Hazardous Waste Summary:
Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D002
Waste Description: CORROSIVE WASTE

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: F006
Waste Description: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS, EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC, AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste Code: F008
Waste Description: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

ACE PLATING CO., INC. (Continued) **S105632824**

Case Worker:	RV
Local Agency:	Not reported
RB Case Number:	1290
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Contaminated Surface / Structure, Soil, Soil Vapor
Potential Contaminants of Concern:	Tetrachloroethylene (PCE), Trichloroethylene (TCE), Chromium, Chromium VI
Site History:	Plating operations started in the mid-1910s in the southwestern portion of the Site until 2005. Ace Plating owned and conducted plating related operations on the 11 contiguous parcels, specifically electrochemical coating of metal parts. Numerous assessments conducted at the site indicate that the soil is impacted with VOCs and metals. The soil vapor has been sampled throughout the Site with tetrachloroethene (PCE) concentrations at 5 feet below ground surface (bgs) ranging from 7.9 micrograms per liter (g/L) to 87 g/L. The soil vapor data is limited at depths greater than 30 feet bgs. At 60 feet bgs and below, PCE concentrations range from 39 g/L below the Assembly Room to 127 g/L offsite on Crocker Street. The lateral extent of shallow PCE greater than 12 g/L is only defined on the east side. The source of the PCE is unknown but slightly higher concentrations exist in the central portions of the Plating Rooms. Chromium concentrations ranged from 1.5 mg/kg to 4,300 mg/kg for total chromium and from 0.92 to 840 mg/kg for hexavalent chromium. The maximum concentrations were both collected from SSVW-2 at 1 foot bgs located in the alley between the Crocker Street and Towne Avenue buildings and is adjacent to the location of the former chromium tanks. Outside of the area impacted by the former chromium tanks, the maximum chromium concentration is 4200 mg/kg for total chromium and 94 mg/kg for hexavalent chromium at MW-1. Degreasers that contained PCE were utilized in Plating Rooms 1 and 2 from 1993 to 2001. The maximum PCE concentration is 0.150 mg/kg and was sampled 4 feet deep in the vicinity of the former nickel dip tank in Plating Room 2. Two groundwater monitoring wells have been installed. Hexavalent chromium was not detected above the laboratory detection limits in any of the groundwater samples collected. Tetrachloroethylene (PCE) and 1,1-dichloroethene are the only VOC detected in groundwater, with the maximum concentration detected in MW-3 at a concentration of 33 ug/L and 2.7 ug/L, respectively.

CA BOND EXP. PLAN:

Reponsible Party:	COST RECOVERY/OPERATION AND MAINTENANCE SITE
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	DHS has utilized Bond funds to complete the remedial action. DHS is currently undertaking appropriate cost recovery actions.
Site Description:	This site was previously used to scrap electrical transformers.
Hazardous Waste Desc:	Polychlorinated biphenyls (PCBs) were detected in the soil.
Threat To Public Health & Env:	The remedial action has been completed. Soil contaminated with PCBs was excavated and redisposed of in a licensed landfill. There is no threat to public health and the environment.
Site Activity Status:	In August, 1985, the RP, Mr. Rodney Dean, pled no contest to three felony counts of illegal storage, transportation and disposal of hazardous wastes. Mr. Dean's probation required that the cleanup of the site be completed and reported to the court. The RP retained a contractor for the cleanup and began the remedial actions. The contractors removed much of the contaminated soil. DHS completed the cleanup after the RP exhausted his financial resources. DHS is currently in the cost recovery stage.

Background Info:	The site is located at 590 South Santa Fe Avenue, Los Angeles, California. The site consists of two land parcels totaling approximately 2.68 actes of land and is located witin an indus-industrial portion of the City of Los Angeles. Historically the site has been used for chemeical or paint manufacturing.

BUTTERFIELD (SUN CHEMICAL CORPORATION) (Continued) **S105481902**

Not reported
The site was formerly under the oversight of the California Regional Water Quality Control Board (CRWQCB). (CRWQCB) has overseen the site investiation and remediation since approximately 1986.
Not reported
Previous sampling activities have confirmed both soil and groundwater contamination. Contaminants of concern identified in the groundwater and soil include benzene, ethyl benzene, 1,1-dichlorethane, 1,1-dichloroethene, 4-methyl-2-pentanone (MIBK), toluene, and total xylene. The toluene, and xylene appear to be primarily located within the groundwater beneath the northern portion of the site whereas MIBK has been identified in the groundwater along the southwest corner of the site and may extend beyond the site boundary.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Site Characterization Workplan
Completed Date:	03/30/2005
Comments:	Meeting scheduled to discuss the cost for the additional assessment.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Fieldwork
Completed Date:	07/12/2017
Comments:	DTSC site visit. Meeting with MTA and Arcadis regarding current and upcoming activities.
Completed Area Name:	Shallow Soil
Completed Sub Area Name:	Not reported
Completed Document Type:	Fieldwork
Completed Date:	11/05/2015
Comments:	Oversight during excavation.
Completed Area Name:	Groundwater
Completed Sub Area Name:	Not reported

UNITED TECHNOLOGIES INMONT COR (Continued) **S101617157**

Completed Document Type: Treatability Study Workplan
Completed Date: 06/24/2016
Comments: DTSC approved Pilot Workplan for bench scale test of Insitu Chemical Oxidation (ISCO).

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fact Sheets
Completed Date: 09/02/2015
Comments: The Factsheet will be distributed to the community informing them of the public comment period for the Draft Removal Action Workplan (RAW). Public comment period will occur from September 7 to October 7, 2015. The RAW describes cleanup options for the Site soil and a pilot study to test options for the deeper soil and groundwater.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Public Notice
Completed Date: 09/01/2015
Comments: The Public Notice will be published in the local newspapers.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 01/25/2017
Comments: Investigation Report describes additional delineation of the Site's contamination. DTSC approved the Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot Study/Treatability Workplan
Completed Date: 12/24/2004
Comments: Plan proposed data gap investigation, air sparging and soil vapor extraction.

Completed Area Name: Soil
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 06/30/2016
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report
Completed Date: 12/24/2004
Comments: Addendum includes response to DTSC comments and additional data from pilot study.

Completed Area Name: Groundwater
Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 11/19/2021
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report

UNITED TECHNOLOGIES INMONT COR (Continued) **S101617157**

Completed Date: 02/27/2006
Comments: DTSC sent letter in reponse to Soil Vapor Extraction (SVE) Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Plan
Completed Date: 02/11/2008
Comments: Ground Water Monitoring Work scheduled.

Completed Area Name: Groundwater
Completed Sub Area Name: Not reported
Completed Document Type: Well Decommissioning Workplan
Completed Date: 06/10/2016
Comments: DTSC accepted Workplan.

Completed Area Name: Soil
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 02/04/2015
Comments: Report summarizes investigation of underground storage tanks.

Completed Area Name: Groundwater
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/28/2014
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 07/30/1997
Comments: w

Completed Area Name: Soil
Completed Sub Area Name: Not reported
Completed Document Type: Fieldwork
Completed Date: 12/15/2015
Comments: Field oversight for excavation.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 10/30/2015
Comments: The Removal Action Workplan, which includes excavation of contaminated soil and in situ chemical oxidation, has been approved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Clean Loan Agreement
Completed Date: 02/04/2002
Comments: Response Action Agreement (RAA) approved and signed by proponent and DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Judgement
Completed Date: 02/09/2018

UNITED TECHNOLOGIES INMONT COR (Continued) **S101617157**

Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

Completed Area Name: Groundwater
Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 11/25/2019
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Workplan
Completed Date: 12/02/2013
Comments: Workplan approved to conduct sampling for data gaps.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fieldwork
Completed Date: 11/17/2013
Comments: Sampling activities have begun to delineate contamination.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Community Profile
Completed Date: 03/30/2016
Comments: Profile details Site information and community involvement activities.
Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 01/23/2014
Comments: Updated Cost Estimate completed.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Correspondence
Completed Date: 12/19/2014
Comments: Tech Memo to Cal/EPA.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Standard Voluntary Agreement
Completed Date: 03/11/2015
Comments: Not reported

Completed Area Name: PROJECT WIDE

Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 11/09/2015
Comments: Not reported

UNITED TECHNOLOGIES INMONT COR (Continued) **S101617157**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Responsible Agency Review
Completed Date: 10/30/2015
Comments: Addendum to MTA's EIS/EIR prepared to evaluate activities in the Removal Action Workplan. The activities in the RAW do not significantly alter the findings or conclusions reached in the previously certified EIS/EIR.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 11/01/2016
Comments: DTSC projected cost estimate for remediation activities.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/01/2008
Comments: OK

Completed Area Name: Shallow Soil
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 03/22/2016
Comments: The Completion Report summarizes the removal of underground storage tanks and shallow soil excavation. DTSC approved Report. Soil contamination at greater depth and groundwater contamination needs to be completed.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 06/30/2014
Comments: Based on the elevated concentrations in the groundwater, DTSC requires submittal of a pilot study workplan that would evaluate potential remedies.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Treatability Study Report
Completed Date: 06/27/2018
Comments: DTSC provided comments to Metro and will meet in August to discuss changes to ISCO use.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Letter - Demand
Completed Date: 09/28/2008
Comments: DTSC sent first demand letter to RP to recover the CLEAN Loan.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Standard Voluntary Agreement
Completed Date: 04/08/2013
Comments: VCA signed by Butterfield owner and DTSC to conduct additional investigation and remediation, if necessary.

UNITED TECHNOLOGIES INMONT COR (Continued) **S101617157**

Completed Area Name:	Soil
Completed Sub Area Name:	Not reported
Completed Document Type:	CEQA - Initial Study/ Environmental Impact Report
Completed Date:	08/12/2015
Comments:	In accordance with CEQA, DTSC has reviewed the Environmental Impact Report (EIR) prepared by MTA for the MTA Westside Subway Extension Project (WSE) to ensure that CEQA requirements have been satisfied. The Butterfield/MTA Site will be developed as a maintenance yard for the WSE. The EIR included activities associated with the RAW and thereby evaluated environmental impact(s) from the Site. The EIR can be found on MTA s website: http://www.metro.net/projects/westside/final-eis-eir/

Alternate Address:	2182 EAST 11TH STREET
Alternate City,St,Zip:	LOS ANGELES, CA 90021
Background Info:	The Site is also known as the Western Lead and Metal Company Site. The Site is located in an industrial area near downtown Los Angeles and is surrounded by warehouses, food distributors, light manufacturing, and scrap metal recyclers. The Site is roughly bounded by 11th Street (Property), to the north, the Union Pacific Railroad right-of-way to the east, 14th Street, to the south, and Wilson Street to the west. The Site includes the property at 2182 East 11th Street, which was occupied by several different companies as a lead smelter from 1946 to 1965. The Western Lead Products Company operated a lead smelter on the Property from 1954 to 1960 under the name of Western Lead and Metal Company. After 1965, the Property was used for die-cast manufacturing operations. The Property is approximately 110 feet by 140 feet and is currently devoid of any buildings, and is secured by fencing. The other areas of the Site include: portions of the Union Pacific Railroad right-of-way, between 14th and 10th Streets; a narrow strip of the property occupied by Coast Produce; and a residencial property at the corner of Wilson and 14th Streets. Since 1991, several site assessments have been conducted. These assessments involved mostly surface soil sampling and analyses for metals including lead, antimony, and arsenic. In 1996, the Property was paved with three inches of asphalt to prevent exposure of the public to contaminated soil. In addition, DTSC collected several surface soil samples in the areas surrounding the Property. Extremely high levels of

WESTERN LEAD AND METAL CO (INTERNATIONAL LEAD CO.) (Continued) **1001115052**

lead (up to 574,000 ppm), antimony (up to 14,000 ppm), and arsenic (up to 920 ppm) were detected in the narrow strip along the southern and western boundaries of the Property; high levels of lead, copper, and zinc were detected along the railroad right-of-way; and elevated levels of lead (up to 1,450 ppm) were detected on the residential property. A Consent Order (Imminent and Substantial Endangerment) was entered into with Quemetco Inc., (an RSR Subsidiary) and Union Pacific Railroad Company. As required by the Order, in 1977, Quemetco completed an Emergency Removal Action at Areas 3 and 4 which are located at the perimeter of the Property and the residential property. Union Pacific has also conducted an Emergency Removal Action at Areas 1 and 2 (railroad right-of-wau). The Remedial Investigation found the extent of metal contamination. Currently, the Draft RAW, which proposes to place a 4-inch asphalt cover on the Property area and excavate soil, from the Site boundary, has been approved. The 30 day Public Comment Period starts on August 23 and ends September 22, 2004.

Comments:	Updated cost estimate sent to RP.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	10/21/2004
Comments:	The RAW proposes to address the lead & arsenic contaminated soil by placing a four-inch asphalt cap on the property area (15,000 sq.ft.) and removing soil from nine impacted areas at the Site boundary. Implementation is scheduled for end of January 2005.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Investigation Report
Completed Date:	04/15/2003
Comments:	The Remedial Investigation is approved. The RI involved sampling of lead and other metals, and volatile organic compounds, particularly tetrachlorethene and 1,1,1-trichloroethane.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	11/18/1997
Comments:	Soil removal (excavation) of lead-contaminated soils. The Implementation Report for completion of the Emergency Removal Action by Quemetco at Area 3 (Coast Produce Warehouse) and Area 4 (Residential property at 2151 E. 14th Street) was approved. An estimated 120 tons of contaminated lead was excavated and disposed of off-site.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	07/18/1997
Comments:	UPRR: A removal action workplan (RAW-UPRR) was approved for Union Pacific Railroad track areas along Lemon Street (between 10th & 14th Streets). These areas are designated as Areas 1 & 2. A Notice of Exemption was also filed with the OPR as required by the CEQA laws and guidelines. The RAW-UPRR included excavation, treatment and disposal of contaminated soils in the neighboring railroad right-of-way (track) areas of the International Lead Company site.

Completed Date: 09/19/2000
Comments: DTSC entered into a Voluntary Cleanup Agreement (Agreement) (Docket Number HSA-A 99/00-171) with Whittaker Corporation (Proponent) to conduct a Preliminary Endangerment Assessment.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 11/07/1994
Comments: DTSC received an information letter for 3 possible hazardous substance release sites allegedly associated with Quemetco/RSR Corp, a lead smelter.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report

EASTERN SMELTING AND REFINING SITE (Continued) **S123547822**

Completed Date:	06/13/2003
Comments:	DTSC approves PEA Report. The PEA investigative activities conducted at the former smelting site identified arsenic (3410 mg/kg), and lead (25,700 mg/kg). DTSC concluded that the current conditions (building and pavement intact, no exposed soil) at the Site does not pose a potential threat to industrial workers. Due to elevated levels of the above-mentioned metals in the soil, if there is any demolition of the buidling or parking lot, or development at the Site, the responsible party(s) will be required to submit a Removal Action Workplan or Remedial Action Plan to DTSC for approval.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	* Final Remedial Action
Completed Date:	12/16/1991
Comments:	The Final Remedial Action consisted of placing an asphalt cap on the unpaved portions of the Olympic Base Site which would be maintained according to the requirements set forth in the RAP. A deed restriction was recorded on the property. The design of the cap was prepared and included in the RAP workplan.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	Southern California Gas has entered into a consent order with DHS for oversight/monitoring of its cleanup efforts. DHS has budgeted $50,000 for direct costs related to the project. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project. The responsible parties will pay all costs associated with site cleanup.
Site Description:	The Olympic Base facility, currently owned by Southern California Gas Company, is the site of a former oil gasification "towne gas" plant.
Hazardous Waste Desc:	The wastes are generally characterized as polynuclear or polycyclic aromatic hydrocarbons (PNAs or PAHs). Other constituents of concern are cyanide, lead, and semivolatile organics. Soil contamination is present at the site from the surface to a depth of 10 to 15 feet in both the northern and southern portions of the site.
Threat To Public Health & Env:	The primary concern is potential contamination of ground water. Usable ground water lies approximately 200 feet below the ground surface and the water table may rise to only 100 feet below the site. Ground water contamination has not been verified. Surface soil contamination may migrate offsite due to airborne particulates.
Site Activity Status:	The Southern California Gas Company has completed a remedial

Address: 2424 E OLYMPIC BLVD
Cleanup Status: OPERATING PERMIT
Latitude: 34.02333
Longitude: -118.2280
Facility Type: Permitted - Operating
Facility Size: Small Storage
Supervisor: WILLIAM HEUNG
Site Code: 300144
Senate District: 30, 24, 26
Assembly District: 53
Public Information Officer: Not reported
Commercial Offsite Facility Types: Not reported
Quarterly Update: QUARTERLY UPDATE: Quarterly Update Period: July 2022 to September 2022 No inquiries from the facility or the public have occurred this quarter. FACILITY DESCRIPTION/HISTORY: The facility is located at 2424 East Olympic Boulevard, Los Angeles. The Assessor s Parcel Numbers are Lots A, C, and E, Tract Number 8769, Book 52, pages 5 to 8, of Record of Surveys, Recorder of the County of Los Angeles. This facility consists of a 14 acre parcel which contains several owner operations and one lessee operation. The owner/operator is a natural gas distribution utility serving nearly all of southern and central California. The owner/operator maintains Gas Transmission and Measurement Sections and two vehicle fleet maintenance garages at this location. The lessee is involved in recycle of demolition and construction debris. The hazardous waste operation is storage of containers of polychlorinated biphenyls (PCB) containing hazardous waste from company owned off-site facilities. The facility has three permitted units: (1) PCB Drum Storage Building for a capacity of 17,160 gallons, (2) East Outdoor Storage Pad for a capacity of 4,400 gallons, and (3) West Outdoor Storage Pad for a capacity of 4,400 gallons. This facility is categorized as a small storage facility. PERMITTING REGULATORY DESCRIPTION/HISTORY The Facility was issued an Interim Status Document (ISD) in May 16, 1983 by the Department of Health Services (DOHS), the predecessor of DTSC. On June 30, 1996, DTSC issued the Facility a Hazardous Waste Facility Permit. The expiration date for that Permit was June 30, 2006. This Permit was renewed on May 4, 2007. On June 11, 2007, the Facility proposed a Class 1 permit modification of an administrative change to correct the facility size classification from large to small. DTSC approved the request on October 19, 2007. The expiration date for that Permit was May 14, 2017. DTSC issued the renewal of the Permit on June 30, 2018. Currently, there is no corrective action in this facility.

Final Date:	2018-06-28 00:00:00
Type:	RCRA
Title Description:	Permit Renewal
Due Date:	Not reported
Comments:	Scheduled date for call-in letter; Point of contact is changed; model letter was used as a template. The call-in letter was returned with no reason. Called facility. The address was correct, but they preferred Pico Rivera address for future communication. Resent the returned Call-in Letter.

SO CAL GAS/OLYMPIC BASE MGP (Continued) **S105689611**

Background Info: The Southern California Gas (SCG), Olympic Base Site was once a gas manufacturing plant where oil was converted into gas for lighting, heating, and cooking. Residues from the gasification process, mainly consisting of a material "lamp black", were were discovered at the site. "Lamp Black" contains varying amounts of a family of compounds called polynuclear or polycyclic aromatic hydrocarbons (PNAs or PAHs).
The plant was built in the period 1907-1908 by the City Gas Company. In 1908, the Domestic Gas Company purchased and took over the operations of City Gas. In 1910, SCG was incorporated and became the successor of Domestic Gas. SCG operated the plant until 1927, when the service for 100% natural gas started. The plant operated on a standby basis until 1952, when all gas manufacturing operations ceased and the plant was dismantled. SCG has administrative facilities on other portions of the facility.
A Consent Order was signed in December 1986, which addressed the work needed to complete the Remedial Investigation/-Feasibility Study (RI/FS) process. The RI report was approved by the Department on September 17, 1987. The RI found that soil from about 2 to 12 feet below ground surface is contaminated. The contaminants are not readily vaporized, nor do they enter aqueous phase solution. Groundwater aquifers beneath the site are unsaturated to a depth of 90 feet. Air monitoring at the site does not indicate that the contaminants are emitting vapors to the air. SCG then submitted a FS report in May 1988. DHS has reviewed the FS report and requested a full Health Risk Assessment (HRA) based on appropriate biological receptors and exposure pathways on October 20, 1988. The HRA was approved by the Department on June 4, 1990. The FS was revised by SCG and the report approved on July 19, 1990.
The RP submitted a draft RAP on August 20, 1990, as requested by the Department. The Department has published a fact sheet on the findings of the RI/FS. The RAP meeting with the community was held on November 17, 1990 and the RAP was subsequently approved in January of 1991.
The RAP proposed an asphalt cap on the site, groundwater monitoring, and a deed restriction. Groundwater monitoring is necessary as the region the site is located in is currently experiencing a drought; however, if this should change the groundwater table will rise, possibly impacting the conclusions of the RI. The deed restriction, protected the integrity of the cap by limiting land use and excavation of the waste.
The Department directed the RP to prepare a Remedial Design and Implementation (RD&I) plan. The plan included engineering specifications for the asphalt cap, permits, and a schedule for completion of the cap. The cap will be repaired as necessary; necessary; it is expected to require replacement every ten years. This operation and maintenance program will last for 20 years.

Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	12/21/1998
Comments:	A PEA was performed. Soil sampling and analysis was conducted for PCBs, metals, VOCs, and TPH. The results showed that concentrations of PCBs and VOCs were found at the site. Soil contaminated with PCBs was removed from the site, and additional sampling was conducted. The additional sampling performed at the site confirmed that the low levels of PCBs and VOCs remaining on the site do not pose a human health risk as specified in DTSC's PEA manual.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Standard Voluntary Agreement
Completed Date:	05/31/1996
Comments:	DTSC signed a Voluntary Cleanup Agreement with Santa Fe for the completion and review of a Preliminary Endangerment Assessment.
Completed Area Name:	PROJECT WIDE

SANTA FE/W.A. GRANT (Continued) **S102860873**

Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 09/04/1996
Comments: DTSC reviewed a Preliminary Endangerment Assessment for the site under a Voluntary Cleanup Agreement. Based on the information and data presented, DTSC determined that the hazardous constituents remaining at the site do not constitute a threat to human health or the environment.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 09/13/1995
Comments: The Department received a Non-Emergency Hazardous Substance Release Report dated January 31, 1995. Review of the document indicates that the site is contaminated with elevated levels of heavy metals such as lead, copper and zinc. Foundry operations existed at the site from at least 1906 until 1990, operated by W.G. Grant & Co. Santa Fe Railway is the current owner of the site. RP removed USTs from the site without any regulatory agency oversight. Due to evidence of a release, DTSC is recommending that a PEA be conducted to evaluate the site. On September 13, 1995, DTSC notified the RP thereof.

Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System:
California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 11/13/2001
Comments: DTSC received a confirmed copy of the recorded Deed Restriction for the subject site. The document was recorded with L.A. County Recorder, November 8, 2001.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Standard Voluntary Agreement
Completed Date: 09/20/1999
Comments: VCA executed on 9/20/1999 to provide review and comment on a Preliminary Endangerment Assessment (PEA) equivalent report. Site was formerly used as a foundry, auto parts rebuilder and most recently as a chrome plating shop. Owner has already con- ducted a removal action without DTSC oversight.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 12/13/2001
Comments: DTSC issued a No Further Action letter for the Site. Based upon the data presented in the PEA report and the recording of the Deed Restrictions, DTSC determined that the Site does not pose a threat to human health or the environment.

FINDS:
Registry ID: 110002138696

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites
A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 01/25/2023

NPL LIENS: Federal Superfund Liens
Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 12/20/2022

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing
Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines
An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

HAZNET: Facility and Manifest Data
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Version Date:	2018
Northwest Map:	12021991 HOLLYWOOD, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

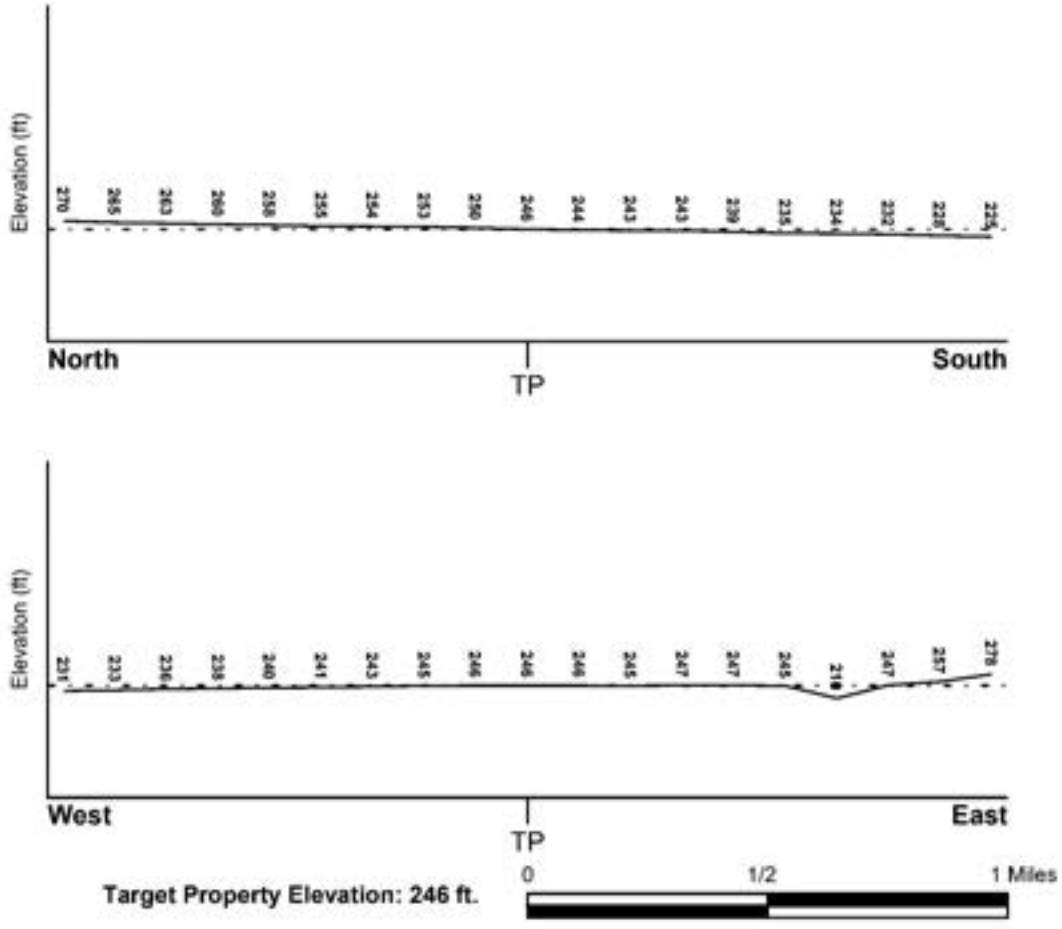
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1636F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1620F	FEMA FIRM Flood data
06037C1638F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LOS ANGELES	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile WSW
Site Name:	SUNGRO CHEMICALS
Site EPA ID Number:	CAD009689696
Surficial Aquifer Flow Dir.:	Southeast
Inferred Depth to Water:	approximately 221 feet.
Hydraulic Connection:	A clay layer exists between the ground surface and the water table in the site vicinity.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
C13	1/2 - 1 Mile SW	Not Reported
C14	1/2 - 1 Mile SW	Not Reported
15	1/2 - 1 Mile SE	Not Reported
1G	1/2 - 1 Mile SW	Not Reported
2G	1/2 - 1 Mile SW	Not Reported
3G	1/2 - 1 Mile SE	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	URBAN LAND
Soil Surface Texture:	variable
Hydrologic Group:	Not reported
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 10 inches
Depth to Bedrock Max:	> 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Surficial Soil Types:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

HMC
HAZARD MANAGEMENT CONSULTING

February 14, 2013

Mr. Trevor Sterry
Alameda Produce Market LLC
c/o EVOQ Properties, Inc.
626 Wilshire Blvd, Suite 850
Los Angeles, California 90017

Subject: Results of Soil and Soil Gas Sampling
777 South Alameda Street
Los Angeles, California

Dear Mr. Sterry:

This report presents the results of the soil and soil gas sampling performed at the property located at 777 South Alameda Street in the city of Los Angeles, California (Site; Figure 1). AEI Consultants, Inc. (AEI) completed a Phase I Environmental Site Assessment (ESA) for the Site in 2004 (referred to herein as the "2004 Phase I ESA"). Based on the results of the 2004 Phase I ESA, AEI listed a number of Recognized Environmental Concerns (RECs) associated with the property. Hazard Management Consulting, Inc. (HMC) subsequently reviewed the report and evaluated the data. As noted herein, AEI based some of their conclusions and recommendations on assumptions, speculations, or misinformation. Following our review, HMC compiled a list of environmental concerns (i.e. RECs as defined by the American Society for Testing and Materials [ASTM] and All Appropriate Inquires [AAI] Standards) or areas of environmental interest. All of these areas were further investigated as part of the soil and soil gas sampling described below.

The property has been used for commercial purposes for over 100 years. In the 1800s, the Site was used for residential purposes; in the early-1900s, the Site was redeveloped by the Pacific Electric Railroad Company as a railcar maintenance yard; and in 1917, the property was redeveloped with the existing buildings as the Los Angeles Terminal. The Los Angeles Terminal

211 W. Avenida Cordoba, Suite 200 San Clemente, CA 92672 tel 949/361/3902 fax 949/361/3697
www.hmcinc.biz info@hmcinc.biz

buildings were originally constructed for produce storage, warehouse, distribution, and office space and are currently being occupied by American Apparel for clothing sewing and office purposes. It is our understanding that the client currently owns the Site and will be pledging the property as collateral. According to AEI, groundwater has been reported in the Site vicinity at depths of approximately 21 feet below ground surface (bgs).

BACKGROUND

In general, the Site has had three main land uses, (1) residential and vacant land (1800s), (2) a railcar maintenance yard (occupied by the Pacific Electric Railcar Company from the 1900s to 1916), and (3) warehouse, distribution, and offices (referred to as the Los Angeles Terminal from 1917 to the present). Due to the location of the Site to the Downtown Los Angeles area, many historical sources of data were available during completion of AEI's Phase I ESA including historical Sanborn Fire Insurance Maps (Sanborn Maps), historical aerial photographs, agency files, city directories, and regulatory databases.

Based on the 2004 Phase I ESA, AEI presented a number of RECs which, in AEI's opinion, needed further investigation. As noted below, some of these concerns were based on assumptions, not on facts or data collected. The following presents the areas of concern outlined by AEI and HMC's evaluation of the data presented in the report. Following our review, environmental issues were compiled by HMC into a list of Environmental Concerns (i.e. RECs) or Environmental Interests. The following presents a brief discussion of the historical land use, environmental issues presented in the 2004 Phase I ESA, and our evaluation of the data collected.

- **Residential Land Use** – AEI did not have environmental concerns or recommendation for further investigations. HMC concurs.

- **Pacific Electric Railroad Company** – The Pacific Electric Railroad Company operated an electric railcar maintenance yard. AEI concluded that a number of operations conducted by the Pacific Electric Railroad Company would be considered REC's. Most of these areas of concern obtained from a scaled Sanborn Map which labeled areas of former activities. As noted on Figure 2, HMC superimposed these historical features onto an existing Site plan to obtain

the location of these historical features with respect to current buildings. The following presents AEI's concerns and HMC's evaluation of these RECs.

- Former Machine Shop – Machine shops are typically used to machine metal parts. According to AEI, the operations may have used many different chemicals such as petroleum hydrocarbons (lubricating oils) and solvents. Machine shop activities also produce metal wastes. HMC concurs with AEI that the Former Machine Shop is a possible environmental concern and additional investigations are warranted.

- Former Paint Shop and Former Paint Mixing Area – This area appears to have been used to store and mix paints, as well as to paint railcars. These activities would include the use of paints (petroleum based) and solvents. HMC concurs with AEI that this area would be considered an environmental concern and further investigations are warranted.

- Former Oil House – According to AEI, this area was used to "store oil, fuel and solvents in several above and/or below ground storage tanks." HMC reviewed historical Sanborn Maps and does not concur with AEI that underground storage tanks (USTs) were used within the Former Oil House. Sanborn Maps typically indicate the presence of USTs with the designation "Gas & Oil;" which was not shown on the Sanborn Map. Additionally, it is highly unlikely that solvents were stored in an "Oil House." Oil in the Oil House was most likely stored in above ground storage tanks (ASTs) or 55-gallon drums, due to the existence of a "iron rack" noted immediately southeast of the Oil House. HMC concurs with AEI that this area would be considered an environmental concern, however the types of materials stored were likely petroleum based fuel oils (not solvents) and the type of storage was likely above ground (i.e. ASTs and/or drums), not belowground (i.e. USTs).

- Former Woodworking, Carpenter, and Planing Mill - According to AEI, "lacquers, solvents, and paints may have been used in this area." HMC does not concur with this assumption. It is our opinion that this building was likely used for woodworking purposes and that painting or varnishing was completed in the Former Paint Shop and Former Paint Mixing Area. Therefore, HMC does not concur with AEI that further investigations are warranted in this area. However, as discussed herein and for precautionary measures, HMC completed a subsurface investigation in the area of this former feature as part of our overall Site screening.

- Former Repair Shop – The Former Repair Shop was possibly used to repair railcars. According to AEI, chemicals used included "oils, solvents, fuels and other vehicle fluids." Although there was no indication that these chemicals were used in this area, HMC concurs with AEI that the Former Repair Shop would be considered an environmental concern and further investigations are warranted.

- Former Electrical Construction Department – AEI assumed that these small buildings which encroach partially onto the Site were used to store and manufacture electrical equipment. AEI indicated that manufacturing electrical equipment typically used chemicals such as oils, PCBs, solvents and may have produced heavy metal wastes. Based on our review of AEI's report, there is no evidence that these buildings were used for anything other than office, storage, and a small "shop," as labeled on the Sanborn Maps. Therefore, HMC does not concur with AEI's conclusions and recommendation for additional testing. However, as a precautionary measure, HMC did collect a soil gas sample in the vicinity of this feature as part of our overall Site screening event.

- Coke Storage Building – According to AEI this building was used to store coke that was likely used in large furnaces and generators. Based on Sanborn Maps reviewed by HMC, this building was located approximately 250 feet south of the Site. Although AEI presented this feature as an environmental concern to the Site, based on the distance of this building from the Site and the type of material stored, HMC does not concur with AEI that additional investigations are warranted.

- Pintsch Gas Plant - According to AEI, the Pintsch Gas Plant was possibly located on the Site. AEI assumed this location based on limited data provided by the Environmental Data Resources Inc. (EDR) database report obtained during the Phase I ESA. AEI assumed that this facility was on the subject property due to the indication by EDR that in 1906 the gas plant maintained a "woodworking building" and used coal as a fuel. Because the Site contained a Woodworking, Carpenter, and Planing Mill and close-by Coke Storage Building in 1906, AEI assumed that these activities were associated with the gas plant, although they were clearly labeled as associated with the Pacific Electric Railroad Company's electric railcar maintenance yard. HMC reviewed the EDR database which indicates that in 1906 the gas plant was located north of Bay Street, in the block between South Alameda Street and Lawrence Street. Based on this information, the gas plant would have been located east of the Site and beyond Alameda Street. This corresponds to historical aerial photographs which show a large AST with an accordion style roof (similar to those used to store gasses) located east of the Site. Furthermore, a manufacture gas plant (MGP) has been investigated and was located at this location at what is now the current location of the Greyhound Parking Lot across Alameda Street from the Site. At this property, the Department of Toxic Substances Control (DTSC) is acting as lead regulatory agency and Sempra Energy is the responsible party. Some additional off-site characterization is being completed to the south and southwest of this property. A work plan has been prepared to conduct additional sampling along Alameda Street. Based on the information provided, there is a low likelihood that the former Pintsch Gas Plant was located on-Site, but rather, was located off-Site east of Alameda Street, and therefore, this feature would not be considered an environmental concern to the Site. As noted herein, and as a precautionary measure, HMC collected a soil sample along the east-

ern property line as part of the subsurface investigation to assure that this off-Site facility had not impacted the Site.

- Los Angeles Terminal – The Site was redeveloped by Southern Pacific as the Los Angeles Terminal in 1917. Through the years a number of buildings were constructed as the Los Angeles Terminal, these buildings were reportedly constructed and used for warehouse, distribution, and offices. There has been no information obtained from regulatory records that would suggest that manufacturing operations occurred during this time. The Los Angeles Terminal included the four existing buildings (referred to herein as "Building 1 through 4") and five other buildings that have since been razed. During this time these buildings were used for offices and warehouse purposes, primarily for produce warehouse and distribution. The distribution businesses used three clustered fuel USTs that were located in the southern portion of the Site. These USTs were removed in 1997 under the direction and oversight of the City of Los Angeles Fire Department (LAFD). Although AEI indicated that they could not find a copy of the closure letter for the USTs, HMC discovered the no further action (NFA) letter in an appendix of AEI's report. For convenience, a copy of the NFA letter is provided as Attachment A. According to AEI, a number of historical tenants were considered environmental concerns based entirely on their business name (e.g. SE Rycoff, Terminal Economics Laboratory, Pittsburg Steel Company, French Battery Company, Oleo Manufacturing and Packaging, Terminal Refrigerators, etc.) and were assumed to be conducting manufacturing operations. Most of these historical tenants occupied Buildings 2 and 3. Based on our review, there has been no indication in regulatory agency files or historical databases that suggest manufacturing operations were conducted by these tenants. Therefore, HMC does not concur with AEI that the operations conducted by the former occupants would be considered an environmental concern. In addition, HMC does not concur with AEI that the three clustered USTs would be considered an environmental concern. However, as discussed herein, and for precautionary measures, HMC completed soil and soil gas investigations in these areas as part of a Site screening to further assess whether an environmental issue was present.

Based on the above information, the following Environmental Concerns (i.e. RECs as defined by ASTM and AAI standards) were assessed by HMC as needing further evaluation. To address these areas, and as discussed herein, HMC completed a shallow soil and soil gas investigation. Prior to beginning work, these areas of concern were superimposed from historical documents (i.e. Sanborn Maps) onto an existing Site plan (Figure 2).

Environmental Concerns (RECs)

- Former Machine Shop;
- Former Paint Shop and Former Paint Mixing Area;
- Former Oil House; and
- Former Repair Shop.

In addition to the Environmental Concerns noted above, HMC also evaluated other unknown areas of concern by completing an overall Site screening which included the collection of soil and soil gas samples. The Site screening also included specific locations of Environmental Interest that were presented in the AEI report, but would not be considered an REC in accordance with ASTM and AAI Standards. These features were further investigated as a precautionary measure to assure that they had not impacted the Site.

Environmental Interests

- Former occupants of Buildings 1 through 4;
- Area of the Former USTs;
- Former Woodworking, Carpenter, and Planing Mill;
- Former Electrical Construction Department;
- Former Off-Site Gas Plant; and
- General Site Screening.

OBJECTIVE

The objective of the investigation described herein was to assess whether elevated concentrations of selected chemicals were present in soil and soil gas in areas of Environmental Concerns and in the vicinity of Environmental Interests.

CLEAN UP GUIDELINES

HMC completed a subsurface investigation which included the collection of soil and soil gas samples throughout the Site. Selected soil samples were analyzed by a State-certified laboratory for total petroleum hydrocarbons carbon chain C_{10}-C_{32} (TPHcc), Title 22 metals, polynuclear aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and/or polychlorinated biphenyls (PCBs) in general accordance with EPA Method Nos. 8015 (modified), 6010/7000 series, 8270C, 8260B, and 8082. Soil gas samples were collected and analyzed for VOCs in general accordance with EPA Method No. 8260B.

Laboratory results of soil samples indicated no detectable concentrations of PAHs, VOCs, and PCBs. No detectable concentrations of petroleum hydrocarbons were noted in soil samples in the carbon chain C_{10} through C_{22} (i.e. total petroleum hydrocarbons as gasoline C_{10}-C_{12} [TPHg] and total petroleum hydrocarbons as diesel fuel C_{13}-C_{22} [TPHd]).

