Policy LU 11.8: Promote compact development and encourage walking, biking, and transit use by encouraging no or minimal parking, when possible.	**Consistent.** The Project would promote compact development by proposing a mixed-use development located within a neighborhood with several existing commercial, residential, industrial, and retail establishments. The Project does not propose excess parking as compared to the LAMC requirements. Additionally, it encourages alternative transportation by providing secured bicycle parking facilities. This would promote active transportation modes such as biking and walking. Additionally, the Project is located within 0.50 miles several Metro bus stops, providing residents, employees, and visitors to the Project with public transportation alternatives.
Policy LU 11.9: Encourage underground parking, when provided, to increase the amount of above grade building square footage dedicated to active uses and to improve the pedestrian environment.	**Consistent.** The Project would provide vehicle parking spaces within two subterranean parking levels under each building.
Policy LU 19.2: Ensure a vibrant mixture of land uses, including office, hotel, retail, residential, cultural, and entertainment, that together reinforce Downtown as the primary center of urban activity in the Southern California region.	**Consistent.** The Project proposes vibrant mixture of uses including high-density residential uses and retail uses located in downtown Los Angeles.
Policy LU 22.2: Foster and reinforce cohesive, pedestrian-friendly, and inviting streetscapes that promote walking, bicycling, and transit use. Encourage the creative infill of landscaped setbacks and inoperative spaces, such as those resulting from inconsistent street walls.	**Consistent.** The Project includes the provision of pedestrian amenities including adequate sidewalks, street trees, open space, and landscaping. The Project also proposed ground-floor commercial space, which would further enhance the pedestrian experience. Overall, the Project would be designed to actively engage with streets and public space.
Policy LU 22.6: Encourage new developments to contribute to the pedestrian and open space network with publicly accessible plazas and paseos. Design these spaces with appropriate shade and landscaping.	**Consistent.** The Project incorporates various design features to promote open space and improve the pedestrian network, which include landscaping elements that provide shade and adequate sidewalks along Project frontages.
Policy LU 22.9: Encourage an active, walkable environment through building design that incorporates active ground floor uses and streetscape elements that provide an enhanced pedestrian experience.	**Consistent.** The Project incorporates landscaping and lighting along Project frontages and is designed to be street facing from Alameda Street and 7th Street. In addition, the Project proposes ground floor commercial space, which would further enhance the pedestrian experience.
Policy MC 2.1: Establish a mode share goal of 75% for transit, walking, and biking for the year 2040 to improve the sustainability of Downtown's mobility network and increase access for residents, workers, and visitors.	**Consistent.** Although Policy MC 2.1 sets a City goal for mode share and not a project-specific goal, the Project would be consistent with this policy. Specifically, the Project would support multi-modal mobility options such as biking and transit usage. Additionally, the Project design incorporates the TDM strategy of LAMC required bicycle parking to reduce the number of single occupancy vehicle trips to the Project Site.
Policy MC 2.2: Implement strategies to reduce vehicle miles traveled per capita.	**Consistent.** The Project is estimated to generate lower household VMT per capita than the average for the area. Further, it would implement a TDM program to further reduce VMT per capita.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in *Downtown Community Plan* (Los Angeles Department of City Planning, adopted May 2023, effective January 2025).

TABLE 7 (CONT.)
PROJECT CONSISTENCY WITH DOWNTOWN COMMUNITY PLAN

Objective, Policy, Program, or Plan [a]	Analysis of Project Consistency
Policy MC 2.5: Facilitate integration between different modes of travel to create a seamless experiences as users switch between modes and to promote transit use and active transportation.	**Consistent.** The Project would support multi-modal mobility options such as biking with a bicycle parking facilities. Additionally, the Project is located within 0.50 miles of several Metro bus stops.
Policy MC 3.4: Enhance the pedestrian experience between major destinations and transit stations through improved streetscapes and wayfinding programs.	**Consistent.** The Project incorporates landscaping and lighting along Project frontages and is designed to be street facing from Alameda Street and 7th Street. In addition, the Project proposes ground-floor commercial space, which would further enhance the pedestrian experience.
Policy MC 4.2: Encourage residential and office buildings to provide bicycle related amenities such as repair stations and showers to facilitate cycling for residents, workers, and visitors.	**Consistent.** The Project proposes residential uses and would provide bicycle infrastructure, services, and amenities to encourage bicycling for residents, employees, and visitors to the Project Site.
Policy MC 7.3: Encourage projects to include designated spaces for rideshare vehicles and pick-up / drop-off zones.	**Consistent.** The Project will provide passenger loading opportunities within the Project Site.

Notes:

TABLE 8
PROJECT CONSISTENCY WITH CITYWIDE DESIGN GUIDELINES

Objective, Policy, Program, or Plan [a]	**Analysis of Project Consistency**
Pedestrian-First Design	
Guideline 1: Promote a safe, comfortable, and accessible pedestrian experience for all Design projects to be safe and accessible and contribute to a better public right-of-way for people of all ages, genders, and abilities, especially the most vulnerable - children, seniors, and people with disabilities. **Guideline 2: Carefully incorporate vehicular access such that it does not degrade the pedestrian experience** Design to avoid pedestrian and vehicular conflicts and to create an inviting and comfortable public right-of-way. A pleasant and welcoming public realm reinforces walkability and improves the quality of life for users. **Guideline 3: Design projects to actively engage with streets and public space and maintain human scale** New projects should be designed to contribute to a vibrant and attractive public realm that promotes a sense of civic pride. Better connections within the built environment contribute to a livable and accessible city and a healthier public realm.	**Consistent.** The Project design includes accessible sidewalks, pedestrian amenities, and well-designed vehicular access driveways in accordance with the City's design considerations. The Project would provide street trees to provide for a more comfortable pedestrian environment. Further, the orientation of the Project pedestrian entrances ensures that the Project actively engages with the street activity and its surrounding uses. The Project proposes ground floor commercial space, which would further enhance the pedestrian experience.

Notes:
[a] Objectives, Policies, Programs, or Plans based on information provided in the Citywide Design Guidelines (Los Angeles Department of City Planning, 2019).

Section 4B: Threshold T-2.1
Causing Substantial VMT Analysis

Threshold T-2.1 states that a residential project would result in a significant VMT impact if it cannot meet the household VMT per capita of 15% below the existing average household VMT per capita for the Area Planning Commission (APC) area in which a project is located. Similarly, a commercial project would result in a significant VMT impact if it cannot meet the work VMT per employee of 15% below the existing average work VMT per employee for the APC area in which the project is located.

The VMT analysis presented below was conducted in accordance with the TAG, which satisfies State requirements under SB 743.

VMT METHODOLOGY

The following describes the methodology by which vehicle trips and VMT are calculated in *City of Los Angeles VMT Calculator Version 1.5* (LADOT, October 2024) (VMT Calculator), as detailed in *City of Los Angeles VMT Calculator Documentation* (LADOT and LADCP, May 2020). LADOT developed the VMT Calculator to estimate project-specific daily household VMT per capita and daily work VMT per employee for developments within City limits, which are based on the following types of one-way trips:

- Home-Based Work Production: trips from a residential use to a workplace destination
- Home-Based Other Production: trips from a residential use to a non-workplace destination (e.g., retail, restaurant)
- Home-Based Work Attraction: trips from a workplace to a residential use destination

As detailed in *City of Los Angeles VMT Calculator Documentation*, the household VMT per capita threshold applies to Home-Based Work Production and Home-Based Other Production trips, and the work VMT per employee threshold applies to Home-Based Work Attraction trips, as the

location and characteristics of residences and workplaces are often the main drivers of VMT, as detailed in Appendix 1 of *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR, December 2018) (Technical Advisory).

Other types of trips generated in the VMT Calculator include Non-Home-Based Other Production (trips to a non-residential destination originating from a non-residential use), Home-Based Other Attraction (trips to a non-workplace destination originating from a residential use), and Non-Home-Based Other Attraction (trips to a non-residential destination originating from a non-residential use). These trip types are not factored into the VMT per capita and VMT per employee thresholds as those trips are typically localized and are assumed to have a negligible effect on the VMT impact assessment. However, those trips are factored into the calculation of total project VMT for screening purposes when determining if VMT analysis would be required.

Table 2.2-1 of the TAG details the following daily household VMT per capita and daily work VMT per employee impact criteria (15% below APC average) for the APC areas:

APC	Daily Household VMT per Capita	Daily Work VMT per Employee
Central	6.0	7.6
East LA	7.2	12.7
Harbor	9.2	12.3
North Valley	9.2	15.0
South LA	6.0	11.6
South Valley	9.4	11.6
West LA	7.4	11.1

Source: TAG

The Project is located within the Central APC and, therefore, has a daily household VMT per capita impact threshold (15% below APC average) of 6.0 and a daily work VMT per employee impact threshold (15% below APC average) of 7.6.

Retail VMT

According to the TAG, regional-serving retail can lengthen trips and increase VMT because it is likely to shift business away from local-serving retail options. Conversely, local-serving retail (which includes restaurant space) tends to shorten trips and reduce VMT because it attracts trips from nearby residences and businesses that would otherwise travel further to find suitable options. As detailed in OPR's Technical Advisory and the TAG, retail stores that are less than 50,000 sf within mixed-use development projects are considered local-serving and are assumed to have less than significant VMT impacts.

Travel Behavior Zones (TBZ)

The City developed TBZ categories to determine the magnitude of VMT and vehicle trip reductions that could be achieved through TDM strategies. As detailed in *City of Los Angeles VMT Calculator Documentation*, the development of the TBZs considered the population density, land use density, intersection density, and proximity to transit of each Census tract in the City. The TBZs are categorized as follows:

1. Suburban (Zone 1): Very low-density primarily centered around single-family homes and minimally connected street network
2. Suburban Center (Zone 2): Low-density developments with a mix of residential and commercial uses with larger blocks and lower intersection density
3. Compact Infill (Zone 3): Higher density neighborhoods that include multi-story buildings and well-connected streets
4. Urban (Zone 4): High-density neighborhoods characterized by multi-story buildings with a dense road network

The VMT Calculator determines a project's TBZ based on the latitude and longitude of a project address. The Project is located within a Compact Infill (Zone 3) TBZ.

Mixed-Use Development Methodology

As detailed in *City of Los Angeles VMT Calculator Documentation*, the VMT Calculator accounts for the interaction of land uses within a mixed-use development and considers the following sociodemographic, land use, and built environment factors for a project area:

- Land use density of the project
- Transportation network connectivity
- Availability of and proximity to transit
- Proximity to retail and other destinations
- Vehicle ownership rates
- Household size

Trip Lengths

The VMT Calculator determines a project's VMT based on trip length information from the City's Travel Demand Forecasting Model, which considers the traffic analysis zones within 0.125 miles of a project to determine the average trip length and trip type, which factor into the calculation of a project's VMT.

Population and Employment Assumptions

As previously stated, the VMT thresholds identified in the TAG are based on household VMT per capita and work VMT per employee. Thus, the VMT Calculator contains population assumptions developed based on Census data for the City and employment assumptions derived from multiple data sources, including *2012 Developer Fee Justification Study* (Los Angeles Unified School District [LAUSD], 2012), *Trip Generation Manual, 9th Edition* (ITE, 2012), the San Diego Association of Governments Activity Based Model, the United States Department of Energy, and other modeling resources. A summary of population and employment assumptions for various land uses is provided in Table 1 of *City of Los Angeles VMT Calculator Documentation*.

TDM Measures

Additionally, the VMT Calculator measures the reduction in VMT resulting from a project's incorporation of TDM measures or strategies whether as part of regulatory compliance, project design features, or mitigation measures. The following seven categories of TDM measures or strategies are included in the VMT Calculator:

1. Parking
2. Transit
3. Education and Encouragement
4. Commute Trip Reductions
5. Shared Mobility
6. Bicycle Infrastructure
7. Neighborhood Enhancement

TDM measures or strategies within each of these categories have been empirically demonstrated to reduce trip-making or mode choice in such a way as to reduce VMT, as documented in *Quantifying Greenhouse Gas Mitigation Measures* (California Air Pollution Control Officers Association, 2010).

PROJECT VMT ANALYSIS

The VMT Calculator was used to evaluate Project VMT for comparison to the VMT impact criteria. Based on guidance from the City, the VMT Calculator was modeled for the Project's land uses and their respective sizes as the primary input.

As stated in the TAG, retail and restaurant uses totaling less than 50,000 sf would be considered local-serving and would have a negligible effect on regional VMT. Therefore, the VMT impact of the Project's commercial component (totaling 6,547 sf) would be considered less-than-significant. As such, the VMT analysis presented below evaluates the household VMT per capita generated by the residential uses of the Project.

Project VMT

The Project would not be subject to the LAMC Section 12.26GJ requirement to incorporate TDM measures. However, as mentioned above, as a project design feature and TDM strategy, the Project would satisfy LAMC Section 12.21.A.16 by providing short term and long term bicycle parking, as identified in the VMT Calculator as a Bicycle Infrastructure strategy.

The VMT analysis results based on the VMT Calculator are detailed in Table 9. The VMT Calculator estimates that the Project would have 2,354 residents and generate a total home-based production VMT of 12,244. Thus, the Project would generate an average household VMT per capita of 5.2. The average household VMT per capita of the Project would not exceed the Central APC significant household VMT impact threshold (15% below APC average) of 6.0 and, therefore, the Project would not result in a significant VMT impact, and no mitigation measures would be required. The detailed output from the VMT Calculator is provided in Appendix D.

CUMULATIVE ANALYSIS

Cumulative effects of development projects are determined based on the consistency with the air quality and GHG reduction goals of *Connect SoCal – A Plan for Navigating to a Brighter Future* (Southern California Association of Governments, Adopted April 2024) (RTP/SCS) in terms of development location, density, and intensity. The RTP/SCS presents a long-term vision for the region's transportation system through Year 2050 and balances the region's future mobility and housing needs with economic, environmental, and public health goals.

As detailed in the TAG, for projects that do not demonstrate a project impact by applying an efficiency-based impact threshold (i.e., household VMT per capita or work VMT per employee) in the project impact analysis, a less than significant impact conclusion is sufficient in demonstrating there is no cumulative VMT impact, as those projects are already shown to align with the long-term VMT and GHG goals of the RTP/SCS.

As described above, the Project would not result in a significant VMT impact. Further, the Project would be designed to further reduce single occupancy trips to the Project Site by implementing TDM strategies including the provision of bike parking per the LAMC as Project design features.

Therefore, the Project would result in a less-than-significant cumulative impact under Threshold T-2.1, and no further evaluation or mitigation measures would be required.

Furthermore, the Project Site is well served by Metro rail and various local bus lines and would contribute to the productivity and use of the regional transportation system. The Project would both provide housing and commercial uses near transit and encourage active transportation by providing new bicycle parking infrastructure, in line with RTP/SCS goals. Thus, the Project would encourage a variety of transportation options and would be consistent with the RTP/SCS goal of maximizing mobility and accessibility in the region.

TABLE 9
VMT ANALYSIS SUMMARY

Prcject Information	
Land Use	**Size**
Housing | Multi-Family	886 du
Housing | Affordable Housing - Family	114 du
Retail | High-Turnover Sit-Down Restaurant [a]	6,547 sf
VMT Screening Analysis [b]	
Net Daily Vehicle Trips	4,676
Net Daily VMT	30,560
Prcject VMT Analysis [c]	
Resident Population	2,354
Employee Population	26
Project Area Planning Commission	Central
Travel Behavior Zone (TBZ) [d]	Compact Infill
Maximum Allowable VMT Reduction [e]	40%
Daily Vehicle Trips	4,648
Total Daily VMT	30,369
Total Home-Based Production VMT	12,244
Household VMT per Capita [f]	5.2
Impact Threshold	6.0
Significant Impact	**NO**
Total Home-Based Work Attraction VMT	125
Work VMT per Employee [g]	N/A
Impact Threshold	7.6
Significant Impact	**NO**

Notes:

du = dwelling units sf = square feet

[a] Commercial area analyzed as High-Turnover (Sit-Down) Restaurant to provide the most conservative analysis.

[b] As part of the VMT Screening Analysis of the approved MOU, the VMT Calculator Version 1.5 (October 2024) was used to estimate the net daily vehicle trips and net daily VMT for the Project prior to any VMT reductions associated with the implementation of TDM strategies as part of the Project. Based on the results, a detailed VMT analysis for the Project is required.

[c] The Project VMT evaluation incorporates VMT reductions associated with the implementation of TDM strategies as part of the Project and includes the provision of LAMC-required bicycle parking.

[d] A "Compact Infill" TBZ is characterized in *City of Los Angeles VMT Calculator Documentation* (LADOT and LADCP, May 2020) as higher density neighborhoods that include multi-story buildings and well connected streets.

[e] The maximum allowable VMT reduction is based on the Project's designated TBZ as determined in *Transportation Demand Management Strategies in LA VMT Calculator* (LADOT, November 2019) and *Quantifying Greenhouse Gas Mitigation Measures* (California Air Pollution Control Officers Association, 2010).

[f] Household VMT per Capita is based on the "home-based production" trip types.

[g] Per the TAG, retail and restaurant uses totaling less than 50,000 sf would be considered local-serving and would have a negligible impact on regional VMT. Therefore, the VMT impact of the Project's commercial component would be considered less-than-significant.

Section 4C: Threshold T-2.2

Substantially Inducing Additional Automobile Travel Analysis

The intent of Threshold T-2.2 is to assess whether a transportation project would induce substantial VMT by increasing vehicular capacity on the roadway network, such as the addition of through traffic lanes on existing or new highways, including general purpose lanes, high-occupancy vehicle lanes, peak period lanes, auxiliary lanes, and lanes through grade-separated interchanges.

The Project is not a transportation project that would induce automobile travel. Therefore, further evaluation is not required, and the Project would not result in a significant impact under Threshold T-2.2.

Section 4D: Threshold T-3

Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use Analysis

Threshold T-3 requires that a project undergo further evaluation if it proposes new driveways or new vehicle access points to the property from the public ROW or modifications along the public ROW (i.e., street dedications). Project access plans were reviewed to determine if the Project would substantially increase hazards due to geometric design features, including safety, operational, or capacity impacts, with consideration of the following factors:

1. The relative amount of pedestrian activity at Project access points
2. Design features/physical configurations that affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists
3. The type of bicycle facilities the project driveway(s) crosses and the relative level of utilization
4. The physical conditions of the site and surrounding area, such as curves, slopes, walks, landscaping or other barriers that could result in vehicle/pedestrian, vehicle/bicycle, or vehicle/vehicle impacts
5. The Project location, or Project-related changes to the public ROW, relative to proximity to the HIN or a Safe Routes to School program area
6. Any other conditions, including the approximate location of incompatible uses that would substantially increase a transportation hazard.

PROJECT HAZARDS ANALYSIS

Driveway Design Features

Vehicular access to the Development Area is only available from within the Project Site and provided by internal driveways along Warehouse Street and Bay Street (outside of the public right of way). The Project would not modify roadway widths or otherwise affect the geometric design of the existing roads surrounding the Project Site, nor would it implement any features that would

obstruct sight distance or paths of vehicular, pedestrian, or bicycle travel at the existing intersections of Alameda Street & Bay Street, Alameda Street & Center Street, or 7th Street & Warehouse Street. The existing Project Site pedestrian and bicycle access would be maintained separate from vehicular access. Therefore, the Project driveways would neither result in an increase of total number of curb cuts, nor substantially increase vehicular conflicts with other vehicles, bicycles, and/or pedestrians, nor present any geometric design hazards related to traffic movement in the public right of way.

Pedestrian and Bicycle Activity

The Development Area pedestrian and bicycle access would be provided separate from the vehicular access via residential lobbies and commercial entrances located along the Project frontages on Alameda Street and Center Street. The Project would result in an increase in both pedestrian and bicycle activity primarily along 7th Street and Alameda Street; however, the existing 15-foot sidewalks along those frontages meet the City's standards and provide a continuous pedestrian connection to the Project Site. Additionally, the Project would improve the streetscape along the adjacent streets with new street trees and landscaping elements to create a walkable and attractive pedestrian environment. The driveways would not cross any existing or proposed bicycle infrastructure. Therefore, the Project is not anticipated to result in significant vehicle-pedestrian or vehicle-bicycle conflicts.

Physical Terrain

The topography of the Project Site is generally level, and the existing driveways intersect the sidewalk and street at right angles and provide adequate building setback to allow pedestrians and bicyclists to observe vehicles within the driveways. In addition, all pedestrian/bicycle access points would be located separate from vehicle driveways to limit potential pedestrian/bicycle and vehicle conflicts.

The Project would provide landscaped elements and street trees for shade along the Project Site perimeter and within the Project Site to create a walkable and attractive pedestrian environment.

Pedestrian sidewalks would be improved to meet City standards and to provide continuous pedestrian connections along the Project Site frontage.

Project Location

Adjacent to the Project Site, 7th Street is identified as part of the HIN. The Project Site is not considered part of any identified SRTS. Additionally, the SRTS map does not identify any infrastructure improvement projects within the Study Area.

While the Development Area driveways are located internal to the Project Site, the existing Project Site driveways are located along 7th Street, which is designated as part of the BLN and PED, and Alameda Street, which is designated as part of the PED, as identified in the Mobility Plan. Although these designations prioritize bicycle and pedestrian mobility, the Project would not create conflicts with these modal priorities because it does not introduce design elements or traffic patterns that would obstruct or degrade their functionality. As such, the Project would not preclude or interfere with the implementation of future roadway improvements benefiting transit, pedestrians, or bicycles.

Incompatible Uses

The Project design incorporates and expands on the surrounding areas to provide a more attractive, well-defined, and accessible interaction between the Project Site and the surrounding uses. None of the Project design elements or land uses are considered incompatible with the surrounding uses. The Project is a primarily residential use located adjacent to predominantly industrial uses; the vehicular mix would be typical of a mixed-use, primarily residential developments rather than industrial operations that generate a high volume of truck traffic that could disrupt mobility priorities. Further, there are no unusual or new obstacles that would be considered hazardous to motorized vehicles, non-motorized vehicles, or pedestrians.

Based on the analysis above, the Project does not present any geometric design hazards related to traffic movement, mobility, pedestrian accessibility, or incompatible uses. Thus, the Project would not result in a significant impact under Threshold T-3.

CUMULATIVE ANALYSIS

In addition to potential Project-specific impacts, the TAG requires that the Project be reviewed in combination with Related Projects with access points along the same block as the Project to determine if there may be a cumulatively significant impact. The Related Projects are included in the non-CEQA analysis for future conditions and would have to be designed according to the City's guidelines. Therefore, the Project would not result in cumulative impacts, including safety, operational, or capacity impacts, that would substantially increase hazards due to geometric design features.

FREEWAY SAFETY ANALYSIS

Section 2.4.4 of the TAG outlines the methodology of assessing potential vehicle to vehicle impacts that may result in unsafe vehicle queues from freeway off-ramp facilities due to speed differentials between the mainline freeway lanes and the queued vehicles at the off-ramp.

Analysis Methodology

Further freeway safety analysis is required for a development project when the project adds 25 or more peak hour trips to any freeway off-ramp. A project would result in adverse safety conditions at such a ramp if each of the following three criteria were met:

1. Under a scenario analyzing future conditions upon project buildout, with project traffic included, the off-ramp queue would extend to the mainline freeway lanes[4].
2. A project would contribute at least two vehicle lengths (50 feet, assuming 25 feet per vehicle) to the queue.
3. The average speed of mainline freeway traffic adjacent to the off-ramp during the analyzed peak hour(s) is greater than 30 mph.

[4] If an auxiliary lane is provided on the freeway, then half the length of the auxiliary lane is added to the ramp storage length.

Should an adverse safety condition be identified, corrective measures to be considered include TDM measures to reduce a project's trip generation, investments in active transportation or transit system infrastructure to reduce a project's trip generation, changes to the traffic signal timing or lane assignments at the ramp intersection, or physical changes to the off-ramp. Any physical change to the ramp would have to improve safety, not induce greater VMT, and not result in secondary environmental impacts.

Project Freeway Safety Analysis

Based on the Project's trip generation estimates and trip assignments, which are described in Chapter 3 and detailed in the MOU provided in Appendix A, the Project would not add 25 or more peak hour trips to any freeway off-ramp locations. Therefore, no further freeway off-ramp queuing analysis is required as it is assumed that the Project would not result in a significant safety impact with that level of peak hour trips, and no corrective measures at any freeway off-ramps would be required.

Chapter 5

Non-CEQA Transportation Analysis

This chapter summarizes the non-CEQA transportation analysis of the Project. It includes an evaluation of Project traffic, proposed access provisions, safety, and circulation operations of the Project, and pedestrian, bicycle, and transit facilities in the vicinity of the Project. This chapter also details the evaluation of the Project's operational conditions and effects due to Project construction.

Per Section 3.1 of the TAG, any deficiencies identified based on the non-CEQA transportation analysis is "not intended to be interpreted as thresholds of significance, or significance criteria for purposes of CEQA review unless otherwise specifically identified in Section 2." Section 3 of the TAG identifies the following four non-CEQA transportation analyses for reviewing potential transportation deficiencies that may result from a development project:

- Pedestrian, Bicycle, and Transit Access Assessment
- Project Access, Safety, and Circulation Evaluation
- Residential Street Cut-Through Analysis
- Project Construction Assessment

The four non-CEQA transportation analyses are reviewed in detail in Sections 5A through 5D. An additional analysis of the Project's proposed parking is provided in Section 5E.

Section 5A

Pedestrian, Bicycle, and Transit Assessment

This section assesses the Project's potential effect on pedestrian, bicycle, and transit facilities in the vicinity of the Project Site.

Factors to consider when assessing a project's potential effect on pedestrian, bicycle, and transit facilities, include the following:

- Would the project directly or indirectly result in a permanent removal or modification that would lead to the degradation of pedestrian, bicycle, or transit facilities?
- Would a project intensify use of existing pedestrian, bicycle, or transit facilities?

EXISTING FACILITIES

Pedestrians and Bicycles

Adjacent to the Project Site, approximately 15-foot-wide sidewalks are provided along Alameda Street & 7th Street. The adjacent signalized study intersection at Alameda Street & 7th Street (Intersection #3) provides pedestrian facilities, including curb ramps on all approaches, pedestrian phasing, and high-visibility crosswalk striping as shown in Figure 5. Additional pedestrian facilities located within the Project Site vicinity are illustrated in Figure 8.

In the immediate vicinity of the Project Site, there are currently Class II bicycle lanes on 7th Street east of Central Avenue and Class IV protected bicycle lanes on 7th Street west of Central Avenue and on Central Avenue. The Project would maintain the existing lanes adjacent to the Project Site on 7th Street, and no Development Area driveways or existing Project Site driveways would introduce new points of conflict between vehicles and bicycles.

Transit

The Metro Local 60 and 62 bus stops are located immediately adjacent to the Project Site at Alameda Street & 7th Street. Additional Metro service within the study area is provided in Table 2 and shown in Figure 9. The Project is located approximately 0.25 miles southeast from Central Avenue & 6th Street, which is a major transit stop served by two or more bus lines with a 20-minute service interval during the morning and afternoon commute periods. Specifically, Metro Lines 16, 18, 53, 60, 62, and 720 are available at this intersection.

