative impacts that may result from the Project in combination with other nearby development projects. A cumulative impact could occur if the Project, with other future development projects located on the same block were to cumulatively preclude the City's ability to serve transportation user needs as defined by the City's transportation policy framework. As stated above, no related projects have been identified within one-half mile of the Project Site. Therefore, cumulative impacts would be less than significant.

As described above, a formal VMT assessment is not required to be performed for the Project because the forecast of net new daily vehicle trips does not exceed the daily trip threshold of 250 net new daily vehicle trips established as the screening criteria in the TAG, and the Project was determined to result in no impact related to VMT as it results in a decrease of 1,355 net daily vehicle trips when compared to existing conditions. As identified in the TAG, development projects that do not exhibit significant VMT impacts are considered to align with the long-term VMT and greenhouse gas reduction goals of both the City and regional SCAG transportation plans. Therefore, since the Project itself does not result in VMT impacts, it is also deemed to have a less than significant cumulative VMT impact.

Pursuant to the TAG, the potential for cumulative impacts related to hazardous design features should be determined by reviewing project site access plans for cumulative development projects with access points proposed along the same block(s) as a proposed project. As stated above, no related projects have been identified within one-half mile of the Project Site. Therefore, there would be no cumulative impacts related to substantially increasing hazards due to geometric design features or incompatible uses, and this impact would be less than significant.

Finally, similar to the Project, all ingress/egress and access associated with any other development projects would be designed and constructed in conformance to all applicable requirements, including the City Building Code, City Fire Code, LAMC, and other LAFD standards and requirements for design and construction. As all projects, including the Project and any other

development projects, would be required to comply with existing regulations related to access, cumulative impacts with respect to emergency access would be less than significant.

XVIII. TRIBAL CULTURAL RESOURCES

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☒	☐	☐
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☐	☒	☐	☐

The analysis in this section is based on the following, which are included in Appendix I of this IS/MND:

- Tribal Cultural Resources Technical Memorandum, SWCA Environmental Consultants, March 9, 2023.
- AB 52 Letter, City of Los Angeles, June 6, 2023.

a. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

b. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American

tribe, and that is: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Less Than Significant with Mitigation Incorporated. A significant impact would occur if the project would cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place or object with cultural value to a California Native American tribe, which is Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).

Approved by Governor Brown on September 25, 2014, Assembly Bill 52 (AB 52) establishes a formal consultation process for California Native American Tribes to identify potential significant impacts to Tribal Cultural Resources (TCRs), as defined in Public Resources Code Section 21074, as part of CEQA. Effective July 1, 2015, AB 52 applies to projects that file a Notice of Preparation of an MND or EIR on or after July 1, 2015. PRC Section 21084.2 now establishes that a project with an effect that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment. To help determine whether a project may have such an effect, PRC Section 21080.3.1 requires a lead agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a proposed project. That consultation must take place prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report for a project. As a result of AB 52, the following must take place: 1) prescribed notification and response timelines; 2) consultation on alternatives, resource identification, significance determinations, impact evaluation, and mitigation measures; and 3) documentation of all consultation efforts to support CEQA findings for the administrative record.

Under AB 52, if a lead agency determines that a project may cause a substantial adverse change to a TCR, the lead agency must consider measures to mitigate that impact. PRC Section 21074 provides a definition of a TCR. In brief, in order to be considered a TCR, a resource must be either: 1) listed, or determined to be eligible for listing, on the national, State, or local register of historic resources, or 2) a resource that the lead agency chooses, in its discretion supported by substantial evidence, to treat as a TCR. In the latter instance, the lead agency must determine that the resource meets the criteria for listing in the State register of historic resources or City Designated Cultural Resource. In applying those criteria, a lead agency shall consider the value of the resource to the tribe.

As specified in AB 52, lead agencies must provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if the tribe has submitted a written request to be notified. The tribe must respond to the lead agency within 30 days of receipt

of the notification if it wishes to engage in consultation on the project, and the lead agency must begin the consultation process within 30 days of receiving the request for consultation. An informational letter (included in Appendix I-2 of this IS/MND) was mailed to a total of 10 Tribes known to have resources in this area, on June 6, 2023, describing the Project and requesting any information regarding resources that may exist on or near the Project Site.

On June 9, 2023, staff received an email from Sarah Brunzell, on behalf of the Cultural Resources Management (CRM) Division of the Fernandeño Tatviam Band of Mission Indians (FTBMI), requesting a Tribal Consultation meeting for the Project. The Tribal representative requested that the Applicant submit a FTBMI Project Intake Form, in order to further evaluate the Project's impacts related to Tribal Cultural Resources. On June 27, 2023, the Tribal representative indicated that the Project is categorized as Medium Sensitivity and directed the Applicant to complete a new consultation form. On June 29, 2023, the Planning staff had a meeting with the Tribal representative to discuss the Project's potential impacts to Tribal Cultural Resources in the region. During that meeting, the Tribal representative provided the following information. The Tribal representative stated that the Project is in close proximity to a number of Tribal Cultural Resource Sites, some of which have also been documented as Cultural Resources (CA-LAN-413, CA-LAN-0834, etc). The Tribal representative also stated that the village of Jucayunga is also near the proposed undertaking as well as Rancho El Escorpion, a site that is both historic and prehistoric in nature. Although the Project location has been previously developed, the construction occurred prior to AB 52 presumably with no Tribal Monitor(s) present and the current proposed undertaking will disturb native soil. The FTBMI CRM Division requested the following: that prior to the initiation of ground-disturbing activities, the Project to retain a professional Native American monitor procured by the Fernandeño Tataviam Band of Mission Indians; that the Lead Agency and/or applicant shall, in good faith, consult with the FTBMI on the disposition and treatment of any Tribal Cultural Resource encountered during all ground disturbing activities; and if human remains or funerary objects are encountered during any activities associated with the Project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted.

According to the tribal cultural resources technical memorandum (included in Appendix I-1 of this IS/MND), no resources that could qualify as tribal cultural resources were identified in a CHRIS records search within the Project Site or a half-mile radius. The results of the sacred lands file (SLF) search conducted by the Native American Heritage Commission (NAHC) indicated that there are known tribal cultural resources in the vicinity of the Project Site. A review of ethnographic literature and historical maps document significant Native American villages and sites nearby. The Chumash village known as *Atavsanga* (also known as *Ataguama* or *Totongna*) is the closest ethnographically documented village to the Project Site, located approximately two miles to the southwest. The Tatavian village known as *Momonga* is located approximately 3.5 miles to the north (near present-day Chatsworth), and the Gabrielino village known as *Siutcanga* is located approximately 8.4 miles to the southeast (near present-day Encino). These villages are often correlated with the later Spanish and Mexican period ranchos, as ranchos developed around existing Native American settlements. *Atavsanga* and *Siutcanga* are both believed to have been

located within the boundaries of Ranchos El Escorpion and Encino, respectively.

The Project Site (both the Main and proposed North Campuses) was developed in the early 1960s with the Main Campus buildings and sports field, and a multi-tenant mini shopping center and paved parking lot within the proposed North Campus. The shopping center was expanded in 1981 to its current size. The development of the Project Site and its prior use as agricultural fields is likely to have substantially compromised the integrity of the physical setting and likely destroyed or displaced any tribal cultural resources that may have been deposited on the surface or shallowly buried. Furthermore, the surficial geology of the Project Site has been identified as late to middle Pleistocene old alluvial fan deposits. According to the paleontological resources study conducted for this Project (contained in Appendix E of this IS/MND), the depth to the underlying, previously undisturbed sediments is unknown, but likely very shallow (e.g., three feet below ground surface). These types of sediments are naturally less likely to contain buried archaeological resources.

Archaeological remains that are tribal cultural resources can occur below paved surfaces within developed urban settings. While the CHRIS records search results did not identify any such archaeological resources within the Project Site or vicinity, most of the Project Site was not inspected for archaeological resources before being developed. SWCA (the preparer of the tribal cultural resources technical memorandum) considers the greater region of the Project Site as having moderate sensitivity for tribal cultural resources. However, the Project Site consists of a comparatively small area within the greater region and has been subject to multiple episodes of ground disturbances. As a result, archaeological materials once located on the surface or in shallow deposits are very unlikely to have been preserved within the Project Site, and though more deeply buried deposits could exist, SWCA considers the sensitivity for archaeological resources to decrease within the Project Site. Based on the Historic period developments within the Project Site and SWCA's interpretation of the sediment profiles across the entire Project Site, the sensitivity for tribal cultural resources within the near-surface is considered low.

While there are known significant Native American village sites located in the general vicinity of the Project Site, such as *Atavsanga* and *Momonga*, the Project Site is not located near or in a comparable environmental setting to suggest an increased likelihood for associated tribal cultural resources to be discovered within the Project Site. The Project Site is set within what has been a broad floodplain of the Los Angeles River for which there are only generalized indicators of former use by Native Americans such that substantial material deposits are likely to have occurred. These generalized indicators include a reasonable proximity to former stream courses and important natural resources that occur in higher densities near waterways. Two intermittent streams are located in the vicinity of the Project Site: Dayton Creek formed approximately 0.6 mile to the north, and Bell Creek is approximately 0.7 miles to the south. Dayton Creek connects to Chatsworth Creek, which is located approximately 0.7 miles east of the Project Site. Both Chatsworth and Bell Creeks connect to the south-flowing Los Angeles River, currently located approximately 2.1 miles southeast of the Project Site. The proximity to these streams could suggest the area was more intensively used by Native Americans, such that there would be a

corresponding increase in the potential for a tribal cultural resource to be present.

Overall, late to middle Pleistocene old alluvial fan deposits below the artificial fill within the Project Site are naturally less likely to contain buried archaeological resources. The depth to the depth to the underlying, previously undisturbed sediments is unknown, but likely very shallow (e.g., three feet below ground surface). Additionally, the impacts to the near-surface from Historic period agricultural use and developments further decreases the likelihood of encountering any buried archaeological resources due to the compromised integrity of the physical setting. Based on these findings, SWCA considers the sensitivity for tribal cultural resources to be low.

Nevertheless, should tribal cultural resources be inadvertently encountered, the Project would comply with Mitigation Measures MM-TCR-1 through MM-TCR-3, provided below, regarding the discovery and handling of any potential resources. With implementation of MM-TCR-1 through MM-TCR-3, impacts with respect to tribal cultural resources would be less than significant.

Cumulative Impacts

Impacts related to tribal cultural resources tend to be site-specific and are assessed on a site-by-site basis. The Project's impacts with respect to tribal cultural resources would be less than significant with implementation of Mitigation Measures MM-TCR-1 through MM-TCR-3. In addition, no related projects have been identified within one-half mile of the Project Site. As such, the Project would not contribute to any potential cumulative impacts related to tribal cultural resources, cumulative impacts related to tribal cultural resources would be less than significant.

Mitigation Measures

MM-TCR-1 Prior to commencing any ground disturbance activities at the Project Site, the Applicant, or its successor, shall retain one (1) tribal monitor that is qualified to identify subsurface tribal cultural resources. Ground disturbance activities shall include excavating, digging, trenching, plowing, drilling, tunneling, quarrying, grading, leveling, removing peat, clearing, driving posts, augering, backfilling, blasting, stripping topsoil or a similar activity at the Project Site. The qualified tribal monitor shall be approved by the Fernandeño Tataviam Band of Mission Indians.

If cultural resources are discovered during Project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be retained by the Applicant, or its successor, to assess the find. A qualified archaeologist/archaeological monitor shall be identified as principal personnel who must meet the Secretary of the Interior's Standards and Guidelines for Archeology and have a minimum of 10 years of experience as a principal investigator working with Native American archaeological sites in Southern California. The archaeologist shall ensure that all other personnel associated with and hired for the archaeological monitoring are appropriately trained and qualified. Work on the

portions of the Project outside of the buffered area may continue during this assessment period. The Fernandeño Tataviam Band of Mission Indians shall be contacted about any pre-contact and/or post-contact finds and be provided information after the archaeologist makes their initial assessment of the nature of the find, to provide Tribal input with regards to significance and treatment.

MM-TCR-2 The Lead Agency and/or Applicant shall, in good faith, consult with the Fernandeño Tataviam Band of Mission Indians on the disposition and treatment of any Tribal Cultural Resource encountered during all ground disturbing activities.

MM-TCR-3 If human remains or funerary objects are encountered during any activities associated with the Project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code shall be enforced for the duration of the Project.

XIX. UTILITIES AND SERVICE SYSTEMS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	☒	☐
c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

a. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. As discussed below, Project impacts related to these issues would be less than significant.

Water

Local water conveyance infrastructure in the vicinity of the Project Site is maintained and operated by the Los Angeles Department of Water and Power (LADWP). As shown on Table XIX-1, the Project would consume approximately 2,663,284 gallons of water per year, or approximately 7,297 gallons of water per day. This is a conservative estimate that does not take into account

the water consumed by the existing shopping center on the North Campus, which would be removed as part of the Project.

Table XIX-1
Estimated Water Consumption and Wastewater Generation[1]

Land Use	Total (gallons/year)[2]
High School Expansion	2,299,554
Recreational Swimming Pool	363,730
Total	**2,663,284**

1 Conservatively assumes that all water converts to wastewater.
2 Calculated via CalEEMod. Refer to Appendix B of this IS/MND and conservatively does not take credit for the removal of the existing shopping center uses on the North Campus.

As part of the permitting process for the Project, the Project Applicant would be required to coordinate with the LADWP Water Service Organization to determine if the existing water supply infrastructure maintains sufficient capacity to accommodate the Project's demand for water, which is done through a Service Advisory Request (SAR). When completed, the SAR provides information regarding the range of flows and pressures that can be expected at the requested service location. The type and cost of improvements are also provided in the SAR. A project developer will then be required to participate in the cost of any necessary new water main extensions and/or replacements required to serve a project. In the event LADWP is unable to perform required installations and replacements in a timely manner, the project developer can have the work performed by a private contractor, in consultation with LADWP.[74] Water main and related infrastructure upgrades would not be expected to create a significant impact to the physical environment because: (1) any disruption of service would be of a short-term nature; (2) replacement of the water mains would be within public and private rights-of-way; and (3) the existing infrastructure would be replaced with new infrastructure in areas that have already been significantly disturbed. For these reasons, the Project would not require or result in relocation or the construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects. Therefore, Project impacts related to water facilities would be less than significant.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, implementation of the Project in conjunction with other development projects could result in an increased impact on water conveyance infrastructure. As with the Project, any other development projects would be subject to review by LADWP to ensure that existing infrastructure would be adequate to meet the water demand requirements for each project. All development in the City is subject to LADWP and City requirements regarding potential infrastructure improvements need to meet respective water infrastructure needs. Additionally, all

74 *Los Angeles Department of Water and Power,* Guide to Water Services.

development in the City is required to comply with Fire Code requirements for fire flow and other fire protection requirements and are subject to ongoing evaluations by LADWP, the City's Department of Public Works, and the Los Angeles Fire Department to ensure water conveyance infrastructure is adequate. Compliance with existing regulations would ensure that cumulative impacts related to water infrastructure would be less than significant.

Wastewater

LA Sanitation (LASAN) operates and maintains the wastewater treatment, reclamation and collection facilities serving most of the City of Los Angeles incorporated areas as well as several other cities and unincorporated areas in the Los Angeles basin and San Fernando Valley. The collection infrastructure consists of over 6,700 miles of local, trunk, mainline and major interceptor sewers, five major outfall sewers, and 46 pumping plants. The wastewater generated by the Project would ultimately flow to the Hyperion Treatment Plant (HTP) System. The existing design capacity of the Hyperion Service Area is approximately 550 mgd and the existing average daily flow for the system is approximately 300 mgd.[75] Thus, there is approximately 250 mgd of available capacity within the Hyperion Service Area. As identified on Table XIX-1, above, the Project would generate approximately 2,663,284 gallons of wastewater per year, or approximately 7,297 gallons of wastewater per day. This is a conservative estimate that does not take into account the wastewater generated by the existing shopping center on the North Campus, which would be removed as part of the Project. With a remaining daily capacity of 250 mgd, the Hyperion Service Area would have adequate capacity to serve the Project. Therefore, Project impacts related to wastewater treatment would be less than significant.

Regarding sewer infrastructure capacity, the City has a codified regulatory process to confirm that there is sufficient infrastructure capacity to serve a project. The LAMC includes regulations that require the City to assure available sewer capacity for new projects and to collect fees for improvements to the infrastructure system. LAMC Section 64.15 requires that the City perform a Sewer Capacity Availability Review (SCAR) when an applicant seeks a sewer permit to connect a property to the City's sewer system, proposes additional discharge through their existing public sewer connection, or proposes a future sewer connection or future development that is anticipated to generate 10,000 gallons or more of sewage per day. A SCAR provides a preliminary assessment of the capacity of the existing municipal sewer system to safely convey a project's newly generated wastewater to the appropriate sewage treatment plant.

LAMC Sections 64.11 and 64.12 require approval of a sewer permit, also called an "S" Permit, prior to connection to the wastewater system. LAMC Sections 64.11.2 and 64.16.1 require the payment of fees for new connections to the City's sewer system to assure the sufficiency of sewer infrastructure. New connections to the sewer system are assessed a Sewerage Facilities Charge. The rate structure for the Sewerage Facilities Charge is based upon wastewater flow strength as

[75] City of Los Angeles Department of Public Works, LA Sanitation, Sewer System Management Plan, Hyperion Sanitary Sewer System, January 2019.

well as volume. The determination of wastewater flow strength for each applicable project is based on City guidelines for the average wastewater concentrations of two parameters, biological oxygen demand and suspended solids, for each type of land use. Sewerage Facilities Charge fees are deposited in the City's Sewer Construction and Maintenance Fund for sewer and sewage-related purposes, including, but not limited to, industrial waste control and water reclamation purposes. As the Project would comply with the City's codified regulatory process to ensure adequate sewer capacity, Project impacts with respect to wastewater infrastructure would be less than significant.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, implementation of the Project combined with other development projects in the area could increase the need for wastewater treatment. As with the Project, other development projects would be subject to review by the Bureau of Sanitation to ensure that existing infrastructure would be adequate to meet the requirements for each project. All development in the City is subject to City requirements regarding potential infrastructure improvements need to meet respective wastewater infrastructure needs. Further, with a remaining treatment capacity of approximately 250 mgd, the Hyperion Service Area would have adequate capacity to accommodate the wastewater treatment requirements of cumulative development, and no new or upgraded treatment facilities would be required. Therefore, the cumulative wastewater treatment impacts would be less than significant.

Storm Water Drainage

As discussed in response to Checklist Question X(c)(iii) (Hydrology and Water Quality – Storm Drain Capacity), Project impacts related to storm drainage facilities would be less than significant.

Cumulative Impacts

Refer to the cumulative impact discussion provided in response to Checklist Topic X (Hydrology and Water Quality).

Electrical Power

As discussed in response to Checklist Questions VI(a) and (b) (Energy), Project impact related to electric power facilities would be less than significant.

Cumulative Impacts

Refer to the cumulative impact discussion provided in response to Checklist Topic VI (Energy).

Natural Gas

As discussed in response to Checklist Question VI(a) and (b) (Energy), Project impact related to natural gas facilities would be less than significant.

Cumulative Impacts

Refer to the cumulative impact discussion provided in response to Checklist Topic VI (Energy).

Telecommunications

In the Project Site area, existing telephone, cable television, and internet service is available from a variety of providers, including AT&T, Spectrum, and Frontier. The Project Site could be served by existing telecommunications facilities that are available in the Project Site area and would not require new or expanded facilities. Therefore, Project impacts related to telecommunications facilities would be less than significant.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, like the Project, any other development projects would represent infill development served by existing utilities, including telecommunications infrastructure. As with the Project, any other development projects would likely require project- or site-specific infrastructure to connect to the existing infrastructure, would not require new or expanded facilities. Therefore, cumulative impacts related to telecommunications infrastructure would be less than significant.

b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. A significant impact may occur if a project were to increase water consumption to such a degree that new water sources would need to be identified, or that existing resources would be consumed at a pace greater than planned for by purveyors, distributors, and service providers. The City's water supply comes from local groundwater sources, the Los Angeles-Owens River Aqueduct, State Water Project, and from the Metropolitan Water District of Southern California, which is obtained from the Colorado River Aqueduct. These sources, along with recycled water, are expected to supply the City's water needs in the years to come. As concluded in LADWP's 2020 Urban Water Management Plan (UWMP), projected water demand for the City would be met by the available supplies during an average year, single dry year, and multiple dry year in each year from 2025 to 2045. LADWP's 2020 UWMP also includes a drought risk assessment, which shows that there would be no water shortages over the five-year drought, which started in 2021.[76]

[76] Los Angeles Department of Water and Power, 2020 Urban Water Management Plan, page 11-13.

As shown on Table XIX-1, above, the Project would consume approximately 2,663,284 gallons of water per year, or approximately 7,297 gallons of water per day. According to LADWP, if a project is consistent with the City's General Plan, the projected water demand associated with that project is considered to be accounted for in the most recently adopted UWMP, which is prepared by the LADWP to ensure that existing and projected water demand within its service area can be accommodated. As discussed previously in response to Checklist Question XI(b) (Land Use and Planning), the Project is consistent with the City's General Plan land use designation for the Project Site. As discussed in previously in response to Checklist Question III(a) (Air Quality), the Project would not result in an increase in student enrollment beyond the currently permitted maximum enrollment and therefore the Project would be within the population projections contained in SCAG's RTP/SCS, upon which the current UWMP was based. Thus, the Project's demand for water could be accommodated by LADWP's existing and projected water supplies. As such, the Project would not require new or additional water supply or entitlements, and impacts related to water supply would be less than significant.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, implementation of the Project in conjunction with other development projects could increase demand for water services provided by the City's water supply system. LADWP (through its UWMP) anticipates that its projected water supplies will meet demand through the year 2040. In terms of the City's overall water supply condition, any project that is consistent with the City's General Plan has been taken into account in the planned growth of the water system. In addition, any project that conforms to the demographic projections from SCAG's RTP/SCS and is located in the service area is considered to have been included in LADWP's water supply planning efforts so that projected water supplies would meet projected demands. For projects that meet the requirements established pursuant to SB 610, SB 221, and Sections 10910-10915 of the State Water Code, a water supply assessment demonstrating sufficient water availability is required on a project-by-project basis. Similar to the Project, any other development projects would be required to comply with City and State water code and conservation programs for both water supply and infrastructure.

Both the Project and any other development projects would be subject to the water conservation measures outlined in the City's Green Building Code, which would partially offset the cumulative demand for water. LADWP undertakes expansion or modification of water service infrastructure to serve future growth in the City as required in the normal process of providing water service. For these reasons, cumulative impacts related to water would be less than significant.

c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less Than Significant Impact. A significant impact may occur if a project would increase wastewater generation to such a degree that the capacity of facilities currently serving the Project Site would be exceeded. As discussed in subsection (a), above, with a remaining daily capacity of approximately 250 mgd, the Hyperion Service Area would have adequate capacity to serve the Project. Therefore, Project impacts related to wastewater treatment would be less than significant.

Cumulative Impacts

For a full discussion of cumulative impacts with respect to wastewater treatment, please see subsection (a), above. As discussed therein, cumulative impacts related to wastewater treatment would be less than significant.

d. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less Than Significant Impact. A significant impact may occur if a project were to increase solid waste generation to a degree that existing and projected landfill capacity would be insufficient to accommodate the additional solid waste or impair the attainment of solid waste reduction goals. The landfills that serve the City and the capacity of these landfills are shown in Table XIX-2, below. As shown, the landfills have an approximate available daily intake of 19,957 tons.

Table XIX-2
Landfill Capacity

Landfill Facility	Estimated Remaining Life (years)	Estimated Remaining Disposal Capacity (million tons)	Permitted Intake (tons/day)	2019 Average Daily Disposal (tons/day)	Available Daily Intake (tons/day)
Antelope Valley	10	10.97	5,548	2,079	3,469
Chiquita Canyon	28	56.99	12,000	5,436	6,564
Lancaster	22	9.95	5,100	357	4,743
Sunshine Canyon	18	55.16	12,100	6,919	5,181
				Total	**19,957**
Source: County of Los Angeles, Countywide Integrated Waste Management Plan, 2019 Annual Report, September 2020.					

As shown on Table XIX-3, the Project would generate approximately 125.1 tons of solid waste per year, or approximately 0.34 tons of solid waste per day. This is a conservative estimate that does not take into account the solid waste generated by the existing shopping center on the North Campus, which would be removed as part of the Project. With a remaining daily intake capacity

of approximately 19,957 tons of solid waste per day, the four Class III landfills serving the City that accept commercial solid waste could accommodate the Project's increase of approximately 0.34 tons of solid waste per day. Further, pursuant to AB 939, each city and county in the state must divert 50 percent of its solid waste from landfill disposal through source reduction, recycling, and composting. Therefore, Project impacts related to solid waste would be less than significant.

Table XIX-3
Estimated Solid Waste Generation

Land Use	Total (tons/year)[1]
High School Expansion	90.0
Recreational Swimming Pool	35.1
Total	**125.1**

[1] Calculated via CalEEMod. Refer to Appendix B of this IS/MND and conservatively does not take credit for the removal of the existing shopping center uses on the North Campus.

Cumulative Impacts

As described previously, no related projects have been identified within one-half mile of the Project Site. Nevertheless, the Project in combination with any other development projects could generate additional solid waste. As shown in Table XIX-2, above, the landfills serving the City have an approximate available daily intake of 19,957 tons. Therefore, the facilities serving the Project area would have adequate capacity to accommodate the solid waste generated by cumulative development. Similar to the Project, any other development projects would be required by the City to participate in regional source reduction and recycling programs pursuant to AB 939, which would further reduce the amount of solid waste to be disposed of at the landfills. Thus, cumulative development would not create the need for new or expanded landfills, and cumulative impacts with respect to solid waste service would be less than significant.

e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. Solid waste management in the State is primarily guided by the California Integrated Waste Management Act of 1989 (AB 939), which emphasizes resource conservation through reduction, recycling, and reuse of solid waste. AB 939 establishes an integrated waste management hierarchy consisting of (in order of priority): 1) source reduction; 2) recycling and composting; and 3) environmentally safe transformation and land disposal. In addition to AB 939, SB 1374 requires that the Project implement a construction waste management plan to recycle and/or salvage a minimum of 75 percent of non-hazardous demolition and construction debris. Additionally, the City is currently implementing its "Zero-Waste-to-Landfill" goal to achieve zero waste to landfills by 2025 to enhance the Solid Waste Integrated Resources Planning Process. The Project would comply with the applicable regulations associated with solid waste, including AB 939, SB 1374, and the Construction and Demolition Waste Recycling Ordinance (Ordinance No. 181,519), which requires all mixed construction and demolition waste generated within City limits be taken to City certified construction and demolition

waste processors. Since the Project would comply with federal, State, and local statutes and regulations related to solid waste, a less than significant impact would occur.

Cumulative Impacts

All development in the City, including the Project and any other development projects, would be required to comply with the City's recycling programs. Therefore, cumulative impacts related to this issue would be less than significant.

XX. WILDFIRE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones would the project:				
a. Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

a. Substantially impair an adopted emergency response plan or emergency evacuation plan?

No Impact. The Project Site is not located in or near a state responsibility area, nor is the Project Site located in a Very High Fire Hazard Severity Zone.[77] Therefore, no impact would occur.

b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact. The Project Site is not located in or near a state responsibility area, nor is the Project Site located in a Very High Fire Hazard Severity Zone.[78] In addition, the Project Site is not located in a hillside zone. Therefore, no impact would occur.

[77] City of Los Angeles, ZIMAS Parcel Profile Report, website: http://zimas.lacity.org, June 13, 2023.

[78] City of Los Angeles, ZIMAS Parcel Profile Report, website: http://zimas.lacity.org, June 13, 2023.

c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact. The Project Site is not located in or near a state responsibility area, nor is the Project Site located in a Very High Fire Hazard Severity Zone.[79] Therefore, no impact would occur.

d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The Project Site is not located in or near a state responsibility area, nor is the Project Site located in a Very High Fire Hazard Severity Zone.[80] Therefore, no impact would occur.

Cumulative Impacts

The Project vicinity is not within or near a very high fire severity zone, and the Project would not result in any impacts related to wildfire. In addition, no related projects have been identified within one-half mile of the Project Site. Therefore, no cumulative impacts related to wildfire would occur.

[79] City of Los Angeles, ZIMAS Parcel Profile Report, website: http://zimas.lacity.org, June 13, 2023.

[80] City of Los Angeles, ZIMAS Parcel Profile Report, website: http://zimas.lacity.org, June 13, 2023.

XXI. MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☐	☒	☐
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☐	☒	☐

a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant with Mitigation Incorporated. As discussed under Checklist Topics IV (Biological Resources) and V (Cultural Resources), the Project would not have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory. As discussed under Checklist Topic VII (Geology and Soils, Paleontological Resources), with implementation of mitigation, the Project would not have the potential to eliminate important examples of the major periods of California history or prehistory related to paleontological resources. As discussed under Checklist Topic XVIII (Tribal Cultural Resources), with implementation of mitigation (MM-TCR-1 through MM-TCR-3), the Project would

not have the potential to eliminate important examples of the major periods of California history or prehistory related to tribal cultural resources. Therefore, these impacts would be less than significant.

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less Than Significant Impact. Based on the analysis contained in this IS/MND, the Project's contribution to cumulative impacts would not be considerable.

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less Than Significant Impact. Based on the analysis contained in this IS/MND, the Project would not result in any direct or indirect adverse effects on human beings, and all Project impacts would be less than significant.

MITIGATION MONITORING PROGRAM

1. INTRODUCTION

This Mitigation Monitoring Program (MMP) has been prepared pursuant to Public Resources Code Section 21081.6, which requires a Lead Agency to adopt a "reporting or monitoring program for changes to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment." In addition, Section 15097(a) of the State CEQA Guidelines requires that a public agency adopt a program for monitoring or reporting mitigation measures and project revisions that are required to mitigate or avoid significant environmental effects. This MMP has been prepared in compliance with the requirements of CEQA, Public Resources Code Section 21081.6, and Section 15097 of the State CEQA Guidelines.

The City of Los Angeles (City) is the Lead Agency for the Project and therefore, is responsible for administering and implementing the MMP. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity that accepts the delegation. However, until mitigation measures have been completed, the Lead Agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.

A Mitigated Negative Declaration (MND) has been prepared to address the potential environmental impacts of the Project. Where appropriate, the MND identified mitigation measures to avoid or reduce potentially significant environmental impacts of the Project. This MMP is designed to monitor the implementation of the mitigation measures identified for the Project.

2. ORGANIZATION

As shown on the pages below, each identified mitigation measure and/or Project Design Feature (PDF) for the Project is listed and categorized by environmental issue area, with accompanying discussion of the following:

Enforcement Agency – the agency with the power to enforce the mitigation measure and/or PDF.

Monitoring Agency – the agency to which reports involving feasibility, compliance, implementation, and development are made, or who physically monitors the Project for compliance with the mitigation measure and/or PDF.

Monitoring Phase – the phase of the Project during which the mitigation measure and/or PDF shall be monitored. Examples include the following general categories:

- Pre-Construction, including the design phase

- Construction
- Pre-Operation
- Operation (Post-construction)

Monitoring Frequency – the frequency of which the mitigation measure and/or PDF shall be monitored.

Action Indicating Compliance – the action of which the enforcement or monitoring agency indicates that compliance with the required mitigation measure and/or PDF has been implemented.

The Project Applicant shall be responsible for implementing all mitigation measures and/or PDFs unless otherwise noted and shall be obligated to provide documentation concerning the implementation of the listed mitigation measures and/or PDFs to the appropriate monitoring agency and the appropriate enforcement agency. All departments listed in the MMP are within the City unless otherwise noted. It is noted that while certain agencies outside of the City may be listed as the monitoring/enforcement agencies for individual mitigation measures and/or PDFs listed in this MMP, the City, as the Lead Agency for the Project, is responsible for overseeing and enforcing implementation of the MMP as a whole.

3. ADMINISTRATIVE PROCEDURES AND ENFORCEMENT

This MMP shall be enforced throughout all phases of the Project. The Project Applicant shall be responsible for implementing each mitigation measure and/or PDF and shall be obligated to provide certification, as identified below, to the appropriate monitoring agency and the appropriate enforcement agency that each mitigation measure and/or PDF has been implemented. The Project Applicant shall maintain records demonstrating compliance with each mitigation measure and/or PDF. Such records shall be made available to the City upon request.

4. PROGRAM MODIFICATION

After review and approval of the final MMP by the Lead Agency, minor changes and modifications to the MMP are permitted, but can only be made subject to City approval. The Lead Agency, in conjunction with any appropriate agencies or departments, will determine the adequacy of any proposed change or modification. This flexibility is necessary in light of the nature of the MMP and the need to protect the environment. No changes will be permitted unless the MMP continues to satisfy the requirements of CEQA, as determined by the Lead Agency.

The Project shall be in substantial conformance with the mitigation measures and/or PDFs contained in this MMP. The enforcing departments or agencies may determine substantial conformance with the mitigation measures and/or PDFs in the MMP in their reasonable discretion. If the department or agency cannot find substantial conformance, a mitigation measure and/or

PDF may be modified or deleted, if the enforcing department or agency or the decision maker for a subsequent discretionary Project-related approval finds that the modification or deletion complies with CEQA, including State CEQA Guidelines Sections 15162 and 15164, which could include the preparation of an addendum or subsequent environmental clearance, if necessary, to analyze the impacts from the modification to or deletion of mitigation measures and/or PDFs. Any addendum or subsequent CEQA clearance that may be required in connection with the modification or deletion shall explain why the mitigation measure and/or PDF is no longer needed, not feasible, or the other basis for modifying or deleting the mitigation measure and/or PDF. Under this process, the modification or deletion of a mitigation measure and/or PDF shall not in and of itself require a modification to any Project discretionary approval unless the Director of Planning also finds that the change to the mitigation measures and/or PDFs results in a substantial change to the Project or the non-environmental conditions of approval.

5. MMP

5.1 MITIGATION MEASURES

Air Quality

MM-AQ-1 All off-road diesel-powered construction equipment shall meet, at a minimum, USEPA Tier 4 Interim off-road emissions standards, or if such equipment is not commercially available for lease or short-term rental within 50 miles of the Project Site, USEPA Tier 3 off-road emissions standards.

Enforcement Agency: South Coast Air Quality Management District (SCAQMD)

Monitoring Agency: Department of City Planning; Department of Building and Safety

Monitoring Phase: Pre-construction; Construction

Monitoring Frequency: Once at Project plan check; Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

Geology and Soils

MM-GEO-1 The Project Applicant shall implement the following best practices with respect to paleontology:

- **Retain a Qualified Professional Paleontologist:** The Project Applicant shall retain a Qualified Professional Paleontologist (Project Paleontologist), who meets or

exceeds the SVP standards, to oversee all regulatory compliance measures and protocols related to paleontological resources.

- **Conduct Worker Training:** The Project Paleontologist should develop a Worker Environmental Awareness Program (WEAP) to train the construction crew on the legal requirements for preserving fossil resources, as well as the procedures to follow in the event of a fossil discovery. This training program would be given to the crew before ground-disturbing work commences and would include handouts to be given to new workers as needed.

- **Monitor for Paleontological Resources:** Ground disturbances greater than or equal to 3 feet below ground surface with the potential to impact late to middle Pleistocene old alluvial fan deposits (Qof) and/or late Miocene Modelo Formation (Tm) should be monitored full-time. Monitoring should be reduced or ceased once over-excavations into the underlying previously undisturbed deposits have been completed, or if Recent to late Holocene artificial fill (Qaf) is the only geologic units encountered during earthwork activities. Ground disturbances in previously disturbed sediments should not be monitored, regardless of depth.

  Monitoring should be conducted by a paleontological monitor who meets the standards of the SVP (2010) working under the supervision of the Project Paleontologist. The Project Paleontologist may periodically inspect construction activities to adjust the level of monitoring in response to subsurface conditions. In consultation with the lead agency and the Project Applicant, monitoring efforts can be increased, reduced, or ceased entirely if determined adequate by the Project Paleontologist. Paleontological monitoring should include inspection of exposed sedimentary units during active excavations within sensitive geologic sediments. The monitor should have authority to temporarily divert activity away from exposed fossils to evaluate the significance of the find and, should the fossils be determined significant, professionally and efficiently recover the fossil specimens and collect associated data. Paleontological monitors should record pertinent geologic data and collect appropriate sediment samples from any fossil localities.

- **Prepare a Paleontological Resources Monitoring Report:** Upon conclusion of ground-disturbing activities, the Project Paleontologist overseeing paleontological monitoring should prepare a final Paleontological Resources Monitoring Report (PRMR) that documents the paleontological monitoring efforts for the Project and describes any paleontological resources discoveries observed and/or recorded during the life of the Project. If paleontological resources are curated, the final PRMR and any associated data pertinent to the curated specimen(s) should be submitted to the designated repository. A copy of the final PRMR should be filed with the lead agency.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

Hazards and Hazardous Materials

MM-HAZ-1 Prior to the issuance of a grading permit, the shallow PCE-impacted soil vapor shall be remediated using soil vapor extraction (SVE) as the primary means of remediation. An SVE remediation system shall be installed consisting of 17 vapor extraction wells. Each vapor extraction well would have a 10-foot screened interval, from five to 15 feet below ground surface, and the wells would be connected to the SVE unit via sub-grade PVC-piping. The soil vapor shall be remediated to the satisfaction of the Los Angeles Fire Department and the Department of Building and Safety.

Enforcement Agency: Department of Building and Safety; Los Angeles Fire Department

Monitoring Agency: Department of Building and Safety

Monitoring Phase: Prior to issuance of grading permit

Monitoring Frequency: Once during field inspection

Action Indicating Compliance: Issuance of grading permit

Noise

MM-NOI-1 For construction activities occurring on the North Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield 23309 Saticoy Street Residences, Melba Street Cul-de-Sac Residences, and Bobbyboyar Avenue Cul-de-Sac Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

MM-NOI-2 For construction activities occurring on the Main Campus, sound barriers rated to achieve a sound attenuation of at least 15 dBA shall be erected to shield Atron Avenue Cul-de-Sac Residences, Covello Street Cul-de-Sac Residences, and Chaminade Avenue Residences from on-site construction noise activities. Sound barriers shall be at least 15 feet in height and composed of materials rated to achieve a transmission loss of at least 25 dBA, which would correlate with the required 15 dBA of sound attenuation.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

MM-NOI-3 Amplified sound systems for the Project's baseball field/bleachers and outdoor aquatics facility/bleacers shall be acoustically engineered with the following design and performance standards:

- Amplified sound levels, as measured at the northern property line of the North Campus, shall not exceed 50 dBA.
- Amplified sound systems shall not be operated outside the operational hours established for the North Campus facilities.
- Speakers shall be directional and oriented away from the northern property line of the North Campus.
- Non-Chaminade users of the facilities shall not be permitted to utilize the facilities' amplified sound systems.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction; Operation

Monitoring Frequency: Once during Project plan check; Field inspection once amplified sound systems have been installed

Action Indicating Compliance: Field inspection sign-off

Transportation

MM-TRANS-1 Construction Traffic Management Plan

Prior to the start of construction, a Construction Traffic Management Plan (CTMP) shall be submitted to LADOT for review and approval. The CTMP will include a Worksite Traffic Control Plan, which will facilitate traffic and pedestrian movement, and minimize the potential conflicts between construction activities, street traffic, bicycles, and pedestrians. The CTMP will include, but not limited to, the following measures:

- Maintaining access for land uses in the vicinity of the Project Site during construction.
- Schedule construction materials deliveries during off-peak periods to the extent practical.
- Organize deliveries and staging of all equipment and materials in the most efficient manner possible, and on-site where possible, to avoid an impact to surrounding roadways.
- Coordinate deliveries to ensure trucks do not wait to unload or load and impact surrounding roadways, and if needed, utilize an off-site staging area.
- Control truck and vehicle access to the Project Site with flagmen.
- Limit lane closures to the maximum extent possible and avoid peak period hours to the extent possible. Where such closures are necessary, the Worksite Traffic Control Plan will identify the location of lane closures and identify all traffic control measures, signs, delineators, and work instructions to be implemented by the construction contractor through the duration of demolition and construction activity.