Concentrations of heavy petroleum hydrocarbons (i.e. carbon chain range C_{23}-C_{32}) in soil were generally assessed based on the Regional Water Quality Control Board, Los Angeles Region (RWQCB) Interim Site Assessment & Cleanup Guidebook dated May 1996 (referred to herein as the "RWQCB guidelines"). The RWQCB guidelines were established to provide cleanup goals to protect groundwater. The RWQCB guidelines take into account a number of variables including constituents detected, lithological conditions, and depth to groundwater. Concentrations of heavier petroleum hydrocarbons, referred to herein as total petroleum hydrocarbons as oil C_{23}-C_{32} (TPHo), were considered elevated if concentrations exceeded 1,000 milligrams per kilogram (mg/kg). These concentrations were based on the RWQCB guidelines for properties where samples are collected at depths of 20 feet or less above groundwater.

Concentrations of Title 22 metals in soil were compared to the health-based cleanup guidelines presented in the Cal-EPA California Human Health Screening Levels for industrial/commercial land use (CHHSLi) and the Federal health-based cleanup guidelines referred to as the Regional

Screening Levels for industrial/commercial land use (RSLi). Metals are naturally occurring. Because the natural occurring concentrations of arsenic in California soils typically exceed the CHHSLi and RSLi values, elevated concentrations of arsenic were defined as levels exceeding published background concentrations. The Kearney Foundation of Soil Science (Kearney) completed a study of California soils. According to Kearney, background concentrations of arsenic in California ranges from approximately 0.59 to 11 milligrams per kilogram (mg/kg). Other available publications documenting metal concentrations in soil throughout the western United States indicate concentrations of naturally occurring arsenic ranging from less than 0.1 to 40 mg/kg (Dragun, 1988) and less than 0.1 to 97 mg/kg (Shacklette & Boerngen, 1984). Based on these publications, arsenic was considered elevated if concentrations exceeded 11 mg/kg. VOCs in soil gas samples were compared to the Cal-EPA CHHSLi values.

SOIL AND SOIL GAS SAMPLING

The following subsurface investigation was completed to address the Environmental Concerns discovered following review of AEI's Phase I ESA. In addition, HMC completed a Site screening to further evaluate unknown areas of concern, and as a precautionary measure, to further assess possible historical features discovered by AEI during completion of the Phase I ESA, referred to by HMC as Environmental Interests.

HMC advanced 24 soil borings on January 29 and 30, 2013 throughout the Site using direct-push equipment. One soil sample was collected at approximately 5 feet below ground surface (bgs) at each location and was screened in the field for staining, odors, and elevated photoionization detection readings (PID). Based on field observations, no staining or odorous soil or elevated PID readings were discovered. Soil lithology generally consisted of silty fine sands. Each soil boring was used to install one soil gas point (designated SG-1 through SG-24) at approximately 5 feet bgs. Following installation, each soil gas sample point was evacuated of 3 purged volumes and a sample was collected and analyzed for VOCs. Laboratory results of soil gas samples are presented on Table 1, and laboratory results of soil samples are presented on

Table 2. Laboratory reports are presented in Attachment B. The following presents the results of these investigations.

Environmental Concerns (RECs)

As noted above, Environmental Concerns were identified during the 2004 Phase I ESA. These areas were further evaluated through the collection and analyses of soil and soil gas samples. The location of these features was obtained from a scaled Sanborn Map provided in the 2004 Phase I ESA.

Former Machine Shop

The Former Machine Shop was associated with the Pacific Electric Railroad Company that occupied the Site in the early 1900s (Figure 2). HMC advanced two soil borings in the location of this former feature and collected two soil samples (SG-17s and SG-18s) and two soil gas samples (SG-17 and SG-18). Laboratory results of soil gas samples indicated no detectable to low concentrations of VOCs (Table 1). Soil samples were analyzed for TPHcc, VOCs, and Title 22 metals. Laboratory results indicated no detectable concentrations of TPHg, TPHd, and VOCs. Low concentrations of TPHo were reported in one of the two samples, well below the RWQCB guidelines; the remaining sample reported no detectable concentrations of TPHo. With the exception of lead, laboratory results indicated no detectable to low concentrations of metals. Laboratory results of lead in one sample (SG-17s) were detected at 500 mg/kg, which exceeded the State-CHHSLi value of 320 mg/kg but not the Federal-RSLi value of 800 mg/kg (Table 2). Because the State value is very conservative, and the fact that other samples in the vicinity showed no detectable concentrations (indicating a very limited extent), this value would not be considered an environmental concern. In addition, the area is currently paved with asphalt and used as a parking lot, limiting the exposure route to human contact.

Former Paint Shop and Former Paint Mixing Area

The Former Paint Shop and Paint Mixing Area were associated with the Pacific Electric Railroad Company. Two soil borings (SG-7 and SG-10) were advanced in the vicinity of the Former Paint Shop and one boring (SG-9) was advanced in the vicinity of the Former Paint Mixing Area (Figure 2). Laboratory results of soil gas samples (SG-7, -9, and -10) indicated no detectable to low concentrations of VOCs (Table 1). One soil sample collected from this area (SG-9s) was analyzed for TPHcc and Title 22 metals. Laboratory results indicated no detectable concentrations of TPHcc and no detectable to low concentrations of Title 22 metals (Table 2).

Former Oil House

The Former Oil House was also associated with the Pacific Electric Railroad Company (Figure 2). HMC advanced one soil boring in this location and collected one soil sample (SG-16s) and one soil gas sample (SG-16). Laboratory results of the soil gas sample indicated no detectable concentrations of VOCs (Table 1). Soil sample SG-16s was analyzed for TPHcc and PCBs. Laboratory results indicated no detectable concentrations of TPHcc and PCBs (Table 2).

Former Repair Shop

The Former Repair Shop was associated with the Pacific Electric Railroad Company (Figure 2). The borings were also used to further assess whether former occupants of Buildings 3 and 4 might have impacted the Site. HMC advanced two soil borings in the location of this former feature for the collection of soil samples (SG-4s and SG-5s) and soil gas samples (SG-4 and SG-5). Laboratory results of soil gas samples indicated no detectable to low concentrations of VOCs (Table 1). The soil samples were analyzed for petroleum hydrocarbons and VOCs and laboratory results indicated no detectable concentrations (Table 2).

Site Screening and Environmental Interests

The remaining 18 sample points were either used as a screening technique drilled in sporadic locations throughout the Site to assess unknown areas of possible concern, or were placed in specific areas of environmental interest as a precautionary measure to assess historical features (Figure 2). The areas of Environmental Interests included the Former Occupants of Buildings 1 through 4; Area of Former USTs; Former Woodworking, Carpenter, and Planing Mill; Former Electrical Construction Department; Former Off-Site Gas Plant; and for General Site Screening. During the Site reconnaissance, HMC discovered two existing clarifiers located next to Building 2. These features were investigated during the Site screening as discussed below.

Former Occupants of Buildings 1 through 4

HMC advanced eight soil borings (SG-1 through -6, -13 and -14) next to or between existing buildings to further assess whether historical occupants might have impacted the Site and for screening purposes (Figure 2). Former occupants included businesses such as SE Rycoff, Terminal Economics Laboratory, Pittsburg Steel Company, French Battery Company, Oleo Manufacturing and Packaging, and Terminal Refrigerators. Soil boring SG-2 was also placed next to two existing clarifiers observed during our Site reconnaissance which are located southeast of to Building 2 (Figure 2).

Laboratory results of the soil gas samples indicated no detectable to low concentrations of VOCs (Table 1). Soil samples were collected from borings SG-1, -2, -4, and -5 for chemical analyses (as noted above, samples SC-4 and -5 were also analyzed to assess soil conditions associated with the Former Repair Shop associated with the former electric railcar maintenance facility). Soil sample SG-1s was analyzed for TPHcc and PCBs and soil sample SG-2s was analyzed for TPHcc and VOCs. Laboratory results of SG-1s indicated no detectable to low concentrations of TPHcc and no detectable concentrations of PCBs (Table 2). Laboratory results of soil sample SG-2s indicated no detectable concentrations of TPHcc and VOCs (Table 2).

Area of the Former USTs

Although the former USTs were removed under the direction and oversight of the LAFD and obtained a NFA letter from that agency, HMC advanced one soil gas point in the area of this feature (SG-8 on Figure 2). Laboratory results indicate no detectable concentrations of VOCs.

Former Woodworking, Carpenter, and Planing Mill

Although the Former Woodworking, Carpenter and Planing Mill was not considered an REC, HMC advanced two soil gas points (designated SG-11 and SG-12) in the location of this former feature (Figure 2). As noted on Table 1, laboratory results indicated no detectable to low concentrations of VOCs.

Former Electrical Construction Department

As shown on Figure 2, the former buildings associated with the Former Electrical Construction Department were mostly located off-Site. These buildings were labeled on Sanborn Maps as being used for office, storage and a "shop." Although not considered an environmental concern, HMC advanced one soil boring in the vicinity of this feature for the collection of soil and soil gas samples (SG-23 on Figure 2). Laboratory results indicated no detectable to low concentrations of VOCs in soil gas (Table 1), and no detectable concentrations of TPHcc and VOCs in soil.

Former Off-Site Gas Plant

To further assess whether this off-Site feature had impacted the Site, HMC advanced one soil boring along the eastern property boundary of the Site (SG-19 on Figure 2). This sample point was also used as a screening point. Laboratory results of the soil gas sample indicated no detectable concentrations of VOCs (Table 1). The soil sample collected from this boring was analyzed for TPHcc and PAHs. Laboratory results indicated no detectable concentrations of TPHcc and PAHs (Table 2).

General Site Screening

As discussed above, a number of the sampling points were used to address known issues, but some were also used as a general Site screening to assess unknown areas of possible environmental concern. Laboratory results of most of these sample points are discussed above. The remaining soil gas points (SG-15, -20, -21, -22, and -24) not discussed above, were placed within the Former Lumber Storage (SG-15) and in the east (SG-20) and southeastern portion of the Site (SG-21, -22, and -24) to further address possible concerns in those areas (Figure 2). With the exception of sample SG-24, laboratory results indicated no detectable to low concentrations of VOCs. Laboratory results of soil gas sample SG-24 indicated tetrachloroethylene (PCE) at a concentration at the CHHSLi value (1.60 micrograms per liter [ug/l]). Due to this conservative value and the fact that other near-by sampling points showed no detectable to low concentrations of PCE, this detection appears to be an anomaly and would not be considered an environmental concern to the Site or possible health risk to occupants.

CONCLUSIONS AND RECOMMENDATIONS

HMC previously prepared a Phase I ESA for the Site which included a review of a previously completed 2004 Phase I ESA by AEI. While HMC concurred that there were RECs associated with the Site from the historical uses, we did not concur on the specific issues of concern noted by AEI and determined that AEI's conclusions included unsupported speculations. HMC compiled a list of Environmental Concerns and Environmental Interests. The Environmental Concerns were based on facts and data provided in the 2004 Phase I ESA and would be considered RECs in accordance with ASTM and AAI Standards. The list of Environmental Interests included other possible environmental concerns outlined in the report, but would not be considered RECs based on the data provided. To further assess general Site conditions, these sample points were also used as a screening technique to assess whether unknown environmental concerns were present.

In general, no detectable to low concentrations of petroleum hydrocarbons, VOCs, PAHs, metals, and PCBs were reported in selected soil samples, and no elevated VOCs were reported in soil gas samples.

Laboratory results of one soil sample, collected in the vicinity of the Former Machine Shop associated with the former electric railcar maintenance yard, indicated concentrations of lead exceeding the conservative State health-based criteria, but not the Federal health-based guidelines. The soil sample was collected at a depth of approximately 5 feet bgs and is currently located beneath an asphalt capped parking lot. Laboratory results of other near-by samples have indicated no detectable concentrations of lead, suggesting a very limited extent. The cleanup guidelines set by the State and Federal regulatory agencies are health-based criteria which are based on contact with the materials. Because these materials are located relatively deep and are capped with asphalt, direct exposure to these materials does not exist based on current conditions. Based on the depth of the materials, capped area, and limited exposure route, there is a low likelihood that these materials would pose an environmental concern to the Site or human health risk to occupants of the Site in its current condition. Therefore, these materials would not need to be remediated in our judgment.

Laboratory results of one soil gas sample collected in the southern portion of the Site indicated concentrations of PCE at the State-CHHSLi value. Other samples in the general vicinity did not show elevated PCE concentrations, which suggests that the concentration is limited in extent and no source area is present. The CHHSLi values are conservative guidelines used to assess whether a vapor intrusion issue could be present. Because no structures are located in the area, there is a low likelihood that these concentrations would pose a possible vapor intrusion issue.

Based on the data collected, there is a low likelihood that elevated concentrations of selected chemicals are present in the vicinity of the Environmental Concerns and Environmental Inter-

ests discovered at the Site. Based on this conclusion, HMC recommends no further investigation or remediation at the Site.

If you have any questions or comments regarding this report, please call the undersigned at your convenience.

Sincerely,
Hazard Management Consulting, Inc.

CHIEF ENGINEER
AND
GENERAL MANAGER

May 2, 1997

Mr. John Durham
S.E. Rykoff and Company
761 Terminal Street
Los Angeles, CA 90021

Dear Mr. Durham:

761 Terminal Street
Los Angeles, California

The Fire Department has reviewed the Tank Closure Report dated April 24, 1997, as submitted by HVN Environmental Service Company, Incorporated.

Based on the information provided to date, this Department has determined that no further action is required at this time.

Please note that this letter does not exempt you of any liability under the California Health and Safety Code or Water Code for past, present or future operations at this site. Nor does it exempt you of the responsibility to correct additional or previously unidentified conditions at this site which cause, or thereafter to cause, pollution or nuisance, or otherwise pose a threat to water quality or public health.

If you require additional information from the Los Angeles City Fire Department, please contact Inspector Gilbert T. Urrea, Jr. of the Environmental Unit, at (213) 485-7543.

Very truly yours,

WILLIAM R. BAMATTRE
Chief Engineer and General Manager

D. C. Wilcox

Dennis C. Wilcox, Captain II
Commander, Environmental Unit

LABORATORY RESULTS

Mobile Geochemistry Inc.

06 February 2013

Mr. Mark S. Cousineau
Hazard Management Consulting, Inc.
211 W. Avenida Cordoba, #200
San Clemente, CA 92672

H&P Project: HMC012913-L6
Client Project: 761 TERMINAL ST

Dear Mr. Mark S. Cousineau:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 1/29/2013 -1/30/2013 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody

Unless otherwise noted, all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Lisa Ferg for

Janis Villarreal
Laboratory Director

Notes and Definitions

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the Environmental Laboratory Accreditation Program (CA) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste for the following methods:

Certificate# 2741, 2763, 2579, 2754 & 2740 approved for EPA 8260 and LUFT GC/MS
Certificate# 2742, 2765, & 2741 approved for LUFT
Certificate# 2765 & 2742 approved for EPA 418.1

H&P Mobile Geochemistry, Inc. is approved as an Environmental Laboratory in conformance with the National Environmental Accreditation Conference Standards for the category Environmental Analysis Air and Emissions for the following analytes and methods:

1,2,4-Trichlorobenzene by EPA TO-15 & TO-14A
Hexachlorobutadiene by EPA TO-15 & TO-14A
1,2,4-Trimethylbenzene by EPA TO-14A
1,2-Dichlorobenzene by EPA TO-15 & TO-14A
1,3,5-Trimethylbenzene by EPA TO-14A
1,4-Dichlorobenzene by EPA TO-15 & TO-14A
Benzene by EPA TO-15 & TO-14A
Chlorobenzene by EPA TO-15 & TO-14A
Ethyl benzene by EPA TO-15 & TO-14A
Styrene by EPA TO-15 & TO-14A
Toluene by EPA TO-15 & TO-14A
Total Xylenes by EPA TO-15 & TO-14A
1,1,1-Trichloroethane by EPA TO-15 & TO-14A
1,1,2,2-Tetrachloroethane by EPA TO-15 & TO-14A
1,1,2-Trichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethane by EPA TO-15 & TO-14A
1,1-Dichloroethene by EPA TO-15 & TO-14A
1,2-Dichloroethane by EPA TO-15 & TO-14A
1,2-Dichloropropane by EPA TO-15 & TO-14A
Benzyl Chloride by EPA TO-15 & TO-14A
Bromoform by EPA TO-15
Bromomethane by EPA TO-15 & TO-14A
Carbon tetrachloride by EPA TO-15 & TO-14A
Chloroethane by EPA TO-15
Chloroform by EPA TO-15 & TO-14A
Chloromethane by EPA TO-15 & TO-14A
cis-1,2-Dichloroethene by EPA TO-15
cis-1,2-Dichloropropene by EPA TO-15 & TO-14A
Methylene chloride by EPA TO-15 & TO-14A
Tetrachloroethane by EPA TO-15 & TO-14A
trans-1,2-Dichloroethene by EPA TO-15
trans-1,2-Dichloropropene by EPA TO-15 & TO-14A
Trichloroethene by EPA TO-15 & TO-14A
Vinyl chloride by EPA TO-15 & TO-14A
2-Butanone by EPA TO-15
4-Methyl-2-Pentanone by EPA TO-15
Hexane by EPA TO-15
Methyl tert-butyl ether by EPA TO-15
Vinyl acetate by EPA TO-15

Dibromochloromethane by EPA TO-15
Dichlorodifluoromethane by EPA TO-15 & TO-14A
Trichlorofluoromethane by EPA TO-15 & TO-14A
Naphthalene by EPA TO-15 & TO-14A
m&p Xylenes by EPA TO-15
o-Xylene by EPA TO-15
1,3-Butadiene by EPA TO-15
1,1,2-Trichlorotrifluoroethane by EPA TO-15 & TO-14A
Carbon disulfide by EPA TO-15
1,4-Dioxane by EPA TO-15
Cyclohexane by EPA TO-15
tert-Butyl Alcohol by EPA TO-15
1,3-Dichlorobenzene by EPA TO-15 & TO-14A
Heptane by EPA TO-15
Bromodichloromethane by EPA TO-15 & TO-14A

This certification applies to samples analyzed in summa canisters.

SAMPLE RECEIVING REVIEW SHEET

BATCH # T130184

Client Name: Ardent Project: 761 Terminal Street

Received by: Dan M Date/Time Received: 1/30/13 1030

Delivered by : ☐ Client ☐ SunStar Courier ☐ GSO ☐ FedEx ☐ Other _____

Total number of coolers received _____ **Temp criteria = 6°C > 0°C (no frozen containers)**

Temperature: cooler #1 _____°C +/- the CF (- 0.2°C) = _____°C corrected temperature

cooler #2 _____°C +/- the CF (- 0.2°C) = _____°C corrected temperature

cooler #3 _____°C +/- the CF (- 0.2°C) = _____°C corrected temperature

Samples outside temp. but received on ice, w/in 6 hours of final sampling.	☒Yes	☐No*	☐N/A
Custody Seals Intact on Cooler/Sample	☐Yes	☐No*	☒N/A
Sample Containers Intact	☒Yes	☐No*	
Sample labels match COC ID's	☒Yes	☐No*	
Total number of containers received match COC	☒Yes	☐No*	
Proper containers received for analyses requested on COC	☒Yes	☐No*	
Proper preservative indicated on COC/containers for analyses requested	☐Yes	☐No*	☒N/A

Complete shipment received in good condition with correct temperatures, containers, labels, volumes preservatives and within method specified holding times. ☒ **Yes** ☐ **No***

* Complete Non-Conformance Receiving Sheet if checked Cooler/Sample Review - Initials and date 1/30/13

EXECUTIVE SUMMARY

This supplemental assessment was completed to better define the extent of soil and soil gas impacts potentially affecting the proposed residential redevelopment project. Previous sampling (HMC 2013) of soil identified the presence of elevated lead (up to 500 mg/Kg) beneath the location of the former onsite machine shop on the north lot. Three (3) of the soil gas samples collected by HMC contained PCE and benzene at concentrations above the current DTSC recommended residential screening level (SL). Low concentrations of TCE and TPH-diesel were also found in soil. PCBs and PAHs were not detected in soil by HMC.

CE implemented additional assessment that included sampling of soil and soil gas from ten (10) borings. Twenty-six (26) soil samples were obtained from depths of 2, 5, 10 and 15 feet and tested for TPH, VOCs and metals. Sixteen (16) soil gas samples were collected from co-located probes placed at depths of 15 and 25 feet and tested for VOCs per EPA Method TO-15.

The soil sample test results reveal that TPH and VOC concentrations were mostly non-detect or below residential clean up goals. Low concentrations of PCE (0.27-11 ug/Kg) were found in shallow soil along with low concentrations of TPH-diesel (3.8-30 mg/Kg) and TPH-oil (25-210 mg/Kg). The concentrations of heavy metals were all below residential risk levels except for one sample (CEB1-2ft) where elevated concentrations of arsenic (15.2 mg/Kg) and lead (275 mg/Kg) were detected. All other concentrations of metals detected were below their respective DTSC residential soil screening level (SL). Sample CEB1-2ft was also tested for soluble lead per methods STLC (42.4 mg/L) and TCLP (1.42 mg/L). The soil sample data confirm that the majority of the soil to be exported during future excavation of the future subterranean basement can be classified as non-hazardous. Several locations, in particular the areas around CEB1-2 ft and HMC SG-17s, contained elevated concentrations of lead, 275 mg/Kg and 500 mg/Kg, respectively. These concentrations exceed the CalEPA residential risk level for lead of 80 mg/Kg. Solubility testing on sample CEB1-2ft indicates the soil in this area is classified as CA hazardous since the STLC concentration exceeds the limit of 5.0 mg/L. Further testing is required to define the limits of the hazardous lead soil around CEB1-2ft.

All sixteen (16)-soil gas samples contained PCE at concentrations that ranged from 130-6,500 ug/m^3. Low concentrations of toluene, ethylbenzene, xylene and the refrigerants R11 and R12 were also detected. The general trend observed was the deeper soil gas probes on the south lot (25 ft) tended to have the higher concentrations of PCE. A vapor intrusion (VI) risk analysis using the current soil gas data confirms the entire footprint of the proposed residential development overlies a soil gas plume that exceeds the CalEPA-DTSC guidance concentrations for evaluation of vapor intrusion (VI) into future residential structures. The primary risk driver for future VI is PCE in soil gas. While it may be feasible to use soil vapor extraction (SVE) to reduce the future VI threat, the cost and time to complete are unknown. Removal of the contaminated soil gas via SVE now will not preclude future VI risks such as a change in regulatory requirements or vapors migrating onsite from offsite properties. For these reasons installation of a Vapor Intrusion Mitigation System (VIMS - membrane) is the preferred mitigation measure.

A Soils Management Plan (SMP) and associated Health & Safety Plan (HASP) should be developed for the future grading work at the site. The SMP will provide procedures for identification, segregation, verification sampling and profiling for offsite disposal of impacted soil. The HASP will specify procedures for protection of worker and community health and safety during implementation of the removal action. The VIMS recommended for the project should include provisions for performance monitoring of the engineering control system. The soil impacts detected (considered de minimus) do not appear to require reporting to a lead enforcement agency.

1.0 INTRODUCTION

The following report represents the findings of the supplemental soil gas and soil sampling conducted at the subject property located at 777 S. Alameda Street, Los Angeles, California. The subject property consists of approximately 10 acres of land on the east side of one (1) 20-acre irregular- shaped parcel. The subject property is associated with the ROW DTLA mall, which is located on the remainder of the parcel to the west. The subject property is currently developed with two (2) asphalt-paved parking lots that are bisected by Center Street. The south parking lot was constructed in approximately 1980 and the north parking lot was constructed in approximately 1989. California Environmental (CE) completed a Phase I report for the subject property in May 2023. CE identified recognized environmental conditions (RECs) for the subject property in the Phase I report, which included:

- The subject property was utilized as a railway yard from at least 1896 until the mid-1970s. Throughout this time period the property was utilized for industrial operations, including a machine shop/blacksmith furnaces, oil house (which likely contained several AST/USTs), woodworking shop, and electrical construction facility. Additionally, the south portion of the subject property was developed with railroad tracks. These operations are known to be associated with several types of contaminants including hydrocarbons, VOCs, PCBs, and metals.

- In 2013 Hazard Management Consulting (HMC) conducted a subsurface assessment on the subject property. The assessment consisted of soil and soil gas sampling that targeted the former industrial operations associated with the former railroad facilities, as well as general site screening. The assessment identified concentrations of metals in soil and VOCs in soil gas that exceed the current applicable residential screening levels (SLs).

    - **North Portion of Subject Property** - One (1) soil sample in the area of the former machine shop contained lead (500 mg/Kg) above the current DTSC recommended residential SL (80 mg/Kg).

    - **South Portion of Subject Property** - Three (3) soil gas as samples contained PCE at concentrations above the current DTSC residential SL. One (1) of these soil gas samples also contained a concentration of benzene that exceeds the current DTSC residential SL. Only one (1) of the four (4) soil gas sample locations with exceedances had a co-located soil sample, which was non-detect for hydrocarbons and VOCs.

The objective of this soil screening and soil gas assessment was to better define the extent of the impacts in soil and soil gas and to evaluate the RECs identified in the May 2023 Phase I report in preparation for redevelopment of the site with several multi-story residential structures, including one level of subterranean parking.

This report includes **CONCLUSIONS AND RECOMMENDATIONS** that are subject to the **NOTICE** at the end of this document. The scope of work included:

- Notification of Underground Service Alert to mark utility locations.
- Conduct a limited geophysical survey to clear underground utilities around boring locations.
- Soil sampling of ten (10) borings at depths ranging from 2 to 15 feet below ground surface (bgs).
- Placement of fifteen (15) soil-gas probes at depths of 15 and 25 feet bgs, approximately 5 and 15 feet below the proposed single subterranean level.
- Analysis of sixteen (16) soil gas, one ambient air and twenty-six (26) soil samples in state certified laboratories.
- Preparation of this report.

1.1 Site Description/Proposed Project

The subject property is located on the west side of South Alameda Street between 7th Street and Bay Street, in the City of Los Angeles, California. The current street addresses for the property are 1390 & 1396 E 7th Street and 777 S. Alameda Street. The 777 S. Alameda Street address is associated with the entire ROW DTLA mall property that extends to the west. According to the Los Angeles County Tax Assessor's office, the Assessor's Parcel Number (APN) for the subject property is a portion of APN 5146-009-008.

The subject property consists of approximately 10 acres of land on the east side of one (1) 20-acre irregular- shaped parcel. The subject property is associated with the ROW DTLA mall, which is located

on the remainder of the parcel to the west. The subject property is currently developed with two (2) asphalt-paved parking lots that are bisected by Center Street. The south parking lot was constructed in approximately 1980 and the north parking lot was constructed in approximately 1989. Access to the property is via S Alameda Street to the east. It is proposed to redevelop the site with several multi-story residential structures, including one level of subterranean parking.

2.0 GEOLOGY AND HYDROGEOLOGY

The subject property is located within the northern portion of the Los Angeles Coastal Plain on the west ancestral bank of the Los Angeles River. The Downey Plain feature is a result of coalesced alluvial fans deposited by the Los Angeles River and Rio Hondo Rivers. Surface sediments at the subject property are Quaternary age and composed of silty to sandy gravel, sand and silt soil types. The Miocene-age Puente formation underlies the unconsolidated Quaternary-age sediments. The Puente Formation is predominantly composed of marine-deposited siltstone, sandstone, and shale. The subject property is located within the Los Angeles Forebay area of the Central Groundwater Basin. The Central Basin occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin. The Los Angeles Forebay occupies the northwesterly portion of the Central Basin Non-Pressure Area.

Groundwater level data was obtained from the RWQCB GeoTracker database for the nearby 1910 Bay Street (T1000011015) site located approximately 1,200 feet east of the subject property. Records indicate that in November 2022 groundwater was measured at 117 to 138 feet bgs with a southwest direction of flow.

3.0 PREVIOUS WORK

The following reports contain data pertinent to the environmental condition of the subject property.

McLaren Hart (MH) – *Phase I Environmental Site Assessment, Rykoff Terminal & Warehouses, 709-761 Terminal Street & 1388 East 7th Street, Los Angeles, California 90021*, dated May 1, 1997. MH prepared a Phase I ESA report for the entire ROW DTLA shopping mall, which includes the subject property. The report was prepared pursuant to the ASTM 1527-1994 Standard for Phase I Environmental Assessments. MH identified one REC for the subject property. The subject property was historically developed with railroad tracks, which are often associated with soil contamination due to material spills during loading/unloading or leaks leading to hydrocarbon contamination. HM recommended conducting soil borings across the property to assess for potential contamination.

AEI Consultants (AEI), *Phase I Environmental Site Assessment, 761 Terminal Street, Los Angeles, California 90021*, dated June 25, 2004. AEI prepared a Phase I ESA report for the entire ROW DTLA shopping mall, which includes the subject property. The report was prepared pursuant to the ASTM 1527-2000 Standard for Phase I Environmental Assessments. AEI identified several RECs associated with the subject property. The Pacific Electric Railroad Company's operations on the subject property included a machine shop/blacksmith, oil house (which likely contained several AST/USTs), woodworking shop, and electrical construction facility. During the site reconnaissance a drum of PCE was observed on the first floor of the building that borders the northwest portion of the subject property. Historically, several tenants that likely used solvents, hydrocarbons, and heavy metals were located on the property adjacent to the west. AEI concluded that soil and groundwater testing would be required to confirm the absence or presence of subsurface contamination.

Hazardous Management Consulting (HMC), *Phase I Environmental Site Assessment, Alameda Square, Los Angeles, California*, dated February 6, 2013. HMC prepared a Phase I ESA report for the entire ROW DTLA shopping mall, which includes the subject property. The report was prepared pursuant to the ASTM 1527-2005 Standard for Phase I Environmental Assessments. HMC identified the historic presence of the Pacific Electric Railway's maintenance operations on the subject property as a REC. HMC noted the operations most likely included the use of fuels, hydrocarbons, solvents, metals and potentially, PCBs. HMC concluded that a subsurface investigation should be conducted to assess the presence of hydrocarbons and solvents in soil gas as well as metals and PCBs that could be present in soil.

HMC, *Results of Soil and Soil Gas Sampling, 777 South Alameda Street, Los Angeles, California*, dated February 14, 2013. The assessment work included a total of 23 soil borings across the entire ROW DTLA property. Of the 23 borings, nine (9) were located on the subject property. The borings on the subject property targeted the former machine shop and oil house located previously located on the north portion of the property, the electrical construction shop on the south portion of the subject property, and general site screening across the north and south parking lots. In each location one (1) soil gas sample was collected from 5 ft bgs and in five (5) locations one (1) 5 ft co-located soil sample

was collected. Soil samples were analyzed for hydrocarbons, VOCs, metals, PAHs, and PCBs dependent on sample location. Soil gas samples were analyzed for VOCs.

All soil gas sample locations on the north portion of the subject property were non-detect for VOCs. One (1) soil sample collected in the area of the former machine shop on the north portion of the property detected lead at 500 mg/kg, above the current DTSC SL for lead in soil at a residential property (80 mg/kg). All other soil samples were below the applicable DTSC SLs for a residential property.

Three (3) soil gas samples in the southern parking lot contained PCE at concentrations ranging from 120 ug/m3 to 1,600 ug/m3, which exceeds the current DTSC SL for PCE in soil gas at a residential property (460 ug/m3). One (1) of the soil gas samples contained a concentration of benzene (120 ug/m3) that exceeds the current DTSC SL for benzene in soil gas a residential property (97 ug/m3). Only one (1) of the four (4) soil gas sample locations with exceedances on the southern portion of the subject property had a co-located soil sample. The one (1) co-located soil sample was non-detect for hydrocarbons and VOCs. The soil gas exceedances of PCE and benzene on the south portion of the subject property, and soil exceedance of lead on the north portion of the subject property, are considered a REC. HMC's 2013 subsurface assessment is attached in.

CBRE, *Phase I Environmental Site Assessment, LA Industrial Portfolio, 747-787 S. Alameda Street, 746 S Central Avenue, 1318-1320 E. 7th Street, 1215 E 7th Street, Los Angeles, California*, 90021, dated April 5, 2017. CBRE prepared a Phase I ESA report for the entire ROW DTLA shopping mall, which includes the subject property. The report was prepared pursuant to the ASTM 1527-2013 Standard for Phase I Environmental Assessments. CBRE did not identify any RECs, HRECs, or CRECs in connection with the subject property.

CalEnviro, Phase I Environmental Assessment Report, Parking Lots of ROW DTLA, Portion of APN 5146-009-008777 S. Alameda Street, Los Angeles, California 90021, dated May 2023. The report identified the subject property was utilized as a railway yard that included a variety of industrial operations. The former onsite industrial operations (machine shop, blast furnace, and oil storage) are considered a REC. A 2013 subsurface assessment identified concentrations of PCE and benzene in soil gas and lead in soil that exceed current regulatory screening levels for a residential property. This is considered a REC. No evidence of historical recognized environmental conditions (HREC) or controlled recognized environmental conditions (CRECs) were identified in connection with the subject property. The previous 2013 assessment on the subject property consisted of soil gas sampling at only 5 feet bgs with sporadic co-located soil sampling and analysis. Based on the future development plans for residential structures including one level of subterranean parking, CE recommended implementing an updated soil and soil gas assessment. Soil characterization samples should be collected from near surface soil to a depth of approximately 5 feet below the proposed final grade of the subterranean basement.

4.0 SUBSURFACE ASSESSMENT

4.1 SOIL SAMPLING

An Underground Service Alert notification was made prior to drilling and Atlas Geophysics cleared utility conflicts for all sampling locations utilizing a total field magnetics and GPR methods. On February 27, 2024 and February 28, 2024, CalEnviro (CE) personnel directed MR Drilling's hydraulic push rig to advance ten (10) soil borings throughout the subject property. Twenty-six (26) soil samples and fifteen (16) co-located soil gas samples were collected from the ten (10) boring locations. Soil samples were obtained from continuous cores at depths of 2, 5, 10, and 15 feet below ground surface. The soil sample locations are depicted on **FIGURE 3 – CE ASSESSMENT PLAN**. The soil samples were retained in capped acetate sleeves. Samples for VOC analysis were collected per USEPA Field Preservation Method 5035 by pushing a Terra-Core sampling device into the soil core and preserving the aliquot using laboratory provided 40 ml VOAs (3), containing sodium bisulfate (2) and methanol (1). All soil samples were stored on ice and transferred to a state certified laboratory operated by Eurofins Calscience. Soil samples were analyzed for (TPH) oil range organics (ORO; C_{23}-C_{40}) and diesel range organics (DRO; C_{13}-C_{22}) via USEPA Method 8015, volatile organic compounds (VOCs) and gasoline range organics (GRO; C_4-C_{12}) via USEPA Method 8260/5035, and Title 22 Metals via USEPA Method 6010.

The soil samples were either below the method detection level or contained very low concentrations of VOCs and TPH. None of the concentrations of VOCs/TPH detected exceeded the recommended soil CalEPA screening levels for residential property. The TPH and VOC soil sample data is tabulated on **TABLE I, APPENDIX I**.

Laboratory analysis of soil for Title 22 Metals (via USEPA Method 6010) found all but one of the twenty-six (26) samples analyzed to be below the residential soil screening concentrations. Soil sample CEB1-2ft showed an elevated concentration of arsenic (15.2 mg/kg), which is greater than the accepted southern California arsenic background level of 12 mg/kg. Lead was also detected in soil sample CEB1-2ft at a concentration of 275 mg/Kg that exceeds the DTSC SL for soil at a residential property of 80 mg/kg. Soil sample CEB1-2ft was also analyzed via Toxicity Characterization Leaching Procedure (TCLP)

and the Soluble Threshold Limit Concentration (STLC). The STLC analysis showed a concentration of 32.4 mg/L that exceeds the California hazardous waste characterization threshold of 5.0 mg/L. The TCLP analysis showed a concentration of 1.42 mg/L, which is below the federal hazardous waste characterization threshold of 5.0 mg/L. All other concentrations of metals detected were below their respective CalEPA-DTSC SL. The metals soil data is tabulated on **TABLE II, APPENDIX I**. The locations of elevated lead and arsenic in soil exceeding the residential screening level is depicted on **FIGURE 4 – METALS IN SOIL ABOVE RESIDENTIAL GOALS**

The soil sample locations are depicted on **FIGURE 3 – CE ASSESSMENT PLAN**. The soil laboratory report and chain of custody record are attached in **APPENDIX II**. Boring logs are included in **ILLUSTRATIONS** section of the report.

4.2 SOIL GAS AND AMBIENT AIR SAMPLING

Soil-gas sampling was conducted on February 29, 2024. American Analytics conducted the soil gas sampling and ambient air sampling under the direction of California Environmental. Five (5) soil gas samples were collected from five (5) single-nested probes placed at 25 feet bgs, and ten (10) soil gas samples, plus one (1) replicate, were collected from five (5) dual-nested soil gas probes placed at 15 and 25 feet bgs. Additionally, one (1) ambient air sample was obtained. The soil gas probe locations and ambient air sample location are shown on the attached **FIGURE 5 – PCE IN SOIL GAS ABOVE RESIDENTIAL GOALS**. Soil-gas and ambient air samples were collected, transferred to an offsite state certified laboratory operated by American Analytics, and analyzed for VOCs via USEPA Method TO-15. Soil gas and ambient air sampling protocols were performed in conformance with the DTSC/RWQCB guidelines (CalEPA/DTSC/RWQCB Soil-Gas Advisory, 2015), and the American Analytics Sampling SOPs.

The soil-gas probes consisted of a sampling tip attached to inert nylon tubing. Each segment of tubing was pre-measured to ensure the correct depth. The sample point was set within a 12-inch sand-sensing zone at the desired depth of each soil vapor point. Dry granular bentonite was placed above and/or below the sand-sensing zone and hydrated in order to seal the sand-sensing zone. The probes were completed to the surface with hydrated bentonite and capped with a gas-tight 2-way valve preventing degassing of the vapor point and interference from the surface. The soil-gas probes were allowed to

equilibrate for approximately 24-hoours prior to the collection of the soil-gas samples. Three dead space purge volumes (3PV) were evacuated from each probe prior to sampling. Isopropanol was utilized as the leak check compound. Vapor probe locations were sampled using the American Analytics SOPs, which includes protocols for surface seals, purge volume tests, tracer compounds, sample flow rate, duplicate samples, and analytical instrument calibration.

Ambient air sampling consisted of placing a Summa canister on a tripod approximately 5 ft above the ground surface. The check valve on the Summa canister was opened allowing ambient air to be drawn into the negatively pressurized Summa canister. Ambient air was sampled using the American Analytics SOPs, which includes protocols for sample flow rate, and analytical instrument calibration.

All sixteen (16)-soil gas samples contained PCE at concentrations that ranged from 130-6,500 ug/m^3. Low concentrations of toluene, ethylbenzene, xylene and the refrigerants R11 and R12 were also detected. The general trend observed was the deeper soil gas probes (25 ft) on the south lot tended to have the higher concentrations of PCE. All other VOCs analytes (via USEPA Method TO-15) were either not detected above the laboratory detection limit or were detected below their respective screening levels. The soil gas data is tabulated on **TABLE III, APPENDIX I**.

Laboratory analysis of the one (1) ambient air sample for VOCs (Via USEPA Method TO-15) found a low concentration of Acetone at 19 µg/m^3 and a low concentration of Isobutane at 2.5 µg/m^3. No other analytes were recorded above the laboratory detection limit. The ambient air data is tabulated on **TABLE III, APPENDIX I**. The soil-gas and ambient air laboratory report and chain of custody record are attached in **APPENDIX II**.

4.3 RISK ANALYSIS

The future vapor intrusion (VI) potential for the VOCs detected in soil gas was evaluated utilizing the methods described in the *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air* (DTSC 2011 VI Guidance) document prepared by DTSC and adopted by the State of California in 2011; including the updated methods outlined in the *Final Draft Supplemental Guidance: Screening*

and Evaluating Vapor Intrusion (2023 Supplemental Guidance) document prepared by DTSC and California State Water Resources Control Board in 2023. The predicted indoor air values were compared to the DTSC screening levels (SLs) for ambient air at a residential property and the San Francisco Regional Water Quality Control Board (SFWQCB) environmental screen levels (ESLs) for indoor air at a residential property.

CE calculated the predicted indoor air concentrations for all VOC compounds historically detected. CE utilized the recommended site screening attenuation factor (AF) of 0.03 for the highest concentration of the detected compounds as outlined in the 2023 Supplemental Guidance and 2011 VI Guidance documents. The AF is a conservative assumption used to help predict future indoor air quality. Comparison of these calculated values to the DTSC indoor air screening levels allows for the appropriate CalEPA-DTSC recommended risk-management decision to be made.