INTENSIFICATION OF USE

The Project would result in additional pedestrian, bicycle, and transit activity in the vicinity of the Project Site. However, the Project would enhance the pedestrian environment by providing a more comfortable pedestrian experience by maintaining accessible sidewalks along the Project frontage and would encourage alternative transportation modes by providing bicycle parking and amenities for employees and visitors. In addition, the Project is located within a 0.25-mile walking distance of numerous Metro bus stops.

CONCLUSION

The Project would result in some intensification of pedestrian, bicycle, and transit activity in the vicinity of the Project Site. However, the amount of additional pedestrian, bicycle, and transit activity generated by the Project would not strain the capacity of facilities and operations dedicated to those modes. Furthermore, it is recognized that LADOT and Metro will continue to maintain and expand regional transit service in order to accommodate pedestrian, bicycle, and transit demand in the region.

Section 5B

Project Access, Safety, and Circulation Assessment

This section summarizes the site access, safety, and circulation of the Project Site. It includes a quantitative evaluation of the Project's access and circulation operations, as well as the anticipated LOS at the Study Area intersections and anticipated traffic queues.

PROJECT ACCESS

Vehicle Access and Internal Circulation

As described in Chapter 1, vehicular access would be provided via driveways along Warehouse Street and internal to the Project Site off Bay Street. The Project would provide internal drive aisles that would accommodate passenger vehicle and truck circulation.

The passenger loading and drop-off areas would be provided internal to the Project Site.

The internal driveways would be designed to be consistent with LADOT standards and reviewed by City staff, if necessary. Access control equipment would be designed and operated in order to limit delays at the driveways and general queue spillover. The circulation aisle widths of the parking areas would be designed to allow adequate and safe circulation of vehicles and trucks without significant conflicts. The vehicular access points are adequate to serve the demand of the Development Area and no significant internal congestion that would affect traffic flow on adjacent public streets is anticipated.

Pedestrians and Bicycles

Pedestrian and bicycle access would be provided separate from the vehicular access via residential lobbies and commercial entrances located along the Project frontages on Alameda Street and Center Street.

In the immediate vicinity of the Project Site, there are currently Class II bicycle lanes on 7th Street east of Central Avenue and Class IV protected bicycle lanes on Central Avenue and on 7th Street west of Central Avenue. No driveways are located on streets with bicycle facilities and, therefore, the driveways would not pose a safety hazard to bicyclists. The Project driveways would be designed and placed to provide adequate sight distance and pedestrian refuge areas to limit potential vehicular-bicycle or vehicular-pedestrian conflicts. In order to facilitate bicycle use, short-term and long-term bicycle parking spaces would be provided, as detailed in Section 5E.

OPERATIONAL EVALUATION

Intersection operations were evaluated for typical weekday morning (7:00 AM to 10:00 AM) and afternoon (3:00 PM to 6:00 PM) peak periods. A total of five signalized intersections and one unsignalized intersection in the vicinity of the Project Site were selected for detailed transportation analysis and are shown in Figure 3.

The following traffic conditions were developed and analyzed as part of this study:

- Existing with Project Conditions: This analysis condition estimates the potential intersection operating conditions that could be expected if the Project were built under existing conditions.
- Future with Project Conditions (Year 2032): This analysis condition estimates the potential intersection operating conditions that could be expected if the Project were occupied in the projected buildout year. In this analysis, the Project-generated traffic is added to Future without Project Conditions (Year 2032).

Methodology

In accordance with the TAG, the intersection delay and queue analyses for the operational evaluation were conducted using *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016) (HCM) methodology, which was implemented using Synchro software and signal timing worksheets from the City to analyze intersection operating conditions. The HCM signalized methodology calculates the average delay, in seconds, for each vehicle passing through the intersections, while the HCM unsignalized two-way stop-control methodology calculates the control delay, in seconds, for individual approaches of an intersection. Table 10 presents a description of the LOS categories, which range from excellent, nearly free-flow traffic at LOS A, to stop-and-go conditions at LOS F, for signalized and unsignalized intersections. The queue lengths were estimated using Synchro, which reports the 95th percentile queue length for signalized and unsignalized intersections. The reported queues are calculated using the HCM signalized and unsignalized intersection methodology.

LOS and queuing worksheets for each scenario are provided in Appendix E.

Existing with Project Conditions

Traffic Volumes. The morning and afternoon peak hour traffic volumes generated by the Project, as described in Chapter 3 and shown in Figure 16, were added to the Existing Conditions morning and afternoon peak hour traffic volumes shown in Figure 10. The resulting volumes are illustrated in Figure 17 and represent Existing with Project Conditions (Year 2024), assuming Project operation under Existing Conditions.

Intersection LOS. Table 11 summarizes the weekday morning and afternoon peak hour LOS results for the Study Area intersections under Existing Conditions (Year 2024) and Existing with Project Conditions (Year 2024). As shown in Table 11, five out of six of the Study Area intersections operate at LOS C or better during both the morning and afternoon peak hours under Existing Conditions (Year 2024) and Existing with Project Conditions (Year 2024). Alameda Street & Center Street (Intersection #4) would operate at LOS D during both the morning and afternoon peak hours under Existing Conditions (Year 2024), LOS D under the morning peak hour under

Existing with Project Conditions (Year 2024), and LOS E during the afternoon peak hour under Existing with Project Conditions (Year 2024).

Future with Project Conditions

All future cumulative traffic growth (i.e., ambient and Related Project traffic growth) and transportation infrastructure improvements described in Chapter 2 are incorporated into this analysis.

Traffic Volumes. The morning and afternoon peak hour traffic volumes generated by the Project described in Chapter 3 and shown in Figure 16 were added to the Future without Project Conditions (Year 2032) morning and afternoon peak hour traffic volumes shown in Figure 13. The resulting volumes are illustrated in Figure 18 and represent Future with Project Conditions (Year 2032) after development of the Project.

Intersection LOS. Table 12 summarizes the results of the Future without Project Conditions (Year 2032) and Future with Project Conditions (Year 2032) during the weekday morning and afternoon peak hours for the Study Area intersections. As shown in Table 12, three out of six of the Study Area intersections operate at LOS C or better during both the morning and afternoon peak hours under Future without Project Conditions (Year 2032) and Future with Project Conditions (Year 2032). Alameda Street & 7th Street (Intersection #3), Alameda Street & Center Steet (Intersection #4), and Alameda Street & Olympic Boulevard (Intersection #6) would operate at LOS F during both the morning and afternoon peak hours under both Future without Project Conditions (Year 2032) and Future with Project Conditions (Year 2032).

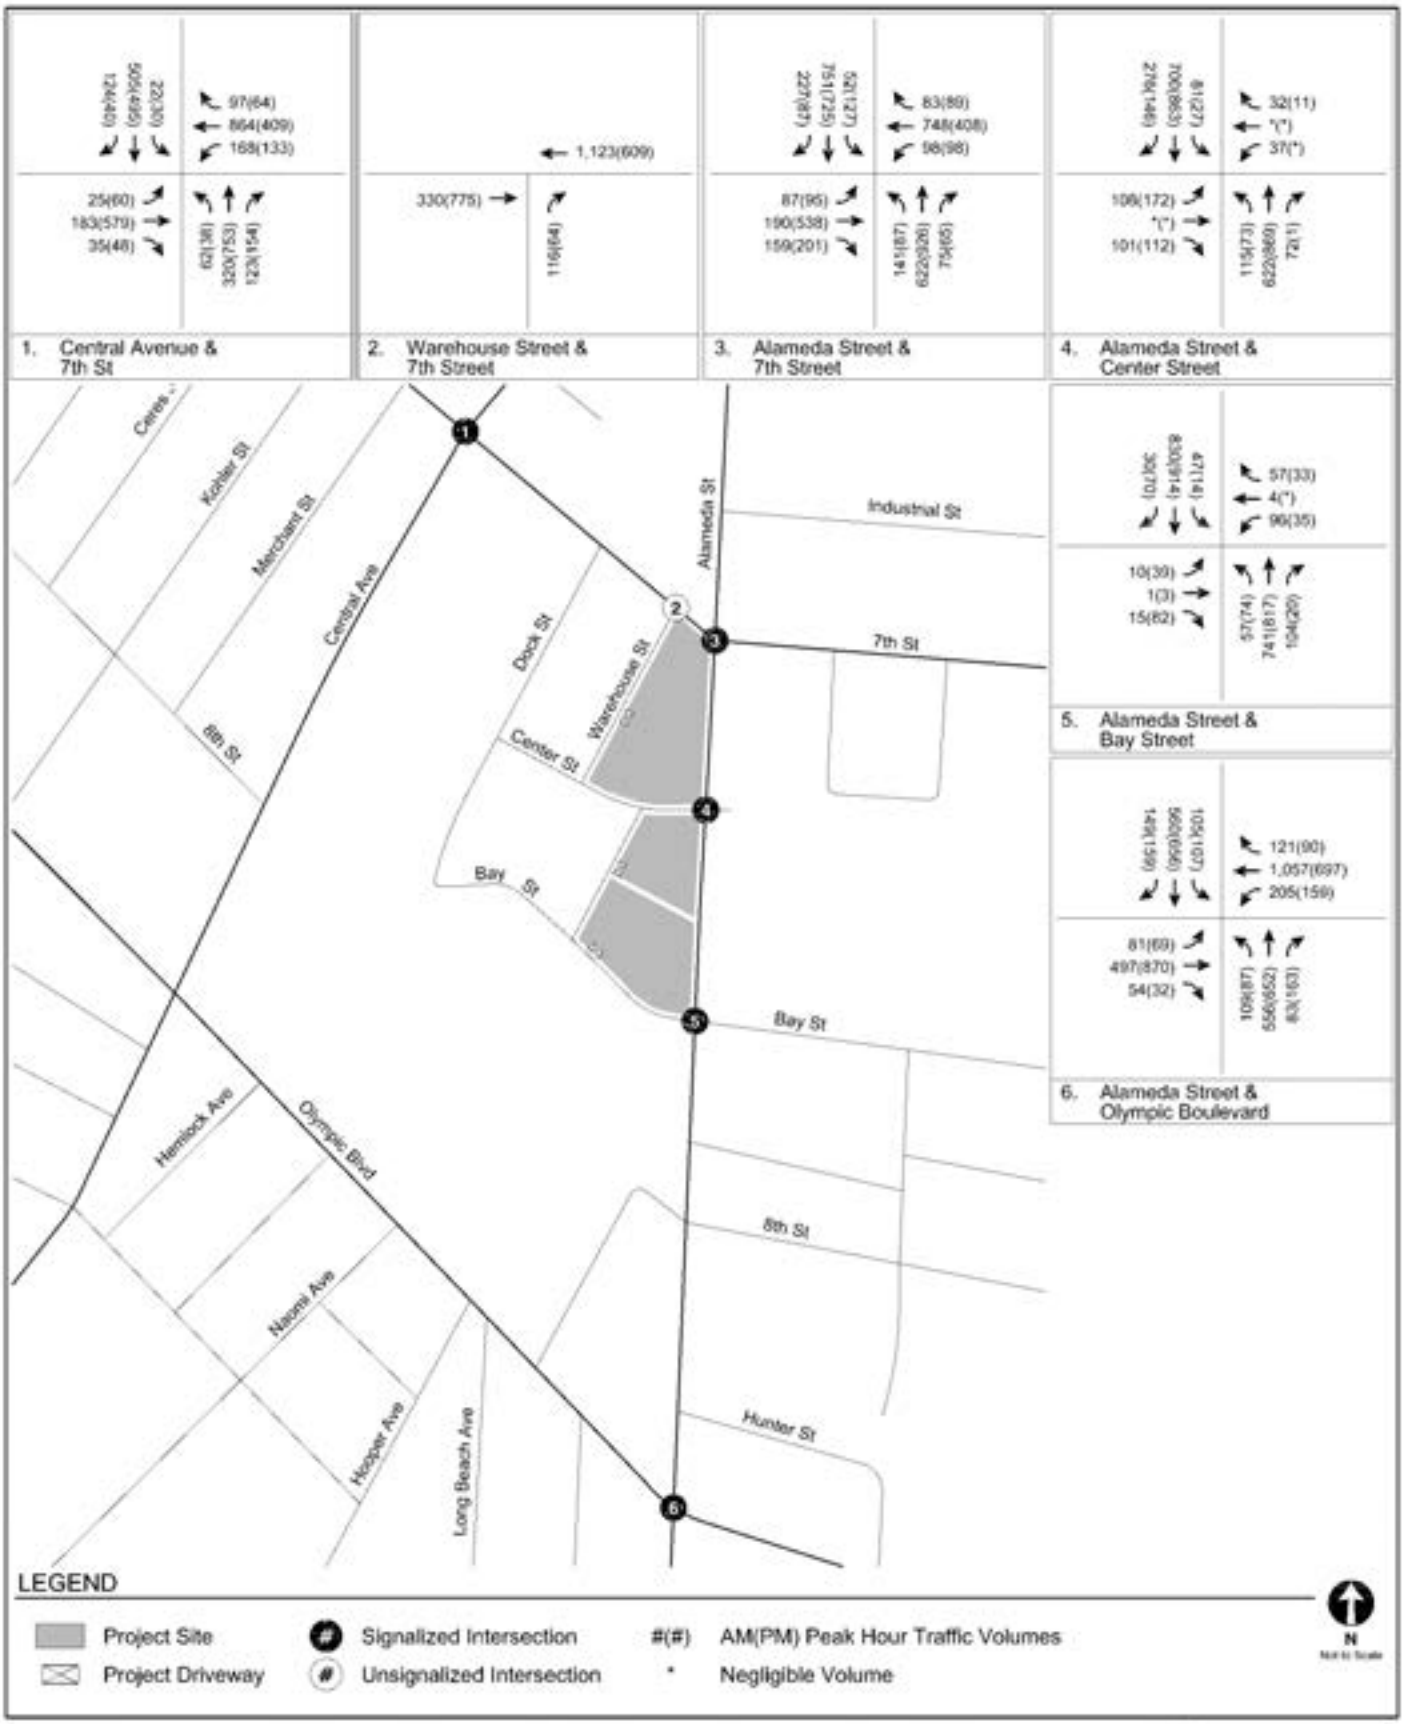
INTERSECTION QUEUING ANALYSIS

In accordance with operational evaluation guidelines detailed in Section 3.3.3 of the TAG, the Project traffic was evaluated to determine whether the Project access would contribute to unacceptable queuing on an Avenue or Boulevard (as designated in the Mobility Plan) at Project driveways or would cause or substantially extend queuing at nearby signalized intersections. Per the TAG, unacceptable or extended queuing may be defined as follows:

- *Additional queue along through lanes and either of the following conditions are expected:*
    - *The prcjected peak hour intersection LOS is D and the through lane queue increases by greater than 75 feet on any approach with the directional approach LOS at E or F, or*
    - *The prcjected peak hour intersection LOS is E or F and the through lane queue increases by greater than 50 feet on any approach with the directional approach LOS at E or F.*
- *Spill over from turn pockets into through lanes.*
- *Block cross streets or alleys.*
- *Spill over from drive-throughs into streets.*
- *Contribute to "gridlock" congestion. For the purposes of this section, "gridlock" is defined as the condition where traffic queues between closely-spaced intersections and impedes the flow of traffic through upstream intersections.*

The queue lengths were estimated using Synchro software, which reports the 95th percentile queue length, in vehicles, for each approach lane. The queue lengths were then converted into a linear distance by multiplying vehicle lengths by 25 feet[5]. The reported queues are calculated using the HCM signalized and all-way stop control intersection methodology. The 95th percentile queue lengths are detailed in the HCM reports provided in Appendix E.

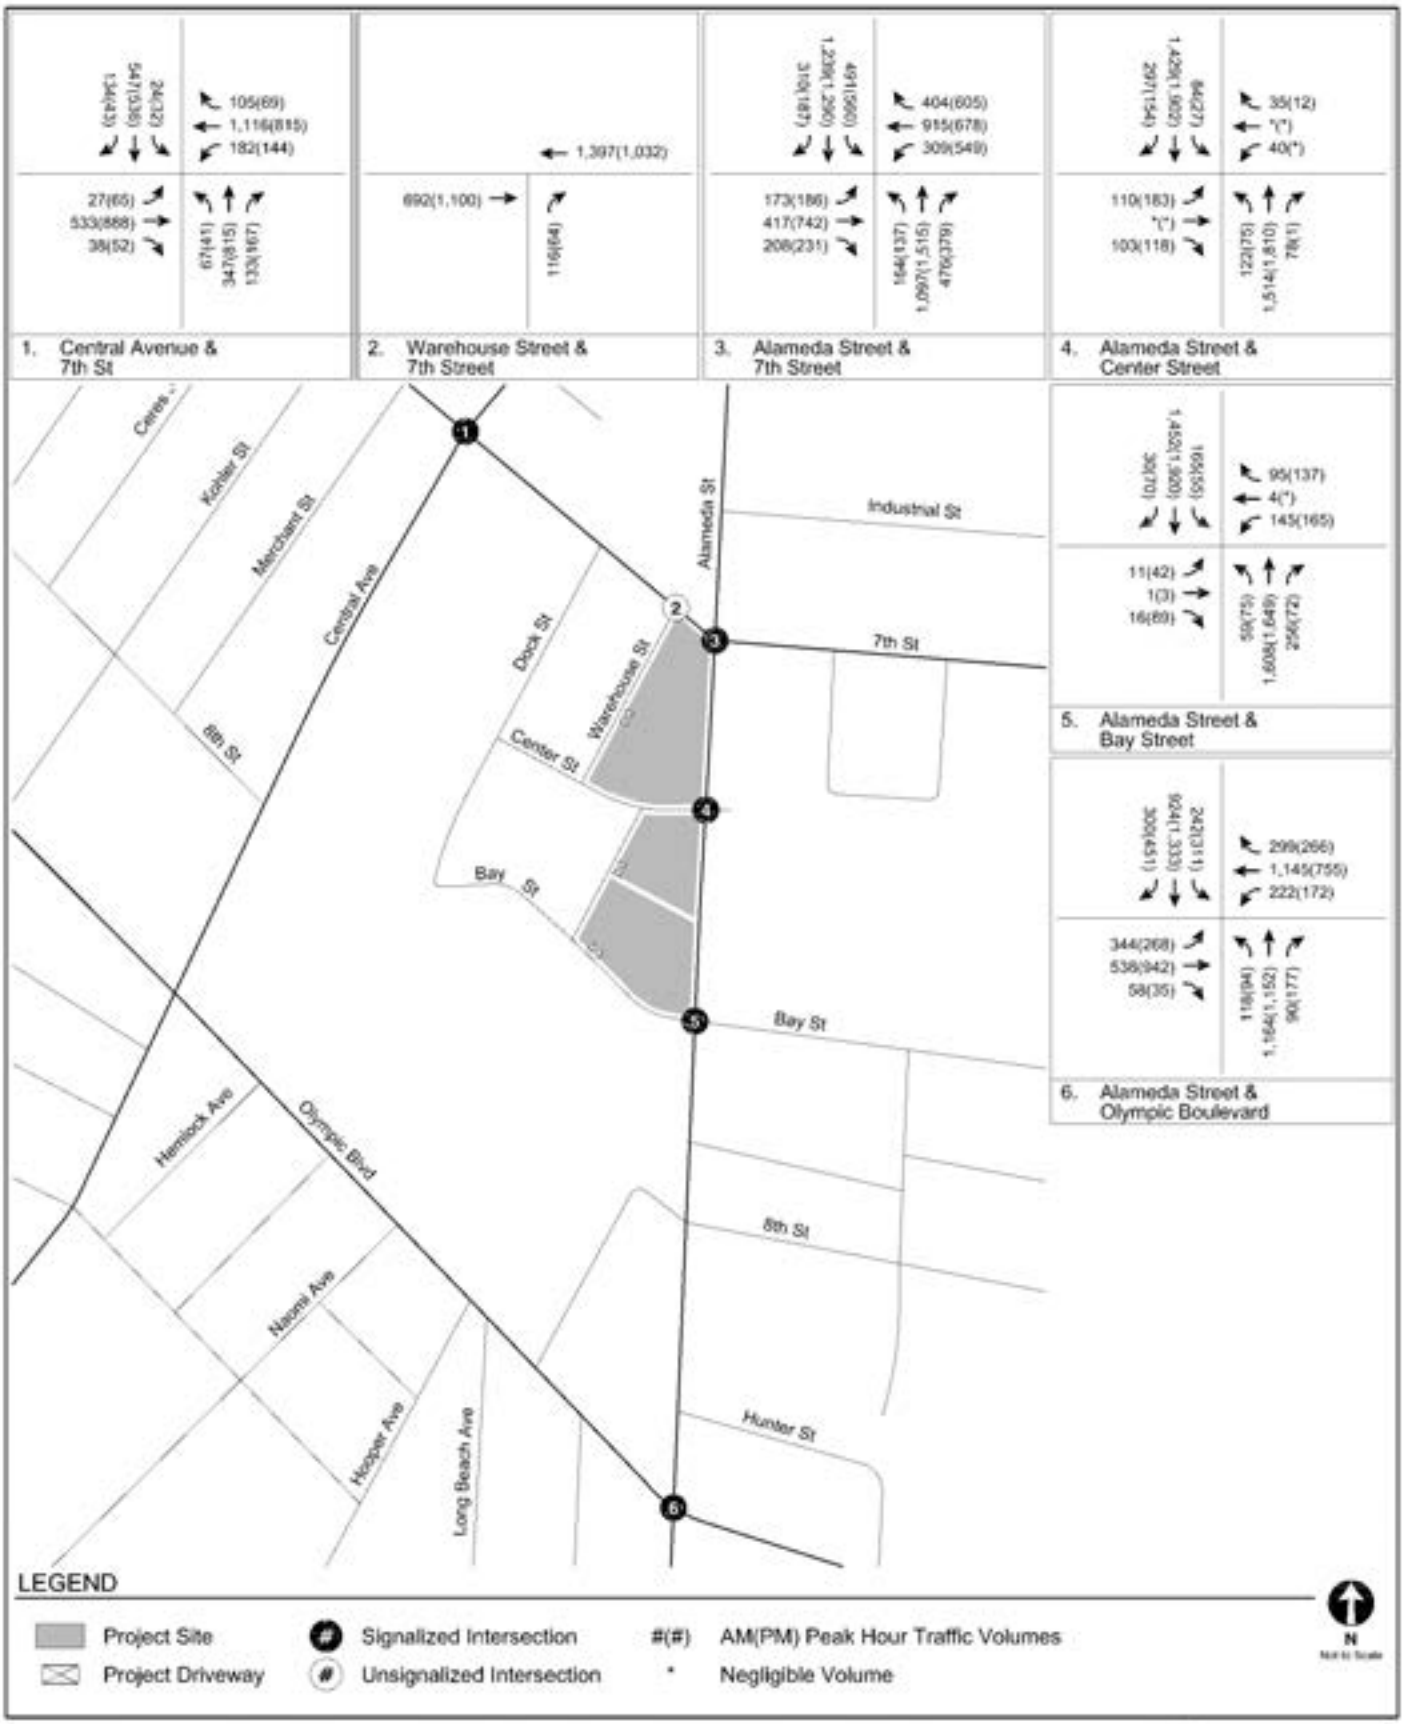
Based on the guidelines detailed above, an operational queuing evaluation was conducted at the five signalized study intersections. As detailed in Table 13, which summarizes the resulting queues, the Project would result in minor increases in vehicle queue lengths, but the minor increases would not be considered unacceptable or extended based on the criteria referenced above.



RECOMMENDED ACTIONS

It is anticipated that the Project will add to the cumulative traffic within the Study Area, as detailed above. As discussed in Section 4B, the Project will implement TDM strategies, such as LAMC required bicycle parking, to reduce both single occupancy trips to the Project Site and Project traffic throughout the Study Area during the most congested time periods of the day. The Project will develop and implement a TDM program, including Project design features such as the

[5] The 25-foot length represents a standard vehicle in queue along with spacing ahead/behind the queued vehicle.



provision of bicycle parking per the LAMC, to promote non-automobile travel, reduce the use of single-occupant vehicle trips, etc.

Further, the Project would improve the overall pedestrian and bicycle environment with landscape elements. Beyond the identified TDM strategy, the Project may also manage site access and internal circulation operations to minimize potential queues and/or conflicts on the adjacent public ROW.

Notes:
LOS: Level of Service
Results per HCM 6th Edition.
[a] Per TAG Section 3.3.3, projects must be evaluated for unacceptable queueing at turn-pockets on an Avenue or Boulevard at project driveway(s) or at nearby signalized intersections.
[b] If the projected peak hour intersection LOS is D, E, or F (See *Table 12 - Future Conditions (Year 2032) Intersection Levels of Service*), evaluation of unacceptable queueing at through lanes is also required.
[c] Directional approach LOS included for locations where through lane queue evaluation is required.
[d] Vehicle storage capacity reflects turn pocket lengths (left/right-turn lanes) and distance between the intersection and the nearest cross street or alley (through lanes).
[e] Vehicle queue lengths were converted to feet (ft) by multiplying 25-feet per reported vehicle length.

Section 5C

Residential Street Cut-Through Analysis

This section summarizes the residential street cut-through analysis for the Project. The objective of the residential street cut-through analysis is to determine potential increases in average daily traffic volumes on designated Local Streets, as classified in the City's General Plan, that can be identified as cut-through trips generated by the Project and that can adversely affect the character and function of those streets.

Section 3.5.2 of the TAG provides a list of questions to assess whether the Project would negatively affect residential streets and guidance on selecting residential street segments for analysis with land use development project:

- *Would the prcject generate a net increase of 250 or more daily vehicles trips?*
- *Does the land use prcject include a discretionary action that would be under review by the Department of City Planning?*
- *All of the following conditions must be present when selecting a residential street segment for analysis:*
    - *The prcject is located along a currently congested Boulevard or Avenue and adds trips that may lead to trip diversion to parallel routes along Residential Streets. The congestion level of the Boulevard or Avenue can be determined based on the estimated peak hour LOS under prcject conditions of the study intersection(s). LOS E and LOS F are considered congested conditions;*
    - *The prcject is prcjected to add a substantial amount of automobile traffic to the congested Boulevard(s), Avenue(s), or Collector(s) that could potentially cause a shift to alternative route(s); and*
    - *Nearby residential street(s) (defined as Local Streets as designated in the City's General Plan passing through a residential neighborhooo) provide motorists with a viable alternative route. A viable alternative route is defined as one which is parallel and reasonably acjacent to the primary route as to make it attractive as an alternative to the primary route. LADOT has discretion to define which routes are viable alternative routes, based on, but not limited to, features such as geography and presence of existing traffic control devices, etc.*

While the Project satisfies the screening criteria to assess whether residential streets would be negatively affected, not all of the required conditions for the residential street segment analysis

selection criteria are present. Notably, the Local Streets nearby to the Project Site are not located within a residential neighborhood and do not provide continuous alternative/parallel routes to Alameda Street or 7th Street; additionally, no Local Streets provide direct access to the Project Site driveways. Thus, the Project is not required to conduct a Local Residential Street Cut-Through Analysis.

Section 5D

Project Construction Assessment

This section summarizes the construction schedule and construction analysis for the Project. The construction analysis relates to the temporary effects that may result from the construction activities associated with the Project and was performed in accordance with Section 3.4, Project Construction, of the TAG.