- Parking for construction workers will be provided either on-site or at off-site, off-street locations.

Enforcement Agency: Los Angeles Department of Transportation

Monitoring Agency: Los Angeles Department of Transportation

Monitoring Phase: Pre-construction; construction

Monitoring Frequency: Once at Project plan check; periodic field inspection

Action Indicating Compliance: Plan approval; field inspection sign-off

Tribal Cultural Resources

MM-TCR-1 Prior to commencing any ground disturbance activities at the Project Site, the Applicant, or its successor, shall retain one (1) tribal monitor that is qualified to identify subsurface tribal cultural resources. Ground disturbance activities shall include excavating, digging, trenching, plowing, drilling, tunneling, quarrying, grading, leveling, removing peat, clearing, driving posts, augering, backfilling, blasting, stripping topsoil or a similar activity at the Project Site. The qualified tribal monitor shall be approved by the Fernandeño Tataviam Band of Mission Indians.

If cultural resources are discovered during Project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be retained by the Applicant, or its successor, to assess the find. A qualified archaeologist/archaeological monitor shall be identified as principal personnel who must meet the Secretary of the Interior's Standards and Guidelines for Archeology and have a minimum of 10 years of experience as a principal investigator working with Native American archaeological sites in Southern California. The archaeologist shall ensure that all other personnel associated with and hired for the archaeological monitoring are appropriately trained and qualified. Work on the portions of the Project outside of the buffered area may continue during this assessment period. The Fernandeño Tataviam Band of Mission Indians shall be contacted about any pre-contact and/or post-contact finds and be provided information after the archaeologist makes their initial assessment of the nature of the find, to provide Tribal input with regards to significance and treatment.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

MM-TCR-2 The Lead Agency and/or Applicant shall, in good faith, consult with the Fernandeño Tataviam Band of Mission Indians on the disposition and treatment of any Tribal Cultural Resource encountered during all ground disturbing activities.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

MM-TCR-3 If human remains or funerary objects are encountered during any activities associated with the Project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code shall be enforced for the duration of the Project.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

5.2. PROJECT DESIGN FEATURES

PDF-1 The Project will adhere to the construction sequence shown in Table 3-2, except:

- Construction of the new surface parking lot on the North Campus and construction of the pedestrian bridge may interchange in the overall sequence of construction activities, but shall not overlap with each other; and
- Demolition of parking lots on the Main Campus and demolition of classroom buildings on the Main Campus may interchange in the overall sequence of construction activities, but shall not overlap with each other.

Enforcement Agency: Department of City Planning

Monitoring Agency: Department of City Planning

Monitoring Phase: Construction

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

PDF-2 The Project will prepare a Traffic Management Plan (TMP) to establish operational procedures for traffic flow around the school related to self-driving students and student drop-off and pick-up operations. The purpose of the plan will be to establish operational procedures to improve traffic circulation utilizing the enhanced access points and parking areas, improve student safety, maximize the efficiency of drop-off and pick-up operations, and reduce delays during those time periods.

Enforcement Agency: Los Angeles Department of Transportation

Monitoring Agency: Los Angeles Department of Transportation

Monitoring Phase: Operation

Monitoring Frequency: Periodic field inspection

Action Indicating Compliance: Field inspection sign-off

Project: Chaminade College Prep Lighting Analysis
#220848.000

Sent via: E-Mail

Regarding: Technical Lighting Analysis

1. Executive Summary

Chaminade College Preparatory School has proposed the construction of new recreational fields and supporting facilities at the parcel of land on the NW corner of Saticoy St. and Woodlake Ave. This existing location consists of a commercial shopping center and associated surface parking.

The purpose of this analysis is to provide information regarding the existing lighting conditions at the proposed project site and to provide analysis of the proposed lighting design to assess if it is anticipated to create “a new source of substantial glare” per CEQA requirements.

Review of the existing lighting conditions showed very low light levels with minimum light spill onto immediately adjacent residential properties and greater spill into adjacent public right-of-ways.

Calculations provided by the manufacturer for the proposed lighting conditions demonstrate that, while the proposed lighting will result in increased maximum intensity (glare potential) and spill light in many locations, the values are anticipated to remain under the thresholds of significance.

2. Project Description

2.1. Existing use

The existing use of the proposed site is a single-story, multi-tenant commercial property. The central building is surrounded by asphalt surface parking on the east, south, and west sides, and asphalt loading dock and support spaces on the north side.

Residential neighborhoods abut the project site immediately to the north, while the site is flanked by two streets, Woodlake Ave. on the east and Saticoy St on the west and south.

2.2. Anticipated use

The proposed site is anticipated to be used by the school for recreational purposes which would include the construction of an outdoor soccer field, baseball field, and indoor swimming facility with exterior pool. The addition of two surface parking lots is anticipated as well.

3. Metrics and Threshold of Significance

3.1. Metrics:

- **Maximum Intensity** Maximum intensity is used to capture the apparent brightness of a light source as viewed from a distance. Maximum intensity, measured in units of candela, is used to evaluate the glare potential of a lighting installation. Maximum intensity is measured using a two-part method, combining luminance measurements taken with a meter with high-dynamic range photography analysis.

  Anticipated intensity can also be captured in proposed designs through extensive modeling exercises which rely on manufacturer-provided photometric data which has been developed using laboratory measured light output from discrete luminaires.

  For the purpose of this analysis, units of intensity (candela, or cd) and luminance (candelas per square meter, or cd/m2) are used interchangeably. Per photometric standards, all luminance measurements were conducted at a distance of more than 5x the largest dimension of the measured source, which creates a mathematical equivalence between intensity and luminance.

- **Light Spill** Light spill is used to capture the amount of spill light at a discrete point and is often referred to as "Light Trespass". Light spill is the illuminance (measured in units of footcandles or lux) falling on a horizontal or vertical surface, meter or calculation point, and is used to evaluate the impact of a lighting installation on another location. Spill light is measured using an illuminance meter. For reference, a full moon on a clear night typically produces about 0.01 footcandle (fc).

3.2. Thresholds of Significance:

Per the City of Los Angeles CEQA guide, the analysis must determine if the project "would create a new source of substantial glare which would adversely affect day or nighttime views in the area." To provide this analysis, thresholds of significance must be determined and are proposed to be the following:

- **Maximum Intensity** Section 93.0117 of the Los Angeles Municipal Code, "Lighting Impacting Residential Property" states that "No person shall construct, establish, create, or maintain any stationary exterior light sources that may cause [property containing a residential unit] to…receive direct glare from the light source."

  Direct glare is defined as glare "resulting from high luminance or insufficiently shielded light sources that is in the field of view."

  There is an exemption from the above restriction for tennis court exterior lighting provided that the luminaire has a light intensity of less than 25,00cd/m2. It is assumed that the cutoff metric of 25,000cd/m2 can be applied to other sporting field and facilities besides exclusively tennis.

- **Light Spill** Section 93.0117 of the Los Angeles Municipal code states that "Light Sources shall be designed and maintained so as to produce not more than two footcandles of illumination as measured at the property line of the nearest residentially zoned property…"

4. Existing Condition Analysis

4.1. Site Visit Conditions

A site visit was conducted by HLB Lighting Design on 6 February 2023. At the time of the measurements the temperature was 56°F with clear skies and 35% humidity. Sunset time was 5:29pm Pacific Standard Time. Measurements commenced at 7:03pm Pacific Standard Time.

4.2. Existing lighting conditions

Existing lighting at the proposed site is mainly provided by three main sources:

- Dropped-lens (aka "sag lens") non-cutoff pole-mounted parking area lights (see Figure 1 and Figure 2))
- Full-cutoff wall-mounted lights on the north side of the western portion of the building (see Figure 3)
- Non-cutoff wall-mounted lights on the north side of the eastern portion of the building (Fields Market, Figure 4)

Figure 1: Approximate location of existing pole-mounted parking lot lighting

Figure 2: Google street view showing relationship between pole and adjacent residential property in the Northeast corner of the site

Figure 3: Google street view showing the full-cutoff wall-mounted lighting on the north side of the existing commercial building at the eastern end

Figure 4: Google street view showing the non-cutoff wall-mounted lighting on the north side of the existing commercial building at the western end

4.3. Equipment

All luminance measurements were taken using a Sekonic L-758 light meter, as shown in Figure 5.

Figure 5: Light meter used for luminance and illuminance measurements

All photographs were taken using a Canon EOS Rebel T6i with an 18-55mm IS SM lens kit and a 24.2 megapixel CMOS sensor as seen in Figure 6. Camera allows for fully manual modes, including manual focus capabilities.

Figure 6: Camera used for photography

4.4. Receptor Site Identification

Five sensitive receptor sites were identified to capture a full picture of the directional impact of the proposed sports and to specifically provide measurements at adjacent existing residential properties. These receptor site locations are identified in Figure 7.

Figure 7: Receptor Site Locations

Receptor Site 1 is located at the NW corner of the proposed site along Saticoy St. (Figure 8).

Figure 8: Receptor Site 1

Receptor Sites 2 (Figure 9) and 3 (Figure 10) are located in the two residential cul-de-sacs that immediately abut the project site on the North at the end of Melba Ave. and Bobbyboyar Ave.

Figure 9: Receptor Site 2

Figure 10: Receptor Site 3

Receptor Sites 4 (Figure 11) and 5 (Figure 12) are located along Woodlake Ave to the east of the property.

Figure 11: Receptor Site 4

Figure 12: Receptor Site 5

Receptor Site 6 (Figure 13) is located immediately South of the site along Saticoy St.

Figure 13: Receptor Site 6

4.5. Receptor Site Measurements

The Receptor Sites were first visited during the day to establish a reference daytime photograph and identify ideal location for nighttime photographs and measurements. After dark, luminance and illuminance measurements were taken at each Site to capture values for existing light spill and glare.

4.6. Maximum Intensity Measurements

To measure maximum intensity, a typical HDRI procedure was employed which consisted of taking a series of bracketed photographs taken at optimal exposures from underexposed to overexposed. Photos were taken by mounting to a tripod so that each image was taken from the same mounting height (5'6") and orientation. Exposures were manually adjusted by varying aperture speed to achieve a step of +/- 1EV. A minimum of seven images were taken at each receptor site location.

Additionally, a reference image was taken for each view. These reference images were taken at the approximate height and orientation of the HDR images. These reference images were used to calibrate the final images.

Finally, a series of luminance measurements were taken at each Receptor Site. The luminance meter was once again located at approximately the same height of the camera. A minimum of two luminance values were taken at markpoints (objects) which could be used to calibrate the final images. These values and markpoint locations were identified on the reference images.

4.7. Maximum Intensity Analysis

The bracketed exposure photographs taken were then used to assess the existing maximum intensity at each Receptor Site and to produce a false-color image showing the scale of measured intensities in the field of view. Both Adobe Photoshop and hdrscope were used to perform the HDR calibration and extract relevant data and images.

4.8. Maximum Intensity Results

The following HDR falsecolor images were developed using the outlined process and demonstrate the maximum intensity (cd/m2) at each Receptor Site.

Figure 14: Maximum intensity at Receptor Site 1

Figure 15: Maximum intensity at Receptor Site 2

Figure 16: Maximum intensity at Receptor Site 4

Figure 17: Maximum intensity at Receptor Site 5

Figure 18: Maximum intensity at Receptor Site 6

Note that the average image luminances at Receptor Site 3 were too low for the image analysis software to produce a falsecolor image. Table 1 contains the maximum intensity values for all Receptor Sites.

Maximum Intensity, [cd/m2]

Receptor Site	Maximum Intensity
1	30
2	170
3	267*
4	170
5	217
6	256

Table 1: Measured maximum intensity

*Since no falsecolor HDR image was able to be produced at this location, maximum intensity value is based on luminance measurements taken in the field.

4.9. Spill Light

To measure spill light, four sets of vertical illuminance measurements were taken with the illuminance meter at a height of approximately 5'-6" above ground level at each receptor site. Additionally, four sets of horizontal illuminance measurements were taken with the illuminance meter at grade at each receptor site. Multiple measurements were necessary to provide accurate accommodations for conditions caused by variables such as traffic, pedestrians, etc. Averages of measured values are shown in Table 2.

For Receptor Sites 2 and 3, measurements were taken at the property line (fence) location, with the vertical spill light measured immediately above the ~6' tall privacy fence to capture the property line condition rather than the spill into the cul-de-sac. For receptor sites 5 and 6, which are located across the public right-of-ways from the property, horizontal measurements were not recorded since the points are offset from the property line.

Vertical & Horizontal Light Spill, [fc]

Receptor Site	Average Vertical Illuminance (Ev)	Average Horizontal Illuminance (Eh)
1	1.45	3.7
2	0.8	1.28
3	0.77	1.3
4	3.8	3.55
5	2.5	n/a
6	2.9	n/a

Table 2: Average measured vertical and horizontal spill light at Receptor Sites

Additionally, horizontal and vertical illuminance measurements were taken along the property line at the east side of the project site and the south side of the project site, shown in **Error! Reference s ource not found.**.

Property Line Light Spill

	Vertical Illuminance (fc), Max	Vertical Illuminance (fc), Min	Horizontal Illuminance (fc), Max	Horizontal Illuminance (fc), Min
East Property Line	19	1.5	6.6	1.2
South Property Line	25	1.2	21	1.9

Table 3: Maximum and minimum vertical and horizontal spill light along property lines

5. Analysis of Proposed Design

5.1. Proposed Sports Lighting Design

Lighting design analysis for proposed sport field design and adjacent pool was conducted by the proposed lighting manufacturer. The proposed lighting design for the sports field calls for 8 poles supporting sport lighting equipment surrounding the recreational field. These poles would range in height from 70'-90' and contain between 5 and 10 directional luminaires per pole. These luminaires are mounted at varying heights and range from 500W-1,430W. Additionally, four smaller poles are proposed to be located at the exterior pool. These poles

would range in height from 40'-50' and contain 3 luminaires each. These luminaires range in wattage from 400W-580W. All proposed luminaires are LED with a standard 5700K color temperature, 75CRI, and estimated lifespan of L90 >120,000hrs.

5.2. Proposed Light Levels and Metrics

Maximum Intensity Maximum intensity was calculated by the manufacturer to capture potential brightness at glare. Calculation points were placed along Saticoy St, which bounds the property to the south and west, with the points specifically located on the sidewalk across the right-of-way and closest to the existing residential. Calculation points were also placed along the north property line, abutting the existing residential properties. The reported maximum intensity values are summarized in Table 4.

	Maximum Intensity (Cd)
Saticoy St – Sidewalk on Opposite Side	11,448
North Property Spill	24,736

Table 4: Anticipated maximum intensity reported by manufacturer

Spill Light The anticipated illuminance, both horizontal and vertical, along the various property lines were reported by the manufacturer to capture potential spill light.

Additionally, horizontal illuminance calculation points were placed extending beyond the property line to the north to capture potential spill light onto the adjacent residential properties. These calculation points were placed at grade with a spacing of 5.0' x 5.0', extending approximately 160' to the north of the property line. The reported values are summarized in Table 5.

	Maximum Horizontal Illuminance (fc)	**Maximum Vertical Illuminance (fc)**
Saticoy St – Sidewalk on Opposite Side	0.72	1.27
North Property Off-Site Spill	1.9	n/a

Table 5: Maximum vertical and horizontal spill light for proposed lighting

5.3 Comparison to CEQA Thresholds

Maximum Intensity The maximum intensity values for the proposed design are 11,448 cd and 24,736 cd at the Saticoy St. and Norther property lines respectively. These values both fall below the established threshold of significance of 25,000cd/m2.

Light Spill The maximum spill light value for the calculation points are reported to be 0.72fc along Saticoy St and 1.9fc to the north. These values fall below the threshold of significance of 2fc of illumination at the property line of the nearest residentially zoned property.

6. Conclusion

In conclusion, the proposed sports lighting design does demonstrate an increase in both spill light and maximum intensity in comparison to the existing lighting conditions. However, the proposed design does not exceed the threshold of significance outlined for maximum intensity nor does it exceed the threshold for spill light for the land immediately adjacent to the property lines.

Chaminade College Preparatory High School Project

CalEEMod Notes

General Note:

Different naming conventions for Project phases are used in the analysis and CalEEMod modeling runs. The following table clarifies which phase names correspond with the CalEEMod runs:

Phase	CalEEMod Name	Description
North Campus – Demolition	CCP HS – North Lot Demolition	Concerns demolition of existing uses on the North Campus site.
North Campus – Grading	CCP HS – North Lot Grading v2	Concerns grading activities on the North Campus site.
North Campus – Construction of new athletic fields and ancillary facilities	CCP HS – North Lot Field Construction	Concerns construction of the athletic field and ancillary facilities on the North Campus site.
North Campus – Construction of new pool facilities	CCP HS – North Lot Pool Facility	Concerns grading, building construction, paving, and architectural coatings activities for construction of the proposed pool facilities on the North Campus site.
Main Campus – Parking Lot Demolition *and* Main Campus – Classroom Demolition	CCP HS – Main Campus Demo	Concerns demolition of the upper-level parking lot and classroom buildings on the Main Campus site. Though the phases would be separate, they were conservatively modeled as one CalEEMod scenario.
Main Campus – Multistory Building Grading	CCP HS – Main Campus Grading	Concerns grading for construction of the proposed multistory building on the Main Campus site.
Main Campus – Multistory Building Grading	CCP HS – Main Campus Building Construction Detailed Report	Concerns building construction and architectural coatings activities for construction of the proposed multistory building on the Main Campus site.
Existing Project Site Emissions	CCP HS – Existing Shopping Center *and* CCP HS - Existing	These two CalEEMod runs estimate emissions associated with existing operations of the shopping center on the North Campus site and Chaminade College Preparatory High School on the Main Campus site.
N/A	CCP HS – Proposed Additions	Concerns increases in additional buildings, uses, and campus area associated with the Project.

Note A.1 This analysis estimates emissions associated with demolition of existing uses on the North Campus only.

Note A.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects. For excavators, CalEEMod default horsepower assumptions were replaced with more conservative default estimates from previous versions of CalEEMod. CalEEMod version 2022 seems to underestimate default horsepower ratings for this equipment.

Note A.3 Estimated haul trips were increased to account for the removal of additional hardscape. Because it is not known which landfill would be utilized, export trip lengths were conservatively increased to 40 miles per trip (one-way) to account for a range of possible destinations. However, it is worth noting that Sunshine Canyon Landfill, the likeliest destination, is located within 20 miles of the Project Site.

Note B.1 This analysis estimates emissions associated with grading for the proposed North Campus uses.

Note B.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects. For excavators, CalEEMod default horsepower assumptions were replaced with more conservative default estimates from previous versions of CalEEMod. CalEEMod version 2022 seems to underestimate default horsepower ratings for this equipment.

Note B.3 Because it is not known which landfill would be utilized, export trip lengths were conservatively increased to 40 miles per trip (one-way) to account for a range of possible destinations. However, it is worth noting that Sunshine Canyon Landfill, the likeliest destination, is located within 20 miles of the Project Site.

Note C.1 This analysis estimates emissions associated with demolition of the Main Campus' upper-level parking area and classroom buildings.

Note C.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects. For excavators, CalEEMod default horsepower assumptions were replaced with more conservative default estimates from previous versions of CalEEMod. CalEEMod version 2022 seems to underestimate default horsepower ratings for this equipment.

Note C.3 Estimated haul trips were increased to account for the removal of additional hardscape. Because it is not known which landfill would be utilized, export trip lengths were conservatively increased to 40 miles per trip (one-way) to account for a range of possible destinations. However, it is worth noting that Sunshine Canyon Landfill, the likeliest destination, is located within 20 miles of the Project Site.

Note D.1 This analysis estimates emissions associated with grading for the multistory building.

Note D.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects. For excavators, CalEEMod default horsepower assumptions were replaced with more conservative default

estimates from previous versions of CalEEMod. CalEEMod version 2022 seems to underestimate default horsepower ratings for this equipment.

Note D.3 Because it is not known which landfill would be utilized, export trip lengths were conservatively increased to 40 miles per trip (one-way) to account for a range of possible destinations. However, it is worth noting that Sunshine Canyon Landfill, the likeliest destination, is located within 20 miles of the Project Site.

Note E.1 This analysis estimates emissions associated with building construction and the application of architectural coatings for the multistory building.

Note E.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects.

Note F.1 Land use subtypes for this analysis were set to reflect those that would comprise the pool facility.

Note F.2 This analysis estimates emissions associated with grading, building construction, paving, and application of architectural coatings for the pool facility. Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects. For excavators, CalEEMod default horsepower assumptions were replaced with more conservative default estimates from previous versions of CalEEMod. CalEEMod version 2022 seems to underestimate default horsepower ratings for this equipment.

Note F.3 Because it is not known which landfill would be utilized, export trip lengths were conservatively increased to 40 miles per trip (one-way) to account for a range of possible destinations. However, it is worth noting that Sunshine Canyon Landfill, the likeliest destination, is located within 20 miles of the Project Site.

Note G.1 Trip generation rates were set to reflect the trip rates established for this use in the Project's Transportation Assessment Report.

Note H.1 Land uses for this analysis reflect the net additional improvements that are proposed by the Project (i.e., additional square footage associated with the multistory building and pool facility, swimming pool, new parking lots, etc.).

Note H.2 Trip generation rates were set to reflect the 952 daily trips associated with the pool facility ("Athletic Center"), as determined in the Project's Transportation Assessment Report.

Note I.1 This analysis estimates emissions associated with the construction of the new athletic field and ancillary structures on the North Campus site.

Note I.2 Construction equipment selections were based on information provided by the Project applicant, as well as the consultant's experience with similar projects.

Note I.3 Worker trips were estimated based on information provided by the Project applicant, as well as the consultant's experience with similar projects.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.2
AQ-DPM	24.5
Drinking Water	83.1
Lead Risk Housing	34.0
Pesticides	42.0
Toxic Releases	48.6
Traffic	29.9
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	47.9
Haz Waste Facilities/Generators	38.7
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	43.8

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.1
AQ-DPM	11.5
Drinking Water	83.1
Lead Risk Housing	25.9
Pesticides	0.00
Toxic Releases	41.0
Traffic	12.8
Effect Indicators	—
CleanUp Sites	19.9

Housing	60.6

Linguistic	14.9
Poverty	23.3
Unemployment	32.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	84.28076479
Employed	66.08494803
Median HI	86.21840113
Education	—
Bachelor's or higher	83.84447581
High school enrollment	100
Preschool enrollment	66.7393815
Transportation	—
Auto Access	19.90247658
Active commuting	33.44026691
Social	—
2-parent households	86.52636982
Voting	69.83190042
Neighborhood	—
Alcohol availability	61.34992942
Park access	37.11022713
Retail density	40.20274605
Supermarket access	46.97805723
Tree canopy	72.5009624

Housing	—
Homeownership	84.9993584
Housing habitability	15.70640318
Low-inc homeowner severe housing cost burden	46.50327217
Low-inc renter severe housing cost burden	0.705761581
Uncrowded housing	87.19363531
Health Outcomes	—
Insured adults	77.62094187
Arthritis	13.5
Asthma ER Admissions	34.6
High Blood Pressure	13.8
Cancer (excluding skin)	6.0
Asthma	83.3
Coronary Heart Disease	13.8
Chronic Obstructive Pulmonary Disease	45.1
Diagnosed Diabetes	54.0
Life Expectancy at Birth	86.5
Cognitively Disabled	50.3
Physically Disabled	28.8
Heart Attack ER Admissions	43.7
Mental Health Not Good	80.9
Chronic Kidney Disease	27.1
Obesity	74.1
Pedestrian Injuries	19.6
Physical Health Not Good	62.9
Stroke	34.3

2016 Voting	61.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.1
AQ-DPM	11.5
Drinking Water	83.1

Lead Risk Housing	25.9
Pesticides	0.00
Toxic Releases	41.0
Traffic	12.8
Effect Indicators	—
CleanUp Sites	19.9
Groundwater	56.9
Haz Waste Facilities/Generators	35.6
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.1
AQ-DPM	11.5
Drinking Water	83.1
Lead Risk Housing	25.9
Pesticides	0.00
Toxic Releases	41.0
Traffic	12.8
Effect Indicators	—
CleanUp Sites	19.9
Groundwater	56.9
Haz Waste Facilities/Generators	35.6
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	63.0
Cardio-vascular	52.8
Low Birth Weights	36.7
Socioeconomic Factor Indicators	—
Education	26.4
Housing	60.6
Linguistic	14.9
Poverty	23.3
Unemployment	32.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	84.28076479
Employed	66.08494803
Median HI	86.21840113
Education	—

2016 Voting	61.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	See Note B.1
Construction: Off-Road Equipment	See Note B.2
Construction: Trips and VMT	See Note B.3

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	CCP HS - North Lot Field Construction
Construction Start Date	1/1/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	19.2
Location	34.20905539636914, -118.63347504508877
County	Los Angeles-South Coast
City	Los Angeles
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	3868
EDFZ	17
Electric Utility	Los Angeles Department of Water & Power
Gas Utility	Southern California Gas
App Version	2022.1.1.17

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Other Non-Asphalt Surfaces	106	1000sqft	2.42	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.1
AQ-DPM	11.5
Drinking Water	83.1
Lead Risk Housing	25.9
Pesticides	0.00
Toxic Releases	41.0
Traffic	12.8
Effect Indicators	—
CleanUp Sites	19.9
Groundwater	56.9
Haz Waste Facilities/Generators	35.6
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	63.0
Cardio-vascular	52.8
Low Birth Weights	36.7
Socioeconomic Factor Indicators	—
Education	26.4
Housing	60.6
Linguistic	14.9
Poverty	23.3

Unemployment	32.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	84.28076479
Employed	66.08494803
Median HI	86.21840113
Education	—
Bachelor's or higher	83.84447581
High school enrollment	100
Preschool enrollment	66.7393815
Transportation	—
Auto Access	19.90247658
Active commuting	33.44026691
Social	—

Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	90.9
Elderly	13.9
English Speaking	64.2
Foreign-born	31.5
Outdoor Workers	49.5
Climate Change Adaptive Capacity	—
Impervious Surface Cover	66.8
Traffic Density	26.6
Traffic Access	23.0
Other Indices	—
Hardship	25.6
Other Decision Support	—
2016 Voting	61.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.1
AQ-DPM	11.5

Drinking Water	83.1
Lead Risk Housing	25.9
Pesticides	0.00
Toxic Releases	41.0
Traffic	12.8
Effect Indicators	—
CleanUp Sites	19.9
Groundwater	56.9
Haz Waste Facilities/Generators	35.6
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	63.0
Cardio-vascular	52.8
Low Birth Weights	36.7
Socioeconomic Factor Indicators	—
Education	26.4
Housing	60.6
Linguistic	14.9
Poverty	23.3
Unemployment	32.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	84.28076479

Employed	66.08494803
Median HI	86.21840113
Education	—
Bachelor's or higher	83.84447581

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Demolition	Demolition	1/1/2024	1/19/2024	5.00	15.0	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Tractors/Loaders/Backhoes	Diesel	Average	2.00	8.00	84.0	0.37
Demolition	Rubber Tired Dozers	Diesel	Average	1.00	8.00	367	0.40
Demolition	Excavators	Diesel	Average	2.00	8.00	158	0.38

5.2.2. Mitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Tractors/Loaders/Backhoes	Diesel	Tier 4 Interim	2.00	8.00	84.0	0.37
Demolition	Rubber Tired Dozers	Diesel	Tier 4 Interim	1.00	8.00	367	0.40
Demolition	Excavators	Diesel	Tier 4 Interim	2.00	8.00	158	0.38

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Demolition	—	—	—	—
Demolition	Worker	12.5	18.5	LDA,LDT1,LDT2
Demolition	Vendor	—	10.2	HHDT,MHDT
Demolition	Hauling	30.0	40.0	HHDT
Demolition	Onsite truck	—	—	HHDT

5.3.2. Mitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Demolition	—	—	—	—
Demolition	Worker	12.5	18.5	LDA,LDT1,LDT2
Demolition	Vendor	—	10.2	HHDT,MHDT
Demolition	Hauling	30.0	40.0	HHDT
Demolition	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	32,204	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Other Non-Asphalt Surfaces	2.75	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2024	0.00	690	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.2
AQ-DPM	24.5
Drinking Water	83.1

Lead Risk Housing	34.0
Pesticides	42.0
Toxic Releases	48.6
Traffic	29.9
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	47.9
Haz Waste Facilities/Generators	38.7
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	43.8
Cardio-vascular	46.5
Low Birth Weights	70.6
Socioeconomic Factor Indicators	—
Education	14.2
Housing	17.9
Linguistic	23.8
Poverty	7.83
Unemployment	56.2

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	83.63916335
Employed	91.08174002

Median HI	84.31926088
Education	—
Bachelor's or higher	72.53945849
High school enrollment	19.24804312
Preschool enrollment	76.10676248

Hardship	24.1
Other Decision Support	—
2016 Voting	44.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	39.0
Healthy Places Index Score for Project Location (b)	82.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat

Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.2
AQ-DPM	24.5
Drinking Water	83.1
Lead Risk Housing	34.0
Pesticides	42.0

Toxic Releases	48.6
Traffic	29.9
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	47.9
Haz Waste Facilities/Generators	38.7
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	43.8
Cardio-vascular	46.5
Low Birth Weights	70.6
Socioeconomic Factor Indicators	—
Education	14.2
Housing	17.9
Linguistic	23.8
Poverty	7.83
Unemployment	56.2

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	83.63916335
Employed	91.08174002
Median HI	84.31926088

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	39.0
Healthy Places Index Score for Project Location (b)	82.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.2
AQ-DPM	24.5
Drinking Water	83.1
Lead Risk Housing	34.0
Pesticides	42.0
Toxic Releases	48.6
Traffic	29.9
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	47.9
Haz Waste Facilities/Generators	38.7
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	43.8
Cardio-vascular	46.5
Low Birth Weights	70.6
Socioeconomic Factor Indicators	—
Education	14.2
Housing	17.9
Linguistic	23.8
Poverty	7.83
Unemployment	56.2

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	83.63916335
Employed	91.08174002
Median HI	84.31926088
Education	—
Bachelor's or higher	72.53945849

Hardship	24.1
Other Decision Support	—
2016 Voting	44.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	39.0
Healthy Places Index Score for Project Location (b)	82.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	17.8	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	21.8	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	80.0
AQ-PM	53.2
AQ-DPM	24.5
Drinking Water	83.1
Lead Risk Housing	34.0
Pesticides	42.0
Toxic Releases	48.6
Traffic	29.9
Effect Indicators	—

CleanUp Sites	0.00
Groundwater	47.9
Haz Waste Facilities/Generators	38.7
Impaired Water Bodies	43.8
Solid Waste	0.00
Sensitive Population	—
Asthma	43.8
Cardio-vascular	46.5
Low Birth Weights	70.6
Socioeconomic Factor Indicators	—
Education	14.2
Housing	17.9
Linguistic	23.8
Poverty	7.83
Unemployment	56.2

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	83.63916335
Employed	91.08174002
Median HI	84.31926088
Education	—
Bachelor's or higher	72.53945849
High school enrollment	19.24804312
Preschool enrollment	76.10676248

Transportation	—
Auto Access	81.29090209
Active commuting	39.76645708
Social	—
2-parent households	66.57256512
Voting	53.76620044
Neighborhood	—
Alcohol availability	70.76863852
Park access	40.45938663
Retail density	73.80982933
Supermarket access	81.67586295
Tree canopy	72.97574747
Housing	—
Homeownership	83.34402669
Housing habitability	86.70601822
Low-inc homeowner severe housing cost burden	23.72642115
Low-inc renter severe housing cost burden	90.56845887
Uncrowded housing	79.21211344
Health Outcomes	—
Insured adults	63.91633517
Arthritis	30.2
Asthma ER Admissions	67.4
High Blood Pressure	34.2
Cancer (excluding skin)	15.0
Asthma	76.7
Coronary Heart Disease	31.2
Chronic Obstructive Pulmonary Disease	50.7

Diagnosed Diabetes	57.0
Life Expectancy at Birth	43.1
Cognitively Disabled	72.6
Physically Disabled	63.7
Heart Attack ER Admissions	76.9
Mental Health Not Good	72.2
Chronic Kidney Disease	55.3
Obesity	68.7
Pedestrian Injuries	72.9
Physical Health Not Good	62.9
Stroke	51.7
Health Risk Behaviors	—
Binge Drinking	52.5
Current Smoker	71.8
No Leisure Time for Physical Activity	73.2
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	82.0
Elderly	21.1
English Speaking	52.4
Foreign-born	58.7
Outdoor Workers	57.7
Climate Change Adaptive Capacity	—
Impervious Surface Cover	68.9
Traffic Density	56.1
Traffic Access	51.4

Other Indices	—
Hardship	24.1
Other Decision Support	—
2016 Voting	44.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	39.0
Healthy Places Index Score for Project Location (b)	82.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	See Note H.1
Operations: Vehicle Data	See Note H.2

PROTECTED TREE REPORT

7500 Chaminade Ave, West Hills, CA 91304

SUMMARY

PROJECT OVERVIEW	
Site Address	**7500 Chaminade Ave, West Hills, CA 91304**
Location and/or Specific Plan	**Chatsworth**
Project Description	**New Buildings and Revised Campus Plans**
Date of Site Visit	**1/13/23 & 01/25/23**
Number of Protected Trees on Site	**0**
Number of Non-Protected Significant Trees 8"+ on Site	**364 Trees**
REMOVAL of Non-Protected Significant 8"+ Trees on Site	**40 removals**
Number of Street Parkway Trees on Site	**33 Trees with 1 removal**

This Tree Report was prepared at the request of the property owner, Chaminade College Preparatory High School, who is preparing to revise and update the campus plan to build two new buildings, relocate and upgrade existing athletic and other outdoor facilities, and reconfigure existing on-site surface parking areas, in conjunction with the continued operation of the HighSchool on this property. The subject property is x square feet and is located in the Chatsworth area of Los Angeles.

PROTECTED TREES, URBAN FORESTRY DIVISION

This property is under the jurisdiction of the City of Los Angeles and guided by the Native Tree Protection Ordinance No. 186873. **Protected Trees** are defined by this ordinance as oaks (*Quercus* sp) indigenous to California but excluding the scrub oak (*Quercus dumosa*); Southern California black walnut (*Juglans californica var. californica)*; Western sycamore (*Platanus racemosa*) and California bay laurel (*Umbellularia californica*) trees with a diameter at breast height (DBH) of four inches (4") or greater. **Protected Shrubs** are defined as Mexican elderberry (*Sambucus mexicana*); Toyon (*Heteromeles arbutifolia*) which measure four inches or more in cumulative diameter, four and one-half feet above the ground level at the base of the shrub.

There are NO trees or shrubs on this property that would be considered protected native within the City of Los Angeles Native Tree Protection Ordinance.

NEIGHBOR TREES

I have also inspected the neighboring properties to confirm there are no protected tree or shrub species that are adjacent to the construction zone, or in areas of impact.

CITY OF LOS ANGELES PARKWAY STREET TREES, URBAN FORESTRY DIVISION

At this time, I observed (33) Parkway Street Trees, 32 to be retained and protected in place. 1 removal.
Cohasset Street - There are (13) thirteen Parkway Street Trees - all Chitalpa 'Pink Dawn'
Saticoy Street - There are (13) thirteen Parkway Street Trees - all Chitalpa 'Pink Dawn'
Saticoy Street- There are (3) three Parkway Street Trees- all Crepe Myrtle
Keswick Avenue - There are (4) four Parkway Street Trees - 2 Pear and 2 African Sumac

One of these parkway street trees #ST489 will be impacted by the proposed project installation of a pedestrian bridge located over Saticoy Street.
All other street trees will be retained and protected in place.

NON-PROTECTED SIGNIFICANT TREES, DEPARTMENT OF CITY PLANNING

The Department of City Planning requires the identification of the location, size, type and condition of all existing trees on the site with a DBH (Diameter at Breast Height) of 8 inches (8") or greater. These trees will be identified as **Non-Protected Significant Trees.**

ACCURATE TOTAL: At this time, I observed three hundred and sixty-four (364) **Non-Protected Significant Trees 8" DBH (Diameter at Breast Height) or greater** on the property.
RETAIN: Three Hundred and twenty-four (324) trees will be retained and protected in place.
REMOVAL: Forty (40) non-protected significant trees 8" + will be impacted by construction and are recommended for removal and replacement to the satisfaction of the City of Los Angeles Department of City Planning.

SMALLER THAN 8" - Non-Protected and NON significant Trees (1" - 8" trunk diameter)
There are one-hundred and eight (108) **Non-protected NON significant trees** on the property.

Seven (7) will be removed. These trees require no replacement. Most of these trees are small, such as 1" - 2" diameter, newly installed, poorly establishing, such as Pink Trumpet Trees that are averaging 2" in diameter, and a few small pepper trees and London plane trees.

One-hundred and one trees (101) will be retained and protected in place.