The site-specific VI cancer risks (CR) and hazard quotients were calculated utilizing Equations 4 and 5 from the 2023 Supplemental VI Guidance document. The estimated cumulative risk and hazard quotient were then calculated utilizing the results. The 2023 Supplemental Guidance document states, *"the points of departure for risk management decisions are 1 x 10^{-6} cancer risk and a noncancer HI of 1."* Additionally, the calculated results are based on the 25-foot soil gas probes as the current redevelopment plans propose to remove 10-15 feet of soil for a subterranean parking garage. The Subject property's calculated cumulative residential VI risk and hazard values, using the attenuation factor of 0.03, are 2.21x10^{-4} and 2.80, respectively. These calculations are presented in **TABLE IV, APPENDX I.** These calculated values exceed the "point of departure" (risk > 1x10^{-6} and HI ≥ 1) and indicates there is a VI risk for future residential structures located on the subject property.

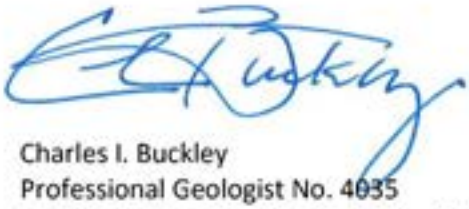
5.0 CONCLUSIONS AND RECOMMENDATIONS

The soil sample data results reveal that TPH and VOC concentrations were mostly non-detect or below residential clean up goals. Low concentrations of PCE (0.27-11 ug/Kg) were found in shallow soil along with low concentrations of TPH-diesel (3.8-30 mg/Kg) and TPH-oil (25-210 mg/Kg). The concentrations

of heavy metals were all below residential risk levels except for one sample (CEB1-2ft) where elevated concentrations of arsenic (15.2 mg/Kg) and lead (275 mg/Kg) were detected. All other concentrations of metals detected were below their respective DTSC SL. Sample CEB1-2ft was also tested for soluble lead per methods STLC (42.4 mg/L) and TCLP (1.42 mg/L). The soil sample data confirm that the majority of the soil to be exported during future excavation of the future subterranean basement can be classified as non-hazardous. Several locations, in particular the areas around CEB1-2 ft and HMC SG-17s, contained elevated concentrations of lead, 275 mg/Kg and 500 mg/Kg, respectively. These concentrations exceed the CalEPA residential risk level for lead of 80 mg/Kg. Solubility testing on sample CEB1-2ft indicates the soil in this area is classified as CA hazardous since the STLC concentration exceeds the limit of 5.0 mg/L. Further testing is required to define the limits of the hazardous lead soil around CEB1-2ft.

All sixteen (16)-soil gas samples contained PCE at concentrations that ranged from 130-6,500 ug/m^3. Low concentrations of toluene, ethylbenzene, xylene and the refrigerants R11 and R12 were also detected. The general trend observed was the deeper soil gas probes (25 ft) on the south lot tended to have the higher concentrations of PCE. A vapor intrusion (VI) risk analysis using the current soil gas data confirms the entire footprint of the proposed residential development overlies a soil gas plume that exceeds the CalEPA-DTSC guidance concentrations for evaluation of vapor intrusion (VI) into future residential structures. It is probable the PCE soil gas plume is related to minor onsite releases of PCE though migration from offsite source(s) cannot be ruled out. The primary risk driver for future VI is PCE in soil gas. While it may be feasible to use soil vapor extraction (SVE) to reduce the future VI threat, the cost and time to complete are unknown. Removal of the contaminated soil gas via SVE now will not preclude future VI risks such as a change in regulatory requirements or vapors migrating onsite from offsite properties. For these reasons installation of a Vapor Intrusion Mitigation System (VIMS - membrane) is the preferred mitigation measure. A soil management plan (SMP) and health and safety plan (HASP) should be developed and implemented during the future grading at the site.

6.0 NOTICE



All properties are subject to some element of environmental risk and the risk cannot be eliminated. Industrial and commercial properties developed prior to modern environmental laws are especially risk prone to environmental hazards which include, but are not limited to, wastes which may be toxic, ignitable, corrosive or reactive. The potential for these environmental hazards to impact the use of the property can be reduced by the identification and mitigation of the hazards prior to development or redevelopment of the property. Due to the difficulty in locating underground wastes, in some cases it is not always possible to ascertain that hazardous wastes are present on the property prior to development.

The subsurface conditions described herein have been ascertained from excavations on the site as indicated, and should in no way be construed to reflect variations which may occur between or beyond these excavations. The chemical laboratory testing described herein was performed by a state certified testing laboratory. The state certified testing laboratory assumes responsibility for the testing procedures used in their analysis.

This report was prepared with the skill and competence as commonly used by environmental professionals in this area. No warranty, expressed or implied, of any kind is made or intended in connection with this report, or by the fact you are being furnished this report, or by any other oral or written statement.

Should you have any questions or desire any additional information, please contact the undersigned.

Legend

Bold - analyte detected

mg/Kg - milligrams per kilogram

µg/Kg - micrograms per kilogram

ND - Non-detect (analyte not detected at or above the reporting limit)

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

F1 - MS and/or MSD recovery exceeds control limits.

DRO - Diesel Range Organics; GRO - Gasoline Range Organics

PCE - Tetrachloroethylene; TCE - Trichloroethylene

DCE - Dichloroethene

Laboratory Test Reports

eurofins | Environment Testing

ANALYTICAL REPORT

PREPARED FOR

Attn: Eric Koons
California Environmental
30423 Canwood Street
Suite 208
Agoura Hills, California 91301

Generated 3/5/2024 12:08:43 PM

JOB DESCRIPTION

#3666 / 777 S. Alameda Street

JOB NUMBER

570-174146-1

Eurofins Calscience
2841 Dow Avenue, Suite 100
Tustin CA 92780

See page two for job notes and contact information.

my EOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Authorization

Client: California Environmental
Job ID: 570-174146-1
Project/Site: #3666 / 777 S. Alameda Street

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
570-174146-1

Receipt
The samples were received on 2/27/2024 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.1° C.

Receipt Exceptions
The number of containers for the following samples did not match the information listed on the Chain-of-Custody (COC): CEB6-10' (570-174146-23) and CEB6-15' (570-174146-24). Received 1 containers, while the COC lists 4.

GC/MS VOA
Method 8260B: The following analyte(s) recovered outside control limits for the LCS associated with analytical batch 570-415139: tert-Butyl alcohol (TBA). This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-415139 recovered outside control limits for the following analytes: Ethanol and tert-Butyl alcohol (TBA). Laboratory control sample / laboratory control sample duplicate (LCS/LCSD) percent recovery is in control for affected analytes.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-415139.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-414991 and analytical batch 570-415447 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-415099 and analytical batch 570-416566 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Accreditation/Certification Summary

Client: California Environmental
Job ID: 570-174146-1
Project/Site: #3666 / 777 S. Alameda Street

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260B	5035	Solid	1,1,2-Trichloro-1,2,2-trifluoroethane
8260B	5035	Solid	1,1-Dichloropropene
8260B	5035	Solid	1,2,3-Trichlorobenzene
8260B	5035	Solid	1,2,4-Trimethylbenzene
8260B	5035	Solid	1,3,5-Trimethylbenzene
8260B	5035	Solid	1,3-Dichloropropane
8260B	5035	Solid	2,2-Dichloropropane
8260B	5035	Solid	2-Butanone
8260B	5035	Solid	2-Chlorotoluene
8260B	5035	Solid	2-Hexanone
8260B	5035	Solid	Acetone
8260B	5035	Solid	Ethanol
8260B	5035	Solid	Isopropylbenzene

Hi Erick,

Please add the ' to the end of all of foot depth on pages 1 & 3.

Thank you for updating the year to 2024.

Noted regarding samples 23 & 24. Please just hold that jar for pending future analysis.

Best,

ERIC KOONS, SENIOR ENVIRONMENTAL SCIENTIST

Subject: 570-174146-1 #3666 / 777 S. Alameda Street Sample Confirmation files from Eurofins Southwest

Hello,

Attached, please find the Sample Confirmation files for job 570-174146-1; #3666 / 777 S. Alameda Street

COC page 2, samples 11 through 20: The sample IDs have an ' following the foot depth while pages 1 and 3 did not. Please confirm if we need to add the ' to pages 1 and 3 or to remove it from page 2?

COC page 3: The collection year listed on the COC references 2004. We update the collection year to match 2024.

Samples 23 and 24: We received one soil jar for each sample instead of 4 along with the 5035 kit.

Please feel free to contact me if you have any questions.

Thank you.

Login Sample Receipt Checklist

Client: California Environmental

Job Number: 570-174146-1

Login Number: 174146
List Number: 1
Creator: Gonzalez, Juan

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Definitions/Glossary

Client: California Environmental
Job ID: 570-174496-1
Project/Site: #3666 / 777 S. Alameda Street

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
570-174496-1

Receipt
The samples were received on 2/29/2024 6:50 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.1° C.

GC/MS VOA
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-416639.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-416720 and 570-416720 and analytical batch 570-417033 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: California Environmental
Job ID: 570-174496-1
Project/Site: #3666 / 777 S. Alameda Street

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260B	5035	Solid	1,1,2-Trichloro-1,2,2-trifluoroethane
8260B	5035	Solid	1,1-Dichloropropene
8260B	5035	Solid	1,2,3-Trichlorobenzene
8260B	5035	Solid	1,2,4-Trimethylbenzene
8260B	5035	Solid	1,3,5-Trimethylbenzene
8260B	5035	Solid	1,3-Dichloropropane
8260B	5035	Solid	2,2-Dichloropropane
8260B	5035	Solid	2-Butanone
8260B	5035	Solid	2-Chlorotoluene
8260B	5035	Solid	2-Hexanone
8260B	5035	Solid	Acetone
8260B	5035	Solid	Ethanol
8260B	5035	Solid	Isopropylbenzene
8260B	5035	Solid	p-Isopropyltoluene
8260B	5035	Solid	Vinyl acetate

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

570-174146-3

Receipt
The samples were received on 2/27/2024 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.1° C.

Receipt Exceptions
The number of containers for the following samples did not match the information listed on the Chain-of-Custody (COC): CEB6-10' (570-174146-23) and CEB6-15' (570-174146-24). Received 1 containers, while the COC lists 4.

Metals
Method 1311: Insufficient sample was provided to perform the leaching procedure with the required 50g for the following sample: CEB1-2' (570-174146-1). The volume of leaching fluid was adjusted proportionally to maintain a 10:1 ratio of leaching fluid to weight of sample. Reporting limits (RLs) are not affected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: California Environmental
Project/Site: #3666 / 777 S. Alameda Street

Hi Erick,

Please add the ' to the end of all of foot depth on pages 1 & 3.

Thank you for updating the year to 2024.

Noted regarding samples 23 & 24. Please just hold that jar for pending future analysis.

Best,

ERIC KOONS, SENIOR ENVIRONMENTAL SCIENTIST

Subject: 570-174146-1 #3666 / 777 S. Alameda Street Sample Confirmation files from Eurofins Southwest

Hello,

Attached, please find the Sample Confirmation files for job 570-174146-1; #3666 / 777 S. Alameda Street

COC page 2, samples 11 through 20: The sample IDs have an ' following the foot depth while pages 1 and 3 did not. Please confirm if we need to add the ' to pages 1 and 3 or to remove it from page 2?

COC page 3: The collection year listed on the COC references 2004. We update the collection year to match 2024.

Samples 23 and 24: We received one soil jar for each sample instead of 4 along with the 5035 kit.

Please feel free to contact me if you have any questions.

Thank you.

Subject: STLC Test Result for Alameda Street

Dear Erick,
I hope this email finds you well. For job #3666 / 777 S. Alameda Street/ 570-174146-2, the STLC test for sample CEB1-2' exceeds 5 mg/L. Please run a TCLP for sample CEB1-2'.

Sincerely,
Maya C. Schwartz

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
570-174146-2

Receipt
The samples were received on 2/27/2024 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.1° C.

Receipt Exceptions
The number of containers for the following samples did not match the information listed on the Chain-of-Custody (COC): CEB6-10' (570-174146-23) and CEB6-15' (570-174146-24). Received 1 containers, while the COC lists 4.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subject: Eurofins Calscience report and EDD files from 570-174146-1 #3666 / 777 S. Alameda Street

Hello,

Attached please find the report and EDD files for job 570-174146-1; #3666 / 777 S. Alameda Street

Samples 5 and 17 contain Lead results that may require STLC/TCLP. If additional analyses are required then please let me know.

The samples were received on 2/27/2024 06:20 PM.

Please feel free to contact me if you have any questions.

Thank you.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Re : SGI- Los Angeles 777 S. Alameda St. / [none]

MB2431108 / 4B29003

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received on 02/29/24 13:06 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Assurance Program Manual, applicable standard operating procedures, and other related documentation. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report or require additional information please call me at American Analytics.

Sincerely,

Allen Aminian

QA/QC Manager

Special Notes

[1] = ** : Result obtained from DF=120

[2] = **a : Result obtained from DF=25

[3] = **b : Result obtained from DF=30

[4] = **c : Result obtained from DF=50

[5] = **d : Result obtained from DF=60

[6] = **e : Result obtained from DF=75

[7] = QL-02 : The recovery for this analyte is outside of the acceptance control limits for the LCS. The data was validated based on the acceptable recovery for this analyte in the LCSD.

[8] = QL-04 : The recovery for this analyte in the LCS and LCSD is marginally above the upper control limit. Since the analyte was not detected in any of the associated samples, the analytical results for this analyte are valid.

[9] = QL-06 : The recovery for this analyte in the LCS and LCSD is marginally above the upper control limit, therefore the reported concentration for this analyte may be biased high.

[10] = QL-07 : The recovery for this analyte in the LCS and LCSD is marginally below the lower control limit, therefore the reported concentration for this analyte may be biased low.

1.0 INTRODUCTION

The following Soil Management Plan (SMP) describes the recommendations for identification and management of VOC and lead impacted soil, if encountered as part of the redevelopment project located at 757-787 South Alameda Street, 1318-1320 East 7th Street, and 746 S. Central Street (Site). The purpose of this SMP is to specify procedures to be implemented during grading, excavation, stockpiling and export of soil during future grading activities. A project specific Health and Safety Plan (HASP) associated with this SMP will govern the onsite worker and community health and safety monitoring, notification, and reporting requirements. The HASP is under development and will be completed prior to the excavation activities commencing on the Site.

1.1 SITE DESCRIPTION

The Site is located on the west side of South Alameda Street between 7th Street and Bay Street, in the City of Los Angeles, California. The street addresses for the Site are 757-787 South Alameda Street, 1318-1320 East 7th Street, and 746 S. Central Street. The Site is approximately 31.3 acres in size. According to the Los Angeles County Tax Assessor's office, the Assessor's Parcel Number (APN) for the subject property is a portion of APN 5146-009-008.

The subject property consists of approximately 10 acres of land on the east side of one (1) 20-acre irregular-shaped parcel (Subject Property). The Subject Property is associated with the ROW DTLA Site, which is located on the remainder of the parcel to the west. The Subject Property is currently developed with two (2) asphalt-paved parking lots that are bisected by Center Street. The south parking lot was constructed in approximately 1980 and the north parking lot was constructed in approximately 1989. Access to the Subject Property is via S Alameda Street to the east. The Site owner proposes to redevelop the Subject Property with three multi-story residential structures with subterranean parking garages (Project). The proposed Project is further discussed in **Section 3.0**.

1.2 PREVIOUS WORK

The following reports document the historical development of the Site and provide baseline soil and soil gas data for the Site and Subject Property. The data tables and assessment plans associated with the historical soil and soil gas testing at the property are attached in **APPENDIX III.**

McLaren Hart (MH) – *Phase I Environmental Site Assessment, Rykoff Terminal & Warehouses, 709-761 Terminal Street & 1388 East 7th Street, Los Angeles, California 90021*, dated May 1, 1997. MH prepared a Phase I ESA report for the entire ROW DTLA Site, which includes the subject property. The report was prepared pursuant to the ASTM 1S27-1994 Standard for Phase I Environmental Assessments. MH identified one REC for the subject property. The subject property was historically developed with railroad tracks, which are a potential source of soil contamination due to material spills during loading/unloading or leaks leading to hydrocarbon contamination. HM recommended conducting soil borings across the property to assess for potential contamination.

AEI Consultants (AEI), *Phase I Environmental Site Assessment, 761 Terminal Street, Los Angeles, California 90021*, dated June 25, 2004. AEI prepared a Phase I ESA report for the entire ROW DTLA Site, which includes the Subject Property. The report was prepared pursuant to the ASTM 1527-2000 Standard for Phase I Environmental Assessments. AEI identified several RECs associated with the Site. The Pacific Electric Railroad Company's operations on the Subject Property included a machine shop/blacksmith, oil house (which likely contained several AST/USTs), woodworking shop, and electrical construction facility. During the site reconnaissance a drum of PCE was observed on the first floor of the building (#4) that borders the northwest portion of the Subject Property. Historically, tenants that likely used solvents, hydrocarbons, and heavy metals were located on the Site adjacent to the west. AEI concluded that soil and groundwater testing would be required to confirm the absence or presence of subsurface contamination.

Hazardous Management Consulting (HMC), *Phase I Environmental Site Assessment, Alameda Square, Los Angeles, California*, dated February 6, 2013. HMC prepared a Phase I ESA report for the entire ROW DTLA Site, which includes the Subject Property. The report was prepared pursuant to the ASTM 1527-2005 Standard for Phase I Environmental Assessments. HMC identified the historic presence of the Pacific Electric Railway's maintenance operations on the Subject Property as a REC. HMC noted the operations most likely included the use of fuels, hydrocarbons, solvents, metals and potentially, PCBs. HMC concluded that a subsurface investigation should be conducted to assess the presence of hydrocarbons and solvents in soil gas as well as metals and PCBs that could be present in soil.

HMC, *Results of Soil and Soil Gas Sampling, 777 South Alameda Street, Los Angeles, California*, dated February 14, 2013. The assessment work included a total of 23 soil borings across the entire ROW DTLA Site. Of the 23 borings, nine (9) were located on the Subject Property. The borings on the Subject Property targeted the former machine shop and oil house located previously located on the north portion of the property, the electrical construction shop on the south portion of the Subject Property, and in background locations across the north and south parking lots. In each location one (1) soil gas sample was collected from 5 ft bgs and in five (5) locations one (1) 5 ft co-located soil sample was collected. Soil samples were analyzed for hydrocarbons, VOCs, metals, PAHs, and PCBs. Soil gas samples were analyzed for VOCs.

One (1) soil sample collected in the former machine shop on the north portion of the property detected lead at 500 mg/kg, above the current DTSC SL for lead in soil at a residential property (80 mg/kg). All other soil samples (11) were below the applicable DTSC SLs for a residential property.

All soil gas sample locations on the north portion of the Subject Property were non-detect for VOCs. Three (3) soil gas samples from the southern parking lot contained PCE at concentrations ranging from 120 ug/m^3 to 1,600 ug/m^3, which exceeds the current DTSC SL for PCE in soil gas at a residential property (460 ug/m^3). One (1) of the soil gas samples contained a concentration of benzene (120 ug/m^3) that exceeds the current DTSC SL for benzene in soil gas a residential property (97 ug/m^3). Only one (1) of the four (4) soil gas sample locations with exceedances on the southern portion of the Subject Property had a co-located soil sample. The one (1) co-located soil sample was non-detect for hydrocarbons and VOCs. The soil gas exceedances of the residential SL for PCE and benzene on the south portion of the Subject Property, and soil with lead above the residential SL on the north portion of the subject property, are considered RECs.

CBRE, *Phase I Environmental Site Assessment, LA Industrial Portfolio, 747-787 S. Alameda Street, 746 S Central Avenue, 1318-1320 E. 7th Street, 1215 E 7th Street, Las Angeles, California*, 90021, dated April 5, 2017. CBRE prepared a Phase I ESA report for the entire ROW DTLA Site, which includes the Subject Property. The report was prepared pursuant to the ASTM 1527-2013 Standard for Phase I Environmental Assessments. CBRE did not identify any RECs or CRECs in connection with the Subject Property. Several HRECs were identified in connection with removal of historical USTs from the portions of the Site to the west of the proposed development. CBRE also identified Business Environmental Risks related to the previous soil/soil gas testing conducted by HMC.

California Environmental (CalEnviro), Phase I Environmental Assessment Report, Parking Lots of ROW DTLA, Portion of APN 5146-009-008777 S. Alameda Street, Los Angeles, California 90021, dated May 2023. The report identified the Subject Property was utilized as a railway yard that included a variety of industrial operations. The former onsite industrial operations (machine shop, blast furnace, and oil storage) are considered a REC. A 2013 subsurface assessment identified concentrations of PCE and benzene in soil gas and lead in soil that exceed current regulatory screening levels for a residential property. This is considered a REC. No evidence of historical recognized environmental conditions (HREC) or controlled recognized environmental conditions (CRECs) were identified in connection with the Subject Property. The previous 2013 assessment on the Subject Property consisted of soil gas sampling at 5 feet bgs with sporadic co-located soil sampling and analysis. Based on the future development plans for residential structures including subterranean parking, CE recommended implementing an updated soil and soil gas assessment.

California Environmental, *Supplemental Soil and Soil Gas Assessment – Phase II, 777 S. Alameda Street, Los Angeles, California 90021,* dated March 2024. CE implemented a screening soil gas assessment based on the recommendations made in the May 2023 Phase I ESA for the Subject Property. CE implemented additional assessment that included sampling of soil and soil gas from ten (10) borings. Twenty-six (26) soil samples were obtained from depths of 2, 5, 10 and 15 feet and tested for TPH, VOCs and metals. Sixteen (16) soil gas samples were collected from co-located probes placed at depths of 15 and 25 feet and tested for VOCs per EPA Method TO-15.

Soil sample test results reveal that TPH and VOC concentrations were mostly non-detect or below residential clean up goals. Low concentrations of PCE (0.27-11 ug/Kg) were found in shallow soil along with low concentrations of TPH-diesel (3.8-30 mg/Kg) and TPH-oil (25-210 mg/Kg). The concentrations of heavy metals were all below residential risk levels except for one sample (CEB1-2ft) where elevated concentrations of arsenic (15.2 mg/Kg) and lead (275 mg/Kg) were detected. All other concentrations of metals detected were below their respective DTSC residential soil screening level (SL). Sample CEB1-2ft was also tested for soluble lead per methods STLC (42.4 mg/L) and TCLP (1.42 mg/L). The soil sample data confirm that the most soil to be exported during future excavation of the future subterranean basement can be classified as non-hazardous. Several locations, in particular the areas around CEB1-2 ft and HMC SG-17s, contained elevated concentrations of lead, 275 mg/Kg and 500 mg/Kg, respectively. These concentrations exceed the CalEPA residential risk level for lead of 80 mg/Kg. Solubility testing on sample CEB1-2ft indicates the soil in this area is classified as CA hazardous since the STLC concentration exceeds the limit of 5.0 mg/L.

All sixteen (16)-soil gas samples contained PCE at concentrations that ranged from 130-6,500 ug/m^3. Low concentrations of toluene, ethylbenzene, xylene, and the refrigerants R11 and R12 were also detected in soil gas. The general trend observed was the deeper soil gas probes on the south lot (25 ft) tended to have the higher concentrations of PCE, indicating an offsite release is the likely cause of impact at the Subject Property. The identified soil vapor impacts do not appear to originate from a release associated with the Subject Property. A vapor intrusion (VI) risk analysis using the current soil gas data confirms the entire footprint of the proposed residential development overlies the PCE soil gas plume that exceeds the CalEPA-DTSC guidance concentrations for evaluation of vapor intrusion (VI) into future residential structures. The primary risk driver for future VI is PCE in soil gas.

CalEnviro concluded that the removal of impacted shallow soils and the installation of a Vapor Intrusion Mitigation System (VIMS - membrane) would be the preferred method of addressing the VI risk. Since an onsite release of PCE (> residential SL) to soil was not identified, source removal activity would be unnecessary. A Soils Management Plan (SMP) and associated Health & Safety Plan (HASP) were recommended for the future grading work at the Subject Property. The VIMS recommended for the Project should include provisions for ongoing performance monitoring of the engineering control system. The soil impacts detected are considered de minimus and do not require reporting to a lead environmental enforcement agency. However, out of an abundance of caution, trigger levels of contaminant concentrations requiring agency notification are incorporated into this plan, listed below in Section 4.10.

Group Delta Consultants, Inc. (Group Delta), *Entitlement-Level Geotechnical Report, ROW DTLA Residential Project, 767 S. Alameda Street, Los Angeles, California,* dated November 6, 2024. The purpose of this investigation was to address primary geotechnical and geologic factors affecting the

Subject Property in accordance with the California Environmental Quality Act (CEQA) and to provide preliminary geotechnical design recommendations for project planning purposes. Group Delta performed a geotechnical field investigation program consisting of a visual site reconnaissance, utility locating investigation, and subsurface explorations. A total of seven (7) hollow-stem auger borings were advanced to depths of 30 to 50 feet below the existing grade. To supplement the data from the borings, eight (8) cone penetration test soundings were performed to depths of about 20 to 45 feet below the existing grade.

Existing fill soils, about 5 feet thick, were encountered in the borings. In addition, loose natural soils were encountered up to a depth of approximately 12 feet in the South Lot and to a depth of approximately 8 feet in the North Lot. Group Delta recommended that existing fill soils and loose natural soils should be over excavated and recompacted and the proposed structures may be supported on shallow foundation and the floor slab may be supported on grade. Group Delta stated excavations up to about 20 feet below the existing grade are planned for the redevelopment.

2.0 SCOPE OF WORK

California Environmental has prepared this SMP on behalf of Alameda Square Owner, LLC and Atlas Capital Group, LLC. This SMP should be implemented during future grading including within the identified soil management areas (SMAs) on the Site. A pre-grading tailgate meeting is required of the grading contractor, the project geotechnical consultant, ownership, and the environmental consultant (enviro-consultant) to manage implementation of the SMP at the Subject Property. The enviro-consultant will advise the contractor of the requirements of the SMP and the respective duties and responsibilities of the contractor. The primary purpose of the SMP is to properly identify and then manage any impacted soil encountered during grading to prepare the property for construction of the planned residential structures. The major components of the SMP are:

- Conduct pre-grading HASP tailgate meeting. Obtain all required grading and haul route permits.
- Implement the HASP for the grading work specifically within the identified SMAs. It is recommended that prior to commencement of the mass grading effort the two SMA areas be cleared of impacts (primarily elevated lead in soil).
- The enviro-consultant shall continuously monitor all slab/footing removals, uncovering and removal of subsurface utilities and soil movement activities including cutting, filling, drilling and movement

of soil within the identified SMA's at the Site. The contractor and or geotech-consultant must notify the enviro-consultant if odorous, stained, or suspect soil is encountered in other areas at the Subject Property. The enviro-consultant shall monitor and test soils if so, notified by the contractor.

- The enviro-consultant shall implement air monitoring as specified by SCAQMD Rule 1166 (control of particulate emissions from soils for VOC emissions) and Rule 1466 (control of particulate emissions from soils with toxic air contaminants, see **APPENDIX I)** during movement of soil within the identified SMAs.

- A Dust Control Supervisor trained under SCAQMD Rule 403 will be on site during all excavation and loading activities for the duration of the Project.

- VOC contaminated soil (soil which registers a concentration of 50 PPM or greater of Volatile Organic Compounds measured using a photoionization detector (PID)) identified during grading shall be segregated, stockpiled, and sampled for the presence of all chemicals of concern described in **Section 4.2**. Sampling frequency shall be at the discretion of the enviro-consultant, but not less than 4 samples per 100 cubic yards (or as required by the landfill) of suspect stockpiled soil. Impacted soil will be profiled and disposed of offsite in a proper California State licensed landfill. All stockpiles will be placed away from the fence line and as far away from residents where feasible and otherwise managed in accordance with Rule 1166 and Rule 403 (Dust Control).

- Lead contaminated soil (soil which registers a concentration of 80 PPM or greater) identified during grading shall be segregated, stockpiled, and sampled for the presence of all metals of concern described in **Section 4.2**. Sampling frequency shall be at the discretion of the enviro-consultant, but not less than 1 sample per 100 cubic yards (or as required by the landfill) of suspect stockpiled soil. Impacted soil will be profiled and disposed of offsite in a proper California State licensed landfill. All stockpiles will be placed away from the fence line and as far away from residents where feasible and otherwise managed in accordance with Rule 1166 and Rule 403 (Dust Control.

- Proper identification, management, and decommissioning of buried sub-structures (i.e., seepage pits, drums, USTs, clarifiers, septic tanks, etc.) is also required. Unknown substructures may be encountered during future grading activities. All underground tanks (USTs), clarifiers, drums, seepage pits and /or unidentified substructures found during future grading require proper management. The grading contractor must notify the enviro-consultant immediately upon uncovering any unknown substructure. The consultants will assist the contractor in the proper and safe identification of the substructure and determine what analytical tests are recommended for assessment. Permits for abandonment of regulated sub-structures must be obtained from the appropriate controlling

agencies as required. Records regarding the uncovering, mitigation, and agency permits/analytical testing associated with unknown substructures must be provided in the post-grading Completion Report.

- Prepare a project *Completion Report* that documents the required monitoring, contains scaled maps showing the location(s) and disposition of any impacted soil encountered, profiles and manifests for soil disposed offsite and lab test data that supports the soil management decisions made by the enviro-consultant.

3.0 OVERVIEW/DESCRIPTION OF GRADING ACTIVITIES

The Project proposes three (bldgs. A, B & C) eight-story mixed-use buildings, including approximately 1,000 total residential units, 1,000 parking spaces, and 6,131 square feet of retail and cafe space. Buildings A and B are planned in the south lot, while Building C is planned in the north lot.

Building A would include two levels of subterranean parking. Future Building B includes residential units on the first through eighth floors and two levels of subterranean garage. Building C includes commercial space on the first floor, residential units on the first through eighth floors, and one level of subterranean parking. The redevelopment plan is shown on the attached **Figure 3 – Redevelopment Plan.**

4.0 SOIL MANAGEMENT AND MONITORING

Soil that is displaced within the SMA's (see **Figure 4 – Soil Management Aeras**) boundaries will be managed according to the processes described in this SMP. This section specifies site access and preparation, chemicals of concern (COCs), identifies the soil management area (SMA), and describes the processes for monitoring, sampling, characterization, handling, stockpiling, and removal of soil.

4.1 SITE ACCESS AND PREPARATION

Prior to commencing work, appropriate fencing with windscreens will be placed around the Subject Property to ensure that all work areas are secure, that trespassers or unauthorized personnel do not enter the work areas, and to minimize fugitive dust emissions. Additionally, no earth-moving activities

will begin without an Underground Service Alert (USA) and identification of utilities in and around the work areas. It is recommended that a private utility locator be retained to conduct a utility survey prior to excavation activities.

4.2 CHEMICALS OF CONCERN

The preceding discussion of the historical assessment data provides the background for the identification of the chemicals of concern (COCs) to be evaluated during grading at the Subject Property. The following COCs are identified as potential contaminants of concern based on detections during the prior assessments:

- Volatile Organic Compounds – EPA Method 8260B/5035
  - Tetrachloroethylene (PCE)
  - Gas Range Organics (GRO)
- Metals – CA Title 22 Metals – EPA 6010/7400
  - Lead/Arsenic
- Total Petroleum Hydrocarbons – EPA 8015
  - TPH-Oil
  - TPH-Diesel

The following site-specific residential soil goals were obtained from soil screening goals developed by USEPA, CalEPA DTSC, and the San Francisco Regional Water Quality Control Board:

TABLE I
Site Specific Soil Goals - Residential

Compound	Site Soil Goal (mg/kg)
TPH-Oil	12,000
TPH-Diesel	260
GRO	430
PCE	0.59
Lead	80
Arsenic	≤12

DTSC HERO Human Health Risk Assessment, Note 3, DTSC-Modified Screening Levels (DTSC-SLs), June 2020 – Revised May 2022.
USEPA - Region 9, Regional Screening Levels, RSLs, November 2024.
SFRWQCB – Environmental Screening Levels, ESLs, January 2019.

The project specific Health and Safety Plan (HASP) associated with this SMP will govern the onsite worker and community health and safety monitoring, notification, and reporting requirements associated with the Site COCs. The HASP is attached as Appendix II.

4.3 SOIL REMOVAL AND SOIL MANAGEMENT AREAS

The following soil management areas (SMAs) were assigned through evaluation of prior assessment activities at the Site and review of historical information for the Site. SMA 1 is located on the southwestern portion of the northern lot. The location of SMA 1 is within a portion of the subterranean parking garage associated with Building C. SMA 2 is located within the footprint of the main lobby associated with Building A. SMA 1 & SMA 2 are shown on the attached **Figure 4 – Soil Management Areas.**

4.4 AIR MONITORING AND DUST CONTROL

Air monitoring and dust/VOC emission control measures must be implemented during all onsite-grading activities within the identified SMAs, pursuant to SCAQMD Rules 1166 and 1466, see **Appendix I**. The air monitoring and dust control measures are also further detailed in the site-specific HASP attached as **Appendix II**. Adherence to these requirements will ensure there are no adverse impacts to the community during implementation of this plan. The goal is no offsite emission of particulate matter or VOCs in ambient air because of man-made fugitive dust created by earth moving activities during the remediation work. A Dust Control Supervisor trained under SCAQMD Rule 403 will be on site during all excavation and loading activities. Periodic monitoring (15 minute) of VOC emissions, as specified by SCAQMD Rule 1166, will be implemented during excavation with in the SMAs. Continuous monitoring of metals impacted emissions, as specified by SCAQMD Rule 1466, will be implemented during excavation within the SMAs. **Vapor suppression methods such as water misting, and the use of foaming agents may be required.**

Best available control and management measures will be employed prior to, during, and after earth moving, utility/substructure removal and slab removal operations. The drainage and erosion control measures shall include the best management practices (BMPs) noted on the civil plans for the Project. The following fugitive dust emissions control measures will be employed at the site during clearing and grubbing, earth moving, soil piling, and loading activities:

Clear & Grub: Maintain stability of soil through pre-watering of site prior to clearing and grubbing. Apply water in sufficient quantities to prevent generation of fugitive dust plumes. If necessary, a soil binder shall be applied to a freshly excavated area at the end of each

working day. Implement required best management practices for storm water management.

Earth-moving: Pre-apply water to the depth of proposed cuts; and re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 100 feet in any direction. Stabilize soils once earth-moving activities are completed. Odor and vapor suppression activities will conform to the HASP document.

Soil Piling: Apply water to stabilize temporary soil piles. Maintain soil piles to avoid steep sides or faces. Piles of suspect impacted soil within 100 yards of off-site occupied buildings must not be greater than eight (8) feet in height; or must have a road bladed to the top to allow water truck access; or must have an operational water irrigation system that is capable of complete stockpile coverage. Piles of suspect impacted soil will not exceed 400 cubic yards of soil. Piles of suspect impacted soil will be covered with plastic sheeting at the end of each workday and will be located a minimum of 50 feet from any concentrated flow of stormwater, drainage courses, and inlets. All stockpiles will be placed away from the fence line and as far away as practicable from residents where feasible.

Loading: Truck loading of impacted soil to occur in designated containment areas that have dust control and lined soil spill control areas. The soil loading and spill control areas will be maintained clean daily. All soil will be pre-watered prior to loading. The free fall of soil from the loader into the truck bed will be minimized to prevent dust emissions. Empty loader bucket such that no visible dust plumes are created and ensure that the loader bucket is close to the truck to minimize drop height while loading. The loaded trucks will have freeboard space above the top of the load of at least six (6) inches. Limit the size of staging area and limit the number and size of staging area entrances and exits. Apply water to stabilize the staging area during use and at project completion.

General: A water truck or water access will be available on site for the duration of the project. Water hoses will also be available for dust suppression. Barriers can be used to ensure vehicles are only on established haul routes and parking areas. Use tarps on all haul trucks. Dust emission will be further suppressed by placing crushed rock (stabilized construction entrance with shaker plates) on the ingress and egress routes from the site. The street area will be swept with a wet-vacuum sweeper as necessary. Haul truck tires will be brushed and cleaned as necessary to prevent tracking of soil offsite.

4.5 DISPOSAL OF SOIL

All impacted soil removed from the Subject Property will be properly profiled, manifested, and disposed of offsite in a California State licensed landfill in accordance with applicable regulatory requirements.

4.6 HAUL ROUTE FOR SOIL DISPOSAL

The haul route will be determined based on the location of the landfill. Trucks will be required to follow the designated haul route required by the City of Los Angeles. All trucks loaded with soil will drive over shaker plates to remove excess soil from the tires and under-carriage of the truck. Each truck leaving the site will carry a completed waste manifest.

4.7 SOIL IMPORT

If soil is imported to the site, it will be evaluated pursuant to DTSC Advisory on Clean Imported Fill Material (2001). One (1) sample of imported soil will be collected per every 250 cubic yards imported. A Phase I Environmental Assessment report provided by the owner(s) of the proposed soil import site(s), prepared per the requirements outlined in ASTM 1527-2013/2021, should be provided to Alameda Square Owner LLC, Atlas Capital Group LLC, and the project environmental consultant for review and approval prior to import of the soil. The imported soil should be tested as described in **Section 4.2**. Imported fill will be compacted as directed by the project geotechnical engineer.

4.8 SOIL SAMPLE COLLECTION AND FIELD SCREENING

Soil will be field screened for lead using a handheld calibrated XRF analyzer. XRF instrument calibration will be conducted at the beginning and end of each workday. Field XRF readings for lead will guide the excavation and stockpiling process, within the outlined SMAs. Laboratory confirmation samples will be required on the base and sidewalls of the excavation to confirm removal to residential goals. The soil will be segregated and stockpiled as either; 1) lead/arsenic below site specific soil goals and suitable for onsite reuse; 2) soil that exceeds site specific soil goals but below hazardous waste concentrations for disposal or cover at a landfill; or 3) soil that exceeds hazardous waste criteria (total lead ≥ 1,000 mg/kg or soluble lead STLC/TCLP ≥ 5 mg/L). Confirmation soil samples will be sent to a state certified lab to confirm field XRF data. Sampling frequency shall be at the discretion of the enviro-consultant but not less than 1 sample per 100 cubic yards of excavated soil.

Soil samples for lead and TPH will be collected by placing freshly exposed soil in appropriately preserved containers, such as lab supplied sterile 4-ounce jars. Soil samples for GRO and VOC analysis will be collected in accordance with EPA method 5035, by pushing a sampling device into the freshly exposed soil surface. The soil cores will be placed directly into laboratory provided 40 ml VOAs (3), containing preservatives (as required by the state accredited lab). Samples will then be placed in a cooler chilled with ice.

All sampling equipment will be decontaminated using a brush and tap water rinse followed by a brush and TSP solution (non-phosphate soap), a tap water rinse, and a deionized water rinse. All sampling equipment will be dried by air or with a towel prior to sampling. Disposable latex gloves and Ziploc bags will be used to prevent cross contamination of the samples.

The consultant or a courier will transport the soil samples, following chain of custody procedures, to a state certified laboratory. The soil sample analysis turnaround time (TAT) will be determined by the needs of the contractor.

4.8.1 Confirmation Soil Samples

Confirmation soil samples will be collected at the base and sidewalls (on a 10-20 foot grid) of the SMA excavations, and any other impacted soil encountered during grading. The locations of the confirmation soil samples will be determined in the field by the project environmental consultant. The collection of additional soil samples during site grading activities may be warranted based on field observations by the enviro-consultant. The confirmation soil sample analyses are detailed in **Section 4.2**. Excavations will not be backfilled until the results of the confirmation soil samples have been reviewed unless the project geotechnical engineer has determined the excavation to be "at-risk."