CONSTRUCTION EVALUATION CRITERIA

Section 3.4.3 of the TAG identifies the following three types of in-street construction constraints that require further analysis to assess the effects of Project construction on the existing pedestrian, bicycle, transit, or vehicle circulation.

1. Temporary transportation constraints – potential effects on the transportation system
2. Temporary loss of access – potential effects on visitors entering and leaving sites
3. Temporary loss of bus stops or rerouting of bus lines – potential effects on bus travelers

The factors considered include magnitude and duration of the temporary loss of access to transportation facilities, the potential inconvenience caused to users of the transportation system, and consideration for public safety. Construction activities could potentially interfere with pedestrian, bicycle, transit, or vehicle circulation and accessibility to adjoining areas. As detailed in Section 3.4.4 of the TAG, the proposed construction plans should be reviewed to determine whether construction activities would require any of the following actions:

- Street, sidewalk, or lane closures
- Block existing vehicle, bicycle, or pedestrian access along a street or to parcels fronting the street
- Modification of access to transit stations, stops, or facilities during revenue hours

- Closure or movement of an existing bus stop or rerouting of an existing bus line
- Creation of transportation hazards

PROPOSED CONSTRUCTION SCHEDULE

The Project is anticipated to be constructed over a 66-month period, with completion anticipated in Year 2032. Buildings A and B are anticipated to be constructed over 39 months, and Building C is anticipated to be constructed over 27 months. For Buildings A and B, peak haul truck activity occurs during the grading/shoring/excavation phase, and peak worker activity occurs during the building construction phase. For Building C, peak haul truck activity occurs during the grading & utilities phase, and peak worker activity occurs during the foundation/structure phase. These phases of construction were studied in greater detail.

PEAK HAUL TRUCK ACTIVITY PHASES

The peak period of truck activity during construction would occur during the grading/shoring/excavation phase of Buildings A and B and the grading & utilities phase of Building C. With the implementation of the Construction Management Plan, which is described in more detail below, it is anticipated that almost all haul truck activity to and from the Project Site would occur outside of the morning and afternoon peak hours. In addition, as discussed in more detail in the following section, worker trips to and from the Project Site would also occur outside of the peak hours. Therefore, no peak hour construction hauling impacts are expected during the respective peak truck activity phase of construction for each building.

Haul trucks would travel on approved truck routes designated within the City. Haul truck traffic would take the most direct route to the appropriate freeway ramps. The haul route will be reviewed and approved by the City.

Grading/Shoring/Excavation Phase Trip Generation – Buildings A & B

For construction of Building A, based on projections compiled for the Project, approximately 73,440 cubic yards (CY) of material would be excavated and removed from the Project Site over a 50-day period. For construction of Building B, approximately 42,960 CY of material would be excavated and removed from the Project Site over a 45-day period. It is anticipated that a maximum of 120 trucks per workday, based on an anticipated haul truck capacity of 14 CY, would be required for Buildings A and B during these phases. Thus, up to 240 daily truck trips (120 inbound, 120 outbound) are forecasted to occur during the grading/shoring/excavation phases, with approximately 18 trips per hour (nine inbound, nine outbound) uniformly over a typical 14-hour (7:00 AM – 9:00 PM), off-peak hauling period.

Because construction trucks (such as earth-hauling trucks and cement trucks) are larger and slower than the passenger vehicles that make up most of the vehicles on the roads, they have a greater effect on traffic than a passenger vehicle. *Transportation Research Circular No. 212, Interim Materials on Highway Capacity* (Transportation Research Board, 1980) defines passenger car equivalency (PCE) for a vehicle as the number of through moving passenger cars to which it is equivalent based on the vehicle's headway and delay-creating effects. Table 8 of *Transportation Research Circular No. 212* and Exhibit 22.11 of the HCM suggest a PCE of 2.0 for trucks traveling on level terrain. Assuming a PCE factor of 2.0, the 240 daily truck trips would be equivalent to 480 daily PCE trips. The 18 hourly truck trips would be equivalent to approximately 36 PCE trips per hour (18 inbound, 18 outbound).

In addition, a maximum of 40 daily construction workers is anticipated during the grading/excavation/shoring phase for both Buildings A and B. The 40 construction workers would result in 80 one-way vehicle trips (40 inbound, 40 outbound) to and from the Project Site daily during the grading/shoring/excavation phase. It is anticipated that most workers would arrive on-site prior to the weekday morning commuter peak hour and leave prior to or after the afternoon commuter peak hour. Therefore, no peak hour construction traffic impacts are expected during the grading/shoring/excavation phases of construction.

Grading & Utilities Phase Trip Generation – Building C

For construction of Building C, approximately 36,210 CY of material would be excavated and removed from the Project Site over an 83-day period. It is anticipated that a maximum of 120 trucks per workday, based on an anticipated haul truck capacity of 14 CY, would be required during this phase. Thus, up to 240 daily truck trips (120 inbound, 120 outbound) are forecasted to occur during the site grading & utilities phase, with approximately 18 trips per hour (nine inbound, nine outbound) uniformly over a typical 14-hour (7:00 AM – 9:00 PM), off-peak hauling period.

Assuming a PCE factor of 2.0, the 240 daily truck trips would be equivalent to 480 daily PCE trips. The 18 hourly truck trips would be equivalent to approximately 36 PCE trips per hour (18 inbound, 18 outbound).

In addition, a maximum of 30 daily construction workers is anticipated during the grading & utilities phase for Building C. The 30 construction workers would conservatively result in 60 one-way vehicle trips (30 inbound, 30 outbound), to and from the Project Site daily. It is anticipated that most workers would arrive on-site prior to the weekday morning commuter peak hour and leave prior to or after the afternoon commuter peak hour. Therefore, no peak hour construction traffic impacts are expected during the grading & utilities phase of construction.

PEAK WORKER ACTIVITY PHASES

During the building construction and foundation/structure phases, parking for construction workers would generally be provided on-site or in local public parking facilities. Restrictions against workers parking in the public ROW in the vicinity of (or adjacent to) the Project Site would be identified as part of the Construction Management Plan. Construction materials storage and truck staging would also generally be contained on-site.

The traffic impacts associated with construction workers depend on the number of construction workers employed during various phases of construction, as well as the travel mode and travel time of the workers. In general, the hours of construction typically require workers to be on-site before the weekday morning commuter peak period and allow them to leave before or after the

afternoon commuter peak period (i.e., arrive at the site prior to 7:00 AM and depart before 3:00 PM or after 6:00 PM). Therefore, most, if not all, construction worker trips would occur outside of the typical weekday commuter peak periods.

According to construction projections prepared for the Project, the peak worker activity phases for each building are the building construction phase of Building A (a maximum of 150 workers per day), the building construction phase of Building B (a maximum of 120 workers per day). and the foundation/structure phase of Building C (a maximum of 150 workers per day). Based on the preliminary construction schedule, the most conservative estimated number of daily vehicle trips associated with the construction workers – approximately 270 one-way trips (270 inbound and 270 outbound trips) – is during the brief overlap during the construction of Buildings A and B, but nearly all those trips would occur outside of the peak hours, as described above. As such, the peak worker activity phases of Project construction are not expected to cause a traffic impact at any of the study intersections.

POTENTIAL IMPACTS ON ACCESS, TRANSIT, AND PARKING

Project construction is not expected to create hazards for roadway travelers, bus riders, or parkers, so long as commonly practiced safety procedures for construction are followed. Such procedures and other measures (e.g., to address temporary traffic control, lane closures, sidewalk closures, etc.) have been incorporated into the Construction Management Plan. The construction-related impacts associated with access and transit are anticipated to be less than significant, and the implementation of the Construction Management Plan described below would further reduce those impacts.

Access

Construction activities are expected to be primarily contained within the Project Site boundaries. However, it is expected that construction fences may encroach into the public ROW (e.g., sidewalks and roadways) adjacent to the Project Site. The sidewalk and one lane on Alameda Street may be temporarily closed throughout the construction period. Temporary traffic controls

would be provided to direct traffic around any closures as required in the Construction Management Plan and emergency access would not be impeded.

The use of the public ROW would require temporary re-routing of pedestrian and bicycle traffic. The Construction Management Plan would include measures to ensure pedestrian and bicycle safety along the affected sidewalks, bicycle facilities, and temporary walkways (e.g., use of light-duty barriers and cones, use of directional signage, maintaining continuous and unobstructed pedestrian paths, and/or providing overhead covering).

Transit

Although no transit rerouting is anticipated, temporary transit stop relocation may occur as a result of the Project construction that would affect the public ROW. An existing bus stop serving the Metro Local 60 and 62 lines is located at the northeast corner of the Project Site, but temporary relocation is not anticipated. Any necessary adjustments to the bus stop would be coordinated with Metro.

Parking

Although staging of construction trucks would primarily be contained on the Project Site, the curbside may be utilized or temporarily closed for short durations during improvement work on curb, gutter, and other street improvements. No on-street parking is permitted adjacent to the Project Site and, therefore, there would be no temporary loss of any on-street parking spaces during the construction period.

CONSTRUCTION TRAFFIC MANAGEMENT PLAN

A detailed Construction Traffic Management Plan, including street closure information, a detour plan, haul routes, and a staging plan would be prepared and submitted to the City for review and approval prior to commencing construction and is part of the building permit approval. The Construction Traffic Management Plan would formalize how construction would be carried out and

identify specific actions that would be required to reduce effects on the surrounding community. The Construction Traffic Management Plan shall be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site, and shall include, but not be limited to, the following elements, as appropriate:

- Advance bilingual notification of adjacent property owners and occupants of upcoming construction activities, including durations and daily hours of operation.
- Prohibition of construction worker or equipment parking on adjacent streets or in predominantly residentially zoned areas.
- Temporary pedestrian, bicycle, and vehicular traffic controls during all construction activities along the Project frontage to ensure traffic safety on public ROWs. These controls shall include, but not be limited to, flag people trained in pedestrian and bicycle safety.
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.
- Spacing of trucks to discourage a convoy effect.
- Containment of construction activity within the Project Site boundaries to the extent feasible.
- Coordination with LADOT Parking Meter Division to address any potential loss of metered parking spaces, if needed.
- Safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers shall be implemented as appropriate, including along all identified LAUSD pedestrian routes to nearby schools.
- Scheduling of construction-related deliveries, haul trips, etc., to occur outside the commuter peak hours, to not impede school drop-off and pick-up activities and students using LAUSD's identified pedestrian routes to nearby schools.
- Sufficient dampening of the construction area to control dust by grading and hauling and reasonable control at all times of dust caused by wind.
- Maintenance of a log, available on the job site always, documenting the dates of hauling and the number of trips (i.e., trucks) per day.
- Identification of a construction manager and provision of a telephone number for any inquiries or complaints from residents regarding construction activities. The telephone number shall be posted at the site readily visible to any interested party during site preparation, grading, and construction.
- Obtainment of the required permits for truck haul routes from the City prior to issuance of any building permit for the Project.

It is likely that construction traffic management plans would also be submitted for City approval by the Related Projects prior to the start of construction activities. As part of the LADOT and/or City Department of Building and Safety established review process of construction management plans, potential overlapping construction activities and proposed haul routes would be reviewed to minimize the effects of cumulative construction activities on any roadway.

Section 5E
Parking Assessment

This section provides an analysis of the proposed parking and the potential parking impacts of the Project.

VEHICLE PARKING CODE REQUIREMENTS

State of California Assembly Bill 2097 (Friedman, 2022) (AB 2097) mandates that development projects located within 0.5 miles of a major transit stop may not be required to provide any parking for residential or commercial uses. The Project site qualifies under AB 2097, as confirmed at the City's Zone Information and Map Access System and, therefore, no vehicle parking spaces are required.

The Project would provide approximately 1,000 vehicle parking spaces within the three buildings' subterranean parking levels. Buildings A,B, and C would each include two levels of subterranean parking.

BICYCLE PARKING CODE REQUIREMENTS

LAMC Section 12.21.A.16 details the bicycle parking requirements for new developments. Per LAMC Section 12.21.A.16.A(2)i, a minimum of two short-term and two long-term bicycle parking spaces shall be provided for all commercial, institutional, and industrial uses.

As shown in Table 14, the Project would require a total of 50 short-term and 479 long-term bicycle parking spaces. The Project's proposed 529 bicycle parking spaces meets the LAMC requirements for on-site bicycle parking supply.

TABLE 14
BICYCLE CODE PARKING REQUIREMENTS

Land Use	Size	Short-Term Bicycle Parking Rate [a]	Short-Term Bicycle Parking Requirement [b]	Long-Term Bicycle Parking Rate [a]	Long-Term Bicycle Parking Requirement [b]
South Building A					
Residential					
1-25 units	25 du	1.0 sp / 10 du	2 sp	1.0 sp / 1 du	25 sp
26-100 units	75 du	1.0 sp / 15 du	5 sp	1.0 sp / 2 du	50 sp
101-200 units	100 du	1.0 sp / 20 du	5 sp	1.0 sp / 2 du	50 sp
201-410 units	210 du	1.0 sp / 40 du	5 sp	1.0 sp / 4 du	52 sp
Restaurant [c]	1,119 sf	1.0 sp / 2,000 sf	2 sp	1.0 sp / 2,000 sf	2 sp
South Building B					
Residential					
1-25 units	25 du	1.0 sp / 10 du	2 sp	1.0 sp / 1 du	25 sp
26-100 units	75 du	1.0 sp / 15 du	5 sp	1.0 sp / 2 du	50 sp
101-200 units	100 du	1.0 sp / 20 du	5 sp	1.0 sp / 2 du	50 sp
201-214 units	14 du	1.0 sp / 40 du	0 sp	1.0 sp / 4 du	3 sp
North Building C					
Residential					
1-25 units	25 du	1.0 sp / 10 du	2 sp	1.0 sp / 1 du	25 sp
26-100 units	75 du	1.0 sp / 15 du	5 sp	1.0 sp / 2 du	50 sp
101-200 units	100 du	1.0 sp / 20 du	5 sp	1.0 sp / 2 du	50 sp
201-376 units	176 du	1.0 sp / 40 du	4 sp	1.0 sp / 4 du	44 sp
Restaurant [c]	5,428 sf	1.0 sp / 2,000 sf	3 sp	1.0 sp / 2,000 sf	3 sp
		Short-Term Bicycle Parking Requirement	**50 sp**	**Long-Term Bicycle Parking Requirement**	**479 sp**
				Total Code Bicycle Parking Requirement	**529 sp**
				Total Code Bicycle Parking Provided	**529 sp**

Notes:
[a] Bicycle requirements as calculated by LAMC Section 12.21.A.16.
[b] Per LAMC Section 12.21.A.16.B, any fraction up to and including one-half may be disregarded, and any fraction over one-half shall be construed as requiring one bicycle parking space.
[c] Per LAMC Section 12.21.A.16.A(2)i, a minimum of two short-term and two long-term bicycle parking spaces shall be provided for all commercial, institutional, and industrial uses.

Chapter 6

Summary and Conclusions

This study was undertaken to analyze the potential transportation impacts of the Project on the transportation system. The following summarizes the results of this analysis:

- The Project is located at 747 and 767 S. Alameda Street.
- The Project proposes the redevelopment of two existing surface parking lots into a mixed-use development consisting of three eight-story buildings to be located on the north and south sides of Center Street, on the eastern edge of the Project Site. A total of 1,000 residential units are included, with 11% designated as affordable, along with a total of 6,547 sf of ground floor commercial space. The Project is anticipated to be completed in Year 2032.
- Vehicular access would be provided via driveways along Warehouse Street and internal to the Project Site off Bay Street. Pedestrian and bicycle access would be provided separate from the vehicular access via residential lobbies and commercial entrances located along the Project frontages on Alameda Street and Center Street.
- The Project is estimated to generate 372 new morning peak hour trips and 367 new afternoon peak hour trips.
- The Project would not conflict with the City's plans, programs, ordinances, and polices and would not result in any significant geometric design hazard impacts. The Project would not cause a significant safety impact at any freeway off-ramp locations.
- The Project would include LAMC-required bicycle parking.
- The Project VMT impacts would be less than significant and, therefore, no mitigation measures would be required.
- The Project provides adequate internal circulation to accommodate vehicular, pedestrian, and bicycle traffic without impeding traffic movements on City streets.
- The addition of Project trips would not adversely affect any residential Local Streets.
- Construction traffic would be generated outside of the commuter morning and afternoon peak hours to the extent feasible and would not result in substantial operational constraints to the adjacent roadway system. A Construction Traffic Management Plan would be prepared to minimize temporary operational effects of construction activities.

Appendix A

Memorandum of Understanding

LADOT

Attachment C

Transportation Assessment Memorandum of Understanding (MOU)

This MOU acknowledges that the Transportation Assessment for the following Project will be prepared in accordance with the latest version of LADOT's Transportation Assessment Guidelines:

I. PROJECT INFORMATION

Project Name: Alameda Square

Project Address: 747 and 767 S. Alameda St. Los Angles, CA 90021

Project Description: The Project proposes the development of a North Building consisting of 367 apartment units (59 affordable units) and 4,806 square feet (sf) commercial uses and a South Building consisting of 633 apartment units (101 affordable units) and 1,325 sf commercial uses.

LADOT Project Case Number: _____ Project Site Plan attached? *(Required)* ☑ Yes ☐ No

II. TRANSPORTATION DEMAND MANAGEMENT (TDM) MEASURES

Select any of the following TDM measures, which may be eligible as a Project Design Feature[1], that are being considered for this project:

	Reduced Parking Supply[2]	✓	Bicycle Parking and Amenities		Parking Cash Out

List any other TDM measures (e.g. bike share kiosks, unbundled parking, microtransit service, etc) below that are also being considered and would require LADOT staff's determination of its eligibility as a TDM measure. LADOT staff will make the final determination of the TDM measure's eligibility for this project.

1 _____ 4 _____

2 _____ 5 _____

3 _____ 6 _____

III. TRIP GENERATION

Trip Generation Rate(s) Source: ITE 10th Edition / Other ITE 11th Edition / LADOT TAG

Trip Generation Adjustment *(Exact amount of credit subject to approval by LADOT)*	**Yes**	**No**
Transit Usage	☑	☐
Existing Active or Previous Land Use	☐	☑
Internal Trip	☑	☐
Pass-By Trip	☑	☐
Transportation Demand Management (See above)	☑	☐

Trip generation table including a description of the existing and proposed land uses, rates, estimated morning and afternoon peak hour volumes (ins/outs/totals), proposed trip credits, etc. attached? *(Required)* ☑ Yes ☐ No

	IN	OUT	TOTAL
AM Trips	108	269	377
PM Trips	221	145	366

NET Daily Vehicle Trips (DVT)

_____ DVT (ITE __ ed.)

4,432 DVT (VMT Calculator ver. 1.4)

[1] At this time Project Design Features are only those measures that are also shown to be needed to comply with a local ordinance, affordable housing incentive program, or State law.

[2] Select if reduced parking supply is pursued as a result of a parking incentive as permitted by the City's Bicycle Parking Ordinance, State Density Bonus Law, or the City's Transit Oriented Community Guidelines.

IV. STUDY AREA AND ASSUMPTIONS

Project Buildout Year: 2032 Ambient Growth Rate: 1.0 % Per Yr.

Related Projects List, researched by the consultant and approved by LADOT, attached? *(Required)* ☑ Yes ☐ No

STUDY INTERSECTIONS and/or STREET SEGMENTS:
(May be subject to LADOT revision after access, safety, and circulation evaluation.)

1 See Table 1 3 _____

2 _____ 4 _____

5 _____ 6 _____

Provide a separate list if more than six study intersections and/or street segments.

Is this Project located on a street within the High Injury Network? ☑ Yes ☐ No

If a study intersection is located within a ¼-mile of an adjacent municipality's jurisdiction, signature approval from said municipality is required prior to MOU approval.

V. ACCESS ASSESSMENT

a. Does the project exceed 1,000 net DVT? ☑ Yes ☐ No
b. Is the project's frontage 250 linear feet or more along an Avenue or Boulevard as classified by the City's General Plan? ☑ Yes ☐ No
c. Is the project's building frontage encompassing an entire block along an Avenue or Boulevard as classified by the City's General Plan? ☑ Yes ☐ No

VI. ACCESS ASSESSMENT CRITERIA

If Yes to any of the above questions a., b., or c., the Transportation Assessment must assess the project's potential effect on pedestrian, bicycle, and transit facilities in the vicinity of the proposed project. Complete **Attachment C.1: Access Assessment Criteria** and attach to the draft Transportation Assessment to support the analysis. For the full scope of analysis, see Section 3.2 of the Transportation Assessment Guidelines.

VII. SITE PLAN AND MAP OF STUDY AREA

Please note that the site plan should be submitted to the Department of City Planning for cursory review.

Does the attached site plan and/or map of study area show	Yes	No	Not Applicable
Each study intersection and/or street segment	☑	☐	☐
*Project Vehicle Peak Hour trips at each study intersection	☑	☐	☐
*Project Vehicle Peak Hour trips at each project access point	☑	☐	☐
*Project trip distribution percentages at each study intersection	☑	☐	☐
Project driveways designed per LADOT MPP 321 (show widths and directions or lane assignment)	☑	☐	☐
Pedestrian access points and any pedestrian paths	☑	☐	☐
Pedestrian loading zones	☑	☐	☐
Delivery loading zone or area	☑	☐	☐
Bicycle parking onsite	☑	☐	☐
Bicycle parking offsite (in public right-of-way)	☐	☐	☑

*For mixed-use projects, also show the project trips and project trip distribution by land use category.

VIII. FREEWAY SAFETY ANALYSIS SCREENING

Will the project add 25 or more trips to any freeway off-ramp in either the AM or PM peak hour? ☐ YES ☑ NO
Provide a brief explanation or graphic identifying the number of project trips expected to be added to the nearby freeway off-ramps serving the project site. If Yes to the question above, a freeway ramp analysis is required.

IX. CONTACT INFORMATION

	CONSULTANT	DEVELOPER
Name:	Gibson Transportation Consulting, Inc.	Alameda Square Owner LLC
Address:	555 W 5th St., Suite 3375, Los Angeles, CA 90013	1318 East 7th Street, #200, Los Angeles, CA 90021
Phone Number:	(213) 683-0088	(213) 988-8890
E-Mail:	lmullarkey-williams@gibsontrans.com	ejenkins@ATLAS-CAP.COM

Approved by:	x	Consultant's Representative		11/27/23 Date	x	LADOT Representative		12/06/2023 **Date
Adjacent Municipality:				Approved by: (if applicable)		Representative		Date

**MOUs are generally valid for two years after signing. If after two years a transportation assessment has not been submitted to LADOT, the developer's representative shall check with the appropriate LADOT office to determine if the terms of this MOU are still valid or if a new MOU is needed.

Attachment C.1: Access Assessment Worksheet

LADOT

Access Assessment Worksheet

This Worksheet supports the analysis needed to assess the project's potential effect on pedestrian, bicycle, and transit facilities in the vicinity of the proposed project. If the project exceeds the screening criteria in Section V of the MOU, complete and attach to the draft Transportation Assessment to support the analysis. For the full scope of analysis, see Section 3.2 of the Transportation Assessment Guidelines.:

I. PROJECT INFORMATION

Project Name: Alameda Square

Project Address: 747 and 767 S. Alameda St. Los Angles, CA 90021

Project Description: The Project proposes the development of a North Building consisting of 367 apartment units (59 affordable units) and 4,806 square feet (sf) commercial uses and a South Building consisting of 633 apartment units (101 affordable units) and 1,325 sf commercial uses.

LADOT Project Case Number: _____

II. PEDESTRIAN/ PERSON TRIP GENERATION

Source of Pedestrian/Person Trip Generation Rate(s)? □ ITE 10th Edition □ Other:

	Land Use	Size/Unit	Daily Person Trips
Proposed	To be provided.		
	Total new trips:		

Pedestrian/Person trip generation table including a description of the proposed land uses, trip credits, person trip assumptions, comparison studies used for reference, etc. attached? □ Yes □ No

III. PEDESTRIAN ATTRACTORS INVENTORY

Attach Pedestrian Map for the area (1,320 foot radius from edge of the project site) depicting:

- site pedestrian entrance(s)
- Existing or proposed passenger loading zones
- pedestrian generation/distribution values
  - Geographic Distribution: N 25 % S 25 % E 25 % W 25 %
- transit boarding and alighting of transit stops (should include Metro rail stations; Metro, DASH, and other municipal bus stops)

- Key pedestrian destinations with hours of operation:
  - schools (school times)
  - government offices with a public counter or meeting room
  - senior citizen centers
  - recreation centers or playgrounds
  - public libraries
  - medical centers or clinics
  - child care facilities
  - post offices
  - places of worship
  - grocery stores
  - other facilities that attract pedestrian trips
- pedestrian walking routes to key destinations from project site

Note: Pedestrian Count Summary, Bicycle Count Summary, Manual Traffic Count Summary will need to be attached to the Transportation Assessment

IV. FACILITIES INVENTORY

Is a High Injury Network street located within 1,320 foot radius from the edge of the project site? ☑ Yes ☐ No

If yes, list streets and include distance from the project:

7th St	at 0 (feet)
Central Ave	at 700 (feet)
6th St	at 1,130 (feet)
	at _____ (feet)

Attach Radius Map for the area (1,320 foot radius from edge of the project site) depicting the following existing and proposed facilities:

- transit stops
- bike facilities
- traffic control devices for controlled crossings
- uncontrolled crosswalks
- location of any missing, damaged or substandard sidewalks

For a reference of planned facilities, see the Transportation Assessment Support Map

Crossing Distances

LADOT City of Los Angeles Transportation Assessment MOU

Does the project property have frontage along an arterial street (designated as either an Avenue or Boulevard?)

☑ Yes ☐ No

If yes, provide the distance between the crossing control devices (e.g. signalized crosswalk, or controlled mid-block crossing) along any arterial within 1,320 feet of the property.

_____(feet) at See Table #5 _____(feet) at _____

_____(feet) at _____ _____(feet) at _____

_____(feet) at _____ _____(feet) at _____

_____(feet) at _____ _____(feet) at _____

_____(feet) at _____ _____(feet) at _____

_____(feet) at _____ _____(feet) at _____

For each street along the property frontage, provide:

the roadway configuration: See Table 6

- **2-Lane**
- **3-Lane w/ striped median**
- **3-Lane w/ raised median**
- **4-Lane**
- **5-Lane w/ striped median**
- **5-Lane w/ raised median**
- **6-Lane**
- **Other:_____**

and crossing distance: _____ ft total _____ ft to median _____ ft to median

V. Project Construction

Will the project require any construction activity within the city right-of-way? ☑ Yes ☐ No

If yes, will the project require temporary closure of any of the following city facilities?

- sidewalk
- bike lane
- parking lane
- travel lane
- bus stop
- bicycle parking (racks or corrals)
- bike share or other micro-mobility station
- car share station
- parklet
- ✓ other: Bay Street, Private Alley

Source: KFA Architecture, November, 2023.