No Existing Trees from old Survey - 12 trees not on map, placeholder #'s are in the spreadsheet.
The original survey had inadvertently mapped some trees that are not there, and appear to not have been there or died due to the mega-drought and were removed.
These trees #'s are on the spreadsheet, but indicated as a GREY numbered circle on the map.
These #'s are 23, 24, 118, 119, 131, 170, 180, 191, 203, 204, 220 & 478

ASSIGNMENT

The Assignment included:

- Field Observation and Inventory of Trees on Site
- Recommendations for the protection of trees to remain
- Photographs of the subject trees are included in Appendix B
- Matrix of proposed protected tree removals and protected trees to remain
- Evaluation of potential construction impacts
- A Tree Location Plot Map is included in Appendix A
- Protected tree construction impact guidelines

LIMITS OF THE ASSIGNMENT

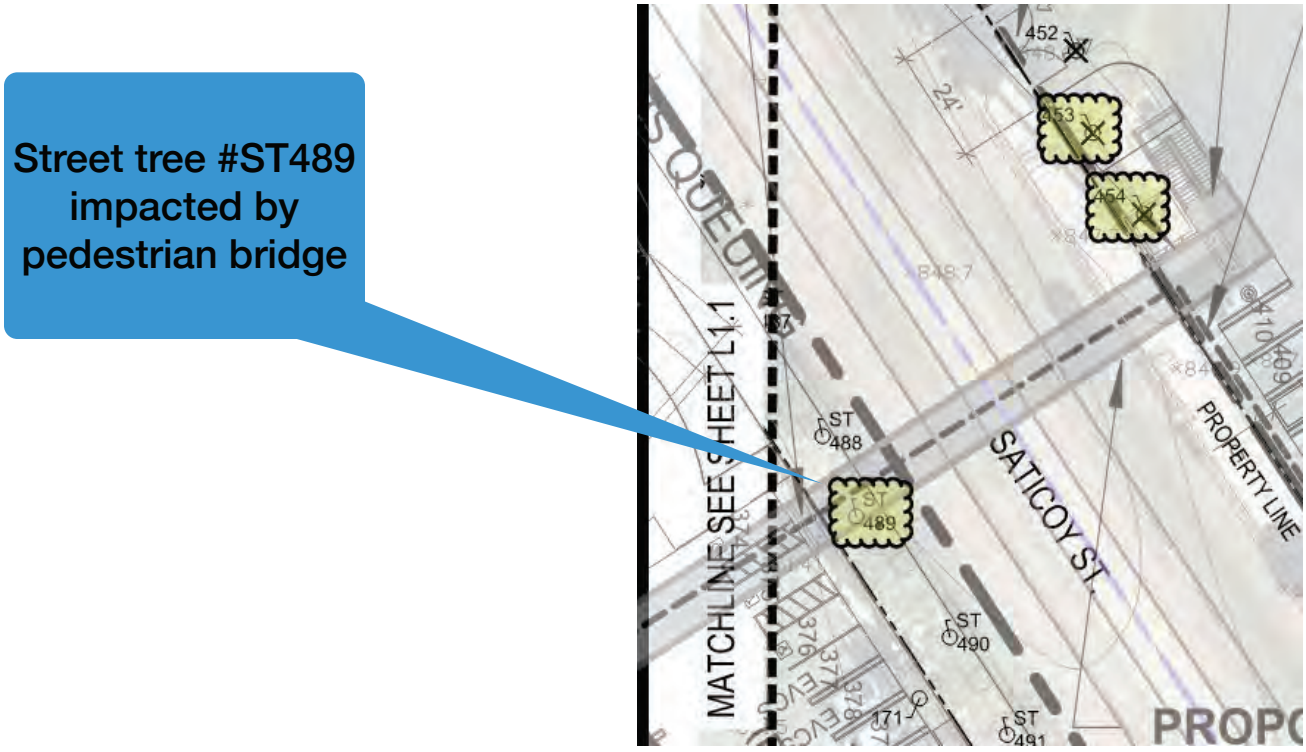
The field inspection was a visual, grade level tree assessment. No special tools or equipment were used. No tree risk assessments were performed. My site examination and the information in this report is limited to the date and time the inspection occurred. The information in this report is limited to the condition of the trees at the time of my inspection.

TREE CHARACTERISTICS AND SITE CONDITIONS

Detailed information with respect to size, condition, species and recommendations are included in the Summary of Field Inspections in Appendix C. The trees are numbered on the Tree Location Map in Appendix A.

IMPACT ANALYSIS AND SPECIFIC RECOMMENDATIONS

NON-PROTECTED SIGNIFICANT TREES 8" or GREATER in Trunk Diameter



TOTAL: At this time, I observed three hundred and sixty-four (364) **Non-Protected Significant Trees 8" or greater** on the property.

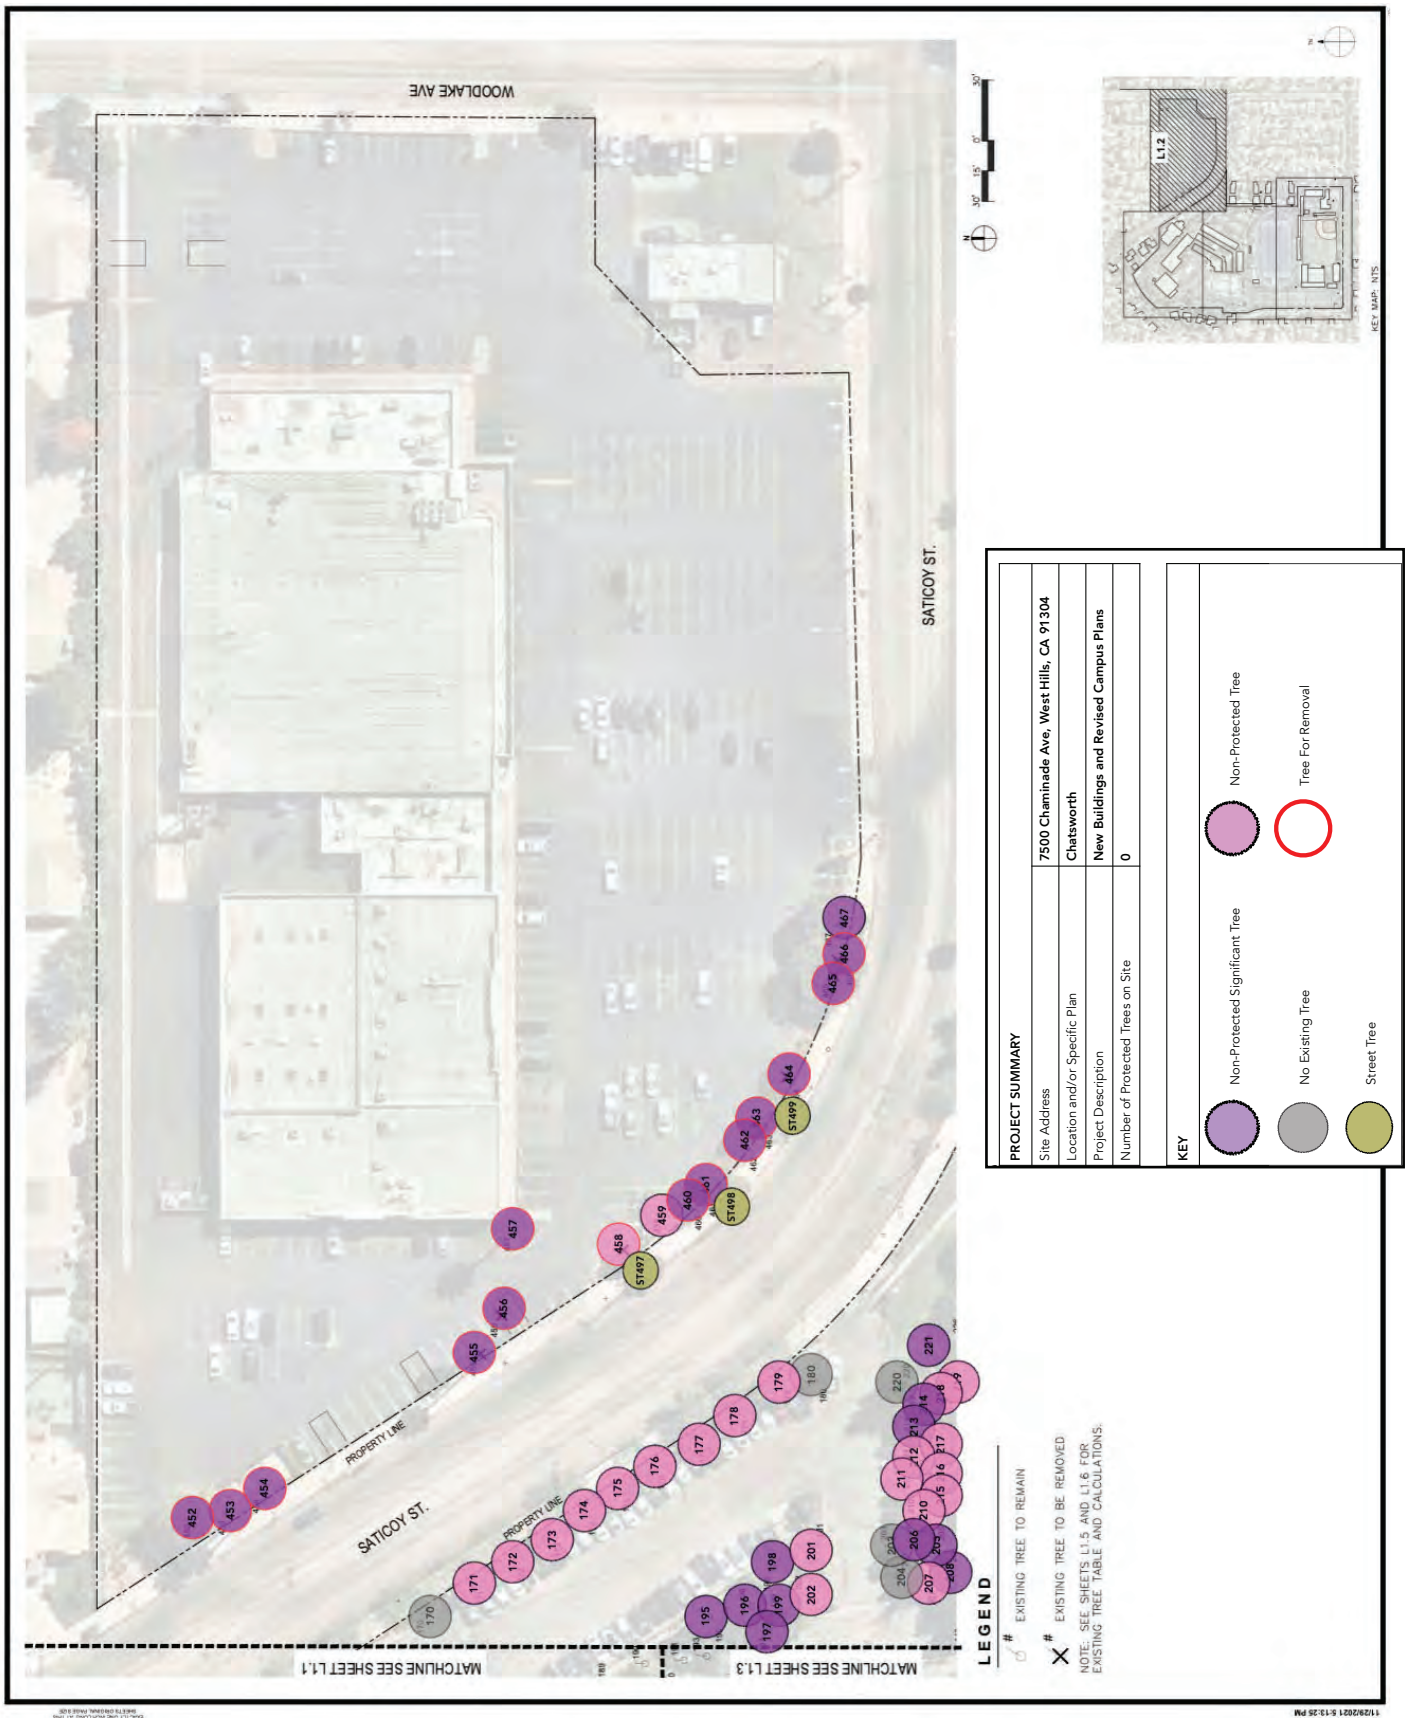
RETAINED: Three hundred and twenty-four (324) trees will be retained and protected in place.

REMOVAL: Forty (40) non-protected significant trees 8" or greater will be impacted by construction and are recommended for removal and replacement to the satisfaction of the City of Los Angeles Department of City Planning.
The majority of these removals are less desirable species, such as stone pine which are highly prone to root plate failure when overly mature. Other species are Redwood (*Sequoia sempervirens*), which are not climate adapted, and do not perform well in the San Fernando Valley. Other removal species are non-native and less desirable, such as evergreen ash, Mexican fan palms, which provide no shade and queen palms.

STREET TREES

Thirty-two parkway trees to be retained and protected in place. One parkway street tree #ST489 a Pink Dawn *(Chitalpa tashkentensis)* will be impacted by the proposed pedestrian bridge This tree will be removed and replaced at a 2:1 ratio to the satisfaction of the Urban Forestry Division.

SUMMARY OF DATA COUNTS



Summary of Data (also located on page 47)

	TOTAL	TOTAL FOR REMOVAL	TOTAL TO BE RETAINED	Trees to be Planted in Replacement
Non-Protected Significant Trees 8" or Greater (Less than 12")	54	10	44	10
Non-Protected Significant Trees 12" or Greater	310	30	280	30
Non-Protected Trees LESS than 8"	108	7	101	0
Street Trees	33	1	32	2
Not existing trees - place holder # (grey circle on map)	12	0	0	0
Totals	517	48	457	42

APPENDIX D - SUMMARY OF DATA

Summary of Data

	TOTAL	TOTAL FOR REMOVAL	TOTAL TO BE RETAINED	Trees to be Planted in Replacement
Non-Protected Significant Trees 8" or Greater (Less than 12")	54	10	44	10
Non-Protected Significant Trees 12" or Greater	310	30	280	30
Non-Protected Trees LESS than 8"	108	7	101	0
Street Trees	33	1	32	2
Not existing trees - place holder # (grey circle on map)	12	0	0	0
Totals	517	48	457	42

Recommended Species and Size of Replacement Trees

Non-Protected Significant trees will be replaced at a one-to-one (1:1) ratio, to the satisfaction of the City of Los Angeles Department of City Planning.

Street trees to be replaced at a 2:1 ratio to the satisfaction of the Urban Forestry Department.

NEW TREE PLANTING

The ideal time to plant trees and shrubs is during the dormant season, in the fall after leaf drop or early spring before budbreak. Weather conditions are cool and allow plants to establish roots in the new location before spring rains and summer heat stimulate new top growth. Before you begin planting your tree, be sure you have had all underground utilities located prior to digging.

If the tree you are planting is balled or bare root, it is important to understand that its root system has been reduced by 90 to 95 percent of its original size during transplanting. As a result of the trauma caused by the digging process, trees commonly exhibit what is known as transplant shock. Containerized trees may also experience transplant shock, particularly if they have circling roots that must be cut. Transplant shock is indicated by slow growth and reduced vigor following transplanting. Proper site preparation before and during planting coupled with good follow-up care reduces the amount of time the plant experiences transplant shock and allows the tree to quickly establish in its new location. Carefully follow nine simple steps, and you can significantly reduce the stress placed on the plant at the time of planting.

NEW TREE PLANTING, continued

1. Dig a shallow, broad planting hole. Make the hole wide, as much as three times the diameter of the root ball but only as deep as the root ball. It is important to make the hole wide because the roots on the newly establishing tree must push through surrounding soil in order to establish. On most planting sites in new developments, the existing soils have been compacted and are unsuitable for healthy root growth. Breaking up the soil in a large area around the tree provides the newly emerging roots room to expand into loose soil to hasten establishment.

2. Identify the trunk flare. The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, you may have to remove some soil from the top of the root ball. Find it so you can determine how deep the hole needs for proper planting.

3. Remove tree container for containerized trees. Carefully cutting down the sides of the container may make this easier. Inspect the root ball for circling roots and cut or remove them. Expose the trunk flare, if necessary.

4. Place the tree at the proper height. Before placing the tree in the hole, check to see that the hole has been dug to the proper depth and no more. The majority of the roots on the newly planted tree will develop in the top 12 inches of soil. If the tree is planted too deeply, new roots will have difficulty developing because of a lack of oxygen. It is better to plant the tree a little high, 1-2 inches above the base of the trunk flare, than to plant it at or below the original growing level. This planting level will allow for some settling.

5. Straighten the tree in the hole. Before you begin backfilling, have someone view the tree from several directions to confirm that the tree is straight. Once you begin backfilling, it is difficult to reposition the tree.

6. Fill the hole gently but firmly. Fill the hole about one-third full and gently but firmly pack the soil around the base of the root ball. Be careful not to damage the trunk or roots in the process. Fill the remainder of the hole, taking care to firmly pack soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. It is not recommended to apply fertilizer at time of planting.

7. Stake the tree, if necessary. If the tree is grown properly at the nursery, staking for support will not be necessary in most home landscape situations. Studies have shown that trees establish more quickly and develop stronger trunk and root systems if they are not staked at the time of planting. However, protective staking may be required on sites where lawn mower damage, vandalism, or windy conditions are concerns. If staking is necessary for support, there are three methods to choose among: staking, guying, and ball stabilizing. One of the most common methods is staking. With this method, two stakes used in conjunction with a wide, flexible tie material on the lower half of the tree will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram). Remove support staking and ties after the first year of growth.

8. Mulch the base of the tree. Mulch is simply organic matter applied to the area at the base of the tree. It acts as a blanket to hold moisture, it moderates soil temperature extremes, and it reduces competition from grass and weeds. A 2- to 3-inch layer is ideal. More than 3 inches may cause a problem with oxygen and moisture levels. When placing mulch, be sure that the actual trunk of the tree is not covered. Doing so may cause decay of the living bark at the base of the tree. A mulch-free area, 1 to 2 inches wide at the base of the tree, is sufficient to avoid moist bark conditions and prevent decay.

TREE MAINTENANCE AND PRUNING

Some trees do not generally require pruning. The occasional removal of dead twigs or wood is typical. Occasionally a tree has a defect or structural condition that would benefit from pruning. Any pruning activity should be performed under the guidance of a certified arborist or tree expert.

Because each cut has the potential to change the growth of the tree, no branch should be removed without a reason. Common reasons for pruning are to remove dead branches, to remove crowded or rubbing limbs, and to eliminate hazards. Trees may also be pruned to increase light and air penetration to the inside of the tree's crown or to the landscape below. In most cases, mature trees are pruned as a corrective or preventive measure.

Routine thinning does not necessarily improve the health of a tree. Trees produce a dense crown of leaves to manufacture the sugar used as energy for growth and development. Removal of foliage through pruning can reduce growth and stored energy reserves. Heavy pruning can be a significant health stress for the tree.

Yet if people and trees are to coexist in an urban or suburban environment, then we sometimes have to modify the trees. City environments do not mimic natural forest conditions. Safety is a major concern. Also, we want trees to complement other landscape plantings and lawns. Proper pruning, with an understanding of tree biology, can maintain good tree health and structure while enhancing the aesthetic and economic values of our landscapes.

Pruning Techniques – From the I.S.A. Guideline

Specific types of pruning may be necessary to maintain a mature tree in a healthy, safe, and attractive condition.

Cleaning is the removal of dead, dying, diseased, crowded, weakly attached, and low- vigor branches from the crown of a tree.

Thinning is the selective removal of branches to increase light penetration and air movement through the crown. Thinning opens the foliage of a tree, reduces weight on heavy limbs, and helps retain the tree's natural shape.

Raising removes the lower branches from a tree to provide clearance for buildings, vehicles, pedestrians, and vistas.

Reduction reduces the size of a tree, often for clearance for utility lines. Reducing the height or spread of a tree is best accomplished by pruning back the leaders and branch terminals to lateral branches that are large enough to assume the terminal roles (at least one-third the diameter of the cut stem). Compared to topping, reduction helps maintain the form and structural integrity of the tree.

TREE MAINTENANCE AND PRUNING, continued

How Much Should Be Pruned?

Mature trees should require little routine pruning. A widely accepted rule of thumb is never to remove more than one-quarter of a tree's leaf-bearing crown. In a mature tree, pruning even that much could have negative effects. Removing even a single, large- diameter limb can create a wound that the tree may not be able to close. The older and larger a tree becomes, the less energy it has in reserve to close wounds and defend against decay or insect attack. Pruning of mature trees is usually limited to removal of dead or potentially hazardous limbs.

Wound Dressings

Wound dressings were once thought to accelerate wound closure, protect against insects and diseases, and reduce decay. However, research has shown that dressings do not reduce decay or speed closure and rarely prevent insect or disease infestations. Most experts recommend that wound dressings not be used.

DISEASES AND INSECTS

Continual observation and monitoring of your tree can alert you to any abnormal changes. Some indicators are: excessive leaf drop, leaf discoloration, sap oozing from the trunk and bark with unusual cracks. Should you observe any changes, you should contact a Tree specialist or Certified Arborist to review the tree and provide specific recommendations. Trees are susceptible to hundreds of pests, many of which are typical and may not cause enough harm to warrant the use of chemicals. However, diseases and insects may be indication of further stress that should be identified by a professional.

GRADE CHANGES

The growing conditions and soil level of trees are subject to detrimental stress should they be changed during the course of construction. Raising the grade at the base of a tree trunk can have long-term negative consequences. This grade level should be maintained throughout the protected zone. This will also help in maintaining the drainage in which the tree has become accustomed.

INSPECTION

The property owner should establish an inspection calendar based on the recommendation provided by the tree specialist. This calendar of inspections can be determined based on several factors: the maturity of the tree, location of tree in proximity to high-use areas vs. low-use area, history of the tree, prior failures, external factors (such as construction activity) and the perceived value of the tree to the homeowner.

Assumptions and Limiting Conditions

No warranty is made, expressed or implied, that problems or deficiencies of the trees or the property will not occur in the future, from any cause. The Consultant shall not be responsible for damages or injuries caused by any tree defects, and assumes no responsibility for the correction of defects or tree related problems.

The owner of the trees may choose to accept or disregard the recommendations of the Consultant, or seek additional advice to determine if a tree meets the owner's risk abatement standards.

The Consulting Arborist has no past, present or future interest in the removal or retaining of any tree. Opinions contained herein are the independent and objective judgments of the consultant relating to circumstances and observations made on the subject site.

The recommendations contained in this report are the opinions of the Consulting Arborist at the time of inspection. These opinions are based on the knowledge, experience, and education of the Consultant. The field inspection was a visual, grade level tree assessment.

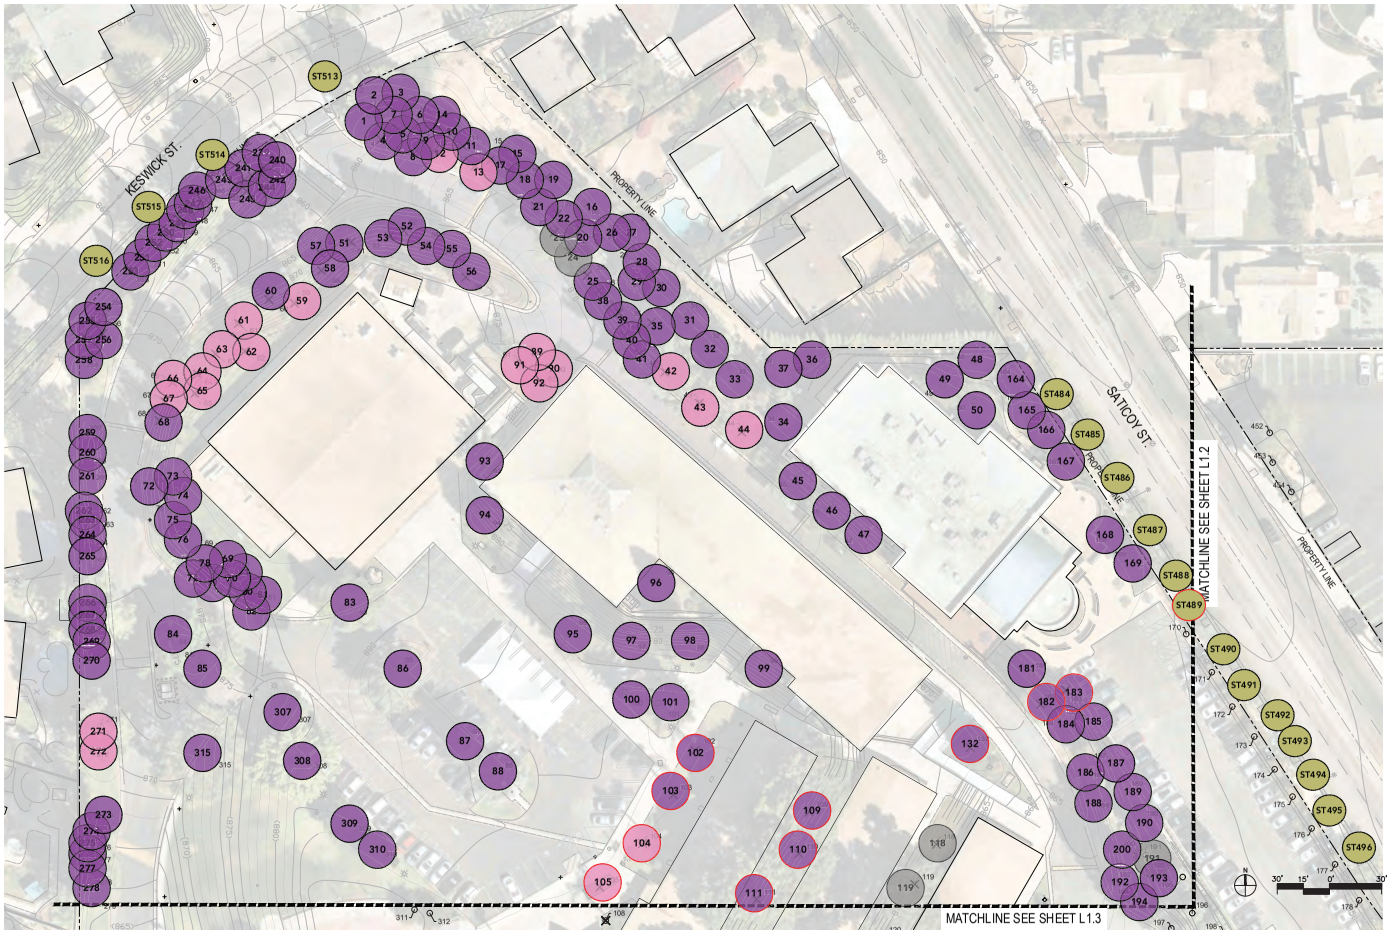
The Consulting Arborist shall not be required to give testimony, perform site monitoring, provide further documentation, be deposed, or to attend any meeting without subsequent contractual arrangements for this additional employment, including payment of additional fees for such services as described by the Consultant.

The Consultant assumes no responsibility for verification of ownership or locations of property lines, or for results of any actions or recommendations based on inaccurate information.

This Arborist report may not be reproduced without the express permission of the Consulting Arborist and the client to whom the report was issued. Any change or alteration to this report invalidates the entire report.

Should you have any further questions regarding this property, please contact me at (310) 663-2290.

Respectfully submitted,



Lisa Smith

TECHNICAL MEMORANDUM

To: Stacie Henderson, Senior Project Manager
CAJA Environmental Services, LLC
9410 Topanga Canyon Boulevard, Suite 101
Chatsworth, CA 91311

From: Jackie Worden, Lead Biologist

Date: January 30, 20223

Re: Chaminade High School Expansion / SWCA Project No. 67816

INTRODUCTION

The proposed Chaminade High School Expansion Project (Project), located in the West Hills neighborhood of the city of Los Angeles, California, proposes to update and expand the Chaminade High School campus within existing developed areas. The Project on the Main Campus will include two new quads, a new administrative office building, updates to existing classrooms and offices, two new sports fields, and temporary portable buildings. Project development on the North Campus includes a new surface parking lot, two sports fields and a pool. A new pedestrian bridge across Saticoy Street is proposed to connect the Main Campus and the North Campus.

The Project site on the Main campus is located entirely within developed areas, including multi-story academic and administrative buildings, sports fields, and facilities. The Project site on the North Campus is currently developed with a one-story multi-tenant mini shopping center and surface parking lot, built between 1962 and 1964. The surrounding area is fully urbanized and is characterized primarily by residential properties.

Project Location

The Project site is composed of four parcels:

- Main Campus: 7500 Chaminade Avenue (assessor parcel number [APN] 2027-005-009);
- North Campus:
    - 23255 Saticoy Street, 7629 Woodlake Avenue, 7621 Woodlake Avenue (APNs 2027-005-005, 2027-005-006, and 2027-005-007).

The Project is situated in Section 35 of Township 2 North, Range 17 West on the U.S. Geological Survey (USGS) *Calabasas* 7.5 minute quadrangle.

The attached figures illustrate the regional and vicinity location and the boundaries of the Project.

PURPOSE & SCOPE

We understand the City of Los Angeles requires completion of the Biologist's Statement of Biological Resources form for this project. The completed form is attached.

The first item on the form is the date of the field survey. Based on our professional experience and knowledge of the project site and vicinity, we believe a sufficient biological review can be completed through a desktop analysis of aerial photos and published data. This recommendation is based on the following factors:

- The subject property is fully developed and lacks natural habitats.
- The site is surrounded by urban development.
- No trees would be removed.
- No protected trees are present.
    - An arborist report is under preparation by The Tree Resource (Lisa Smith, Registered Consulting Arborist #464)
- There are no water resources on the site.
- The are no records in the California Natural Diversity Database (CNDDB) of sensitive or special status species within the Calabasas United States Geological Survey (USGS) quadrangle and/or within a 0.25-mile radius of the project site.

REGULATORY SUMMARY

Nesting Birds

The federal Migratory Bird Treaty Act (MBTA) prohibits any person, unless permitted by regulations, to "…pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatsoever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of this Convention … for the protection of migratory birds ... or any part, nest, or egg of any such bird." (16 United States Code (USC) 703).

Section 3503 of the State of Calfiornia Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 provides protection for all birds of prey, including their eggs and nests. Take or possession of any migratory non-game bird as designated in the MBTA is prohibited by Section 3513 of the Fish and Game Code.

Protected Tree and Shrub Relocation and Preservation Ordinance

Section 46.00 of the City's Municipal Code and Ordinance Number 186,873 (City of Los Angeles 2021) define 'protected tree or shrub' to include the Southern California indigenous tree and shrub species listed below which measure four inches or more in cumulative diameter, four and one-half feet above ground level. Oak tree including valley oak (*Quercus lobata*) and California live oak (*Quercus agrifolia*), or any other tree of the oak genus indigenous to California but excluding the scrub oak (*Quercus berberidifolia*).

- Southern California black walnut (*Juglans californica*)
- Western (California) sycamore (*Platanus racemosa*)
- California bay (*Umbellularia californica*)
- Mexican elderberry (*Sambucus mexicana*) [also called blue elderberry, *Sambucus nigra* ssp. *caerulea*]
- Toyon (*Heteromeles arbutifolia*)

A permit is required from the Board of Public Works (or designee) to relocate or remove any protected tree or shrub. Mitigation requirements are replacement within the same property boundaries at a minimum ratio of 4 to 1. Protected trees shall only be mitigated with trees (not shrubs) from the above list; protected shrubs shall be mitigated only by shrubs (not trees) from this list. Replacement trees shall be at least 15-gallon, measure 1 inch or great diameter at 1 foot above the base, and be no less than 7 feet in height, measured from the base.

IMPACT ASSESSMENT

Potential adverse impacts to biological resources are limited to short-term construction impacts, such as noise, dust and increased human activity. Active nesting birds could be affected during construction. Although no trees are proposed for removal, active nests adjacent to construction could be disturbed.

The arborist report under preparation will confirm the absence of protected trees or shrubs.

RECOMMENDATIONS

Nesting Bird Protection

Potentially suitable nesting habitat is present on the Project Site in the mature trees and shrubs. If activities associated with construction, or grading are planned during the bird nesting/breeding season (generally 15 January through 31 August), it is recommended that a qualified biologist conduct surveys for active nests in accordance with the following procedures:

1. A qualified biologist shall conduct weekly nesting bird surveys within the Project Site and adjacent properties commencing no more than 3 days prior to the initiation of any ground-disturbing activities including grubbing, site clearance, movement of equipment and/or vehicles onto Project Site and/or construction work.

2. If an active nest of a protected native bird is found, the Applicant shall delay all project-related work as described in item #1 above until August 31.

3. Alternatively, the qualified biologist could continue weekly surveys to monitor nest(s) activity until the nest is vacated, juveniles have fledged, and there is no evidence of a second nesting attempt.

    a) The biologist shall establish a protective buffer zone around the nest(s) to be marked in the field with flagging, stakes and/or temporary exclusionary fencing (to be installed by the applicant at the direction of the biologist). The size of the buffer shall be determined by the biologist based on the species of nesting bird and stage of nesting (25-50 feet for songbirds; 100 feet for raptors).

    b) Construction personnel shall be instructed to avoid the buffer zone, the reasons for the buffer zone, and laws protecting active nesting.

    c) The biologist shall provide the Applicant with a technical memorandum describing the methods and results of these protective, to be submitted to the City of Los Angeles.

PHASE I HISTORIC ASSESSMENT

Teresa Grimes | Historic Preservation
Teresa.Grimes@icloud.com
323-868-2391

Date: September 6, 2023

For: Chris Landon
Chaminade College Preparatory
7500 Chaminade Avenue
West Hills, CA 91304

Subject: Chaminade College Preparatory, High School

INTRODUCTION

This Phase I Historic Assessment was prepared in response to your request for information regarding a proposed development project (Project) in the City of Los Angeles. The Project involves updating the existing Main Campus of Chaminade College Preparatory and expanding to a new North Campus (see **Figure 1**). The Main Campus is located at 7500 Chaminade Avenue, 23241 Cohasset Street, and 23260 Saticoy Street. The North Campus is located at 23217-55 Saticoy Street and 7619-29 Woodlake Avenue. The proposed Project on both sites would involve the demolition of buildings over 45 years of age (all buildings on the North Campus and select structures on the Main Campus) and the construction of new buildings and facilities. I conducted research to determine if the Project has the potential to impact historical resources defined by the California Environmental Quality Act (CEQA). My qualifications as a historic preservation professional are included in **Appendix A.**

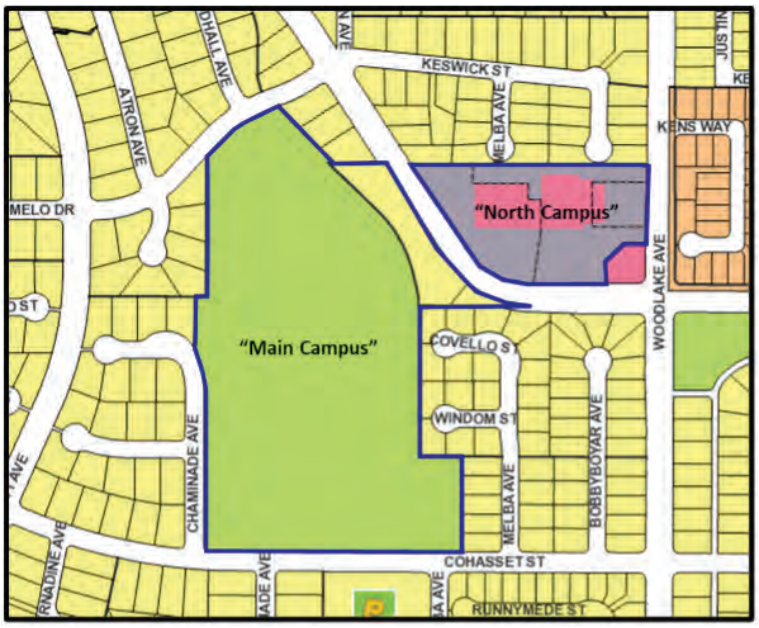

Figure 1: Project Site, Main Campus and North Campus

HISTORICAL RESOURCES UNDER CEQA

CEQA defines a historical resource as a property listed in the California Register of Historical Resources (California Register) or determined to be eligible for listing in the California Register by the State Historical Resource Commission. A property designated under a local preservation ordinance or identified as eligible in a historic resource survey is presumed to be a historical resource unless a preponderance of evidence demonstrates that the property is not architecturally, historically, or culturally significant.[1] The lead agency has the discretion to treat a property as a historical resource if it meets statutory requirements and substantial evidence supports the conclusion. Thus, there are three categories of historical resources:

- *Mandatory historical resources* are properties listed or determined to be eligible for listing in the California Register by the State Historical Resource Commission.[2] The California Register automatically includes properties listed and formally determined to be eligible for listing in the National Register of Historic Places (National Register) as well as some California State Landmarks and Points of Historical Interest.

- *Presumptive historical resources* are properties included in a local register of historical resources as defined by subdivision (k) of Section 5020.1 of the Public Resources.[3] The Los Angeles Cultural Heritage Ordinance and the Historic Preservation Overlay Zone Ordinance meet this definition. Therefore, properties designated Los Angeles Historic Cultural Monuments (HCMs) and areas designated as Historic Preservation Overlay Zones (HPOZs) are presumed to be historical resources by the City of Los Angeles. However, properties identified as significant by SurveyLA are not presumptive historical resources, as SurveyLA does not meet the criteria set forth in subdivision (g) of Section 5024.1 of the Public Resources Code. [4] Any presumptive historical resource may be subject to a finding that a preponderance of the evidence demonstrates that the property is not significant.

- *Discretionary historical resources* are properties determined to be eligible for listing in the California Register by the lead agency. The determination must be supported by evidence in light of the whole record.[5] The City of Los Angeles considers properties identified as significant by SurveyLA to be discretionary historical resources unless a Historical Resource Assessment Report demonstrates otherwise.

PREVIOUS DESIGNATIONS AND EVALUATIONS

The following sources were consulted to determine if the Project Site (Main and North Campuses) or immediate surroundings include properties currently designated under national, state, or local landmark or historic district programs or identified as significant in a historic resource survey or study. The immediate surroundings were defined as adjacent parcels. Properties may include buildings, structures, sites, objects, and districts.

1. The Built Environment Resources Directory (BERD) was reviewed to determine if any properties on the Project Site or adjacent parcels are listed or determined to be eligible for listing in the National Register, listed or determined to be eligible for listing in the California Register, a California Registered Historical Landmark, a Point of Historical Interest, or evaluated in a historic resource survey or other planning activities.

    a. This research revealed no such properties located on the Project Site or adjacent parcels.

2. The Los Angeles Historic Resources Inventory website, HistoricPlacesLA.org, was reviewed to determine if properties located on the Project Site or adjacent parcels are designated an HCM or located within a designated HPOZ.

    a. This research revealed the properties on the Project Site and adjacent parcels are not designated an HCM or located within a designated HPOZ.

3. The findings of SurveyLA, the citywide historic resource survey of Los Angeles, are also included in HistoricPlacesLA.org as well as individual survey reports for each Community Plan Area (CPA). The Project Site is located within the Canoga Park-Winnetka-Woodland Hills-West Hills CPA.

    a. This research revealed the properties on the Project Site and adjacent parcels were not identified by SurveyLA.

Therefore, the properties comprising the Project Site are not mandatory or presumptive historical resources as defined by CEQA and interpreted by the City of Los Angeles. Furthermore, there are no mandatory or presumptive historical resources immediately surrounding the Project Site. The properties that comprise the Project Site, referred to as the Main Campus and North Campus, are discussed in greater detail below.

---

[1] Public Resources Code § 5024.1 and Title 14 California Code of Regulations § 4850 & § 15064.5 (a) (2).

[2] Title 14 California Code of Regulations § 15064.5 (a) (1).

[3] A local register of historical resources is defined as a list of properties officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution.

[4] A resource identified as significant in a historical resource survey may be listed in the California Register if the survey meets all of the following criteria:

1. The survey has been or will be included in the State Historic Resources Inventory.
2. The survey and the survey documentation were prepared in accordance with office procedures and requirements.
3. The properties were evaluated and determined by the office (SHOP) to have a significance rating of Category 1 to 5 on DPR Form 523.
4. If the survey is five or more years old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historical resources which have become eligible or ineligible due to changed circumstances or further documentation and those which have been demolished or altered in a manner that substantially diminishes the integrity of the resource.

[5] Title 14 California Code of Regulations § 15064.5 (a) (3) (4).

MAIN CAMPUS

Construction History - The Main Campus includes Assessor Parcel Number 2027-005-009 and 002. The Chaminade High School for Boys was founded by the Society of Mary (Marianists) in Cheviot Hills in the fall of 1952. In 1961, the Marianists relocated the school to the existing Main Campus in West Hills. An article in *The Tidings* includes an illustration suggesting that there was a master plan for the campus that included numerous buildings and structures with folded plate roofs that were never constructed (see **Figure 2**).[6] The original buildings on the Main Campus were designed by architects Barker and Ott and included an administration building, a library, a classroom building, a lab building, and a multipurpose building. The builder was Fred E. Potts.[7] The faculty residence was repurposed from an existing single-family house and the student residence was a temporary building. These buildings that once stood in the southwestern portion of the campus were demolished at an unknown date but are now occupied by new buildings discussed below.