4.9 LABORATORY ANALYSIS

Soil samples for excavated soil characterization-profiling will be tested for the following constituents:

- Metals (CA Title 22 Metals – Lead only)
- VOCs – Volatile Organic Compounds w/ GRO (EPA Method 8260B/5035)
- TPH – Total Petroleum Hydrocarbons (EPA Method 8015M)

Soil considered for reuse as backfill will be tested for the following constituents:

- VOCs - Volatile Organic Compounds (EPA Methods 8260B/5035)

- TPH - Total Petroleum Hydrocarbons (EPA Method 8015M)
- Heavy Metals including Lead (EPA Methods 6010B and 7471A)

Based on the source area, imported soil will be tested for the following minimum constituents at a frequency as listed below:

Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

- Imported from land near an existing freeway
  - Lead (EPA Methods 6010B or 7471A)
  - PAHs - Polycyclic Aromatic Hydrocarbons (EPA Method 8310)
- Imported from land near a mining or rock quarry
  - Heavy Metals (EPA Methods 6010B or 7471A)
  - Asbestos (Polarized light microscopy) and pH
- Imported from agricultural land
  - Organochlorine Pesticides (EPA Methods 8081A or 8080A)
  - Organophosphorus Pesticides (EPA Method 8141A)
  - Chlorinated Herbicides (EPA Method 8151A)
  - Heavy Metals (EPA Methods 6010B or 7471A)
- Imported from residential/acceptable commercial land
  - VOCs - Volatile Organic Compounds (EPA Methods 8021 or 8260B/5035)
  - SVOCs - Semi-volatile Organic Compounds (EPA Method 8270C)
  - TPH - Total Petroleum Hydrocarbons (EPA Method 8015M)
  - PCBs - Polychlorinated Biphenyls (EPA Methods 8082 or 8080A)
  - Heavy Metals including Lead (EPA Methods 6010B and 7471A)

The sample analysis turn-around time will be dependent upon the urgency of the sample results at the time of collection.

4.10 SOIL CONCENTRATION TRIGGERS FOR AGENCY NOTIFICATION

The following site-specific soil concentration triggers for future agency notification were obtained from soil screening goals developed by USEPA, CalEPA DTSC, and the Regional Water Quality Control Board. Agency notifications will be made for widespread occurrences of these constituents that represent a significant threat to human health and/or the environment (considered a reportable release). Detections to date (sporadic low concentrations of lead/arsenic/TPH) are deemed de minimus not requiring agency notification.

TABLE II
Triggers for Agency Notification

COCs	Trigger Concentration (mg/kg)
TPH – Oil	>12000
TPH – Diesel	>260
VOC – GRO	>430
VOC – PCE	>0.59
Metals – Lead	>80

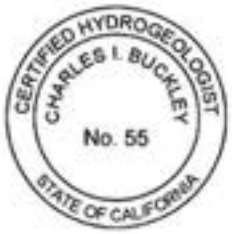
SFRWQCB – Environmental Screening Levels, ESLs, January 2019.

4.11 SCHEDULE OF IMPLEMENTATION

The implementation schedule of onsite activities associated with this SMP is to be determined, but it will be implemented and commenced prior to the initiation of any site preparation or grading activity.

4.12 REPORTING



A project Completion Report will be prepared that documents the required monitoring, contains scaled maps showing the location(s) and disposition of the impacted soil encountered, profiles and manifests for soil disposed offsite and lab test data that supports the soil management decisions made by the enviro-consultant.

5.0 PUBLIC AND WORKER HEALTH AND SAFETY

The HASP is attached as Appendix II. The HASP provides the specifications for the minimum training required for all personnel involved in earth moving activities at the subject property. All required notifications will be provided of the chemical and physical hazards known to be associated with soil management activities addressed in the SMP/HASP.

Should you have any questions or desire any additional information, please contact the undersigned.

Respectfully submitted,

APPENDIX I

SCAQMD Rules 403, 1166, & 1466

(Adopted May 7, 1976) (Amended November 6, 1992)
(Amended July 9, 1993) (Amended February 14, 1997)
(Amended December 11, 1998)(Amended April 2, 2004)
(Amended June 3, 2005)

RULE 403. FUGITIVE DUST

(a) Purpose

The purpose of this Rule is to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce or mitigate fugitive dust emissions.

(b) Applicability

The provisions of this Rule shall apply to any activity or man-made condition capable of generating fugitive dust.

(c) Definitions

(1) ACTIVE OPERATIONS means any source capable of generating fugitive dust, including, but not limited to, earth-moving activities, construction/demolition activities, disturbed surface area, or heavy- and light-duty vehicular movement.

(2) AGGREGATE-RELATED PLANTS are defined as facilities that produce and / or mix sand and gravel and crushed stone.

(3) AGRICULTURAL HANDBOOK means the region-specific guidance document that has been approved by the Governing Board or hereafter approved by the Executive Officer and the U.S. EPA. For the South Coast Air Basin, the Board-approved region-specific guidance document is the Rule 403 Agricultural Handbook dated December 1998. For the Coachella Valley, the Board-approved region-specific guidance document is the Rule 403 Coachella Valley Agricultural Handbook dated April 2, 2004.

(4) ANEMOMETERS are devices used to measure wind speed and direction in accordance with the performance standards, and maintenance and calibration criteria as contained in the most recent Rule 403 Implementation Handhook.

(5) BEST AVAILABLE CONTROL MEASURES means fugitive dust control actions that are set forth in Table I of this Rule.

(6) BULK MATERIAL is sand, gravel, soil, aggregate material less than two inches in length or diameter, and other organic or inorganic particulate matter.

(7) CEMENT MANUFACTURING FACILITY is any facility that has a cement kiln at the facility.

(8) CHEMICAL STABILIZERS are any non-toxic chemical dust suppressant which must not be used if prohibited for use by the Regional Water Quality Control Boards, the California Air Resources Board, the U.S. Environmental Protection Agency (U.S. EPA), or any applicable law, rule or regulation. The chemical stabilizers shall meet any specifications, criteria, or tests required by any federal, state, or local water agency. Unless otherwise indicated, the use of a non-toxic chemical stabilizer shall be of sufficient concentration and application frequency to maintain a stabilized surface.

(9) COMMERCIAL POULTRY RANCH means any building, structure, enclosure, or premises where more than 100 fowl are kept or maintained for the primary purpose of producing eggs or meat for sale or other distribution.

(10) CONFINED ANIMAL FACILITY means a source or group of sources of air pollution at an agricultural source for the raising of 3,360 or more fowl or 50 or more animals, including but not limited to, any structure, building, installation, farm, corral, coop, feed storage area, milking parlor, or system for the collection, storage, or distribution of solid and liquid manure; if domesticated animals, including horses, sheep, goats, swine, beef cattle, rabbits, chickens, turkeys, or ducks are corralled, penned, or otherwise caused to remain in restricted areas for commercial agricultural purposes and feeding is by means other than grazing.

(11) CONSTRUCTION/DEMOLITION ACTIVITIES means any on-site mechanical activities conducted in preparation of, or related to, the building, alteration, rehabilitation, demolition or improvement of property, including, but not limited to the following activities: grading, excavation, loading, crushing, cutting, planing, shaping or ground breaking.

(12) CONTRACTOR means any person who has a contractual arrangement to conduct an active operation for another person.

(13) DAIRY FARM is an operation on a property, or set of properties that are contiguous or separated only by a public right-of-way, that raises cows or

produces milk from cows for the purpose of making a profit or for a livelihood. Heifer and calf farms are dairy farms.

(14) DISTURBED SURFACE AREA means a portion of the earth's surface which has been physically moved, uncovered, destabilized, or otherwise modified from its undisturbed natural soil condition, thereby increasing the potential for emission of fugitive dust. This definition excludes those areas which have:

(A) been restored to a natural state, such that the vegetative ground cover and soil characteristics are similar to adjacent or nearby natural conditions;

(B) been paved or otherwise covered by a permanent structure; or

(C) sustained a vegetative ground cover of at least 70 percent of the native cover for a particular area for at least 30 days.

(15) DUST SUPPRESSANTS are water, hygroscopic materials, or non-toxic chemical stabilizers used as a treatment material to reduce fugitive dust emissions.

(16) EARTH-MOVING ACTIVITIES means the use of any equipment for any activity where soil is being moved or uncovered, and shall include, but not be limited to the following: grading, earth cutting and filling operations, loading or unloading of dirt or bulk materials, adding to or removing from open storage piles of bulk materials, landfill operations, weed abatement through disking, and soil mulching.

(17) DUST CONTROL SUPERVISOR means a person with the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule 403 requirements at an active operation.

(18) FUGITIVE DUST means any solid particulate matter that becomes airborne, other than that emitted from an exhaust stack, directly or indirectly as a result of the activities of any person.

(19) HIGH WIND CONDITIONS means that instantaneous wind speeds exceed 25 miles per hour.

(20) INACTIVE DISTURBED SURFACE AREA means any disturbed surface area upon which active operations have not occurred or are not expected to occur for a period of 20 consecutive days.

(21) LARGE OPERATIONS means any active operations on property which contains 50 or more acres of disturbed surface area; or any earth-moving operation with a daily earth-moving or throughput volume of 3,850 cubic

meters (5,000 cubic yards) or more three times during the most recent 365-day period.

(22) OPEN STORAGE PILE is any accumulation of bulk material, which is not fully enclosed, covered or chemically stabilized, and which attains a height of three feet or more and a total surface area of 150 or more square feet.

(23) PARTICULATE MATTER means any material, except uncombined water, which exists in a finely divided form as a liquid or solid at standard conditions.

(24) PAVED ROAD means a public or private improved street, highway, alley, public way, or easement that is covered by typical roadway materials, but excluding access roadways that connect a facility with a public paved roadway and are not open to through traffic. Public paved roads are those open to public access and that are owned by any federal, state, county, municipal or any other governmental or quasi-governmental agencies. Private paved roads are any paved roads not defined as public.

(25) PM_{10} means particulate matter with an aerodynamic diameter smaller than or equal to 10 microns as measured by the applicable State and Federal reference test methods.

(26) PROPERTY LINE means the boundaries of an area in which either a person causing the emission or a person allowing the emission has the legal use or possession of the property. Where such property is divided into one or more sub-tenancies, the property line(s) shall refer to the boundaries dividing the areas of all sub-tenancies.

(27) RULE 403 IMPLEMENTATION HANDBOOK means a guidance document that has been approved by the Governing Board on April 2, 2004 or hereafter approved by the Executive Officer and the U.S. EPA.

(28) SERVICE ROADS are paved or unpaved roads that are used by one or more public agencies for inspection or maintenance of infrastructure and which are not typically used for construction-related activity.

(29) SIMULTANEOUS SAMPLING means the operation of two PM_{10} samplers in such a manner that one sampler is started within five minutes of the other, and each sampler is operated for a consecutive period which must be not less than 290 minutes and not more than 310 minutes.

(30) SOUTH COAST AIR BASIN means the non-desert portions of Los Angeles, Riverside, and San Bernardino counties and all of Orange

County as defined in California Code of Regulations, Title 17, Section 60104. The area is bounded on the west by the Pacific Ocean, on the north and east by the San Gabriel, San Bernardino, and San Jacinto Mountains, and on the south by the San Diego county line.

(31) STABILIZED SURFACE means any previously disturbed surface area or open storage pile which, through the application of dust suppressants, shows visual or other evidence of surface crusting and is resistant to wind-driven fugitive dust and is demonstrated to be stabilized. Stabilization can be demonstrated by one or more of the applicable test methods contained in the Rule 403 Implementation Handbook.

(32) TRACK-OUT means any bulk material that adheres to and agglomerates on the exterior surface of motor vehicles, haul trucks, and equipment (including tires) that have been released onto a paved road and can be removed by a vacuum sweeper or a broom sweeper under normal operating conditions.

(33) TYPICAL ROADWAY MATERIALS means concrete, asphaltic concrete, recycled asphalt, asphalt, or any other material of equivalent performance as determined by the Executive Officer, and the U.S. EPA.

(34) UNPAVED ROADS means any unsealed or unpaved roads, equipment paths, or travel ways that are not covered by typical roadway materials. Public unpaved roads are any unpaved roadway owned by federal, state, county, municipal or other governmental or quasi-governmental agencies. Private unpaved roads are all other unpaved roadways not defined as public.

(35) VISIBLE ROADWAY DUST means any sand, soil, dirt, or other solid particulate matter which is visible upon paved road surfaces and which can be removed by a vacuum sweeper or a broom sweeper under normal operating conditions.

(36) WIND-DRIVEN FUGITIVE DUST means visible emissions from any disturbed surface area which is generated by wind action alone.

(37) WIND GUST is the maximum instantaneous wind speed as measured by an anemometer.

(d) Requirements

(1) No person shall cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area such that:

(A) the dust remains visible in the atmosphere beyond the property line of the emission source; or

(B) the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook), if the dust emission is the result of movement of a motorized vehicle.

(2) No person shall conduct active operations without utilizing the applicable best available control measures included in Table 1 of this Rule to minimize fugitive dust emissions from each fugitive dust source type within the active operation.

(3) No person shall cause or allow PM_{10} levels to exceed 50 micrograms per cubic meter when determined, by simultaneous sampling, as the difference between upwind and downwind samples collected on high-volume particulate matter samplers or other U.S. EPA-approved equivalent method for PM_{10} monitoring. If sampling is conducted, samplers shall be:

(A) Operated, maintained, and calibrated in accordance with 40 Code of Federal Regulations (CFR), Part 50, Appendix J, or appropriate U.S. EPA-published documents for U.S. EPA-approved equivalent method(s) for PM_{10}.

(B) Reasonably placed upwind and downwind of key activity areas and as close to the property line as feasible, such that other sources of fugitive dust between the sampler and the property line are minimized.

(4) No person shall allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift.

(5) No person shall conduct an active operation with a disturbed surface area of five or more acres, or with a daily import or export of 100 cubic yards or more of bulk material without utilizing at least one of the measures listed in subparagraphs (d)(5)(A) through (d)(5)(E) at each vehicle egress from the site to a paved public road.

(A) Install a pad consisting of washed gravel (minimum-size: one inch) maintained in a clean condition to a depth of at least six inches and extending at least 30 feet wide and at least 50 feet long.

(B) Pave the surface extending at least 100 feet and at least 20 feet wide.

(C) Utilize a wheel shaker/wheel spreading device consisting of raised dividers (rails, pipe, or grates) at least 24 feet long and 10 feet wide to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.

(D) Install and utilize a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.

(E) Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the actions specified in subparagraphs (d)(5)(A) through (d)(5)(D).

(6) Beginning January 1, 2006, any person who operates or authorizes the operation of a confined animal facility subject to this Rule shall implement the applicable conservation management practices specified in Table 4 of this Rule.

(e) Additional Requirements for Large Operations

(1) Any person who conducts or authorizes the conducting of a large operation subject to this Rule shall implement the applicable actions specified in Table 2 of this Rule at all times and shall implement the applicable actions specified in Table 3 of this Rule when the applicable performance standards can not be met through use of Table 2 actions; and shall:

(A) submit a fully executed Large Operation Notification (Form 403 N) to the Executive Officer within 7 days of qualifying as a large operation;

(B) include, as part of the notification, the name(s), address(es), and phone number(s) of the person(s) responsible for the submittal, and a description of the operation(s), including a map depicting the location of the site;

(C) maintain daily records to document the specific dust control actions taken, maintain such records for a period of not less than three years; and make such records available to the Executive Officer upon request;

(D) install and maintain project signage with project contact signage that meets the minimum standards of the Rule 403 Implementation Handbook, prior to initiating any earthmoving activities;

(E) identify a dust control supervisor that:

(i) is employed by or contracted with the property owner or developer;

(ii) is on the site or available on-site within 30 minutes during working hours;

(iii) has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule requirements;

(iv) has completed the AQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class; and

(F) notify the Executive Officer in writing within 30 days after the site no longer qualifies as a large operation as defined by paragraph (c)(18).

(2) Any Large Operation Notification submitted to the Executive Officer or AQMD-approved dust control plan shall be valid for a period of one year from the date of written acceptance by the Executive Officer. Any Large Operation Notification accepted pursuant to paragraph (e)(1), excluding those submitted by aggregate-related plants and cement manufacturing facilities must be resubmitted annually by the person who conducts or authorizes the conducting of a large operation, at least 30 days prior to the expiration date, or the submittal shall no longer be valid as of the expiration date. If all fugitive dust sources and corresponding control measures or special circumstances remain identical to those identified in the previously accepted submittal or in an AQMD-approved dust control plan, the resubmittal may be a simple statement of no-change (Form 403NC).

(f) Compliance Schedule

The newly amended provisions of this Rule shall become effective upon adoption. Pursuant to subdivision (e), any existing site that qualifies as a large operation will have 60 days from the date of Rule adoption to comply with the notification and recordkeeping requirements for large operations. Any Large Operation

Notification or AQMD-approved dust control plan which has been accepted prior to the date of adoption of these amendments shall remain in effect and the Large Operation Notification or AQMD-approved dust control plan annual resubmittal date shall be one year from adoption of this Rule amendment.

(g) Exemptions

(1) The provisions of this Rule shall not apply to:

(A) Dairy farms.

(B) Confined animal facilities provided that the combined disturbed surface area within one continuous property line is one acre or less.

(C) Agricultural vegetative crop operations provided that the combined disturbed surface area within one continuous property line and not separated by a paved public road is 10 acres or less.

(D) Agricultural vegetative crop operations within the South Coast Air Basin, whose combined disturbed surface area includes more than 10 acres provided that the person responsible for such operations:

(i) voluntarily implements the conservation management practices contained in the Rule 403 Agricultural Handbook;

(ii) completes and maintains the self-monitoring form documenting sufficient conservation management practices, as described in the Rule 403 Agricultural Handbook; and

(iii) makes the completed self-monitoring form available to the Executive Officer upon request.

(E) Agricultural vegetative crop operations outside the South Coast Air Basin whose combined disturbed surface area includes more than 10 acres provided that the person responsible for such operations:

(i) voluntarily implements the conservation management practices contained in the Rule 403 Coachella Valley Agricultural Handbook; and

(ii) completes and maintains the self-monitoring form documenting sufficient conservation management practices, as described in the Rule 403 Coachella Valley Agricultural Handbook; and

(iii) makes the completed self-monitoring form available to the Executive Officer upon request.

(F) Active operations conducted during emergency life-threatening situations, or in conjunction with any officially declared disaster or state of emergency.

(G) Active operations conducted by essential service utilities to provide electricity, natural gas, telephone, water and sewer during periods of service outages and emergency disruptions.

(H) Any contractor subsequent to the time the contract ends, provided that such contractor implemented the required control measures during the contractual period.

(I) Any grading contractor, for a phase of active operations, subsequent to the contractual completion of that phase of earth-moving activities, provided that the required control measures have been implemented during the entire phase of earth-moving activities, through and including five days after the final grading inspection.

(J) Weed abatement operations ordered by a county agricultural commissioner or any state, county, or municipal fire department, provided that:

(i) mowing, cutting or other similar process is used which maintains weed stubble at least three inches above the soil; and

(ii) any discing or similar operation which cuts into and disturbs the soil, where watering is used prior to initiation of these activities, and a determination is made by the agency issuing the weed abatement order that, due to fire hazard conditions, rocks, or other physical obstructions, it is not practical to meet the conditions specified in clause (g)(1)(H)(i). The provisions this clause shall not exempt the owner of any property from stabilizing, in accordance with paragraph (d)(2), disturbed surface areas which have been created as a result of the weed abatement actions.

(K) sandblasting operations.

(2) The provisions of paragraphs (d)(1) and (d)(3) shall not apply:

(A) When wind gusts exceed 25 miles per hour, provided that:

(i) The required Table 3 contingency measures in this Rule are implemented for each applicable fugitive dust source type, and;

(ii) records are maintained in accordance with subparagraph (e)(1)(C).

(B) To unpaved roads, provided such roads:

(i) are used solely for the maintenance of wind-generating equipment; or

(ii) are unpaved public alleys as defined in Rule 1186; or

(iii) are service roads that meet all of the following criteria:

(a) are less than 50 feet in width at all points along the road;

(b) are within 25 feet of the property line; and

(c) have a traffic volume less than 20 vehicle-trips per day.

(C) To any active operation, open storage pile, or disturbed surface area for which necessary fugitive dust preventive or mitigative actions are in conflict with the federal Endangered Species Act, as determined in writing by the State or federal agency responsible for making such determinations.

(3) The provisions of (d)(2) shall not apply to any aggregate-related plant or cement manufacturing facility that implements the applicable actions specified in Table 2 of this Rule at all times and shall implement the applicable actions specified in Table 3 of this Rule when the applicable performance standards of paragraphs (d)(1) and (d)(3) can not be met through use of Table 2 actions.

(4) The provisions of paragraphs (d)(1), (d)(2), and (d)(3) shall not apply to:

(A) Blasting operations which have been permitted by the California Division of Industrial Safety; and

(B) Motion picture, television, and video production activities when dust emissions are required for visual effects. In order to obtain this exemption, the Executive Officer must receive notification in writing at least 72 hours in advance of any such activity and no nuisance results from such activity.

(5) The provisions of paragraph (d)(3) shall not apply if the dust control actions, as specified in Table 2, are implemented on a routine basis for

each applicable fugitive dust source type. To qualify for this exemption, a person must maintain records in accordance with subparagraph (e)(1)(C).

(6) The provisions of paragraph (d)(4) shall not apply to earth coverings of public paved roadways where such coverings are approved by a local government agency for the protection of the roadway, and where such coverings are used as roadway crossings for haul vehicles provided that such roadway is closed to through traffic and visible roadway dust is removed within one day following the cessation of activities.

(7) The provisions of subdivision (e) shall not apply to:

(A) officially-designated public parks and recreational areas, including national parks, national monuments, national forests, state parks, state recreational areas, and county regional parks.

(B) any large operation which is required to submit a dust control plan to any city or county government which has adopted a District-approved dust control ordinance.

(C) any large operation subject to Rule 1158, which has an approved dust control plan pursuant to Rule 1158, provided that all sources of fugitive dust are included in the Rule 1158 plan.

(8) The provisions of subparagraph (e)(1)(A) through (e)(1)(C) shall not apply to any large operation with an AQMD-approved fugitive dust control plan provided that there is no change to the sources and controls as identified in the AQMD-approved fugitive dust control plan.

(h) Fees

Any person conducting active operations for which the Executive Officer conducts upwind/downwind monitoring for PM_{10} pursuant to paragraph (d)(3) shall be assessed applicable Ambient Air Analysis Fees pursuant to Rule 304.1. Applicable fees shall be waived for any facility which is exempted from paragraph (d)(3) or meets the requirements of paragraph (d)(3).

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Backfilling	01-1 Stabilize backfill material when not actively handling; and 01-2 Stabilize backfill material during handling; and 01-3 Stabilize soil at completion of activity.	✓ Mix backfill soil with water prior to moving ✓ Dedicate water truck or high capacity hose to backfilling equipment ✓ Empty loader bucket slowly so that no dust plumes are generated ✓ Minimize drop height from loader bucket
Clearing and grubbing	02-1 Maintain stability of soil through pre-watering of site prior to clearing and grubbing; and 02-2 Stabilize soil during clearing and grubbing activities; and 02-3 Stabilize soil immediately after clearing and grubbing activities.	✓ Maintain live perennial vegetation where possible ✓ Apply water in sufficient quantity to prevent generation of dust plumes
Clearing forms	03-1 Use water spray to clear forms; or 03-2 Use sweeping and water spray to clear forms; or 03-3 Use vacuum system to clear forms.	✓ Use of high pressure air to clear forms may cause exceedance of Rule requirements
Crushing	04-1 Stabilize surface soils prior to operation of support equipment; and 04-2 Stabilize material after crushing.	✓ Follow permit conditions for crushing equipment ✓ Pre-water material prior to loading into crusher ✓ Monitor crusher emissions opacity ✓ Apply water to crushed material to prevent dust plumes

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Cut and fill	05-1 Pre-water soils prior to cut and fill activities; and 05-2 Stabilize soil during and after cut and fill activities.	✓ For large sites, pre-water with sprinklers or water trucks and allow time for penetration ✓ Use water trucks/pulls to water soils to depth of cut prior to subsequent cuts
Demolition – mechanical/manual	06-1 Stabilize wind erodible surfaces to reduce dust; and 06-2 Stabilize surface soil where support equipment and vehicles will operate; and 06-3 Stabilize loose soil and demolition debris; and 06-4 Comply with AQMD Rule 1403.	✓ Apply water in sufficient quantities to prevent the generation of visible dust plumes
Disturbed soil	07-1 Stabilize disturbed soil throughout the construction site; and 07-2 Stabilize disturbed soil between structures	✓ Limit vehicular traffic and disturbances on soils where possible ✓ If interior block walls are planned, install as early as possible ✓ Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes
Earth-moving activities	08-1 Pre-apply water to depth of proposed cuts; and 08-2 Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 100 feet in any direction; and 08-3 Stabilize soils once earth-moving activities are complete.	✓ Grade each project phase separately, timed to coincide with construction phase ✓ Upwind fencing can prevent material movement on site ✓ Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes

(Amended June 3, 2005)

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Importing/exporting of bulk materials	09-1 Stabilize material while loading to reduce fugitive dust emissions; and 09-2 Maintain at least six inches of freeboard on haul vehicles; and 09-3 Stabilize material while transporting to reduce fugitive dust emissions; and 09-4 Stabilize material while unloading to reduce fugitive dust emissions; and 09-5 Comply with Vehicle Code Section 23114.	✓ Use tarps or other suitable enclosures on haul trucks ✓ Check belly-dump truck seals regularly and remove any trapped rocks to prevent spillage ✓ Comply with track-out prevention/mitigation requirements ✓ Provide water while loading and unloading to reduce visible dust plumes
Landscaping	10-1 Stabilize soils, materials, slopes	✓ Apply water to materials to stabilize ✓ Maintain materials in a crusted condition ✓ Maintain effective cover over materials ✓ Stabilize sloping surfaces using soil binders until vegetation or ground cover can effectively stabilize the slopes ✓ Hydroseed prior to rain season
Road shoulder maintenance	11-1 Apply water to unpaved shoulders prior to clearing; and 11-2 Apply chemical dust suppressants and/or washed gravel to maintain a stabilized surface after completing road shoulder maintenance.	✓ Installation of curbing and/or paving of road shoulders can reduce recurring maintenance costs ✓ Use of chemical dust suppressants can inhibit vegetation growth and reduce future road shoulder maintenance costs

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Screening	12-1 Pre-water material prior to screening; and 12-2 Limit fugitive dust emissions to opacity and plume length standards; and 12-3 Stabilize material immediately after screening.	✓ Dedicate water truck or high capacity hose to screening operation ✓ Drop material through the screen slowly and minimize drop height ✓ Install wind barrier with a porosity of no more than 50% upwind of screen to the height of the drop point
Staging areas	13-1 Stabilize staging areas during use; and 13-2 Stabilize staging area soils at project completion.	✓ Limit size of staging area ✓ Limit vehicle speeds to 15 miles per hour ✓ Limit number and size of staging area entrances/exists
Stockpiles/ Bulk Material Handling	14-1 Stabilize stockpiled materials. 14-2 Stockpiles within 100 yards of off-site occupied buildings must not be greater than eight feet in height; or must have a road bladed to the top to allow water truck access or must have an operational water irrigation system that is capable of complete stockpile coverage.	✓ Add or remove material from the downwind portion of the storage pile ✓ Maintain storage piles to avoid steep sides or faces

(Amended June 3, 2005)

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Traffic areas for construction activities	15-1 Stabilize all off-road traffic and parking areas; and 15-2 Stabilize all haul routes; and 15-3 Direct construction traffic over established haul routes.	✓ Apply gravel/paving to all haul routes as soon as possible to all future roadway areas ✓ Barriers can be used to ensure vehicles are only used on established parking areas/haul routes
Trenching	16-1 Stabilize surface soils where trencher or excavator and support equipment will operate; and 16-2 Stabilize soils at the completion of trenching activities.	✓ Pre-watering of soils prior to trenching is an effective preventive measure. For deep trenching activities, pre-treuch to 18 inches soak soils via the pre-trench and resuming trenching ✓ Washing mud and soils from equipment at the conclusion of trenching activities can prevent crusting and drying of soil on equipment
Truck loading	17-1 Pre-water material prior to loading; and 17-2 Ensure that freeboard exceeds six inches (CVC 23114)	✓ Empty loader bucket such that no visible dust plumes are created ✓ Ensure that the loader bucket is close to the truck to minimize drop height while loading
Turf Overseeding	18-1 Apply sufficient water immediately prior to conducting turf vacuuming activities to meet opacity and plume length standards; and 18-2 Cover haul vehicles prior to exiting the site.	✓ Haul waste material immediately off-site

(Amended June 3, 2005)

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure		Guidance
Unpaved roads/parking lots	19-1	Stabilize soils to meet the applicable performance standards; and	✓ Restricting vehicular access to established unpaved travel paths and parking lots can reduce stabilization requirements
	19-2	Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots.	
Vacant land	20-1	In instances where vacant lots are 0.10 acre or larger and have a cumulative area of 500 square feet or more that are driven over and/or used by motor vehicles and/or off-road vehicles, prevent motor vehicle and/or off-road vehicle trespassing, parking and/or access by installing barriers, curbs, fences, gates, posts, signs, shrubs, trees or other effective control measures.	

Table 2
DUST CONTROL MEASURES FOR LARGE OPERATIONS

FUGITIVE DUST SOURCE CATEGORY		CONTROL ACTIONS
Earth-moving (except construction cutting and filling areas, and mining operations)	(1a)	Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations each subsequent four-hour period of active operations; OR
	(1a-1)	For any earth-moving which is more than 100 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 100 feet in length in any direction.
Earth-moving: Construction fill areas:	(1b)	Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method 1557 or other equivalent method approved by the Executive Officer and the California Air Resources Board and the U.S. EPA, complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations during each subsequent four-hour period of active operations.

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Earth-moving: Construction cut areas and mining operations:	(1c)	Conduct watering as necessary to prevent visible emissions from extending more than 100 feet beyond the active cut or mining area unless the area is inaccessible to watering vehicles due to slope conditions or other safety factors.
Disturbed surface areas (except completed grading areas)	(2a/b)	Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface. Any areas which cannot be stabilized, as evidenced by wind driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.
Disturbed surface areas: Completed grading areas	(2c)	Apply chemical stabilizers within five working days of grading completion; OR
	(2d)	Take actions (3a) or (3c) specified for inactive disturbed surface areas.
Inactive disturbed surface areas	(3a)	Apply water to at least 80 percent of all inactive disturbed surface areas on a daily basis when there is evidence of wind driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; OR
	(3b)	Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; OR
	(3c)	Establish a vegetative ground cover within 21 days after active operations have ceased. Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; OR
	(3d)	Utilize any combination of control actions (3a), (3b), and (3c) such that, in total, these actions apply to all inactive disturbed surface areas.

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Unpaved Roads	(4a)	Water all roads used for any vehicular traffic at least once per every two hours of active operations [3 times per normal 8 hour work day]; OR
	(4b)	Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR
	(4c)	Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.
Open storage piles	(5a)	Apply chemical stabilizers; OR
	(5b)	Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind driven fugitive dust; OR
	(5c)	Install temporary coverings; OR
	(5d)	Install a three-sided enclosure with walls with no more than 50 percent porosity which extend, at a minimum, to the top of the pile. This option may only be used at aggregate-related plants or at cement manufacturing facilities.
All Categories	(6a)	Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified in Table 2 may be used.

TABLE 3
CONTINGENCY CONTROL MEASURES FOR LARGE OPERATIONS

FUGITIVE DUST SOURCE CATEGORY	CONTROL MEASURES
Earth-moving	(1A) Cease all active operations; OR (2A) Apply water to soil not more than 15 minutes prior to moving such soil.
Disturbed surface areas	(0B) On the last day of active operations prior to a weekend, holiday, or any other period when active operations will not occur for not more than four consecutive days: apply water with a mixture of chemical stabilizer diluted to not less than 1/20 of the concentration required to maintain a stabilized surface for a period of six months; OR (1B) Apply chemical stabilizers prior to wind event; OR (2B) Apply water to all unstabilized disturbed areas 3 times per day. If there is any evidence of wind driven fugitive dust, watering frequency is increased to a minimum of four times per day; OR (3B) Take the actions specified in Table 2, Item (3c); OR (4B) Utilize any combination of control actions (1B), (2B), and (3B) such that, in total, these actions apply to all disturbed surface areas.
Unpaved roads	(1C) Apply chemical stabilizers prior to wind event; OR (2C) Apply water twice per hour during active operation; OR (3C) Stop all vehicular traffic.
Open storage piles	(1D) Apply water twice per hour; OR (2D) Install temporary coverings.
Paved road track-out	(1E) Cover all haul vehicles; OR (2E) Comply with the vehicle freeboard requirements of Section 23114 of the California Vehicle Code for both public and private roads.
All Categories	(1F) Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified in Table 3 may be used.

Table 4
(Conservation Management Practices for Confined Animal Facilities)

SOURCE CATEGORY	CONSERVATION MANAGEMENT PRACTICES	
Manure Handling **(Only applicable to Commercial Poultry Ranches)**	(1a) (1b) (1c) (1d)	Cover manure prior to removing material off-site; AND Spread the manure before 11:00 AM and when wind conditions are less than 25 miles per hour; AND Utilize coning and drying manure management by removing manure at laying hen houses at least twice per year and maintain a base of no less than 6 inches of dry manure after clean out; or in lieu of complying with conservation management practice (1c), comply with conservation management practice (1d). Utilize frequent manure removal by removing the manure from laying hen houses at least every seven days and immediately thin bed dry the material.
Feedstock Handling	(2a)	Utilize a sock or boot on the feed truck auger when filling feed storage bins.
Disturbed Surfaces	(3a) (3b) (3c)	Maintain at least 70 percent vegetative cover on vacant portions of the facility; OR Utilize conservation tillage practices to manage the amount, orientation and distribution of crop and other plant residues on the soil surface year-round, while growing crops (if applicable) in narrow slots or tilled strips; OR Apply dust suppressants in sufficient concentrations and frequencies to maintain a stabilized surface.
Unpaved Roads	(4a) (4b) (4c)	Restrict access to private unpaved roads either through signage or physical access restrictions and control vehicular speeds to no more than 15 miles per hour through worker notifications, signage, or any other necessary means; OR Cover frequently traveled unpaved roads with low silt content material (i.e., asphalt, concrete, recycled road base, or gravel to a minimum depth of four inches); OR Treat unpaved roads with water, mulch, chemical dust suppressants or other cover to maintain a stabilized surface.
Equipment Parking Areas	(5a) (5b)	Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; OR Apply material with low silt content (i.e., asphalt, concrete, recycled road base, or gravel to a depth of four inches).

(Adopted August 5, 1988)(Amended July 14, 1995)(Amended May 11, 2001)

RULE 1166. VOLATILE ORGANIC COMPOUND EMISSIONS FROM DECONTAMINATION OF SOIL

(a) Applicability

This rule sets requirements to control the emission of Volatile Organic Compounds (VOC) from excavating, grading, handling and treating VOC-contaminated soil as a result of leakage from storage or transfer operations, accidental spillage, or other deposition.

(b) Definitions

(1) EXCAVATION is the process of digging out and removing materials, including any material necessary to that process such as the digging out and removal of asphalt or concrete necessary to expose, dig out and remove known VOC contaminated soil.

(2) GRADING is the process of leveling off to produce a smooth surface including the removal of any material necessary to that process such as asphalt and concrete necessary to expose known VOC contaminated soil.

(3) SOIL DECONTAMINATION MEASURE is any process approved by the Executive Officer to remediate, destroy, remove, or encapsulate VOC and VOC-contaminated soil.

(4) UNDERGROUND STORAGE TANK means any one or combination of tanks, including pipes connected thereto, which is used for the storage of organic liquid which is more than 50% beneath the surface of the ground.

(5) VOC CONTAMINATED SOIL is a soil which registers a concentration of 50 ppm or greater of Volatile Organic Compounds as measured before suppression materials have been applied and at a distance of no more than three inches from the surface of the excavated soil with an organic vapor analyzer calibrated with hexane.

(6) VOC CONTAMINATED SOIL MITIGATION PLAN is a plan to minimize VOC emissions to the atmosphere during excavation and any subsequent handling of VOC-contaminated soil.

(7) VOLATILE ORGANIC COMPOUND (VOC) is any volatile compound of carbon, excluding methane, carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, ammonium carbonate, and exempt compounds. Exempt compounds are defined in Rule 102—Definition Of Terms.

(8) VOLATILE ORGANIC MATERIALS include gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOC.

(c) Requirements

(1) A person excavating an underground storage tank and/or transfer piping storing or previously storing VOC materials, or excavating or grading soil containing VOC materials shall:

(A) Apply for, obtain and operate pursuant to a mitigation plan approved by the Executive Officer prior to commencement of excavation or handling. The mitigation plan general requirement and application requirements are found in Attachment A to this rule. A copy of the approved plan must be on site during the entire excavation period.

(B) Notify the Executive Officer at least 24 hours prior to excavation using a form approved by the Executive Officer which is fully completed.

If the excavation does not commence on start date, renotification is required.

An alternative notification procedure may be authorized for multiple excavations within a single facility, with prior written approval from the Executive Officer.

(C) Monitor for VOC contamination pursuant to subdivision (e), at least once every 15 minutes commencing at the beginning of excavation or grading and record all VOC concentration readings in a format approved by the Executive Officer; and

(D) When VOC-contaminated soil is detected during excavation or grading:

(i) Implement the approved mitigation plan (Attachment A).

(ii) Notify the Executive Officer within 24 hours of detection of VOC-contaminated soil.

(iii) Monitor and record VOC concentration readings as prescribed in the plan. Monitoring records must be kept available on site.

(iv) Keep calibration records for all monitoring instruments available on site.

(2) A person handling VOC-contaminated soil at or from an excavation or grading site shall:

(A) Segregate VOC-contaminated stockpiles from non-VOC contaminated stockpiles such that mixing of the stockpiles does not take place.

(B) Spray VOC-contaminated soil stockpiles with water and/or approved vapor suppressant and cover them with plastic sheeting for all periods of inactivity lasting more than one hour.

(C) Conduct a daily visual inspection of all covered VOC contaminated soil stockpiles to ensure the integrity of the plastic covered surfaces. A daily inspection record must be maintained on site.

(D) Comply with the provisions in subparagraph (c) (1)(A) and clause (c)(1)(D)(i).

(E) Maintain a record of the identification and business addresses of the generator, transporter and storage/treatment facilities. Such record shall be signed by each party at the time custody is transferred.

(F) Treat or remove contaminated soil from an excavation or grading site within 30 days from the time of excavation.

(3) If the VOC concentration in the excavated soil is measured at greater than 1000 ppm, spray the soil with water or vapor suppressant and:

(A) As soon as possible, but not more than 15 minutes, place the soil in sealed containers, or

(B) As soon as possible, but not more than 15 minutes, load into trucks, moisten with additional water, cover and transport off site, or

(C) Implement other alternative storage methods approved in writing by the Executive Officer.

(4) A person treating VOC-contaminated soil shall:

(A) Obtain a permit to construct and operate treatment equipment, as applicable, from the Executive Officer, and

(B) Implement VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology applied during all segments, and which include, but are not limited to, at least one of the following:

(i) Installation and operation of an underground VOC collection system and a disposal system prior to excavation.

(ii) Collection and disposal of the VOC from the excavated soil on-site using equipment approved by the Executive Officer.

(iii) Any equivalent VOC-contaminated soil control measure previously approved in writing by the Executive Officer.

(5) A person shall not engage in or allow any on-site or off-site spreading, grading or screening of VOC-contaminated soil, which results in uncontrolled evaporation of VOC to the atmosphere.

(6) Loading trucks for contaminated soil must meet the following:

(A) The truck and trailer shall be adequately tarped prior to leaving the site; no excavated materials shall extend above the sides or rear of the truck or trailer to prevent soil spillage during transport, and

(B) The exterior of the truck, trailer and tires shall be cleaned off prior to the truck leaving the site.

(d) Exemptions

(1) The provisions of this rule shall not apply to the following:

(A) Excavation, handling, and treating of less than one (1) cubic yard of contaminated soil.

(B) Removal of soil for sampling purposes,

(C) Accidental spillage of five (5) gallons or less of VOC containing material.

(2) The provisions of paragraphs (c)(1) and (c)(2) shall not apply to soil excavation or handling as a result of an emergency as declared by an authorized health officer, agricultural commissioner, fire protection officer, or other authorized agency officer. Whenever possible, the Executive Officer shall be notified by telephone prior to commencing such excavation. The Executive Officer shall be notified in writing no later than 48 hours following such excavation. Written notification shall include written emergency declaration from the authorized officer.

(e) Test Methods

(1) A person shall measure excavated soils for volatile organic compounds to determine contamination by:

(A) Using an organic vapor analyzer calibrated with hexane, complying with 40 CFR Part 60 Appendix A, EPA Reference Method 21 Seetion 3 or any equivalent method with prior approval in writing by the Executive Officer. If other calibrating gases are used, then the measured readings shall be correlated to and expressed as hexane.