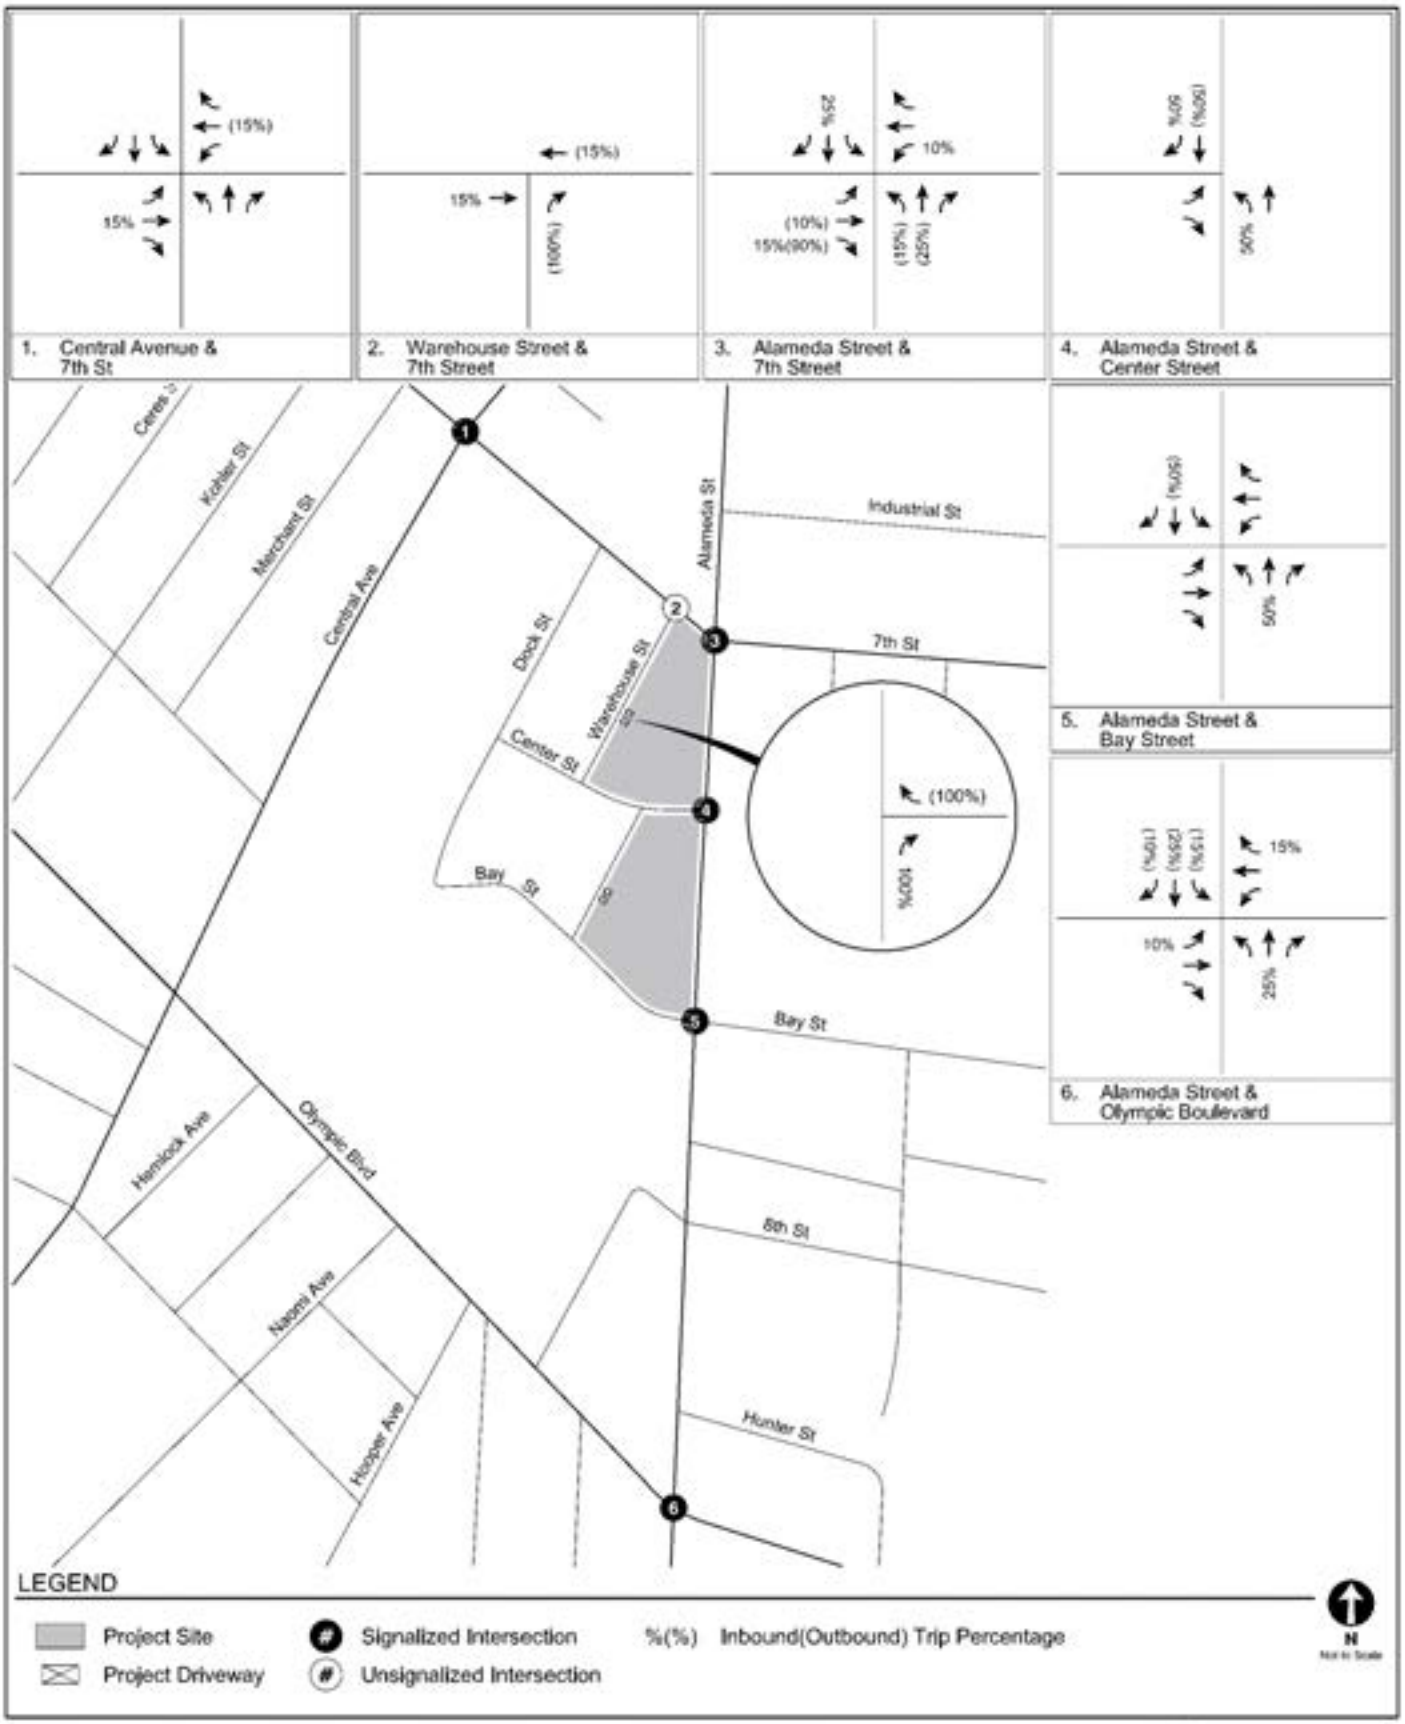
Notes

du dwelling unit ksf: 1,000 square feet

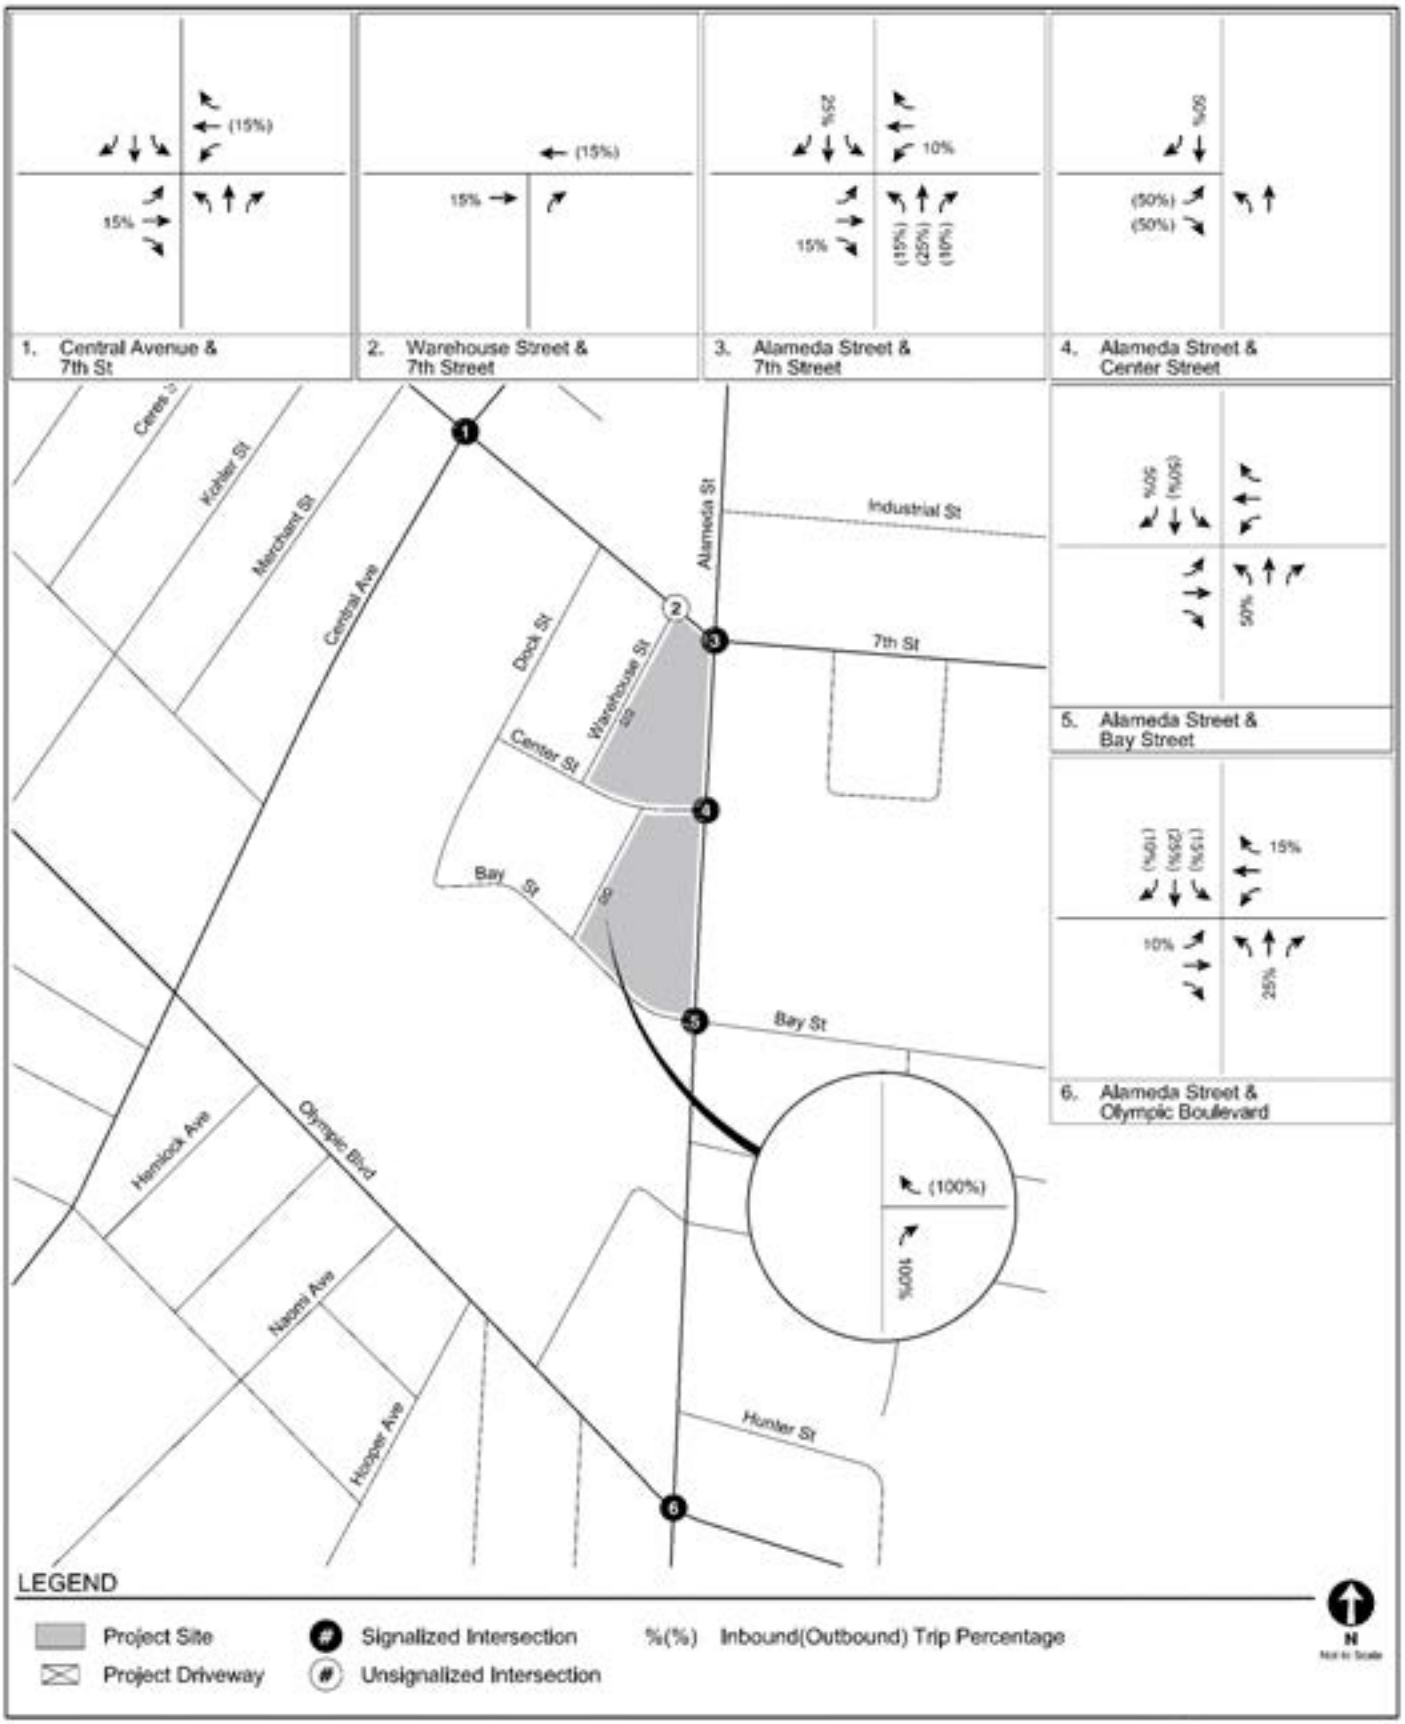
[a] Source: *Trip Generation, 11th Edition*, Institute of Transportation Engineers, 2021.



[b] Per LADOT's Transportation Assessment Guidelines, residential or mixed-use developments inside a Transit Priority Area (TPA) which include Affordable Housing Senior Units are eligible to use a City specific trip generation rate based on vehicle trip count data collected at affordable housing sites in the City of Los Angeles in 2016.

[c] The Project site is located adjacent to a bus stop that serves Metro Next Gen Tier 1 Service Line 60 at Alameda Street & 7th Street. Therefore, a 15% transit reduction was applied to account for transit usage and walking visitor arrivals.

[d] Commercial area analyzed as High-Turnover (Sit-Down) Restaurant to provide the most conservative analysis.



[e] Internal capture reductions account for person trips made between distinct land uses within a mixed-use development (i.e., between residential and restaurant).

[f] Pass-by reductions account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion.

FIGURE 8

TABLE 4
FREEWAY OFF-RAMP SCREENING PROCESS

Freeway Off-Ramp	Peak Hour	Project Traffic	Meets Screening Criteria? [a]
I-10 Eastbound			
Off-ramp to	AM	5	NO
Alameda Street [a]	PM	11	NO
I-10 Westbound			
Off-ramp to	AM	5	NO
14th Street [b]	PM	11	NO
US-101 Southbound			
Off-ramp to	AM	3	NO
7th Street [c]	PM	11	NO
US-101 Northbound			
Off-ramp to	AM	5	NO
7th Street [d]	PM	11	NO

Notes:

[a] Based on *Transportation Assessment Guidelines* (LADOT, August 2022), a transportation assessment for a development project must include analysis of any freeway off-ramp where a project adds 25 or more peak hour trips.

[b] 5% of incoming trips were assumed to travel eastbound on I-10 to the Project Site via off-ramps to Alameda Street.

[c] 5% of incoming trips were assumed to travel westbound on I-10 to the Project Site via off-ramps to 14th Street.

[d] 5% of incoming trips were assumed to travel southbound on US-101 to the Project Site via off-ramps to 7th Street.

[e] 5% of incoming trips were assumed to travel northbound on US-101 to the Project Site via off-ramps to 7th Street.

TABLE 5
FACILITIES INVENTORY - CROSSING DISTANCES

Street Segment	Distance (ft)
Alameda St from 6th St to 7th St	1,050
Alameda St from 7th St to Bay St	1,090
Alameda St from Bay St to 8th St	500
7th St from Central Ave to Alameda St	880
7th St from Alameda St to Decatur St	1,055
6th St from Central Ave to Alameda St	430
6th St from Alameda St to Mateo St	1,640
Central Ave from 6th St to 7th St	810
Central Ave from 7th St to 8th St	1,235

ROADWAY CONFIGURATION AND CROSSING DISTANCES ALONG PROJECT FRONTAGES

Street	Roadway Configuration	Crossing Distance		
		Total Distance (ft)	Distance to Median (ft)	Distance to Median (ft)
Alameda Street	4-Lane with Striped Median	70	35	35
7th Street	4-Lane with Striped Median	60	30	30

CITY OF LOS ANGELES VMT CALCULATOR Version 1.4

Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project: Alameda Square

Scenario:

Address: 747 S ALAMEDA ST, 90021

Is the project replacing an existing number of residential units with a smaller number of residential units AND is located within one-half mile of a fixed-rail or fixed-guideway transit

○ Yes ○ No

Existing Land Use

Land Use Type	Value	Unit
Housing | Single Family		DU

☐ Click here to add a single custom land use type (will be included in the above list)

Proposed Project Land Use

Land Use Type	Value	Unit
Housing | Multi-Family	840	DU
Retail | General Retail	6.131	ksf
Housing | Affordable Housing - Family	160	DU
Housing | Multi-Family	840	DU

☐ Click here to add a single custom land use type (will be included in the above list)

Project Screening Summary

Existing Land Use	Proposed
0 Daily Vehicle Trips	4,432 Daily Vehicle Trips
0 Daily VMT	28,834 Daily VMT

Tier 1 Screening Criteria

Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station. ☐

Tier 2 Screening Criteria

The net increase in daily trips < 250 trips	4,432 Net Daily Trips
The net increase in daily VMT ≤ 0	28,834 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	6.131 ksf

The proposed project is required to perform VMT analysis.

Measuring the Miles

11/7/2023

VMT Calculator User Agreement

The Los Angeles Department of Transportation (LADOT), in partnership with the Department of City Planning and Fehr & Peers, has developed the City of Los Angeles Vehicle Miles Traveled (VMT) Calculator to estimate project-specific daily household VMT per capita and daily work VMT per employee for land use development projects. This application, the VMT Calculator, has been provided to You, the User, to assess vehicle miles traveled (VMT) outcomes of land use projects within the City of Los Angeles. The term "City" as used below shall refer to the City of Los Angeles. The terms "City" and "Fehr & Peers" as used below shall include their respective affiliates, subconsultants, employees, and representatives.

The City is pleased to be able to provide this information to the public. The City believes that the public is most effectively served when they are provided access to the technical tools that inform the public review process of private and public land use investments. However, in using the VMT Calculator, You agree to be bound by this VMT Calculator User Agreement (this Agreement).

VMT Calculator Application for the City of Los Angeles. The City's consultant calibrated the VMT Calculator's parameters in 2018 to estimate travel patterns of locations in the City, and validated those outcomes against empirical data. However, this calibration process is limited to locations within the City, and practitioners applying the VMT Calculator outside of the City boundaries should not apply these estimates without further calibration and validation of travel patterns to verify the VMT Calculator's accuracy in estimating VMT in such other locations.

Limited License to Use. This Agreement gives You a limited, non-transferrable, non-assignable, and non-exclusive license to use and execute a copy of the VMT Calculator on a computer system owned, leased or otherwise controlled by You in Your own facilities, as set out below, provided You do not use the VMT Calculator in an unauthorized manner, and that You do not republish, copy, distribute, reverse-engineer, modify, decompile, disassemble, transfer, or sell any part of the VMT Calculator, and provided that You know and follow the terms of this Agreement. Your failure to follow the terms of this Agreement shall automatically terminate this license and Your right to use the VMT Calculator.

Ownership. You understand and acknowledge that the City owns the VMT Calculator, and shall continue to own it through Your use of it, and that no transfer of ownership of any kind is intended in allowing You to use the VMT Calculator.

Warranty Disclaimer. In spite of the efforts of the City and Fehr & Peers, some information on the VMT Calculator may not be accurate. The VMT Calculator, OUTPUTS AND ASSOCIATED DATA ARE PROVIDED "as is" WITHOUT WARRANTY OF ANY KIND, whether expressed, implied, statutory, or otherwise including but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

Limitation of Liability. It is understood that the VMT Calculator is provided without charge. Neither the City nor Fehr & Peers can be responsible or liable for any information derived from its use, or for any delays, inaccuracies, incompleteness, errors or omissions arising out of your use of the VMT Calculator or with respect to the material contained in the VMT Calculator. You understand and agree that Your sole remedy against the City or Fehr & Peers for loss or damage caused by any defect or failure of the

VMT Calculator, regardless of the form of action, whether in contract, tort, including negligence, strict liability or otherwise, shall be the repair or replacement of the VMT Calculator to the extent feasible as determined solely by the City. In no event shall the City or Fehr & Peers be responsible to You or anyone else for, or have liability for any special, indirect, incidental or consequential damages (including, without limitation, damages for loss of business profits or changes to businesses costs) or lost data or downtime, however caused, and on any theory of liability from the use of, or the inability to use, the VMT Calculator, whether the data, and/or formulas contained in the VMT Calculator are provided by the City or Fehr & Peers, or another third party, even if the City or Fehr & Peers have been advised of the possibility of such damages.

This Agreement and License shall be governed by the laws of the State of California without regard to their conflicts of law provisions, and shall be effective as of the date set forth below and, unless terminated in accordance with the above or extended by written amendment to this Agreement, shall terminate on the earlier of the date that You are not making use of the VMT Calculator or one year after the beginning of Your use of the VMT Calculator.

By using the VMT Calculator, You hereby waive and release all claims, responsibilities, liabilities, actions, damages, costs, and losses, known and unknown, against the City and Fehr & Peers for Your use of the VMT Calculator.

Before making decisions using the information provided in this application, contact City LADOT staff to confirm the validity of the data provided.

Print and sign below, and submit to LADOT along with the transportation assessment Memorandum of Understanding (MOU).

Appendix C

CEQA T-1 Plans, Policies, Programs Consistency Worksheet

LADOT

Attachment D: Plan, Policy, and Program Consistency Worksheet

Plans, Policies and Programs Consistency Worksheet

The worksheet provides a structured approach to evaluate the threshold T-1 question below, that asks whether a project conflicts with a program, plan, ordinance or policy addressing the circulation system. The intention of the worksheet is to streamline the project review by highlighting the most relevant plans, policies and programs when assessing potential impacts to the City's circulation system.

> ***Threshold T-1***: Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadways, bicycle, and pedestrian facilities?

This worksheet does not include an exhaustive list of City policies, and does not include community plans, specific plans, or any area-specific regulatory overlays. The Department of City Planning project planner will need to be consulted to determine if the project would obstruct the City from carrying out a policy or program in a community plan, specific plan, streetscape plan, or regulatory overlay that was adopted to support multimodal transportation options or public safety. LADOT staff should be consulted if a project would lead to a conflict with a mobility investment in the Public Right of Way (PROW) that is currently undergoing planning, design, or delivery. This worksheet must be completed for all projects that meet the Section I. Screening Criteria. For description of the relevant planning documents, **see Attachment D.1.**

For any response to the following questions that checks the box in **bold text** ((i.e.□ **Yes** or □ **No**), further analysis is needed to demonstrate that the project does not conflict with a plan, policy, or program.

I. SCREENING CRITERIA FOR POLICY ANALYSIS

If the answer is 'yes' to any of the following questions, further analysis will be required:

Does the project require a discretionary action that requires the decision maker to find that the project would substantially conform to the purpose, intent and provisions of the General Plan?

☑ Yes □ No

Is the project known to directly conflict with a transportation plan, policy, or program adopted to support multimodal transportation options or public safety?

□ Yes ☑ No

Is the project required to or proposing to make any voluntary modifications to the public right-of-way (i.e., dedications and/or improvements in the right-of-way, reconfigurations of curb line, etc.)?

□ Yes ☑ No

II. PLAN CONSISTENCY ANALYSIS

A. Mobility Plan 2035 PROW Classification Standards for Dedications and Improvements

These questions address potential conflict with:

LADOT

Plan, Policy, and Program Consistency Worksheet

Mobility Plan 2035 Policy 2.1 *– Adaptive Reuse of Streets. Design, plan, and operate streets to serve multiple purposes and provide flexibility in design to adapt to future demands.*

Mobility Plan 2035 Policy 2.3 *– Pedestrian Infrastructure. Recognize walking as a component of every trip, and ensure high quality pedestrian access in all site planning and public right-of-way modifications to provide a safe and comfortable walking environment.*

Mobility Plan 2035 Policy 3.2 *– People with Disabilities. Accommodate the needs of people with disabilities when modifying or installing infrastructure in the public right-of-way.*

Mobility Plan 2035 Street Designations and Standard Roadway Dimensions

A.1 Does the project include additions or new construction along a street designated as a Boulevard I, and II, and/or Avenue I, II, or III on property zoned for R3 or less restrictive zone? ☑ Yes ☐ No

A.2 If **A.1 is yes**, is the project required to make additional dedications or improvements to the Public Right of Way as demonstrated by the street designation. ☐ Yes ☑ No ☐ N/A

A.3 If **A.2 is yes**, is the project making the dedications and improvements as necessary to meet the designated dimensions of the fronting street (Boulevard I, and II, or Avenue I, II, or III)?

☐ Yes ☐ No ☑ N/A

If the answer is to **A.1 or A.2 is NO, or to A.1, A.2 and A.3. is YES**, then the project does not conflict with the dedication and improvement requirements that are needed to comply with the Mobility Plan 2035 Street Designations and Standard Roadway Dimensions.

A.4 If the answer to **A.3. is NO**, is the project applicant asking to waive from the dedication standards?