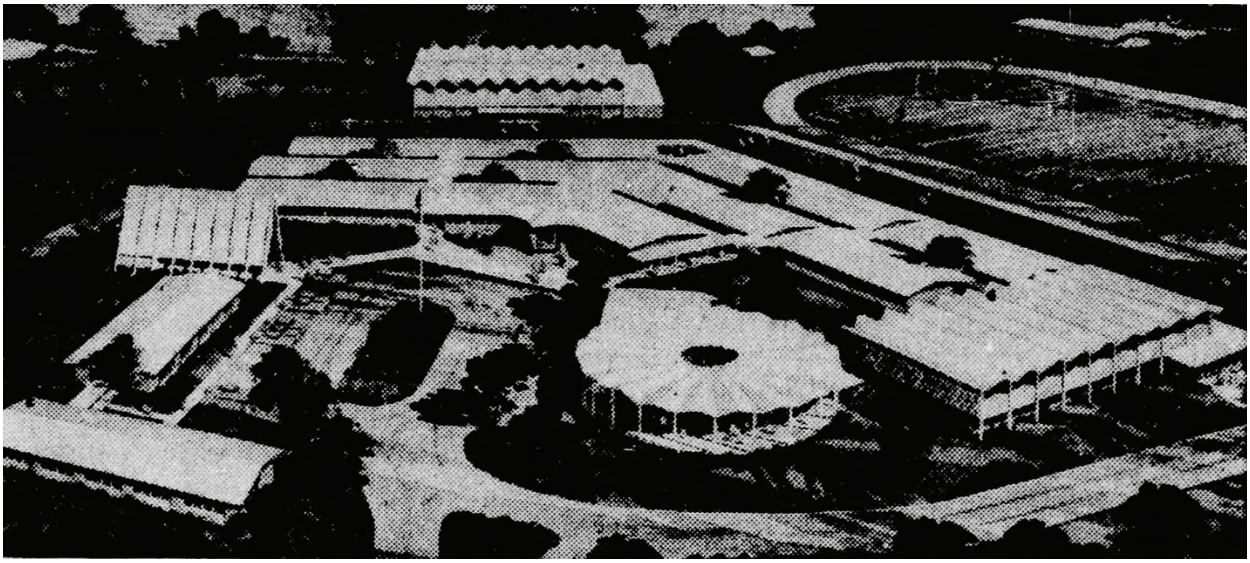

Figure 2: 1960 Campus Plan

The original buildings still standing are located in the approximate center of the Main Campus and are arranged in three rows with a northwest orientation (see current map of campus in **Appendix B**). The buildings are all one-story in height, sheathed in stucco, and covered by low-pitched gable roofs. No building permits for their construction were found at the Los Angeles Department of Building and Safety.

In 1964, the school broke ground on the construction of a cafetorium that was later named the Bob Hope Student Center.[8] It was also designed by architects Barker and Ott and the builder

[6] "New Campus Ready For Chaminade Prep," *The Tidings*, August 25, 1961.
[7] "Chaminade Groundbreaking Slated Sunday," *Van Nuys News and Valley Green Sheet*, January 20, 1961.
[8] "Ceremony Set at Chaminade for Building," *Valley News*, October 16, 1964.

was the Ray Wilson Company.[9] The building is situated in the northwestern corner of the Main Campus and is two stories in height and rectangular in plan.

Most of the buildings and structures on the Main Campus are less that 50 years of age and include: a telescope house (later converted into the Fine Arts Building) constructed in 1975;[10] a shower and locker room building constructed in 1975;[11] another classroom building constructed near the original buildings in 1978, filling a gap in the plan;[12] the Uribe Sports Center constructed in 1981;[13] bleacher seating constructed in 1988;[14] Marian Hall, a classroom building, constructed 1992;[15] Mundy's, a merchandise sales and storage building, constructed in 1997;[16] the Condon Family Center for Science and Technology constructed in 2005; and the Tutor Family Center for Performing Arts constructed in 2012.[17] See **Appendix E** for selected building permits.

Los Angeles Citywide Historic Context Statement - The significance of a property must be evaluated within its historic context(s). Historic properties may include buildings, structures, objects, sites, and districts. Historic contexts are those patterns or trends in history by which a specific property is understood. The *Los Angeles Citywide Historic Context Statement* (*LACHCS*) was used to identify the relevant contexts for judging the significance of the Main Campus. The *LACHCS* is organized into nine broad contexts that cover the period from 1850 to 1980 and are specific to Los Angeles. The most relevant context for the evaluation of the Main Campus is Public and Private Institutional Development. The property's potential to meet the eligibility standards for listing under federal, state, and local landmark and historic district programs for the associated theme and subthemes within this context is discussed below.

Parochial school campuses may be eligible as districts in the Public and Private Institutional Development Context, in the Education Theme, and in the Educational Development and Campus Planning Subthemes. A narrative for these two subthemes has not been developed yet. According to the Archdiocese of Los Angeles Administrative Handbook, the Catholic school system in Southern California was developed by Bishop Thomas J. Conaty (1847-1915); originating with 19 parochial schools and five academies in 1903 with a total enrollment of 2,895.[18] Founded in 1952, Chaminade College Preparatory does not represent an important aspect of educational development in Los Angeles because it was not among the earliest high schools established. Additionally, it is not significant for an association with West Hills. It was originally located in Cheviot Hills and only moved to West Hills for more space. Furthermore,

[9] Building Permit No. 1964LA76791 and Certificate of Occupancy November 21, 1968.
[10] Building Permit No. 1975VN20967.
[11] Building Permit Nos. VN20174 and VN25118 and Certificate of Occupancy December 5, 1975.
[12] Building Permit No. 1978LA62661.
[13] "Chaminade Prep to Mark Gym Opening," *Los Angeles Times*, April 30, 1981.
[14] Building Permit No. 1988LA97526.
[15] Building Permit No. 1992HO17862.
[16] Building Permit No. 97010-20000-01899.
[17] Building Permit No. 10010-20000-00127.
[18] "Overview," Archdiocese of Los Angeles Administrative Handbook, accessed August 2, 2023, https://handbook.la-archdiocese.org/Pages/Chapter%201.aspx.

the campus does not retain the essential physical features from the period of significance, which would be the 1960s when the school moved to West Hills. Most of the buildings and structures were constructed over the last 50 years. Thus, the campus does not convey a visual sense of an historic environment. For the reasons outlined above, the Main Campus does not meet the eligibility standards for the Educational Development Subtheme.

Likewise, the Main Campus does not meet the eligibility standards for the Campus Planning Subtheme. As previously stated, there appears to have been a master plan for the Main Campus at one time. However, after the first buildings were constructed in 1961 the master plan appears to have been abandoned. Henceforth, buildings and structures were constructed as needed and as funds were available. Therefore, the Main Campus does not possess a significant concentration of buildings and structures united historically or aesthetically by a master plan.

Additionally, the individual buildings were not designed in prominent architectural styles of the period and are not important examples of the work of master architects. Barker and Ott was a partnership between Merl Lee Barker (1888-1970) and G. Lawrence Ott (1895-1975). The partnership began in the 1930s and the Catholic church was a primary client. Other examples of the firm's work include the Mount Carmel High School (1934-35, demolished) and St. Charles Borromeo Church (1937-38); Congregational Church of the Messiah (1953); St. Bernadette Roman Catholic Church (1961), and St. John Baptist de la Salle Church (1969). Barker and Ott may have designed a few noteworthy buildings, but no information was found that they could be considered master architects, which is defined by the National Register as a figure of generally recognized greatness in the field and by the Los Angeles Cultural Heritage Ordinance as a person whose individual genius influenced his or her age.

NORTH CAMPUS

Construction History - The North Campus includes three Assessor Parcel Numbers: 2027-005-005, 006, and 007. It is occupied by the West Hills Shopping Center, which includes a main building that was constructed in stages between 1962 and 2004 and surface parking lots (see **Figure 3**). The building is one story in height and is mostly covered by a flat roof surrounded by raised parapets.

According to the Los Angeles County Office of the Assessor, the original portion of the building was constructed in 1962 on APN 2027-005-006, the approximate center of the property. It is one story in height with a square shape. No building permit for the construction was found at the Los Angeles Department of Building and Safety. As early as 1965, the building was occupied by an Alpha Beta Acme Market.[19] The following year, 1963, a 20-foot by 70-foot addition was constructed on the east side of the building.[20] The owner was Walter H. Leimert Jr., the scion of the real estate family that developed Leimert Park, among other neighborhoods.

[19] 1965 City Directory.
[20] Building Permit No. 1963VN27354 and Certificate of Occupancy July 30, 1964.

Figure 3: West Hills Shopping Center Construction Stages

The architect and engineer on the building permit is listed as none and the builder is listed as the owner. The 1965 aerial photograph (see **Appendix C**) indicates that another addition was constructed on the west side of the building by this time, although the Los Angeles Department of Building and Safety has no record of the construction. However, a permit was issued in 1965 to convert the interior into a bakery. [21] In 1989 the building nearly doubled in size with the construction of a 134-foot-by 157-foot addition on the west.[22] The owner was the Walter Leimert Company, the architect was T.W. Layman, the engineer was Marv Hornstein, and the builder was the owner. In 2004, another addition was constructed.[23] This time at the rear (north) of the 1989 portion of the building. The owner was Leimert Saticoy LP, the architect was Michele Mcdonough, the engineer was Lizandro Mercado, and the builder was the owner. Other alterations to the building documented by the permit record include various tenant improvements, sign changes, and improvements to electrical and mechanical systems. See **Appendix E** for selected building permits.

Los Angeles Citywide Historic Context Statement – The most relevant context from the *LACHCS* for the evaluation of the North Campus is Commercial Development. The property's potential to meet the eligibility standards for the associated theme and subtheme within this context is discussed below.

Shopping centers may be eligible in the Commercial Development Context in the Neighborhood Commercial Development Theme and in the Post WWII Neighborhood Shopping Centers

[21] Building Permit No. 1965VN70253.
[22] Building Permit Nos. 1988VN44022, 1989VN62385, and 1989VN2146 and Certificate of Occupancy November 20, 1989.
[23] Building Permit No. 03014-10000-04774.

Subtheme. The property, however, does not meet the eligibility standards for this subtheme because it was not originally designed as a shopping center. It was designed as a market and did not evolve into a true shopping center until long after the period of significance (1936-1965) for the subtheme. The building is set back from the street and oriented toward the surface parking lot, but that is true of most commercial buildings from the period.

For most of its history, the property was owned by the Walter H. Leimert Company. While the company played a significant role in the residential development, and to a lesser extent the commercial development, of Los Angeles, the property is not significant for this association. Mere association is not in and of itself to qualify, the association must be important. The property appears to be one of many developed and owned by the company since its founding in Oakland in 1902. In 1926, Leimert moved the company to Southern California and developed Bellhurst Park in Glendale. The company is best known for the development of Leimert Park in 1928 and would go on to develop Beverlywood, Cheviot Knolls, and Rancho Malibu among other subdivisions. The company was prolific, and the building is not an important example of their work.

Additionally, the property does not meet the eligibility standards for the Markets Subtheme in the Neighborhood Commercial Development Theme. The original portion of the building was constructed as a market during the period of significance (1910-1975) for the subtheme and includes a surface parking lot, but it does not exhibit quality of design through distinctive features that would make it a good example of a type, period, or method of construction. The name of the original architect, if any, is unknown.

The Alpha Beta Acme Market may have been the original tenant; however, the building is not significant for an important association with this company. Alpha Beta Food Markets incorporated in 1929, but the first store opened in Pomona in 1917. In 1961, the company merged with American Stores, operators of Acme Markets on the East Coast, and assumed the name Alpha Beta Acme Markets.[24] As the building does not appear to have been constructed by the company, it is not an example of the store design from the 1960s. When Alpha Beta Acme closed at this location is unclear. The name does not appear at this address in available City Directories after 1965. The demise of the Alpha Beta Acme name began with the 1988 merger of American Stores with Lucky Stores. It has been occupied by West Hills Market, later called Fields Market, since the early 2000s.

The Commercial Merchants, Leaders, and Builders Theme in the Commercial Development Context pertains to people who played a significant role in the commercial history of Los Angeles. Several steps are involved in determining whether a property is significant under this theme. First, the person must be significant within the context commercial development. Second, the property must be associated with the person's productive life. Finally, the property

[24] "Alpha-Beta," Grocerteria.com, accessed August 3, 2023, https://www.groceteria.com/store/regional-chains/alphabeta/#:~:text=The%20company%20went%20public%20in,%2DLo%2C%20beginning%20in%201960.&text=In%201961%2C%20Alpha%20Beta%20merged,%E2%80%9CAlpha%20Beta%20Acme%20Markets%E2%80%9D.

must be compared with other associated properties to identify the best representation of the person's historic contributions. Walter H. Leimert Jr. served as president of the Walter H. Leimert Company from 1960 until his death in 2004.[25] Initially with his father, who died in 1970, and then on his own, Leimert developed Beverly Highlands in the Hollywood Hills, Saint Hubert Wood and Sierra Park in Orange County, and Cambria Pines near Hearst Castle. Leimert Jr. may be significant in the context of residential development but not commercial development.

CONCLUSIONS

The properties comprising the Project Site are not historical resources as defined by CEQA. None of the properties are currently designated under national, state, or local landmark or historic district programs. Additionally, none of the properties have been previously evaluated as potential historical resources, individually or collectively, in a historic resource survey including SurveyLA. Research conducted for this memorandum indicates that the properties have no potential to meet the relevant eligibility standards in the LACHCS for listing under federal, state, and local landmark or historic district programs due to a lack of significance and/or integrity. No further investigation is recommended, and the preparation of an Historical Resource Assessment Report is not warranted.

TERESA GRIMES | Historic Preservation

Teresa.Grimes@icloud.com
323-868-2391

Teresa Grimes has 30 years of experience in the field of historic preservation. She is widely recognized as an expert in the identification and evaluation of historical resources having successfully prepared dozens of landmark and historic district applications for a wide variety of property types. Teresa graduated from the University of California with a Master of Art degree in Architecture and has worked in the private, public, and non-profit sectors. Teresa has extensive experience in the preparation of environmental compliance documents in accordance with the California Environmental Quality Act including the identification of historical resources, analysis of direct, indirect, and cumulative impacts, and development of mitigation measures. Her many projects throughout Southern California include the Art Center College of Design Master Plan, Baldwin Hills Crenshaw Plaza, Cinerama Dome Entertainment Center, City of Hope Master Plan, Claremont Graduate University Master Plan, Claremont McKenna College Master Plan, John Anson Ford Theatres, Oakwood School Master Plan, Los Angeles County Museum of Art, Times Mirror Square, Sunset Las Palmas Studios, and Sunset Bronson Studios.

Educational Background

- M.A., Architecture, University of California, Los Angeles, 1992
- B.A., Political Science, University of California, Los Angeles, 1986

Qualifications

- Meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.

Professional Activities

- Pasadena Heritage Board Member, 2008-2012
- Highland Park Heritage Trust, Board Member, 1996-1998
- West Hollywood Cultural Heritage Advisory Board, 1990-1994

750 no matter what the buy-

Chaminade High School Site Sold

Charles Dunn Co., realtors, report the sale of Chaminade High School property at 2500 S Beverly Drive, to the Jewish Home for the Aged.

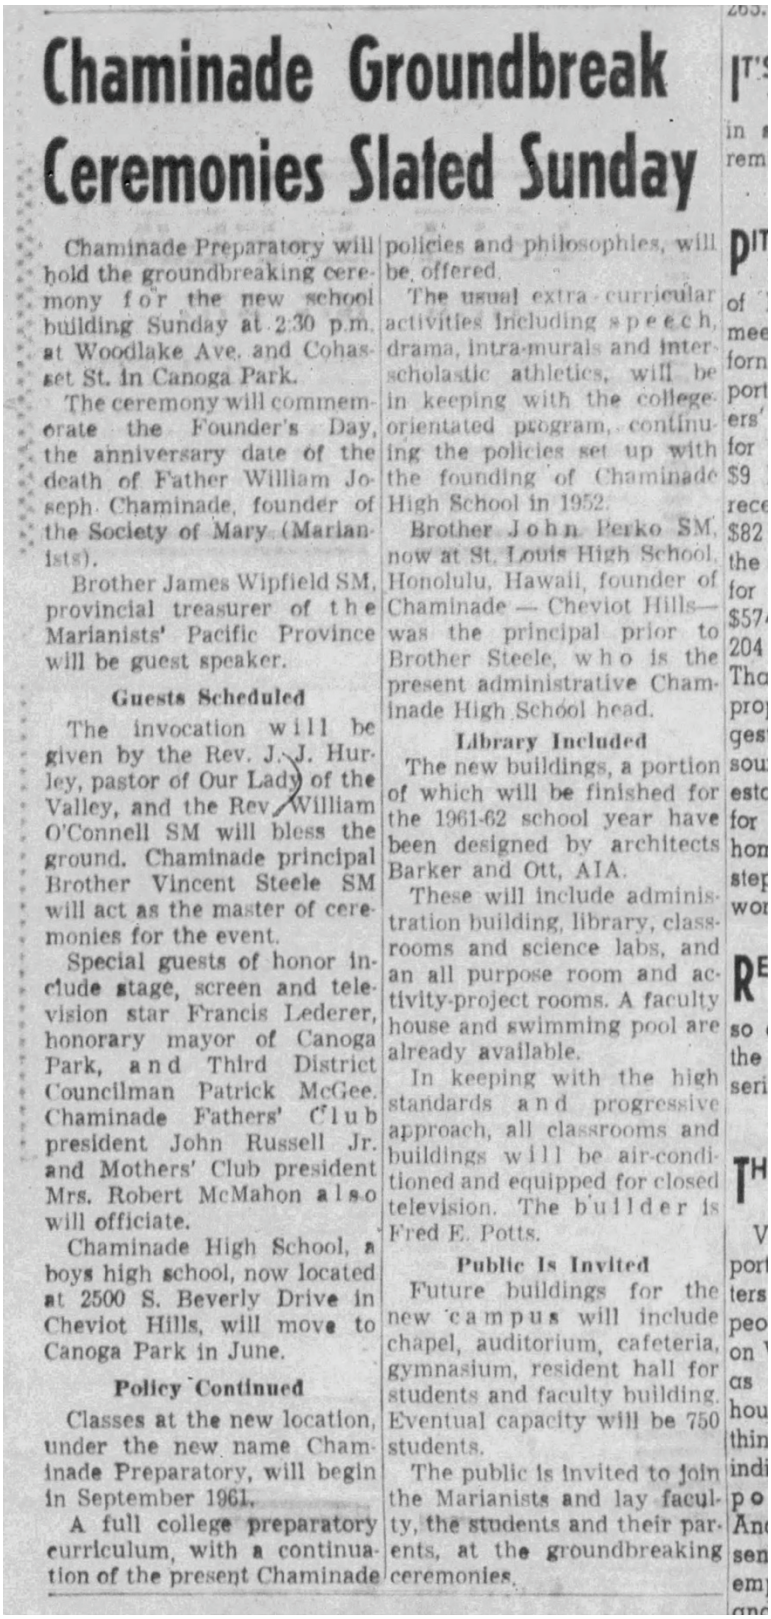
Chaminade, conducted by the Brothers of Mary, will continue to occupy the property for the remainder of the school year and next fall will open a new school on a 20-acre parcel at 23285 Cohasset St., Canoga Park. The Canoga Park property was purchased from James and Clarence Pierce, whose family has owned the property for 40 years. Coldwell, Banker & Co. represented the Jewish Home for the Aged and Pierce, Charles Dunn Co. represented Chaminade.

Los Angeles Mirror, November 25, 1960

New Chaminade to Rise

Groundbreaking ceremonies for Chaminade Preparatory, successor to Chaminade High School, now in Cheviot Hills, will take place at 2:30 p.m. this Sunday on the site, Woodlake Ave. and Cohasset St., Canoga Park.

Construction of three long buildings at center of above drawing by Barker & Ott, architects, will begin immediately. These will include classrooms, administration, library, laboratories and all-purpose room.



Future buildings will include, from left, resident halls, chapel, gymnasium, circular cafeteria and auditorium. Faculty house, swimming pool, right background, are already on the property.

Like present Chaminade High, founded in 1952, the new school will be conducted by the Society of Mary (Marianists). The groundbreaking will coincide with Founder's Day, anniversary of the death of Fr. William Joseph Chaminade, founder of the Marianists.

Brother James Wipfield, S.M., provincial treasurer, will be guest speaker, and Fr. William O'Connell, S.M., will bless the site. Brother Vincent Steele, S.M., Chaminade principal, will be master of ceremonies.

Classes at the new location are scheduled to begin in September 1961. Fred E. Potts will be the builder.

The Tidings, January 20, 1961

Chaminade Groundbreak Ceremonies Slated Sunday

Chaminade Preparatory will hold the groundbreaking ceremony for the new school building Sunday at 2:30 p.m. at Woodlake Ave. and Cohasset St. in Canoga Park.

The ceremony will commemorate the Founder's Day, the anniversary date of the death of Father William Joseph Chaminade, founder of the Society of Mary (Marianists).

Brother James Wipfield SM, provincial treasurer of the Marianists' Pacific Province will be guest speaker.

Guests Scheduled

The invocation will be given by the Rev. J. J. Hurley, pastor of Our Lady of the Valley, and the Rev. William O'Connell SM will bless the ground. Chaminade principal Brother Vincent Steele SM will act as the master of ceremonies for the event.

Special guests of honor include stage, screen and television star Francis Lederer, honorary mayor of Canoga Park, and Third District Councilman Patrick McGee. Chaminade Fathers' Club president John Russell Jr. and Mothers' Club president Mrs. Robert McMahon also will officiate.

Chaminade High School, a boys high school, now located at 2500 S. Beverly Drive in Cheviot Hills, will move to Canoga Park in June.

Policy Continued

Classes at the new location, under the new name Chaminade Preparatory, will begin in September 1961.

A full college preparatory curriculum, with a continuation of the present Chaminade policies and philosophies, will be offered.

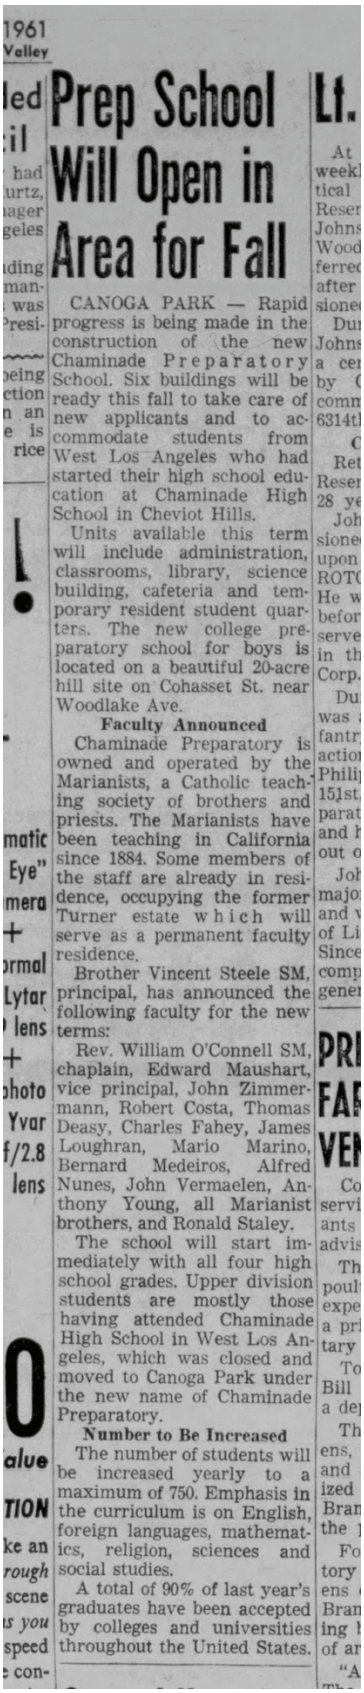
The usual extra-curricular activities including speech, drama, intra-murals and interscholastic athletics, will be in keeping with the college orientated program, continuing the policies set up with the founding of Chaminade High School in 1952.

Brother John Perko SM, now at St. Louis High School, Honolulu, Hawaii, founder of Chaminade — Cheviot Hills — was the principal prior to Brother Steele, who is the present administrative Chaminade High School head.

Library Included

The new buildings, a portion of which will be finished for the 1961-62 school year have been designed by architects Barker and Ott, AIA.

These will include administration building, library, classrooms and science labs, and an all purpose room and activity-project rooms. A faculty house and swimming pool are already available.



In keeping with the high standards and progressive approach, all classrooms and buildings will be air-conditioned and equipped for closed television. The builder is Fred E. Potts.

Public Is Invited

Future buildings for the new campus will include chapel, auditorium, cafeteria, gymnasium, resident hall for students and faculty building. Eventual capacity will be 750 students.

The public is invited to join the Marianists and lay faculty, the students and their parents, at the groundbreaking ceremonies.

The Van Nuys News and Valley Green Sheet, January 20, 1961

1961
Valley

Prep School Will Open in Area for Fall

CANOGA PARK — Rapid progress is being made in the construction of the new Chaminade Preparatory School. Six buildings will be ready this fall to take care of new applicants and to accommodate students from West Los Angeles who had started their high school education at Chaminade High School in Cheviot Hills.

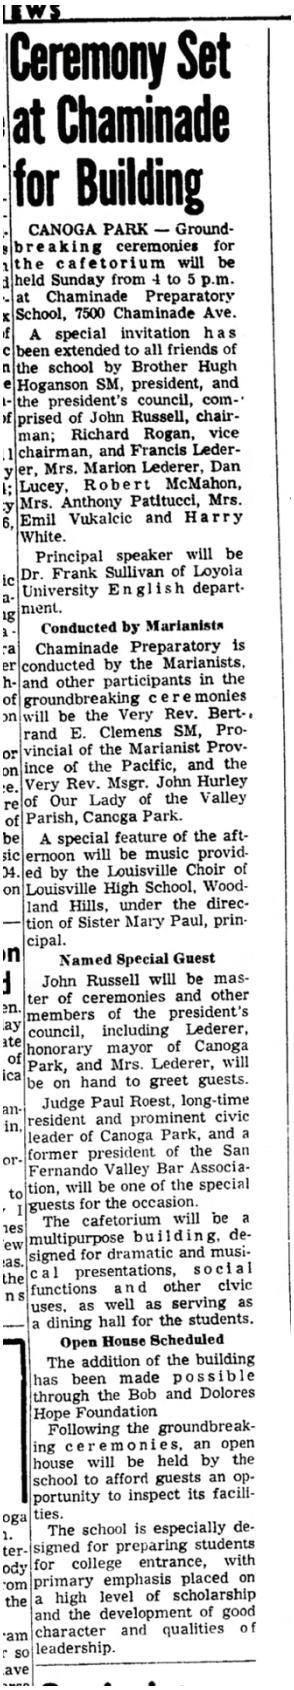
Units available this term will include administration, classrooms, library, science building, cafeteria and temporary resident student quarters. The new college preparatory school for boys is located on a beautiful 20-acre hill site on Cohasset St. near Woodlake Ave.

Faculty Announced

Chaminade Preparatory is owned and operated by the Marianists, a Catholic teaching society of brothers and priests. The Marianists have been teaching in California since 1884. Some members of the staff are already in residence, occupying the former Turner estate which will serve as a permanent faculty residence.

Brother Vincent Steele SM, principal, has announced the following faculty for the new terms:

Rev. William O'Connell SM, chaplain, Edward Maushart, vice principal, John Zimmermann, Robert Costa, Thomas Deasy, Charles Fahey, James Loughran, Mario Marino, Bernard Medeiros, Alfred Nunes, John Vermaelen, Anthony Young, all Marianist brothers, and Ronald Staley.



The school will start immediately with all four high school grades. Upper division students are mostly those having attended Chaminade High School in West Los Angeles, which was closed and moved to Canoga Park under the new name of Chaminade Preparatory.

Number to Be Increased

The number of students will be increased yearly to a maximum of 750. Emphasis in the curriculum is on English, foreign languages, mathematics, religion, sciences and social studies.

A total of 90% of last year's graduates have been accepted by colleges and universities throughout the United States.

The Van Nuys News and Valley Green Sheet, August 17, 1961

Ceremony Set at Chaminade for Building

CANOGA PARK — Groundbreaking ceremonies for the cafetorium will be held Sunday from 4 to 5 p.m. at Chaminade Preparatory School, 7500 Chaminade Ave.

A special invitation has been extended to all friends of the school by Brother Hugh Hoganson SM, president, and the president's council, comprised of John Russell, chairman; Richard Rogan, vice chairman, and Francis Lederer, Mrs. Marion Lederer, Dan Lucey, Robert McMahon, Mrs. Anthony Patitucci, Mrs. Emil Vukalcic and Harry White.

Principal speaker will be Dr. Frank Sullivan of Loyola University English department.

Conducted by Marianists

Chaminade Preparatory is conducted by the Marianists, and other participants in the groundbreaking ceremonies will be the Very Rev. Bertrand E. Clemens SM, Provincial of the Marianist Province of the Pacific, and the Very Rev. Msgr. John Hurley of Our Lady of the Valley Parish, Canoga Park.

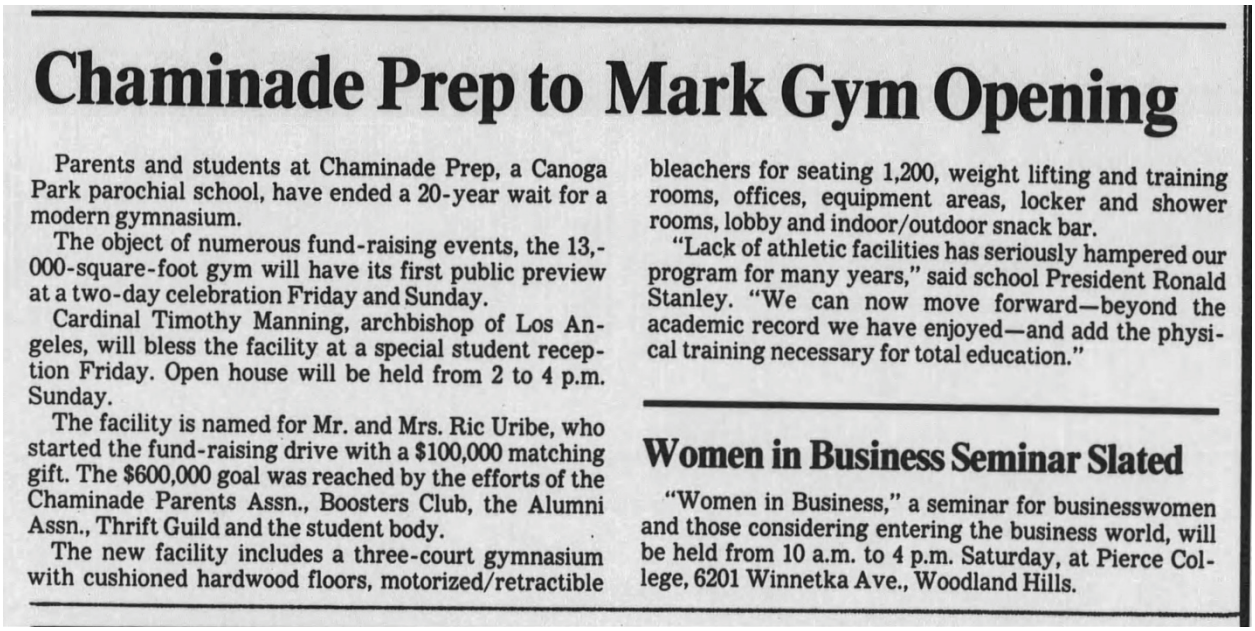
A special feature of the afternoon will be music provided by the Louisville Choir of Louisville High School, Woodland Hills, under the direction of Sister Mary Paul, principal.

Named Special Guest

John Russell will be master of ceremonies and other members of the president's council, including Lederer, honorary mayor of Canoga Park, and Mrs. Lederer, will be on hand to greet guests.

Judge Paul Roest, long-time resident and prominent civic leader of Canoga Park, and a former president of the San Fernando Valley Bar Association, will be one of the special guests for the occasion.

The cafetorium will be a multipurpose building, designed for dramatic and musical presentations, social functions and other civic uses, as well as serving as a dining hall for the students.



Open House Scheduled

The addition of the building has been made possible through the Bob and Dolores Hope Foundation

Following the groundbreaking ceremonies, an open house will be held by the school to afford guests an opportunity to inspect its facilities.

The school is especially designed for preparing students for college entrance, with primary emphasis placed on a high level of scholarship and the development of good character and qualities of leadership.

Valley News, October 16, 1964

Chaminade Prep to Mark Gym Opening

Parents and students at Chaminade Prep, a Canoga Park parochial school, have ended a 20-year wait for a modern gymnasium.

The object of numerous fund-raising events, the 13,-000-square-foot gym will have its first public preview at a two-day celebration Friday and Sunday.

Cardinal Timothy Manning, archbishop of Los Angeles, will bless the facility at a special student reception Friday. Open house will be held from 2 to 4 p.m. Sunday.

The facility is named for Mr. and Mrs. Ric Uribe, who started the fund-raising drive with a $100,000 matching gift. The $600,000 goal was reached by the efforts of the Chaminade Parents Assn., Boosters Club, the Alumni Assn., Thrift Guild and the student body.

The new facility includes a three-court gymnasium with cushioned hardwood floors, motorized/retractible bleachers for seating 1,200, weight lifting and training rooms, offices, equipment areas, locker and shower rooms, lobby and indoor/outdoor snack bar.

"Lack of athletic facilities has seriously hampered our program for many years," said school President Ronald Stanley. "We can now move forward—beyond the academic record we have enjoyed—and add the physical training necessary for total education."

Women in Business Seminar Slated

"Women in Business," a seminar for businesswomen and those considering entering the business world, will be held from 10 a.m. to 4 p.m. Saturday, at Pierce College, 6201 Winnetka Ave., Woodland Hills.

Los Angeles Times, April 30, 1981

Unless a shorter period of time has been established by an official action, plan check approval expires one and a half years after the plan check fee has been paid. This permit expires two years after the building permit fee has been paid or 180 days after the fee has been paid and construction has not commenced or if work is suspended, discontinued or abandoned for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by the Dept. of Building & Safety (Sec. 22.12 & 22.13 LAMC).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. The following applies to B contractors only: I understand the limitations of Section 7057 related to my ability to take prime contracts or subcontracts involving specialty trades. (For 1 or 2 family dwellings, use the declaration attachment if separate general, electrical, plumbing, and/or HVAC contractor's & workers' comp. declarations are desired.)

License Class B Lic. No. 608743 Print: X REED LAWRENCE Sign: X Reed Lawrence

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations.

☐ I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

☒ I have and will maintain workers's compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: X LEGION INSURANCE Policy Number: X WC 1122681

☐ I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

Sign: X Reed Lawrence Date: X 8/10/00 ☐ Contractor ☒ Authorized Agent ☐ Owner

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES

19. CONSTRUCTION LENDING AGENCY

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).

Lender's name: _____ Lender's address: _____

20. ASBESTOS REMOVAL

Notification of asbestos removal: ☒ Is not applicable ☐ Letter was sent to the AQMD or EPA Sign: X Reed Lawrence Date: X 8/10/00

21. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors License Law for the following reason (Section 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 commencing with Sec. 7000 of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale)

☐ I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

☐ I am exempt under Sec. _____, Bus. & Prof. Code for the following reason: _____

Print: _____ Sign: _____ Date: / / ☐ Owner ☐ Authorized Agent

22. FINAL DECLARATION

I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein. Also that it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, that neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

PERMIT EXPIRATION

This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by the Dept. of Building & Safety (Sec. 22.12 & 22.13 LAMC).

17. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the following reason (Section 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

(__) I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale).

OR

(X) I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(__) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(__) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier:_____ Policy Number:_____

(X) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION

I certify that notification of asbestos removal is either not applicable or was sent to the AQMD or EPA as per section 19827.5 of the Health and Safety Code.

20. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Owner-Builder Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration and Final Declaration; and

(2) This permit is being obtained with the consent of the legal owner of the property.

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. The following applies to B contractors only: I understand the limitations of Section 7057 of the Business and Professional Code related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class: B Lic. No.: 865616 Contractor: E P I CONSTRUCTION INC

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

( ) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(X) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: Kemper Employers Ins. Co. Policy Number: BB1093191

( ) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. CONSTRUCTION LENDING AGENCY DECLARATION

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).
Lender's name (if any): _____ Lender's address: _____

21. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Licensed Contractor's Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning, Construction Lending Agency Declaration and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

21. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors License Law for the following reason (Section 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 commencing with Sec. 7000 of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

X I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale)

☐ I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

☐ I am exempt under Sec. _____ Bus. & Prof. Code for the following reason: _____

X Print: RICHARD S. LEACH Sign: _____ Date: 7,22,97 ☐ Owner ☒ Authorized Agent

22. FINAL DECLARATION

I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein. Also that it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, that neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

Unless a shorter period of time has been established by an official action, plan check approval expires one and a half years after the fee has been paid. This permit expires two years after the fee has been paid or 180 days after the fee has been paid and construction has not commenced; or if work is suspended, discontinued or abandoned for a continuous period of 180 days (Sec. 98.0603 L.A.M.C.). Claims for refund of fees paid on permits must be filed within one year from the date of expiration for building permits granted by the Department of Building and Safety (Sec. 22.12 & 22.13 L.A.M.C.).

☐ I declare that notification of Asbestos Removal is not applicable ☐ I declare that a notification letter has been sent to the AQMD or EPA Sign _____ Date _____

4 OWNER-BUILDER DECLARATION

I hereby affirm, under penalty of perjury that I am exempt from the Contractors License Law for the following reason (Sec. 7031.5, Business & Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chap. 9 commencing with Sec. 7000 of Div. 3 of the Business & Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Sec. 7031.5 by any applicant for a permit, subjects the applicant to a civil penalty of not more than five hundred dollars ($500):

☐ I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to the owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he or she did not intend to improve for the purpose of sale.)

☒ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

☐ I am exempt under Sec. _____ Bus. & Prof. Code for the following reason _____

Print RICHARD S. LEACH Sign _____ Date 7/6/95 ☒ OWNER ☐ AUTHORIZED AGENT

5 FINAL DECLARATION

I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein. Also, that it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, that neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed.

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

15. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date _____ Lic. Class _____ Lic. No. _____ Contractor's Signature _____

Contractor's Mailing Address _____

OWNER-BUILDER DECLARATION

16. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☒ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____ B. & P. C. for this reason _____

Date 5-4-88 Owner's Signature James A. DeHart

WORKERS' COMPENSATION DECLARATION

17. I hereby affirm that I have a certificate of consent to self-insure, or a certificate of Workers' Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. _____ Insurance Company _____

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Los Angeles City Dept. of Bldg. & Safety.