(B) Placing the probe inlet at a distance of no more than three inches from the surface of the excavated soil and while slowly moving the probe across the soil surfaee, observe the instrument readout. If an increased meter reading is observed, continue to sample the excavated soil until the maximum meter reading is obtained. Leave the probe inlet at this maximum reading location for approximately double the instrument response time. If the maximum observed meter reading is greater than the 50 ppm standard in the regulation, record and report the results.

(2) The presence of VOC in stored or spillage materials shall be determined by SCAQMD Method 313 [Determination of Presence of Volatile Organic Compounds (VOC) in Headspace] and/or Method 304 (Determination of Volatile Organic Compounds in Various Materials) contained in the SCAQMD "Laboratory Methods of Analysis for Enforcement Samples" manual.

(f) Enforcement

(1) Violation of any provision of this rule or the violation of the approved mitigation plan shall be grounds for the Executive Officer to amend or revoke the mitigation plan, in addition to penalties provided by the Health & Safety Code.

(2) If the owner or operator is served with a Notice of Violation for creating a public nuisance, the owner or operator shall suspend operation until the public nuisance is mitigated to the satisfaction of the Executive Officer.

ATTACHMENT A
GENERAL MITIGATION PLANS REQUIREMENTS

VOC Contaminated Soil Mitigation Plans shall be written to minimize VOC emissions to the atmosphere during excavation, grading, handling and treatment of VOC contaminated soil. VOC Contaminated Soil Mitigation Plans shall consist of three types: Various Locations, Site Specific and Facility Treatment.

(1) General Requirements

(A) A plan is not transferable.

(B) A person responsible for the excavation, grading or handling of VOC contaminated soil must be completely familiar with the plan and must adhere to the plan requirement. The Executive Officer may require that the plan be signed by the owner and/or operator.

(C) A plan may be amended upon renewal.

(D) Permission to excavate, grade or handle VOC contaminated soil may be withdrawn by the District upon a finding by the Executive Officer that the excavation, grading or handling of the VOC contaminated soil is causing a public nuisance or violating other AQMD rules or regulations.

(2) Various Location Plans:

(A) Shall be limited to the excavation of 2000 cubic yards or less of VOC contaminated soil in any consecutive 12 month period at the same site.

(B) Shall not be used in conjunction with any other various location plan at the same site within a consecutive 12-month period.

(C) Shall expire after one year from issuance unless renewed.

(D) Shall not be issued for nor used for operations that involve grading, soil treatment or remediation, or landfills.

(3) Site Specific Plans:

(A) Shall be for excavation of greater than 2000 cubic yards of VOC contaminated soil.

(B) Shall be issued for specific excavation or grading locations for a period not to exceed two years.

(C) Shall not be renewable.

(4) Facility Treatment Plans:

(A) Shall be issued for a treatment facility at a permanent location.

(B) Shall expire after one year from issuance unless renewed.

(5) Applications for Site Specific Plans shall contain as a minimum:

(A) Reasons for excavation or grading.

(B) Cause of VOC soil contamination and history of the site.

(C) Description of tanks or piping associated with the soil contamination.

(D) An estimate of the amount of contaminated soil.

(E) The operating schedule for excavation and removal.

(F) Description of how the excavation or grading will be conducted.

(G) Description of mitigation measures for dust, odors and VOC.

(H) Details of disposal of VOC contaminated soil, including the ultimate receptor.

(I) Description of monitoring equipment and techniques.

(J) A map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential areas or other sensitive receptors such as hospitals or locations where children or elderly people live or work.

(K) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(6) Applications for Facility Treatment Plans shall at a minimum:

(A) Include a list of all AQMD permits to construct or operate which have been issued for that treatment and control equipment.

(B) Provide for the implementation of VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology during all operations.

(C) Provide a map showing the facility layout including the location of all proposed VOC and non-VOC contaminated soil stockpiles.

(D) Specify the total amount of VOC contaminated soil proposed to be stockpiled on site.

(E) Provide for VOC contaminated soil stockpiles to be kept moist with water or suppressant and be covered to prevent fugitive emissions.

(F) Provide for VOC contaminated soil stockpiles to be segregated from non-VOC contaminated soil stockpiles.

(G) Provide for maintenance of records for stockpiles according to the source name, address and dates of reception.

(H) Provide for records of the generator, transporter and storage/treatment facilities and indicate their identification and business addresses. Such records shall be signed by each party at the time custody is transferred.

(I) Provide a map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential area or other sensitive receptors such as hospitals, or locations where children or elderly people live or work.

(J) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(K) Specify the operating schedule and maximum amount of VOC-contaminated soil proposed to be remediated on a daily basis.

(7) In approving a plan, the Executive Officer require reasonable conditions deemed necessary to ensure the operations comply with the plan and AQMD rules. The conditions may include, but shall not be limited to, procedures for ensuring responsibility for the implementation of the plan, accessibility to the site for AQMD staff, notification of actions required by the plan, identification of emission receptors, monitoring and testing, suppression and covering of stockpiles, prevention of public nuisance from VOC or dust emissions, prevention of fugitive emissions of VOC contaminated soil, loading of truck trailers, and disposal and treatment.

(8) In approving a plan, the Executive Officer may require any records deemed necessary to be maintained by the operator to demonstrate compliance with the plan. Such records shall be retained for at least 2 years and be made available to the Executive officer upon request.

(Adopted July 7, 2017)(Amended December 1, 2017)(Amended June 4, 2021)

RULE 1466. CONTROL OF PARTICULATE EMISSIONS FROM SOILS WITH TOXIC AIR CONTAMINANTS

(a) Purpose

The purpose of this rule is to minimize the amount of off-site fugitive dust emissions containing toxic air contaminants by reducing particulate emissions in the ambient air as a result of earth-moving activities, including, dredging, excavating, grading, earth-cutting and filling, loading, unloading, handling, mechanized land clearing, treating, stockpiling, transferring, and removing of soil that contains applicable toxic air contaminants, from sites that meet the applicability requirements of subdivision (b).

(b) Applicability

(1) This rule shall apply to any owner or operator conducting earth-moving activities of soil with applicable toxic air contaminant(s) as defined in paragraph (c)(16) that have been identified as contaminant(s) of concern at a site that has been designated and notified by:

(A) The U.S. Environmental Protection Agency (U.S. EPA) as a Superfund National Priorities List site;

(B) The California Department of Toxic Substances Control (DTSC) as a Brownfield or Cleanup Program site;

(C) The State Water Resources Control Board (State Water Board) or Regional Water Quality Control Board (Regional Water Board) as a Site Cleanup Program site;

(D) A county, local, or state regulatory agency as a Hazardous Material Release site, as defined in California Health and Safety Code Section 25260; or

(E) The Executive Officer pursuant to subdivision (i).

(2) This rule shall not apply to:

(A) Earth-moving activities of soil with applicable toxic air contaminant(s) of less than 50 cubic yards; or

(B) Removal of soil for sampling purposes.

(c) Definitions

(1) ADEQUATELY WET means the condition of being sufficiently mixed or penetrated with water to prevent the release of particulates or visible emissions. The process by which an adequately wet condition is achieved is by using a dispenser

or water hose with a nozzle that permits the use of a fine, low-pressure spray or mist.

(c) (2) ADJACENT ATHLETIC AREA means any outdoor athletic field or park where youth organized sports occur that is in physical contact or separated solely by a public roadway or other public right-of-way to a SCHOOL.

(3) ADJOINING means in physical contact with or separated solely by a public roadway or other public right-of-way.

(4) CHEMICAL STABILIZERS means any non-toxic chemicals that are used to bind soil together to control FUGITIVE DUST emissions.

(5) DISTURBED SURFACE AREA means a portion of the earth's surface which has been physically moved, uncovered, destabilized, or otherwise modified from its undisturbed natural soil condition, thereby increasing the potential for FUGITIVE DUST. This definition excludes those areas which have:

(A) Been restored to a natural state, such that the vegetative ground cover and soil characteristics are similar to adjacent or nearby natural conditions;

(B) Been paved or otherwise covered by a permanent structure; or

(C) Sustained a vegetative ground cover of at least 70 percent of the native cover for a particular area for at least 30 days.

(6) DUST SUPPRESSANTS means water or hygroscopic materials, other than CHEMICAL STABILIZERS, that are used as a treatment material to reduce FUGITIVE DUST emissions.

(7) EARTH-MOVING ACTIVITIES means, for the purpose of this rule, any activity on a site that meets the applicability requirements of subdivision (b) where SOIL WITH APPLICABLE TOXIC AIR CONTAMINANT(S) is being moved or uncovered, including: dredging, excavating, grading, earth-cutting and filling operations, loading, unloading, handling, mechanized land clearing, treating, transferring, removing, and adding to or removing from STOCKPILES, and vehicular movement of equipment associated with these activities. EARTH-MOVING ACTIVITIES do not include vehicular movement from: delivery vehicles, passenger vehicles transporting personnel to and from the site, vehicles used for administrative purposes, vehicles transporting personnel for the purposes of soil sampling and conducting ambient PM_{10} monitoring requirements, watering trucks, and equipment used exclusively on a portion(s) of the site where there is no SOIL WITH APPLICABLE TOXIC AIR CONTAMINANT(S).

(c) (8) FUGITIVE DUST means, for the purpose of this rule, any solid particulate matter that is in contact with ambient air and has the potential to become airborne, other than solid particulate matter that is emitted from an exhaust stack.

(9) JOINT USE AGREEMENT PROPERTY means a shared public facility in which a formal agreement exists between a SCHOOL and another government entity setting forth the terms and conditions for shared use.

(10) OWNER OR OPERATOR means any firm, business establishment, association, partnership, corporation or individual, whether acting as principal, agent, employee, contractor, or other capacity.

(11) PAVED ROAD means a public or private improved street, highway, alley, public way, or easement that is covered by typical roadway materials, but excludes access roadways that connect a facility with a public paved roadway and are not open to through traffic. Public paved roads are those open to public access and that are owned by any federal, state, county, municipal, or any other governmental or quasi-governmental agencies. Private paved roads are any PAVED ROADS not defined as public.

(12) PROPERTY LINE means the boundary of an area where a person has the legal use or possession of the property. Where such property is divided into one or more sub-tenancies, the property line(s) shall refer to the boundaries dividing the areas of all sub-tenancies.

(13) SCHOOL means any public or private education center, including juvenile detention facilities with classrooms, used for the education of more than 12 children at the education center in kindergarten through grade 12. A SCHOOL also includes an Early Learning and Developmental Program by the U.S. Department of Education or any state or local early learning and development programs such as preschools, Early Head Starts, Head Start, First Five, and Child Development Centers. A SCHOOL does not include any private education center in which education is primarily conducted in private homes. A SCHOOL includes any building or structure, playground, athletic field, or other area of school property.

(14) SLAG means, for the purpose of this rule, the by-product material that is separated from metals during smelting or refining of ore.

(15) SOIL means dirt, sand, gravel, clay, SLAG, and aggregate material less than two inches in length or diameter, and other organic or inorganic particulate matter.

(16) SOIL WITH APPLICABLE TOXIC AIR CONTAMINANT(S) means, for the purpose of this rule, SOIL that has been identified by the U.S. EPA, the DTSC, the

State Water Board, the Regional Water Board, or a county, local, or state regulatory agency, to contain one or more of the applicable toxic air contaminants listed in Table I that exceed action levels as specified by the designating agency, or soil that has been identified by the Executive Officer to contain one or more of the toxic air contaminants listed in Rule 1401 – New Source Review of Toxic Air Contaminants (Table I) or Hazardous Air Pollutants Identified as Toxic Air Contaminants as listed in California Code of Regulations Section 93001, excluding volatile organic compounds regulated under Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil.

(c) (17) STABILIZED SURFACE means any previously DISTURBED SURFACE AREA or STOCKPILE, which through the application of CHEMICAL STABILIZERS or DUST SUPPRESSANTS, shows visual or other evidence of surface crusting and is resistant to WIND-DRIVEN FUGITIVE DUST, and is demonstrated to be stabilized. Stabilization can be demonstrated by one or more of the applicable test methods contained in the most current version of the South Coast AQMD *Rule 403 Fugitive Dust Implementation Handbook* or in Volumes I and II of South Coast AQMD's *Dust Control in the Coachella Valley*.

(18) STOCKPILE means any accumulation of SOIL, which is not fully enclosed and which attains a height of three feet or more and a total surface area of 150 square feet or more.

(19) TRACK-OUT means, for the purpose of this rule, any SOIL that adheres to and agglomerates on the exterior surface of motor vehicles, haul trucks, and equipment (including tires) that has been released onto a PAVED ROAD and that can be removed by a vacuum sweeper under normal operating conditions.

(20) WIND-DRIVEN FUGITIVE DUST means visible emissions from any DISTURBED SURFACE AREA, which is generated by wind action alone.

(d) Monitoring Requirements

(1) When on-site earth-moving activities occur, the owner or operator shall conduct continuous direct-reading near real-time ambient monitoring of PM_{10} concentrations pursuant to paragraph (d)(3).

(2) If the PM_{10} concentration exceeds 25 micrograms per cubic meter, as measured pursuant to paragraph (d)(3) and as determined pursuant to paragraph (d)(9), the owner or operator shall cease on-site earth-moving activities, apply dust suppressant to fugitive dust sources, or implement other dust control measures as

necessary until the PM_{10} concentration is equal to or less than 25 micrograms per cubic meter averaged over 30 minutes.

(d) (3) The owner or operator conducting on-site earth-moving activities shall install PM_{10} monitors and conduct ambient PM_{10} monitoring:

(A) In accordance with a U.S. EPA-approved equivalent method for PM_{10} monitoring or using a Rule 1466 Approved PM_{10} Monitor;

(B) Using a minimum of two monitors, placing each monitor as close to the property line as feasible, where:

(i) One or more monitors is in the seasonal prevailing wind direction upwind of the area(s) of on-site earth-moving activity, indicative of background PM_{10} levels, and not generally influenced by fugitive dust sources from the site; and

(ii) One or more monitors is in the seasonal prevailing wind direction downwind of the area(s) of on-site earth-moving activity;

(C) Using PM_{10} monitors that are identical in: make and model, settings, and configuration; and

(D) Using ambient PM_{10} monitors that are operated, maintained, and calibrated in accordance with appropriate U.S. EPA-published documents for U.S. EPA-approved equivalent methods for PM_{10} and manufacturer's instructions.

(4) On and before December 31, 2021, the owner or operator shall collect ambient PM_{10} data with a data acquisition system (DAS) that is capable of logging direct-reading near real-time data providing the date, time, and PM_{10} concentration in micrograms per cubic meter every 10 minutes or less.

(5) On and after January 1, 2022, the owner or operator shall collect ambient PM_{10} data with a DAS that is capable of logging direct-reading near real-time data providing the date and time, calibrated to Pacific Standard Time (PST), and PM_{10} concentration in micrograms per cubic meter every 1 minute or less.

(6) On and after January 1, 2022, the owner or operator shall operate PM_{10} monitors with the heated sampler inlet on.

(7) On and after January 1, 2022, prior to conducting any on-site earth-moving activities, and weekly thereafter, the owner operator shall conduct intra-instrument precision tests with the PM_{10} monitors in accordance with *Appendix 2 – Procedures to Demonstrate Intra-Instrument Precision*, or make available documentation and supporting data certifying that such intra-instrument precision tests were run by an

equipment rental company or other third party, that demonstrate an intra-instrument precision of:

(d) (7) (A) No more than 25 percent as calculated pursuant to Step 7a in *Appendix 2* when ambient PM_{10} concentrations are equal to or greater than 15 micrograms per cubic meter; or

(B) No more than 5 micrograms per cubic meter as calculated pursuant to Step 7b in *Appendix 2* when ambient PM_{10} concentrations are less than 15 micrograms per cubic meter.

(8) On and after January 1, 2022, each day prior to conducting on-site earth-moving activities, the owner or operator shall conduct a passing zero check on each PM_{10} monitor in accordance with:

(A) Steps 4 and 5 of *Appendix 2* that demonstrates an average PM_{10} concentration of 0 ± 3 micrograms per cubic meter; or

(B) Manufacturer's instructions if a monitor is operated using an auto-zero check procedure that directs filtered particle-free air into the measurement chamber.

(9) The owner or operator shall calculate the PM_{10} concentration as a 120-minute rolling average, where:

(A) The initial average starts at the commencement of on-site earth-moving activities and ends 120 minutes after the commencement of on-site earth-moving activities;

(B) On and before December 31, 2021, the averages subsequent to the initial average specified in subparagraph (d)(9)(A) are to be calculated every 10 minutes and cover the previous 120-minute period;

(C) On and after January 1, 2022, the averages subsequent to the initial average specified in subparagraph (d)(9)(A) are to be calculated every 1 minute and cover the previous 120-minute period;

(D) The PM_{10} concentration is calculated by subtracting the results of the upwind monitor(s) from the downwind monitor(s) for the same averaging period;

(i) If the wind direction is in the seasonal prevailing wind direction, then the monitor(s) described pursuant to clause (d)(3)(B)(i) shall be designated as the upwind monitor(s) and the monitor(s) described pursuant to clause (d)(3)(B)(ii) shall be designated as the downwind monitor(s); and

(d) (9) (D) (ii) If there is greater than a ± 90 degree change in wind direction from the seasonal prevailing wind direction, then the monitor(s) described pursuant to clause (d)(3)(B)(i) shall be designated as the downwind monitor(s) and the monitor(s) described pursuant to clause (d)(3)(B)(ii) shall be designated as the upwind monitor(s);

(E) If there is more than one upwind monitor, the upwind result is the average concentration of all upwind monitors for the same rolling averaging period;

(F) If there is more than one downwind monitor, the downwind result is the maximum concentration of any of the downwind monitors for the same rolling averaging period;

(G) On and before December 31, 2021, when on-site earth-moving activities resume after ceasing pursuant to paragraph (d)(2), the average shall start when on-site earth-moving activities resume and shall end 120 minutes after on-site earth-moving activities resume, and the subsequent averages are to be calculated every 10 minutes and shall cover the previous 120-minute period; and

(H) On and after January 1, 2022, when on-site earth-moving activities resume after ceasing pursuant to paragraph (d)(2), the average shall start when on-site earth-moving activities resume and shall end 120 minutes after on-site earth-moving activities resume, and the subsequent averages are to be calculated every one minute and shall cover the previous 120-minute period.

(10) An owner or operator that elects to move the monitors accordingly when there is a change in wind direction in place of meeting the requirements specified in clauses (d)(3)(B)(i), (d)(3)(B)(ii), (d)(9)(D)(i), and (d)(9)(D)(ii), shall:

(A) Place a minimum of one upwind monitor in the upwind direction of the area(s) of on-site earth-moving activity, indicative of background PM_{10} levels, and not generally influenced by fugitive dust sources from the site;

(B) Place a minimum of one downwind monitor in the downwind direction of the area(s) of on-site earth-moving activity; and

(C) Move the monitor(s) in subparagraph (d)(10)(A) to the new upwind location and the monitor(s) in subparagraph (d)(10)(B) to the new downwind location when there is a change in wind direction.

(11) In the event that a DAS fails to log ambient PM_{10} data pursuant to paragraph (d)(5) or that the data management system integrated with the PM_{10} monitor(s) and

DAS(s) fails to calculate PM_{10} concentrations pursuant to subparagraph (d)(9)(C) due to a technical issue beyond the reasonable control of an owner or operator, including, but not limited to, internet connection disruptions and computer malfunctions, the owner or operator shall:

(d) (11) (A) Restore the DAS or data management system to working condition as soon as practicable and no later than the start of the next working day; and

(B) Manually record the PM_{10} concentration from the monitor(s) associated with the non-operational DAS once every 10 minutes or less and calculate the PM_{10} concentration pursuant to the averages specified in subparagraph (d)(9)(B) until the DAS is restored or calculate the PM_{10} concentration pursuant to the averages specified in subparagraph (d)(9)(B) until the data management system is restored.

(12) When conducting ambient PM_{10} monitoring as required in paragraph (d)(1), the owner or operator shall monitor wind direction and speed using a minimum of one stationary anemometer or wind sensor that:

(A) Is sited over open, level terrain within the project site with minimal obstructions to the wind flow at a minimum height of eight feet above grade;

(B) Meets the performance criteria of:

(i) Wind direction accuracy of ± 7 degrees and resolution of 1 degree; and

(ii) Wind speed accuracy of 2 miles per hour (mph) or ± 5 percent of the observed wind speed, whichever is greater, and resolution of 1 mph;

(C) Has a National Institute of Standards and Technology (NIST) Traceability certification;

(D) Is equipped with a data logger that records wind direction and speed data once every 1 minute or less and archives the recorded wind direction and speed data, including the date and time, calibrated to PST; and

(E) Is operated, calibrated, and maintained in accordance with manufacturer's specifications, but no less frequent than once every 6 months of cumulative operation.

(13) The Executive Officer may approve a PM_{10} monitor to be added as a Rule 1466 Approved PM_{10} Monitor if the PM_{10} monitor meets the specifications listed in *Appendix 1 – Rule 1466 Approved PM_{10} Monitors*. The request for a PM_{10} monitor to be added as a Rule 1466 Approved PM_{10} Monitor shall:

(A) Be submitted to Rule1466ApprovedMonitors@aqmd.gov;

(d) (13) (B) Include a description of the PM_{10} monitor, any accessories, and all monitor specifications; and

(C) Include documentation demonstrating compliance with each specification listed in *Appendix 1*.

(e) Requirements to Minimize Fugitive Dust Emissions

(1) On and before December 31, 2021, an owner or operator shall not conduct on-site earth-moving activities unless the area is surrounded with fencing that is a minimum of 6 feet tall and at least as tall as the height of the tallest stockpile, with a windscreen that has a porosity of 50 ± 5 percent. A section of the perimeter surrounding an on-site earth-moving activity area may be excluded from this requirement if that section:

(A) Has a solid physical barrier, such as a solid wall or other solid feature that minimizes air flow, that is a minimum of 6 feet tall but at least 6 inches taller than the height of the tallest stockpile; or

(B) Does not have on-site earth-moving activity occurring within 300 feet from the perimeter of that section.

(2) On and after January 1, 2022, an owner or operator shall not conduct on-site earth-moving activities unless the area is surrounded with fencing that is a minimum of 6 feet tall but at least 6 inches taller than the height of the tallest stockpile, with a windscreen that has a porosity of 50 ± 5 percent or a mesh windscreen that has a shade value or opacity of 85 ± 5 percent. A section of the perimeter surrounding an on-site earth-moving activity area may be excluded from this requirement if that section meets the conditions as specified in subparagraph (e)(1)(A) or (e)(1)(B).

(3) An owner or operator conducting on-site earth-moving activities shall:

(A) Adequately wet to the depth of earth-moving activity and allow time for penetration; and

(B) Adequately wet at frequencies to prevent the generation of visible dust plumes.

(4) An owner or operator that is moving vehicles on, within, or off a site shall:

(A) Post signs at all entrances of the site to designate the speed limit as 15 mph;

(B) Stabilize the surface of all vehicular traffic and parking areas by applying gravel, paving, chemical stabilizers pursuant to paragraph (e)(13), or dust suppressant;

(C) Not allow any track-out outside of the property line that is 25 feet or more in cumulative length. Remove any track-out at a minimum frequency of

once each day using a vacuum equipped with a filter(s) rated by the manufacturer to achieve a 99.97 percent control efficiency for 0.3 micron particles;

(e) (4) (D) Clean the soil from the exterior of trucks, trailers, and tires prior to the truck leaving the site, without the use of forced air; and

(E) Utilize at least one of the following measures at each vehicle egress from the site to a public road:

(i) Install a pad consisting of washed gravel (minimum-size: 1 inch), maintained in a clean condition, to a depth of at least 6 inches and extending at least 30 feet wide and at least 50 feet long;

(ii) Pave the surface extending at least 100 feet from the property line and at least 30 feet wide;

(iii) Utilize a wheel shaker/wheel spreading device consisting of raised dividers (rails, pipes, or grates) at least 24 feet long and 30 feet wide; or

(iv) Install and utilize a wheel washing system to remove soil from tires and vehicle undercarriages.

(5) An owner or operator conducting on-site earth-moving activities shall ensure that stockpiles with any soil with applicable toxic air contaminant(s) be:

(A) Segregated from non-contaminated stockpiles;

(B) Labelled with "South Coast AQMD Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminant(s) Applicable Soil";

(C) Maintained to avoid steep sides or faces that exceed the angle of repose;

(D) No more than 400 cubic yards of soil;

(E) Maintained to minimize fugitive dust emissions containing toxic air contaminants by applying chemical stabilizers pursuant to paragraph (e)(13), applying dust suppressant, or completely covering pursuant to paragraph (e)(14); and

(F) Either chemically stabilized pursuant to paragraph (e)(13) and/or completely covered pursuant to paragraph (e)(14) at all times when earth-moving activities and ambient PM_{10} monitoring are not occurring.

(6) An owner or operator conducting truck and trailer loading activities of soil containing applicable toxic air contaminant(s) shall:

(A) Apply dust suppressant to material prior to loading;

(B) Empty the loader bucket slowly so that no visible dust plumes are generated;

(e) (6) (C) Minimize the drop height from the loader bucket;

(D) Maintain at least 6 inches of space between the soil and the top of the truck bed and trailer while transporting within a site; and

(E) Completely cover the truck bed and trailer prior to leaving the site.

(7) An owner or operator conducting truck and trailer unloading activities of soil containing applicable toxic air contaminant(s) shall:

(A) Apply dust suppressant to material prior to unloading; and

(B) Empty the trailer slowly so that no visible dust plumes are generated.

(8) The owner or operator shall immediately remove any spilled soil.

(9) The owner or operator shall cease on-site earth-moving activities if the wind speed is greater than 15 mph averaged over a 15-minute period or the instantaneous wind speed exceeds 25 mph.

(10) During on-site earth-moving activities, the owner or operator shall have an on-site dust control supervisor that:

(A) Is employed by or contracted with the owner or operator;

(B) Is located on the site during working hours;

(C) Is in a position to expeditiously employ sufficient dust control measures to ensure compliance with all rule requirements;

(D) Has completed the South Coast AQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class; and

(E) Has the following credentials, if asbestos is an applicable toxic air contaminant:

(i) Successfully completed the Asbestos Abatement Contractor/Supervisor course pursuant to the Asbestos Hazard Emergency Response Act (AHERA), and obtained and maintained accreditation as an AHERA Asbestos Abatement Contractor/Supervisor; and

(ii) Trained on the provisions of 40 CFR Part 61.145, 61.146, 61.147 and 61.152 (Asbestos NESHAP provisions) and Part 763, and has the means to comply with these provisions.

(11) An owner or operator shall apply a chemical stabilizer pursuant to paragraph (e)(13) and/or use a cover pursuant to paragraph (e)(14) on potential sources of fugitive dust when earth-moving activities are not occurring in the specific location(s) containing the potential source(s) of fugitive dust.

(e) (12) An owner or operator shall inspect daily, including days when no on-site earth-moving activities are occurring, labeled stockpiles pursuant to subparagraph (e)(5)(B) and stabilized or covered stockpiles pursuant to (e)(5)(F).

(A) For a stabilized stockpile, such inspections shall include a demonstration of stabilization by one or more of the applicable test methods contained in the most current version of the South Coast AQMD *Rule 403 Fugitive Dust Implementation Handbook* or Volumes I and II of South Coast AQMD's *Dust Control in the Coachella Valley.*

(B) For a covered stockpile, such inspections shall include a visual inspection of all seams and plastic cover surfaces to ensure that no portion of the soil is exposed to the atmosphere.

(13) When utilizing a chemical stabilizer, an owner or operator shall:

(A) Ensure the chemical stabilizer meets any specifications, criteria, or tests required by any federal, state, or local agency or any applicable law, rule, or regulation; and

(B) Unless otherwise indicated, use a sufficient concentration of the chemical stabilizer and an application frequency sufficient to maintain a stabilized surface and no less than what is specified by the manufacturer for the period of inactivity.

(14) When using a cover for stockpiles, an owner or operator shall ensure the cover:

(A) Is at least 10 mil thick plastic sheeting that overlaps a minimum of 24 inches; and

(B) Is anchored and secured so that no portion of the soil is exposed to the atmosphere.

(15) An owner or operator that is conducting earth-moving activities of soil with applicable toxic air contaminant(s) at a school, joint use agreement property, adjacent athletic area, or at a site that is adjoining a school, joint use agreement property, or adjacent athletic area shall:

(A) Only conduct earth-moving activities at a school or at a site that is adjoining a school outside of the hours between 7:30 a.m. and 4:30 p.m. on days when the school is in session;

(B) Not conduct earth-moving activities at a school, joint use agreement property, adjacent athletic area, or at a site that is adjoining a school, joint use agreement property, or adjacent athletic area if there is a school sponsored activity or youth organized sports taking place at that site;

(e) (15) (C) Handle excavated soils with applicable toxic air contaminant(s) by:

(i) Immediately placing soil in a leak-tight container whereby any contained solids or liquids are prevented from escaping or spilling out;

(ii) Directly loading soil in truck beds, trailers, and bins for transport, applying chemical stabilizer pursuant to paragraph (e)(13) or dust suppressant, and completely covering prior to transporting; or

(iii) Stockpiling pursuant to paragraph (e)(5), in a fenced area that is not accessible to the general public, and locked when not in use; and

(D) Within five days of its excavation, remove all soil with applicable toxic air contaminant(s) from the site.

(f) Notification Requirements

(1) The owner or operator shall electronically submit an initial notification to the Executive Officer, using a format approved by the Executive Officer, of the intent to conduct any on-site earth-moving activities.

(A) Initial notifications shall be submitted:

(i) At least 72 hours but no more than 30 days prior to conducting any earth-moving activities on any site meeting the applicability requirements of subdivision (b); or

(ii) As soon as the information becomes available but no later than 48 hours after the information becomes available that on-site earth-moving activities of soil with applicable toxic air contaminant(s) exceed 50 cubic yards.

(B) Initial notifications shall include the following requirements:

(i) Name, address, telephone number, and e-mail address of the owner or operator;

(ii) Name, telephone number, and e-mail address of the on-site dust control supervisor;

(iii) Project name and, if applicable, the project identification number from the designating agency;

(iv) Project location (address and/or coordinates);

(v) Identify whether the site is a school, joint use agreement property, adjacent athletic area, or is adjoining a school, joint use agreement property, or adjacent athletic area;

(f) (1) (B) (vi) A map indicating the specific location(s) of each on-site earth-moving activity and the concentrations of the applicable toxic air contaminant(s) and location of PM_{10} monitors;

(vii) A description of the on-site earth-moving activities, estimated volume of soil with applicable toxic air contaminant(s), and a schedule that includes the anticipated start and completion dates of on-site earth-moving activities;

(viii) Current and/or previous type of operation(s) and use(s) at the site;

(ix) Applicable exemption(s); and

(x) Whether the notice being provided is a revised notification.

(2) Notification Updates

Initial notifications pursuant to paragraph (f)(1) shall be updated when any of the following conditions arise:

(A) Earlier Start Date

A change in the start date of on-site earth-moving activities to an earlier date shall be reported to the South Coast AQMD no later than 72 hours before any on-site earth-moving activities begin.

(B) Later Start Date

A delay in the start date of on-site earth-moving activities shall be reported to the South Coast AQMD as soon as the information becomes available, but no later than the original start date.

(C) Change in Exemption Status

Any change(s) in exemption status pursuant to subdivision (k) shall be reported to the South Coast AQMD as soon as the information becomes available, but no later than 48 hours after the information becomes available.

(D) Completion Date

The completion date of on-site earth-moving activities shall be reported to the South Coast AQMD no later than 48 hours after on-site earth-moving activities are completed.

(3) Within 72 hours of an exceedance of the PM_{10} emission limit specified in paragraph (d)(2), the owner or operator shall electronically submit a notification to the Executive Officer, using a format approved by the Executive Officer, of the exceedance and shall include the following information:

(f) (3) (A) Name, address, telephone number, and e-mail address of the owner or operator;

(B) Name, telephone number, and e-mail address of the on-site dust control supervisor;

(C) Project name and, if applicable, the project identification number from the designating agency;

(D) Project location (address and/or coordinates);

(E) PM_{10} monitoring results and wind direction and speed results pursuant to subdivision (d), including location of monitors, result, date and time of exceedance(s), 12 hours before first exceedance, and 12 hours after last exceedance;

(F) On-site earth-moving activities occurring at the date and time of exceedance(s); and

(G) Dust control measure(s) taken to mitigate fugitive dust.

(g) Signage Requirements

When conducting on-site earth-moving activities, the owner or operator shall install and maintain project signage.

(1) Unless otherwise approved in writing by the Executive Officer, signage shall:

(A) Be installed at all entrances and at intervals of 1,000 feet or less along the property line or perimeter of the site, with a minimum of one sign along each side;

(B) Be located between 6 and 8 feet above grade from the bottom of the sign;

(C) Display lettering at least 4 inches tall with text contrasting with the sign background; and

(D) Display the following information:

(i) Local or toll-free phone number for the site contact or pre-recorded notification center that is accessible 24 hours a day; and

(ii) Warning statement:

"THIS SITE CONTAINS SOILS THAT CONTAIN THE FOLLOWING CHEMICALS: [LIST APPLICABLE TOXIC AIR CONTAMINANT(S)]
TO REPORT ANY DUST LEAVING THE SITE PLEASE CALL [FACILITY CONTACT AND PHONE NUMBER] OR THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT AT 1-800-CUT-SMOG".

(g) (2) If signage pursuant to paragraph (g)(1) exceeds 48 inches by 96 inches, the owner or operator or designating agency shall include the warning statement referenced in clause (g)(1)(D)(ii), displaying lettering at least 4 inches tall with text contrasting with the sign background, but may use 2.5 inch tall lettering to list applicable toxic air contaminant(s). All other signage requirements set forth in paragraph (g)(1) shall remain the same. If signage continues to exceed 48 inches by 96 inches with these parameters, the owner or operator or designating agency may use alternative signage as set forth in paragraph (g)(3).

(3) The owner or operator or designating agency may use alternative signage approved by the Executive Officer pursuant to subdivision (j). Notwithstanding subdivision (j), the request shall include a visual representation of the alternative sign, including proposed lettering height, and locations and, at a minimum, the alternative signage shall:

(A) Display text contrasting with the sign background; and

(B) Display the following warning statement:

"THIS SITE CONTAINS SOILS THAT CONTAIN THE FOLLOWING CHEMICALS: [LIST APPLICABLE TOXIC AIR CONTAMINANT(S)] TO REPORT ANY DUST LEAVING THE SITE PLEASE CALL THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT AT 1-800-CUT-SMOG".

(4) The owner or operator may be excluded from installing and maintaining project signage pursuant to subparagraph (g)(1)(A) at any entrance(s) or interval(s) along the property line or perimeter of the site that is not visible and not accessible to the public unless the site is a school, joint use agreement property, or adjacent athletic area or the site is adjoining a school, joint use agreement property, or adjacent athletic area.

(h) Recordkeeping Requirements

The owner or operator shall maintain records for a period of not less than 3 years and shall make such records available to the Executive Officer upon request. At a minimum, records shall be maintained daily and shall include:

(1) Inspections of all stabilized or covered stockpiles containing soils with applicable toxic air contaminant(s) and all re-stabilization, cover repair, and label maintenance activities, including dates and times the specific activities were conducted;

(2) Results of wind and PM_{10} monitoring, including: ambient PM_{10} data; rolling average PM_{10} concentrations and calculations; wind direction and speed

corresponding to the rolling average PM_{10} concentrations; movement of monitoring instruments corresponding to wind direction changes; instrument make and model; settings; proof of valid calibration in accordance with manufacturer's recommended schedule; configuration; calibration, correction, and correlation factors; maintenance; operator training; daily instrument performance check records and manual zero or auto-check results; weekly zero calibration records and intra-instrument precision test data and calculation results; and all instrument logs for all monitoring instruments;

(h) (3) All instrument maintenance activities, including: zero calibration, cleaning, filter replacement, and performance checks, including dates and times of the specific procedures;

(4) Documentation of all DAS and data management system failures, including date and time of the failure, date and time of the correction, the technical issue(s) causing the failure, and activities performed to restore the failed DAS or data management system to working condition;

(5) On-site earth-moving activities conducted and the corresponding volume of soil with applicable toxic air contaminant(s);

(6) Names and business addresses of the transporting and receiving facilities, and a copy of the shipping manifest;

(7) Complaints called in, including the name of complainant and contact information, date and time, on-site earth-moving activities occurring at the date and time, complaint, and action taken to mitigate the source of the complaint; and

(8) A copy of all submitted notifications for the project.

(i) Executive Officer Designated Sites

(1) The Executive Officer may designate a site if the Executive Officer has evidence that the site contains soil with applicable toxic air contaminant(s) as defined in paragraph (c)(16), after consultation with U.S. EPA, DTSC, the State Water Resources Control Board, the Regional Water Quality Control Board, and/or local, county, or state regulatory agencies, and consideration of the following:

(A) Site history, including current and/or previous type(s) of operation(s) and use(s) at the site and regulatory history;

(B) Concentration(s) of applicable toxic air contaminant(s) in the soil;

(C) Background concentration(s) of applicable toxic air contaminant(s);

(D) Volume of soil with applicable toxic air contaminant(s);

(i) (1) (E) Distance to a residence, park, school, joint use agreement property, adjacent athletic area, or a site adjoining a school, joint use agreement property, or adjacent athletic area;

(F) Meteorological data;

(G) Health risk information or other data provided by the owner or operator, if available; and

(H) Ambient monitoring data and other applicable data, if available.

(2) Prior to making a determination, the Executive Officer will notify the owner or operator in writing that the site may be subject to this rule.

(A) In the event the owner or operator exercises this opportunity to demonstrate that this rule does not apply, the owner or operator shall submit information to the Executive Officer within 14 days of the notification substantiating why the site should he excluded from this rule.

(B) Upon final determination, the Executive Officer will notify the owner or operator in writing if the site is subject to this rule.

(3) During the determination period, the owner or operator shall comply with the provisions of this rule or cease all on-site earth-moving activities until a determination is made.

(j) Alternative Provisions

(1) If requesting an alternative provision pursuant to paragraph (g)(3), the owner or operator or designating agency shall submit the request in writing at least 30 days prior to conducting any earth-moving activities and include all information to the Executive Officer to substantiate its position.

(2) The Executive Officer may request additional information from the owner or operator or designating agency.

(3) The owner or operator or designating agency shall submit all requested information within 14 days of the request for additional information.

(4) The Executive Officer will review the request for an alternative provision and will approve or reject the data and notify the owner or operator or designating agency in writing. Approved alternative provisions may not be used retroactively.

(5) Alternative provisions that were approved and notified in writing by the Executive Officer before June 4, 2021 shall be deemed compliant with the requirements of the applicable provisions of the rule, shall remain in effect only for the period of time and for the specific project for which they were granted, and shall not be renewed or extended.

(k) Exemptions

(1) The owner or operator may be exempt from one or more provisions of this rule provided there is written confirmation that the designating agency under subparagraphs (b)(1)(A) through (b)(1)(D) has consulted with the Executive Officer and has determined that the provision(s) are not needed based on information specified in subparagraphs (i)(1)(A) through (i)(1)(H).

(2) On-site earth-moving activities performed within an enclosed system vented to South Coast AQMD permitted air pollution control equipment shall be exempt from all requirements except: subparagraphs (e)(4)(C) through (e)(4)(E), subparagraphs (e)(6)(D) and (e)(6)(E), and subdivisions (f), (g), and (h).

(3) Linear trenching for natural gas, power, sewer, and water projects on roadways with soil with applicable toxic air contaminant(s), directly loaded into a truck bed, trailer, or bin for transport, shall be exempt from all requirements except: paragraphs (e)(3) through (e)(9), paragraphs (e)(13) and (e)(15), and subdivisions (f), (h), and (i).

(4) On-site earth-moving activities consisting only of excavation activities of soil with applicable toxic air contaminant(s) of less than 500 cubic yards, directly loaded into a truck bed, trailer, or bin for transport, shall be exempt from all requirements except: paragraphs (e)(3) through (e)(9), paragraphs (e)(13) and (e)(15), and subdivisions (f), (h), and (i).