☐ Yes ☐ No ☑ N/A

Lists any streets subject to dedications or voluntary dedications and include existing roadway and sidewalk widths, required roadway and sidewalk widths, and proposed roadway and sidewalk width or waivers.

Alameda St

Frontage 1 Existing PROW"/Curb' : Existing 50'/15' Required 50'/15' Proposed 50'/15'

7th St

Frontage 2 Existing PROW"/Curb' : Existing 43'/15' Required 43'/15' Proposed 43'/15'

Frontage 3 Existing PROW"/Curb' : Existing _____ Required _____ Proposed _____

Frontage 4 Existing PROW"/Curb' : Existing _____ Required _____ Proposed _____

If the answer to **A.4 is NO**, the project is inconsistent with Mobility Plan 2035 street designations and must file for a waiver of street dedication and improvement.

If the answer to **A.4 is YES**, additional analysis is necessary to determine if the dedication and/or improvements are necessary to meet the City's mobility needs for the next 20 years. The following factors may contribute to determine if the dedication or improvement is necessary:

Is the project site along any of the following networks identified in the City's Mobility Plan?

- Transit Enhanced Network
- Bicycle Enhanced Network
- Bicycle Lane Network
- Pedestrian Enhanced District
- Neighborhood Enhanced Network

To see the location of the above networks, see **Transportation Assessment Support Map**.[1]

Is the project within the service area of Metro Bike Share, or is there demonstrated demand for micro-mobility services?

If the project dedications and improvements asking to be waived are necessary to meet the City's mobility needs, the project may be found to conflict with a plan that is adopted to protect the environment.

B. Mobility Plan 2035 PROW Policy Alignment with Project-Initiated Changes

B.1 Project-Initiated Changes to the PROW Dimensions

These questions address potential conflict with:

Mobility Plan 2035 Policy 2.1 *– Adaptive Reuse of Streets. Design, plan, and operate streets to serve multiple purposes and provide flexibility in design to adapt to future demands.*

Mobility Plan 2035 Policy 2.3 *– Pedestrian Infrastructure. Recognize walking as a component of every trip, and ensure high quality pedestrian access in all site planning and public right-of-way modifications to provide a safe and comfortable walking environment.*

Mobility Plan 2035 Policy 3.2 *– People with Disabilities. Accommodate the needs of people with disabilities when modifying or installing infrastructure in the public right-of-way.*

Mobility Plan 2035 Policy 2.10 *– Loading Areas. Facilitate the provision of adequate on and off-site street loading areas.*

Mobility Plan 2035 Street Designations and Standard Roadway Dimensions

B.1 Does the project propose, above and beyond any PROW changes needed to comply with Section 12.37 of the LAMC as discussed in Section II.A, physically modify the curb placement or turning radius and/or physically alter the sidewalk and parkways space that changes how people access a property?

Examples of developer-initiated physical changes to the public right-of-way include:

- widening the roadway,
- narrowing the sidewalk,
- adding space for vehicle turn outs or loading areas,
- removing bicycle lanes, bike share stations, or bicycle parking

[1] LADOT Transportation Assessment Support Map https://arcg.is/fubbD

- modifying existing bus stop, transit shelter, or other street furniture
- paving, narrowing, shifting or removing an existing parkway or tree well

□ Yes ✓ No

B.2 Driveway Access

These questions address potential conflict with:

Mobility Plan 2035 Policy 2.10 – *Loading Areas. Facilitate the provision of adequate on and off-site street loading areas.*

Mobility Plan 2035 Program PL.1. Driveway Access. *Require driveway access to buildings from non-arterial streets or alleys (where feasible) in order to minimize interference with pedestrian access and vehicular movement.*

Citywide Design Guidelines - Guideline 2*: Carefully incorporate vehicular access such that it does not degrade the pedestrian experience.*

Site Planning Best Practices:

- *Prioritize pedestrian access first and automobile access second. Orient parking and driveways toward the rear or side of buildings and away from the public right-of-way. On corner lots, parking should be oriented as far from the corner as possible.*
- *Minimize both the number of driveway entrances and overall driveway widths.*
- *Do not locate drop-off/pick-up areas between principal building entrances and the adjoining sidewalks.*
- *Orient vehicular access as far from street intersections as possible.*
- *Place drive-thru elements away from intersections and avoid placing them so that they create a barrier between the sidewalk and building entrance(s).*
- *Ensure that loading areas do not interfere with on-site pedestrian and vehicular circulation by separating loading areas and larger commercial vehicles from areas that are used for public parking and public entrances.*

B.2 Does the project add new driveways along a street designated as an Avenue or a Boulevard that conflict with LADOT's Driveway Design Guidelines (See Sec. 321 in the Manual of Policies and Procedures) by any of the following:

- locating new driveways for residential properties on an Avenue or Boulevard, and access is otherwise possible using an alley or a collector/local street, or
- locating new driveways for industrial or commercial properties on an Avenue or Boulevard and access is possible along a collector/local street, or
- the total number of new driveways exceeds 1 driveway per every 200 feet[2] along on the Avenue or Boulevard frontage, or
- locating new driveways on an Avenue or Boulevard within 150 feet from the intersecting street, or
- locating new driveways on a collector or local street within 75 feet from the intersecting street, or

[2] for a project frontage that exceeds 400 feet along an Avenue or Boulevard, the incremental additional driveway above 2 is more than 1 driveway for every 400 additional feet.

- locating new driveways near mid-block crosswalks, requiring relocation of the mid-block crosswalk

☐ Yes ☑ No

If the answer to **B.1 and B.2 are both NO**, then the project would not conflict with a plan or policies that govern the PROW as a result of the project-initiated changes to the PROW.

Impact Analysis

If the answer to either **B.1 or B.2 are YES**, City plans and policies should be reviewed in light of the proposed physical changes to determine if the City would be obstructed from carrying out the plans and policies. The analysis should pay special consideration to substantial changes to the Public Right of Way that may either degrade existing facilities for people walking and bicycling (e.g., removing a bicycle lane), or preclude the City from completing complete street infrastructure as identified in the Mobility Plan 2035, especially if the physical changes are along streets that are on the High Injury Network (HIN). The analysis should also consider if the project is in a Transit Oriented Community (TOC) area, and would degrade or inhibit trips made by biking, walking and/ or transit ridership. The streets that need special consideration are those that are included on the following networks identified in the Mobility Plan 2035, or the HIN:

- Transit Enhanced Network
- Bicycle Enhanced Network
- Bicycle Lane Network
- Pedestrian Enhanced District
- Neighborhood Enhanced Network
- High Injury Network

To see the location of the above networks, see **Transportation Assessment Support Map**.[3]

Once the project is reviewed relevant to plans and policies, and existing facilities that may be impacted by the project, the analysis will need to answer the following two questions in concluding if there is an impact due to plan inconsistency.

B.2.1 Would the physical changes in the public right of way or new driveways that conflict with LADOT's Driveway Design Guidelines degrade the experience of vulnerable roadway users such as modify, remove, or otherwise negatively impact existing bicycle, transit, and/or pedestrian infrastructure?

☐ Yes ☑ No ☐ N/A

B.2.2 Would the physical modifications or new driveways that conflict with LADOT's Driveway Design Guidelines preclude the City from advancing the safety of vulnerable roadway users?

☐ Yes ☑ No ☐ N/A

If either of the answers to either **B.2.1 or B.2.2 are YES**, the project may conflict with the Mobility Plan 2035, and therefore conflict with a plan that is adopted to protect the

[3] LADOT Transportation Assessment Support Map https://arcg.is/fubbD

environment. If either of the answers to both **B.2.1. or B.2.2. are NO**, then the project would not be shown to conflict with plans or policies that govern the Public Right-of-Way.

C. Network Access

C. 1 Alley, Street and Stairway Access

These questions address potential conflict with:

Mobility Plan Policy 3.9 *Increased Network Access: Discourage the vacation of public rights-of-way.*

C.1.1 Does the project propose to vacate or otherwise restrict public access to a street, alley, or public stairway?

☐ Yes ☑ No

C.1.2 If the answer to C.1.1 is Yes, will the project provide or maintain public access to people walking and biking on the street, alley or stairway?

☐ Yes ☐ **No** ☑ N/A

C.2 New Cul-de-sacs

These questions address potential conflict with:

Mobility Plan 2035 Policy 3.10 *Cul-de-sacs: Discourage the use of cul-de-sacs that do not provide access for active transportation options.*

C.2.1 Does the project create a cul-de-sac or is the project located adjacent to an existing cul-de-sac?

☐ Yes ☑ No

C.2.2 If yes, will the cul-de-sac maintain convenient and direct public access to people walking and biking to the adjoining street network?

☐ Yes ☐ **No** ☑ N/A

If the answers to either C.1.2 or C.2.2 are YES, then the project would not conflict with a plan or policies that ensures access for all modes of travel. If the answer to either **C.1.2 or C.2.2 are NO**, the project may conflict with a plan or policies that governs multimodal access to a property. Further analysis must assess to the degree that pedestrians and bicyclists have sufficient public access to the transportation network.

D. Parking Supply and Transportation Demand Management

These questions address potential conflict with:

Mobility Plan 2035 Policy 3.8 *– Bicycle Parking, Provide bicyclists with convenient, secure and well maintained bicycle parking facilities.*

Mobility Plan 2035 Policy 4.8 *– Transportation Demand Management Strategies. Encourage greater utilization of Transportation Demand Management Strategies to reduce dependence on single-occupancy vehicles.*

LADOT

Plan, Policy, and Program Consistency Worksheet

Mobility Plan 2035 Policy 4.13 *– Parking and Land Use Management: Balance on-street and off-street parking supply with other transportation and land use objectives.*

D.1 Would the project propose a supply of onsite parking that exceeds the baseline amount[4] as required in the Los Angeles Municipal Code or a Specific plan, whichever requirement prevails?

☐ Yes ☑ No

D.2 If the answer to D.1. is YES, would the project propose to actively manage the demand of parking by independently pricing the supply to all users (e.g. parking cash-out), or for residential properties, unbundle the supply from the lease or sale of residential units?

☐ Yes ☐ **No** ☑ N/A

If the answer to **D.2. is NO** the project may conflict with parking management policies. Further analysis is needed to demonstrate how the supply of parking above city requirements will not result in additional (induced) drive-alone trips as compared to an alternative that provided no more parking than the baseline required by the LAMC or Specific Plan. If there is potential for the supply of parking to result in induced demand for drive-alone trips, the project should further explore transportation demand management (TDM) measures to further off-set the induced demands of driving and vehicle miles travelled (VMT) that may result from higher amounts of on-site parking. The TDM measures should specifically focus on strategies that encourage dynamic and context-sensitive pricing solutions and ensure the parking is efficiently allocated, such as providing real time information. Research has demonstrated that charging a user cost for parking or providing a 'cash-out' option in return for not using it is the most effective strategy to reduce the instances of drive-alone trips and increase non-auto mode share to further reduce VMT. To ensure the parking is efficiently managed and reduce the need to build parking for future uses, further strategies should include sharing parking with other properties and/or the general public.

D.3. Would the project provide the minimum on and off-site bicycle parking spaces as required by Section 12.21 A.16 of the LAMC?

☑ Yes ☐ **No**

D.4. Does the Project include more than 25,000 square feet of gross floor area construction of new non-residential gross floor?

☐ Yes ☑ No

D.5 If the answer to D.4. is YES, does the project comply with the City's TDM Ordinance in Section 12.26 J of the LAMC?

☐ Yes ☐ **No** ☑ N/A

If the answer to **D.3. or D.5. is NO** the project conflicts with LAMC code requirements of bicycle parking and TDM measures. If the project includes uses that require bicycle parking (Section 12.21 A.16) or TDM (Section 12.26 J), and the project does not comply with those Sections of the LAMC, further analysis is required to ensure that the project supports the intent of the two LAMC sections. To meet the intent of

[4] The baseline parking is defined here as the default parking requirements in section 12.21 A.4 of the Los Angeles Municipal Code or any applicable Specific Plan, whichever prevails, for each applicable use not taking into consideration other parking incentives to reduce the amount of required parking.

bicycle parking requirements, the analysis should identify how the project commits to providing safe access to those traveling by bicycle and accommodates storing their bicycle in locations that demonstrates priority over vehicle access.

Similarly, to meet the intent of the TDM requirements of Section 12.26 J of the LAMC, the analysis should identify how the project commits to providing effective strategies in either physical facilities or programs that encourage non-drive alone trips to and from the project site and changes in work schedule that move trips out of the peak period or eliminate them altogether (as in the case in telecommuting or compressed work weeks).

E. Consistency with Regional Plans

This section addresses potential inconsistencies with greenhouse gas (GHG) reduction targets forecasted in the Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP) / Sustainable Communities Strategy (SCS).

E.1 Does the Project or Plan apply one the City's efficiency-based impact thresholds (i.e. VMT per capita, VMT per employee, or VMT per service population) as discussed in **Section 2.2.3** of the TAG?

☑ Yes ☐ No

E.2 If the Answer to **E.1 is YES**, does the Project or Plan result in a significant VMT impact?

☐ **Yes** ☑ No ☐ N/A

E.3 If the Answer to **E.1 is NO**, does the Project result in a net increase in VMT?

☐ **Yes** ☐ No ☑ N/A

If the Answer to **E.2 or E.3 is NO**, then the Project or Plan is shown to align with the long-term VMT and GHG reduction goals of SCAG's RTP/SCS.

E.4 If the Answer to **E.2 or E.3 is YES**, then further evaluation would be necessary to determine whether such a project or land use plan would be shown to be consistent with VMT and GHG reduction goals of the SCAG RTP/SCS. For the purpose of making a finding that a project is consistent with the GHG reduction targets forecasted in the SCAG RTP/SCS, the project analyst should consult **Section 2.2.4** of the Transportation Assessment Guidelines (TAG). **Section 2.2.4** provides the methodology for evaluating a land use project's cumulative impacts to VMT, and the appropriate reliance on SCAG's most recently adopted RTP/SCS in reaching that conclusion.

The analysis methods therein can further support findings that the project is consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy for which the State Air Resources Board, pursuant to Section 65080(b)(2)(H) of the Government Code, has accepted a metropolitan planning organization's determination that the sustainable communities strategy or the alternative planning strategy would, if implemented, achieve the greenhouse gas emission reduction targets.

ATTACHMENT D.1: CITY PLAN, POLICIES AND GUIDELINES

The Transportation Element of the City's General Plan, Mobility Plan 2035, established the "Complete Streets Design Guide" as the City's document to guide the operations and design of streets and other public rights-of-way. It lays out a vision for designing safer, more vibrant streets that are accessible to people, no matter what their mode choice. As a living document, it is intended to be frequently updated as City departments identify and implement street standards and experiment with different configurations to promote complete streets. The guide is meant to be a toolkit that provides numerous examples of what is possible in the public right-of-way and that provides guidance on context-sensitive design.

The Plan for A Healthy Los Angeles (March 2015) includes policies directing several City departments to develop plans that promote active transportation and safety.

The City of Los Angeles Community Plans, which make up the Land Use Element of the City's General Plan, guide the physical development of neighborhoods by establishing the goals and policies for land use. The 35 Community Plans provide specific, neighborhood-level detail for land uses and the transportation network, relevant policies, and implementation strategies necessary to achieve General Plan and community-specific objectives.

The stated goal of Vision Zero is to eliminate traffic-related deaths in Los Angeles by 2025 through a number of strategies, including modifying the design of streets to increase the safety of vulnerable road users. Extensive crash data analysis is conducted on an ongoing basis to prioritize intersections and corridors for implementation of projects that will have the greatest effect on overall fatality reduction. The City designs and deploys Vision Zero Corridor Plans as part of the implementation of Vision Zero. If a project is proposed whose site lies on the High Injury Network (HIN), the applicant should consult with LADOT to inform the project's site plan and to determine appropriate improvements, whether by funding their implementation in full or by making a contribution toward their implementation.

The Citywide Design Guidelines (October 24, 2019) includes sections relevant to development projects where improvements are proposed within the public realm. Specifically, Guidelines one through three provide building design strategies that support the pedestrian experience. The Guidelines provide best practices in designing that apply in three spatial categories of site planning, building design and public right of way. The Guidelines should be followed to ensure that the project design supports pedestrian safety, access and comfort as they access to and from the building and the immediate public right of way.

The City's Transportation Demand Management (TDM) Ordinance (LA Municipal Code 12.26.J) requires certain projects to incorporate strategies that reduce drive-alone vehicle trips and improve access to destinations and services. The ordinance is revised and updated periodically and should be reviewed for application to specific projects as they are reviewed.

The City's LAMC Section 12.37 (Waivers of Dedication and Improvement) requires certain projects to dedicate and/or implement improvements within the public right-of-way to meet the street designation standards of the Mobility Plan 2035.

The Bureau of Engineering (BOE) Street Standard Dimensions S-470-1 provides the specific street widths and public right of way dimensions associated with the City's street standards.

Appendix D

VMT Analysis Worksheets

CITY OF LOS ANGELES VMT CALCULATOR Version 1.5

Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project: Residential at ROW DTLA

Scenario: Full Build

Address: 747 S ALAMEDA ST. 90021

Is the project replacing an existing number of residential units with a smaller number of residential units AND is located within one-half mile of a fixed-rail or fixed-guideway transit station?

● Yes ● No

Existing Land Use

Land Use Type	Value	Unit
Housing | Single Family		DU

Click here to add a single custom land use type (will be included in the above list)

Proposed Project Land Use

Land Use Type	Value	Unit
Retail | High-Turnover Sit-Down Restaurant	6.547	ksf
Housing | Multi-Family	886	DU
Housing | Affordable Housing - Family	114	DU
Retail | High-Turnover Sit-Down Restaurant	6.547	ksf

Click here to add a single custom land use type (will be included in the above list)

Project Screening Summary

Existing Land Use	Proposed Project
0 Daily Vehicle Trips	4,676 Daily Vehicle Trips
0 Daily VMT	30,560 Daily VMT

Tier 1 Screening Criteria

Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station. ☐

Tier 2 Screening Criteria

The net increase in daily trips < 250 trips	4,676 Net Daily Trips
The net increase in daily VMT ≤ 0	30,560 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	6.547 ksf

The proposed project is required to perform VMT analysis.

1. INTRODUCTION

1.1. PROJECT DESCRIPTION

The Applicant is proposing to develop three buildings containing 1,000 residential units including 114 Very Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings (Project) on a portion of the site located at 757–787 S. Alameda Street, 1318–1396 E. 7th Street, 736–796 S. Central Avenue, 1301–1327 E. 8th Street, 700–760 S. Market Court, 720–746 S. Terminal Street, and 760 S. Warehouse Street in the Downtown Community Plan area of the City of Los Angeles (City), presently know as ROW DTLA (Project Site). The Project would redevelop the two existing surface parking lots (Development Area) into a mixed-use development located on the north and south sides of Center Street, on the eastern edge of the Project Site. The Development Area is comprised of approximately 4.85 gross acres.

Building A would include commercial space at the first floor; 410 residential units at the first through eighth floors; and two levels of subterranean parking. Building B would include 214 residential units at the first through eight floors and two levels of subterranean parking. Building C would include commercial space at the first floor; 376 residential units at the first through eighth floors; and two levels of subterranean parking. The proposed buildings would range from approximately 100 feet to 103 feet in height. Upon completion, 884,278 square feet of new floor would be provided in the Development Area. When accounting for the existing floor area to remain, approximately 2,477,695 square feet of floor area would be provided within the Project Site with a total FAR of 1.86:1.

The Project would include up to 1,092 vehicular parking spaces. A total of 96,278 square feet of open space would also be provided. The existing uses within the remainder of the Project Site outside of the Development Area will remain and would not be modified by the Project.

1.2. SCOPE OF WORK

This report provides a description of the surface water hydrology, surface water quality, and groundwater at the Project Site and an analysis of the effects of the Project on surface water hydrology, surface water quality, and groundwater.

2. REGULATORY FRAMEWORK

2.1. SURFACE WATER HYDROLOGY

2.1.1 COUNTY OF LOS ANGELES HYDROLOGY MANUAL

Per the City's Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works Hydrology Manual as its basis of design for storm drainage facilities. The Los Angeles County Department of Public Works' Hydrology Manual requires that a storm drain conveyance system be designed for a 25-year storm event and that the combined capacity of a storm drain and street flow system accommodate flow from a 50-year storm event. Areas with sump conditions are required to have a storm drain conveyance system capable of conveying flow from a 50-year storm event. The County also limits the allowable discharge into existing storm drain facilities based on the MS4 Permit (described below) and is enforced on all new developments that discharge directly into the County's storm drain system. Any proposed drainage improvements of County owned storm drain facilities such as catch basins

and storm drain lines require the approval/review from the Los Angeles County Flood Control District (LACFCD) department.

2.1.2 LOS ANGELES MUNICIPAL CODE

Any proposed drainage improvements within the street right of way or any other property owned by, to be owned by, or under the control of the City requires the approval of a B-permit (Section 62.105, LAMC). Under the B-permit process, storm drain installation plans are subject to review and approval by the City of Los Angeles Department of Public Works Bureau of Engineering. Additionally, any connections to the City's storm drain system from a property line to a catch basin or a storm drain pipe requires a storm drain permit from the City of Los Angeles Department of Public Works, Bureau of Engineering.

2.2. SURFACE WATER QUALITY

2.2.1 CLEAN WATER ACT

The federal Clean Water Act was first introduced in 1948 as the Water Pollution Control Act. The Clean Water Act authorizes Federal, state, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries. The primary goals of the Clean Water Act are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and to provide surface waters that are fishable and swimmable. As such, the Clean Water Act forms the basic national framework for the management of water quality and the control of pollutant discharges. The Clean Water Act also sets forth several objectives to achieve the above-mentioned goals. These objectives include regulating pollutant and toxic pollutant discharges; providing for water quality that protects and fosters the propagation of fish, shellfish and wildlife; developing wastewater treatment management plans; and developing and implementing programs for the control of non-point sources of pollution.

Since its introduction, major amendments to the Clean Water Act have been enacted (e.g., 1961, 1966, 1970, 1972, 1977, and 1987). Amendments enacted in 1970 created the U.S. Environmental Protection Agency (USEPA), while amendments enacted in 1972 deemed the discharge of pollutants into waters of the United States from any point source unlawful unless authorized by a USEPA National Pollutant Discharge Elimination System (NPDES) permit. Amendments enacted in 1977 mandated development of a "Best Management Practices" Program at the state level and provided the Water Pollution Control Act with the common name of "Clean Water Act," which is universally used today. Amendments enacted in 1987 required the USEPA to create specific requirements for discharges.

In response to the 1987 amendments to the Clean Water Act and as part of Phase I of its NPDES permit program, the USEPA began requiring NPDES permits for: (1) municipal separate storm sewer systems (MS4) generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. Phase II of the USEPA's NPDES permit program, which went into effect in early 2003, extended the requirements for NPDES permits to: (1) numerous small municipal separate storm sewer systems, (2) construction sites of one to five acres, and (3) industrial facilities owned or operated by small municipal separate storm sewer systems. The NPDES permit program is typically administered by individual authorized states.

In 2008, the USEPA published draft Effluent Limitation Guidelines (ELGs) for the construction and development industry. On December 1, 2009, the EPA finalized its 2008 Effluent Guidelines

Program Plan.

In California, the NPDES stormwater permitting program is administered by the State Water Resources Control Board (SWRCB). The SWRCB was created by the Legislature in 1967. The joint authority of water distribution and water quality protection allows the Board to provide protection for the State's waters, through its nine Regional Water Quality Control Boards (RWQCBs). The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California's waters, acknowledging areas of different climate, topography, geology, and hydrology. The RWQCBs develop "basin plans" for their hydrologic areas, issue waste discharge requirements, enforce action against stormwater discharge violators, and monitor water quality.

2.2.2 CALIFORNIA PORTER-COLOGNE ACT

The Porter-Cologne Water Quality Control Act established the legal and regulatory framework for California's water quality control. The California Water Code authorizes the SWRCB to implement the provisions of the Clean Water Act (CWA), including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants.

As discussed above, under the California Water Code (CWC), the State of California is divided into nine RWQCBs, governing the implementation and enforcement of the CWC and CWA. The Project Site is located within Region 4, also known as the Los Angeles Region. Each RWQCB is required to formulate and adopt a Basin Plan for its region. This Plan must adhere to the policies set forth in the CWC and established by the SWRCB. The RWQCB is also given authority to include within its Basin Plan water discharge prohibitions applicable to conditions, areas, or types of waste.

2.2.3 FEDERAL ANTIDEGRADATION POLICY

The Federal Antidegradation Policy (40 Code of Federal Regulations 131.12) requires states to develop statewide antidegradation policies and identify methods for implementing them. Pursuant to the Code of Federal Regulations (CFR), state antidegradation policies and implementation methods shall, at a minimum, protect and maintain (l) existing in-stream water uses; (2) existing water quality, where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource.

2.2.4 CALIFORNIA ANTIDEGRADATION POLICY

The California Antidegradation Policy, otherwise known as the *Statement of Policy with Respect to Maintaining High Quality Water in California* was adopted by the SWRCB (State Board Resolution No. 68-16) in 1968. Unlike the Federal Antidegradation Policy, the California Antidegradation Policy applies to all waters of the State, not just surface waters. The policy states that whenever the existing quality of a water body is better than the quality established in individual Basin Plans, such high quality shall be maintained and discharges to that water body shall not unreasonably affect present or anticipated beneficial use of such water resource.

2.2.5 CALIFORNIA TOXICS RULE

In 2000, the EPA promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State. The EPA promulgated this rule

based on the EPA's determination that the numeric criteria are necessary in the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health.

2.2.6 BOARD BASIN PLAN FOR THE COASTAL WATERSHEDS OF LOS ANGELES AND VENTURA COUNTIES

As required by the CWC, the LARWQCB has adopted a plan entitled "Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties" (Basin Plan). Specifically, the Basin Plan designates beneficial uses for surface and groundwaters, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's Antidegradation Policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.

The Basin Plan is a resource for the RWQCB and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

2.2.7 NPDES PERMIT PROGRAM

The NPDES permit program was first established under authority of the CWA to control the discharge of pollutants from any point source into the waters of the United States. As indicated above, in California, the NPDES stormwater permitting program is administered by the SWRCB through its nine RWQCBs.

2.2.8 THE CONSTRUCTION GENERAL PERMIT

SWRCB Order No. 2009-0009-DWQ known as "The Construction General Permit" was adopted on September 2, 2009, and amended by Order No. 2010-0014-DWQ effective on February 14, 2011, and Order No. 2012-0006-DWQ effective on July 17, 2012. This NPDES permit establishes a risk-based approach to stormwater control requirements for construction projects by identifying three Project risk levels. The main objectives of the Construction General Permit are to:

1. Reduce erosion
2. Minimize or eliminate sediment in stormwater discharges
3. Prevent materials used at a construction site from contacting stormwater
4. Implement a sampling and analysis program
5. Eliminate unauthorized non-stormwater discharges from construction sites
6. Implement appropriate measures to reduce potential effects of the Project on waterways both during and after construction of projects
7. Establish maintenance commitments on post-construction pollution control measures

California mandates requirements for all construction activities disturbing more than one acre of land to develop and implement a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP documents the selection and implementation of Best Management Practices (BMPs) for a specific construction Project, charging Owners with stormwater quality management responsibilities. A

construction site subject to the Construction General Permit must prepare and implement a SWPPP that meets the requirements of the Construction General Permit[1].