Date _____ Applicant's Signature _____

Applicant's Mailing Address _____

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

18. I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws of California.

Date 5-4-88 Applicant's Signature James A. DeHart

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

19. I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____

Lender's Address _____

20. I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes.

I realize that this permit is an application for inspection, that it does not approve or authorize the work specified herein, that it does not authorize or permit any violation or failure to comply with any applicable law, that neither the city of Los Angeles nor any board, department, officer or employee thereof make any warranty or shall be responsible for the performance or results of any work described herein or the condition of the property or soil upon which such work is performed. (See Sec. 91.0202 LAMC)

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

15. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date _____ Lic. Class _____ Lic. No. _____ Contractor's Signature _____

Contractor's Mailing Address _____

OWNER-BUILDER DECLARATION

16. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

X I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____ B. & P. C. for this reason _____

Date 6-16-92 Owner's Signature James A. DeLong

WORKERS' COMPENSATION DECLARATION

17. I hereby affirm that I have a certificate of consent to self-insure, or a certificate of Worker's Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. _____ Insurance Company _____

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Los Angeles City Dept. of Bldg. & Safety.

Date _____ Applicant's Signature _____

Applicant's Mailing Address _____

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

18. I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws of California.

Date 6-16-92 Applicant's Signature James A. DeLong

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

19. I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____

Lender's Address _____

20. I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes.

I realize that this permit is an application for inspection, that it does not approve or authorize the work specified herein, that it does not authorize or permit any violation or failure to comply with any applicable law, that neither the city of Los Angeles nor any board, department, officer or employee thereof make any warranty or shall be responsible for the performance or results of any work described herein or the condition of the property or soil upon which such work is performed. (See Sec. 91.0202 LAMC)

PERMIT EXPIRATION

This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by the Dept. of Building & Safety (Sec. 22.12 & 22.13 LAMC).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. If doing work on a residential property, I certify that I hold a valid certification as a Home Improvement contractor per Business and Professions Code, Section 7150.2c. The following applies to B contractors only: I understand the limitations of Section 7057 of the Business and Professional Code related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class:_____ Lic. No.:_____ Contractor:_____

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(_) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(X) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier:_____ Policy Number:_____

(_) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION

I certify that notification of asbestos removal is either not applicable or was sent to the AQMD or EPA as per section 19827.5 of the Health and Safety Code.

20. CONSTRUCTION LENDING AGENCY DECLARATION

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).

Lender's name (if any):_____ Lender's address:_____

21. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Licensed Contractor's Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration, Construction Lending Agency Declaration and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. The following applies to B contractors only: I understand the limitations of Section 7057 of the Business and Professional Code related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class: B Lic. No.: 739378 Contractor: VALLEY COMMERCIAL CONTRACTORS L P

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(__) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(X) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: State Comp. Ins. Fund Policy Number: 044-0025874

(__) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead

20. CONSTRUCTION LENDING AGENCY DECLARATION

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).
Lender's name (if any): Lender's address:

21. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Licensed Contractor's Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning, Construction Lending Agency Declaration and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

(E) SIMPSON, JAMES THOMAS	4091 RIVERSIDE DR 114,	CHINO, CA 91710		S3602	

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951)

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. The following applies to B contractors only: I understand the limitations of Section 7057 of the Business and Professional Code related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class: B License No.: 885375 Contractor: LOFTIN CONSTRUCTION INC

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

( ) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(X) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: TBD Policy Number: AWL0025801

( ) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is available at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead

20. CONSTRUCTION LENDING AGENCY DECLARATION

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).

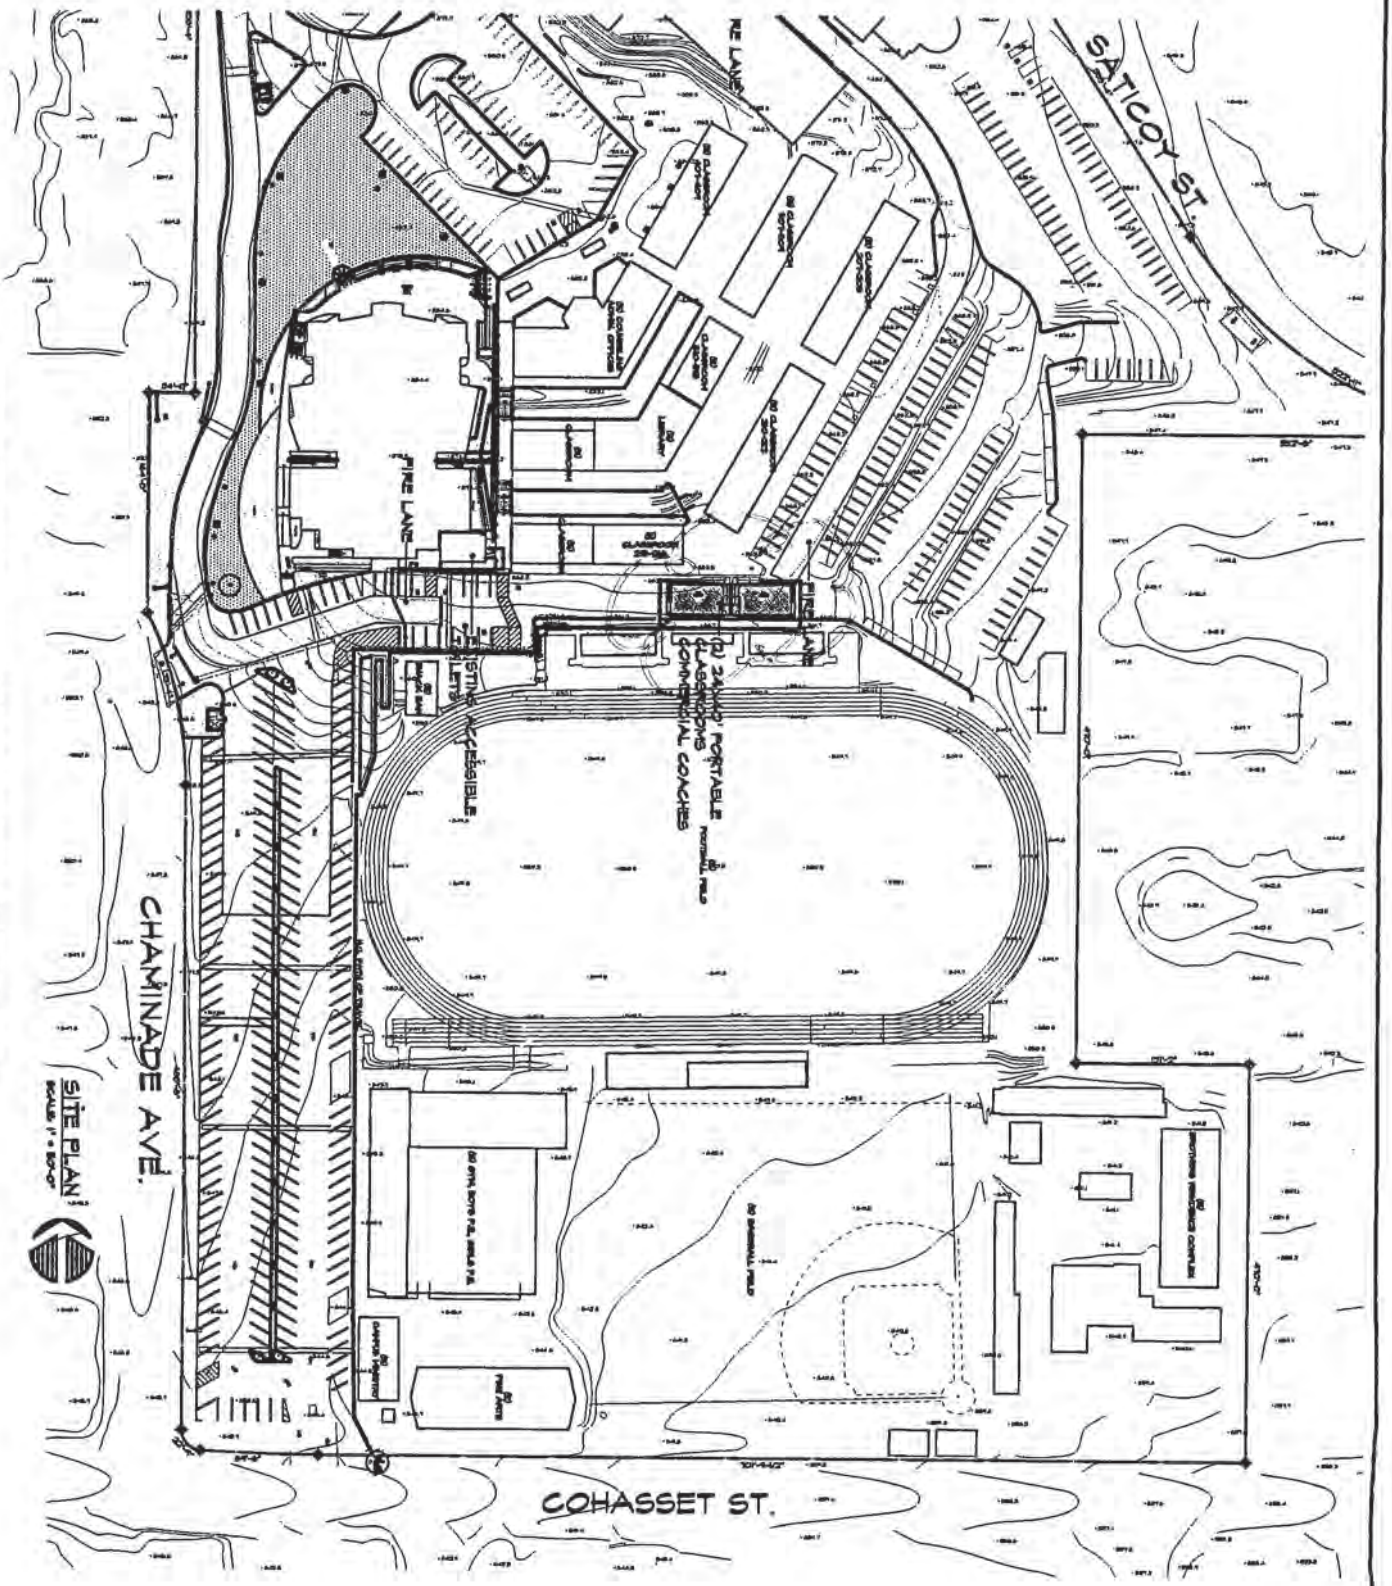
Lender's Name (If Any): Lender's Address:

21. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Licensed Contractor's Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning, Construction Lending Agency Declaration, and Final Declaration; and



(2) This permit is being obtained with the consent of the legal owner of the property.

Notification of asbestos removal: ☐ Is not applicable ☐ Letter was sent to the AQMD or EPA Sign: _____ Date: ___/___/___

21. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors License Law for the following reason (Section 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 commencing with Sec. 7000 of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

X I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale)

☐ I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

☐ I am exempt under Sec. _____ Bus. & Prof. Code for the following reason: _____

X Print: RICHARD S. LEACH Sign: _____ Date: 7,22,97 ☐ Owner ☒ Authorized Agent

22. FINAL DECLARATION

I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein. Also that it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, that neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

16. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date 2-1-80 Lic. Class B-1 Lic. No. 36 9043 Contractor Dyer Bros. Constr.

Contractor's Mailing Address 1223 So. Baldwin Ave Arcadia CA. 91006

OWNER-BUILDER DECLARATION

17. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____ B. & P. C. for this reason _____

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

16. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date 5/3/89 Lic. Class B Lic. Number 308470 Contractor _____ (Signature)

OWNER-BUILDER DECLARATION

17. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____, B. & P. C. for this reason _____

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

16. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date _____ Lic. Class _____ Lic. Number _____ Contractor: _____ (Signature)

OWNER-BUILDER DECLARATION

17. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☒ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____, B. & P. C. for this reason. _____

Date 8/7/89 Owner's Signature Nabeel B. Saoud

WORKERS' COMPENSATION DECLARATION

18. I hereby affirm that I have a certificate of consent to self-insure, or a certificate of Worker's Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. _____ Insurance Company _____

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Los Angeles City Dept. of Bldg. & Safety.

Date _____ Applicant's Signature _____

Applicant's Mailing Address _____

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

19. I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws of California.

Date 8/7/89 Applicant's Signature Nabeel B. Saoud

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

20. I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____ Lender's Address _____

21. I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes.

I realize that this permit is an application for inspection, that it does not approve or authorize the work specified herein, that it does not authorize or permit any violation or failure to comply with any applicable law, that neither the city of Los Angeles nor any board, department, officer or employee thereof make any warranty or shall be responsible for the performance or results of any work described herein or the condition of the property or soil upon which such work is performed. (See Sec. 91.0202 LAMC)

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

19. I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws of California.

X Date 10-13-89 Applicant's Signature Michael Buffum

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

20. I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____ Lender's Address _____

21. I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes.

I realize that this permit is an application for inspection, that it does not approve or authorize the work specified herein, that it does not authorize or permit any violation or failure to comply with any applicable law, that neither the city of Los Angeles nor any board, department, officer or employee thereof make any warranty or shall be responsible for the performance or results of any work described herein or the condition of the property or soil upon which such work is performed. (See Sec. 91.0202 LAMC)

OWNER-BUILDER DECLARATION

20. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

In the event that any box (i.e. 1-16) is filled to capacity , it is possible that additional information has been captured electronically and could not be printed due to space restrictions. Nevertheless the information printed exceeds that required by section 19825 of the Health and Safety Code of the State of California.

15. BUILDING RELOCATED FROM:

16. CONTRACTOR, ARCHITECT & ENGINEER NAME	ADDRESS		CLASS	LICENSE #	PHONE #
(A) MCDONOUGH, MICHELE MARIE	2424 FIFTH AVENUE,	LOS ANGELES, CA 90018		C25320	
(E) MERCADO, LIZANDRO	30403 NORTH MALLORCA PL,	CASTAIC, CA 91384		S4331	
(O) OWNER-BUILDER				0	

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inpection within 60 days of receiving a request for final inspection (HS 17951).

17. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the following reason (Section 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that h or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

(_) I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or imrove for the purpose of sale).

OR

(_) I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(_) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(_) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: _____ Policy Number: _____

(_) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is available at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Owner-Builder Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration/ Lead Hazard Warning, and Final Declaration; and

(2) This permit is being obtained with the consent of the legal owner of the property.

TECHNICAL MEMORANDUM

To: Stacie Henderson
CAJA Environmental Services, LLC
15350 Sherman Way, Suite 315
Van Nuys, California 91406

From: Rafaella Lisboa, Project Manager

Date: March 9, 2023

Re: **Archaeological Resources Assessment for the Proposed Chaminade College Preparatory High School Project, West Hills, California / SWCA Project No. 067816**

INTRODUCTION

CAJA Environmental Services, LLC (CAJA), retained SWCA Environmental Consultants (SWCA) to conduct an archaeological resources assessment for the proposed Chaminade College Preparatory High School Project (project), located in the West Hills neighborhood of the city of Los Angeles, California. The study was carried out to identify the presence of archaeological resources on the project site and assess the potential for encountering undocumented archaeological resources as a result of project implementation. In accordance with the approved scope of work, built architectural resources are not addressed.

The proposed project will expand and update the school campus with a total lot area of approximately 25.86 acres, including a new three-story school building, updated parking areas, remodeled athletic fields, new student quads, and renovated classrooms and offices on the existing campus (located on approximately 21.03 acres at 7500 Chaminade Avenue, 23241 Cohasset Street, and 23260 Saticoy Street; "Main Campus"), an expanded school campus to include approximately 4.83 acres located across Saticoy Street at 23217–23255 Saticoy Street and 7619–7629 Woodlake Avenue proposed for new athletic and parking facilities (new "North Campus"), and a new pedestrian bridge across Saticoy Street ("pedestrian bridge"). This memorandum summarizes the environmental and cultural context for the project and its vicinity, presents the results of background research conducted through the California Historical Resources Information System (CHRIS) and additional archival sources, provides findings with regard to potential archaeological constraints, and offers recommendations for future work based on the findings. Since the project site is fully paved, landscaped, or otherwise developed, thereby obscuring the original ground surface, an archaeological resources survey was not conducted as part of this study. The studies were conducted in accordance with the California Environmental Quality Act (CEQA), with the City of Los Angeles (City) as lead agency.

This archaeological resources assessment was prepared by Project Manager Rafaella Lisboa, M.A., RPA, who conducted background research and authored the report, under the direction of Principal Investigator Michael Bever, Ph.D., RPA, who meets the Secretary of the Interior's Professional Qualifications Standards (PQS) for archaeology.

PROJECT DESCRIPTION

The project consists of changing the existing Main Campus and adding a new North Campus. The changes to the Main Campus include a partial demolition of existing surface parking lots, demolition of approximately 32,204 square feet of existing classroom buildings, including the removal of existing portable buildings, and the addition of approximately 60,760 square feet of new floor area to include a new administrative, multi-purpose and classroom building, renovation of existing offices, and the addition of electric vehicle (EV) parking and charging stations within most existing surface parking lots.

The project also involves the expansion of the high school to the North Campus on the north side of Saticoy Street, including the demolition of the existing structures on site totaling approximately 58,706 square feet and the existing surface parking lot. The expansion to the North Campus includes the development of approximately 8,494 square feet of floor area within a proposed athletic field pool house, locker rooms, and proposed building to house restrooms and concessions. The balance of the North Campus site will include a proposed new soccer and baseball field, a new pool and two new surface parking lots. The maximum depth of excavation within the Main Campus area is 8 feet; the North Campus area will be excavated to a maximum depth of 20 feet below surface.

A new pedestrian bridge will be constructed to span Saticoy Street, connecting the North Campus to the Main Campus. The pedestrian bridge will have access at the surface parking lot of the North Campus and the new main entrance to the high school on the Main Campus. In addition, new fencing and vehicular gates, to be located along the northeast drive aisle, parent drop-off along Chaminade Avenue, and the easternmost access along Cohasset Street, will be provided on the Main Campus to complete the perimeter security. New 10-foot-high ornamental fencing will be provided around the perimeter of the North Campus.

New construction on the Main Campus includes a multistory building at the main entrance that will include administrative offices, counseling offices, a library, a multi-purpose room, classrooms, and laboratories. The existing single-story administrative office buildings at the southeast corner of the Main Campus will undergo renovation but will not increase in floor area or height. A new surface parking lot will be constructed in place of the existing paved driveway adjacent to the single-story office building at the southeast corner of the Main Campus. Finally, additional improvements to the Main Campus will include minor demolition and resurfacing of the existing baseball field along Cohasset Street, to be reutilized as a softball field, and the removal and resurfacing of the north surface parking lot to create a new landscaped quad area adjacent to the new administrative building.

Improvements to the North Campus include a baseball field, practice soccer fields, swimming pool, associated facilities, and surface parking. The baseball and soccer fields are inclusive of 40-foot-high safety netting along a portion of the outfield perimeter; a 26-foot-high electric scoreboard located in left-center field facing Saticoy Street; single-story locker rooms, batting cages, and bull pens located along the first and third base-lines; bleachers providing approximately 350 seats and a shade structure reaching 19 feet in height are located behind home plate; and an approximately 100-square-foot press box located between the home and visiting seating sections. Eight stadium light standards ranging in height from 70 to 90 feet are proposed, with the 70-foot light standards located along the perimeter of left and right field and the 80- and 90-foot light standards along Saticoy Street and adjacent to the new surface parking lot. To the west of the baseball field, a 1,540-square-foot single story concession and restroom building (16 feet in height), a 95-stall surface parking lot, and entrance to the pedestrian bridge are proposed.

To the east of the baseball field, an in ground pool with four 40-foot-tall light standards, a single-story (19-foot-high), 6,094-square-foot athletic field and pool house, and 19 surface parking stalls is proposed. There are currently four ingress/egress points along Saticoy Street which will be reduced to the two

access points for this project. There are currently two ingress/egress points along Woodlake Avenue, which will be reduced to one ingress/egress driveway at the approximate location of the existing north access point.

PROJECT LOCATION

The project site comprises five parcels. This includes 7500 Chaminade Avenue (Assessor's Parcel Numbers [APNs] 2027-005-002 and -009), which contains the high school campus (the Main Campus). The proposed project will develop another property designated as the North Campus, which is located at the northwest corner of Saticoy Street and Woodlake Avenue, at 23255 Saticoy Street, 7629 Woodlake Avenue, and 7621 Woodlake Avenue (APNs 2027-005-005, -006, and -007). Combined, the Main Campus and proposed North Campus total approximately 25.9 acres. The proposed North Campus is currently developed with a multi-tenant mini shopping center and surface parking lot, built between 1962 to 1964 (Figure A-1 in Appendix A). The project site is in Section 35, Township 2 North, Range 17 West, and is plotted on the U.S. Geological Survey (USGS) Calabasas, California, quadrangle (Figure A-2 in Appendix A).

REGULATORY SETTINGS

State Regulations

The California Office of Historic Preservation (OHP), a division of the California Department of Parks and Recreation (DPR), is responsible for carrying out the duties described in the California Public Resources Code (PRC) and maintaining the California Historic Resources Inventory and California Register of Historical Resources (CRHR). The state-level regulatory framework also includes CEQA, which requires the identification and mitigation of substantial adverse impacts that may affect the significance of eligible historical and archaeological resources.

California Environmental Quality Act

CEQA requires a lead agency to analyze whether historic or archaeological resources may be adversely impacted by a proposed project. Under CEQA, a "project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment" (PRC 21084.1). Answering this question is a two-part process. First, the determination must be made as to whether the proposed project involves cultural resources. Second, if cultural resources are present, the proposed project must be analyzed for a potential "substantial adverse change in the significance" of the resource.

HISTORICAL RESOURCES

According to Section 15064.5 of the CEQA Guidelines, for the purposes of CEQA, historical resources are defined as follows:

- A resource listed in, or formally determined eligible . . . for listing in the [CRHR] (PRC 5024.1, Title 14 California Code of Regulations [CCR], Section 4850 et seq.).
- A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the [PRC] or identified as significance in a historic resources survey meeting the requirements of Section 5024.1(g) of the [PRC].
- Any object, building, structure, site, area, place, record, or manuscript that the lead agency determines to be eligible for national, state, or local landmark listing; generally, a resource shall

> be considered by the lead agency to be historically significant (and therefore a historic resource under CEQA) if the resource meets the criteria for listing in the [CRHR] (as defined in PRC Section 5024.1, Title 14 CCR, Section 4852).

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity (as defined above) does not meet National Register of Historic Places (NRHP) criteria may still be eligible for listing in the CRHR.

According to CEQA, the fact that a resource is not listed in or determined eligible for the CRHR or is not included in a local register or survey shall not preclude the lead agency from determining that the resource may be a historical resource (PRC 5024.1). Pursuant to CEQA, a project with an effect that may cause a substantial adverse change in the significance of a historical resource may have a significant effect on the environment (CEQA Guidelines, Section 15064.5[b]).

ARCHAEOLOGICAL RESOURCES

In terms of archaeological resources, PRC 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
- Has a special and particular quality such as being the oldest of its type or the best available example of its type.
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If it can be demonstrated that a proposed project will cause damage to a unique archaeological resource, the lead agency may require that reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC 21083.2[a]–[c]). CEQA notes that if an archaeological resource is neither a unique archaeological resource nor a historical resource, the effects of the project on those resources shall not be considered to be a significant effect on the environment (CEQA Guidelines, Section 15064.5[c][4]).

California Register of Historical Resources

Created in 1992 and implemented in 1998, the CRHR is “an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state’s historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change” (PRC 21083.2 and 21084.1). Certain properties, including those listed in or formally determined eligible for the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historical resources surveys, or designated by local landmarks programs, may be nominated for inclusion in the CRHR. According to PRC 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

- **Criterion 1:** It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- **Criterion 2:** It is associated with the lives of persons important in our past.
- **Criterion 3:** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- **Criterion 4:** It has yielded, or may be likely to yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity does not meet NRHP criteria may still be eligible for listing in the CRHR.

Treatment of Human Remains

The disposition of burials falls first under the general prohibition on disturbing or removing human remains under California Health and Safety Code (CHSC) Section 7050.5. More specifically, remains suspected to be Native American are treated under CEQA at CCR Section 15064.5; PRC Section 5097.98 illustrates the process to be followed in the event that remains are discovered. If human remains are discovered during construction, no further disturbance to the site shall occur, and the County Coroner must be notified (CCR 15064.5 and PRC 5097.98).

Local Regulations

Los Angeles Historic-Cultural Monuments

Local landmarks in the City of Los Angeles are known as Historic-Cultural Monuments (HCMs) and are under the aegis of the City of Los Angeles Planning Department, Office of Historic Resources (OHR). An HCM, monument, or local landmark is defined in the Cultural Heritage Ordinance as follows:

> Historic-Cultural Monument (Monument) is any site (including significant trees or other plant life located on the site), building or structure of particular historic or cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified; or which is identified with historic personages or with important events in the main currents of national, State or local history; or which embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age (Municipal Code Section 22.171.7).

City of Los Angeles General Plan

The Conservation Element of the City of Los Angeles General Plan recognizes paleontological resources in Section 3: "Archaeological and Paleontological" (II-3) and identifies protection of paleontological resources as an objective (II-5). The General Plan identifies site protection as important, stating, "Pursuant to CEQA, if a land development project is within a potentially significant paleontological area, the developer is required to contact a bona fide paleontologist to arrange for assessment of the potential impact and mitigation of potential disruption of or damage to the site. If significant paleontological resources are uncovered during project execution, authorities are to be notified and the designated paleontologist may order excavations stopped, within reasonable time limits, to enable assessment, removal or protection of the resources" (City of Los Angeles 2001).

City of Los Angeles CEQA Thresholds of Significance

The City of Los Angeles' CEQA Thresholds of Significance Guide (City of Los Angeles 2006) Section D:1 specifies that the determination of significance for paleontological resources shall be made on a case-by-case basis, taking into consideration the following factors:

- Whether, or the degree to which, the project might result in the permanent loss of, or loss of access to, a paleontological resource; and
- Whether the paleontological resource is of regional or statewide significance (City of Los Angeles 2006).

SETTING

Environmental Setting

The project site is located in the West Hills neighborhood of the City, situated in the western portion of the San Fernando Valley. The project site is within a highly developed and urbanized area bordered by the Simi Hills to the west, Chatsworth to the north, Canoga Park to the east, and U.S. Route 101 to the south (Figure A-3 in Appendix A). The immediate vicinity of the project site is characterized primarily by residential properties. Geographically, the project site is located 4 miles north of the Santa Monica Mountains and 2 miles southwest of Chatsworth Reservoir, which is formed on the eastern margin of the Simi Hills. The project site is situated on a relatively flat, alluvial plain with a slight southern aspect at an elevation of approximately 255 meters (m) (837 feet) above mean sea level. The surficial geology of the site has been identified as late to middle Pleistocene old alluvial fan deposits, undivided (Qof) and late Miocene Modelo Formation, undivided (Tm). According to the paleontological resources study conducted for this project, the depth to the underlying, previously undisturbed sediments is unknown, but likely very shallow (e.g., 3 feet below ground surface) (Carson 2022). Historical topographic maps show two intermittent streams in the vicinity of the project site: Dayton Creek approximately 0.6 miles to the north, and Bell Creek approximately 0.7 mile to the south. Dayton Creek connects to Chatsworth Creek, which is located approximately 0.7 mile east of the project site. Both Chatsworth and Bell Creeks connect to the south-flowing Los Angeles River, currently located approximately 2.1 miles southeast of the project site (Figure A-4 in Appendix A).

CULTURAL SETTING

Prehistoric Period

In the past several decades, researchers have devised numerous prehistoric chronological sequences to aid in understanding cultural changes in southern California. Building on early studies and focusing on data synthesis, Wallace (1955, 1978) developed a prehistoric chronology for the southern California coastal region that is still widely used today and is applicable to near-coastal and many inland areas. Four horizons are presented in Wallace's prehistoric sequence: Early Man, Milling Stone, Intermediate, and Late Prehistoric. Although Wallace's 1955 synthesis initially lacked chronological precision due to a paucity of absolute dates (Moratto 1984:159), this situation has been alleviated by the availability of thousands of radiocarbon dates obtained by southern California researchers in the last three decades (Byrd and Raab 2007:217). Given this, several revisions were subsequently made to Wallace's 1955 synthesis using radiocarbon dates and projectile point assemblages (e.g., Koerper and Drover 1983; Koerper et al. 2002; Mason and Peterson 1994). The summary of prehistoric chronological sequences for southern California coastal and near-coastal areas presented below is a composite of information in Wallace (1955) and Warren (1968), as well as later studies, including Koerper and Drover (1983).

Horizon I: Early Man (ca. 10,000–6000 B.C.)

The earliest accepted dates for archaeological sites on the southern California coast are from two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area ca. 10,000 years ago (Erlandson 1991:105). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to ca. 13,000 years ago (Johnson et al. 2002). Present-day Orange and San Diego Counties contain several sites dating from 9,000 to 10,000 years ago (Byrd and Raab 2007:219; Macko 1998:41; Mason and Peterson 1994:55–57; Sawyer and Koerper 2006). Although the dating of these finds remains controversial, several sets of human remains from the Los Angeles Basin (e.g., "Los Angeles Man," "La Brea Woman," and the Haverty skeletons) apparently date to the middle Holocene, if not earlier (Brooks et al. 1990; Erlandson et al. 2007:54).

Recent data from Horizon I sites indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002) and a greater emphasis on large-game hunting inland.

Horizon II: Milling Stone (6000–3000 B.C.)

Set during a drier climatic regime than the previous horizon, the Milling Stone horizon is characterized by subsistence strategies centered on collecting plant foods and small animals. The importance of seed processing is apparent in the dominance of stone grinding implements in contemporary archaeological assemblages, namely milling stones (metates) and hand stones (manos). Recent research indicates that Milling Stone horizon food procurement strategies varied in both time and space, reflecting divergent responses to variable coastal and inland environmental conditions (Byrd and Raab 2007:220).

Horizon III: Intermediate (3000 B.C.–A.D. 500)

The Intermediate horizon is characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. An increasing variety and abundance of fish, land mammal, and sea mammal remains are found in sites from this horizon along the California coast. Related chipped stone tools suitable for hunting are more abundant and diversified, and shell fishhooks became part of the toolkit during this period. Mortars and pestles became more common during this period, gradually replacing manos and metates as the dominant milling equipment and signaling a shift away from the processing and consuming of hard seed resources to the increasing importance of the acorn (e.g., Glassow et al. 1988; True 1993).

Horizon IV: Late Prehistoric (A.D. 500–Spanish contact)

In the Late Prehistoric horizon, there was an increase in the use of plant food resources in addition to an increase in land and sea mammal hunting. There was a concomitant increase in the diversity and complexity of material culture during the Late Prehistoric horizon, demonstrated by more classes of artifacts. The recovery of a greater number of small, finely chipped projectile points suggests increased use of the bow and arrow rather than the atlatl (spear thrower) and dart for hunting. Steatite cooking vessels and containers are also present in sites from this time, and there is an increased presence of smaller bone and shell circular fishhooks; perforated stones; arrow shaft straighteners made of steatite; a variety of bone tools; and personal ornaments such as beads made from shell, bone, and stone. There was also an increased use of asphalt for waterproofing and as an adhesive. Late Prehistoric burial practices are discussed in the Native American Ethnographic Overview section below.

By A.D. 1000, fired clay smoking pipes and ceramic vessels were being used at some sites (Drover 1971, 1975; Meighan 1954; Warren and True 1961). The scarcity of pottery in coastal and near-coastal sites

implies that ceramic technology was not well developed in that area, or that occupants were trading with neighboring groups to the south and east for ceramics. The lack of widespread pottery manufacture is usually attributed to the high quality of tightly woven and watertight basketry that functioned in the same capacity as ceramic vessels.

During this period, there was an increase in population size accompanied by the advent of larger, more permanent villages (Wallace 1955:223). Large populations and, in places, high population densities are characteristic, with some coastal and near-coastal settlements containing as many as 1,500 people. Many of the larger settlements were permanent villages in which people resided year-round. The populations of these villages may have also increased seasonally.

In Warren's (1968) cultural ecological scheme, the period between A.D. 500 and European contact, which occurred as early as 1542, is divided into three regional patterns: Chumash (Santa Barbara and Ventura Counties), Takic/Numic (Los Angeles, Orange, and western Riverside Counties), and Yuman (San Diego County). The seemingly abrupt introduction of cremation, pottery, and small triangular arrow points in parts of modern-day Los Angeles, Orange, and western Riverside Counties at the beginning of the Late Prehistoric period is thought to be the result of a Takic migration to the coast from inland desert regions. Modern Gabrielino, Juaneño, and Luiseño people in this region are considered the descendants of the Uto-Aztecan, Takic-speaking populations that settled along the California coast in this period.

Ethnographic Overview

Alfred Kroeber was the first scholar to propose boundaries of traditional territories inhabited by California Native American populations following Spanish contact. Kroeber's ethnographic work (1925) established the conventions for names and territorial boundaries, drawn heavily from linguistic groupings, on which subsequent scholarly research would be based (Bean and Smith 1978). These proposed tribal boundaries, however, are far from exact and subsequent scholars have suggested alternate delineations for traditional tribal territories for the region (cf. Johnson 2006). Based on more recent iterations of traditional tribal territory boundaries, the project site is located just within the boundaries of the Ventureño Chumash (King 2011) along a shared border with the Gabrielino to the east, and the Tataviam to the northeast. Therefore, ethnographic contexts for all three tribal groups are presented below.

Chumash

The project area is a cultural transition zone and was traditionally occupied by the Ventureño Chumash (Grant 1978a–c; Kroeber 1925). The Chumash people lived between Malibu in Los Angeles County and San Marcos Creek near the Monterey County line, on all four of the northern Channel Islands, and as far east as the edge of Kern County (Milliken and Johnson 2005). The Chumash territory was divided into seven parts, each representing various linguistic subgroups, some of which were nearly mutually unintelligible (Kroeber 1925; Milliken and Johnson 2005). Most of our information regarding Chumash traditional culture comes from the ethnographic studies conducted by J. P. Harrington, who worked among the surviving Chumash population between 1912 and 1958. The following descriptions of Chumash society are compiled from scant ethnographic and ethnohistoric sources that entail numerous biases and should be taken as general accounts of Native lifeways observed at the time of European contact and later (after indigenous lifeways had been severely disrupted by European presence in the Americas) that likely preclude primary aspects of cultural identity and practices.

The term "Chumash" is derived from a Native American word initially applied to the people living on Santa Cruz Island (King 1994); though Chumash now refers to the entire linguistic and ethnic group of societies that occupied the coast between San Luis Obispo and northwestern Los Angeles County, including the northern Channel Islands, and inland to the western edge of the San Joaquin Valley.

Neighboring groups included the Salinan to the north, the Southern Valley Yokuts and Tataviam to the east, and the Gabrielino (Tongva) to the south.

The Chumash spoke at least six closely related Chumashan languages, which have been divided into two broad groups—Northern Chumash (consisting only of Obispeño) and Southern Chumash (Purisimeño, Ineseño, Barbareño, Ventureño, and Island Chumash) (Mithun 2001). While Island Chumash was the most divergent of the five southern languages, Ventureño may have had the most internal variation with at least six distinct dialects. The Chumashan languages are considered by some to be part of the Hokan language family, though others consider Chumashan to be an isolate stock with a long history in the Santa Barbara region, and not part of the Hokan linguistic family (Mithun 2001). As much of these languages were lost during the past several hundred years post-European contact, it is likely that debate regarding their origins will continue.

Numerous large Chumash villages extended along the Santa Barbara coastline at the time of European contact, particularly at the mouths of large drainages (Grant 1978a:Figure 1) suggesting extensive use of the greater area by Indigenous peoples. At the time of Spanish contact in 1542 and again in 1769, accounts describe settlement along the Santa Barbara Channel coast as relatively dense with multiple large villages. Estimates of total Chumash population for the initial Contact period vary from 8,000–10,000 (Kroeber 1925:551) to 18,000–22,000 (Cook and Heizer 1965:21). Coastal Ventureño and Barbareño Chumash villages were described as containing anywhere from 30 to 120 houses with several hundred to over 1,000 inhabitants and multiple canoes (Brown 2001; Grant 1978b). Early accounts by Spanish explorers note that inland villages were smaller than their coastal counterparts, with 100–500 occupants.

Permanent Chumash villages located along the coast contained hemispherical dwellings arranged in close groups. These were constructed of bent poles and covered by grass or tule mats. Average family dwellings measured approximately 6–7 m (20–23 feet) and had a hole in the roof through which light could enter and smoke would escape, and in rainy weather, these holes were covered with animal skins. Larger dwellings were also described for housing related family groups; these measured approximately 15–17 m (50–56 feet) and could contain around 60 people (Brown 2001; Hudson and Blackburn 1981). Houses in the smaller inland villages were described as rectangular and more like those found among the adjacent Takic speakers, though style and types of artifacts were distinctly like those used by the coastal Chumash (Grant 1978a:518). The chief's house was often the largest dwelling, encompassing his extended household and providing for his hospitality duties. Villages often contained storehouses, one or more subterranean sweat lodges, and a semi-circular dance ground and associated sacred ceremonial enclosure, with a nearby game field surrounded by low walls (McCall and Perry 1986). Satellite gathering or processing areas included earth ovens used to roast yucca and other foods, rockshelters, quarries, and bedrock mortars for processing acorns and similar plant resources (King 1994).

Each Chumash village had a formal cemetery, generally separate from the village proper. Ethnographic records indicate that cemeteries were marked by tall painted poles and frequently had an entrance area where ceremonies were performed. Within the cemetery, stone, wood, or bone markers identified burial sites. Occasionally, individual burials were marked by painted boards with markings indicating the occupation or clan of the deceased (Gamble et al. 2001). Prior to burial, a wake was held in a sacred enclosure. Individuals were then interred face down in a flexed position with personal objects, including effigies, steatite pipes, bowls, ollas, beads, and other grave goods. Social differentiation and hierarchy are inferred from archaeological studies that identified distinct areas appearing to denote high- and low-status families within the cemetery grounds (King 1969).

Chumash society was organized into craft guilds including canoe building, bead making, basketry making, woodworking, and weapon making, among others (Miller 1988). Being a guild member had

strong economic advantages. Membership was primarily open to the upper class, and ranking members of the guilds were *'antap* society members. Chumash society was divided into three classes (McCall and Perry 1986). Upper class members held the important social and religious positions, including chief, canoe builders and owners, and members in the *'antap* society. The middle class contained about half the population, mainly hunters, gatherers, and general workers, and social outcasts and unproductive people populated the lower class. Unlike their southern neighbors, the Chumash did not have a lineage organization and most elite marriages were matrilocal.

Every village had a chief, or *wot*, who was usually male, but hereditary rights to this role were passed down matrilineally (Johnson 1987). The *wot* had both political and religious ceremonial duties to perform; his assistant, the *paha*, helped officiate at rituals. Other officials known as *ksen* were "messengers who traveled from place to place, making announcements and gathering news for the *wot*" (McCall and Perry 1986:40). A large village usually had three to four chiefs, one of whom would be the head chief (Brown 2001). Other portions of Chumash territory were organized into provinces, or groups of villages that were ruled by a single chief.

Chumash subsistence practices varied somewhat between coastal and inland groups based on available resources, but like many indigenous Californian groups, the acorn was a dietary staple. Acorns were gathered in the autumn and stored in villages, where they were ground to a meal, leached, and then cooked daily. In addition to acorns—mainly from the coast live oak (*Quercus agrifolia*)—other nuts, such as pine nuts and walnuts, were collected. Chumash diet also included cattail roots, fruits, and pads from *Opuntia* cactus, along with bulbs and tubers (Miller 1988; Timbrook 2007). Yucca stalks were harvested and roasted, and the buds and flowers were also gathered and consumed. Staples included small hard seeds of several annual and perennial plants such as grass, chia and other sages, and buckwheat. Seasonal resources included berries (blackberry, elderberry, grape, madrone, laurel, and wild cherry), mushrooms, and cress.