(5) On-site earth-moving activities conducted during emergency life-threatening situations, or in conjunction with any officially declared disaster or state of emergency as declared by an authorized health officer, agricultural commissioner, fire protection officer, or other authorized agency officer shall be exempt from all requirements. The Executive Officer shall be notified electronically no later than 48 hours following such on-site earth-moving activities. Written notification shall include written emergency declaration from the authorized officer.

(6) On-site earth-moving activities conducted by essential service utilities to provide electricity, natural gas, telephone, water, or sewer during periods of service outages and emergency disruptions shall be exempt from all requirements. The Executive Officer shall be notified electronically no later than 48 hours following such on-site earth-moving activities.

Table I – Applicable Toxic Air Contaminants

CAS Number	Substance
7440-38-2	**arsenic and arsenic compounds (inorganic)** including, but not limited to: arsenic compounds (inorganic)

Appendix 1 – Rule 1466 Approved PM_{10} Monitors

The Executive Officer may approve PM_{10} monitors that meet the following physical and performance requirements.

1. Physical Requirements
   - 1.1. PM_{10} monitors shall be continuous direct-reading near-real time monitors and shall monitor particulate matter less than 10 microns.
   - 1.2. PM_{10} monitors shall be equipped with:
     - 1.2.a. Omni-directional heated sampler inlet;
     - 1.2.b. Sample pump with active flow control mechanism;
     - 1.2.c. Enclosure;
     - 1.2.d. Data logger capable of logging each data point with average concentration, time, date, and data point number; and
     - 1.2.e. Conductive tubing that minimizes particle loss for any external tubing used to carry sampled air prior to measurement.

2. Performance Requirements
   - 2.1 PM_{10} monitors shall have the following minimum performance standards:
     - 2.1.a. Range: 0 - 10,000 $\mu g/m^3$;
     - 2.1.b. Accuracy, determined through factory testing against a U.S. EPA Federal Reference Method or Federal Equivalent Method, for a minimum of 30 measurements each averaged over 24 hours, to show:
       - 2.1.b.i. ± 5% of reading ± precision; or
       - 2.1.b.ii. Coefficient of determination (R^2) of ≥ 0.95 through simple linear regression;
     - 2.1.c. Resolution: 1.0 $\mu g/m^3$;
     - 2.1.d. Flow control accuracy of ± 5% of factory setpoint; and
     - 2.1.e. Measurement Cycle: User selectable (30 minute and 2 hour).
   - 2.2 Monitors that have a valid *Monitoring Certification Scheme* certification meeting the latest version of the *Monitoring Certification Scheme (MCERTS): Performance Standard for Indicative Ambient Particulate Monitors* may be exempt from meeting the performance requirements listed above, but shall meet all stated physical requirements.

3. Quality Assurance/Quality Control Requirements

In order to ensure the validity of the PM_{10} measurements performed, there shall be appropriate Quality Assurance/Quality Control (QA/QC). It is the responsibility of the owner or operator to adequately supplement QA/QC Plans to include the following critical features: instrument calibration, instrument maintenance, operator training, and daily instrument performance checks.

Appendix 2 – Procedures to Demonstrate Intra-Instrument Precision

An owner or operator shall perform the following procedures to demonstrate the intra-instrument precision of all PM_{10} monitors as required in paragraph (d)(7).

1. Ensure monitors are identical in make and model, settings, and configuration.
2. Ensure monitor inlets are at the same height and located within 4 meters of each other but no less than 1 meter apart for the duration of the test.
3. Power on the monitors and turn on the heated sampler inlet. Allow the monitors to warm-up per manufacturer's recommendations or when readings have stabilized.
4. For each monitor, conduct a zero calibration in accordance with manufacturer's instructions, then conduct a manual zero check by removing any sampling inlet and installing a filter, rated by the manufacturer to achieve a 99.97 percent control efficiency for 0.3 micron particles, on the inlet of the monitor for a minimum of 10 minutes. If the monitors are operated using an auto-zero check procedure that directs filtered particle-free air into the measurement chamber, conduct the zero check in accordance with manufacturer's instructions.
5. Log the PM_{10} concentration reading every minute, and calculate and record the average of the readings of the manual zero check. The average of the manual zero check readings shall be 0 ± 3 micrograms per cubic meter before proceeding to Step 6. If conducting an auto-zero check, the monitor shall pass the zero check in accordance with manufacturer's instructions before proceeding to Step 6. If any monitors fail either the manual zero check or the auto-zero check, the owner or operator shall conduct a zero calibration in accordance with manufacturer's instructions and/or correct any issue(s) causing the failure, followed by conducting a passing zero check on the PM_{10} monitor(s) in accordance with Steps 4 and 5.
6. Remove the filter and install the monitor inlet as required. After waiting 10 minutes, operate the monitors simultaneously and log the PM_{10} concentration reading every minute for a minimum of 60 minutes.

7. Calculate the intra-instrument precision using either of the following equations:
   a. Intra-instrument precision in relative standard deviation or correlation of variation (%) when ambient PM_{10} concentrations are greater than or equal to 15 micrograms per cubic meter:

$$P = \frac{S_t}{C_t} x\ 100\%$$

where,

P = Intra-instrument precision in percent (%);

S_t = Standard deviation of the averaged PM_{10} concentration readings from all tested monitors over the time t of testing duration, to be calculated as:

$$S_t = \sqrt{\frac{\sum(x_i - \bar{x})^2}{(n-1)}}$$

where,

x_i = Mean of the PM_{10} concentration readings for a tested monitor over time t of testing duration,

$\bar{x}$ = Mean of the averaged PM_{10} concentration readings from all tested monitors over the time t of testing duration, and

n = Number of tested monitors; and

C_t = Mean of the averaged PM_{10} concentration readings from all tested monitors over the time t of testing duration; or

   b. Intra-instrument precision in absolute value (micrograms per cubic meter) when ambient PM_{10} concentrations are less than 15 micrograms per cubic meter:

$$P = S_t$$

where,

P = Intra-instrument precision in micrograms per cubic meter, and

S_t = Standard deviation of the averaged PM_{10} concentration readings from all tested monitors over the time t of testing duration.

8. Record the results of the calculations.

INTRODUCTION

The purpose of this Health and Safety Plan (HASP) is to provide site-specific health and safety requirements for soil removal work to be conducted at the subject property. This HASP applies to employees of California Environmental (CE), the grading contractor, and their subcontractors (collectively, "contractors"). This Health and Safety Plan is a site-specific addendum to the contractors' corporate Injury and Illness Prevention Programs (IIPPs), which are in effect for this project.

The Site is located on the west side of South Alameda Street between 7th Street and Bay Street, in the City of Los Angeles, California. The street addresses for the Site are 757-787 South Alameda Street, 1318-1320 East 7th Street, and 746 S. Central Street. The Site is approximately 31.3 acres in size. The 777 S. Alameda Street address is associated with the entire ROW DTLA mall property that extends to the west. The subject property consists of approximately 10 acres of land on the east side of one (1) 20-acre irregular-shaped parcel. The subject property is currently developed with two (2) asphalt-paved parking lots that are bisected by Center Street. Access to the property is via S Alameda Street to the east. It is proposed to redevelop the site with three multi-story residential structures with subterranean parking garages. The soil removal that is the subject of this HASP is the excavation of the parking garages and associated grading and site preparation.

Multiple phases of environmental site assessment have been conducted between 1997 and 2024. Phase 1 site assessments revealed that Pacific Electric Railroad Company operations on the subject property included a railroad tracks, machine shop/blacksmith, oil house, woodworking shop, and electrical construction facility. Historically, several tenants that likely used solvents, hydrocarbons, and heavy metals were located on the property adjacent to the west. Phase 2 site assessments showed localized occurrences of contaminants in different areas of the site. Contaminants exceeding residential screening levels include lead and arsenic in soil and tetrachloroethene (PCE) and benzene in soil gas. Low concentrations of oil and diesel hydrocarbons, below screening levels, were encountered in shallow soil. The soil impacts detected are considered *de minimus* and do not require reporting to an environmental enforcement agency.

Preparation of this Health and Safety Plan is not intended to relieve any contractor, their representatives or any other professionals from their duties and responsibilities with respect to overall site safety for the project. All contractors are responsible for observing all additional health and safety requirements as mandated by Cal/OSHA, the Los Angeles City Fire Department, the South Coast Air Quality Management District, and all other pertinent health and safety rules governing work activities to be conducted at a construction site.

DESCRIPTION OF WORK

The work covered by this HASP involves the removal of potentially contaminated soil for excavation of basements and site preparation. Soil removal includes excavation, stockpiling, sampling, and loading of soil. Soil will be excavated using a backhoe excavator and/or a rubber-tired loader. Excavated soil may be temporarily stockpiled on plastic for characterization sampling. Soil to be exported will be loaded into trucks and transported to offsite disposal facilities. Plastic sheeting, water spray, and/or vapor suppression compounds will be used as necessary to reduce fugitive dust and VOC emissions.

The objective of this Health and Safety Plan is to provide for proper identification, safe handling, and mitigation of contaminated soil that may be encountered during excavation work at the site. To achieve this objective, the following must be accomplished.

- Monitor the working face, excavation, stockpile, and loading area for visible dust emissions, toxic concentrations of dust, explosive or toxic gases, and any changes in materials or conditions.
- Protect workers from hazards that may be encountered during the project.
- Provide for proper identification of contaminated soils.
- Provide for proper handling of contaminated soils.

HAZARD EVALUATION

POTENTIAL HAZARDS

During performance of activities related to this project, there is the potential to encounter a variety of chemical and physical hazards. These include:

- Exposure to hazardous chemicals due to airborne emissions or skin contact with contaminated soil.
- Underground utilities: Electrical, flammable gas or liquid, and pressurized gas or liquid
- Heavy equipment: excavation equipment and truck traffic.
- Noise: heavy equipment may create excessive noise.

Potential job hazards for field conditions and activities in this project include exposure to toxic, irritating, or flammable substances arising from soil gas seepage, petroleum-contaminated soil and groundwater, and lead contaminated soil. The general job hazard analysis is summarized in the following **TABLE I.**

TABLE I - HAZARD EVALUATION

Hazard	Evaluation	General Protective Measures
Exposure to hydrocarbon and VOC vapors exceeding the PEL	Volatile hydrocarbon vapors are unlikely to exceed action levels at the site.	Monitor vapor levels continuously during excavation and loading. Use water spray to suppress vapor generation and disperse vapor accumulation.
Direct contact with petroleum hydrocarbons in soil	Possible skin exposure to workers during drilling.	PPE including gloves, long sleeves, long pants. Frequent hand/face washing.
Fire or explosion due to hydrocarbon vapors	Low levels of hydrocarbon vapors are likely to be present in soil at the site. Concentrations exceeding the LEL are unlikely.	Monitor vapor levels continuously during excavation and loading. Use water spray to suppress vapor generation and disperse vapor accumulation.
Direct contact with lead in soil	Very unlikely during excavation. Levels will not exceed the Action Level for worker exposure.	PPE, including gloves, clothing. Require frequent washing of hands/face; disposable coveralls if levels are high. Do not create dust.
Equipment-related injuries.	Heavy equipment includes standard construction equipment such as trucks and drilling rigs.	Safety measures will be reviewed during site briefing; open pits will be barricaded; personnel will not enter excavations deeper than 5 ft.
Heat Stress.	Heat related illness is possible in especially when wearing PPE.	Increase fluid intake; implement a work/rest regimen; monitor worker core temperature if conditions warrant (i.e. ambient>100°F).
Solar radiation.	Outdoor work involves hazards with overexposure to the sun year round.	Outdoor workers will be encouraged to use sunscreen and/or clothing that minimizes the amount of skin exposed.
Slip, trips, and falls.	These hazards are always present on construction sites.	Good housekeeping and footwear that is appropriate for the conditions. Fall protection for work in elevated locations.

CHEMICAL HAZARDS

In 2023-2024, California Environmental performed soil and soil-gas analysis of samples collected throughout the subject property as part of a Phase II site investigation. The findings indicate that the primary contaminants present in the subsurface are lead and arsenic in soil and tetrachloroethylene (PCE) in soil gas. Other volatile organic compounds (VOC) and petroleum hydrocarbons were detected in very low concentrations throughout the site. Chemical hazard exposures approaching the PEL are considered very unlikely. The main contaminant hazards are summarized in **Table I**.

TABLE I – HAZARD EVALUATION

Compound	Cal-OSHA PEL (ppmv)	Maximum soil concentration mg/kg (ppm)	Maximum soil gas concentration (µg/m³)	Maximum soil gas concentration (ppmv)	Screening Ratio*
Lead	0.01 mg/m³	275	-	-	0.28
PCE	25	0.011	6500	0.96	0.04
Arsenic	0.01 mg/m³	15	-	-	0.015
Ethylbenzene	5	ND	230	0.05	0.01
Toluene	10	0.0020	99	0.03	0.003
Xylenes	100	0.0015	1400	0.32	0.003
Benzene	1	0.0044	nd	nd	-
TPH (diesel/oil)	-	250	-	-	-

* Screening ratio for VOCs = soil gas concentration ÷ PEL
Screening ratio for metals = soil metal concentration * 10 mg/m³ ÷ PEL ÷ 10^6 mg/kg

The screening ratio for contaminants is used to rank the compounds by relative hazard. Screening ratios for all compounds are well below 1.0, meaning that exposure exceeding PEL are unlikely at the highest soil and soil vapor contaminant concentrations previously encountered at the site.

Under SCAQMD Rule 1166, vapor suppression will be implemented to keep VOC emissions near the soil surface below 50 ppm. This will keep breathing zone exposures well below PELs.

The chemical contaminants at this site are not expected to present a significant hazard of airborne exposure. There is a slight hazard of ingestion exposure. Compliance with the **PERSONAL HEALTH AND HYGIENE** section of this plan will protect against accidental ingestion of contaminated soil.

CHEMICALS OF CONCERN (COCS)

The primary contaminants which may be encountered during the excavation process are metals (lead) in soil and industrial solvents (PCE) in soil gas. The potential routes of exposure are inhalation of dust or vapor derived from contaminated soil and dermal contact with or ingestion of contaminated soil. The contaminants most likely to be encountered during excavation are listed below.

Lead

Lead in its elemental form is a heavy ductile gray metal. It does not corrode or decompose readily, and it melts at relatively low temperatures. These properties made it very useful for such things as soldering pipe joints and electrical connections. Lead compounds were widely used in paints for structural steel, heavy equipment, and pavement striping. Tetraethyl lead was added to gasoline until 1979, resulting in contamination of soil with aerially-deposited lead oxide fume near roadways.

Lead has toxic properties that make it hazardous if inhaled or ingested. The Cal/OSHA PEL for lead is 50 $\mu g/m^3$ (micrograms per cubic meter) of air as an 8-hour Time-Weighted Average (TWA). The Action Level is 30 $\mu g/m^3$. The IDLH Level (Immediately Dangerous to Life & Health) is 100 mg/m^3.

Repeated exposure to airborne lead in excess of the PEL may produce a variety of symptoms, including: weakness, eye irritation, facial pallor, paleness of the eyes, lassitude, insomnia, anemia, tremors, malnutrition, constipation, weakness or paralysis of the wrists and ankles, abdominal pain, nephropathy, encephalopathy, gingival lead line, hypertension, anorexia, and weight loss. The target organs include the Central Nervous System (CNS), kidneys, eyes, blood, gingival tissue, and the gastro-intestinal tract.

Development of lead-related ailments generally takes many years of repeated exposure when the levels are low but can be more rapid if high concentrations are encountered. High-level exposures can cause acute health effects including seizures, coma, and death within hours or days. Uncontrolled burning of lead-based paint or other lead-containing materials can result in life-threatening exposure.

Negative Initial Determination

The highest lead concentration found in soil is 275 mg/kg. Under paragraph (d)(5)(B) of Section 1532.1, objective data indicating that materials contain lead at concentrations less than 600 ppm are sufficient to establish a negative initial determination. In addition, the screening ratio calculation shows that airborne exposure cannot exceed the PEL as long as the total airborne dust concentration does not exceed the nuisance dust PEL of 10 mg/m^3, a visibly dusty level. Dust control measures will be implemented to prevent visible emissions of dust during site activities.

Based on the information summarized above, a *negative initial determination* is made for this job in accordance with 8CCR1532.1 (d)(5). Air monitoring, biological monitoring, lead awareness training, and respiratory protection are NOT required to protect employee health and safety during the work of this project.

Tetrachloroethylene (PCE)

Inhalation of PCE can produce headache, dizziness, drowsiness, lack of coordination, irritation of eyes, nose, and throat, and flushing of the neck and face. Exposure to high concentrations can produce narcotic effects. The primary target organs are the Central Nervous System (CNS), mucous membranes, eyes, and skin. The kidneys, liver, and lungs are affected to a lesser extent. Symptoms of CNS depression normally manifest in humans from repeated exposure to 200 ppm for 7 hours/day. Ingestion of PCE may cause toxic effects ranging from nausea and vomiting to somnolence, tremor, and ataxia. The oral toxicity, however, is relatively low. Skin contact with the liquid may cause defatting of the skin and dermatitis. PCE is a confirmed animal carcinogen. The Cal-OSHA PEL is 25 ppm for PCE.

Benzene, Toluene, Ethylbenzene, And Xylenes (BTEX)

Benzene

Benzene is a known human carcinogen. Prolonged skin contact with benzene or excessive inhalation of its vapor may cause headache, weakness, loss of appetite, and lassitude. Continued exposure can cause collapse, bronchitis, and pneumonia. The most important health hazards are cancer (leukemia), bone marrow effects, and injuries to the blood-forming tissue from chronic low-level exposure. The Cal-OSHA PEL is 1 ppm.

Toluene

Exposure to vapors of toluene may cause irritation of the eyes, nose, upper respiratory tract, and skin. Exposure to 200 ppm for 8 hours cause mild fatigue, weakness, confusion, tearing, and a sensation of prickling, tingling, or creeping on the skin that has no objective cause. Exposure to higher concentrations may cause headache, nausea, dizziness, dilated pupils, and euphoria, and in severe cases may cause unconsciousness and death. The liquid is irritating to the eyes and the skin. Contact with the eyes may cause transient corneal damage, conjunctive irritation, and burns if not promptly removed. Repeated and/or prolonged contact with the skin may cause drying and cracking. Toluene may be absorbed through the skin in toxic amounts. Ingestion causes irritation of the gastrointestinal tract and may cause effects resembling those from inhalation of the vapor. Chronic overexposure to toluene may cause irreversible liver and kidney injury. Both the Cal-OSHA PEL is 10 ppm.

Ethylbenzene

Ethylbenzene vapor is severely irritating to the eyes and to the mucous membranes of the respiratory system. Sustained inhalation of excessive levels can cause depression of the central nervous system (CNS) characterized by dizziness, headache, narcosis, and coma. Skin contact with liquid ethylbenzene causes irritation; dermatitis and defatting can also develop. The acute oral toxicity of ethylbenzene is low, however, ingestion of it poses a serious aspiration hazard. Aspirating even a small amount into the lungs can result in extensive edema (lungs filled with fluid) and hemorrhaging of the lung tissue. No systemic effects are suspected at the levels that produce pronounced, unignorable, disagreeable skin and eye irritation. The established Permissible Exposure Level (PEL) is set well below this intolerable level. The Cal-OSHA PEL is 5 ppm.

Xylenes

Liquid xylenes are a skin irritant and causes itching, dryness, and defatting; prolonged contact may cause blistering. Inhaling xylenes can depress the Central Nervous System (CNS), and ingesting it can result in gastrointestinal disturbance; and possibly hematemesis (vomiting blood). Effects on the eyes, kidneys, liver, lungs, and the CNS are also reported. Both the Cal-OSHA PEL is 100 ppm.

Petroleum Hydrocarbons

Diesel and Oil Range Hydrocarbons

For this project, employee exposures to hydrocarbon vapors are unlikely to exceed the Cal/OSHA Permissible Exposure Level (PEL) for regulated hydrocarbon compounds. Air monitoring will be performed at the discretion of the CIH to verify actual exposures. A photoionization detector (PID) will be used to detect low levels of hydrocarbon vapors that may be present. The PID will also be used to determine whether SCAQMD Rule 1166 applies to the soil being excavated.

Elevated readings on the PID (greater than 50 ppm) trigger additional air sampling or laboratory analysis to determine whether Time-Weighted Average exposures exceed Cal/OSHA Action Levels. If exposures

remain below the Cal/OSHA Action LevelAction Levels, additional monitoring is not needed unless conditions change.

Petroleum hydrocarbons, especially when weathered, may cause nausea, headache, or minor upper respiratory irritation. The odor associated with petroleum hydrocarbons both natural and refined are due to low concentrations of highly odoriferous compounds which are not easily measured and are not subject to Cal/OSHA regulation.

Petroleum hydrocarbons may also cause skin irritation, and prolonged or repeated skin contact may cause dermatitis. This hazard exists for personnel who perform or work in proximity to earthwork that involves contaminated material. Handling or working near material that contains hydrocarbons can result in contamination of the skin and/or clothing. Such exposures can be prevented by a combination of work practices (avoidance of direct contact), PPE (gloves or disposable coveralls where direct contact is unavoidable), and personal hygiene.

PHYSICAL HAZARDS

The excavation activities proposed at the subject property may present physical hazards including heavy equipment operations, open excavations, vehicular traffic, and heat stress. These hazards are common to construction work sites and are covered in the contractors' IIPPs.

The following precautions will be observed to protect workers from physical hazards:

- Hard hats and steel-toed boots will be worn at all times.
- Safety glasses will be worn when using impact tools, cutting tools, or grinders.
- Work gloves will be worn when handling equipment or tools.
- High visibility safety vests will be worn by workers on foot in the presence of operating equipment or vehicle traffic.
- Hearing protective devices will be worn in accordance with the contractor's hearing conservation program.
- Equipment will be operated only by trained operators.
- Workers will not enter excavations unless they are sloped and/or shored in accordance with Cal/OSHA regulations.

Excessive exposure to a hot work environment can bring about a variety of heat-induced disorders, including heat stroke, heat exhaustion, cramps, and fainting. Preventative measures in effect for this project include:

- Rest periods in shaded or air-conditioned areas when necessary for the workers to self-limit heat exposure.
- Drinking water in adequate quantity will be provided outside the exclusion zone.
- Site workers will be trained in heat stress recognition and prevention.

Heat stress is unlikely with acclimatized workers in Level D at temperatures below 90 °F. Site workers receive heat stress training as part of HAZWOPER training. If ambient temperatures exceed 90 °F or if Level C PPE is donned then additional heat stress precautions will be implemented.

LEVELS OF PROTECTION

Level D protection is recommended for all work. The protection level will be upgraded if hazardous concentrations of chemicals are encountered in the operator breathing zone. If contaminated soil is exposed, Level C protective clothing is recommended for workers in direct contact with contaminated soil.

Four levels of protection are described as follows:

Level B: A NIOSH approved portable pressure demand self-contained breathing apparatus. Appropriate protective clothing: Chemical splash resistant suit (Saranex-coated Tyvek coveralls) with neoprene gloves and steel-toed neoprene boots. Protective eyewear and hearing protectors where appropriate.

Level C: A NIOSH approved half-face air-purifying respirator with dual P-100 filter cartridges. Appropriate protective clothing: Tyvek coveralls with neoprene or nitrile gloves and steel-toed neoprene boots. Protective eyewear and hearing protectors where appropriate.

Level C (modified): Respiratory protection as for Level C. Appropriate protective clothing: As for Level D. Protective eyewear and hearing protectors where appropriate.

Level D: Work uniform, steel-toed work boots, hard hat, and work gloves. Protective eyewear and hearing protectors where appropriate.

AIR MONITORING

PERSONAL EXPOSURE MONITORING

Employee exposures are not expected to exceed Cal/OSHA PELs during this project. Preliminary data indicates that the hazards will be relatively low. A photoionization detector (PID) will be used to screen for VOC exposures, and if levels reach or exceed the action levels in the tables below additional measures will be taken. Monitoring for airborne dust will be conducted by an SCAQMD Rule 403-certified Dust Control Supervisor.

If PID readings or other dust observations indicate that exposures near the PEL may be present, full-shift samples may be collected in the operator's breathing zone (OBZ) under direction of the CIH. Analytes will be selected based on the results of field screening. If initial monitoring for 2 - 3 shifts shows that TWA exposures are substantially below PEL, the monitoring frequency will be reduced to one shift per week. Additional monitoring will be performed whenever a change in exposure is indicated by field screening or a change in site conditions or work practices.

Action levels for air monitoring are shown in **TABLE II** below.

TABLE II
Action Levels and Action to be Taken

Device	Reading†	Location	Time Period	Action*
PID	< 50 ppm	Working face	--	Continue periodic monitoring. Level D.
	> 50 ppm	Working face	> 1 minute	Monitor OBZ. Follow SCAQMD Rule 1166 for vapor suppression.
	< 100 ppm	OBZ	--	Continue periodic monitoring. Level D.
	> 100 ppm	OBZ	> 15 minutes	Upgrade to Level C (modified). Collect TWA samples.
Dust Monitoring	No visible emissions	Anywhere	--	Continue monitoring. Level D.
	Visible emissions	Anywhere	> 1 minute	Implement dust suppression. Level D.
Assay badge sample	<PEL for carcinogens or <10x PEL for other compounds	OBZ	Full shift	Continue at Level C (modified), continue periodic PID monitoring of OBZ.
Assay badge sample	>PEL for carcinogens or >10x PEL for other compounds	OBZ	Full shift	Upgrade to Level B or shut down operation.
Laboratory Analysis	≥ 0.5 x PEL for Lead	OBZ	Full shift	Upgrade to Level C (modified).

OBZ = Operator Breathing Zone
* Upgrade/downgrade in PPE may be made based on the results of air sampling after consulting with the CIH.

SAFETY MANAGEMENT

The contractors' Site Safety Officer (SSO) and Field Site Safety Officer (FSSO) will ensure that all contractor personnel comply with all applicable regulations and requirements of this plan. The SSO will supervise the FSSO and coordinate and cooperate with the contractors' superintendents, foremen, subcontractors, employees, the owner's representative, authorized visitors, and agency representatives.

Site Safety Officer: TBD

Field Site Safety Officer: TBD

1. Personnel shall be physically able (and mentally willing) to comply with safety requirements.
2. A copy of this health & safety plan shall be kept at the job site and made available to each individual who will work at the site.
3. All contractors and sub-contractors working at the site should have and comply with the following:
    - A corporate Injury & Illness Prevention Plan.
    - A site specific Health and Safety plan.
4. These plans should include and/or address as a separate plan, the following:
    - A written Respiratory Protection program
    - A worker Hazard Communication program
    - A Medical Exposure Monitoring Program
    - A Hearing Conservation Program
5. A tail-gate meeting shall be held to review the safety program at the start of work and periodically as needed.
6. Site workers and visitors shall sign an acknowledgement sheet that confirms that they have read and understand this HSP.
6. Unsafe acts shall be stopped when discovered.
7. Required safety equipment shall be onsite and shall be checked to verify completeness and function prior to being put into service.
8. Any change in site conditions, such as the discovery of previously undefined areas of contamination, will be reviewed by the SSO and this HASP will be amended if necessary.

EXCLUSION ZONE

The exclusion zone shall be as determined by the FSSO and SSO during excavation activities. The FSSO will be responsible for ensuring that unauthorized and unnecessary personnel are excluded from the work zone. Personnel not actively involved in site work activities (other than inspectors from concerned regulatory agencies) shall not be allowed within the exclusion zone. When necessary, work zones will be enclosed, barricaded or otherwise marked off and posted by the FSSO or contractor foreman to prevent the ingress of unauthorized persons and to warn others as to the potential hazards present and to stay clear.

EMERGENCY PROCEDURES

Communication Procedures

A site phone will be available to all workers in the event of an emergency. All emergency services can be obtained by calling 911.

Emergency Exits

All site entrances will be left open to provide for emergency egress during the course of the work but shall be barricaded or marked and inspected periodically to discourage the entrance of unauthorized persons.

Emergency Equipment

The following emergency equipment will be available onsite:

- A first aid kit.
- A fire extinguisher.

Emergency Services

The address, phone number, and name of the local hospital and medical emergency room will be posted on site. Hospital location and driving directions are shown below. All emergency services can be obtained by dialing 911.

HOSPITAL MAP

Adventist Health White Memorial Medical Center
1720 East Cesar E Chavez Avenue
Los Angeles, CA 90033
Phone: (323) 268-5000

1. Head north on S Alameda Street
2. Turn right onto East 4th Street
3. Turn left onto South Boyle Avenue
4. Turn right onto East 1st Street
5. Turn left onto Bailey Street

DECONTAMINATION

Vehicle and equipment decontamination procedures are addressed in the site-specific Soil Management Plan. Personnel decontamination procedures are described below.

The personnel decontamination area will be set up at the exit from the exclusion zone. The decontamination area will be equipped with the following:

- Plastic sheeting to contain fluids and provide a clean surface.
- Buckets with detergent solution and clean water.
- Brushes, sponges, and towels.
- Drinking water.

Level D decontamination procedures:

1. Any disposable PPE, such as nitrile gloves or Tyvek coveralls, shall be removed in the decontamination area and placed into the designated waste containers.
2. All personnel will wash face and hands with detergent and water when prior to eating, drinking, using the restroom, or leaving the site.
3. Equipment or tools will be decontaminated by wet wiping with detergent and water.

SAFETY/TRAINING REQUIREMENTS

Personnel engaging in onsite activities will be properly trained for those activities. All personnel who use respiratory protective equipment will be properly trained in its use and properly fitted to their assigned respirators. All workers required to wear a respirator will be medically cleared. If a worker is or may be exposed above the PEL, they shall be enrolled in a medical surveillance program within 30 days.

All site workers handling hazardous waste soils will be trained for hazardous waste operations in accordance with 8CCR §5192, including up-to-date refresher courses.

PERSONAL HEALTH AND HYGIENE

1. Personal safety and the safety of fellow workers require that all employees arrive at the job and remain mentally alert. No alcohol or drugs shall be permitted at any job site.
2. Parts of the body that come into contact with toxic or irritating chemicals should be washed immediately with detergent and water.
3. Any cut or abrasion shall be treated immediately. A qualified professional health practitioner shall be consulted if the safety manager deems it necessary.
4. Hands and face shall be washed prior to eating, drinking, using the restroom, or smoking, and at the end of the work shift.
5. No smoking is allowed in the exclusion zone. Smoking will be allowed only in an area designated by the contractor's superintendent.

EQUIPMENT

Personal Safety Equipment

Workers shall have available personal protective safety equipment as follows:

1. Plastic hard hats meeting ANSI standards.
2. Steel-toed work boots.
3. Appropriate hearing protection in accordance with the contractor's hearing conservation program.
4. Safety glasses meeting ANSI standards.
5. High-visibility safety vest for work in areas of vehicular traffic.
6. Work gloves for handling heavy tools or equipment.

Personnel and Environmental Monitoring Equipment

Air monitoring equipment is listed in the Air Monitoring section.

Facility Safety Equipment

The following safety equipment shall be continuously available at the job site in sufficient quantities:

1. Clean water, detergent, and paper towels.
2. First aid kit (10 unit).
3. Fire extinguisher.
4. Site phone.

ACKNOWLEDGEMENT

The undersigned site personnel and visitors acknowledge that they have read and understand the above Site-Specific Health & Safety Plan and are familiar with its provisions.

Legend

Bold - analyte detected

mg/Kg - milligrams per kilogram

-- Not Analyzed

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

F1 - MS and/or MSD recovery exceeds control limits.

Notes:

Sample ID - sample identification

feet bgs - feet below the ground surface

ug/l - micrograms per liter

VOCs - volatile organic compounds analyzed in accordance with EPA Method No. 8260B

PCE - tetrachloroethylene

Dup. - duplicate sample

NA - not available

CHHSLi - California Human Health Screening Levels for commercial/industrial land uses, Table 2 - Soil-Gas Screening Numbers for Volatile Chemicals below Buildings Constructed with Engineered Fill below Sub-slab Gravel dated September 23, 2010

Notes:

Sample ID - Sample location and depth

bold font - Table 1 of the Cosco Busan Report

DE - Concentration is between the PEL and the ERL

bgs - below ground surface

ERL - Effects Range-Low: Concentration above which adverse effects are expected to occur often (Long et al., 1995)

Metals - refer to Table 22 in the Cosco Busan Report for a description of the metals analyzed

Mercury - Samples were analyzed for total mercury and methyl mercury. Methyl mercury was not detected above the laboratory reporting limits. Total mercury was detected above the laboratory reporting limits in some samples. Refer to Table 22 in the Cosco Busan Report for a description of the mercury analyzed

Color - Indicates visual staining observed in the soil sample

TPHg - Total petroleum hydrocarbons as gasoline analyzed by EPA Method No. 8015

TPHd - Total petroleum hydrocarbons as diesel analyzed by EPA Method No. 8015

TPHo - Total petroleum hydrocarbons as motor oil analyzed by EPA Method No. 8015

VOCs - Volatile organic compounds analyzed by EPA Method No. 8260

PAHs - Polycyclic aromatic hydrocarbons analyzed by EPA Method No. 8270

PCBs - Polychlorinated biphenyls analyzed by EPA Method No. 8082

ND - Not detected at or above the laboratory reporting limit

-- - Not analyzed

NA - Not available

CHHSLs - California environmental screening levels for residential land use (see Table 1 - Soil screening methods for human health exposure to COPCs compiled by California Environmental Protection Agency, Department of Toxic Substances Control, September 10, 2010)

AWQCB - California Regional Water Quality Control Board, San Francisco Region, Water Quality Control Plan, Appendix A, Table A-1, Maximum Soil Screening Levels for Ingestion, Dermal Contact and Inhalation Pathways, Direct Exposure, dated May 1999

RSL - Regional Screening Levels - Regional Water Quality Control Board, San Francisco Region, Water Quality Control Plan, Appendix A, Table A-1, Maximum Soil Screening Levels for Ingestion, Dermal Contact and Inhalation Pathways, Direct Exposure, dated May 1999, Table A-2, Maximum Soil Screening Levels for Soil Gas Effects and Migration to Groundwater Concerns, Shallow Soils less than or equal to 10 meters deep, screening depth to groundwater assumed to be 5 feet bgs

Chapter 1
Introduction

This study presents the transportation assessment for the Row DTLA Residential Project (Project) located at 757-787 S. Alameda Street, 1318-1396 E. 7th Street, 136-196 S. Central Avenue, 1301-1327 E. 8th Street, 700-760 S Market Court, 720-746 S. Terminal Street, 760 S. Warehouse Street, Los Angeles, CA 90021 (Project Site) presently known as ROW DTLA in *Downtown Community Plan* (Los Angeles Department of City Planning [LADCP], adopted May 2023/effective January 2025) area of the City of Los Angeles, California (City). The methodology and base assumptions used in the analysis were established in consultation with the Los Angeles Department of Transportation (LADOT).

PROJECT DESCRIPTION

The Project proposes the redevelopment of two existing surface parking lots (Development Area) into a mixed-use development consisting of three eight-story buildings to be located on the north and south sides of Center Street, on the eastern edge of the Project Site. A total of 1,000 residential units are included, with 11% designated as affordable, along with a total of 6,547 square feet (sf) of ground floor commercial space.

- Building A is located south of Center Street and includes 410 residential units (including 47 affordable units) and 1,119 sf commercial space.
- Building B is located south of Center Street and includes 214 residential units (including 24 affordable units).
- Building C is located north of Center Street and includes 376 residential units (including 43 affordable units) and 5,428 sf commercial space.

The Project would provide approximately 1,000 vehicle parking spaces within subterranean parking. Buildings A,B, and C would include two levels of subterranean parking. Passenger loading and drop-off areas would be provided internal to the Development Area. The Project

would also provide bicycle parking spaces, including 479 long-term and 50 short-term spaces, as required by the Los Angeles Municipal Code (LAMC). Pedestrian and bicycle access would be provided separate from the vehicular access via residential lobbies and commercial entrances located along the Project frontages on Alameda Street and Center Street. The Project is anticipated to be completed in Year 2032. The conceptual ground level Project site plan is illustrated in Figure 1.

PROJECT LOCATION

The Project Site is in City Council District 14 and is comprised of two Los Angeles County Assessor parcels (Assessor Parcel Numbers 5146-009-008 and 5146-009-003). As illustrated in Figure 2, the Project Site is generally bounded by 7th Street to the north, Alameda Street to the east, Bay Street to the south, and industrial uses to the west, and the Development Area consists of the two existing surface parking lots fronting Alameda Street. The Project Site is also located approximately 0.6 miles north of Interstate 10 (I-10), which provides regional transportation between downtown Los Angeles and Santa Monica (approximately 15.00 miles west).

The Project is located within a Transit Priority Area, which is defined per Public Resources Code Section 21099 (a) as an area within 0.50 miles of an existing or planned major transit stop. A major transit stop, as defined per Public Resources Code Section 21064.3, which was amended by California Assembly Bill 2553 (Friedman, 2024), is a fixed-rail station or an intersection of two or more bus routes with service intervals of 20 minutes or less during the morning and afternoon commuter peak periods. The Project is located approximately 0.25 miles southeast of the intersection of Central Avenue & 6th Street, which is a major transit stop served by two or more bus lines with a 20-minute service interval during the morning and afternoon commute periods. Specifically, Los Angeles County Metropolitan Transportation Authority (Metro) Lines 16, 18, 53, 60, 62, and 720 are available at this intersection.[1] In addition, the Little Tokyo/Arts District Station (Metro A and E Lines) is approximately 1.0 miles north and Union Station (Metro A, B, D, and J Lines, other local/regional transit lines, and commuter rail) is approximately 1.5 miles north of the Project Site along Alameda Street.

[1] All lines listed except Metro Line 62 operate with service intervals of 20 minutes or less during morning and afternoon peak periods.

STUDY SCOPE

The scope of analysis for this study was developed in consultation with LADOT and is consistent with its *Transportation Assessment Guidelines* (updated August 2022) (TAG). It is in compliance with the California Environmental Quality Act (CEQA) Guidelines (California Code of Regulations, Title 14, Section 15000 and following).

The base assumptions and technical methodologies (i.e., vehicle miles traveled [VMT], trip generation, study locations, analysis methodology, etc.) were identified and agreed to in a Transportation Assessment Memorandum of Understanding (MOU), which was reviewed and approved by LADOT in December 2023. A copy of the signed MOU is provided in Appendix A.

ORGANIZATION OF REPORT

This report is divided into six chapters, including this introduction. Chapter 2 describes the Project Context including the study area and existing and future cumulative transportation conditions. Chapter 3 presents the Project Traffic including the Project trip generation, trip distribution, and trip assignment. Chapter 4 details the CEQA Analysis of Transportation Impacts including TAG Thresholds T-1 through T-3 and the Freeway Safety Analysis. Chapter 5 details the Non-CEQA Transportation Analyses including the pedestrian, bicycle, and transit assessments, Project access, safety, and circulation assessments, residential street cut-through analysis, construction analysis, and parking analysis. Chapter 6 summarizes the analyses and study conclusions. The appendices contain supporting documentation, including the MOU that outlines the study scope and assumptions, and additional details supporting the technical analyses.

Chapter 2

Project Context

A comprehensive data collection effort was undertaken to develop a detailed description of existing and future conditions in the Project Study Area, which is illustrated in Figure 3. The Existing Conditions analysis includes an assessment of the existing freeway and street systems, an analysis of traffic volumes and current operating conditions, and an assessment of the existing public transit service, as well as pedestrian and bicycle circulation, at the time of the MOU approval in December 2023. An inventory of lane configurations, signal phasing, parking restrictions, etc., for the analyzed intersections was also collected, along with the peak period traffic counts provided in Appendix B.

In addition, this Chapter contains a discussion of the future conditions detailing the assumptions used to develop the Future without Project Conditions in Year 2032, which correspond to anticipated occupancy of the Project.

STUDY AREA

As noted above, Figure 3 illustrates the operational analysis Study Area, which includes six study intersections detailed in Table 1. The intersections were selected in consultation with LADOT based on the following factors identified in the TAG:

1. Primary Project driveway(s)
2. Intersections at either end of the block on which the Project is located or up to 600 feet from the primary Project driveway(s)
3. Unsignalized intersections that are adjacent to the Project site or that are expected to be integral to the Project's site access and circulation plan
4. Signalized intersections in proximity to the Project site where 100 or more net new peak hour Project trips would be added

The existing lane configurations at the analyzed intersections are illustrated in Figure 4.