2.2.9 LOS ANGELES COUNTY MUNICIPAL STORM WATER SYSTEM (MS4) PERMIT

As described above, USEPA regulations require that MS4 permittees implement a program to monitor and control pollutants being discharged to the municipal system from both industrial and commercial projects that contribute a substantial pollutant load to the MS4.

On December 13, 2001, the LARWQCB adopted Order No. 01-182 under the CWA and the Porter-Cologne Act. This Order is the NPDES Permit or MS4 permit for municipal stormwater and urban runoff discharges within Los Angeles County. The requirements of this Order (the "Permit") cover 84 cities and most of the unincorporated areas of Los Angeles County. Under the Permit, the Los Angeles County Flood Control District (LACFCD) is designated as the Principal Permittee. The Permittees are the 84 Los Angeles County cities (including the City of Los Angeles) and Los Angeles County. Collectively, these are the "Co-Permittees". The Principal Permittee helps to facilitate activities necessary to comply with the requirements outlined in the Permit but is not responsible for ensuring compliance of any of the Permittees.

2.2.10 STORMWATER QUALITY MANAGEMENT PROGRAMS (SQMP)

In compliance with the Los Angeles County MS4 Permit, the Co-Permittees are required to implement a stormwater quality management program (SQMP) with the goal of accomplishing the requirements of the Permit and reducing the amount of pollutants in stormwater runoff. The SQMP requires the County of Los Angeles and the 84 incorporated cities to:

- Implement a public information and participation program to conduct outreach on storm water pollution;
- Control discharges at commercial/industrial facilities through tracking, inspecting, and ensuring compliance at facilities that are critical sources of pollutants;
- Implement a development planning program for specified development projects;
- Implement a program to control construction runoff from construction activity at all construction sites within the relevant jurisdictions;
- Implement a public agency activities program to minimize storm water pollution effects of the Project from public agency activities; and
- Implement a program to document, track, and report illicit connections and discharges to the storm drain system.

The MS4 Permit contains the following provisions for implementation of the SQMP by the Co-Permittees:

1. General Requirements:
    - Each permittee is required to implement the SQMP to comply with applicable stormwater program requirements.

[1] http://www.swrcb.ca.gov/water_issues/programs/stormwater/construction.shtml

- The SQMP shall be implemented and each permittee shall implement additional controls so that discharge of pollutants is reduced.

2. Best Management Practice Implementation:

   - Permittees are required to implement the most effective combination of BMPs for stormwater/urban runoff pollution control. This should result in the reduction of storm water runoff.

3. Revision of the SQMP:

   - Permittees are required to revise the SQMP to comply with requirements of the RWQCB while complying with regional watershed requirements and/or waste load allocations for implementation of total maximum daily loads (TMDLs) for impaired waterbodies. TMDL is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, and an allocation of that load among the various sources of that pollutant.

4. Designation and Responsibilities of the Principal Permittee:

The Los Angeles County Flood Control District is designated as the Principal Permittee who is responsible for:

- Coordinating activities that comply with requirements outlined in the NPDES Permit;
- Coordinating activities among Permittees;
- Providing personnel and fiscal resources for necessary updates to the SQMP;
- Providing technical support for committees required to implement the SQMP; and
- Implementing the Countywide Monitoring Program required under this Order and assessing the results of the monitoring program.

5. Responsibilities of Co-Permittees:

Each co-permittee is required to comply with the requirements of the SQMP as applicable to the discharges within its geographical boundaries. These requirements include:

- Coordinating among internal departments to facilitate the implementation of the SQMP requirements in an efficient way;
- Participating in coordination with other internal agencies as necessary to successfully implement the requirements of the SQMP; and
- Preparing an annual Budget Summary of expenditures for the storm water management program by providing an estimated breakdown of expenditures for different areas of concern, including budget projections for the following year.

6. Watershed Management Committees (WMCs):

   - Each WMC shall be comprised of a voting representative from each Co-Permittee in the

Watershed Management Area (WMA).

- Each WMCs is required to facilitate exchange of information between Co-Permittees, establish goals and deadlines for WMAs, prioritize pollution control measures, develop and update adequate information, and recommend appropriate revisions to the SQMP.

7. Legal Authority:

- Co-Permittees are granted the legal authority to prohibit non-storm water discharges to the storm drain system including discharge to the MS4 from various development types.

2.2.11 CITY OF LOS ANGELES WATER QUALITY COMPLIANCE MASTER PLAN FOR URBAN RUNOFF

On March 2, 2007, City Council Motion 07-0663 was introduced by the City of Los Angeles City Council to develop a water quality master plan with strategic directions for planning, budgeting and funding to reduce pollution from urban runoff in the City of Los Angeles. On April 20, 2009, City Council Motion 07-0663 was adopted by the City of Los Angeles Board of Public Works. The Water Quality Compliance Master Plan for Urban Runoff was developed by the Bureau of Sanitation, Watershed Protection Division in collaboration with stakeholders to address the requirements of City Council Motion 07-0663. The primary goal of the Water Quality Compliance Master Plan for Urban Runoff is to help meet local, state, and federal agencies water quality goals and targets. Examples being the Clean Water Act (CWA), Porter-Cologne Act, and the other regulations mentioned in this section. Implementation of the Water Quality Compliance Master Plan for Urban Runoff is intended over the next 20 to 30 years to result in cleaner neighborhoods, rivers, lakes and bays, augmented local water supply, reduced flood risk, more open space, and beaches that are safe for swimming. The Water Quality Compliance Master Plan for Urban Runoff also supports the Mayor and Council's efforts to make Los Angeles the greenest major city in the nation.

The Water Quality Compliance Master Plan for Urban Runoff identifies and describes the various watersheds in the City, summarizes the water quality conditions of the City's waters, identifies known sources of pollutants, describes the governing regulations for water quality, describes the BMPs that are being implemented by the City, discusses existing TMDL Implementation Plans and Watershed Management Plans. Additionally, the Water Quality Compliance Master Plan for Urban Runoff provides an implementation strategy that includes the following three initiatives to achieve water quality goals:

- Water Quality Management Initiative, which describes how Water Quality Management Plans for each of the City's watershed and TMDL-specific Implementation Plans will be developed to ensure compliance with water quality regulations.

- The Citywide Collaboration Initiative, which recognizes that urban runoff management and urban development are closely linked, requiring collaborations of many City agencies. This initiative requires the development of City policies, guidelines, and ordinances for green and sustainable approaches for urban runoff management.

- The Outreach Initiative, which promotes public education and community engagement with a focus on preventing urban runoff pollution.

The Water Quality Compliance Master Plan for Urban Runoff includes a financial plan that provides a review of current sources of revenue, estimates costs for water quality compliance, and identifies new potential sources of revenue.

2.2.12 CITY OF LOS ANGELES STORMWATER PROGRAM

The City of Los Angeles supports the policies of the Construction General Permit and the Los Angeles County NPDES permit through the Development Best Management Practices Handbook. Part A Construction Activities, 3rd Edition, and associated ordinances were adopted in September 2004. Part B Planning Activities, 5th Edition was adopted in July 2011. The Handbook provides guidance for developers in complying with the requirements of the Development Planning Program regulations of the City's Stormwater Program. Compliance with the requirements of this manual is required by City of Los Angeles Ordinance No. 172,673. The handbook and ordinances also have specific minimum BMP requirements for all construction activities and require dischargers whose construction projects disturb one acre or more of soil to prepare a SWPPP and file a Notice of Intent (NOI) with the SWRCB. The NOI informs the SWRCB of a particular project and results in the issuance of a Waste Discharger Identification (WDID) number, which is needed to demonstrate compliance with the General Permit.

The Development Best Management Practices Handbook, Low Impact Development Manual, Part B: Planning Activities (5th edition, May 2016) (LID Handbook) provides guidance to developers to ensure the post-construction operation of newly developed and redeveloped facilities comply with the Developing Planning Program regulations of the City's Stormwater Program. Compliance with requirements established in the LID Handbook is required under City of Los Angeles Ordinance No. 173,494. The LID Handbook assists developers with the selection, design, and incorporation of stormwater source control and treatment control BMPs into project design plans, and provides an overview of the City's plan review and permitting process. The LID Handbook addresses the need for frequent and/or regular inspections of infiltration facilities in order to ensure on-site compliance of BMP standards, soil quality, site vegetations, and permeable surfaces. These inspections are required to guarantee that facilities follow all proprietary operation and maintenance requirements.

The City of Los Angeles implements the requirement to incorporate stormwater BMPs through the City's plan review and approval process. During the review process, project plans are reviewed for compliance with the City's General Plan, zoning ordinances, and other applicable local ordinances and codes, including stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals. The Standard Urban Stormwater Mitigation Plan (SUSMP) provisions that are applicable to new residential and commercial developments include, but are not limited to, the following[2]:

- Peak Stormwater Runoff Discharge Rate: Post-development peak stormwater runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak stormwater discharge rate will result in increased potential for downstream erosion;
- Conserve natural areas;
- Minimize Stormwater Pollutants of Concern;
- Protect Slopes and Channels;
- Provide storm drain system Stenciling and Signage;
- Properly design outdoor material storage areas;
- Properly design trash storage areas; and
- Provide proof of ongoing BMP Maintenance of any structural BMPs installed.

Design Standards for Structural or Treatment Control BMPs:

[2] Los Angeles Waterboards SUSMP website, https://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/susmp/susmp_details.shtml. accessed March 7, 2024.

- Structural or Treatment control BMPs selected for use at any project covered by this SUSMP shall meet the design standards of this Section unless specifically exempted. Post-construction Structural or Treatment Control BMPs shall be designed to:

A. Mitigate (infiltrate or treat) stormwater runoff from either:

1. The 85th percentile 24-hour runoff event determined as the maximized capture stormwater volume for the area, from the formula recommended in Urban Runoff Quality Management, WEF Manual of Practice No. 23/ASCE Manual of Practice No. 87, (1998), or

2. The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in California Stormwater Best Management Practices Handbook—Industrial/ Commercial, (1993), or

3. The volume of runoff produced from a 0.75-inch storm event, prior to its discharge to a stormwater conveyance system, or

4. The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75-inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. Control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by local agency.

2.2.13 LOW IMPACT DEVELOPMENT (LID)

The City of Los Angeles supports the requirements of the Los Angeles County Municipal NPDES permit through the Planning and Land Development Handbook for Low Impact Development, Part B, 5th Edition, which the City of Los Angeles adopted in May 2016. The LID Handbook sets forth requirements for implementing stormwater BMPs for small scale and large scale development projects. An LID Ordinance Revision effective April 2, 2024 has adjusted the threshold for which LID Clearance is required. Stormwater mitigation is required for new development projects equal to 1 acre or greater of disturbed area and adding more than 5,000 square feet (SF) of impervious surface area[3]. The City of Los Angeles, Bureau of Sanitation, Watershed Protection Division (WPD) reviews and approves Project plans for compliance.

LID is a stormwater management strategy that seeks to mitigate the effects of the Project from increases in runoff and stormwater pollution as close to its source as possible. LID comprises a set of site design approaches and BMPs that promote the use of natural systems for infiltration, evapotranspiration, and use of stormwater. These LID practices can effectively remove nutrients, bacteria, and metals from stormwater while reducing the volume and intensity of stormwater flows. With respect to urban development and redevelopment projects, it can be applied onsite to mimic the site's predevelopment drainage characteristics. Through the use of various infiltration techniques, LID is geared towards minimizing surface area that produces large amounts of runoff and does not allow water to infiltrate into the ground. Where infiltration is infeasible, the use of

[3] https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mde3/~edisp/cnt017152.pdf

bioretention, rain gardens, vegetated rooftops, and rain barrels that will store, evaporate, detain, and/or treat runoff can be used.

Large development projects require that stormwater BMPs be sized, at a minimum, to infiltrate, evapotranspire, store for use, and/or treat through a high removal efficiency biofiltration/biotreatment system, without any stormwater runoff leaving the site to the maximum extent feasible, for at least the volume of water produced by the stormwater quality design storm event that results from:

i. The 0.75-inch, 24-hour rain event, or
ii. The 85th percentile 24-hour runoff event determined from the Los Angeles County 85th percentile precipitation isohyetal map, *whichever is greater*[4]

2.2.14 STANDARD URBAN STORMWATER MITIGATION PLAN (SUSMP)

Any Project that cannot comply with the City of Los Angeles LID requirements shall be required to comply with, at a minimum, all applicable SUSMP requirements[5]. Under the Los Angeles County Municipal NPDES Permit, Permittees are required to implement a development planning program to address storm water pollution. These programs require Project applicants for certain types of projects to implement SUSMP throughout the operational life of their projects. The purpose of SUSMP is to reduce the discharge of pollutants in storm water by outlining BMPs which must be incorporated into the design plans of new development and redevelopment. A Project is subject to SUSMP if it falls under one of the categories listed below:

1. Single-family hillside residential developments
2. Housing developments of 10 or more dwelling units (including single family tract developments)
3. Industrial /Commercial developments with one acre or more of impervious surface area
4. Automotive service facilities*
5. Retail gasoline outlets*
6. Restaurants*
7. Parking lots of 5,000 square feet or more of surface area or with 25 or more parking spaces
8. Projects with 2,500 square feet or more of impervious area that are located in, adjacent to, or draining directly to designated Environmentally Sensitive Areas (ESA)

* Developments of less than 5,000 square feet in these categories are only subject to the prescriptive method described in The City of Los Angeles Best Management Practices Handbook Part B, 3rd Edition.

Permittees are required to adopt the requirements set herein in their own SUSMP. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied in a general way to all projects or on a case-by-case basis.

2.2.15 LOS ANGELES MUNICIPAL CODE

Section 64.70 of the LAMC sets forth the City's Stormwater and Urban Runoff Pollution Control Ordinance. The ordinance prohibits the discharge of the following into any storm drain system:

- Any liquids, solids, or gases which by reason of their nature or quantity are flammable, reactive, explosive, corrosive, or radioactive, or by interaction with other materials could

[4] https://www.lacitysan.org/cs/groups/sg_sw/documents/document/y250/mdk1/~edisp/cnt095945.pdf
[5] http://www.lastormwater.org/green-la/standard-urban-stormwater-mitigation-plan/

result in fire, explosion or injury.

- Any solid or viscous materials, which could cause obstruction to the flow or operation of the storm drain system.
- Any pollutant that injures or constitutes a hazard to human, animal, plant, or fish life, or creates a public nuisance.
- Any noxious or malodorous liquid, gas, or solid in sufficient quantity, either singly or by interaction with other materials, which creates a public nuisance, hazard to life, or inhibits authorized entry of any person into the storm drain system.
- Any medical, infectious, toxic or hazardous material or waste.

Additionally, unless otherwise permitted by a NPDES permit, the ordinance prohibits industrial and commercial developments from discharging untreated wastewater or untreated runoff into the storm drain system. Furthermore, the ordinance prohibits trash or any other abandoned objects/materials from being deposited such that they could be carried into the storm drains. Lastly, the ordinance not only makes it a crime to discharge pollutants into the storm drain system and imposes fines on violators, but also gives City public officers the authority to issue citations or arrest business owners or residents who deliberately and knowingly dump or discharge hazardous chemicals or debris into the storm drain system.

Earthwork activities, including grading, are governed by the Los Angeles Building Code, which is contained in Los Angeles Municipal Code (LAMC), Chapter IX, Article 1. Specifically, Section 91.7013 includes regulations pertaining to erosion control and drainage devices, and Section 91.7014 includes general construction requirements, as well as requirements regarding flood and mudflow protection.

2.3. GROUNDWATER QUALITY

2.3.1 BOARD BASIN PLAN FOR THE COASTAL WATERSHEDS OF LOS ANGELES AND VENTURA COUNTIES

As required by the California Water Code, the LARWQCB has adopted a plan entitled "Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties" (Basin Plan). Specifically, the Basin Plan designates beneficial uses for surface and groundwaters, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's antidegradation policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.

The Basin Plan is a resource for the Regional Board and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

2.3.2 SAFE DRINKING WATER ACT (SDWA)

The Federal Safe Drinking Act, established in 1974, sets drinking water standards throughout the country and is administered by the USEPA. The drinking water standards established in the SDWA, as set forth in the Code of Federal Regulations (CFR), are referred to as the National Primary Drinking Water Regulations (Primary Standards, Title 40, CFR Part 141) and the National Secondary Drinking Water Regulations (Second Standards, 40 CFR Part 143). California passed its own Safe Drinking Water Act in 1986 that authorizes the State's Department of Health Services (DHS) to protect the public from contaminants in drinking water by establishing maximum contaminants levels (MCLs), as set forth in the CCR, Title 22, Division 4, Chapter 15, that are at least as stringent as those developed by the USEPA, as required by the federal Safe Drinking Water Act.

2.3.3 CALIFORNIA WATER PLAN

The California Water Plan (The Plan) provides a framework for water managers, legislators, and the public to consider options and make decisions regarding California's water future. The Plan, which is updated every five years, presents basic data and information on California's water resources including water supply evaluations and assessments of agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. The Plan also identifies and evaluates existing and proposed statewide demand management and water supply augmentation programs and projects to address the State's water needs.

The goal for the California Water Plan Update is to meet CWC requirements, receive broad support among those participating in California's water planning, and be a useful document for the public, water planners throughout the state, legislators and other decision-makers.

3. ENVIRONMENTAL SETTING

3.1. SURFACE WATER HYDROLOGY

3.1.1 REGIONAL

The Project Site is located within the Los Angeles River Watershed Management Area in the Los Angeles Basin. The Los Angeles River Watershed Management Area covers 835 square miles. It is bordered to the north by the City of Santa Clarita, to the east by Angeles National Forest, to the south by City of Long Beach and to the west by Santa Monica.

Major tributaries to the river in the San Fernando Valley are the Pacoima Wash, Tujunga Wash, Burbank Western Channel and Verdugo Wash. At the eastern end of the San Fernando Valley, the river bends around the Hollywood Hills and flows through Griffith and Elysian Parks, in an area known as the Glendale Narrows. South of the Glendale Narrows, the river is contained in a concrete-lined channel down to Long Beach. The main tributaries to the river in this stretch are the Arroyo Seco, the Rio Hondo, and Compton Creek[6]. The Project Site, including the Development Area, is specifically located within the Los Angeles River Watershed – Reach 3 Subwatershed.

[6]https://www.waterboards.ca.gov/rwqcb4/water_issues/programs/regional_program/Water_Quality_and_Watersheds/los_angeles_river_watershed/la_summary.shtml

3.1.2 LOCAL

Drainage from the Development Area (the existing parking lots at the north and south of Center Street) is captured by an on-site storm drain system. The drainage flows offsite to an underground storm drain system flowing south under Alameda Street owned and maintained by the City of Los Angeles, and subsequently discharged into pipes owned by Los Angeles County.

3.1.3 ON SITE

The Development Area is currently paved parking lots. These existing northern and southern parking lots are assumed to be two separate drainage areas that ultimately discharge to the same system owned by the City of Los Angeles. By reviewing the Development Area's topography, the drainage areas were delineated by sharing similar drainage patterns and flow paths which are tributary to a common point or area.

The Development Area's overall topography for the northern parking lot slopes toward the center of the parking lot with a decrease in grade of approximately two feet from the eastern property line at Alameda Street to the center of the parking lot. The overall topography for the southern parking lot peaks at the center of the parking lot with a decrease in grade of approximately one foot from the eastern property line at Alameda Street to the center of the parking lot.

The existing drainage pattern for both the northern and southern parking lots of the Development Area follows the topography. Stormwater runoff is intercepted by a valley gutter and/or diverted east and westerly to three on-site drainage inlets. See **Exhibit 1** for a map of the existing drainage area and drainage inlets.

The existing northern and southern parking lots of the Development Area are comprised of approximately 96% and 91% impervious surfaces, respectively. The existing Development Area is dominantly impervious pavements for pedestrian and vehicular circulation. There are existing landscape areas on-site, however the areas are small parking barrier installations. Based on the Geotechnical Report dated November 6, 2024 and prepared by Group Delta Consultants, Inc., the parking lots of the Development Area consists of asphalt concrete pavement underlain by fill soils and native soils. The fill soils consists of a mixture of silty sand, sandy silt, sand lean clay, and poorly graded sand with occasional gravel and debris fragments intermixed. The native soils were primarily granular in nature comprised of alternating layers of silty sand and poorly graded to well graded sand with occasional gravel.

Existing runoff flows for the Development Area during a 50-year storm event are shown in Table 3.1.3 below. Pursuant to the methodology described in Section 5.1 of this report, calculations were completed using the Los Angeles County HydroCalc program, based on total site area, flow path length and slope, impervious site area, and soil type. See **Exhibit 2** for HydroCalc output.

Table 3.1.3 – Existing Runoff Flows

Drainage Area	Area (Acres)	Q50 (cfs) (volumetric flow rate measured in cubic feet per second)
Existing North Parking Lot (Proposed Building C)	1.99	5.36
Existing South Parking Lot (Proposed Building A & B)	2.86	7.20

3.2. SURFACE WATER QUALITY

3.2.1 REGIONAL

As discussed above, the Project Site, including the Development Area, is located within the Los Angeles River Watershed Management Area of the Los Angeles Basin, which includes several subwatershed areas. As previously described, the Project Site ultimately drains to the Long Beach Harbor via a network of City and County storm drains within the Los Angeles River – Reach 3 Subwatershed.

3.2.1.1 BENEFICIAL USES OF THE LOS ANGELES RIVER – REACH 3 SUBWATERSHED

The potential beneficial uses for waterbodies in the Los Angeles Region as set forth in the Basin Plan are listed and defined below[9]. The specific beneficial uses applicable to the waters in the Los Angeles River – Reach 3 Subwatershed are shown in Table 3.2.2 below[10].

- Municipal and Domestic Supply (MUN): Uses of water for community, military, or individual water supply systems including, but not limited to, drinking water supply.
- Industrial Service Supply (IND): Uses of water for industrial activities that do not depend primarily on water quality including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, or oil well re-pressurization.
- Ground Water Recharge (GWR): Uses of water for natural or artificial recharge of ground water for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
- Warm Freshwater Habitat (WARM): Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
- Wildlife Habitat (WILD): Use of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.
- Wetland Habitat (WET): Uses of water that support wetland ecosystems, including, but not limited to, preservation or enhancement of wetland habitats, vegetation, fish, shellfish, or wildlife, and other unique wetland functions which enhance water quality, such as providing flood and erosion control, stream bank stabilization, and filtration and purification of naturally occurring contaminants.

3.2.1.2 IMPAIRMENTS AND TMDLS IN THE LOS ANGELES RIVER – REACH 3 SUBWATERSHED

Section 303(d) of the federal Clean Water Act requires the State and RWQCBs to identify impaired water bodies that do not meet quality standards and develop TMDLs to restore the impaired water bodies to their full beneficial uses. A TMDL specifies the maximum amount of a pollutant that a water body can receive and still meet water quality standards. Those facilities and activities that discharge into the water body, collectively, must not exceed the TMDL. The most recent 303(d) list of impaired water bodies was approved by the USEPA in 2012. The majority of the LA River Watershed outside of National Forest land is considered impaired due to a variety of point and nonpoint sources. The pollutants of concern identified for these water bodies include pH levels, ammonia, a number of metals, coliform, trash, scum, algae, oil, chlorpyrifos as well as other pesticides, and volatile organics[11].

Several TMDLs are in place within the Los Angeles River Subwatershed, including the Los Angeles Trash TMDL, Los Angele Nitrogen Compounds and Related Effects TMDL, Los Angeles River and Tributaries Metals TMDL, and the Los Angeles River Bacteria TMDL[11.1].

3.2.2 LOCAL

In general, urban stormwater runoff occurs following precipitation events, with the volume of runoff flowing into the drainage system depending on the intensity and duration of the rain event. Contaminants that may be found in stormwater from developed areas include sediments, trash, bacteria, metals, nutrients, organics and pesticides. The sources of contaminants include surface areas where precipitation falls, as well as the air through which it falls. Contaminants on surfaces such as roads, maintenance areas, parking lots, and buildings, which are usually contained in dry weather conditions, may be carried by rainfall runoff into drainage systems. The City of Los Angeles has installed catch basins to capture debris before entering the storm drain system. In addition, the City conducts routine street cleaning operations, as well as periodic cleaning and maintenance of catch basins to reduce stormwater pollution within the City.

3.2.3 ON SITE

The only known structural BMPs for the treatment of stormwater runoff in the Development Area are onsite catch basins and landscaping. There are a range of non-structural BMPs that are currently utilized at the Project Site and Development Area to minimize the impact of pollutant sources. These include general housekeeping practices such as regular trash collection and proper storage of hazardous materials and waste. Based on the existing operations within the Project Site and Development Area, the on-site runoff likely contains the following pollutants of concern: sediment; nutrients; pesticides; metals; pathogens; and oil and grease.

3.3. GROUNDWATER

3.3.1 REGIONAL

Groundwater use for domestic water supply is a major beneficial use of groundwater basins in Los Angeles County. The City of Los Angeles overlies the Los Angeles Coastal Plain Groundwater Basin. The Los Angeles Coastal Plain Groundwater Basin is comprised of the Hollywood, Santa Monica, Central, and West Coast Subbasins. Groundwater flow in the Los Angeles Coastal Plain

[11]https://www.waterboards.ca.gov/rwqcb4/water_issues/programs/regional_program/Water_Quality_and_Watersheds/los_angeles_river_watershed/la_summary.shtml
[11.1]https://www.waterboards.ca.gov/rwqcb4/water_issues/programs/basin_plan/2020/Chapter_7/Chapter_7.pdf

Groundwater Basin is generally south-southwesterly and may be restricted by natural geological features. Replenishment of groundwater basins occurs mainly by percolation of precipitation throughout the region via permeable surfaces, spreading grounds, and groundwater migration from adjacent basins, as well as injection wells designed to pump freshwater along specific seawater barriers to prevent the intrusion of saltwater.

3.3.2 LOCAL

Within the Los Angeles Coastal Plain Groundwater basin, the Project Site, including the Development Area, specifically overlies the Central Subbasin. The Central Subbasin occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin. This subbasin is commonly referred to as the "Central Basin" and is bounded on the north by a surface divide called the La Brea high, and on the northeast and east by emergent less permeable Tertiary rocks of the Elysian, Repetto, Merced and Puente Hills. The southeast boundary between Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage province boundary[12].

Recharge to the Central Subbasin occurs primarily through the Montebello forebay extending southward from the Whittier Narrows where the San Gabriel River encounters the Central Basin. Both forebays have unconfined groundwater conditions and relatively interconnected aquifers that extend up to 1,600 feet deep to provide recharge to the aquifer system of this subbasin (DWR 1961).

3.3.3 ON SITE

Based on the Geotechnical Report dated November 6, 2024 and prepared by Group Delta Consultants, Inc., groundwater was not encountered within any of the borings to a maximum explored depth of 50 feet below the ground surface. The historically highest ground water level at the site is approximately 150 feet below ground surface, per the Seismic Hazard Zone Report for the Los Angeles Quadrangle (CGS,1998).

4. CRITERIA

While this analysis is not required for the Housing Element Checklist, the Applicant has prepared this analysis, outside of the Housing Element Checklist, for supplemental and informational purposes only.