Seeds were processed using various grinding implements including wooden and stone mortars, pestles, bedrock mortars, and hand stones. Tools used to gather plant foodstuffs consisted of at least several forms of gathering and winnowing baskets, woven seed beaters, and sharpened digging sticks. A variety of basket styles were manufactured for the processing and serving of foods, including straining and leaching acorn meal, and processed meal and other foods were cooked in water-tight baskets (Miller 1988). Other baskets were made for storing grains, acorns, meal, prepared foods, and other dietary resources. Carved steatite bowls, ollas, and comals also were used for cooking, and meals were sometimes served on wooden plates and bowls.

On the coast, shellfish was harvested from intertidal habitats and fishing was conducted from shore as well as from wooden plank canoes (*tomol*), which may also have been employed for marine mammal hunting. The *tomol* not only facilitated marine resource procurement but also facilitated interaction between the mainland and the Channel Islands. Seals, sea lions, otters, porpoises, and whales were hunted with harpoons. Deep-sea fish such as bonito, sea bass, halibut, barracuda, yellowtail, and shark were caught with hooks and lines, harpoons, and deep or shoreline nets. Digging sticks were used to procure clams and scallops from the beach sands, and flat bone or wood wedges were used to pry mussels and abalone from intertidal rocks during low tides.

Local Chumash populations captured mule deer, antelope, cottontail, jackrabbit, mice, and wood rats; mountain and valley quail, dove, and resident and migratory waterfowl, among other birds; and various types of reptiles, amphibians, and insects. Larger animals, such as mule deer, coyote, and fox, were hunted with the bow and arrow; smaller game was captured with traps and snares. Hunting was accomplished by various means, with the bow and arrow, spears, slings, throwing sticks, traps, and deadfalls (Hudson and Blackburn 1979). Hunting parties were comprised of up to eight people;

communal hunting groups used large nets and clubs, and individuals used throwing sticks to kill smaller prey like rabbits and hares (Brown 2001). Bone and shell were used to produce a wide range of utilitarian and nonutilitarian items, such as eating utensils, ornaments, whistles, gorges, fishhooks, harpoons, awls, and antler wedges. The steatite industry was especially developed in the southern areas, manifested in a variety of ornaments, vessel forms, and ceremonial objects.

Trade was an integral component of Chumash subsistence, and trade relationships among inland, coastal, and island groups were well established, though the specifics of what was traded between island and mainland groups is less clear. Coastal Chumash traded with their inland Chumash neighbors, who in turn traded with their Yokut, Tataviam, Kitanemuk, and Gabrielino neighbors to the north, east, and south (Miller 1988). Extensive trade network increased the diversity of goods available throughout Chumash territory, encouraged craft specialization, and established the coastal villages as middlemen. The coastal villages were well positioned with their access to abundant marine resources; they built and kept the boats that moved trade goods across the channel and likely profited from this exchange.

The Chumash are well known for their material culture, which included highly decorated utilitarian tools and ceremonial items, as well as rock art (Grant 1978a–b; Hudson and Blackburn 1984, 1986). Carved steatite items included bowls decorated with beads, medicine tubes, effigies, beads, pipes, and charmstones. Rock paintings are found in sheltered locations near the coast and inland to the farthest reaches of the Chumash sphere. In the interior region inhabited by the Cuyama Chumash who spoke the Ineseño dialect, archaeological and ethnographic evidence strongly suggest a Chumash affiliation with the Carrizo Plain rock art, where the rock paintings—mostly pictographs comprised of polychrome abstract designs and some petroglyphs—reach a high degree of development. Despite being recognized as the location of the most extensive rock art, the Carrizo Plain area is among the least studied of Chumash regions. The remote location of the majority of Chumash rock art suggests the paintings may represent shrines or sacred areas.

Chumash religion was well developed and integrated into everyday life. Rituals and ceremonies were observed throughout the year; the most important was performed at the Winter Solstice, when a large festival was held in honor of the Sun. Astronomers carefully marked the shortest day of the year to know when to begin the rites and dances and used the observation to recalibrate their calendar. The *Hutush* autumn harvest festival, a time of thanksgiving, celebrated the Earth Goddess as provider of all foods (McCall and Perry 1986). Ceremonies were performed in everyday life and to mark special occasions; rituals were performed to name children, cure the sick of various ailments, and initiate young men into the mysteries of religion. The *'antap* society, restricted to the upper class, was also the federation of shamans who controlled ceremonial observances.

Gabrielino/Tongva

The name Gabrielino (sometimes spelled Gabrieleno or Gabrieleño) denotes those people who were administered by the Spanish from Mission San Gabriel Arcángel. By the same token, Native Americans in the sphere of influence of Mission San Fernando Rey de España were historically referred to as Fernandeño (Kroeber 1925). This group is now considered to be a regional dialect of the Gabrielino language, along with the Santa Catalina Island and San Nicolas Island dialects (Bean and Smith 1978). In the post-Contact period, Mission San Gabriel included natives of the greater Los Angeles area, as well as members of surrounding groups such as Kitanemuk, Serrano, and Cahuilla. There is little evidence that the people we call Gabrielino had a broad term for their group; rather, they identified themselves as an inhabitant of a specific community through the use of locational suffixes (e.g., a resident of Yaanga was called a Yabit, much the same way that a resident of New York is called a New Yorker) (Dakin 1978:222).

Native words that have been suggested as labels for the broader group of Native Americans in the Los Angeles region include Tongva (or Tong-v) and Kizh (Kij or Kichereno); although there is evidence that these terms originally referred to local places or smaller groups of people within the larger group that we now call Gabrielino (Heizer 1968). Many present-day descendants of these people have taken on Tongva as a preferred group name because it has a native rather than Spanish origin and one group of descendants prefers the term Kizh (King 1994). The term Gabrielino/Tongva, which combines the most commonly used group names, is used in the remainder of this study to designate native people of the Los Angeles Basin and their descendants.

Gabrielino/Tongva lands encompassed the greater Los Angeles Basin and three Channel Islands—San Clemente, San Nicolas, and Santa Catalina. Their mainland territory was bounded on the north by the Chumash at Topanga Creek, the Serrano at the San Gabriel Mountains in the east, and the Juaneño on the south at Aliso Creek (Bean and Smith 1978:538; Kroeber 1925:636).

The Gabrielino/Tongva language, as well as that of the neighboring Juaneño/Luiseño, Serrano, and Tatataviam/Alliklik, belongs to the Takic branch of the Uto-Aztecan language family, which can be traced to the Great Basin area (Mithun 2004:539, 543–544). This language family's origin differs substantially from that of the Chumash to the north and the Ipai, Tipai, and Kumeyaay farther south. The language of the Ipai, Tipai, and Kumeyaay is derived from the California-Delta branch of the Yuman-Cochimi language family, which originated in the American Southwest (Mithun 2004:577). The Chumash language is unlike both the Yuman-Cochimi and Uto-Aztecan families and may represent a separate lineage (Mithun 2004:390). Linguistic analysis suggests that Takic-speaking immigrants from the Great Basin area began moving into southern California around 500 B.C. (Kroeber 1925:579). This migration may have displaced both Chumashan- and Yuman-speaking peoples, but the timing and extent of the migrations and their impact on indigenous peoples is not well understood. The Gabrielino/Tongva language consisted of two main dialects, Eastern and Western; the Western included much of the coast and the Channel Island population (King 2004). Lands of the Western group encompassed much of the western Los Angeles Basin and San Fernando Valley, northward along the coast to the Palos Verdes Peninsula (McCawley 1996:47).

Gabrielino/Tongva society was organized along patrilineal non-localized clans, a characteristic Takic pattern. Clans consisted of several lineages, each with their own ceremonial leader. The chief, or *tómyaar*, always came from the primary lineage of the clan/village. One or two clans generally made up the population of a village. Even though the Gabrielino/Tongva did not have a distinctly stratified society, there were two general classes of individuals: elites and commoners. The elites consisted of primary lineage members, other lineage leaders (who maintained a separate ceremonial language), the wealthy, and the elite families of the various villages who commonly married among themselves. The commoner class contained those from "fairly well-to-do and long-established lineages" (Bean and Smith 1978:543). A third, lower class consisted of slaves taken in war and individuals, unrelated to the inhabitants, who drifted into the village.

The Gabrielino/Tongva established large, permanent villages in the fertile lowlands along rivers and streams, and in sheltered areas along the coast, stretching from the foothills of the San Gabriel Mountains to the Pacific Ocean. A total tribal population has been estimated of at least 5,000 (Bean and Smith 1978:540), but recent ethnohistoric work suggests that a number approaching 10,000 seems more likely (O'Neil 2002). Several Gabrielino/Tongva villages appear to have served as trade centers, due in large part to their centralized geographic position in relation to the southern Channel Islands and to other tribes. These villages maintained particularly large populations and hosted annual trade fairs that would bring their population to 1,000 or more for the duration of the event (McCawley 1996:113–114).

Houses constructed by the Gabrielino/Tongva were large, circular, domed structures made of willow poles thatched with tule that could hold up to 50 people (Bean and Smith 1978). Other structures served as sweathouses, menstrual huts, ceremonial enclosures, and probably communal granaries. Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Gabrielino/Tongva villages (McCawley 1996:27).

The Gabrielino/Tongva subsistence economy centered on gathering and hunting. The surrounding environment was rich and varied, and the tribe exploited mountains, foothills, valleys, and deserts as well as riparian, estuarine, and open and rocky coastal eco-niches. Like most Native Californians, acorns were the staple food (an established industry by the time of the early Intermediate period). Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978:546; Kroeber 1925:631-632; McCawley 1996:119–131). Groups residing near the ocean used ocean-going plank canoes (known as a *ti'at*) and tule balsa canoes for fishing, travel, and trade between the mainland and the Channel Islands. The ocean-going canoes were capable of holding six to 14 people and were also used for travel and trade between the mainland and the Channel Islands. The tule balsa canoes were used for near-shore fishing (Blackburn 1963; McCawley 1996:117–127).

The Gabrielino/Tongva participated in an extensive exchange network, trading coastal goods for inland resources. They exported Santa Catalina Island steatite products, roots, seal and otter skins, fish and shellfish, red ochre, and lead ore to neighboring tribes, as well as people as far away as the Colorado River. In exchange, they received ceramic goods, deer skin shirts, obsidian, acorns, and other items. This burgeoning trade was facilitated through craft specialists, a standard medium of exchange (*Olivella* bead currency), and the regular destruction of valuables in ceremonies, which maintained a high demand for these goods (McCawley 1996:112–115).

Deceased Gabrielino/Tongva were either buried or cremated, with inhumation being more common on the Channel Islands and the neighboring mainland coast and cremation predominating on the remainder of the coast and in the interior (Harrington 1942; McCawley 1996:157). Cremation ashes have been found in archaeological contexts buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966:27), as well as scattered among broken ground stone implements (Cleland et al. 2007). Archaeological data such as this correspond with ethnographic descriptions of an elaborate mourning ceremony that included a wide variety of offerings, including seeds, stone grinding tools, otter skins, baskets, wood tools, shell beads, bone and shell ornaments, and projectile points and knives. Offerings varied with the sex and status of the deceased (Johnston 1962:52–54; McCawley 1996:155–165; Reid 1926:24–25). At the behest of the Spanish missionaries, cremation essentially ceased during the post-Contact period (McCawley 1996:157).

European contact with the Gabrielino/Tongva occurred as early as 1542 with the Spanish expedition led by Juan Rodriguez Cabrillo, followed by Sebastián Vizcaíno in 1602, who both visited Santa Catalina Island. Colonization of Gabrielino/Tongva lands did not begin in earnest until after the inland expedition led by Gaspar de Portolá in 1769. By 1771, four missions had been constructed in the region, including Mission San Gabriel, founded in Los Angeles County in September 1771 (Bean and Smith 1978:540–541; Engelhardt 1927; McCawley 1996:3–6).

In the early twentieth century, Gabrielino/Tongva who still lived in San Gabriel neighborhoods near the old mission joined the Mission Indian Federation and sought redress from the federal government over lost lands. A generation later, partly as an outgrowth of the Civil Rights Movement, Gabrielino/Tongva started to form political organizations of their own to affect handling of ancestral remains discovered at construction sites and to seek federal acknowledgement of their tribe. There are currently five such

organizations with total membership approaching nearly a thousand people. They are still struggling to receive federal recognition.

Tataviam

The Tataviam lived in the upper drainage of the Santa Clara River between the San Fernando Valley to the south and the top of Pastoria Creek in the Tehachapi Mountains to the north. To the east, their ancestral lands extended to part of the southern fringe of Antelope Valley. The core Tataviam population centered on the south sides of the Liebre, Sawmill, and Sierra Pelona Mountains. Neighboring groups include the Ventureño Chumash to the west, Emigdiano Chumash to the north, Kitanemuk to the northeast, Vanyume Serrano to the east, and Western Gabrielino to the south in the San Fernando Valley (Grant 1978a; Johnson and Earle 1990:193; King and Blackburn 1978:535).

The Tataviam language is a part of the Takic branch of the Uto-Aztecan language family, also spoken by the Western Gabrielino and Kitanemuk (Mithun 2001:540). This language family can be traced to the Great Basin area, which represents an origin different from the Chumash. According to Bright (1975), the Tataviam language may be "the remnant, influenced by Takic, of a language family otherwise unknown in southern California" or the language was probably Takic but not from the Serran or Cupan branches like Kitanemuk and Vanyume, respectively. The Tataviam language probably began to differentiate itself from the others around 1000 B.C. (King and Blackburn 1978:535). The name "Tataviam" itself is derived from the Kitanemuk's designation for this group (King and Blackburn 1978:535). Kroeber (1925:614) referred to them as the "Alliklik," named by the Ventureño Chumash to separate them from the Beñeme Serrano in the western Mojave Desert and Antelope Valley.

Information about Tataviam social organization and political structure is relatively limited, but there is no evidence that would substantially differentiate them from the Kitanemuk and Western Gabrielino. Tataviam villages ranged from large centers of around 200 individuals to small settlements of 10 to 15 people (King and Blackburn 1978:536). Intermediate-sized villages were dispersed between the larger centers, with smaller villages spaced around the larger villages. King and Blackburn (1978:534) estimate the total Tataviam population at the time of historic contact at no more than 1,000 people, with the widest possible territorial extent considered. Mortuary practices probably included cremation, as well as a mourning ceremony practiced in late summer or early fall (King and Blackburn 1978:535).

Archaeological data, the primary source of information available, indicate broad similarities among the Tataviam, Chumash, and Gabrielino (King and Blackburn 1978:536). Considering their environment and available data, it is probable that Tataviam relied more heavily on yucca as a staple than neighboring groups. Additional plant foods most likely included acorns, sage seeds, juniper seeds, and islay berries. Animal resources included small mammals such as rabbits and rodents, as well as deer and possibly antelope. Extensive trade networks developed between inland groups of the desert regions. They traded lithic material and large game animals with coastal groups for marine resources, shell, asphaltum, and steatite.

The first European visit to the general Tataviam area occurred in A.D. 1769, when Lieutenant Colonel Gaspar de Portolá led an overland expedition from the newly established settlement at San Diego in an attempt to find Monterey Bay. They traversed the San Fernando Valley in August 1769, passing to the north of where Mission San Fernando would be founded 28 years later. From there, they entered Tataviam territory in the Newhall-Saugus area through the Freemont Pass (Portolá 1909). The general vicinity was probably crossed again during the second Portolá expedition in 1770 and by the Friar Francisco Garces expedition in 1776 (Beck and Haase 1974:15). The Mission of San Fernando was founded in 1798 on the southern fringe of Tataviam lands, and by 1820, most of the population had been baptized at the mission. During this time, Tataviam often intermarried with surrounding Native American groups, most notably the Kitanemuk, and often attended and participated in Chumash ceremonies.

Following the Spanish period, interest in the Santa Clara Valley grew as fur trappers in the early 1800s, the discovery of gold in Placerita Canyon in 1842, and provisioning of miners heading for the gold strikes in the 1850s led to Euro-American settlement, ranching, and agriculture within the valley. Beef, grain, and other foodstuffs in demand by the miners resulted in an economic windfall for the ranches in the valley. As a consequence, the ranchers expanded their range into Tataviam hunting grounds and harvesting fields. Tataviam families and communities intermarried with and were absorbed into other Native American settlements in southern California during the late nineteenth century (Johnson and Earle 1990:209). Several Tataviam descendant families lasted into the twentieth century, but by 1916, there were no longer any Tataviam speakers (King and Blackburn 1978:536).

Native American Communities in the San Fernando Valley

In general, it has proven very difficult or impossible to establish definitively the precise location of Native American villages occupied after Spanish contact (McCawley 1996:31–32). Native American place names recorded during this period did not necessarily represent continually occupied settlements within discrete locations. Instead, in at least some cases, the communities were represented by several smaller camps scattered throughout an approximate geography, shaped by natural features subject to change over generations (Johnston 1962:122). In fact, many of the villages had long since been abandoned by the time ethnographers, anthropologists, and historians attempted to document any of their locations, at which point the former village sites were affected by urban and agricultural development, and Native American lifeways had been irrevocably changed. Kroeber remarked on the subject as follows:

> Many of the latter (i.e., place-names) no doubt originally denoted villages; but it is usually impossible to determine. The Indians of this region, Serrano, Gabrielino, and Luiseño, have long had relations to the old ranchos or land grants, by which chiefly the country was known and designated until the Americans began to dot it with towns. The Indians kept in use, and often still retain, native names for these grants. Some were the designations of the principal village on the grant, others of the particular spot on which the ranch headquarters were erected, still others of the camp sites, or hills, or various natural features. The villages, however, are long since gone, or converted into reservations, and the Indians, with all their native terminology, think in terms of Spanish grants or American towns. Over much of southern California—the "Mission Indian" district—the opportunity to prepare an exact aboriginal village map passed away 50 years ago. (Kroeber 1925:616)

Efforts at relocating former settlements have been further complicated by the frequency with which alternative names and spellings for communities were used, and that there are conflicting reports on the meaning or locational references in the names. Although the precise location of any given village is subject to much speculation, it is clear the San Fernando Valley and greater Los Angeles area once contained many Gabrielino settlements, including several concentrated along the banks of major waterways, near the coast, and along the base of foothills.

The closest ethnographically documented villages to the project site are *Atavsanga* (also known as *Ataguama* or *Totongna*) located approximately 2 miles to the southwest, *Momonga* located 3.5 miles to the north (near present-day Chatsworth), and *Siutcanga* located approximately 8.4 miles to the southeast (near present-day Encino) (Figure A-5). As described above by Kroeber (1925) and later noted by others (e.g., Harrington 1986 [cited in McCawley 1996]), the settlements and placename are often correlated with the later Spanish and Mexican period ranchos. This appears to be because the ranchos developed around existing Native American settlements, partly because Native Americans intentionally established rancherias near the Spanish and Mexican ranch houses, and also because the ranchos were the most common means by which geographic locations were historically described. For example, *Atavsanga* and *Siutcanga* are both believed to have been located within the boundaries of Ranchos El Escorpion and

Encino, respectively. The project site is located approximately 0.7 miles north of Rancho El Escorpion (Figure A-6).

Trails and travel corridors between settlements shared a similar association so that the roads established by the Spanish between the missions, presidios, and pueblos likely followed existing footpaths used by Native Americans, some of which have been retained by contemporary street alignments. Some of these early trails are depicted in nineteenth century maps (see Figures A-6and A-7). The closest such trail to the project site—labeled "Road from Ventura to Los Angeles" in Figure A-6—is plotted approximately 2.5 miles south of the project site. This is typically understood to have been the route taken by the first Spanish land expedition, and then maintained as part of the network of roads connecting the major settlements of the Mission system, known as El Camino Real (lit. "The Royal Road"). The "road," however, was never a single trail. Many of these early travel routes were likely established along the trails previously used by Native Americans for foraging, communication, travel, and trade. Though foot trails can be ephemeral and completely change course from year to year, such trails are known to have existed between significant Gabrielino settlements, and temporary camps or other types of Native American features (such as burials) would have been common along these paths, especially where they intersect water sources or are located near other natural resources and culturally significant landmarks, including favorable viewsheds. The earliest survey maps created after California's annexation into the United States offer some indication of the trail system operating prior to this time. Unfortunately, as with the location of settlements, maps of Native American trails were never drawn after Spanish contact and the routes described in ethnographic sources refer only to generalized travel corridors.

Historic Overview

The post-Contact history of California is divided into three periods that are defined by the ruling national government: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). Each period is briefly described below. Some chronologies include the Mission period (1769–1834), defined by the active span of those Spanish, and later Mexican, Catholic institutions. The Protohistoric period is used here to refer to the era of initial interaction between Native Americans and European explorers and settlers, ranging from 1542 through the early 1800s in outlying areas, where a mixture of native and nonnative cultural traits can be observed archaeologically.

Spanish Period (1769–1822)

The first Europeans to observe what became southern California were members of the 1542–1543 expedition of Juan Rodriguez Cabrillo. When sailing past Santa Monica Bay, Cabrillo noted the numerous campfires of the Gabrielino/Tongva and thus named the area the Bay of Smokes. Cabrillo and other early explorers sailed along the coast and made limited expeditions into Alta (upper) California between 1529 and 1769. Although Spanish, Russian, and British explorers briefly visited Alta California during this nearly 250-year span, they did not establish permanent settlements.

Gaspar de Portolá and Franciscan Father Junípero Serra established the first Spanish settlement in Alta California at San Diego in 1769. Mission San Diego de Alcalá was the first of 21 missions built by the Spanish between 1769 and 1823. Portolá continued north, passing near the project site in August of 1769, and reaching San Francisco Bay on October 31. The process of converting the local Native American population to Christianity through baptism and relocation to mission grounds was begun in this region by the Franciscan padres at the San Gabriel Mission, which was established in 1771 (Engelhardt 1927). The San Fernando Mission was founded 26 years later, its location chosen as a stopping point between the San Gabriel and San Buenaventura missions (Englehardt 1927b). Most Native Americans from the Los Angeles Basin were persuaded to settle in the vicinity of the two missions. These included the Eastern Gabrielino of the plains as far south as the Santa Ana River and west to the Los Angeles River.

The padres also proselytized the Serrano of the San Gabriel and San Bernardino Mountains, as well as the Vanyume Serrano of the Mojave Desert; many of the western Cahuilla in the Coachella and San Jacinto Valley; some Luiseño of the San Jacinto Valley; and Western Gabrielino of the plains west of the Los Angeles River, San Fernando Valley, and the southern Channel Islands. The missions were charged with administering to the Native Americans within their areas. Although mission life gave the Native Americans the skills needed to survive in their rapidly changing world, the close quarters and regular contact with Europeans transmitted diseases for which they had no immunity, decimating their populations (McCawley 1996).

Mexican Period (1822–1848)

After the end of the Mexican Revolution against the Spanish crown (1810–1821), all Spanish holdings in North America (including both Alta and Baja California) became part of the newly formed Mexican Empire, and shortly thereafter, a constitutionally based United Mexican States. Under Mexican rule, the authority of the California missions gradually declined, culminating with their secularization. Events leading up to the secularization of the California missions spanned many years and much political upheaval, after which the Mexican Congress passed the Secularization Act in August 1833. Not only did the action divest the Franciscans of property, it also opened both of the Californias to colonization. The first 10 of the missions were secularized in 1834, San Gabriel among them.

Historical documents suggest that what followed was a period of intrigue, revolution, and lawlessness. With a disruption in trade came an increase in the number of American interlopers. Political resistance erupted on every front as Mexican citizens in California (*Californios*) vied for control of their ranchos against American intruders and Mexican authority. Although the Mexican government directed that each mission's lands, livestock, and equipment be divided among its neophytes, the majority of these holdings quickly fell into non-Indian hands. As mission landholdings passed into private hands, neophyte workers, who had become dependent on the missions, were left to fend for themselves.

If mission life was difficult for Native Americans, secularization was worse. After two generations of dependence upon the missions, they were suddenly disenfranchised. After secularization, "nearly all of the Gabrielinos went north while those of San Diego, San Luis and San Juan overran this county, filling the Angeles and surrounding ranchos with more servants than were required" (Dakin 1978[1939]:282)

Former mission lands were quickly divided and granted to private citizens for use as agricultural and pastoral land. Most of the land grants to Californios were located inland, a policy intended to increase the population away from the coastal areas where the Spanish settlements were concentrated (Dakin 1978[1939]:282). With no work at the mission, there was a far greater labor force in the region than could be employed.

After years of surreptitious commerce, the first party of American immigrants arrived in Los Angeles in 1841, including William Workman and John Rowland, who soon became influential landowners. As the possibility of a takeover of California by the United States loomed large in the 1840s, the Mexican government increased the number of land grants in an effort to keep the land in Mexican hands (Wilkman and Wilkman 2006). Governor Pío Pico and his predecessors made more than 600 rancho grants between 1833 and 1846, putting most of the state's lands into private ownership for the first time (Gumprecht 1999). Trade in the region changed as well. British and American trade displaced supply ships from Mexico and, in 1841, the first party of American immigrants arrived at the Pueblo de Los Angeles.

American Period (1848–Present)

The United States took control of California in 1846, seizing Monterey, San Francisco, San Diego, and Los Angeles with little resistance. Los Angeles soon slipped from American control, however, and was

retaken in 1847. Approximately 600 U.S. sailors, marines, Army dragoons, and mountain men converged under the leadership of Colonel Stephen W. Kearney and Commodore Robert F. Stockton in early January of that year to challenge the California resistance, which was led by General Jose Maria Flores. The American party scored a decisive victory over the Californios in the Battle of the Rio San Gabriel and at the Battle of La Mesa the following day, effectively ending the war and opening the door for increased American immigration (Harlow 1992).

The 1848 Treaty of Guadalupe Hidalgo formally ended the war and required that legitimate land grants be honored. California was admitted as the 31st state on September 9, 1850. Pursuant to the Land Act of 1851 requiring claims be filed with the United States Public Lands Commission, Eulogio de Celis filed his claim in 1852; it was granted in 1873. After de Celis died in 1869, San Fernando Mission land was sold in 1874 to California State Senator Charles Maclay and his partner George K. Porter. Maclay founded the community of San Fernando in 1874 on his eastern section and included land for the Southern Pacific Railroad (SPRR) that would eventually construct a tunnel through the pass at San Fernando.

In 1903, George Porter sold his share of the land to Leslie Brand's newly syndicated San Fernando Mission Land Company. One of their major shareholders was Moses Sherman, who sat on the city water commission board that in 1905 approved plans for the Los Angeles Aqueduct and later exercised their option to buy Porter's land (Roderick 2001). The aqueduct was constructed between 1908 and 1913, which was preceded by a real estate boom in the San Fernando Valley, leading to the founding of several modern-day cities and communities, including Owensmouth in March of 1912—renamed Canoga Park in 1931. Around 1911, the Pacific Electric Railway had extended its lines from Hollywood to Van Nuys, sharing portions of track with SPRR, and connecting passenger rails to the northwest portion of the San Fernando Valley. The San Fernando Valley was annexed to Los Angeles County in 1917, and the region's economy slowly began shifting from agricultural to light industrial and commercial.

Chatsworth Reservoir and Chatsworth High Line Conduit

The Los Angeles Aqueduct was opened in 1913 and measured 233 miles long. The aqueduct diverted water from the Owens Valley to the San Fernando Reservoir. The Chatsworth Reservoir was built in 1918 and was fed from the San Fernando Reservoir by a conduit called the Chatsworth High Line (alternatively spelled or referred to as the Chatsworth Hi-Line) that ran along the northern edge of the San Fernando Valley. The Chatsworth Reservoir was the nineteenth and last water-retention basin developed to store and manage water imported via the Los Angeles Aqueduct. The reservoir was placed into service in 1919 and was created by two large earth-filled dams and two smaller dikes spanning gaps between hills. The reservoir dams were built using the hydraulic fill method where there was no mechanical compaction of the soil forming the dam. From 1919 to 1950, the reservoir was the main water storage facility for the western San Fernando Valley and primarily served agricultural irrigation needs. The reservoir use shifted toward domestic water supply as the valley shifted away from agricultural usage toward suburban housing. Following the 1971 Sylmar earthquake, the California Department of Water Resources Division of Safety of Dams determined that the Chatsworth dams would have to be completely rebuilt in order to be safe during a major earthquake. The reservoir was drained and taken out of service in 1972. The Chatsworth Nature Preserve/Reservoir Ecology Pond was established as mitigation for waterfowl habitat lost as a result of the draining of residual water from Chatsworth Reservoir following the 1971 Sylmar earthquake and was located at the northern end of the reservoir (Chatsworth Historical Society 2017). In 1997, the City Council renamed the 1,325-acre parcel Chatsworth Reservoir the Chatsworth Nature Preserve/Reservoir, forming the only nature preserve in the City of Los Angeles.

ARCHIVAL RESEARCH

Aerial Photograph Review

SWCA's archival research included a review of historical maps for the project site and vicinity and focused on documenting modifications to the physical setting and identifying any potential natural or artificial features with relevance to use by Native Americans (e.g., stream courses, vegetation, historical topography, roads, habitation markers) or use of the location by non–Native American people in the Historic period. Historical topographic maps show the project area appears to be used for agriculture or is vacant unused land from 1903 to 1944. A review of historical aerial photographs beginning in 1947, the earliest year for which an aerial map is available, shows both the Main and proposed North Campuses were being used as agricultural fields. This continued until 1959, as shown on an aerial photo from that year. Sometime between 1959 and 1967, the area was graded for the construction of the Chaminade College Preparatory high school and shopping mall where the proposed North Campus will be developed. An aerial photograph from 1967 shows the high school and shopping mall fully built by then (Historic Aerials 2021). The original buildings are still present on the project site, though it appears to have been subject to several alterations. The multi-tenant mini shopping center within the proposed North Campus area that is slated for demolition was built between 1962 to 1964 and expanded in 1981 to its current size. Between 1959 and 1967, residential development started on parcels immediately adjacent to the south and southwest boundaries of the project site, with residences showing in the parcels between Chaminade Avenue and Cohasset Street, between Cohasset Street and Valerio Street, and west of Platt Avenue. By 1977, the entire neighboring areas were developed with residences.

Cultural Resources Records Search

On August 23, 2021, SWCA requested a confidential search of CHRIS records from the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton, which houses the records for Los Angeles County. The purpose of the record search was to identify all previously conducted cultural resource surveys and all previously recorded cultural resources within the project area, including potential eligibility for inclusion in the NRHP and CRHR. The search included any previously recorded cultural resources and investigations within a 0.5-mile radius of the project site. The search also involved a review of the National Register of Historic Places, the California Register of Historical Resources, the California Points of Historical Interest list, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. In addition, the search consisted of a review of all available historic USGS 7.5- and 15-minute quadrangle maps.

Previously Conducted Cultural Resource Studies

Results of the CHRIS records search indicate that six previous archaeological investigations have been conducted within 0.5 mile of the project site. None of these studies intersect the project site. Details pertaining to these studies are included in Confidential Appendix B.

Previously Recorded Cultural Resources

The CHRIS records search indicated that no previously recorded cultural resources have been identified within the project site or within a 0.5-mile radius of the project site.

Sacred Lands File Search

SWCA submitted a Sacred Lands File (SLF) search request for the project site to the Native American Heritage Commission (NAHC) on August 23, 2021. The NAHC's email response (Appendix C) was

received on September 24, 2021, indicating that the results for the SLF check conducted by through the NAHC was positive. The reply requested that associated California Native American tribes be contacted for more information. The NAHC provided a contact list of 14 Native American individuals or tribal organizations that may have knowledge of tribal cultural resources in or near the study area (Table 1). SWCA provided the contact list to CAJA on October 11, 2021, since they were in coordination with the City.

Table 1. Summary of Native American Individuals and Groups Culturally Affiliated with the Project Area.

Name and Title	Affiliation
Andrew Salas, Chairperson	Gabrieleño Band of Mission Indians–Kizh Nation
Anthony Morales, Chairperson	Gabrieleño/Tongva San Gabriel Band of Mission Indians
Julie Tumamait-Stenslie, Chairperson	Barbareño/Ventureño Band of Mission Indians
Christina Conley, Tribal Consultant and Administrator	Gabrielino Tongva Indians of California Tribal Council
Charlez Alvarez	Gabrielino-Tongva Tribe
Jairo Avila, Tribal Historic Preservation Officer	Fernadeño Tataviam Band of Mission Indians
Sandonne Goad, Chairperson	Gabrielino Tongva Nation
Robert F. Dorame, Chairperson	Gabrielino Tongva Indians of California Tribal Council
Rudy Ortega, President	Fernadeño Tataviam Band of Mission Indians
Julio Quair, Chairperson	Chumash Council of Bakersfield
Mariza Sullivan, Chairperson	Coastal Band of the Chumash Nation
Fred Collins, Spokesperson	Northern Chumash Tribal Council
Mark Vigil, Chief	San Luis Obispo County Chumash Council
Kenneth Kahn, Chairperson	Santa Ynez Band of Chumash Indians

SUMMARY AND RECOMMENDATIONS

SWCA reviewed the results of CHRIS and SLF searches to identify the presence of cultural resources within the project site. The CHRIS records search indicated that there have been no cultural resources studies conducted within the project site, and that no cultural resources have been previously documented in the project site or within a 0.5-mile radius. The results of the SLF search conducted by the NAHC indicated that there are known tribal cultural resources in the vicinity of the project site. The NAHC provided a contact list of tribal representatives who may have more information about these known resources. SWCA provided the contact list to CAJA on October 11, 2021, since they were in coordination with the City.

The closest ethnographically documented Native American village sites in the general vicinity include *Atavsanga*, located approximately 2 miles southwest of the project site, and *Momonga* approximately 3.5 miles to the north, and *Siutcanga* located approximately 8.4 miles to the southeast. Two intermittent streams are located in the vicinity of the project site: Dayton Creek, approximately 0.6 mile to the north, and Bell Creek, approximately 0.7 mile to the south. Dayton Creek connects to Chatsworth Creek, which is located approximately 0.7 mile east of the project site.

Archival research indicated that beginning at least in the mid-1940s, the project site (both the Main and proposed North Campuses) was a plowed field associated with agricultural activities. The parcels were

graded sometime after 1959 for the construction of the Chaminade College Preparatory High School and shopping mall where the proposed North Campus will be developed.

Archaeological remains associated with prehistoric or historic Native Americans can occur below paved surfaces within developed urban settings. While the CHRIS records search results did not identify any such archaeological resources within the project site or vicinity, most of the project site was not inspected for archaeological resources before being developed. SWCA considers the greater region of the project site as having moderate sensitivity for prehistoric or historic Native American archaeological resources. However, the project site consists of a comparatively small area within the greater region and has been subject to multiple episodes of ground disturbances. As a result, archaeological materials once located on the surface or in shallow deposits are very unlikely to have been preserved within the project site, and though more deeply buried deposits could exist, SWCA considers the sensitivity for prehistoric and historic Native American archaeological resources to decrease within the project site, compared with the surrounding area.

Based on the above considerations, SWCA finds a **low potential for encountering prehistoric and Historic period Native American archaeological resources** within the project site. This is supported by the surficial geology of the site, which has been identified as late to middle Pleistocene old alluvial fan deposits, undivided (Qof) and late Miocene Modelo Formation, undivided (Tm). According to the paleontological resources study conducted for this project, the depth to the underlying, previously undisturbed sediments is unknown, but likely very shallow (e.g., 3 feet below ground surface) (Carson 2022). These types of sediments are naturally less likely to contain buried archaeological resources. The likelihood of encountering any cultural resources is further decreased due to the compromised integrity of the physical setting as a result of plowing, as evidenced by past agricultural activities as seen on historic aerial imagery, and the development of the school campus and commercial property. The maximum depth of excavation for the project is anticipated to be approximately eight feet below surface within the Main Campus area, which likely would be within previously disturbed or artificial fill. The North Campus area will be excavated to a maximum depth of 20 feet below surface, which would likely require excavation of underlying alluvial sediments and removal of the overlying artificial fill.

Historic period archaeological resources could be preserved below the current ground surface, especially within the artificial fill. The CHRIS results were negative for previously recorded historic-era archaeological sites. As previously mentioned, the project site consisted of agricultural land from at least 1928 to 1959, with the high school and the shopping center constructed between 1959 and 1967. This shopping center was expanded in 1981 to its current size. The lack of evidence of built structures within the project site prior to 1959, indicates there is a low potential to encounter structural remains, features, and artifacts associated with the agricultural fields from the late nineteenth to mid twentieth century. For these reasons, SWCA finds the project site has a **low sensitivity for containing Historic period (non-Native American) archaeological resources.**

The multi-tenant mini shopping center and surface parking lot located within the proposed North Campus area were built between 1962 to 1964; however, an assessment of built architectural resources was not included in this current scope and not addressed in this study. Because these buildings are at least 45 years old, SWCA recommends that they be assessed by a qualified architectural historian to determine if the properties qualify as historical resources for the purposes of CEQA. CEQA requires a lead agency to analyze whether historic and/or archaeological resources may be adversely impacted by a proposed project. Under CEQA, a “project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment” (PRC Section 21084.1). Answering this question is a two-part process: first, the determination must be made as to whether the proposed project involves cultural resources. Second, if cultural resources are present, the

proposed project must be analyzed for a potential "substantial adverse change in the significance" of the resource.

According to CEQA Guidelines Section 15064.5, historical resources are:

1. A resource listed in, or formally determined eligible for listing in, the California Register of Historical Resources (CRHR) (PRC 5024.1, Title 14 CCR, Section 4850 et seq);
2. A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the PRC or identified as significance in a historic resources survey meeting the requirements of Section 5024.1(g) of the PRC;
3. Any building, structure, object, site, or district that the lead agency determines eligible for national, state, or local landmark listing; generally, a resource shall be considered by the lead agency to be historically significant (and therefore a historic resource under CEQA) if the resource meets the criteria for listing on the California Register (as defined in PRC Section 5024.1, Title 14 CCR, Section 4852).

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. According to CEQA, the fact that a resource is not listed in or determined eligible for listing in the CRHR or is not included in a local register or survey shall not preclude the lead agency from determining that the resource may be an historical resource (PRC Section 5024.1). Pursuant to CEQA, a project with an effect that may cause a substantial adverse change in the significance of a historical resource may have a significant effect on the environment (CEQA Guidelines, Section 15064.5(b).

CEQA Guidelines specify that "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines, Section 15064.5). Material impairment occurs when a project alters in an adverse manner or demolishes "those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion" or eligibility for inclusion in the NRHP, CRHR, or local register.
In addition, pursuant to CEQA Guidelines Section 15126.2, the "direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects."

In order to satisfy the above-stated requirements of CEQA, SWCA recommends a built architectural resources study be conducted, where the buildings identified on the project site, including the buildings on the proposed North Campus, which will be demolished, be evaluated as historical resources.
The evaluation should include property-specific research to fully characterize construction and development history, an examination of the building's features and characteristics, and an accurate depiction of the building's condition, historic integrity, alterations, and changes over time. The regulatory setting, methods, and results of the work, including any recommendations for additional work (if needed), should be compiled into a historic resources assessment report. SWCA recommends this work be carried out by a qualified architectural historian, defined as one who meets or exceeds the Secretary of Interior's Professional Qualifications Standards for Architectural History.