EXISTING TRANSPORTATION CONDITIONS

Existing Street System

The existing street system in the Study Area consists of a regional roadway system including freeways, arterials, collector, and local streets that provide regional, sub-regional, or local access and circulation within the Study Area. These transportation facilities generally provide two to six travel lanes and usually allow parking on either side of the street. Typically, the speed limits range between 15 and 40 miles per hour (mph) on the streets and between 55 and 65 mph on freeways.

Street classifications are designated in *Mobility Plan 2035, An Element of the General Plan* (LADCP, September 2016) (Mobility Plan). The Mobility Plan defines specific street standards to provide an enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Per the Mobility Plan, street classifications are defined as follows:

- Freeways are high-volume, high-speed roadways with limited access provided by interchanges that carry regional traffic through and do not provide local access to adjacent land uses.
- Arterial Streets are major streets that serve through traffic, as well as provide access to major commercial activity centers. Arterials are divided into two categories:
    - Boulevards represent the widest Arterial Streets that typically provide regional access to major destinations and include two categories:
        - Boulevard I provides up to four travel lanes in each direction with a target operating speed of 40 mph and generally includes a right-of-way (ROW) width of 136 feet and pavement width of 100 feet.
        - Boulevard II provides up to three travel lanes in each direction with a target operating speed of 35 mph, and generally includes a ROW width of 110 feet, and pavement widths of 80 feet.
    - Avenues are typically narrow arterials that pass through both residential and commercial areas and include three categories:
        - Avenue I provides up to two travel lanes in each direction with a target operating speed of 35 mph, with a ROW width of 100 feet and pavement width of 70 feet.

- Avenue II provides up to two travel lanes in each direction with a target operating speed of 30 mph, with a ROW width of 86 feet and pavement width of 56 feet.

- Avenue III provides up to two travel lanes in each direction with a target operating speed of 25 mph, with a ROW width of 72 feet and pavement width of 46 feet.

- Collector Streets are generally located in residential neighborhoods and provide access to and from Arterial Streets for local traffic and are not intended for cut-through traffic. They provide one travel lane in each direction with operating speeds of 25 mph and a ROW width of generally 66 feet and pavement width of 40 feet.

- Local Streets are intended to accommodate lower volumes of vehicle traffic and provide parking on both sides of the street. They provide one travel lane in each direction with a target operating speed of 15 to 20 mph. Pavement widths may vary between 30-36 feet within a ROW width of 50-60 feet. Local Streets include two categories:

    - Continuous Local Streets connect to other streets at both ends.

    - Non-continuous Local Streets lead to a dead-end.

Primary regional access to the Project Site is provided by I-10, US Route 101 (US 101), and Interstate 5 (I-5). The arterials providing access to the Project Site include Alameda Street and 7th Street. The following is a brief description of the roadways in the Study Area, including their classifications under the Mobility Plan:

Freeways

- I-10 – I-10 generally runs in the east-west direction and is located approximately 0.5 miles southeast of the Project Site. In the vicinity of the Project Site, I-10 provides three to five travel lanes in each direction. Access to and from I-10 is available via interchanges at 8th Street, Porter Street, Mateo Street, Santa Fe Street, Olympic Boulevard and Alameda Street.

- US 101 – US 101 generally runs in the north-south direction and is located less than 1.0 miles east of the Project Site. In the vicinity of the Project Site, US 101 provides three travel lanes in each direction. Access to and from US 101 is available via interchanges at Alameda Street, Vignes Street, Commercial Street, 4th Street, 7th Street, Whittier Boulevard.

- I-5 – I-5 generally runs in the north-south direction and is located less than 1.0 miles east of the Project Site. In the vicinity of the Project Site, I-5 provides five travel lanes in each direction. Access to and from I-5 is available via interchanges at 4th Street, 7th Street, and Boyle Avenue.

Roadways

- Alameda Street – Alameda Street is a designated Avenue I. It travels in the north-south direction and is located adjacent to the eastern boundary of the Project Site. It provides four travel lanes, two in each direction, with left-turn lanes at intersections and a two-way left-turn median. On-street parking is generally prohibited within the Study Area.

- Olympic Boulevard – Olympic Boulevard is a designated Avenue I. It travels in the east-west direction and is located south of the Project Site. It provides four travel lanes, two in each direction, with left-turn lanes at intersections. Unmetered parking is generally available on both sides of the street west of Alameda Street within the Study Area.

- Central Avenue – Central Avenue is a designated Avenue I. It travels in the north-south direction and is located west of the Project Site. It provides four travel lanes, two in each direction. Metered parking is generally available on both sides of the street north of 7th Street and unmetered parking is generally available on the west side of the street south of 7th Street within the Study Area.

- 7th Street – 7th Street is a designated Avenue II. It travels in the east-west direction and is located to the northern boundary of the Project Site. It provides four travel lanes, two in each direction, with left-turn lanes at intersections. Unmetered parking is generally available on both sides of the street within the Study Area.

- Warehouse Street – Warehouse Street is a designated Local Street along the Project Site and an unidentified street/private street south of the Project Site. It travels in the north-south direction and is located to the western boundary of the Project Site. It provides two travel lanes, one in each direction. On-street parking is generally prohibited within the Study Area.

- Bay Street – Bay Street is a designated Collector east of Alameda Street and a private street west of Alameda Street/internal to the Project Site. It travels in the east-west direction and is located east of the Project Site. It provides two travel lanes, one in each direction. Unmetered parking is generally available on both sides of the street east of Alameda Street.

- Center Street – Center Street is an unidentified/private street that bifurcates the Project Site. It travels in the east-west direction and provides two travel lanes, one in each direction. On-street parking is generally prohibited within the Study Area.

As required in the TAG, an inventory was conducted of facilities serving pedestrians, bicyclists, and transit riders. The existing mobility facilities at each of the analyzed Study Area intersections are detailed in Figure 5 and the existing Mobility Plan designations and pedestrian destinations within the Study Area are shown in Figure 6.

Existing Pedestrian Facilities

Figure 7 identifies the local-serving commercial uses, cultural uses, and institutional facilities within 0.25 miles of the Project Site considered pedestrian destinations. An inventory was collected of existing transportation facilities serving pedestrians, bicyclists, and transit riders within the Project Site vicinity that support pedestrian activity to and from the pedestrian destinations, as shown in Figure 8.

The walkability of existing facilities is based on the availability of pedestrian routes necessary to accomplish daily tasks without the use of an automobile. These attributes are quantified by WalkScore.com and assigned a score out of 100 points. With the various commercial businesses and cultural facilities adjacent to residential neighborhoods, the walkability of the Project Site is approximately 85 points[2].

Along the Project frontages, approximately 15-foot-wide sidewalks are provided along Alameda Street and 7th Street. The adjacent signalized study intersection of Alameda Street & 7th Street (Intersection #3) provides pedestrian facilities, including curb ramps on all approaches, pedestrian phasing, and high-visibility crosswalk striping, as shown in Figure 5. Additional pedestrian facilities located within the Project Site vicinity are illustrated in Figure 8.

Vision Zero. As described in the City's *Vision Zero: Eliminating Traffic Deaths in Los Angeles by 2025* (August 2015), Vision Zero is a traffic safety policy that promotes strategies to eliminate transportation-related collisions that result in severe injury or death. Vision Zero has identified the High Injury Network (HIN), a network of streets included based on collision data from 2012 to 2016[3], where strategic investments will have the biggest impact in reducing death and severe injury. The Project Site is located adjacent to 7th Street, which is identified in the HIN. As depicted in Figure 8, Central Avenue, Olympic Boulevard, and Alameda Street south of Olympic Boulevard have also been identified in the HIN.

---

[2] Walk Score (www.walkscore.com) rates the Project Site with a score of 85 of 100 possible points (scores accessed on January 15, 2024, for 747 S Alameda Street). Walk Score calculates the walkability of specific addresses by considering the ease of living in the neighborhood with a reduced reliance on automobile travel.

[3] *LADOT Announces update to Vision Zero High Injury Network* (LADOT, May 15, 2018) provides the latest update to the City's Vision Zero program (https://ladotlivablestreets.org/news/HIN-update).

Existing Bicycle System

Based on *2010 Bicycle Plan, A Component of the City of Los Angeles Transportation Element* (LADCP, adopted March 1, 2011) (2010 Bicycle Plan), the existing bicycle system consists of a limited network of bicycle lanes (Class II) and bicycle routes (Class III). Class II bicycle lanes are a component of street design with dedicated striping, separating vehicular traffic from bicycle traffic. Class III bicycle routes and bicycle-friendly streets are those where motorists and cyclists share the roadway and there is no separated striping for bicycle travel. Bicycle routes and bicycle-friendly streets are preferably placed on Collector and lower-volume Arterial Streets. Bicycle routes with shared lane markings, or "sharrows", remind bicyclists to ride farther from parked cars to prevent collisions, increase awareness of motorists that bicycles may be in the travel lane, and shows bicyclists the correct direction of travel.

The components of the 2010 Bicycle Plan have been incorporated into the bicycle network of the Mobility Plan. The Mobility Plan consists of a Bicycle Enhanced Network (Low-Stress Network) (BEN) and a Bicycle Lane Network (BLN). The BEN is a subset of and supplement to the 2010 Bicycle Plan and is comprised of a network of streets that prioritize bicyclists and provide bicycle paths (Class I) and protected bicycle lanes (Class IV). Class IV protected bicycle lanes, including cycle tracks, bicycle traffic signals, and demarcated areas to facilitate turns at intersections and along neighborhood streets, provide further protection from other travel lanes. Class IV networks often provide mini-roundabouts, cross-street stop signs, crossing islands at major intersection crossings, improved street lighting, bicycle boxes, and bicycle-only left-turn pockets. Once implemented, these facilities would offer a safer environment for both cyclists and motorists. The BLN consists of Class II bicycle lanes with striped separation from motorized vehicle traffic and Class III bicycle lanes (sharrows).

In addition, bike-share facilities provide accessible and affordable short-term bicycle rentals to complete first-mile/last-mile connections. Within the City, the Metro Bike Share program currently services downtown Los Angeles, Central Los Angeles, Hollywood, North Hollywood, Westwood, and the Westside.

As shown in Figure 8, there are currently Class II bicycle lanes on 7th Street east of Central Avenue and Class IV protected bicycle lanes on Central Avenue and on 7th Street west of Central Avenue.

Existing Transit System

Figure 9 illustrates the existing transit service operated by Metro and transit stops within the Study Area. Table 2 details the transit lines currently operating in the Study Area for each of the service providers in the region, the type of service (peak vs. off-peak, express vs. local), and the frequency of service, as described above. The average frequency of transit service during the peak hour was derived from the number of peak-period stops made nearest the Project Site and reflects current conditions, including recent changes per Metro's NextGen Bus Plan.

Existing Traffic Volumes

Intersection turning movement counts for typical weekday morning (7:00 AM to 10:00 AM) and afternoon (3:00 PM to 6:00 PM) peak periods were collected in December 2023 while schools were in session and weather conditions were clear. The traffic counts were adjusted to reflect Existing Conditions (Year 2024) by adding a 1% growth factor. The Existing Conditions (Year 2024) intersection peak hour traffic volumes are illustrated in Figure 10. Traffic count and factoring worksheets are provided in Appendix B.

FUTURE CUMULATIVE TRANSPORTATION CONDITIONS

The forecast of traffic volumes for the Future without Project Conditions was prepared in accordance with procedures outlined in the TAG. Specifically, two requirements are provided for developing the cumulative traffic volume forecast:

> "The Transportation Assessment must estimate ambient traffic conditions for the study horizon year selected during the scoping phase and recorded in the executed MOU. The study must clearly identify the horizon year and annual ambient growth rate used for the study. The horizon year should align with the development project's expected completion year. For development projects constructed in phases over several years, the Transportation Assessment should analyze intermediary milestones before the buildout and completion of the project. The annual ambient growth rate shall be determined by LADOT staff during the scoping process and can be based on an adopted TSP, the most recent SCAG regional transportation model, the citywide transportation model, or other empirical information approved by LADOT.

> "The Transportation Assessment must consider related projects. For related development projects, this should include the associated trip generation for known development projects within one-half mile (2,640 foot) radius of the project site and one-quarter mile (1,320 foot) radius of the farthest outlying study intersections. Consultation with the Department of City Planning and LADOT may be required to compile the related projects list. The City's ZIMAS database can be used to assist in identifying development projects that have submitted applications to the City of Los Angeles. Project access and circulation constraints would be determined by adding project-generated trips to future base traffic volumes including ambient growth and related projects and conducting the operational analysis."

As detailed below, the analysis of future conditions includes both ambient growth, which reflects increase in traffic due to regional growth and development outside the Study Area, and traffic generated by ongoing or entitled projects near or within the Study Area (Related Projects). The ambient growth factor likely captures some traffic increases resulting from the Related Projects. Therefore, due to inherent double-counting of vehicles, the traffic analysis provides a conservative estimate of Future without Project Conditions traffic volumes.

Ambient Traffic Growth

Existing traffic is expected to increase because of regional growth and development outside the Study Area. Based on discussions with LADOT during the MOU process, an ambient growth factor of 1% per year compounded annually was applied to be conservative by adjusting the existing traffic volumes to reflect the effects of the regional growth and development by Year 2032. The total adjustment applied over the eight-year period between Year 2024 and the anticipated buildout year of the Project was 8.29%. This growth factor accounts for increases in traffic due to potential projects plus projects not yet proposed and projects located outside the Study Area.

Related Projects

In accordance with the TAG, this study also considered the effects of the Project on other developments either proposed, approved, or under construction (collectively, the Related Projects). Including this analytical step, the potential impact of the Project is evaluated within the context of past, present, and probable future developments capable of producing cumulative impacts. In accordance with the procedures outlined in the TAG, Related Projects within 0.50 miles of the

Project Site and within 0.25 miles of the farthest outlying study intersection were considered for analysis.

The list of Related Projects is based on information provided by LADCP and LADOT in October 2024, as well as recent studies of development projects in the area. The Related Projects are detailed in Table 3 and their approximate locations are illustrated in Figure 11. Though the buildout years of many of these Related Projects are uncertain and may be well beyond the buildout year of the Project and, notwithstanding that some may never be approved or developed, they were all considered as part of this Study and conservatively assumed to be completed by the Project buildout Year 2032. Therefore, the traffic growth due to the development of Related Projects considered in this analysis is highly conservative and, by itself, substantially overestimates the actual traffic volume growth in the area that would likely occur in the next six years prior to Project buildout. With the addition of the 1% per year ambient growth factor previously discussed, the Future without Project Condition is even more conservative. Using these assumptions, the potential operational traffic impacts of the Project were evaluated. The development of estimated traffic volumes added to the study intersections due to Related Projects involves the use of a three-step process: trip generation, trip distribution, and trip assignment.

Trip Generation. Trip generation estimates for the Related Projects were provided by LADOT or were calculated using a combination of previous study findings and the trip generation rates contained in the latest Institute of Transportation Engineers' (ITE) trip generation manual. The Related Projects trip generation estimates detailed in Table 3 are conservative in that they do not in every case account for either the trips generated by the existing uses to be removed or the likely use of other travel modes (e.g., transit, bus, bicycling, walking, carpool, etc.) Further, in many cases, they do not account for the internal capture trips within a multi-use development or for the interaction of trips between multiple Related Projects, in which one Related Project serves as the origin for a trip destined for another Related Project.

Trip Distribution. The geographic distribution of the traffic generated by the Related Projects is dependent on several factors. These include the type and density of the proposed land uses, the geographic distribution of the population from which the employees/residents and potential patrons of the proposed developments are drawn, and the location of these projects in relation to the surrounding street system. These factors are considered along with logical travel routes through the street system to develop a reasonable pattern of trip distribution.

Trip Assignment. The trip generation estimates for the Related Projects were assigned to the local street system using the trip distribution pattern described above. Figure 12 illustrates the peak hour traffic volumes associated with these Related Projects at the six study intersections.

Future without Project Conditions Traffic Volumes

The Future without Project Conditions peak hour traffic volumes include the combination of Existing Conditions traffic volumes, ambient growth to Year 2032, and Related Project traffic. These volumes at the six study intersections are illustrated in Figure 13.

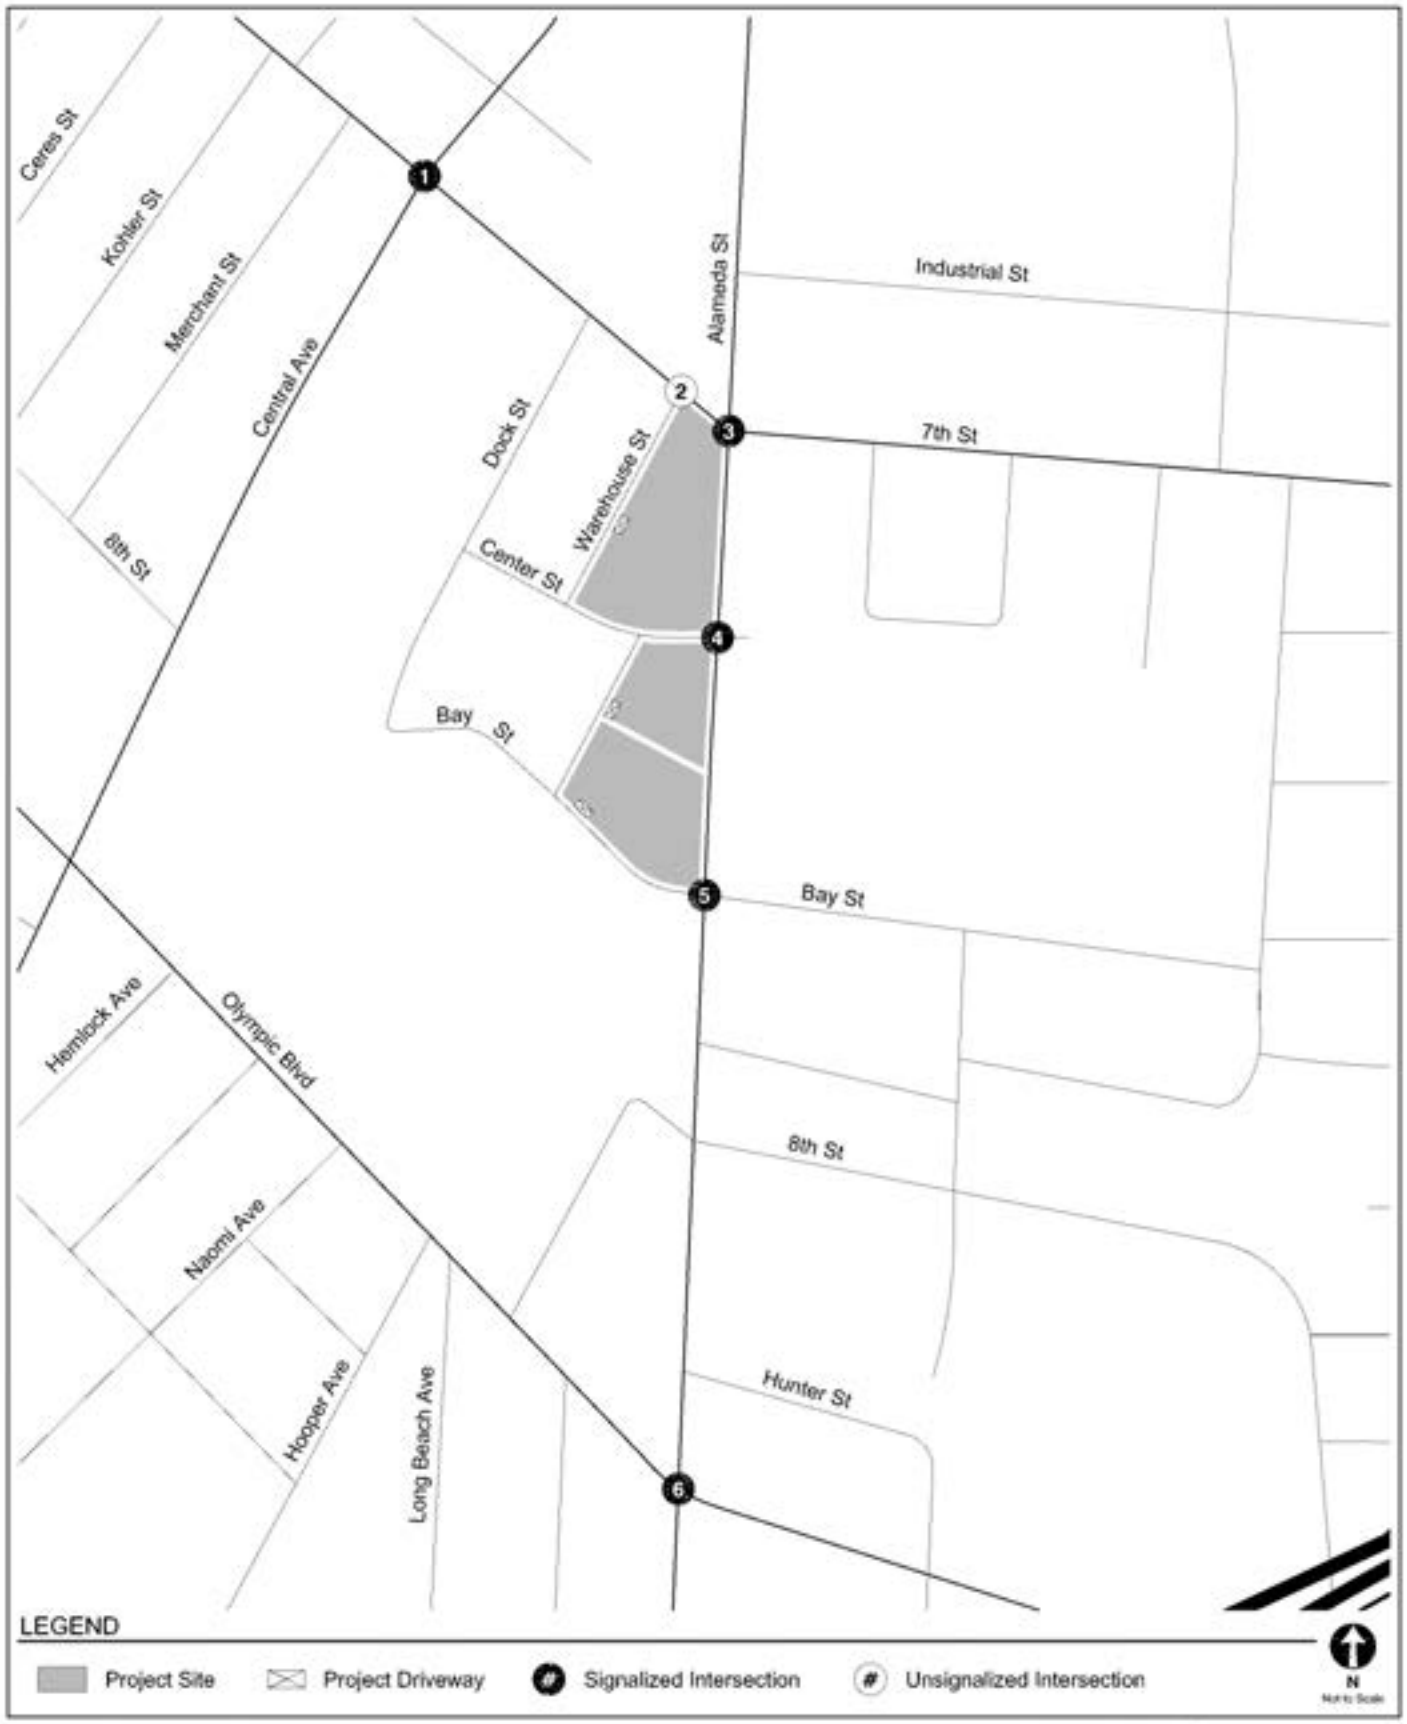
Future Roadway and Street Improvements

The analysis of Future Conditions considered roadway improvements that were funded and reasonably expected to be implemented prior to the buildout of the proposed Project. Any roadway improvement that would result in changes to the physical configuration at the study intersections was incorporated into the analysis where applicable. Other proposed traffic/trip reduction strategies such as transportation demand management (TDM) programs for individual buildings and developments were omitted from the Future Conditions analyses for the purposes of a conservative analysis, as TDM programs are unique to each project and subject to revision along with the amount of claimed trip reduction. The following plans were evaluated for their potential effects on the future roadway configurations.

Vision Zero. No future transportation improvements have been proposed as part of any Vision Zero projects, and no additional improvements are currently proposed within the Study Area.

Mobility Plan. In the Mobility Plan, the City identifies key corridors as components of various "mobility-enhanced networks." Each network is intended to focus on improving a particular aspect of urban mobility, including transit, neighborhood connectivity, bicycles, pedestrians, and vehicles. The specific improvements that may be implemented in those networks have not yet been identified, and there is no schedule for implementation; therefore, no changes to intersection lane configurations were made because of the Mobility Plan. However, the following mobility-

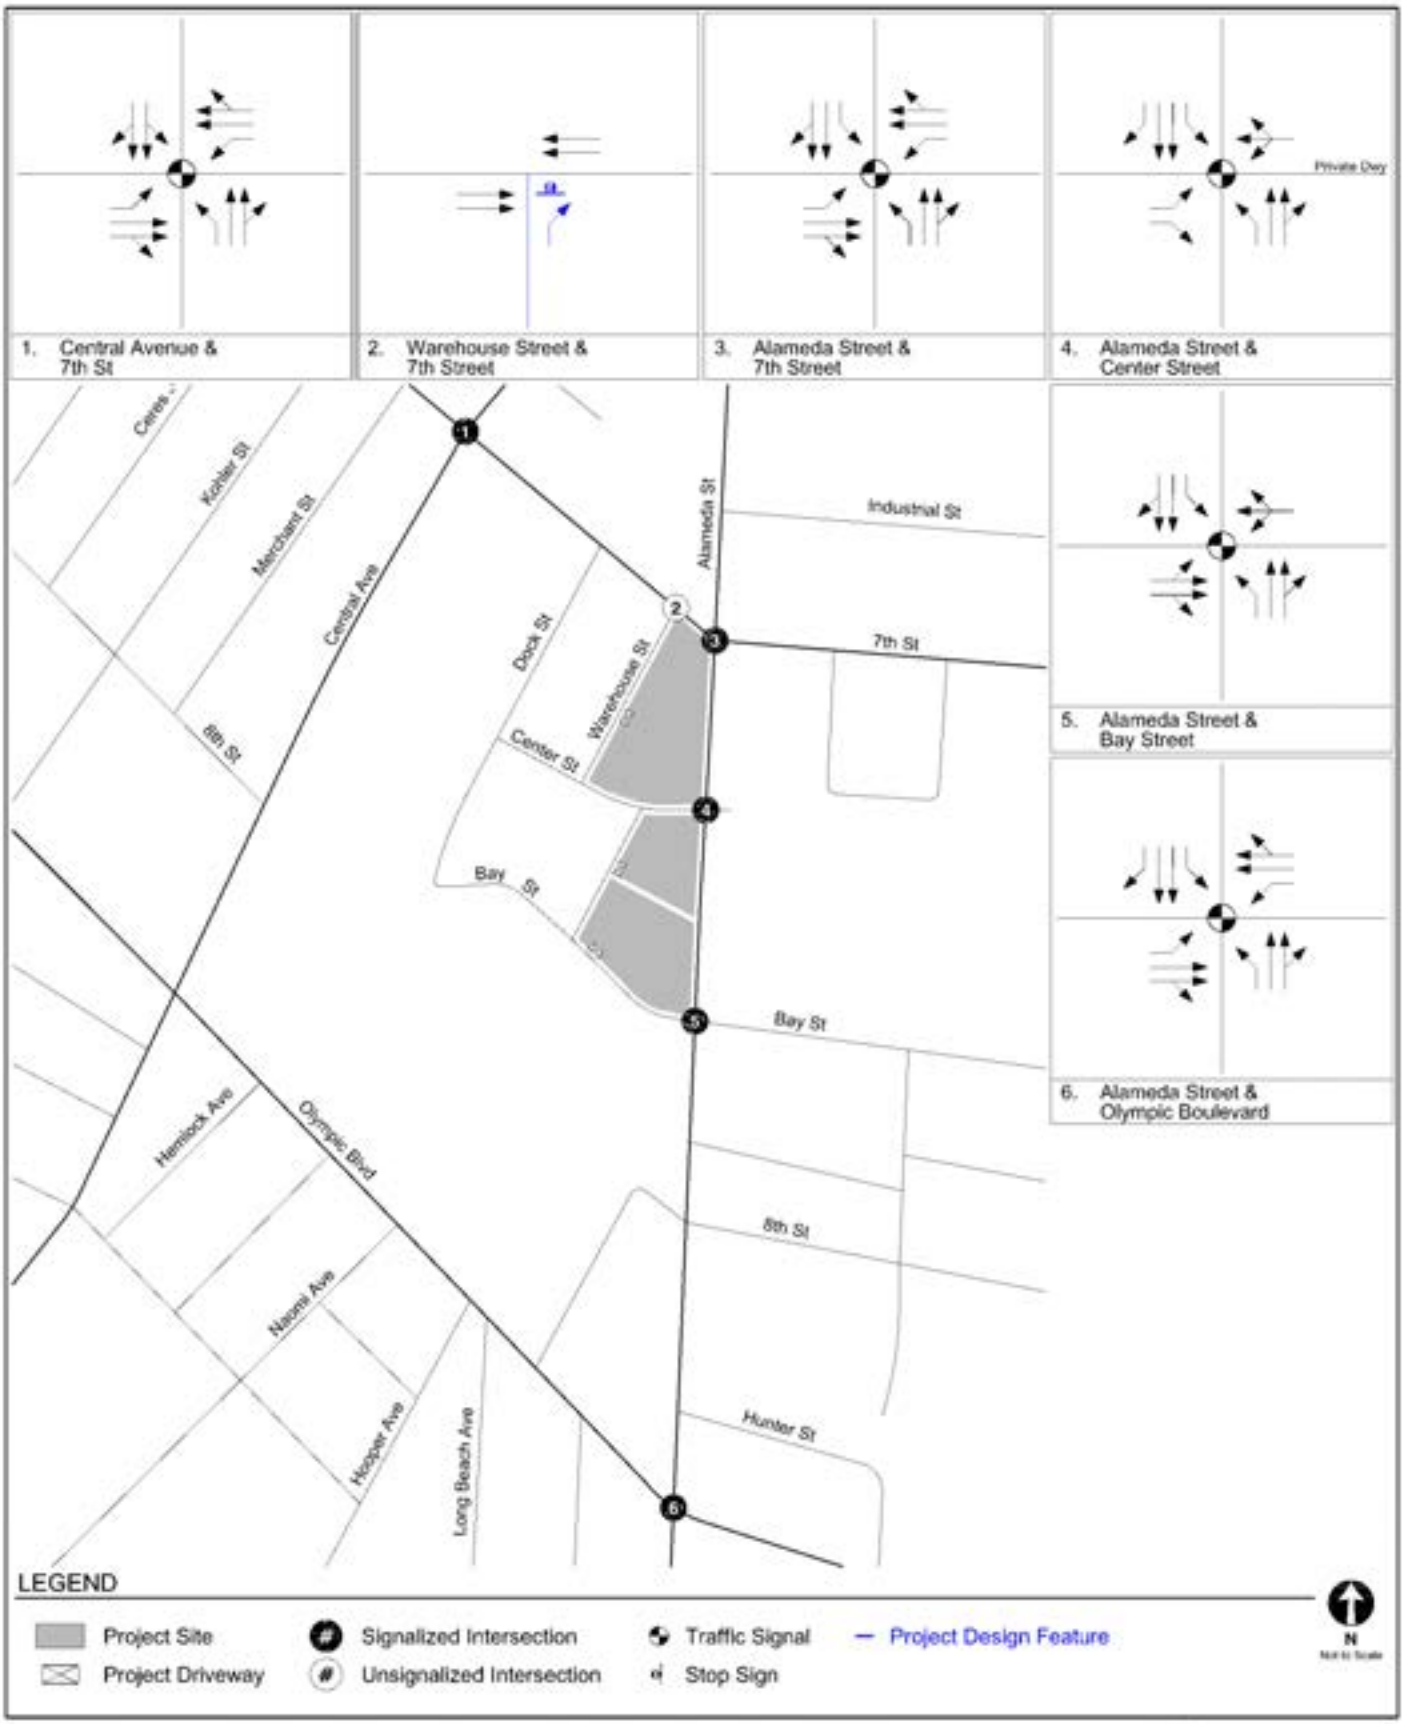
enhanced networks included corridors within the Study Area, as well as others within 0.25 miles of the Project Site, and are illustrated in Figure 14:



- Transit Enhanced Network (TEN): The TEN aims to improve existing and future bus services through reliable and frequent transit service to increase transit ridership, reduce single-occupancy vehicle trips, and integrate transit infrastructure investments within the surrounding street system. Central Avenue and Olympic Boulevard are designated as part of the TEN.

- Neighborhood Enhanced Network (NEN): The NEN reflects the synthesis of the bicycle and pedestrian networks and serves as a system of Local Streets that are slow moving and safe enough to connect neighborhoods through active transportation. No streets within the Study Area are designated as part of the NEN.

- BLN/BEN: Within the Study Area, 7th Street west of Central Avenue has been identified as part of the BLN, and Central Avenue and 7th Street west of Central Avenue have been identified as part of the BEN.



- Pedestrian Enhanced District (PED): The Mobility Plan aims to promote walking to reduce the reliance on automobile travel by providing more attractive and pedestrian-friendly sidewalks, as well as adding pedestrian signalizations, street trees, and pedestrian-oriented design features. Several streets within the Study Area, including Alameda Street north of Bay Street, 7th Street, and Central Avenue, are designated PEDs, where pedestrian improvements could be prioritized to provide better connectivity to and from major destinations within communities.

Safe Routes to School. The Safe Routes to School (SRTS) program seeks to enhance pedestrian safety and comfort on routes to and from school. The program invests in "school zone projects, neighborhood street projects and traffic safety education" and includes improvements such as continental and scramble crosswalks, curb extensions and ramps, rectangular rapid flashing beacons, traffic signals, and bicycle facilities. The nearest schools to the Project Site are Para Los Ninos Elementary School, approximately 0.1 miles east of the Project Site, and Metropolitan High School, approximately 0.25 miles east of the Project Site. There are no SRTS projects planned within the Study Area.

Notes:

[a] Related project information provided by the Los Angeles Department of Transportation in March 2024, Department of City Planning, and recent traffic studies prepared in the area. This list includes known development projects within one-half mile (2,460 foot) radius of the Project Site and within one-quarter mile (1,230 foot) radius of the furthest outlying study intersection.

Chapter 3
Project Traffic

Trip generation estimates, trip distribution patterns and trip assignments were prepared for the Project. These components form the basis of the Project's traffic analysis.

PROJECT DESCRIPTION

As detailed in Chapter 1, the Project is a mixed-use development consisting of three eight-story buildings located on the north and south sides of Center Street, on the eastern edge of the Project Site. A total of 1,000 residential units are included, with 11% designated as affordable, along with a total of 6,547 sf of ground floor commercial space.

- Building A is located south of Center Street and includes 410 residential units (including 47 affordable units) and 1,119 sf commercial space.
- Building B is located south of Center Street and includes 214 residential units (including 24 affordable units).
- Building C is located north of Center Street and includes 376 residential units (including 43 affordable units) and 5,428 sf commercial space.

PROJECT TRIP GENERATION

The number of peak hour trips expected to be generated by the Project was estimated using morning and afternoon peak hour rates published in *Trip Generation Manual, 11th Edition* (ITE, 2021), as well as morning and afternoon peak hour rates for Affordable Housing Family units based on empirical data collected in the City and published in the TAG. Because restaurant uses are expected to generate higher trip amounts than other commercial uses, a more conservative analysis was conducted by considering all 6,547 sf of the Project's commercial uses as high-turnover (sit-down) restaurant use for trip generation purposes.

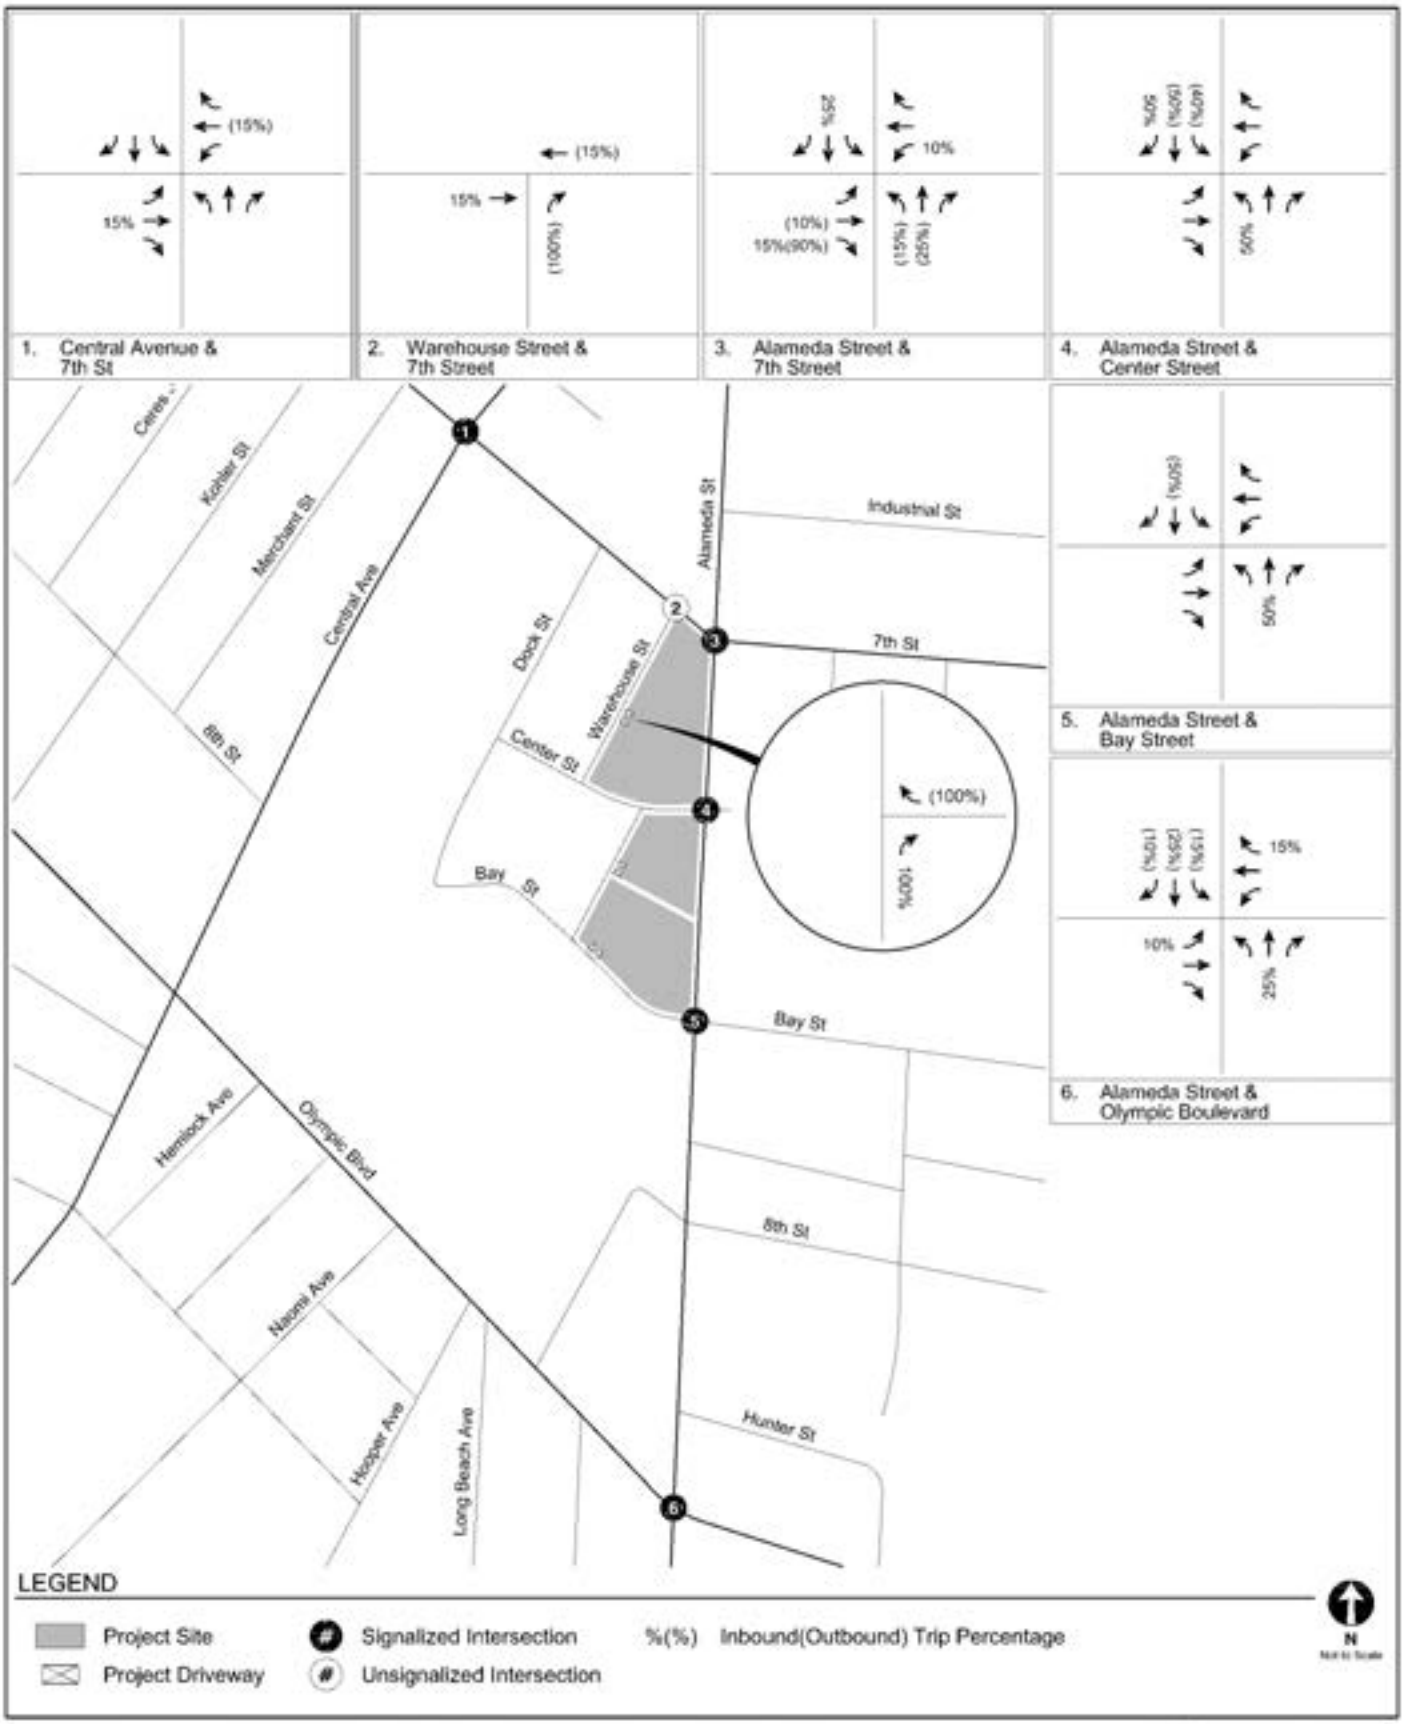
In consultation with LADOT during the MOU process, the following are allowable trip generation reductions to account for internal capture, public transit usage/walking arrivals, and pass-by trips:

- Internal Capture: A 10% internal capture reduction was applied to the commercial trip generation estimates to account for person trips made between the different uses of the Project without requiring an additional vehicle trip (i.e., residents visiting the restaurant uses).