4.1. SURFACE WATER HYDROLOGY

Appendix G of the CEQA Guidelines provides thresholds to assess effects of the Project with regard to surface water hydrology. These thresholds are as follows:

Would the project:

- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

[12] https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Groundwater-Management/Bulletin-118/Files/2003-Basin-Descriptions/4_011_04_CentralSubbasin.pdf

  - Result in substantial erosion or siltation on- or off-site;
  - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or Impede or redirect flood flows;
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

In the context of these thresholds from Appendix G of the CEQA Guidelines, the City of Los Angeles CEQA Thresholds Guide (L.A. CEQA Thresholds Guide) states that a project would normally have a significant impact on surface water hydrology if it would:

- Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;
- Substantially reduce or increase the amount of surface water in a water body; or
- Result in a permanent adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.

4.2. SURFACE WATER QUALITY

Appendix G of the CEQA Guidelines provides thresholds to assess the effects of the Project with regard to surface water quality. These thresholds are as follows:

Would the project:

- Violate any water quality standard or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
  - Result in substantial erosion or siltation on- or off-site;
  - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
  - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
  - Impede or redirect flood flows;
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan;

In the context of the above questions from Appendix G, the L.A. CEQA Thresholds Guide states that a project would normally have a significant impact on surface water quality if it would result in discharges that would create pollution, contamination or nuisance, as defined in Section 13050 of the CWC or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

The CWC includes the following definitions:

- "Pollution" means an alteration of the quality of the waters of the state to a degree which unreasonably affects either of the following: 1) the waters for beneficial uses or 2) facilities

which serve these beneficial uses. "Pollution" may include "Contamination".

- "Contamination" means an impairment of the quality of the waters of the state by waste to a degree, which creates a hazard to the public health through poisoning or though the spread of disease. "Contamination" includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected.
- "Nuisance" means anything which meets all of the following requirements: 1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; 2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; and 3) occurs during, or as a result of, the treatment or disposal of wastes[13].

4.3. GROUNDWATER HYDROLOGY

Appendix G of the CEQA Guidelines provides thresholds to assess the effects of the Project with regard to groundwater. These thresholds are as follows:

Would the project:

- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

In the context of the above question from Appendix G, the L.A. CEQA Thresholds Guide states that a project would normally have a significant impact on groundwater if it would:

- Change potable water levels sufficiently to:
  - Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought;
  - Reduce yields of adjacent wells or well fields (public or private); or
  - Adversely change the rate or direction of flow of groundwater; or
- Result in demonstrable and sustained reduction of groundwater recharge capacity.

4.4. GROUNDWATER QUALITY

Appendix G of the CEQA Guidelines provides thresholds to assess the effects of the Project with regard to groundwater quality. These thresholds are as follows:

Would the project:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan;

In the context of the above questions from Appendix G pertaining to groundwater quality, the

[13] City of Los Angeles. LA. CEQA Thresholds Guide. 2006
https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/A07.pdf

L.A. CEQA Thresholds Guide states that a project would normally have a significant impact on groundwater quality if it would:

- Affect the rate or change the direction of movement of existing contaminants;
- Expand the area affected by contaminants;
- Result in an increased level of groundwater contamination (including that from direct percolation, injection or salt water intrusion); or
- Cause regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations (CCR), Title 22, Division 4, and Chapter 15 and in the Safe Drinking Water Act.

5. METHODOLOGY

5.1. SURFACE WATER HYDROLOGY

The Development Area is located within the City of Los Angeles, and drainage collection, treatment, and conveyance are regulated by the City. Per the City's Special-Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works (LACDPW) Hydrology Manual as its basis of design for storm drainage facilities. The LACDPW Hydrology Manual requires projects to have drainage facilities that meet the Urban Flood level of protection. The Urban Flood is runoff from a 25-year frequency design storm falling on a saturated watershed. A 25-year frequency design storm has a probability of 1/25 of being equaled or exceeded in any year. A 50-year frequency storm as a probability of 1/50 of being equaled or exceeded in any year. To provide a more conservative analysis, this report analyzes the greater storm event threshold, i.e., the 50-year frequency design storm event.

The Modified Rational Method was used to calculate storm water runoff. The "peak" (maximum value) runoff for a drainage area is calculated using the formula, Q = CIA per below:

Q = Volumetric flow rate (cfs)
C = Runoff coefficient (dimensionless)
I = Rainfall Intensity at a given point in time (in/hr)
A = Basin area (acres)

The Modified Rational Method assumes that a steady, uniform rainfall rate will produce maximum runoff when all parts of the basin area are contributing to outflow. This occurs when the storm event lasts longer than the time of concentration. The time of concentration (Tc) is the time it takes for rain in the most hydrologically remote part of the basin area to reach the outlet.

The method assumes that the runoff coefficient (C) remains constant during a storm. The runoff coefficient is a function of both the soil characteristics and the percentage of impervious surfaces in the drainage area.

The Los Angeles County Department of Public Works developed a program, HydroCalc Calculator, to automate time of concentration calculations as well as the peak runoff rates and volumes using the Modified Rational Method design criteria as outlined in the Hydrology Manual. The data input requirements include area size, flow path length, flow path slope, rainfall isohyet, soil type, design storm frequency, and fire factor. The HydroCalc Calculator was used to calculate the storm water peak runoff flow rate for the existing and proposed Project conditions.

5.2. SURFACE WATER QUALITY

The Project will meet the requirements of the City of Los Angeles LID Handbook. Under section 3.2.2 of the LID Handbook, post-construction stormwater runoff from a new development must be infiltrated, evapotranspirated, captured and used, and/or treated through high efficiency BMPs onsite for at least the volume of water produced by a 0.75-inch storm event or the 85th percentile 24-hour runoff event, whichever is greater. The LID Handbook prioritizes the selection of BMPs used to comply with stormwater mitigation requirement. The order of priority is:

1. Infiltration Systems
2. Stormwater Capture and Use
3. High Efficient Biofiltration/Bioretention Systems
4. Combination of Any of the Above

Feasibility screening for each stormwater mitigation method is delineated in the LID Handbook. A site-specific soils report is required to determine infiltration feasibility. To be feasible, the depth between the infiltration system and the observed groundwater should be greater than ten feet, the infiltration rate should be greater than 1.5 in/hr, and the site should not be located within a hillside grading area or near potential geotechnical hazards. If these conditions are not met, infiltration may potentially still be feasible, per the results of the site-specific soils report, and approval of the City of Los Angeles, Bureau of Sanitation, Watershed Protection Division. If infiltration is confirmed infeasible for the Project Site, capture and use feasibility will be considered. For capture and use to be feasible, the Estimated Total Water Usage for irrigation from October 1 – April 30 must be greater than or equal to the volume of water produced by the stormwater quality design storm event.

5.3. GROUNDWATER HYDROLOGY

The effects of the Project as it relates to the level of the underlying groundwater table of the Central Groundwater Subbasin included a review of the following considerations:

Analysis and Description of the Project's Existing Condition

- Identification of the Central Subbasin as the underlying groundwater basin, and description of the level, quality, direction of flow, and existing uses for the water;
- Description of the location, existing uses, production capacity, quality, and other pertinent data for spreading grounds and potable water wells in the vicinity (usually within a one-mile radius), and;
- Area and degree of permeability of soils on the Project Site, and;

Analysis of the Proposed Project Impact on Groundwater Level

- Description of the rate, duration, location and quantity of extraction, dewatering, spreading, injection, or other activities;
- The projected reduction in groundwater resources and any existing wells in the vicinity (usually within a one-mile radius); and
- The projected change in local or regional groundwater flow patterns.

In addition, this report discusses the effect of both construction and demolition activities at the Project Site on the groundwater quality of the underlying Central Subbasin.

Short-term groundwater quality effects of the Project could potentially occur during construction of the Project as a result of soil or shallow groundwater being exposed to construction materials, waste, and spilled materials. These potential effects of the Project are qualitatively assessed.

5.4. GROUNDWATER QUALITY

In addition to the items discussed in Section 5.3 above, this report discusses the impact of both existing and proposed activities in the Development Area on the groundwater quality of the underlying Los Angeles Groundwater Basin.

6. PROJECT ANALYSIS

6.1. CONSTRUCTION

6.1.1 SURFACE WATER HYDROLOGY

Construction activities for the Project would include demolition of the surface parking lots in the Development Area. Construction of three multi-story buildings, one on the northern lot (Building C) and one on each of the two southern lots (Buildings A and B). All three buildings will have two levels of subterranean parking. Excavation for the subterranean lots would follow demolition. These activities will temporarily alter existing surface drainage patterns and flows on the Development Area by diverting existing surface flows.

The Project would be required to comply with all applicable City grading permit regulations that require necessary measures, plans, and inspections to reduce sedimentation and erosion. Thus, through implementation of BMPs, and compliance with applicable City grading regulations, the Project would not substantially alter the Project Site or Development Area drainage patterns in a manner that would result in substantial erosion, siltation, or flooding on- or off-site. Similarly, adherence to standard compliance measurements in construction activities would ensure that during construction the Project would not cause flooding, substantially increase or decrease the amount of surface water flow from the Project Site or Development Area into a water body, or result in a permanent, adverse change to the movement of surface water. Finally, as the existing Development Area is almost entirely impervious and would remain so during most of the construction period, construction activities would have a minimal effect on drainage patterns.

6.1.2 SURFACE WATER QUALITY

Construction activities such as earth moving, maintenance/operation of construction equipment, dewatering, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. A SWPPP would be implemented to provide good housekeeping measures and best management practices (BMPs) to reduce pollutant loads. BMPs would be identified and designed during the design stage of the Project, in accordance with City of Los Angeles Grading Division Guidelines and the California Stormwater Quality Association (CASQA) BMP Handbook. The following are examples of BMPs that may be applicable to the Project:

- Sandbags
- Storm drain inlets protection
- Stabilized construction entrance/exit

- Wind erosion control
- Stockpile management

Through compliance with NPDES requirements and City grading regulations, including the implementation of BMPs, construction of the Project would not result in discharge that would cause: (1) pollution which would alter the quality of the water of the State (i.e., Long Beach Harbor) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the water of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes. Furthermore, construction of the Project would not result in discharges that would cause regulatory standards to be violated in Los Angeles River – Reach 3 Subwatershed.

6.1.3 GROUNDWATER HYDROLOGY

The Development Area does not contain water supply wells nor do any wells exist within one mile of the Project Site[14]. In addition, the Project would not include the construction of water supply wells that could be impacted by construction. Additionally, Project construction would not reduce recharge rates since no appreciable recharge occurs on-site.

Development of the proposed Project would require construction of 2-level subterranean parking structures to a depth of approximately 22 feet below grade for all three buildings. Based on the Geotechnical Report prepared by Group Delta Consultants and dated November 6, 2024, groundwater on-site was not encountered within the 50-foot depth explored. Therefore, the separation between excavation and groundwater is greater than 30 feet deep, and excavation is not anticipated to disturb the groundwater table. If groundwater is encountered during excavation, a temporary dewatering system, such as pumping or wellpoints, would be implemented in accordance with NPDES permit requirements. Therefore, effects of the Project to groundwater flow and level during construction can be considered negligible.

6.1.4 GROUNDWATER QUALITY

Contaminated soil, if present, has the potential to adversely impact the quality of groundwater. A Phase I Environmental Site Assessment was prepared by California Environmental and dated May 2023. Per the Phase I Environmental Report, the subject property was utilized as a railway yard that included a variety of industrial operations (machine shop, blast furnace, and oil storage) throughout the 1900s. These operations are considered Recognized Environmental Conditions (RECs). A Supplemental Soil and Soil Gas Assessment – Phase II was prepared by California Environmental Geologists & Engineers, Inc. and dated March 2024. It was determined in this assessment that the soil exceeds CalEPA guidance concentrations. A Soil Management Plan (SMP) and Health and Safety Plan (HASP) have been developed and will be implemented during the future grading at the Development Area.

During on-site grading and building construction, hazardous materials, such as fuels, paints, solvents, and concrete additives, could be used and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous waste could increase the opportunity for hazardous materials releases into groundwater. Compliance with all applicable federal, state, and local requirements concerning the handling, storage, and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into

[14] http://dpw.lacounty.gov/general/wells/

groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. In addition, as there are no groundwater production wells or public water supply wells within one mile of the Development Area or Project Site, construction activities would not be anticipated to affect existing wells.

6.2 OPERATION

6.2.1 SURFACE WATER HYDROLOGY

The Project proposes construction of a multi-story residential development with 2 levels of subterranean parking for all three buildings (Buildings A, B, and C). Development of the proposed Project would reduce the impervious surface area on-site for the north portion of the Development Area to approximately 80% from the initial 96%. Similarly for the two south portions of the Development Site, the Project would reduce the impervious surface to 80% from the initial 91%.

The Development Area will be split up into 3 separate drainage areas. The proposed Project will also be divided into multiple subdrainage areas, based on the slope of each roof area as determined by the architect, plumbing systems to channel roof stormwater flow, and site grading as designed by the civil engineer. These areas will be finalized during the final design phase of the Project. See **Exhibit 3** for proposed drainage areas.

Table 6.2.1 shows the 50-year frequency design storm event peak flow rate within the proposed Development Area. Calculations were completed using the Los Angeles County HydroCalc program, based total site area, flow path length and slope, impervious site area, and soil type. A comparison of the pre- and post- peak flow rates indicates that there would be a slight increase in stormwater runoff. This change is due to the reduction of the time of concentration. The change is slight because the boundaries of the existing and proposed drainage areas are substantially similar, therefore flow patterns and discharge points would be generally maintained within the Project. See Exhibit 4 for HydroCalc output.

Table 6.2.1 – Proposed Runoff Flows

Drainage Area	Area (Acres)	Q50 (cfs) (volumetric flow rate measured in cubic feet per second)	Total Q50 (cfs)
Existing North Portion of Development Area (Building C)	1.99	5.36	5.36
Proposed North Portion of Development Area (Building C)	1.99	5.29	5.29
Existing South Portion of Development Area (Buildings A & B)	2.86	7.20	7.20
Proposed South Portion of Development Area (Building B)	1.02	2.93	7.82
Proposed South Portion of Development Area (Building A)	1.84	4.89	

The above table indicates a minor increase in overall stormwater runoff. While the slight increase does not create an impact, the runoff will be reduced with BMPs that did not previously exist. Therefore, the Project would not result in an incremental impact on either on- site or off-site flooding during a 50-year storm event, substantially reduce nor increase the amount of surface water in a water body, or result in a permanent adverse change to the movement of surface water that would result in an incremental effect on the capacity of the existing storm drain system.

6.2.2 SURFACE WATER QUALITY

The land uses associated with the Project (Residential & Commercial) would include potential sources of surface water pollutants. Refer to Table 6.2.2-1 for anticipated and potential pollutants that could be generated by the proposed on-site land uses for residential and commercial.

Table 6.2.2-1 – Project Pollutants

Project Pollutant Sources	Pollutants of Concerns
Lawns, Landscaping, and Parks	Sediment (coarse and fine) Nutrients (dissolved and particulate) Pesticides, pathogens, trash and debris
Parking Lots and Driveways	Sediment (fine) Metals (dissolved and particulate) TPH, trash
Roads	Sediment (coarse and fine) Metals (dissolved and particulate) TPH, PAH, trash and debris

To treat and control surface water pollutants and comply with City of Los Angeles LID requirements, the Project will implement a post-construction stormwater BMP. The BMP must

treat at least the volume of water produced by a 0.75-inch storm event or the 85th percentile 24-hour runoff event, whichever is greater. The 85th percentile rainfall depth for the Project Site is 1-inch, which is greater than the 0.75-inch storm event, therefore the BMP will be sized accordingly. The 24-hour, 85th percentile volume was calculated using the HydroCalc program. The calculation was based on the area, flow path length and slope, impervious area, and soil type. The 24-hour design mitigation volume for the LID BMP is shown in Table 6.2.2-2 below. See **Exhibit 5** for HydroCalc output.

Table 6.2.2-2 – LID 24-Hour Design Mitigation Volume

Drainage Area	Area (Acres)	Mitigation Volume Required, Vm (cf)
Proposed Building C	1.99	5,195
Proposed Building B	1.02	2,663
Proposed Building A	1.84	4,804

As discussed above, the LID Handbook sets forth requirements for BMP selection prioritization. A site-specific soil report and percolation testing is required to confirm the feasibility of on-site infiltration. The Geotechnical Report by Group Delta Consultants, Inc. dated November 6, 2024 concludes infiltration is feasible based on analyzing the soil hydraulic conductivity.

The report recommends a preliminary infiltration rate of 5 in/hr. Group Delta Consultants, Inc. also noted that Infiltration rates and infiltration testing to confirm design rates can be provided once additional details regarding the infiltration infrastructure are known and that infiltration will need to comply with the following:

- The infiltration facilities shall be designed to overflow to the street, in the event that the drainage capacity is exceeded or in case of future failure to adequately infiltrate.
- Water infiltration into the ground must occur a minimum of 10 feet above the groundwater table.
- Infiltration facilities shall be located so that soils supported by retaining and basement walls are not saturated.
- No infiltration facility shall be placed to infiltrate water into fill material.
- No infiltration facility shall be placed to infiltrate water into the upper loose soils on site, occurring to depths of approximately 5 to 15 feet where present.
- The distance between the infiltration facility and the adjacent private property line shall be a minimum of 10 feet. No setback is required from the property line for a public street unless required by the Department of Public Works.
- Foundations shall be set back a minimum of 10 feet from the infiltration facility and the bottom of the footing shall be a minimum of 10 feet from the expected zone of saturation. The boundary of the zone of saturation may be assumed to project downward from the top of the permeable portion of the infiltration facility at gradient of 1:1.
- Dry wells should be located at least 10 feet from buildings and shall be cased to a depth where the potential saturation zone is at least 10 feet from any footing. The annular space around the casing shall be sealed to prevent water from raising up the outside of the casing.

The depth between the subterranean parking levels, approximately 22 feet below grade, and the groundwater table, which was not encountered within the 50-foot depth exploration, is greater than 10 feet. In addition, the Geotechnical Report states that the potential for surface rupture, liquefaction, and expansive soils is considered low. The Project Site, including the Development Area is not located in a methane zone. Therefore, the majority of the infiltration feasibility requirements are satisfied.

If infiltration is determined to be infeasible following percolation testing, the next stormwater

mitigation method considered will be capture and use. For capture and use to be feasible, the Estimated Total Water Use from April 1 – October 31 must be greater than the design mitigation volume. Based on proposed Project Site conditions and Water Efficient Landscape Ordinance (WELO) water calculation prepared by the Project's landscape architect, the Estimated Total Water Use would be 1,535.90 cubic feet, 1,943.87 cubic feet, and 1,495.80 cubic feet, which is less than the design mitigation volume of 4,804 cubic feet, 2,663 cubic feet, and 5,195 cubic feet for Buildings A, B, and C, respectively. Therefore, under the currently proposed conditions, capture and use would be infeasible. Note that if the Applicant prefers to use a capture and use BMP, the site pervious area could potentially be increased accordingly until it is feasible.

If both infiltration and capture and use are determined to be infeasible, the final stormwater mitigation method considered will be biofiltration/bioretention. In this case the Project would propose the use of a bio-filtration system of sufficient size to accommodate the design mitigation volume. See **Exhibit 6** for preliminary BMP sizing calculations and LID concept plan.

Due to the incorporation of the LID BMP, which is an existing regulatory requirement the Project is obligated to adhere to, operation of the Project would not result in discharges that would cause: (1) pollution which would alter the quality of the waters of the State (i.e., Long Beach Harbor) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes. Furthermore, operation of the Project would not result in discharges that would cause regulatory standards to be violated.

6.2.3 GROUNDWATER HYDROLOGY

The percolation of precipitation that falls on pervious surfaces is variable dependent upon the soil type, condition of the soil, vegetative cover, and other factors. Ground-disturbing activities for the Project include demolition of the existing surface parking lot and excavation to an average depth of 20 feet below grade for new subterranean parking structures within the northern and southern portions of the Development Area, as well as excavation to a depth of 28 feet below grade within discrete locations for elevator pits and associated footings. Based on the site-specific soils report prepared by Group Delta Consultants, Inc., groundwater was not encountered within the 50-foot depth explored. The Seismic Hazard Zone Report for the Los Angeles Quadrangle (CGS, 1998) indicates that the historic-high groundwater depth at the site is about 150 feet. Given the difference in elevation between the groundwater and excavation depth, it is unlikely that the proposed Project will encounter groundwater, and groundwater hydrology on-site will be minimally affected. In the event that groundwater is encountered, the Project will need to incorporate structural designs for subterranean levels that are able to withstand hydrostatic forces as well as comprehensive waterproofing systems in accordance with current industry standards and construction methods.

6.2.4 GROUNDWATER QUALITY

Operation of the Project would involve the limited use of potentially hazardous materials typical of those used in residential and commercial developments, including cleaning agents, paints, pesticides, and other materials used for landscaping. The potentially hazardous materials of the existing parking lot use include vehicle fluids (oil, gasoline, etc.), electrical waste, and trash. The Project proposes a reduction of impervious area and the implementation of BMPs to comply with LID and water quality regulations. All potentially hazardous materials would be used, stored, and disposed of in accordance with manufacturers' specifications and handled in compliance with applicable standards and regulations.

Based on the above, operations of the Project would not change the rate or direction of movement of existing contaminants, expand the area affected by contaminants, increase the level of groundwater contamination, or cause regulatory water quality standards at existing production wells to be violated.

7. CONCLUSIONS

Based on the analysis contained in this report, the Project will not negatively affect surface water hydrology, surface water quality, or groundwater.

ENERGY TECHNICAL REPORT
FOR
THE ROW DTLA RESIDENTIAL PROJECT

I. Introduction

This Energy Technical Study (Technical Study) has been prepared to evaluate potential impacts related to energy resources due to construction and operation of the ROW DTLA Residential Project (Project) pursuant to the California Environmental Quality Act (CEQA).

The Project is located at 757–787 S. Alameda Street, 1318–1396 E. 7th Street, 736–796 S. Central Avenue, 1301–1327 E. 8th Street, 700–760 S. Market Court, 720–746 S. Terminal Street, and 760 S. Warehouse Street in the Downtown Community Plan area of the City of Los Angeles (City), presently know as ROW DTLA (Project Site). The Project proposes the redevelopment of two existing surface parking lots (Development Area) into a mixed-use development located on the north and south sides of Center Street, on the eastern edge of the Project Site. The Project proposes three eight-story buildings that would provide 1,000 total residential units, including 114 Very Low Income units, and 6,547 square feet of commercial uses. The Project would provide up to 1,092 vehicle parking spaces and approximately 529 bicycle parking spaces. The Project is expected to be completed in 2032.

On November 24, 2021, the City Council certified the Citywide Housing Element 2021–2029 and Safety Element Updates Final Environmental Impact Report (EIR), SCH No. 2021010130, EIR No. ENV-2020-6762-EIR (Program EIR), to adopt the 2021–2029 Citywide Housing Element and the Updates to the Safety Element and the Plan for a Healthy LA (Health Element). Pursuant to CEQA Guidelines Sections 15168(c)(4) and 15168(d), Projects that are found to be within the scope of the program analyzed in the Program EIR and its environmental effects do not require further CEQA documentation. The energy analysis below confirms that the Project would not result in significant energy impacts that were not already examined in the Program EIR.

II. Project Location and Existing Uses

The Project Site consists of three large, irregularly shaped parcels that collectively measure approximately 31 acres in size. The Project Site occupies the northern half of the

block bounded by E. 7th Street on the north, S. Central Avenue on the west, S. Alameda Street on the east, and E. Olympic Boulevard to the south, with the partially vacated former E. 8th and Bay streets providing internal access within the middle of the block.

The Project Site is located in an expansive industrial district east of Downtown Los Angeles. The area surrounding the Project Site is primarily developed with warehouses, cold storage facilities, small-scale manufacturing operations, and other industrial uses, though in more recent years newer commercial office, commercial retail, and residential uses have been developed in the vicinity of the Site.

The Project Site is comprised of an industrial complex historically called the Los Angeles Union Wholesale Terminal, previously owned by the Southern Pacific Railroad, which currently encompasses a total of eight buildings, including seven large industrial buildings that were constructed between 1917 and 1923, and a parking garage constructed in 2016 (the District).

The portion of the Project Site along Central Avenue is used as a wholesale produce market and an outdoor weekend market known as Smorgasburg. The middle portion of the Site between 7th and 8th Street supports 46 retailers and restaurants and another 48 office and hybrid office/light manufacturing tenants which span multiple industries including technology, apparel, construction, produce wholesale and consumer goods, with the exception of 747 S. Alameda Street, which is currently vacant. The Project Site also includes a ten-story concrete parking structure that was built in 2016 and is accessed via S. Alameda Street. The parking structure contains approximately 3,884 parking spaces.

The Development Area is located within the eastern portion of the Project Site along Alameda Street and is comprised of approximately 4.85 gross acres. The Development Area is currently developed with surface parking.

III. Project Description

The Project includes the development of three mixed-use buildings containing 1,000 residential units including 114 Very Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings. Building A would include commercial space at the first floor; 410 residential units at the first through eighth floors; and two levels of subterranean parking. Building B would include 214 residential units at the first through eight floors and two levels of subterranean parking. Building C would include commercial space at the first floor; 376 residential units at the first through eighth floors; and two levels of subterranean parking. The proposed buildings would range from approximately 100 feet to 103 feet in height. Upon completion, 884,278 square feet of new floor would be provided in the Development Area. When accounting for the

existing floor area to remain, approximately 2,477,695 square feet of floor area would be provided within the Project Site with a total FAR of 1.86:1.

The Project would include up to 1,092 vehicular parking spaces. A total of 96,278 square feet of open space would also be provided. The existing uses within the remainder of the Project Site outside of the Development Area will remain and would not be modified by the Project.

IV. Scope of Work

The City of LA Housing Element Update Initial Study prepared an Energy analysis to identify potential impacts related to implementation of the City's updated Housing Element. Conclusions of the energy analysis within the Initial Study resulted in less than significant impacts. No further analysis was performed with regard to Energy within the Housing Element Update EIR.

The Project was assessed for Energy impacts consistent with CEQA Guidelines Appendix F. The following analysis addresses the energy consumption and energy efficiency of construction and operation of the Project. The analysis also demonstrates consistency of the Project with the Energy analysis contained in the City of LA Housing Element Update Initial Study. Calculation worksheets, assumptions, and model outputs for the Energy analysis are included in Appendix EN-2.

V. Environmental Impacts

A. Regulatory Framework

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Energy at the federal, state, regional, and local levels. These regulations are included as Appendix EN-1.

B. Energy Methodology

In accordance with Appendix G of the State CEQA Guidelines, the Project would have a significant impact related to energy if it would:

Threshold (a): Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

Threshold (b): Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

With regard to Threshold (a), this analysis relies upon Appendix F of the CEQA Guidelines, prepared in response to the requirement in PRC Section 21100(b)(3), which states that an energy analysis shall include a detailed statement setting forth "[m]itigation measures proposed to minimize significant effects of the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy."