Dear Mr. Landon:

In accordance with your authorization of our proposal dated March 16, 2022, we have performed a geotechnical investigation for the proposed Chaminade High School improvements located at 7500 Chaminade Avenue, 23241 Cohasset Street, 23217-23260 Saticoy Street, 7619-7629 Woodlake Avenue in the City of Los Angeles, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed, provided the recommendations of this report are followed and implemented during design and construction.

If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOCON WEST, INC.

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for proposed Chaminade High School improvements located at 7500 Chaminade Avenue, 23241 Cohasset Street, 23217-23260 Saticoy Street, 7619 and 7629 Woodlake Avenue in the City of Los Angeles, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and, based on conditions encountered, to provide conclusions and recommendations pertaining to the geotechnical aspects of design and construction.

The scope of this investigation included a site reconnaissance, field exploration, laboratory testing, engineering analysis, and the preparation of this report. The site was explored on April 18, 2022, and April 19, 2022, by excavating twelve 8-inch diameter borings to depths ranging between approximately 6½ to 51 feet below the existing ground surface using a truck-mounted hollow-stem auger drilling machine. The approximate locations of the exploratory borings are depicted on the Site Plan (see Figures 2A through 2D). A detailed discussion of the field investigation, including boring logs, is presented in Appendix A.

Laboratory tests were performed on selected soil samples obtained during the investigation to determine pertinent physical and chemical soil properties. Appendix B presents a summary of the laboratory test results.

The recommendations presented herein are based on analysis of the data obtained during the investigation and our experience with similar soil and geologic conditions. References reviewed to prepare this report are provided in the *List of References* section.

If project details vary significantly from those described herein, Geocon should be contacted to determine the necessity for review and possible revision of this report.

2. SITE AND PROJECT DESCRIPTION

The subject site is located at 7500 Chaminade Avenue, 23241 Cohasset Street, 23217-23260 Saticoy Street, 7619 and 7629 Woodlake Avenue in the City of Los Angeles, California. The subject property consists of the Main Campus at 7500 Chaminade Avenue, 23241 Cohasset Street, and 2360 Saticoy Street (see Figure 2B), and the North Campus located at 23217-23255 Saticoy Street and 7619-7629 Woodlake Avenue (see Figure 2C).

The Main Campus is currently occupied by the existing Chaminade High School campus located at the northeast corner of the intersection of Chaminade Avenue and Cohasset Street. The Main Campus includes several one- and multi-level classroom, administrative, and ancillary buildings, as well as a sports stadium and athletic fields. The Main Campus is bounded by Keswick Street to the north, by Chaminade Avenue to the west, by Cohasset Street to the south, and by multiple single-story residential structures to the east. The main campus slopes to the south with approximately 42 feet of vertical relief across the site.

The North Campus, north and east of Saticoy Street, is relatively level with approximately 4 feet of vertical relief (see Figure 2C). The North Campus is currently occupied by several single-story commercial structures surrounded by on grade asphalt parking. Surface water drainage at the site appears to be by sheet flow along the existing ground contours to the city streets.

It is our understanding that the proposed improvements will include :

- Constructing a pedestrian bridge over Saticoy Street connecting the Main and North Campus
- North Campus:
    - Demolish the existing commercial structures and remove the existing paving
    - Construct a new pool and pool house
    - Construct new sports fields with associated ancillary structures
    - Construct an on-grade parking area
- Main Campus:
    - Demolish 6 of the existing administrative and classroom structures (including 2 portable buildings)
    - Construct a new Main three-story administrative/classroom structure
    - Renovate existing surface parking areas and sports fields.

Based on the preliminary nature of the design at this time, wall and column loads were not available. It is anticipated that column loads for the proposed structures will be up to 300 kips, and wall loads will be up to 4 kips per linear foot.

At this time the proposed building elevations have not yet been finalized. The existing and anticipated proposed site conditions are depicted on the Site Plans and Cross Sections (see Figures 2A through 2E). Once the design phase and foundation configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. PRIOR INVESTIGATION REPORTS

We were provided with a copy of prior geotechnical investigation reports for the site prepared by Geotechnologies, Inc. that include the following:

Geotechnical Engineering Investigation, Proposed Performing Arts Center, 7500 Chaminade Avenue, West Hills, California, File No. 19793, dated June 1, 2009, by Geotechnologies, Inc.

Stormwater Disposal, Performing Arts Center, Chaminade High School, 7500 Chaminade Avenue, West Hills, California, File No. 19793, dated February 24, 2010, by Geotechnologies, Inc.

Response to Geology and Soils Report Correction Letter, Proposed Performing Arts Center, Chaminade High School, 7500 Chaminade Avenue, West Hills, California, File No. 19793, dated May 5, 2010, by Geotechnologies, Inc.

In 2009, Geotechnologies, Inc. excavated five hollow stem auger borings and three test pits on the west side of the Main Campus for the design of a proposed auditorium/performing arts center. Also, as part of the same investigation, three additional large-diameter borings were excavated in 2010, two in the area west of the existing football stadium, in the parking lot for a proposed infiltration area (borings B6 and B7) and one in the area of the deepest portion of the excavation for the performing arts center (boring B8). The borings ranged from 20 to 40 feet beneath the existing ground surface and the test pits ranged from 5½ to 7½ feet beneath the existing ground surface. The geologic materials encountered in the borings consist of artificial fill, alluvium, and sedimentary bedrock of the Monterey Formation. The depth to bedrock in the explorations ranged from 1 to 16 feet and the bedrock consists of interbedded siltstone, diatomaceous siltstone, siliceous siltstone and sandstone. Boring B8 was downhole logged by a geologist. Bedding in the Monterey Formation bedrock was observed in the borings and test pits to strike N20W to N70E and dip 10 degrees northeast and 12 to 30 degrees southeast. Static groundwater was not encountered in the prior borings; however, water seepage was encountered in boring B7 within the bedrock at a depth of approximately 18 feet below the ground surface. Residual shear tests were performed on bedrock samples collected in boring B8.

Geocon West, Inc. has reviewed the referenced report by Geotechnologies Inc. (2009, 2010). Where applicable, the recommendations presented herein consider the subsurface and laboratory data included in the prior report, as well as our own subsurface and laboratory data. Furthermore, we assume responsibility for the utilization of the exploration and laboratory data presented within the prior geotechnical report. Geocon West, Inc. is the Geotechnical Consultant of Record and will be providing all necessary geotechnical consultation, plan review, design recommendations, inspection and testing services for this project. Where differing, the recommendations presented herein supersede all previous recommendations. The previous investigation reports are presented in Appendix C.

4. GEOLOGIC SETTING

The site is located in the western portion of the San Fernando Valley, an alluvial-filled basin approximately 23 miles wide and 12 miles long (Hitchcock and Wills, 2000). The alluvium within the San Fernando Valley is derived primarily from the Santa Monica Mountains to the south, the Santa Susana Mountains to the north, the Simi Hills to the west, the San Gabriel Mountains to the northeast, and the Verdugo Mountains to the east. The site is located on the valley floor and the surficial alluvial sediments underlying the site were derived primarily from local drainages originating in the Santa Susana Mountains to the north (Hitchcock and Wills, 2000). Locally, isolated bedrock outcrops are present in the site vicinity and shallow bedrock underlies the northern portion of the main campus.

5. SOIL AND GEOLOGIC CONDITIONS

Based on our field investigation and published geologic maps of the area, the site is underlain by artificial fill, Holocene age alluvium and colluvium, and the northern portion of the main campus is underlain by shallow sedimentary bedrock of the Monterey Formation, also called the Modelo Formation (Dibblee, 1992). Detailed stratigraphic profiles of the materials encountered at the site are provided on the boring logs in Appendix A.

5.1 Artificial Fill

As encountered in the borings, the artificial fill at the site is typically less than 3 feet thick except in the northeastern portion of the Main Campus (B6) and the eastern portion of the North Campus (B2) where fill was encountered to depths of 6 feet in boring B6 and 5 feet in boring B2. The artificial fill generally consists of brown to dark brown or grayish brown sandy clay, sandy silt, and silty sand with varying amounts of gravel. The fill is characterized as dry to moist and soft to hard or loose to medium dense. Artificial fill was encountered in the prior Geotechnologies borings at the site to a maximum depth of 7 feet beneath the ground surface in boring B3. The fill consists of dark brown to yellowish brown sandy and clayey silt, silty clay, and silty sand and is characterized moist and stiff or medium dense. The fill is likely the result of past grading or construction activities at the site. Deeper fill may exist between excavations and in other portions of the site that were not directly explored.

5.2 Alluvium

The artificial fill is locally underlain by Holocene age alluvium in borings B1 through B4 on the North Campus and in borings B5 through B7 along the east side of the Main Campus and in boring B12 in the southern portion of the Main Campus. The alluvium consists primarily of brown to dark brown, olive brown or dark gray interbedded clay, sandy clay, sandy silt, silty sand, clayey sand, and poorly graded sand with various amounts of gravel. The alluvium is characterized as fine to medium-grained, dry to saturated, and very loose to dense or soft to hard. Alluvium was encountered beneath the fill in the prior Geotechnologies borings B6 and B7, in southern portion of the Main Campus. As logged in the prior borings, the alluvium consists of yellowish brown to dark brown silty sand to sandy silt or clayey silt to silty clay and is characterized moist and stiff or medium dense.

5.3 Colluvium

Colluvium was encountered beneath the artificial fill in borings B10 and B11, south of the existing performing arts center. The colluvium ranges from 2 to 3 feet thick and consists of olive brown to dark brown sandy clay and sandy silt with various amounts of bedrock fragments. The colluvium is characterized as slightly moist to moist, and stiff to hard.

5.4 Monterey Formation

Sedimentary bedrock of the Miocene age Monterey Formation (also known as the Modelo Formation) directly underlies the artificial fill in borings B8 and B9 (adjacent to the proposed administration building in the central portion of the Main Campus) and was encountered below the surficial soils (alluvium and colluvium) in the remainder of the borings. The bedrock at the site consists of interbedded sandstone and siltstone with some localized diatomaceous siltstone and siliceous siltstone beds. The bedrock is characterized as poorly bedded to well-bedded, soft to hard, and slightly to highly weathered with various amounts of oxidation staining. Bedrock was encountered in all borings, including the prior borings by Geotechnologies Inc., except in the current borings B2 and B12. Boring B2 is located on the east side of the North Campus in the vicinity of the proposed pool house and boring B12 is located on the southern portion of the Main Campus. Based on the prior explorations at the site, bedding in the Monterey Formation bedrock was observed in the prior borings and test pits to strike N20W to N70E and dip 10 degrees northeast and 12 to 30 degrees southeast (Geotechnologies, 2009; 2010).

6. GROUNDWATER

Based on a review of the California Division of Mines and Geology (CDMG) Seismic Hazard Evaluation of the Calabasas 7.5-Minute Quadrangle (CDMG, 1997; revised 2001), the historic high groundwater level beneath the site is greater than 10 feet below the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990s. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever exceed the historic high levels.

Groundwater was encountered during site exploration in borings B1 and B12 at depths of approximately 32 feet and 14½ feet beneath the existing ground surface, respectively. However, static groundwater was not encountered in the prior borings by Geotechnologies Inc. (2009, 2010), drilled to a maximum depth of 40 feet below ground surface. Groundwater seepage was encountered within the bedrock at a depth of approximately 18 feet in boring B7 (Geotechnologies, 2010). Based on the reported historic high groundwater levels in the site vicinity (CDMG, 1997; revised 2001), the depth to groundwater encountered in our borings, and the depth of proposed construction, static groundwater is not expected to be encountered during construction or to have a detrimental effect on the project. However, it is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially along the top of the bedrock contact and within impermeable fine-grained soils which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the immediate site vicinity. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 8.25).

7. GEOLOGIC HAZARDS

7.1 Surface Fault Rupture

The numerous faults in Southern California include Holocene-active, pre-Holocene, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS, formerly known as CDMG) for the Alquist-Priolo Earthquake Fault Zone Program (CGS, 2018a). By definition, a Holocene-active fault is one that has had surface displacement within Holocene time (about the last 11,700 years). A pre-Holocene fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years) but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a state-designated Alquist-Priolo Earthquake Fault Zone (CGS, 2022b; 2018b) for surface fault rupture hazards. No Holocene-active or pre-Holocene faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. However, the site is located in the seismically active Southern California region and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 3, Regional Fault Map.

The closest active fault to the site is the Simi-Santa Rosa Fault Zone, located approximately 7.4 miles to the northwest (USGS, 2006). Other nearby active faults are the Santa Susana Fault, the San Fernando segment of the Sierra Madre Fault Zone, an unnamed fault in North Hollywood, the San Gabriel Fault Zone, and the Verdugo Fault located approximately 8.2 miles north-northeast, 9.7 miles northeast, 13 miles east-southeast, 15 miles north, and 18 miles east of the site, respectively. (Ziony and Jones, 1989; USGS, 2006). The active San Andreas Fault Zone is located approximately 34 miles northeast of the site (USGS, 2006).

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Southern California area at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987, M_w 5.9 Whittier Narrows earthquake and the January 17, 1994 M_w 6.7 Northridge earthquake were a result of movement on the Puente Hills Blind Thrust and the Northridge Thrust, respectively. These thrust faults and others in the Southern California area are not exposed at the surface and do not present a potential surface fault rupture hazard at the site; however, these deep thrust faults are considered active features capable of generating future earthquakes that could result in moderate to significant ground shaking at the site.

7.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 5.0 in the site vicinity are depicted on Figure 4, Regional Seismicity Map. A partial list of moderate to major magnitude earthquakes that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
Near Redlands	July 23, 1923	6.3	80	E
Long Beach	March 10, 1933	6.4	56	SE
Tehachapi	July 21, 1952	7.5	59	NNW
San Fernando	February 9, 1971	6.6	19	NE
Whittier Narrows	October 1, 1987	5.9	33	ESE
Sierra Madre	June 28, 1991	5.8	36	E
Landers	June 28, 1992	7.3	125	E
Big Bear	June 28, 1992	6.4	103	E
Northridge	January 17, 1994	6.7	6	E
Hector Mine	October 16, 1999	7.1	137	E
Ridgecrest	July 5, 2019	7.1	122	NE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

7.3 Seismic Design Criteria

The following table summarizes the site-specific design criteria obtained from the 2022 California Building Code (CBC; Based on the 2021 International Building Code [IBC] and ASCE 7-16), Chapter 16 Structural Design, Section 1613 Earthquake Loads. The data was calculated using the online application *U.S. Seismic Design Maps*, provided by the Structural Engineers Association of California (SEAOC). The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.2.2 of the 2022 CBC and Table 20.3-1 of ASCE 7-16. The values presented below are for the risk-targeted maximum considered earthquake (MCE_R).

2022 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2019 CBC Reference
Site Class	C	Section 1613.2.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	1.5g	Figure 1613.2.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.6g	Figure 1613.2.1(2)
Site Coefficient, F_A	1.2	Table 1613.2.3(1)
Site Coefficient, F_V	1.7	Table 1613.2.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	1.8g	Section 1613.2.3 (Eqn 16-36)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	1.02g	Section 1613.2.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.2g	Section 1613.2.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.68g	Section 1613.2.4 (Eqn 16-39)

The table on the following page presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-16.

ASCE 7-16 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-16 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.538g	Figure 22-9
Site Coefficient, F_{PGA}	1.2	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.646g	Section 11.8.3 (Eqn 11.8-1)

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,475 years. According to the 2022 California Building Code and ASCE 7-16, the MCE is to be utilized for the evaluation of liquefaction, lateral spreading, seismic settlements, and it is our understanding that the intent of the Building code is to maintain "Life Safety" during a MCE event. The Design Earthquake Ground Motion (DE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years.

Deaggregation of the MCE peak ground acceleration was performed using the USGS online Unified Hazard Tool, 2014 Conterminous U.S. Dynamic edition (v4.2.0). The result of the deaggregation analysis indicates that the predominant earthquake contributing to the MCE peak ground acceleration is characterized as a 6.66 magnitude event occurring at a hypocentral distance of 11.17 kilometers from the site.

Deaggregation was also performed for the Design Earthquake (DE) peak ground acceleration, and the result of the analysis indicates that the predominant earthquake contributing to the DE peak ground acceleration is characterized as a 6.58 magnitude occurring at a hypocentral distance of 13.67 kilometers from the site.

Conformance to the criteria in the above tables for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

7.4 Liquefaction Potential - General

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Liquefaction in California" and "Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine- to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

The State of California Seismic Hazard Zone Map for the Calabasas Quadrangle (CDMG, 1998; CGS, 2022b) indicates that the southern portion of the Main Campus and the entire North Campus are located in an area designated as having a potential for liquefaction. Consequently, the proposed pool, pool house and pedestrian bridge are located within areas designated as having a potential for liquefaction. Groundwater was encountered during site exploration in borings B1 (North Campus) and B12 (southern portion of the Main Campus) at depths of approximately 32 feet and 14½ feet beneath the existing ground surface, respectively.

7.4.1 North Campus Liquefaction Potential

The North Campus is underlain by artificial fill, potentially liquefiable alluvium, further underlain by Monterey formation bedrock. The depth of the bedrock ranges from 12 feet on the west portion of the property, to 42 feet on the east side of the property.

It is anticipated that the proposed pedestrian bridge structure can be founded on relatively shallow bedrock using deepened foundations (piles) extending through the potentially liquefiable materials. Since structures will be supported on bedrock, it is our opinion that the potential for liquefaction and associated ground deformations to impact structures is considered very low.

Due to the depth of bedrock on the east side of the North Campus, deepened foundations are not considered economically feasible for the construction of the North Campus pool house improvements. Therefore, a liquefaction analysis was performed to determine the feasibility of a shallow foundation system.

Liquefaction analysis of the soils underlying the site was performed using an updated version of the spreadsheet template LIQ2_30.WQ1 developed by Thomas F. Blake (1996). This program utilizes the 1996 NCEER method of analysis. This semi-empirical method is based on a correlation between values of Standard Penetration Test (SPT) resistance and field performance data.

Screening criteria developed by Bray and Sancio (2006) characterize fine-grained soils which are not susceptible to liquefaction as soils with a plasticity index (PI) that is greater than 18 or with a saturated moisture content that is less than 80 percent of the liquid limit. In order to apply the screening criteria, laboratory testing was performed to evaluate the Atterberg Limits and saturated moisture content of select soil samples. Laboratory test results used for the screening criteria are presented as Figures B16 and B17.

The liquefaction analysis was performed for a Design Earthquake level by using a high groundwater table of 10 feet below the ground surface, a magnitude 6.58 earthquake, and a peak horizontal acceleration of 0.431g ($⅔PGA_M$). The enclosed liquefaction analyses included herein for borings B1 indicate that the alluvial soils below the proposed foundation level would be prone to approximately 2.2 inches of liquefaction settlement during a Design Earthquake ground motion (see enclosed calculation sheets, Figures 5 and 6). The resulting differential settlement at the foundation level is anticipated to be approximately 1½ inches over a distance of 20 feet.

It is our understanding that the intent of the Building Code is to maintain “Life Safety” during Maximum Considered Earthquake level events. Therefore, additional analysis was performed to evaluate the potential for liquefaction during a MCE event. The structural engineer should evaluate the proposed structure for the anticipated MCE liquefaction induced settlements and verify that anticipated deformations would not cause the foundation system to lose the ability to support the gravity loads and/or cause collapse of the structure.

The liquefaction analysis was also performed for Maximum Considered Earthquake levels by using a historic high groundwater table of 10 feet below the ground surface, a magnitude 6.66 earthquake, and a peak horizontal acceleration of 0.646g (PGA_M). The enclosed liquefaction analysis, included herein for boring B1 indicates that the alluvial soils below the proposed foundation would be prone to approximately 2½ inches of liquefaction settlement during a Maximum Considered Earthquake ground motion (see enclosed calculation sheets, Figures 7 and 8). The resulting differential settlement at the foundation level is anticipated to be approximately 1¼ inches over a distance of 20 feet.

7.4.2 Main Campus Liquefaction Potential

Based on the anticipated configurations of the proposed improvements, all proposed foundations will be underlain by Monterey formation bedrock. It is recommended that building foundations be founded on bedrock. Based on these considerations, it is our opinion that the potential for liquefaction and associated ground deformations to impact the proposed structure is considered very low.

Once the configuration of the proposed improvements are finalized, additional analysis should be performed as necessary to address liquefaction potential.

7.5 Slope Stability

The topography at the site slopes to the south with 42 feet of elevation difference, and the topography in the immediate site vicinity slopes gently to the southeast. The site is located within a City of Los Angeles Hillside Grading Area but is not located within a city-designated Hillside Ordinance Area (City of Los Angeles, 2022). The County of Los Angeles Safety Element (Leighton, 1990) indicates that the site is within a hillside area. According to the California Geological Survey (CDMG, 1998), the site is not located within an area identified as having a potential for seismic slope instability. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Based on these considerations, the potential for slope stability hazards to impact the proposed development is considered low.

The planned excavation for the proposed administration building will expose bedrock in the majority of the excavation (see Figure 2E). As previously indicated, bedding in the Monterey Formation bedrock was observed in the prior borings and test pits to strike N20W to N70E and dip 10 degrees northeast and 12 to 30 degrees southeast (Geotechnologies, 2009; 2010). If this bedding orientation is consistent across the site, day-lighted (adverse) bedding will be exposed along the west (east- and southeast-facing) and north (south-facing) excavation walls for the proposed administration building. However, due to the limited bedding information collected at the site and the inconsistency of the observed bedding orientations, the bedding orientation at the site should be verified during excavation.

7.6 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. Based on a review of the County of Los Angeles Safety Element (Leighton, 1990), the site is not located within a potential inundation area for an earthquake-induced dam failure. Therefore, the potential for inundation at the site as a result of an earthquake-induced dam failure is considered low.

7.7 Tsunamis, Seiches, and Flooding

The site is not located within a coastal area. Therefore, tsunamis, are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Therefore, flooding from a seismically induced seiche is considered unlikely.

The site is within an area of minimal flooding (Zone X) as defined by the Federal Emergency Management Agency (FEMA, 2022; LACDPW, 2022).

7.8 Oil Fields & Methane Potential

Based on a review of the California Geologic Energy Management Division (CalGEM) Well Finder Website, the site is not located within an oil field and there are no oil or gas wells documented at the site or within ½-mile of the site (CalGEM, 2022). However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map and undocumented wells could be encountered during construction. Any wells encountered will need to be properly abandoned in accordance with the current requirements of the CalGEM.

The site is not located within a City of Los Angeles Methane Zone or Methane Buffer Zone (City of Los Angeles, 2022). Since the site is not located within the boundaries of a known oil field, the potential for the presence of methane or other volatile gases at the site is considered low. However, should it be determined that a methane study is required for the proposed development it is recommended that a qualified methane consultant be retained to perform the study and provide mitigation measures as necessary.

7.9 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The majority of the site is underlain by shallow bedrock that is not susceptible to subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site. There appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases at the site.

8. CONCLUSIONS AND RECOMMENDATIONS

8.1 General

8.1.1 It is our opinion that neither soil nor geologic conditions were encountered during the investigation that would preclude the construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction.

8.1.2 Up to 6 feet of existing artificial fill was encountered during the site investigation. The existing fill encountered is believed to be the result of past grading and construction activities at the site. Deeper fill may exist in other areas of the site that were not directly explored. Demolition of the existing structures that occupy the site is anticipated to disturb the upper few feet of existing site soils. It is our opinion that the existing fill, in its present condition, is not suitable for direct support of proposed foundations or slabs. The existing fill and site soils are suitable for re-use as engineered fill provided the recommendations in the Grading section of this report are followed (see Section 8.4).

8.1.3 The proposed North Campus pool house (see Figure 2C) is located within a liquefaction hazard zone and underlain by potentially liquefiable soils further underlain by Monterey Formation Bedrock at a depth of 42 feet (see B1). The liquefaction analysis included herein indicates that the alluvial soils below the historic high groundwater level could be prone to approximately 2.2 inches of total settlement as a result of the Design Earthquake peak ground acceleration ($⅔PGA_M$). The resulting differential settlement at the ground surface is anticipated to be approximately 1½ inches over a distance of 20 feet. Based on these considerations it is recommended that a reinforced concrete mat foundation system deriving support in newly placed engineered fill may be utilized for support of the proposed North Campus pool house.

8.1.4 The proposed pedestrian bridge is underlain by artificial fill and moderately compressible alluvial soils further underlain by bedrock at a depth between approximately 12 and 15 feet below the existing ground surface based on current boring data (see Borings B3 and B4). It is recommended that a deepened foundation system (piles) deriving support in bedrock be utilized to support the proposed pedestrian bridge.

8.1.5 The proposed Main Campus administration building will be directly underlain by exposed Monterey Formation Bedrock. The bedrock at this location is considered suitable for direct support of the proposed structure. Based on these considerations a conventional spread foundation system and slab-on-grade is considered suitable for the proposed structure.

8.1.6 The grading and foundation recommendations presented herein are intended to minimize the effects of settlement on proposed improvements.

8.1.7 A Summary of the recommended foundation systems for the proposed structures is provided in the table below.

Recommended Foundation Systems

Campus Location	Structure Name	Recommended Foundation Type	Recommended Slab	Recommended Bearing Material
Main Campus	New Administration Building	Conventional Spread Foundations[1]	Conventional Slab-on-Grade	Bedrock
North/Main Campus	Bridge	Deepened Foundations (Piles)[2]	NA	Bedrock
North Campus	Pool House	Mat Foundation[3]	Mat Foundation[3]	Engineered Fill

1. See Section 8.7 and 8.9 for Conventional Foundation Recommendations
2. See Sections 8.10 through 8.12 for Deepened Foundations Recommendations
3. See Section 8.8 and 8.9 for Mat Foundation Recommendations

8.1.8 Groundwater was encountered during site exploration in borings B1 and B12 at depths of approximately 32 feet and 14½ feet beneath the existing ground surface, respectively. Previously, groundwater seepage was encountered within the bedrock at a depth of approximately 18 feet in boring B7 (Geotechnologies, 2010). It is anticipated that the current static groundwater table is sufficiently deep that it will not be encountered during shallow construction excavations, with the exception of a deep drilled excavation such as piles or elevator pistons. However, local seepage could develop and should be expected on top of the bedrock or within the joints and fractures in the bedrock, especially if conducted during the rainy season.

8.1.9 The bedrock encountered in our investigation is slightly to highly weathered and should be rippable with conventional equipment; however, concretions or well cemented layers may be encountered in the bedrock which could make excavation or drilling conditions difficult. Coring or jack-hammering may be required if concretions are encountered and the contractor should be prepared for these conditions.

8.1.10 Excavations on the order of 14 feet in vertical height are anticipated for construction of the proposed administration structure, including foundation depths. Based on the prior explorations at the site, bedding in the Monterey Formation bedrock was observed in the prior borings and test pits to strike N20W to N70E and dip 10 degrees northeast and 12 to 30 degrees southeast (Geotechnologies, 2009; 2010). Unfavorably oriented (adverse) bedding is anticipated to be exposed along the west (east- and southeast-facing) and north (south-facing) excavation walls for the proposed administration building. As shown on the cross sections, excavations for proposed retaining walls along the north and east sides of the property are anticipated to expose bedrock orientations that are favorable with respect to stability of the excavation.

8.1.11 Due to the depth of the excavations and the proximity to the property lines, city streets, and adjacent on-site structures, excavation for the proposed retaining walls will require sloping and/or shoring measures in order to provide a stable excavation. Where shoring is required, it is recommended that a soldier pile shoring system be utilized. Where excavation depths exceed 12 feet or surcharges are imposed on the shoring system, raker braces or tie-back anchors may be required in conjunction with the soldier piles. The need for lateral bracing and the acceptable shoring deflection should be determined by the project shoring engineer.

8.1.12 The recommendations for shoring and retaining wall design presented herein incorporate the anticipated surcharge loads generated by out-of-slope bedding.

8.1.13 Excavations must be conducted in a manner that maintains stability and must be observed and approved by the Project Geologist (a representative of Geocon West, Inc.). A geologist should periodically observe the excavation to confirm that the orientation of the exposed bedrock is consistent with the conditions observed during our investigation.

8.1.14 Due to the nature of the proposed design and intent for a partial subterranean level, waterproofing of subterranean walls and slabs is suggested. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.1.15 Where new paving is to be placed, it is recommended that all existing fill soils and soft soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing fill and soft soils in the area of new paving is not required, however, paving constructed over existing uncertified fill or unsuitable soils may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified and properly compacted. Paving recommendations are provided in the *Preliminary Pavement Recommendations* section of this report (see Section 8.15).

8.1.16 Based on the results of the percolation testing performed at the site, a stormwater infiltration system is not considered feasible for this project. A discussion of the test results is provided in the *Stormwater Infiltration* section of this report (see Section 8.23).

8.1.17 Once the design and foundation loading configurations for the proposed structure proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Based on the final foundation loading configurations, the potential for settlement should be reevaluated by this office.

8.1.18 Any changes in the design, location or elevation, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

8.2 Soil and Excavation Characteristics

8.2.1 The in-situ soils can be excavated with moderate effort using conventional excavation equipment. Some caving should be anticipated in unshored excavations, especially if granular fill soils are encountered. The surficial bedrock is moderately to highly weathered and should be rippable with conventional equipment; however, concretions or well cemented layers may be encountered in the bedrock which could make excavation or drilling conditions difficult. Coring or jack-hammering may be required if concretions are encountered and the contractor should be prepared for these conditions.

8.2.2 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of existing adjacent improvements.

8.2.3 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping or shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 8.21).

8.2.4 The existing site soils encountered during the field investigation near the ground surface are considered to have a “low” to “medium” (EI = 21, 57 and 63) expansive potential and are classified as “expansive” in accordance with the 2022 California Building Code (CBC) Section 1803.5.3. The recommendations presented herein assume that the proposed foundations and slabs will derive support in the “expansive” soils.

8.3 Minimum Resistivity, pH, and Water-Soluble Sulfate

8.3.1 Potential of Hydrogen (pH) and resistivity testing as well as chloride content testing were performed on representative samples of soil to generally evaluate the corrosion potential to surface utilities. The tests were performed in accordance with California Test Method Nos. 643 and 422 and indicate that the soils encountered at foundation depths are considered "moderately corrosive" to "corrosive" with respect to corrosion of buried ferrous metals on site. The results are presented in Appendix B (Figures B26 and B27) and should be considered for design of underground structures. Due to the corrosive potential of the soils, it is recommended that PVC, ABS or other approve plastic piping be utilized in lieu of cast-iron when in direct contact with the site soils.

8.3.2 Laboratory tests were performed on representative samples of the site soils to measure the percentage of water-soluble sulfate content. Results from the laboratory water-soluble sulfate tests are presented in Appendix B (Figures B26 and B27) and indicate that the on-site materials possess "S0" sulfate exposure to concrete structures as defined by 2022 CBC Section 1904 and ACI 318 Table 19.3.1.1.

8.3.3 Geocon West, Inc. does not practice in the field of corrosion engineering and mitigation. If corrosion sensitive improvements are planned, it is recommended that a corrosion engineer be retained to evaluate corrosion test results and incorporate the necessary precautions to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils.

8.4 Grading

8.4.1 Grading is anticipated to include excavation of site soils for foundations, foundations of small outlying structures, and utility trenches, as well as placement of backfill for walls, ramps, and trenches.

8.4.2 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer, geotechnical engineer, and building official in attendance. Special soil handling requirements can be discussed at that time.

8.4.3 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill and alluvium encountered during exploration are suitable for re-use as engineered fill, provided any encountered oversize material (greater than 6 inches) and any encountered deleterious debris are removed.

8.4.4 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. Concrete should not be mixed with the fill soils unless approved by the Geotechnical Engineer; in accordance with City policy, concrete and asphalt is not permitted to be mixed into structural fill. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.) and the City of Los Angeles Inspector.

8.4.5 At a minimum, it is recommended that the upper 5 feet of existing earth materials within the proposed North Campus pool house footprint area be excavated and properly compacted for support of the reinforced concrete mat foundation system. Deeper excavations should be conducted as necessary to remove any existing deeper artificial fill or soft alluvial soil at the direction of the Geotechnical Engineer (a representative of Geocon). The excavation should extend laterally a minimum distance of 3 feet beyond the building footprint area, including building appurtenances, or a distance equal to the depth of fill below the foundation, whichever is greater. The limits of existing fill and/or soft alluvial soils removal will be verified by the Geocon representative during site grading activities.

8.4.6 It is recommended that foundations for the proposed Main Campus administrative building and pedestrian bridge penetrate through the existing artificial fill and alluvial soils in order to derive support exclusively in the underlying competent bedrock. All excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.) prior to the placement of engineered fill. If the existing artificial fills and site soils are not properly compacted for slab support, then a structural slab, that derives all support from the pile foundation system, will be required.

8.4.7 It is anticipated that bedrock will be exposed throughout the Main Campus administration building footprint area at the excavation bottom, and the bedrock is considered suitable for support of the foundations and concrete slab-on-grade. Any bedrock that is unintentionally disturbed should be compacted for slab support. At the ground floor level, it is recommended that all existing artificial fill and/or soft colluvium be excavated and properly compacted for slab support. The limits of existing fill and/or soft colluvium removal will be confirmed by the Geocon representative during site grading activities.

8.4.8 All imported fill shall be observed, tested and approved by Geocon West, Inc. prior to bringing soil to the site. Rocks larger than 6 inches in diameter shall not be used in the fill. Imported soils should have an expansion index less than 50 and soils corrosivity properties that are equally or less detrimental to that of the existing onsite soils (see Figure B26 and B27).

8.4.9 The City of Los Angeles Department of Building and Safety requires a minimum compactive effort of 95 percent of the laboratory maximum dry density in accordance with ASTM D 1557 (latest edition) where the soils to be utilized in the fill have less than 15 percent finer than 0.005 millimeters. Soils with more than 15 percent finer than 0.005 millimeters may be compacted to 90 percent of the laboratory maximum dry density in accordance with ASTM D 1557 (latest edition). All fill and backfill soils should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to near optimum moisture content, and properly compacted to the required degree of compaction in accordance with ASTM D 1557 (latest edition). Soils should be moisture conditioned to two percent above optimum moisture content.

8.4.10 Where new paving is to be placed, it is recommended that all existing fill and soft alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing fill and soft soils in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvial soil may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified, moisture conditioned to at least 2 percent above optimum moisture content, and compacted to at least 92 percent relative compaction for paving support. Paving recommendations are provided in *Preliminary Pavement Recommendations* section of this report (see Section 8.15).

8.4.11 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be tied to the proposed to the main structures, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed, foundations may derive support directly in the competent undisturbed alluvium, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative.

8.4.12 Utility trenches should be properly backfilled in accordance with the following requirements. The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least 1 foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of Geocon). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. If gravel is used for trench bedding and shading (typical when seepage is present) it must be 3/16-inch rounded birds-eye rock in accordance with the City of LA plumbing department requirements. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack slurry is also acceptable as backfill (see Section 8.5). Prior to placing any bedding materials or pipes, the excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

8.4.13 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon), prior to placing bedding materials, fill, steel, gravel, or concrete.

8.5 Controlled Low Strength Material (CLSM)

8.5.1 Controlled Low Strength Material (CLSM) may be utilized in lieu of compacted soil as engineered fill where approved in writing by the Geotechnical Engineer. Where utilized within the City of Los Angeles use of CLSM is subject to the following requirements:

Standard Requirements

1. CLSM shall be ready-mixed by a City of Los Angeles approved batch plant;
2. CLSM shall not be placed on uncertified fill, on incompetent natural soil, nor below water;
3. CLSM shall not be placed on a sloping surface with a gradient steeper than 5:1 (horizontal to vertical);
4. Placement of the CLSM shall be under the continuous inspection of a concrete deputy inspector;
5. The excavation bottom shall be accepted by the soil engineer and the City Inspector prior to placing CLSM.

Requirements for CLSM that will be used for support of footings

1. The cement content of the CLSM shall not be less than 188 pounds per cubic yard (min. 2 sacks);

2. The excavation bottom must be level, cleaned of loose soils and approved in writing by Geocon prior to placement of the CLSM;

3. The ultimate compressive strength of the CLSM shall be no less than 100 psi when tested on the 28th day per ASTM D4832 (latest edition), Standard Test Method for Preparation and Testing of Controlled Low Strength Material Test Cylinders. Compression testing will be performed in accordance with ASTM C39 and City of Los Angeles requirements;

4. Samples of the CLSM will be collected during placement, a minimum of one test (two cylinders) for each 50 cubic yards or fraction thereof;

5. Overexcavation for CLSM placement shall extend laterally beyond the footprint of any proposed footings as required for placement of compacted fill, unless justified otherwise by the soil engineer that footings will have adequate vertical and horizontal bearing capacity.

8.6 Foundation Design – General

8.6.1 A Summary of the recommended foundation systems for the proposed structures is provided in the table on the following page.

Recommended Foundation Systems

Campus Location	Structure Name	Recommended Foundation Type	Recommended Slab	Recommended Bearing Material
Main Campus	New Administration Building	Conventional Spread Foundations[1]	Conventional Slab-on-Grade	Bedrock
North/Main Campus	Bridge	Deepened Foundations (Piles)[2]	NA	Bedrock
North Campus	Pool House	Mat Foundation[3]	Mat Foundation[3]	Engineered Fill

1. See Section 8.7 and 8.9 for Conventional Foundation Recommendations
2. See Sections 8.10 through 8.12 for Deepened Foundations Recommendations
3. See Section 8.8 and 8.9 for Mat Foundation Recommendations

8.6.2 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

8.6.3 This office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.6.4 Once the design and foundation loading configurations for the proposed structures proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions, the potential for settlement should be reevaluated by this office.

8.7 Conventional Foundation Design

8.7.1 Where a conventional foundation system is utilized, foundations should derive support in the competent bedrock. Foundations should penetrate through the existing artificial fill, alluvium or colluvium and any soft or highly weathered bedrock, in order to derive support exclusively in competent bedrock. Foundation's excavations must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.7.2 Continuous footings may be designed for an allowable bearing capacity of 4,500 pounds per square foot (psf), and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing material.

8.7.3 Isolated spread foundations may be designed for an allowable bearing capacity of 5,000 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing material.

8.7.4 The allowable soil bearing pressure above may be increased by 300 psf and 700 psf for each additional foot of foundation width and depth, respectively, up to a maximum allowable soil bearing pressure of 7,000 psf.

8.7.5 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

8.7.6 If depth increases are utilized for the perimeter foundations, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.7.7 Continuous footings should be reinforced with four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. Reinforcement for spread footings should be designed by the project structural engineer.

8.7.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

8.7.9 Provided the foundation excavations and the concrete slab-on-grade subgrade exposes undisturbed bedrock, no special subgrade presaturation is required prior to placement of concrete. However, the slab and foundation subgrade should be sprinkled as necessary to maintain a moist condition as would be expected in any concrete placement. Where engineered fill is placed as subgrade soils, due to the expansive nature of the soils, the moisture content in the slab and foundation subgrade should be maintained at 2 percent above optimum moisture content prior to and at the time of concrete placement.

8.7.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavation and exposed soil conditions are consistent with those anticipated. If unanticipated conditions are encountered, foundation modifications may be required.

8.7.11 This office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.8 Mat Foundation Design

8.8.1 Once the recommended grading has been completed, the proposed pool house structure may be supported by a reinforced mat foundation system deriving support in newly placed engineered fill. The mat foundation system allows for more efficient construction and is better at distributing loads to minimize the effect of potential settlement.