- Transit Usage: A 15% transit usage reduction was applied to the trip generation estimates (except for the office uses, for which transit usage is assumed to be inherent in the trip generation rates) in accordance with the TAG methodology for a development within 0.25 miles of a major transit stop.

- Pass-By: Consistent with Attachment H of the TAG, a 20% pass-by reduction was applied to the commercial restaurant trip generation to account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion. These trips are not considered new to the public streets. This credit does not apply to Project trips at the Project driveway or adjacent intersections.

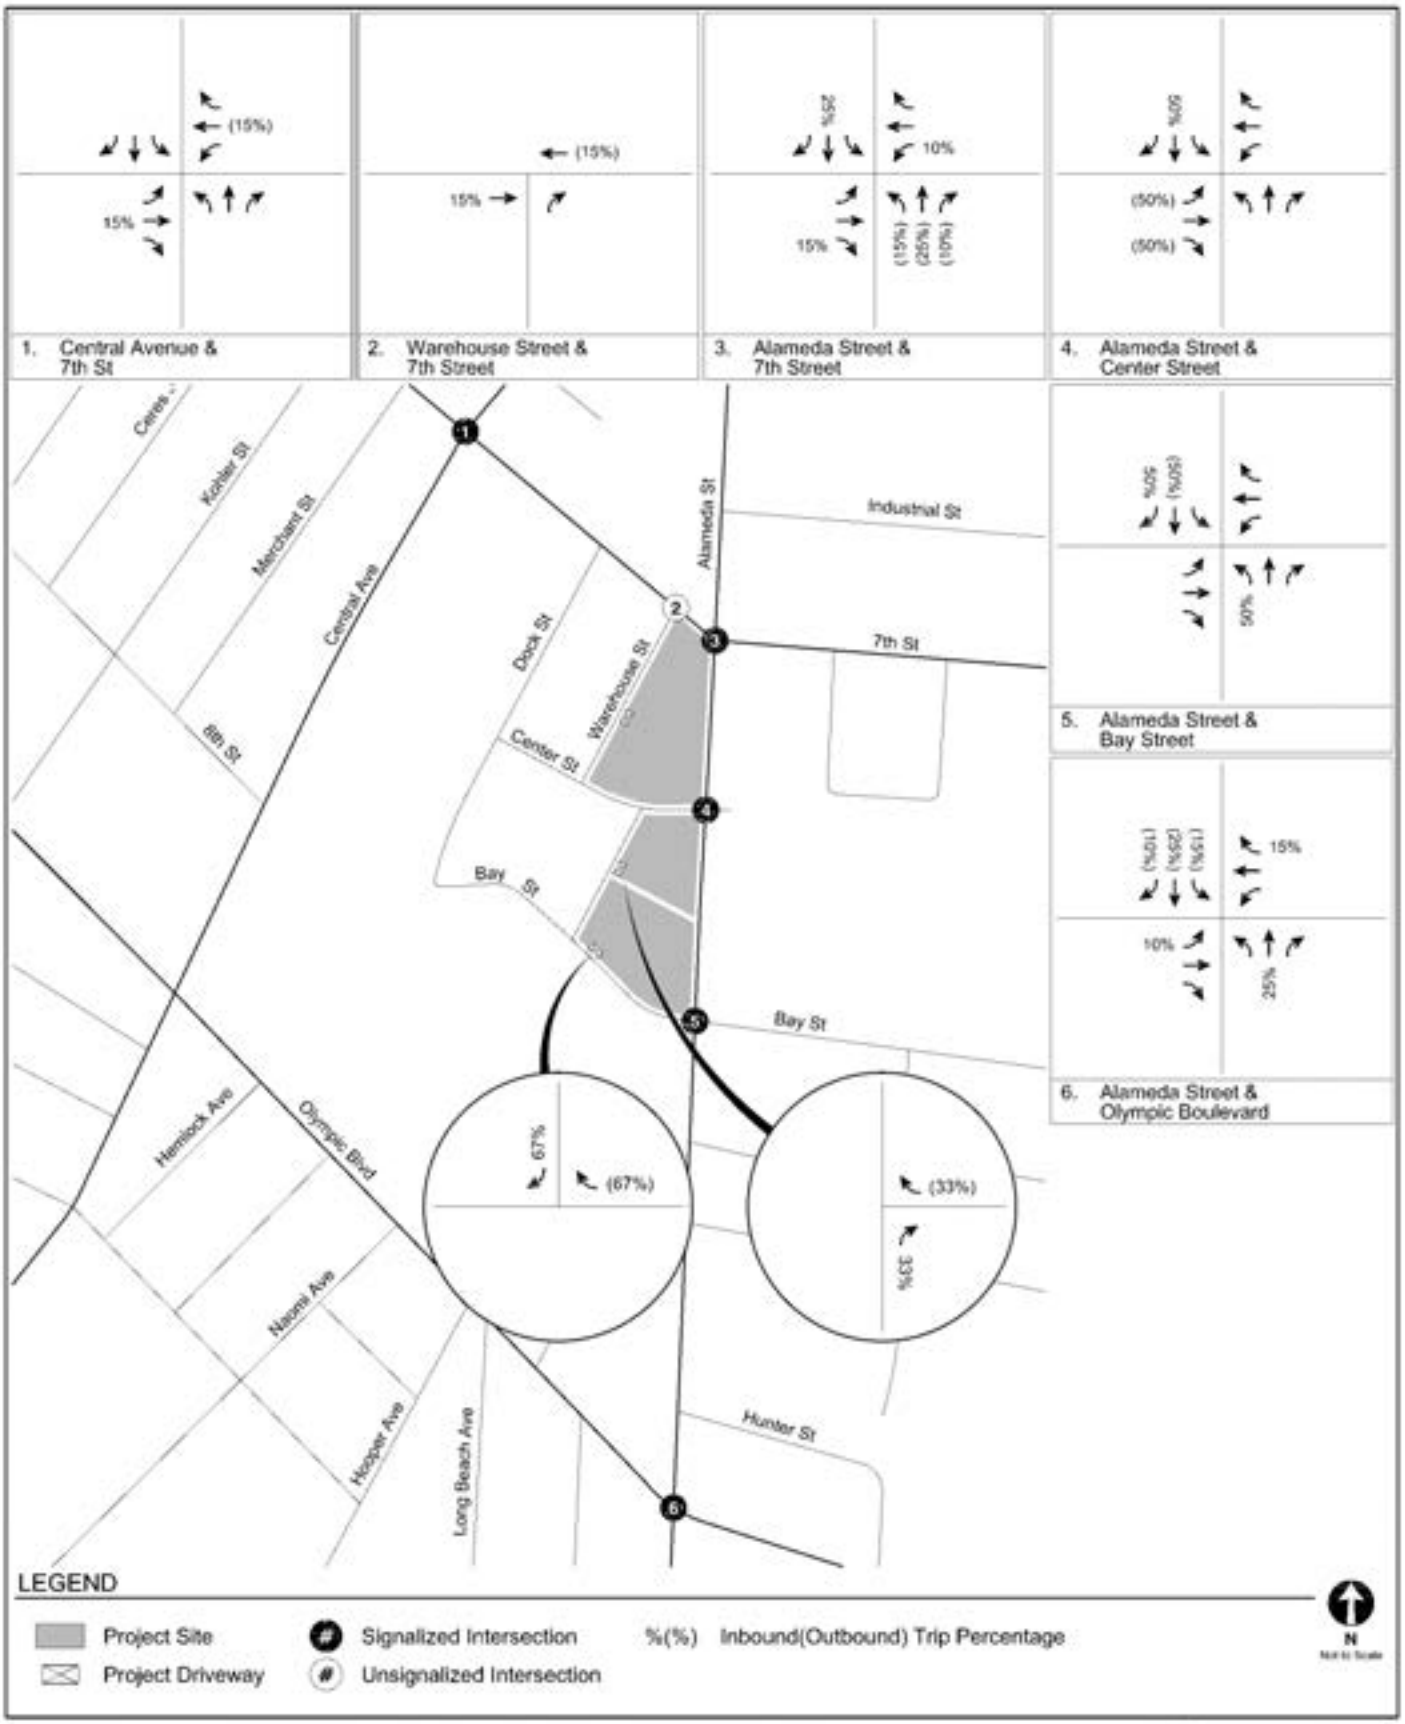
After accounting for the reductions described above, the Project is estimated to generate 372 new morning peak hour trips (106 inbound, 266 outbound) and 367 new afternoon peak hour trips (221 inbound, 146 outbound), as detailed in Table 4.



PROJECT TRIP DISTRIBUTION

The geographic distribution of trips generated by the Project is primarily dependent on the location of employment and commercial uses from which tenants of the Project would be drawn, characteristics of the street system serving the Project Site, existing intersection traffic volumes, the location of the proposed driveways, as well as input from LADOT staff.

The intersection-level trip distribution for the Project is illustrated in Figures 15A and 15B.



PROJECT TRIP ASSIGNMENT

The Project trip generation estimates detailed in Table 4 and the trip distribution pattern illustrated in Figures 15A and 15B, were used to assign the Project-generated traffic through the study intersections. Figure 16 illustrates the Project-only traffic volumes at the study intersections during typical weekday morning and afternoon peak hours.

Notes:
du: dwelling unit ksf: 1,000 square feet
[a] Source: *Trip Generation, 11th Edition*, Institute of Transportation Engineers, 2021.
[b] Per LADOT's Transportation Assessment Guidelines, residential or mixed-use developments inside a Transit Priority Area (TPA) which include Affordable Housing Senior Units are eligible to use a City specific trip generation rate based on vehicle trip count data collected at affordable housing sites in the City of Los Angeles in 2016.
[c] The Project site is located adjacent to a bus stop that serves Metro Next Gen Tier 1 New High Frequency Line 60 at Alameda Street & 7th Street. Therefore, a 15% transit reduction was applied to account for transit usage and walking visitor arrivals.
[d] Commercial area analyzed as High-Turnover (Sit-Down) Restaurant to provide the most conservative analysis.
[e] Internal capture reductions account for person trips made between distinct land uses within a mixed-use development (i.e., between residential and restaurant).
[f] Pass-by reductions account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion.

Chapter 4

CEQA Analysis of Transportation Impacts

This chapter presents the results of an analysis of CEQA-related transportation impacts. The analysis identifies any potential conflicts the Project may have with adopted City plans and policies and the proposed improvements to address potential conflicts, as well as the results of a Project VMT analysis that satisfies State requirements under *State of California Senate Bill 743* (Steinberg, 2013) (SB 743).

METHODOLOGY

SB 743, made effective in January 2014, required the Governor's Office of Planning and Research (OPR) to change the CEQA guidelines regarding the analysis of transportation impacts. Under SB 743, the focus of transportation analyses shifted from driver delay (level of service [LOS]) to VMT, in order to reduce greenhouse gas emissions (GHG), create multimodal networks, and promote mixed-use developments. The TAG defines the methodology to be used for analyzing a project's transportation impacts in accordance with SB 743.

Per the TAG, the CEQA transportation analysis used the following thresholds for identifying significant impacts:

- Threshold T-1: Conflicting with Plans, Programs, Ordinances, or Policies
- Threshold T-2.1: Causing Substantial Vehicle Miles Traveled (VMT)
- Threshold T-2.2: Substantially Inducing Additional Automobile Travel
- Threshold T-3: Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use

The thresholds were reviewed and analyzed, as detailed in the following Sections 4A-4D.

Section 4A: Threshold T-1

Conflicting with Plans, Programs, Ordinances, or Policies Analysis

Threshold T-1 considers whether a project would conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadways, bicycle, and pedestrian facilities.

The purpose of Threshold T-1 is to assess whether a project would conflict with an adopted program, policy, plan, or ordinance that protects the environment. In general, transportation policies or standards adopted to protect the environment are those that support multimodal transportation options and a reduction in VMT. A project would not result in an impact merely based on whether or not it would implement a particular program, plan, policy, or ordinance. Many of these programs must be implemented by the City over time, and over a broad area, and the intention of Threshold T-1 is to ensure that proposed development projects and plans do not preclude the City from implementing adopted programs, plans and policies. As stated in Section 2.1.4 of the TAG, a project that generally conforms with, and does not obstruct, the City's development policies and standards will generally be considered consistent for purposes of the Threshold T-1 analysis.

PLANS, PROGRAMS, ORDINANCES, AND POLICIES

Table 2.1-1 of the TAG identifies the City plans, policies, programs, ordinances, and standards relevant in determining project consistency. Attachment D of the TAG, *Plans, Policies, and Programs Consistency Worksheet*, provides a structured approach to evaluate whether a project conflicts with the City's plans, programs, ordinances, or policies and streamlines the review by highlighting the most relevant plans, policies, and programs for assessing potential impacts to the City's transportation system. The Plans, Policies, and Programs Consistency Worksheet was completed for the Project and is provided in Appendix C.

As summarized below and in Appendix C, the Project is consistent with the City documents listed in Table 2.1-1 and the Plans, Policies, and Programs Consistency Worksheet of the TAG;

therefore, the Project would not result in a significant impact under Threshold T-1. Detailed discussion on the Project's consistency with the applicable plans, programs, ordinances, or policies is provided below.

Mobility Plan

The Mobility Plan combines "complete street" principles with the following five goals that define the City's mobility priorities:

- Safety First: Design and operate streets in a way that enables safe access for all users, regardless of age, ability, or transportation mode of choice.
- World Class Infrastructure: A well-maintained and connected network of streets, paths, bikeways, trails, and more provides Angelenos with the optimum variety of mode choices.
- Access for All Angelenos: A fair and equitable system must be accessible to all and must pay particularly close attention to the most vulnerable users.
- Collaboration, Communication, and Informed Choices: The impact of new technologies on our day-to-day mobility demands will continue to become increasingly important to the future. The amount of information made available by new technologies must be managed responsibly in the future.
- Clean Environments and Healthy Communities: Active transportation modes such as bicycling and walking can significantly improve personal fitness and create new opportunities for social interaction, while lessening impacts on the environment.

A detailed analysis of the Project's consistency with the Mobility Plan is provided in Table 5. As detailed in Chapter 2, the Mobility Plan identifies key corridors within the Study Area as components of various "mobility-enhanced networks." Though no specific improvements have been identified adjacent to the Project Site or within the Study Area and, thus, there is no schedule for implementation, the mobility-enhanced networks represent a focus on improving a particular aspect of urban mobility, including transit, neighborhood connectivity, bicycles, pedestrians, and vehicles. The Project would be designed with the mobility-enhanced networks as a top priority.

Vehicular access to the Project Site is provided via existing driveways along Alameda Street at Bay Street and Center Street. Development Area access is only available from within the Project Site and provided by internal driveways along Warehouse Street and Bay Street. Warehouse Street is a designated Local Street internal to the Project Site and an unidentified/private street

south of the Project Site. Bay Street is an unidentified/private street internal to the Project Site. No dedications would be required in accordance with the Mobility Plan.

The Project driveways would be improved and designed in accordance with the standards set forth in *Manual of Policies and Procedures* (LADOT, updated 2020). Appropriate access and safety measures would be placed to limit potential queue spillover into the public ROW that could interrupt pedestrian, bicycle, and vehicular flow. In addition, the driveways anticipated to provide truck access would be designed to adequately accommodate truck-turning maneuvers without encroachment into the public ROW.

Separate pedestrian and bicycle access to the Project Site would be provided via residential lobbies and commercial entrances located along the Project frontages on Alameda Street and Center Street. In addition, the Project would also be designed in compliance with Americans with Disabilities Act (ADA) standards to provide accessibility for all patrons of the Project.

Secured bicycle parking facilities within the Project Site would be provided per the LAMC. This Project design feature would promote active transportation modes such as biking and walking, thereby reducing the Project VMT per employee compared to the average for the area, as demonstrated in Section 4B. Further, the Project does not propose modifying, removing, or otherwise affecting existing bicycle infrastructure.

Thus, the Project would not conflict with the goals of the Mobility Plan.

Plan for a Healthy Los Angeles

Plan for a Healthy Los Angeles: A Health and Wellness Element of the General Plan (LADCP, March 2015) (*Plan for a Healthy Los Angeles*) contains guidelines for the City to follow to enhance the City's position as a regional leader in health and equity, encourage healthy design and equitable access, and increase awareness of equity and environmental issues.

A detailed analysis of the Project's consistency with *Plan for a Healthy Los Angeles* is provided in Table 6. The Project prioritizes safety and access for all individuals utilizing the Project Site by complying with all ADA requirements and providing direct connections to pedestrian amenities

with separate pedestrian and vehicle accesses and active street frontages. Further, the Project supports healthy lifestyles and encourages alternative modes of transport by locating housing, including 114 affordable units, and jobs near transit (Metro bus lines), providing bicycle parking, and enhancing the pedestrian environment with shade trees and landscaping. The Project is also estimated, as demonstrated in Section 4B, to generate lower VMT per household than the areawide average, reducing GHG emissions.

Thus, the Project would be consistent with the goals of *Plan for a Healthy Los Angeles*.

Land Use Element of the General Plan

The City General Plan's Land Use Element contains 35 Community Plans that establish specific goals and strategies for the various neighborhoods across Los Angeles. This Project falls within the boundaries of *Downtown Community Plan*.

Downtown Community Plan. A detailed analysis of the Project's consistency with *Downtown Community Plan* is provided in Table 7. The intent of *Downtown Community Plan*, which was adopted on May 3, 2023 and became effective on January 27, 2025, is to create and implement a vision of the future for downtown Los Angeles. According to regional projections, by Year 2040, downtown Los Angeles will add approximately 125,000 people, 70,000 housing units, and 55,000 jobs. The following "core principles" represent the long-term priorities of the plan:

- Accommodate anticipated growth through Year 2040 in an inclusive, equitable, sustainable, and healthy manner, while supporting and sustaining Downtown's ongoing revitalization
- Reinforce Downtown's jobs creation
- Grow and support the residential base
- Strengthen neighborhood character
- Promote a transit-, bicycle-, and pedestrian-friendly environment
- Create linkages between districts
- Create world-class streets and public realm

The Project would provide a mixed-use development with residential and local-serving restaurant uses buildings to accommodate future growth in the nearby Arts District, an emerging neighborhood in downtown Los Angeles, in an inclusive, equitable, sustainable, and healthy manner as it would aim to enhance and improve the existing Project Site. The Project proposes a high-density mixed-use infill development located in proximity to transit. The Project would enhance the local job base by adding new residents within the downtown Los Angeles area.

The Project would provide bicycle and pedestrian amenities that promote a transit-, bicycle-, and pedestrian-friendly environment, such as wider sidewalks, street trees, and landscaping that improve walkability and connectivity for pedestrian access between transit stops and nearby destinations. The Project would also provide bicycle parking to encourage bicycling for residents, employees, and visitors to the Project Site. Pedestrian and bicycle access would be separate from vehicular access, further prioritizing pedestrian and bicycle safety and comfort. The Project, through its characteristics highlighted above, both supports policies and does not hinder other goals and policies identified in *Downtown Community Plan*. Therefore, the Project is consistent with and would not obstruct the implementation of the policies recommended by *Downtown Community Plan*.

LAMC Section 12.21.A.16 (Bicycle Parking)

LAMC Section 12.21.A.16 details the bicycle parking requirements for new developments. As further detailed in Section 5E, the Project would provide short-term and long-term spaces to satisfy the LAMC requirements for on-site bicycle parking supply.

LAMC Section 12.26G (TDM Ordinance)

LAMC Section 12.26G, the TDM Ordinance (1993) establishes TDM requirements for non-residential projects, in addition to non-residential components of mixed-use projects in excess of 25,000 sf. The total non-residential component of the Project does not exceed 25,000 sf. Therefore, the Project would not be subject to the requirements of LAMC Section 12.26G and would not be required to incorporate TDM measures. However, as mentioned above, as a project

design feature and TDM strategy, the Project would satisfy LAMC Section 12.21.A.16 by providing short term and long term bicycle parking.

Vision Zero Corridor Plans

Vision Zero implements projects that are designed to increase safety on the most vulnerable City streets. The City has identified a number of streets as part of the HIN where City projects will be targeted. As previously detailed, the Project Site is located adjacent to 7th Street, which is identified in the HIN, and Central Avenue, Olympic Boulevard, and Alameda Street south of Olympic Boulevard have also been identified in the HIN.

Currently, no Vision Zero Safety improvements are planned along the identified streets. Nonetheless, the Project improvements to the pedestrian environment would not preclude any Vision Zero safety improvements by the City. Thus, the Project would not conflict with Vision Zero.

Streetscape Plans

None of the City's established Streetscape Plans would affect the Project Site. Nevertheless, the Project would not preclude the City from future streetscape improvements.

Citywide Design Guidelines

The Pedestrian-First Design approach of the *Citywide Design Guidelines* (LADCP Urban Design Studio, October 2019) identifies design strategies that "create human-scale spaces in response to how people actually engage with their surroundings, by prioritizing active street frontages, clear paths of pedestrian travel, legible wayfinding, and enhanced connectivity. Pedestrian-First Design promotes healthy living, increases economic activity at the street level, enables social interaction, creates equitable and accessible public spaces, and improves public safety".

The Pedestrian-First Design guidelines are as follows:

- Guideline 1: Promote a safe, comfortable, and accessible pedestrian experience for all.
- Guideline 2: Carefully incorporate vehicular access such that it does not degrade the pedestrian experience.
- Guideline 3: Design projects to actively engage with streets and public space and maintain human scale.

A detailed analysis of the Project's consistency with the Pedestrian-First Design guidelines of the Citywide Design Guidelines is provided in Table 8.

The Project design includes accessible sidewalks, pedestrian amenities, and well-designed vehicular access driveways in accordance with the Citywide Design Guidelines. The Project would provide street trees uniformly within the sidewalk to provide overhead shade, as well as a more comfortable environment for pedestrians. Further, the Project would provide separate pedestrian entrances to ensure safe pedestrian access separate from vehicular activity. Thus, the Project would be consistent with the Pedestrian-First Design goal of *Citywide Design Guidelines*.

CUMULATIVE ANALYSIS

In addition to potential Project-specific impacts, the TAG requires that the Project be reviewed in combination with nearby Related Projects to determine if the potential exists for a cumulatively significant impact resulting from inconsistency with a particular program, plan, policy, or ordinance. In accordance with the TAG, the cumulative analysis must include consideration of any Related Projects within 0.50 miles of the Project Site and within 0.25 miles of the furthest outlying study intersection and any transportation system improvements in the vicinity. Table 3 identifies Related Projects within a 0.50-mile radius of the Project Site and 0.25-mile radius of the furthest outlying study intersection, as required by the TAG and approved in the MOU.

Each of the Related Projects considered in this cumulative analysis of consistency with programs, plans, policies, and ordinances would be separately reviewed, including a check for their consistency with applicable policies, prior to approval by the City. Collectively, the Project and the Related Projects add high-density development in a major commercial area with high-quality transit options and high levels of pedestrian activity. Thus, the Project and the Related Projects would not preclude the City's ability to serve transportation needs as defined by the City's

transportation policy framework. Therefore, the Project, together with the Related Projects identified in Table 3, would neither create inconsistencies nor result in cumulative impacts with respect to the identified programs, plans, policies, and ordinances.

TABLE 5
PROJECT CONSISTENCY WITH MOBILITY PLAN 2035

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Chapter 1 - Safety First	
Policy 1.1 Roadway User Vulnerability Design, plan, and operate streets to prioritize the safety of the most vulnerable roadway user.	**Consistent.** With the development of the Project, Alameda Street and 7th Street along the Project frontage would be improved to provide adequate pedestrian safety and to meet the goals and long-term needs of the Mobility Plan. The Project would provide driveways on local/unidentified streets internal to the Project Site, designed and placed in accordance with current City standards to reduce interruptions to vehicle, bicycle, and pedestrian safety. No driveways would be located along a street with an existing bicycle facility. Further, the Project does not propose modifying, removing, or otherwise affecting existing bicycle infrastructure.
Policy 1.6 Multi-Modal Detour Facilities Design detour facilities to provide safe passage for all modes of travel.	**Consistent.** Construction activities would be maintained on-site to the extent feasible. Any impediments to the public right-of-way would be addressed with implementation of a Construction Management Plan.
Chapter 2 - World Class Infrastructure	
Policy 2.3 Pedestrian Infrastructure Recognize walking as a component of every trip, and ensure high-quality pedestrian access in all site planning and public right-of-way modifications to provide a safe and comfortable walking environment.	**Consistent.** The Project would enhance pedestrian access within and around the Project Site by providing pedestrian connections between the two buildings on the Project Site for residents, employees, and guests. To enhance the pedestrian environment, the Project would maintain sidewalks along the Project frontages to meet Mobility Plan standards, as well as separate vehicle and pedestrian access to reduce interruptions to pedestrian traffic and safety. Landscaping along the Project frontages would also be provided to further enhance the pedestrian environment. The Project proposes ground floor commercial space, which would further enhance the pedestrian experience.
Policy 2.4 Neighborhood Enhanced Network Provide a slow speed network of locally serving streets.	**Consistent.** No streets adjacent to the Project are identified as part of the Mobility Plan's Neighborhood Enhanced Network. The Project is proposing pedestrian improvements along the Project frontages to meet the long-term mobility needs identified in the Mobility Plan.
Policy 2.5 Transit Network Improve the performance and reliability of existing and future bus service.	**Consistent.** No streets adjacent to the Project Site are identified as part of the Mobility Plan's Transit Enhanced Network. Nevertheless, the Project would encourage more transit usage by developing a mixed-use project with convenient access to bus transit services.
Policy 2.6 Bicycle Networks Provide safe, convenient, and comfortable local and regional bicycling facilities for people of all types and abilities. (includes scooters, skateboards, rollerblades, etc.)	**Consistent.** The Project does not propose modifying, removing, or otherwise affecting existing bicycle infrastructure. No driveways would be located along a street with an existing bicycle facility. Bicycle parking would also be provided on-site in accordance with LAMC requirements.
Policy 2.7 Vehicle Network Provide vehicular access to the regional freeway system.	**Consistent.** Vehicular access would be provided via driveways along Warehouse Street and internal to the Project Site off Bay Street. These two streets feed onto 7th Street and Alameda Street, which both provide regional access to and from the freeway system.
Policy 2.9 Multiple Networks Consider the role of each mode enhanced network when designing a street that included multiple modes.	**Consistent.** 7th Street and Alameda Street adjacent to the Project Site are part of multiple networks designated by the Mobility Plan. The Project would provide and accommodate for the various modes of travel on the streets and minimize conflicts to prioritize safety. The Project would not preclude any future improvements to the adjacent roadway network.
Policy 2.10 Loading Areas Facilitate the provision of adequate on and off-street loading areas.	**Consistent.** All proposed delivery drop-off/loading zones would be provided on-site, including loading for large trucks. The loading zones would be managed to facilitate safe loading operations and to limit vehicle queue spillovers into the travel lanes.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Mobility Plan 2035: An Element of the General Plan* (Los Angeles Department of City Planning, January 2016).

TABLE 5 (CONT.)
PROJECT CONSISTENCY WITH MOBILITY PLAN 2035

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Chapter 3 - Access for All Angelenos	
Policy 3.1 Access for All Recognize all modes of travel, including pedestrian, bicycle, transit, and vehicular modes – including goods movement – as integral components of the City's transportation system.	**Consistent.** The Project is committed to encouraging multi-modal transportation alternatives and access for all travel modes to and from the Project Site. The Project would provide loading zones on-site for trucks. The Project also would provide infrastructure (short- and long-term bicycle parking) to encourage walking and bicycling. Additionally, the Project is located adjacent to numerous Metro bus stops which provides access to a variety of travel modes for residents, employees, and visitors to the Project Site.
Policy 3.2 People with Disabilities Accommodate the needs of people with disabilities when modifying or installing infrastructure in the public right-of-way.	**Consistent.** The Project's vehicular and pedestrian entrances would be designed in accordance with LADOT standards and would comply with Americans with Disabilities Act (ADA) requirements. The Project design would also be in compliance with all ADA requirements and would provide direct connections to pedestrian amenities at adjacent intersections.
Policy 3.5 Multi-Modal Features Support "first-mile, last-mile solutions" such as multi-modal transportation services, organizations, and activities in the areas around transit stations and major bus stops (transit stops) to maximize multi-modal connectivity and access for transit riders.	**Consistent.** As a Project design feature, the Project would provide LAMC-required bicycle parking facilities. This feature would support multi-modal connectivity and access for transit riders.
Policy 3.8 Bicycle Parking Provide bicyclists with convenient, secure, and well-maintained bicycle parking facilities.	**Consistent.** The Project would provide short-term and long-term bicycle parking throughout the Project Site that would satisfy the LAMC requirement.
Chapter 4 - Collaboration, Communication, & Informed Choices	
Policy 4.5 Improved Communication Facilitate communications between citizens and the City in reporting on and receiving responses to non-emergency street improvements.	**Consistent.** As part of the Project's Construction Management Plan, advance notification to the adjacent property owners and occupants of upcoming construction activities, including durations and daily hours of construction, would be provided.
Policy 4.8 Transportation Demand Management Strategies Encourage greater utilization of Transportation Demand Management (TDM) strategies to reduce dependence on single-occupancy vehicles.	**Consistent.** The Project incorporates bike parking per LAMC requirements, including short-term and long-term parking facilities and bicycle amenities, as a design features to reduce the number of single occupancy vehicle trips to the Project Site.
Policy 4.13 Parking and Land Use Management Balance on-street and off-street parking supply with other transportation and land use objectives.	**Consistent.** The Project would provide sufficient off-street parking to accommodate Project parking demand. No on-street parking would be provided adjacent to the Project on Alameda Street or 7th Street.
Policy 4.14 Wayfinding Provide widespread, user-friendly information about mobility options and local destinations, delivered through a variety of channels including traditional signage and digital platforms.	**Consistent.** The Project would incorporate illumination for parking, signage, and security purposes.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Mobility Plan 2035: An Element of the General Plan* (Los Angeles Department of City Planning, January 2016).

TABLE 5 (CONT.)
PROJECT CONSISTENCY WITH MOBILITY PLAN 2035

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Chapter 5 - Clean Environments & Healthy Communities	
Policy 5.1 Sustainable Transportation Encourage the development of a sustainable transportation system that promotes environmental and public health.	**Consistent.** As part of the Project, secured bicycle parking facilities and pedestrian connections within the Project Site and connecting to off-site pedestrian facilities would be provided. This would promote active transportation modes such as biking and walking. Additionally, the Project is located adjacent to several Metro bus stops, providing residents, employees, and visitors to the Project with public transportation alternatives.
Policy 5.2 Vehicle Miles Traveled (VMT) Support ways to reduce vehicle miles traveled (VMT) per capita.	**Consistent.** The Project is estimated to generate lower household VMT per capita than the average for the area, as demonstrated in Section 4B. Additionally, the Project incorporates bicycle parking as a Project design feature to reduce the number of single-occupancy vehicle trips to the Project Site.
Policy 5.4 Clean Fuels and Vehicles Continue to encourage the adoption of alternative fuels, new mobility technologies, and supporting infrastructure.	**Consistent.** The Project would incorporate bicycle parking to promote and provide employees and patrons the opportunity to utilize alternative transportation modes to reduce VMT by reducing the number of single occupancy vehicle trips to the Project Site, as well as support electric vehicles by providing charging stations and infrastructure.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Mobility Plan 2035: An Element of the General Plan* (Los Angeles Department of City Planning, January 2016).

TABLE 6
PROJECT CONSISTENCY WITH PLAN FOR A HEALTHY LOS ANGELES

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Chapter 1 - Los Angeles, a Leader in Health and Equity	
Policy 1.5 Plan for Health Improve Angelenos' health and well-being by incorporating a health perspective into land use, design, policy, and zoning decisions through existing tools, practices, and programs.	**Consistent.** The Project prioritizes safety and access for all individuals utilizing the site by complying with all ADA requirements and providing direct connections to pedestrian amenities at adjacent intersections. Further, the Project supports healthy lifestyles by locating housing and jobs near transit (Metro Local Bus Lines), providing bicycle parking, and enhancing the pedestrian environment by providing landscape elements for a more comfortable environment for pedestrians along 7th Street and Alameda Street.
Policy 1.6 Poverty and Health Reduce the debilitating impact that poverty has on individual, familial, and community health and well-being by: promoting cross-cutting efforts and partnerships to increase access to income; safe, healthy, and stable affordable housing options; and attainable opportunities for social mobility.	**Consistent.** The Project includes 114 affordable housing units within close proximity to transit. Also, the Project's ground floor commercial uses provide employment and entrepreneurial opportunities accessible via alternative modes of transit near the Project Site.
Policy 1.7 Displacement and Health Reduce the harmful health impacts of displacement on individuals, families and communities by pursuing strategies to create opportunities for existing residents to benefit from local revitalization efforts by: creating local employment and economic opportunities for low-income residents and local small businesses; expanding and preserving existing housing opportunities available to low-income residents; preserving cultural and social resources; and creating and implementing tools to evaluate and mitigate the potential displacement caused by large-scale investment and development.	**Consistent.** In addition to the 114 affordable housing units, the Project provides employment opportunities near transit through its provision of ground floor commercial space. Further, the Project does not displace any existing housing; rather, it converts a substantial amount of underutilized land into an active and vibrant mixed-use community with improved mobility options.
Chapter 5 - An Environment Where Life Thrives	
Policy 5.7 Land Use Planning for Public Health and GHG Emission Reduction Promote land use policies that reduce per capita greenhouse gas emissions, result in improved air quality and decreased air pollution, especially for children, seniors and others susceptible to respiratory diseases.	**Consistent.** The Project incorporates bike parking per LAMC requirements, including short-term and long-term parking facilities and bicycle amenities, as a design feature to reduce the number of single occupancy vehicle trips to the Project Site. VMT directly contributes to GHG emissions, so a reduced VMT per capita also reduces GHG per capita.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Plan for a Healthy Los Angeles: A Health and Wellness Element of the General Plan* (Los Angeles Department of City Planning, March 2015).

TABLE 7
PROJECT CONSISTENCY WITH DOWNTOWN COMMUNITY PLAN

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Policy LU 1.1: Ensure the development of complete neighborhoods with diverse uses and resilient infrastructure, parks, streetscapes, transit, and community amenities.	**Consistent.** The Project proposes a mixed-use development located within 0.5 miles of numerous Metro bus stops which provide access to alternative transportation modes for residents, employees, and visitors to the Project Site. The Project aims to enhance the existing site by actively engaging with streets and public space.
Policy LU 1.2: Create zoning tools to provide for a diverse and inclusive Downtown through a range of housing and employment options.	**Consistent.** The Project includes a mix of market rate and affordable housing units, as well as ground floor commercial space that can provide employment and entrepreneurial opportunities.
Policy LU 2.1: Foster an equitable and inclusive Downtown, with housing options that can accommodate the fullest range of economic and social needs.	**Consistent.** The Project includes a mix of market rate and affordable housing units.
Policy LU 3.1: Recognize additional housing unit options to accommodate a variety of household sizes, including larger households, such as those with children, multigenerational living, and special needs populations.	**Consistent.** The Project includes a mix of market rate and affordable housing units with various unit mixes.
Policy LU 3.3: Foster healthy communities composed of mixed-income housing in proximity to transit, jobs, amenities, services, cultural resources, and recreational facilities.	**Consistent.** The Project is located within 0.50 miles several Metro bus stops, providing residents, employees, and visitors to the Project with public transportation alternatives.
Policy LU 9.7: Expand access to employment opportunities with improved physical connections to and within Downtown and expanded transit service to employment districts.	**Consistent.** The Project would expand access to employment opportunities by locating a mixed-use development within 0.50 miles of several Metro bus stops, providing residents, employees, and visitors to the Project with public transportation alternatives.
Policy LU 7.8: Encourage mixed-use and commercial development to provide retail spaces conducive to community-serving small businesses and business incubation.	**Consistent.** The Project proposes a mix of high-density residential uses and commercial uses.
Policy LU 10.4: Support infill development that responds and contributes to neighborhood character.	**Consistent.** The Project is an infill development as it proposes to convert a substantial amount of underutilized land into an active and vibrant mixed-use community that includes high-density residential uses and commercial uses.
Policy LU 11.1: Require active ground floors and street frontages that improve walkability and connectivity, especially between transit stations and nearby destinations.	**Consistent.** The Project incorporates landscaping and lighting along Project frontages and is designed to be street facing from 7th Street and Alameda Street. Additionally, the Project is located within 0.50 miles several Metro bus stops, providing residents, employees, and visitors to the Project with public transportation alternatives.
Policy LU 11.4: Encourage building design that connects and orients people toward destinations and activity centers.	**Consistent.** The Project includes open space, landscaping, and comfortable pedestrian walkways to active the streetscape and connect people towards destinations and activity centers.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Downtown Los Angeles Community Plan* (Los Angeles Department of City Planning, January 2025).

TABLE 7 (CONT.)
PROJECT CONSISTENCY WITH DOWNTOWN COMMUNITY PLAN

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