8.8.2 The recommended allowable bearing pressure is 3,000 pounds per square foot (psf). The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

8.8.3 It is recommended that a modulus of subgrade reaction of 100 pounds per cubic inch (pci) be utilized for the design of the mat foundation bearing in the undisturbed bedrock. The modulus should be reduced in accordance with the following equation when used with larger foundations:

$$K_R = K\left[\frac{B+1}{2B}\right]^2$$

where: K_R = reduced subgrade modulus
K = unit subgrade modulus
B = foundation width (in feet)

8.8.4 The thickness of and reinforcement for the mat foundation should be designed by the project structural engineer.

8.8.5 For seismic design purposes, a coefficient of friction of 0.40 may be utilized between the concrete mat and bedrock without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

8.8.6 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

8.8.7 Waterproofing of the building slab is suggested for this project. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer.

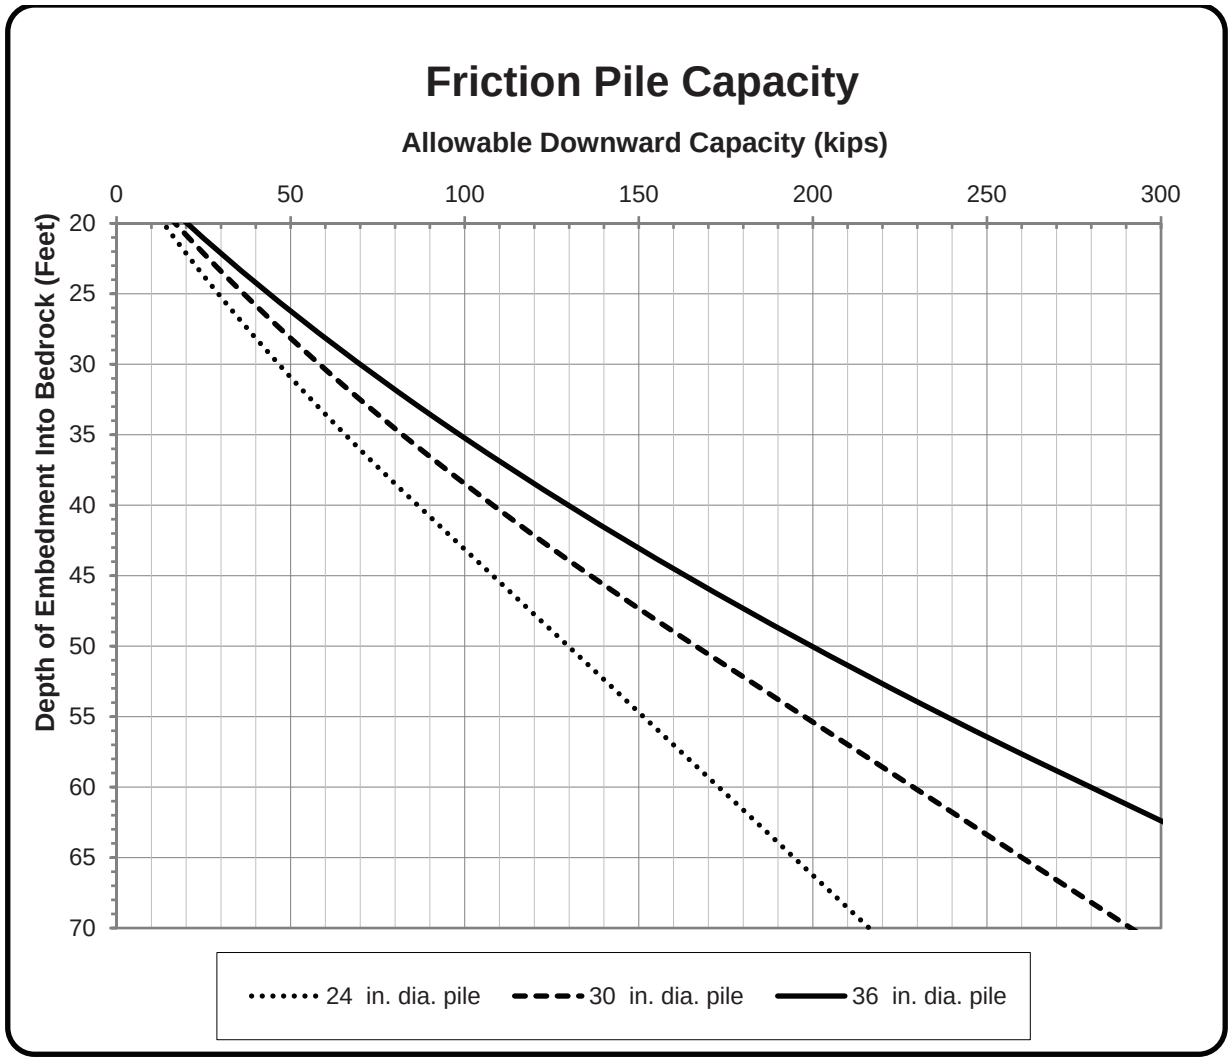
8.8.8 This office should be provided a copy of the final construction plans so that the recommendations presented herein could be properly reviewed and revised if necessary.

8.9 Foundation Settlement

8.9.1 The enclosed liquefaction settlement analyses indicate that the alluvial soils underlying the North Campus could be susceptible to approximately 2.2 inches of total settlement as a result of the Design Earthquake peak ground acceleration (⅔PGA_M). The differential settlement at the foundation level is anticipated to be less than 1½ inches over a distance of 20 feet. These settlements are in addition to the static settlements indicated below and must be considered in the structural design.

8.9.2 Where conventional foundations will be utilized, the footings will be underlain by bedrock which is not prone to liquefaction. Therefore, settlement will be limited to static settlement resulting from the building load. The maximum anticipated static settlement for a conventional foundation system designed with the maximum allowable bearing value of 7,000 psf and deriving support in undisturbed bedrock is expected to be less than ½ inch and occur below the heaviest loaded structural element. Differential settlement is not expected to exceed ¼ inch over a distance of 20 feet or between adjacent bedrock-supported foundations.

8.9.3 The North Campus pool house may be supported by a mat foundation system deriving support in newly placed engineered fill. The maximum static settlement for a reinforced mat foundation system deriving support in the newly placed engineered fill with a maximum allowable bearing value of 3,000 psf is expected to be less than 1 inch and occur below the heaviest loaded structural element. Static differential settlement over a distance of 20 feet, is expected to be less than ½ inch. Based on seismic considerations, the proposed North Campus pool house structure should be designed for a combined static and seismically induced differential settlement of 2.0 inches over a distance of 20 feet.



8.9.4 Once the design and foundation loading configuration for the proposed structure proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions, the potential for settlement should be reevaluated by this office.

8.10 Friction Pile Design

8.10.1 For preliminary design purposes 24-, 30-, and 36-inch diameter drilled cast-in-place friction piles have been evaluated. Friction piles should be embedded a minimum of 20 feet into bedrock. The allowable axial capacities for pile embedment into the competent alluvial soils are provided in the charts below. The axial capacities are based on skin friction; end-bearing capacity is not being considered. The axial capacities also include consideration of down drag forces due to consolidation of the overlying compressible soils as well as down drag from liquefiable soils. An average down drag load of 16 kips, 20 kips, and 24 kips was applied for 24-, 30-, and 36-inch diameter piles respectively.

8.10.2 Once the proposed building configuration proceeds to a more finalized stage, the estimated Downdrag forces should be revised.

8.10.3 Friction piles supporting the proposed on-grade structure at may use the capacities presented in the chart below.

8.10.4 All drilled pile excavations should be continuously observed by personnel of this firm to verify adequate penetration into the recommended bearing materials. The capacity presented is based on the ultimate strength of the bedrock. The compressive and tensile strength of the pile sections should be checked to verify the structural capacity of the piles.

8.10.5 Single pile uplift capacity can be taken as 60 percent of the allowable downward capacity.

8.10.6 The allowable downward capacity and allowable uplift capacity may be increased by one-third when considering transient wind or seismic loads.

8.10.7 The maximum expected static settlement for the structure supported on friction piles is estimated to be less than ½ inch. Differential settlement between adjacent pile foundations is not expected to exceed ½ inch. The majority of the foundation settlement is expected to occur on initial application of loading and during construction.

8.10.8 For increased resistance to differential foundation movement and lateral drift, the pile tops should be interconnected in two horizontal directions with grade beams or tied with a structural slab. The project structural engineer should provide slab and grade beam design, reinforcement and spacing dependent on anticipated loading. However, for grade beams we recommend a minimum embedment depth below lowest adjacent pad grade of 24 inches and a minimum width of 12 inches. In addition, minimum reinforcement should consist of four No. 4 steel reinforcing bars; two placed near the top of the grade beam and two near the bottom.

8.10.9 If pile spacing is at least three times the maximum dimension of the pile, no reduction in axial capacity is considered necessary for group effects. If pile spacing is closer than three pile diameters, an evaluation for group effects including appropriate reductions should be performed by Geocon based on pile dimension and spacing. This will be addressed under separate cover, if necessary, as the design progresses.

8.11 End-Bearing Caissons

8.11.1 Drilled, cast-in-placed end-bearing caissons may also be used to support proposed improvements provided the foundations derive support in bedrock. Drilled, cast-in-place end-bearing concrete caissons should be a minimum of 24 inches in diameter. For preliminary design purposes 24, 36, and 48-inch diameter drilled cast-in-place end-bearing caissons have been evaluated. Caissons should be embedded a minimum of 5 feet into the bedrock to be considered fixed. The allowable axial capacities for end-bearing caissons embedded into the competent alluvial soils are provided in the table on the following page. The axial capacities also include consideration of downdrag forces due to liquefaction and or consolidation of the overlying alluvial soils.

8.11.2 End-bearing caissons supporting the proposed structures may use the capacities presented in the following table.

Caisson Diameter (inches)	Depth Embedded into Bedrock (ft)	Axial Capacity* (kips)
24	5	18
	10	27
36	5	58
	10	79
48	5	116
	10	154

*Capacities have been reduced for Buoyancy

8.11.3 All drilled excavations should be continuously observed by personnel of this firm to verify adequate penetration into the recommended bearing materials. The capacity presented is based on the ultimate strength of the bedrock. The compressive and tensile strength of the caisson sections should be checked to verify the structural capacity of the caissons.

8.11.4 The allowable downward capacity and allowable uplift capacity may be increased by one-third when considering transient wind or seismic loads.

8.11.5 Single caisson uplift capacity may be determined using a frictional resistance of 250 pounds per square foot.

8.11.6 The maximum expected static settlement for the structure supported on end-bearing caissons is estimated to be less than ¾ inch. Differential settlement between adjacent caissons foundations and/or spread foundations in bedrock is not expected to exceed ½ inch. The majority of the foundation settlement is expected to occur on initial application of loading and during construction.

8.11.7 For increased resistance to differential foundation movement and lateral drift, the caisson tops should be interconnected in two horizontal directions with grade beams or tied with a structural slab. The project structural engineer should provide slab and grade beam design, reinforcement and spacing dependent on anticipated loading. However, for grade beams we recommend a minimum embedment depth below lowest adjacent pad grade of 24 inches and a minimum width of 12 inches. In addition, minimum reinforcement should consist of four No. 4 steel reinforcing bars; two placed near the top of the grade beam and two near the bottom.

8.11.8 If caisson spacing is at least three times the maximum dimension of the caisson, no reduction in axial capacity is considered necessary for group effects. If caisson spacing is closer than three diameters, an evaluation for group effects including appropriate reductions should be performed by Geocon based on caisson dimension and spacing.

8.11.9 All loose soils must be completely removed from the bottom of all end-bearing foundation excavations and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.12 Deepened Foundation Installation

8.12.1 Casing may be required if caving occurs in the granular soil layers during deep drilled excavation. The contractor should have casing available and should be prepared to use it. If casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet. Continuous observation of the drilling and pouring of the piles by the Geotechnical Engineer (a representative of Geocon West, Inc.), is required.

8.12.2 Friction piles do not require the complete removal of all loose earth materials from the bottom of the excavation since the end-bearing capacity is not being considered for design; however, a clean out of the excavation bottom will be required. Where end-bearing caissons are used, all loose soils must be completely removed. Foundation excavations must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete.

8.12.3 Groundwater was encountered at the time of exploration in Borings B1 and B12. Therefore, the contractor should be prepared for groundwater during pile installation if it is encountered. Piles placed below the water level require the use of a tremie to place the concrete into the bottom of the hole. A tremie should consist of a rigid, water-tight tube having a diameter of not less than 6 inches with a hopper at the top. The tube should be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie should be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end should be closed at the start of the work to prevent water entering the tube and should be entirely sealed at all times, except when the concrete is being placed. The tremie tube should be kept full of concrete. The flow should be continuous until the work is completed and the resulting concrete seal should be monolithic and homogeneous. The tip of the tremie tube should always be kept about 5 feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

8.12.4 A special concrete mix should be used for concrete to be placed below water. The design shall provide for concrete with a strength of 1,000 psi over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste shall be included. The slump shall be commensurate to any research report for the admixture, provided that it shall also be the minimum for a reasonable consistency for placing when water is present. Extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet. Continuous observation of the drilling and pouring of the piles by a representative of this firm is required.

8.12.5 Closely spaced piles should be drilled and filled alternately, with the concrete permitted to set at least eight hours before drilling an adjacent hole. Pile excavations should be filled with concrete as soon after drilling and inspection as possible; the holes should not be left open overnight.

8.13 Lateral Design

8.13.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.40 may be used with the dead load forces in the undisturbed alluvial soils, bedrock, or properly compacted engineered fill.

8.13.2 Passive earth pressure for the sides of foundations and slabs poured against competent bedrock may be computed as an equivalent fluid having a density of 500 pounds per cubic foot (pcf), with an increase of 200 psf for each additional foot of embedment, up to a maximum earth pressure of 2,700 pcf. Passive earth pressure for the sides of foundations poured against properly compacted engineered fill or undisturbed alluvium may be computed as an equivalent fluid having a density of 230 pounds per cubic foot with a maximum earth pressure of 2,300 pounds per square foot. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third.

8.13.3 Ultimate lateral capacities for ¼ inch deflection of fixed and free-head drilled cast-in place piles are presented in the table below. No factors of safety have been applied to the lateral load values calculated to induce ¼-inch lateral deflection. Lateral capacities provided are for 24-, 30-, and 36-inch diameter drilled cast-in-place concrete piles, penetrating the earth materials encountered during the course of this investigation. Assumed as part of these lateral capacity calculations are a concrete modulus of elasticity of at least 3,000,000 psi.

LATERAL LOAD CAPACITIES OF DRILLED CAST-IN-PLACE PILES

FIXED HEAD (NO HEAD ROTATION)

PILE NUMBER	PILE DIAMETER (INCHES)	Lateral Load Capacity "P" (KIPS)	Maximum Positive Moment "Mp" (LAT FORCE =P)	Maximum Negative Moment "Mp" (LAT FORCE =P)	Depth to Max Pos. Moment (Feet)	Depth to Zero Moment (Feet)	Depth to Inflection Point (Feet)	MINIMUM PILE LENGTH FOR APPLICABILITY OF LATERAL DESIGN DATA (FEET)
1	24	**43**	**1.4** P	**-5.1** P	**12**	**25**	**6.4**	**25**
2	30	**61**	**1.7** P	**-6.1** P	**15**	**30**	**7.6**	**30**
3	36	**81**	**1.9** P	**-7.1** P	**17**	**35**	**8.8**	**35**

FREE HEAD (HINGED)

PILE NUMBER	PILE DIAMETER (INCHES)	Lateral Load Capacity "P" (KIPS)	Maximum Moment "Mp" (LAT FORCE =P)	Depth to Zero Moment (Feet)	Depth to Maximum Moment (Feet)
1	24	**17**	**4.3** P	**23**	**7**
2	30	**25**	**5.2** P	**27**	**9**
3	36	**33**	**6.0** P	**31**	**10**

Lateral capacities are based on 1/4-inch deflection.
Moment magnitudes are presented as a function of the applied lateral load “P”.
"P" is entered in units of kips and the moment magnitude will be in units of kip-feet.
The maximum negative moment is at the rigid, pile to pile cap or grade beam connection at the top of the pile.

8.13.4 Once the project design proceeds to a more finalized state and the foundation system has been selected, an LPile analysis of lateral pile capacity can be performed, if necessary. If piles are spaced at least at least 8 diameters on-center when loaded in-line and at least 3 diameters on-center when loaded in parallel, no reduction in lateral capacity is considered necessary for group effects. If pile spacing is closer, an evaluation for group effects including appropriate reductions should be incorporated into the pile design based on pile dimension, spacing, and the direction of loading. This will be addressed under separate cover if necessary, as the design progresses.

8.14 Concrete Slabs-on-Grade

8.14.1 Concrete slabs-on-grade for structures, not subject to vehicle loading, should be a minimum of 4 inches of concrete reinforced with No. 4 steel reinforcing bars placed 16 inches on center in both horizontal directions and positioned vertically near the slab midpoint. The concrete slab-on-grade should derive support on either undisturbed bedrock or newly placed engineered fill subsequent to the recommended grading.

8.14.2 Slabs-on-grade that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder selection and design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials (ACI 302.2R-06) as well as ASTM E1745 and should be installed in general conformance with ASTM E 1643 (latest edition) and the manufacturer's recommendations. A minimum thickness of 15 mils extruded polyolefin plastic is recommended; vapor retarders which contain recycled content or woven materials are not recommended. The vapor retarder should have a permeance of less than 0.01 perms demonstrated by testing before and after mandatory conditioning. The vapor retarder should be installed in direct contact with the concrete slab with proper perimeter seal. If the California Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of clean aggregate. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4-inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

8.14.3 For seismic design purposes, an allowable coefficient of friction of 0.40 may be utilized between concrete slabs and subgrade soils; and 0.15 for slabs underlain by a vapor retarder.

8.14.4 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moisture conditioned to at least 2 percent above optimum moisture content and properly compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

8.14.5 The recommendations of this report are intended to reduce the potential for cracking of slabs due to minor soil movements. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

8.15 Preliminary Pavement Recommendations

8.15.1 Where new paving is to be placed, it is recommended that all existing fill and soft alluvium materials be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing artificial fill and soft alluvium in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvium material may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of paving subgrade should be scarified, moisture conditioned to at least two percent above optimum moisture content, and properly compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

8.15.2 The following pavement sections are based on an assumed R-Value of 20. Once site grading activities are complete an R-Value should be obtained by laboratory testing to confirm the properties of the soils serving as paving subgrade, prior to placing pavement.

8.15.3 The Traffic Indices listed below are estimates. Geocon does not practice in the field of traffic engineering. The actual Traffic Index for each area should be determined by the project civil engineer. If pavement sections for Traffic Indices other than those listed below are required, Geocon should be contacted to provide additional recommendations. Pavement thicknesses were determined following procedures outlined in the *California Highway Design Manual* (Caltrans). It is anticipated that the majority of traffic will consist of automobile and large truck traffic.

PRELIMINARY PAVEMENT DESIGN SECTIONS

Location	Estimated Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Automobile Parking and Driveways	4.0	3.0	4.0
Trash Truck & Fire Lanes	7.0	4.0	12.0

8.15.4 Asphalt concrete should conform to Section 203-6 of the "*Standard Specifications for Public Works Construction"* (Green Book). Class 2 aggregate base materials should conform to Section 26-1.02A of the "*Standard Specifications of the State of California, Department of Transportation"* (Caltrans). The use of Crushed Miscellaneous Base (CMB) in lieu of Class 2 aggregate base is acceptable. Crushed Miscellaneous Base should conform to Section 200-2.4 of the "*Standard Specifications for Public Works Construction"* (Green Book).

8.15.5 Unless specifically designed and evaluated by the project structural engineer, where exterior concrete paving will be utilized for support of vehicles, it is recommended that the concrete be a minimum of 6 inches of concrete reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions. Concrete paving supporting vehicular traffic should be underlain by a minimum of 4 inches of aggregate base and a properly compacted subgrade. The subgrade and base material should be compacted to 92 and 95 percent relative compaction, respectively. as determined by ASTM Test Method D 1557 (latest edition).

8.15.6 The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of pavements. Ponding of water on or adjacent to the pavement will likely result in saturation of the subgrade materials and subsequent cracking, subsidence and pavement distress. If planters are planned adjacent to paving, it is recommended that the perimeter curb be extended at least 12 inches below the bottom of the aggregate base to minimize the introduction of water beneath the paving.

8.16 Retaining Wall Design

8.16.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 14 feet. In the event that walls significantly higher than 14 feet are planned, Geocon should be contacted for additional recommendations.

8.16.2 Retaining wall foundations may be designed in accordance with the recommendations provided in the *Foundation Design* sections of this report (see Sections 8.6).

8.16.3 Based on the orientation of the proposed excavations with respect to the strike and dip of the bedrock, Adverse bedding conditions are expected for south and east facing excavations. The retaining wall recommendations presented below include consideration of the surcharge due to out-of-slope bedding on the south and east retaining walls. Excavations into bedrock should be observed and approved in writing by the Project Geologist (a representative of Geocon West, Inc.) during excavation to check for the presence of jointing or bedding which may require revised retaining wall recommendations.

8.16.4 Retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure). Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure). The table below presents recommended pressures to be used in retaining wall design, assuming that proper drainage will be maintained. Calculation of the recommended wall pressures are provided on Figures 9 through 11.

RETAINING WALL WITH LEVEL BACKFILL SURFACE
(North and West Facing Retaining Walls – Favorable Bedding)

HEIGHT OF RETAINING WALL (Feet)	ACTIVE PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)	AT-REST PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)
Up to 12	30	54

RETAINING WALL WITH SURCHARGE FROM JOINTING OR BEDDING
(East and South Facing Retaining Walls – Adverse Bedding)

HEIGHT OF RETAINING WALL (FEET)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (AT-REST PRESSURE)
Up to 12	69	95

RETAINING WALL WITH LEVEL BACKFILL SURFACE
(Walls Supporting Alluvial Soils or Engineered Fill)

HEIGHT OF RETAINING WALL (FEET)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (AT-REST PRESSURE)
Up to 12	46	63

8.16.5 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, the equivalent fluid pressure to be used in design of undrained walls is 110 pcf. The value includes hydrostatic pressures plus buoyant lateral earth pressures.

8.16.6 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic, or adjacent structures. Recommendations for the incorporation of surcharges are provided in section 8.24 of this report. Once the design becomes more finalized, an addendum letter can be prepared revising recommendations and addressing specific surcharge conditions throughout the project, if necessary.

8.16.7 In addition to the recommended earth pressure, the upper 10 feet of the retaining wall adjacent to the street or driveway areas should be designed to resist a uniform lateral pressure of 100 psf, acting as a result of an assumed 300 psf surcharge behind the wall due to normal street traffic. If the traffic is kept back at least 10 feet from the wall, the traffic surcharge may be neglected.

8.16.8 Seismic lateral forces should be incorporated into the design as necessary, and recommendations for seismic lateral forces are presented below.

8.17 Dynamic (Seismic) Lateral Forces

8.17.1 The structural engineer should determine the seismic design category for the project in accordance with Section 1613 of the CBC. If the project possesses a seismic design category of D, E, or F, proposed retaining walls in excess of 6 feet in height should be designed with seismic lateral pressure (Section 1803.5.12 of the 2022 CBC).

8.17.2 A seismic load of 10 pcf should be used for design of walls that support more than 6 feet of backfill in accordance with Section 1803.5.12 of the 2022 CBC. The seismic load is applied as an equivalent fluid pressure along the height of the wall and the calculated loads result in a maximum load exerted at the base of the wall and zero at the top of the wall. This seismic load should be applied in addition to the active earth pressure. The earth pressure is based on half of two-thirds of PGA_M calculated from ASCE 7-16 Section 11.8.3.

8.18 Retaining Wall Drainage

8.18.1 Retaining walls not designed for hydrostatic pressures should be provided with a drainage system. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 12). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of Geocon), prior to placement of gravel or compacting backfill.

8.18.2 As an alternative, a plastic drainage composite such as Miradrain or equivalent may be installed in continuous, 4-foot wide columns along the entire back face of the wall, at 8 feet on center. The top of these drainage composite columns should terminate approximately 18 inches below the ground surface, where either hardscape or a minimum of 18 inches of relatively cohesive material should be placed as a cap (see Figure 13). These vertical columns of drainage material would then be connected at the bottom of the wall to a collection panel or a 1-cubic-foot rock pocket drained by a 4-inch subdrain pipe.

8.18.3 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures.

8.18.4 Moisture affecting below grade walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.19 Elevator Pit Design

8.19.1 The elevator pit slab and retaining wall should be designed by the project structural engineer. Elevator pits may be designed in accordance with the recommendations in the *Foundation Design* and *Retaining Wall Design* sections of this report (see Sections 8.6 and 8.16).

8.19.2 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic, or adjacent foundations and should be designed for each condition as the project progresses.

8.19.3 If retaining wall drainage is to be provided, the drainage system should be designed in accordance with the *Retaining Wall Drainage* section of this report (see Section 8.18).

8.19.4 It is suggested that the exterior walls and slab be waterproofed to prevent excessive moisture inside of the elevator pit. Waterproofing design and installation is not the responsibility of the geotechnical engineer.

8.20 Elevator Piston

8.20.1 If a plunger-type elevator piston is installed for this project, a deep drilled excavation will be required. It is important to verify that the drilled excavation is not situated immediately adjacent to a foundation or shoring pile, or the drilled excavation could compromise the existing foundation or pile support, especially if the drilling is performed subsequent to the foundation or pile construction.

8.20.2 Groundwater should be expected and casing may be required if caving is experienced in the drilled excavation. The contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. Continuous observation of the drilling and installation of the elevator piston by the Geotechnical Engineer (a representative of Geocon West, Inc.) is required.

8.20.3 The annular space between the piston casing and drilled excavation wall should be filled with a minimum of 1½-sack slurry pumped from the bottom up. As an alternative, pea gravel may be utilized. The use of soil to backfill the annular space is not acceptable.

8.21 Temporary Excavations

8.21.1 Excavations up to 14 feet in height are anticipated for excavation and construction of the proposed administration structure, including foundation system. The excavations are expected to expose artificial fill, alluvium, colluvium and bedrock which are considered stable for vertical excavations up to 5 feet in height where loose soils or caving sands are not present, where adverse bedding conditions are not present and where not surcharged by adjacent traffic or structures.

8.21.2 Excavations into bedrock should be observed by the Project Geologist (a representative of Geocon West, Inc.) during excavation to check for the presence of jointing or bedding which may require special recommendations for sloping and/or shoring. Any recommendations deemed necessary will be provided at that time.

8.21.3 Vertical excavations greater than the permissible heights outlined above will require sloping and/or shoring measures in order to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments could be sloped back at a uniform 1.5:1 (H:V) slope gradient or flatter up to a maximum height of 10 feet. Temporary unsurcharged embankments may also be sloped back at a uniform 2:1 (H:V) slope gradient or flatter up to a maximum height of 15 feet. A uniform slope does not have a vertical portion. Where space is limited, shoring measures will be required. Shoring recommendations are provided in Section 8.22 of this report.

8.21.4 Where sloped embankments are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. The soils exposed in the cut slopes should be inspected during excavation by our personnel so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

8.22 Shoring – Soldier Pile Design and Installation

8.22.1 The following information on the design and installation of shoring is preliminary. Review of the final shoring plans and specifications should be made by this office prior to bidding or negotiating with a shoring contractor.

8.22.2 Installation of shoring on a sloping ground surface requires careful consideration of excavation sequencing. Prior to installation of shoring, grading to create a relatively flat pad for equipment access may be required. Excavation of unsupported vertical cuts into a sloping ground surface would remove support from the ascending portion of the slope and create a potentially unstable condition. Unsupported vertical excavation into a slope is not permitted. Equipment access can be created by placement of additional fill to build up a temporary equipment pad against the existing slope.

8.22.3 One method of shoring would consist of steel soldier piles, placed in drilled holes and backfilled with concrete. Installation of shoring piles by vibration is not recommended at this site due to the dense nature of the underlying bedrock. Where maximum excavation heights are less than 12 feet the soldier piles are typically designed as cantilevers. Where excavations exceed 12 feet or are surcharged, soldier piles may require lateral bracing utilizing drilled tie-back anchors or raker braces to maintain an economical steel beam size and prevent excessive deflection. The size of the steel beam, the need for lateral bracing, and the acceptable shoring deflection should be determined by the project shoring engineer. Should it be determined that temporary tiebacks or rakers are necessary, additional recommendations can be provided under separate cover.

8.22.4 The design embedment of the shoring pile toes must be maintained during excavation activities. The toes of the perimeter shoring piles should be deepened to take into account any required excavations necessary for grading activities, foundations, and/or adjacent drainage systems.

8.22.5 The proposed soldier piles may also be designed as permanent piles. The required pile depth, dimension, spacing should be determined and designed by the project structural and shoring engineers. All piles utilized for shoring can also be incorporated into a permanent retaining wall system (shotcrete wall) and should be designed in accordance with the earth pressure provided in the *Retaining Walls* section of this report (see Section 8.16).

8.22.6 Drilled cast-in-place soldier piles should be placed no closer than three diameters on center. The minimum diameter of the piles is 18 inches. Structural concrete should be used for the soldier piles below the excavation; lean-mix concrete may be employed above that level. As an alternative, lean-mix concrete may be used throughout the pile where the reinforcing consists of a wideflange section. The slurry must be of sufficient strength to impart the lateral bearing pressure developed by the wideflange section to the soil. For design purposes, an allowable passive value for the bedrock below the bottom plane of excavation may be assumed to be 500 pcf, with an increase of 200 psf for each additional foot of embedment. The allowable passive value may be doubled for isolated piles, spaced a minimum of 3 times the pile diameter. To develop the full lateral value, provisions should be implemented to assure firm contact between the soldier piles and the undisturbed bedrock.

8.22.7 Casing may be required if caving is experienced in the drilled excavation and the contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. If casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet. Continuous observation of the drilling and pouring of the piles by the Geotechnical Engineer (a representative of Geocon West, Inc.), is required.

8.22.8 The contractor should be aware that some difficult drilling conditions could be encountered in the bedrock which could require coring and jack-hammering. The contractor should be prepared for these conditions prior to commencement of drilling activities.

8.22.9 Groundwater seepage was encountered during this site exploration and in past explorations. Therefore, the contractor should be prepared for groundwater during pile installation should the need arise. Piles placed below the water level require the use of a tremie to place the concrete into the bottom of the hole. A tremie should consist of a rigid, water-tight tube having a diameter of not less than 6 inches with a hopper at the top. The tube should be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie should be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end should be closed at the start of the work to prevent water entering the tube and should be entirely sealed at all times, except when the concrete is being placed. The tremie tube should be kept full of concrete. The flow should be continuous until the work is completed and the resulting concrete seal should be monolithic and homogeneous. The tip of the tremie tube should always be kept about 5 feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

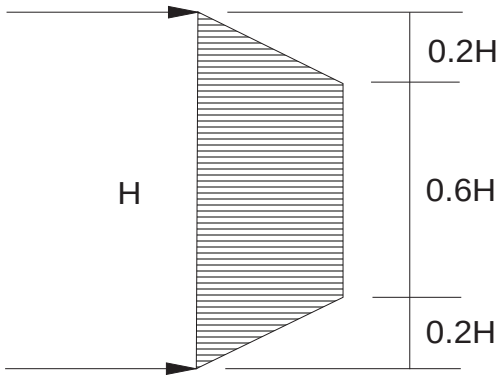
8.22.10 A special concrete mix should be used for concrete to be placed below water. The design should provide for concrete with an unconfined compressive strength psi of 1,000 pounds per square inch (psi) over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste should be included. The slump should be commensurate to any research report for the admixture, provided that it should also be the minimum for a reasonable consistency for placing when water is present.

8.22.11 The frictional resistance between the soldier piles and retained soil may be used to resist the vertical component of the anchor load. The coefficient of friction may be taken as 0.40 based on uniform contact between the steel beam and retained earth. The portion of soldier piles below the plane of excavation may also be employed to resist the downward loads. The downward capacity may be determined using a frictional resistance of 340 pounds per square foot.

8.22.12 Due to the nature of the site soils, it is expected that continuous lagging between soldier piles will be required. However, it is recommended that the exposed soils be observed by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify the presence of any cohesive soils and the areas where lagging may be omitted.

8.22.13 The time between lagging excavation and lagging placement should be as short as possible. Soldier piles should be designed for the full-anticipated pressures. Due to arching in the soils, the pressure on the lagging will be less. It is recommended that the lagging be designed for the full design pressure but be limited to a maximum of 400 pounds per square foot.

8.22.14 For the design of shoring, it is recommended that an equivalent fluid pressure based on the following tables, be utilized for design. A trapezoidal distribution of lateral earth pressure may be used where shoring will be restrained at the top by bracing or tie backs. The recommended active and trapezoidal pressure are provided in the following tables. A diagram depicting the trapezoidal pressure distribution of lateral earth pressure is provided below the table. Calculation of the recommended shoring pressures are provided on Figures 14 and 15.



SHORING WALL WITH LEVEL BACKFILL SURFACE
(North and West Facing Shoring Walls – Favorable Bedding)

HEIGHT OF SHORING (FEET)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE) Triangular	EQUIVALENT FLUID PRESSURE (Pounds Per Square Foot per Foot) Trapezoidal (Where H is the height of the shoring in feet)
Up to 14	25	16H

SHORING WALL WITH LEVEL BACKFILL SURFACE
(South and East facing Shoring Walls – Adverse Bedding)

HEIGHT OF SHORING (FEET)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE) Triangular	EQUIVALENT FLUID PRESSURE (Pounds Per Square Foot per Foot) Trapezoidal (Where H is the height of the shoring in feet)
Up to 14	63	40H

Trapezoidal Distribution of Pressure

8.22.15 Where a combination of sloped embankment and shoring is utilized, the pressure will be greater and must be determined for each combination. Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic, or adjacent structures and must be determined for each combination.

8.23 Stormwater Infiltration

8.23.1 During the April 18 and April 19, 2022 site exploration, borings B4 and B7 were utilized to perform percolation testing. The borings were backfilled to the proposed invert elevation with a bentonite seal placed at the bottom of the excavation. Slotted casing was placed in the boring, and the annular space between the casing and excavation was filled with filter pack. The boring was then filled with water to pre-saturate the soils. On April 19, 2022, the casings were refilled with water and percolation test readings were performed after repeated flooding of the cased excavation. Based on the test results, the measured percolation rate and design infiltration rate, for the earth materials encountered, are provided in the following table. These values have been calculated in accordance with the Boring Percolation Test Procedure in the County of Los Angeles Department of Public Works GMED *Guidelines for Geotechnical Investigation and Reporting, Low Impact Development Stormwater Infiltration* (June 2021). Percolation test field data and calculation of the measured percolation rate and design infiltration rate are provided on Figures 16 and 17.

Boring	Soil Type	Infiltration Depth (ft)	Measured Percolation Rate (in / hour)	Design Infiltration Rate (in / hour)
B4	SM	4-8	0.12	0.04
B7	CL	2-5	0.04	0.01

8.23.2 The results of the percolation testing indicate that the soils are not conducive to infiltration of stormwater. The design infiltration rate is below the minimum infiltration rate of 0.3 inch per hour recommended in the County guidelines. It is recommended that stormwater be retained, filtered, and discharged in accordance with the requirements of the local governing agency.

8.24 Surcharge from Adjacent Structures and Improvements

8.24.1 Additional pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

8.24.2 It is recommended that line-load surcharges from adjacent wall footings, use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.20 \times \left(\frac{z}{H}\right)}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.28 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

where x is the distance from the face of the excavation or wall to the vertical line-load, H is the distance from the bottom of the footing to the bottom of excavation or wall, z is the depth at which the horizontal pressure is desired, Q_L is the vertical line-load and $\sigma_H(z)$ is the horizontal pressure at depth z.

8.24.3 It is recommended that vertical point-loads, from construction equipment outriggers or adjacent building columns use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.28 \times \left(\frac{z}{H}\right)^2}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.77 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)^2}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

then

$$\sigma'_H(z) = \sigma_H(z) cos^2(1.1\theta)$$

where x is the distance from the face of the excavation/wall to the vertical point-load, H is distance from the outrigger/bottom of column footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, Q_p is the vertical point-load, $\sigma_H(z)$ is the horizontal pressure at depth z, θ is the angle between a line perpendicular to the excavation/wall and a line from the point-load to location on the excavation/wall where the surcharge is being evaluated, and $\sigma_H(z)$ is the horizontal pressure at depth z.

8.25 Surface Drainage

8.25.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

8.25.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2022 CBC 1804.4 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. Discharge from downspouts, roof drains and scuppers are not recommended onto unprotected soils within 5 feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the soils providing foundation support. Landscape irrigation is not recommended within 5 feet of the building perimeter footings except when enclosed in protected planters.

8.25.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

8.25.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

8.26 Plan Review

8.26.1 Grading, foundation, and shoring plans should be reviewed by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the date of this report. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

4. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project Geotechnical Engineer of Record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Recency of Movement	DESCRIPTION	
						ON LAND	OFFSHORE
Quaternary	Late Quaternary	Holocene	200			Displacement during historic time (e.g. San Andreas fault 1906) includes areas of known fault creep.	
			11,700			Displacement during Holocene time.	Fault offsets seafloor sediments at or near seafloor age.
		Pleistocene				Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
	Early Quaternary		700,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Pliocene-Holocene age.	Fault cuts strata of Quaternary age.
			1,600,000				
Pre-Quaternary			4.5 billion (Age of Earth)			Faults without recognized Quaternary displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.

* Quaternary now recognized as extending to 2.6 Ma (Walker and Geissman, 2009). Quaternary faults in this map sheet predominant using the previous 1.6 Ma criterion.

FIGURE 17

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The site was explored on April 18, 2022, and April 19, 2022 by excavating twelve 7-inch diameter borings to depths ranging between approximately 6½ feet to 51 feet below the existing ground surface using a truck-mounted hollow-stem auger drilling machine. Representative and relatively undisturbed samples were obtained by driving a 3-inch, O. D., California Modified Sampler into the "undisturbed" soil mass with blows from a 140-pound auto-hammer falling 30 inches. The California Modified Sampler was equipped with 1-inch high by 2$^{3}/_{8}$-inch diameter brass sampler rings to facilitate soil removal and testing. Bulk samples were obtained from the borings and Standard Penetration Tests (SPTs) were performed in borings B1, B3 and B5.

The soil conditions encountered in the borings were visually examined, classified and logged in general accordance with the Unified Soil Classification System (USCS). The logs of the borings are presented on Figures A1 and A12. The logs depict the soil and geologic conditions encountered and the depth at which samples were obtained. The logs also include our interpretation of the conditions between sampling intervals. Therefore, the logs contain both observed and interpreted data. We determined the lines designating the interface between soil materials on the logs using visual observations, penetration rates, excavation characteristics and other factors. The transition between materials may be abrupt or gradual. Where applicable, the logs were revised based on subsequent laboratory testing. The locations of the borings are shown on Figures 2B through 2D.

APPENDIX B

APPENDIX B

LABORATORY TESTING

Laboratory tests were performed in accordance with generally accepted test methods of the "American Society for Testing and Materials (ASTM)", or other suggested procedures. Selected samples were tested for direct shear strength, consolidation characteristics, Atterburg limits, grain size, corrosivity, and in-place dry density and moisture content. The results of the laboratory tests are summarized in Figures B1 through B27. The in-place dry density and moisture content of the samples tested are presented on the boring logs, Appendix A.