In addition, with regard to potential impacts to energy, the *L.A. CEQA Thresholds Guide* states that a determination of significance shall be made on a case-by case basis, considering the following factors:

- The extent to which the project would require new (off-site) energy supply facilities and distribution infrastructure, or capacity-enhancing alterations to existing facilities;
- Whether and when the needed infrastructure was anticipated by adopted plans; and
- The degree to which the project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements.

In accordance with Appendix F and the *L.A. CEQA Thresholds Guide*, the following factors were considered in determining whether this threshold of significance is met:

1. The Project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the Project, including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed;
2. The effects of the Project on local and regional energy supplies and on requirements for additional capacity;
3. The effects of the Project on peak and base period demands for electricity and other forms of energy;
4. The degree to which the Project complies with existing energy standards;
5. The effects of the Project on energy resources;
6. The Project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

7. The degree to which the Project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements.

(1) Construction

During Project construction, energy would be consumed in the form of electricity associated with the conveyance of water used for dust control (including supply and conveyance) and, on a limited basis, powering lights, electronic equipment, or other construction activities necessitating electrical power.[1] Electricity usage associated with the supply and conveyance of water used for dust control during construction was calculated using CalEEMod.[2] Electricity used to power lighting, electronic equipment, and other construction activities necessitating electrical power was calculated based on data provided in South Coast Air Quality Management District (SCAQMD) construction surveys (i.e., construction activity, horsepower, load factor, and hours of use per day).[3] Although the Development Area would use electricity from poles where possible, electricity demand calculations were based on the SCAQMD construction surveys which identify the use of diesel generators to supply construction sites with electrical power.

In terms of natural gas, construction activities typically do not involve the consumption of natural gas and current plans do not involve use of natural gas-powered construction equipment.

Project construction would also consume energy in the form of petroleum-based fuels associated with the use of off-road construction vehicles and equipment on the Development Area construction worker travel to and from the Development Area, and delivery and haul truck trips (e.g., the hauling of demolition material to off-site reuse and disposal facilities). Fuel consumption from on-site heavy-duty construction equipment was calculated based on the equipment mix and usage factors provided in the CalEEMod construction output files included in Appendix EN-2 of this Technical Report. The total horsepower was then multiplied by fuel usage estimates per horsepower-hour included in Table A9-3-E of the SCAQMD *CEQA Air Quality Handbook*. Fuel consumption from construction worker, vendor, and delivery/haul trucks was calculated using the trip rates and distances provided in the CalEEMod construction output files. Total vehicle miles traveled (VMT) was then calculated for each type of construction-related trip and divided by the corresponding county-specific miles per gallon factor using CARB's EMFAC 2021 model (EMFAC2021). EMFAC provides the total annual VMT and fuel consumed for each vehicle type. Consistent with CalEEMod,

---

1 *Construction activities include demolition of the existing site, site preparation, grading, building construction, building finishes, landscaping and paving.*

2 *California Air Pollution Control Officers Association, CalEEMod™ Version 2022.1 User's Guide, April 2022.*

3 *California Air Pollution Control Officers Association, CalEEMod Users Guide, Appendix D, Technical Source Documentation, April 2022.*

construction worker trips were assumed to include 50 percent light duty gasoline auto and 50 percent light duty gasoline trucks. Construction vendor and delivery/haul trucks were assumed to be heavy-duty diesel trucks. Refer to Appendix EN-2 of this Technical Report for detailed calculations.

(2) Operation

Annual consumption of electricity (including electricity usage associated with the supply and conveyance of water) and natural gas (e.g., restaurant cooking use) was calculated using demand factors provided in CalEEMod and accounting for the City's All-Electric Ordinance which does not allow natural gas usage for new developments with exceptions for certain uses such as restaurant cooking (Ordinance No. 187,714).[4]

Energy impacts associated with transportation during operation were also assessed. Daily trip generation used in this analysis was based on *Transportation Assessment for the Alameda Square Prcject* dated March 2025 (Transportation Assessment).[5] As discussed therein, the Project daily VMT was calculated using the Los Angeles Department of Transportation (LADOT) VMT Calculator. Based on this annual VMT, gasoline and diesel consumption rates were calculated using the County-specific mpg calculated using EMFAC2021. The vehicle fleet mix for vehicles anticipated to visit the Development Area was calculated consistent with the CalEEMod default for Los Angeles County. Supporting calculations are provided in Appendix EN-2. These calculations were used to determine if the Project would cause the wasteful, inefficient and/or unnecessary consumption of energy as required by Appendix F and Appendix G of the CEQA Guidelines.

The Project's estimated energy demands were also analyzed relative to Los Angeles Department of Water and Power's (LADWP's) and SoCalGas' existing and planned energy supplies in 2032 (i.e., the Project buildout year) to determine if these two energy utility companies would be able to meet the Project's energy demands.

C. Energy Impacts

(1) Impact Determination in the Housing Element Update EIR

A summary of the energy analysis from Environmental Checklist Section 6 Energy, of the Housing Element Update Initial Study, is provided below. In accordance with Appendix G of the State CEQA Guidelines, the energy analysis addressed whether the Housing Element Update would have a significant impact related to energy if it would:

---

[4] *In accordance with Ordinance No. 187,714, restaurant cooking uses will consume natural gas.*

[5] *Gibson Transportation Consultants, Inc., Transportation Assessment for The ROW DTLA Residential Prcject, Los Angeles, California, March 2025.*

Threshold (a): Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

Threshold (b): Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

With regard to Threshold (a) of CEQA Guidelines Appendix G, as evaluated in the Housing Element Update Initial Study, implementation of the Housing Element Update would not result in wasteful, inefficient, or unnecessary consumption of energy resources during construction or operations. As such, impacts were found to be less than significant.

With regard to Threshold (b) of CEQA Guidelines Appendix G, as evaluated in the Housing Element Update Initial Study, implementation of the Housing Element Update would not conflict with plans for renewable energy or energy efficiency. As such, impacts were found to be less than significant.

(2) Impact Analysis

The following analysis addresses requirements of Appendix F and Appendix G of the CEQA Guidelines, to determine whether Threshold (a) and Threshold (b) of Appendix G of the CEQA Guidelines would be exceeded.

a. Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact. Regarding Energy Threshold (a), this analysis relies upon Appendix F of the CEQA Guidelines discussed above.

The Project would consume energy during construction and operational activities. Sources of energy for these activities would include electricity usage, natural gas consumption, and transportation fuels such as diesel and gasoline. The analysis below includes the Project's energy requirements and energy use efficiencies by fuel type for each stage of the Project (construction, operation, and maintenance activities). For purposes of this analysis, Project maintenance would include activities such as repair of structures, landscaping and architectural coatings. Energy usage related to Project maintenance activities are assumed to be included as part of Project operations. Project removal activities of the structures constructed under this Project would include demolition or abandonment of the site. However, it is not known when or even if the Project would be removed. Therefore, analysis of energy usage related to Project removal activities would be speculative. For this reason, energy usage related to Project removal was not analyzed.

Construction

During Project construction, energy would be consumed in the form of electricity associated with the conveyance of water used for dust control and, on a limited basis, powering lights, electronic equipment, or other construction activities necessitating electrical power. As discussed below, construction activities, including the construction of the new buildings, typically do not involve the consumption of natural gas. Project construction would also consume energy in the form of petroleum-based fuels associated with the use of off-road construction vehicles and equipment on the Development Area, construction worker travel to and from the Development Area, and delivery and haul truck trips (e.g., hauling of demolition material to off-site reuse and disposal facilities).

Electricity

Electricity would be supplied to the Development Area by LADWP and would be obtained from both existing infrastructure serving the Project Site and gas- and/or diesel-powered portable generators, as required. As shown in Table 1 on page 9, approximately 50,936 kilowatt-hours (kWh) of electricity would be consumed during Project construction. The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease upon completion of construction. When not in use, electric equipment would be powered off to avoid unnecessary energy consumption. In addition, although Title 24 (building energy efficiency standards) requirements typically apply to energy usage for buildings, long-term construction lighting providing illumination for the Development Area and staging areas would also comply with applicable Title 24 requirements (includes limits on the wattage allowed per specific area), which would result in the conservation of energy. Therefore, the use of electricity during Project construction would be minimal and would not be wasteful, inefficient, or unnecessary.

Natural Gas

Construction activities, including the construction of the new buildings, typically do not involve the consumption of natural gas. Accordingly, natural gas would not be supplied to support Project construction activities; thus, there would be no demand generated during construction.

Transportation Energy

The petroleum-based fuel use summary provided in Table 1 represents the amount of transportation energy (i.e., gasoline and diesel) that could potentially be consumed during Project construction based on a conservative set of assumptions. As shown, on- and off-road vehicles would consume an estimated 603,400 gallons of gasoline and approximately

Table 1
Summary of Energy Use During Construction[a]

Fuel Type	Quantity
Electricity	
Water Consumption (Dust Control)[b]	1,695 kWh
Construction Temporary Power (Lighting, power tools)	49,241 kWh
Total Electricity	**50,936 kWh**
Gasoline	
On-Road Construction Equipment	603,400 gallons
Off-Road Construction Equipment	0 gallons
Total Gasoline	**603,400 gallons**
Diesel	
On-Road Construction Equipment	554,701 gallons
Off-Road Construction Equipment	110,113 gallons
Total Diesel	**664,814 gallons**

kWh = kilowatt-hour
Note: Numbers may not add up exactly due to rounding.
[a] *Detailed calculations are provided in Appendix EN-2 of this Technical Report.*
[b] *Energy usage associated with supply and conveyance of water from the source.*
Source: Eyestone Environmental, 2025.

664,814 gallons of diesel fuel throughout the Project's construction. For comparison purposes, the fuel usage during Project construction would represent approximately 0.016 percent of the 2026 (start year of construction) annual on-road gasoline-related energy consumption and 0.107 percent of the 2026 annual diesel fuel-related energy consumption in Los Angeles County.[6]

Operation

During operation of the Project, energy would be consumed for multiple purposes, including, but not limited to HVAC; refrigeration; lighting; and the use of electronics, equipment, and machinery. Energy would also be consumed during Project operations related to water usage, solid waste disposal, and vehicle trips. The Project would increase electrification by installing space heating, water heating and residential appliances (cooking, clothes dryers) powered by electricity while restaurant cooking would be powered by natural gas consistent with the City's Ordinance 187,714 (All-Electric Building Ordinance).

[6] *California Air Resources Board, EMFAC2021 Web Database, www.arb.ca.gov/emfac. Details provided in Appendix EN-2 of this Technical Report.*

Electricity

As the Project would comply with Title 24 standards and applicable requirements of the City's Green Building Code, buildout of the Project would result in a projected net increase in the on-site demand for electricity totaling approximately 8,241,221 kWh per year (refer to Table 2 on page 11). Based on LADWP's 2022 Resource Plan, LADWP forecasts that its total energy sales in the 2032–2033 fiscal year (the Project's buildout year) will be 23,737 gigawatt hour (GWh) of electricity.[7] As such, the Project-related net increase in annual electricity consumption would represent only approximately 0.035 percent of LADWP's projected sales in 2032–2033. As discussed above in Appendix EN-1, Regulatory Framework, one of the objectives of SB 350 is to increase procurement of California's electricity from renewable sources from 33 percent to 50 percent by 2030. LADWP is committed to ensuring the sustainability of its power supply and is required to procure at least 50 percent of its energy portfolio from renewable sources by 2030, which will ensure that projected supplies will be more than sufficient to meet demand.

Natural Gas

The Southern California Gas Company (SoCalGas) currently provides natural gas service to the Project Site. With compliance of Title 24 standards and applicable requirements of the City's Green Building Code (including the City's All-Electric Ordinance), buildout of the Project is anticipated to generate a net increase in the on-site demand for natural gas totaling approximately 437,713 cubic feet (cf) per year, or approximately 1,199 cf per day. Based on the 2024 California Gas Report, the California Energy and Electric Utilities estimates natural gas consumption within SoCalGas's planning area will be approximately 1.97 billion cf per day in 2032.[8] The Project, with an increase in natural gas consumption of 1,199 cf per day, would represent approximately 0.00006 percent of SoCalGas' 2032 forecasted annual consumption in SoCalGas' planning area.[9] As such, Project operation would not use natural gas in an inefficient, wasteful, or unnecessary manners, and operational impacts to transportation energy would be less than significant.

Transportation Energy

During operation, Project-related traffic would result in the consumption of petroleum-based fuels related to vehicular travel to and from the Development Area. As shown in Table 2, the Project's demand for gasoline and diesel would be approximately 386,543 and 70,640 gallons per year, respectively. The Development Area, is located in a Job Center,

---

7 *LADWP, 2022 Final Power Strategic Long-Term Resource Plan.*

8 *California Gas and Electric Utilities, 2024 California Gas Report.*

9 *Consistent with Ordinance 187,714, the Project will include 437,713 cf/year of natural gas usage for restaurant cooking.*

Table 2
Summary of Total Annual Energy Use During Project Operation[a]

Source	Project with Project Features
Electricity	
Building	7,686,061 kWh
Water	353,653 kWh
EV Chargers	201,507 kWh
Total Electricity	**8,241,221 kWh**
Natural Gas	437,713 cf
Mobile (Transportation)	
Gasoline	386,543 gallons
Diesel	70,640 gallons
Total Transportation Fuel	**457,183 gallons**

cf = cubic feet
kWh = Kilowatt-hour
EV = electric vehicle
[a] *Detailed calculations are provided in Appendix EN-2 of this Technical Report. Energy usage presented is net increase (new construction minus existing uses to be removed).*
Source: Eyestone Environmental, 2025.

City-designated TPA, SCAG-designated HQTA under the 2020–2045 RTP/SCS and SCAG-designated PDA (i.e., Neighborhood Mobility Area, Livable Corridor, and TPA), as well as an HQTC under the 2024–2050 RTP/SCS which indicates that the Development Area is an appropriate site for increased density and employment opportunities from a "smart growth" regional planning perspective.[10]

Extensive public transit service is also provided in the vicinity of the Project Site, including the Development Area. The existing transit services in the vicinity of the Development Area would provide Project employees, residents, and guests with various public transportation opportunities in lieu of driving. Additionally, the Project would provide bicycle parking areas for Project residents and guests. The Project would also incorporate transportation demand management (TDM) measures that would reduce trips and VMT as compared to standard ITE trip generation rates including reduced parking, pedestrian project enhancements, and bicycle parking. Furthermore, the Project would install EV-ready and EV-equipped parking spaces as part of the Project. As such, Project operation would not

[10] *According to the 2020–2045 RTF/SCS an HQTA is a corridor-focused Priority Growth Area (PGA) within 0.5 mile of an existing or planned fixed guideway transit stop or a bus transit corridor where buses pick up passengers at a frequency of every 15 minutes (or less) during peak commuting hours.*

use transportation energy in an inefficient, wasteful, or unnecessary manners, and operational impacts to transportation energy would be less than significant.

Conclusion

As previously discussed, CEQA Guidelines Appendix F recommends quantification of a project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project's life cycle including construction, operation, maintenance, and/or removal. In addition, per CEQA Guidelines Appendix F, if appropriate, the energy intensiveness of materials may be discussed. The Project's energy requirements were calculated based on the methodology contained in CalEEMod for electricity and natural gas usage. As discussed previously, Project VMT data were calculated using LADOT's VMT calculator which incorporates reduction measures such as increased density and proximity to mass transit. The calculations also took into account energy efficiency measures such as Title 24, CalGreen Code, and vehicle fuel economy standards. Table 1 and Table 2 on pages 9 and 11, respectively, provide a summary of Project construction and operational energy usage, respectively. During Project construction activities, a total of 50,936 kWh of electricity would be consumed along with 1,268,214 gallons of transportation fuel (gasoline and diesel). During Project operation, a total of 8,241,221 kWh of electricity, 437,713 cf of natural gas, and 457,183 gallons of transportation fuel would be consumed on an annual basis. Details are provided in Appendix EN-2 of this technical report.

b. The effects of the prcject on local and regional energy supplies and on requirements for additional capacity

Construction

As discussed above, electricity would be intermittently consumed during the conveyance of the water used to control fugitive dust, as well as to provide electricity for temporary lighting and other general construction activities. The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease upon completion of construction. When not in use, electric equipment would be powered off to avoid unnecessary energy consumption. The estimated construction electricity usage would represent less electricity usage than the estimated electricity usage during operation which, as discussed below, would be within the supply and infrastructure service capabilities of LADWP. As previously discussed above, construction activities, including the construction of new buildings and facilities, typically do not involve the consumption of natural gas. Accordingly, natural gas would not be supplied to support Project construction activities. Thus, there would be no demand generated by construction, resulting in a net decrease when compared to existing operations. Transportation fuel usage during Project construction activities would represent approximately 0.016 percent of gasoline usage and approximately 0.107 percent of diesel usage within Los Angeles County,

respectively.[11] As energy consumption during Project construction activities would be relatively negligible, the Project would not affect local or regional energy supplies and would not require additional capacity during construction.

Operation

Based on LADWP's 2022 Power Strategic Long-Term Resources Plan, LADWP forecasts that its total energy sales in the 2032–2033 fiscal year (the Project's buildout year) will be 23,737 GWh of electricity.[12] As such, the Project-related increase in annual electricity consumption of 8,241,221 kWh per year would represent approximately 0.035 percent of LADWP's projected sales in 2032.

Based on the 2024 California Gas Report, the California Energy and Electric Utilities estimates natural gas consumption within SoCalGas's planning area will be approximately 1.97 billion cf per day in 2032.[13] The Project, with an increase in natural gas consumption of 1,199 cf per day, would represent approximately 0.00006 percent of SoCalGas' 2032 forecasted consumption in SoCalGas' planning area.[14]

At buildout, the Project would result in an increase of 386,543 gallons of gasoline and 70,640 gallons of diesel per year, or a total of 457,183 gallons of petroleum-based fuels consumed per year, as shown in Appendix EN-2. Transportation fuel usage during Project operational activities would represent approximately 0.012 percent of gasoline and diesel usage within Los Angeles County.[15]

As energy consumption during Project operation would be relatively negligible, compared to total supply by energy providers, and the Project's energy requirements would be within LADWP's and SoCalGas' service provisions, Project impacts on energy usage during operation would be less than significant.

[12] *LADWP, 2022 Final Power Strategic Long-Term Resource Plan.*

[13] *California Gas and Electric Utilities, 2024 California Gas Report.*

[14] *Consistent with Ordinance 187,714, the Prcject will include 437,713 cf/year of natural gas usage for restaurant cooking.*

[15] *The gasoline usage percentage is derived by taking the annual gasoline usage during Prcject operations (386,543 gallons) and dividing that number by the total amount of gasoline usage within LA County during the same year (3,358,385,245 gallons) to arrive at 0.012 percent. The diesel usage percentage is derived by taking the annual diesel usage during Prcject operations (70,640 gallons) and dividing that number by the total amount of diesel usage within LA County during the same year (612,370,685 gallons) to arrive at 0.012 percent.*

c. The effects of the prcject on peak and base period demands for electricity and other forms of energy

As discussed above, electricity demand during construction and operation of the Project would have a negligible effect on the overall capacity of LADWP's power grid and base load conditions. In addition, LADWP's annual growth projection in peak demand of the electrical power grid of 0.4 percent would be sufficient to account for future electrical demand by the Project.[16] Therefore, Project electricity consumption during operation would have a negligible effect on load conditions of the power grid.

As discussed above, natural gas demand during operations would result in an increase of natural gas usage onsite. Based on the 2024 California Gas Report, the California Energy and Electric Utilities estimated natural gas consumption within SoCalGas' planning area would be approximately 1.97 billion cf per day in 2032 (the Project's buildout year).[17] The Project, with an increase in natural gas consumption of 1,199 cf per day, in compliance with City Ordinance 187,714 would represent approximately 0.00006 percent of SoCalGas' 2032 forecasted consumption in SoCalGas' planning area. In addition, as previously described, the Project would incorporate a variety of energy conservation measures to reduce energy usage.

d. The degree to which the prcject complies with existing energy standards

Although Title 24 requirements typically apply to energy usage for buildings, long-term construction lighting providing illumination for the Project Site and staging areas would also be required to comply with applicable Title 24 requirements (including limits on the wattage allowed per specific area). In addition, construction equipment would comply with energy efficiency requirements contained in the Federal Energy Independence and Security Act and previous Energy Policy Acts for electrical motors and equipment.[18] Electricity and natural gas usage during Project operation is presented in Table 2 on page 11; this electricity and natural gas usage would comply with Title 24 standards and applicable CALGreen requirements as well as the Los Angeles Green Building Code. The Project would include all electric HVAC systems and Energy Star–labeled all electric appliances in residential areas. Therefore, Project construction and operational activities would comply with existing energy standards with regards to electricity and natural gas usage.

Regarding transportation fuels, trucks and equipment used during proposed construction activities for the Project would comply with CARB's anti-idling regulations as well as the In-Use Off-Road Diesel-Fueled Fleets regulation. Although these regulations are

---

16 *LADWP, 2018 Retail Electric Sales and Demand Forecast.*

17 *California Gas and Electric Utilities, 2024 California Gas Report.*

18 *Energy Independence and Security Act of 2007, Public Law 110-140.*

intended to reduce criteria pollutant emissions, compliance with the anti-idling and emissions regulations would also result in efficient use of construction-related energy. During Project operation, it is assumed that vehicles traveling to and from the Project Site would comply with CAFE fuel economy standards, as required.

e. Effects of the Prcject on Energy Resources

LADWP's electricity generation is derived from a mix of non-renewable and renewable sources such as coal, natural gas, solar, geothermal wind, and hydropower. The LADWP's most recently adopted 2022 Power Strategic Long-Term Resources Plan identifies adequate resources (natural gas, coal) to support future generation capacity. Therefore, Project construction and operation activities would have a negligible effect on electricity supply.

Natural gas supplied to Southern California is mainly sourced from out of state with a small portion originating in California. Sources of natural gas for the Southern California region are obtained from locations throughout the western United States as well as Canada.[19] According to the U.S. Energy Information Administration (EIA), the United States currently has over 86 years of natural gas reserves.[20] Compliance with energy standards is expected to result in more efficient use of natural gas (lower consumption) in future years. Therefore, Project construction and operation activities would have a negligible effect on natural gas supply.

Transportation fuels (gasoline and diesel) are produced from crude oil, which is imported from various regions around the world. Based on current proven reserves, crude oil production would be sufficient to meet consumption through 2050.[21] The Project would also comply with CAFE fuel economy standards, which would result in more efficient use of transportation fuels (lower consumption). Therefore, Project construction and operation activities would have a negligible effect on the transportation fuel supply.

As discussed above, LADWP is required to procure at least 50 percent of their energy portfolio from renewable sources by 2030. The current sources of renewable energy procured by LADWP include wind, solar, and geothermal sources. These sources accounted for 39.5 percent of LADWP's overall energy mix in 2023, the most recent year for which data

---

[19] *California Gas and Electric Utilities, 2024 California Gas Report.*

[21] *U.S. Energy Information Administration, Frequently Asked Questions, www.eia.gov/tools/faqs/faq.php?id=38&t=6, accessed May 5, 2025.*

is available.[22] This represents the available off-site renewable sources of energy that would meet the Project's energy demand.

With regard to on-site renewable energy sources, the Project would include photovoltaic and solar thermal collectors or one of the other very narrow set of permitted alternatives as required by Title 24. However, due to the Project Site's location, other on-site renewable energy sources would not be feasible to install on-site as there are no local sources of energy from the following sources: biodiesel, biomass hydroelectric and small hydroelectric, digester gas, methane, fuel cells, landfill gas, municipal solid waste, ocean thermal, ocean wave, and tidal current technologies, or multi-fuel facilities using renewable fuels. Furthermore, wind-powered energy is not viable on the Project Site due to the lack of sufficient wind in the Los Angeles basin. Specifically, based on a map of California's wind resource potential, the Project Site is not identified as an area with wind resource potential.[23]

f. The prcject's prcjected transportation energy use requirements and its overall use of efficient transportation alternatives

As discussed above, at buildout, the Project would result in an increase of 386,543 gallons of gasoline and 70,640 gallons of diesel per year, or a total of 457,183 gallons of petroleum-based fuels consumed per year, as shown in Appendix EN-2. Transportation fuel usage during Project operational activities would represent approximately 0.012 percent of gasoline and diesel usage within Los Angeles County.[24] Furthermore, the Project would implement required TDM measures and include project features to reduce VMT during operational activities.[25] The Project's high-density design and location in proximity to transit, job centers and retail uses would allow for residents to live closer to services and shopping areas, reducing VMT. The Project design, which would include dedicated bicycle parking facilities and an improved streetscape with pedestrian amenities, would also encourage non-automotive forms of transportation such as walking or biking to destinations. Therefore, the Project would encourage the use of efficient transportation alternatives.

---

[23] *California Energy Commission, Systems Assessment & Facilities Siting Division Cartography Unit, California Wind Resource Potential Map,.*

[24] *The gasoline usage percentage is derived by taking the annual gasoline usage during Prcject operations (386,543 gallons) and dividing that number by the total amount of gasoline usage within LA County during the same year (3,358,385,245 gallons) to arrive at 0.012 percent. The diesel usage percentage is derived by taking the annual diesel usage during Prcject operations (70,640 gallons) and dividing that number by the total amount of diesel usage within LA County during the same year (612,370,685 gallons) to arrive at 0.012 percent.*

[25] *The Transportation Assessment did not include required TDM measures to provide a conservative analysis. For analysis of air quality, GHG, energy and noise impacts, VMT was calculated to incorporate required TDM measures as to not over estimate impacts for these analyses.*

g. The degree to which the project design and/or operations incorporate energy-conservation measures, particularly those that go beyond City requirements

The Project would comply the City of LA Green Building Code. The current City of LA Green Building Code requires compliance with CALGreen and California's Building Energy Efficiency Standards (Title 24).

The City has also adopted several plans and regulations to promote the reduction, reuse, recycling, and conversion of solid waste going to disposal systems. These regulations include the City of Los Angeles Solid Waste Management Policy Plan, the RENEW LA Plan, and the Exclusive Franchise System Ordinance (Ordinance No. 182,986). These solid waste reduction programs and ordinances, which the Project would comply with, help to reduce the number of trips associated with hauling solid waste, thereby reducing the amount of petroleum-based fuel consumed. Furthermore, recycling efforts indirectly reduce the energy necessary to create new products made of raw material, which is an energy-intensive process. Thus, through compliance with the City's construction-related solid waste recycling programs, the Project would contribute to reduced fuel-related energy consumption.

Conclusion

As demonstrated in the analysis above, the Project's energy requirements would not significantly affect local and regional supplies or capacity. The Project's energy usage would be consistent with electricity and natural gas future projections for the region. Electricity generation capacity and supplies of natural gas and transportation fuels would be sufficient to meet the needs of Project-related construction and operational activities. During construction, the Project would comply with Title 24 energy efficiency standards where applicable resulting in efficient use of energy. During operation, the Project would comply with applicable energy efficiency requirements such as CALGreen and Title 24. As such, the Project would not result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, and the Project would result in less-than-significant impacts on energy resources. ***The Project would not involve any new significant energy impacts or increase the less than significant impacts identified in the Housing Element Update EIR.***

b. Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. Regarding Energy Threshold (b), the Project was evaluated for consistency with adopted energy conservation plans and policies relevant to the Project. Such adopted energy conservation plans and policies include Title 24 energy efficiency requirements, CALGreen, and City building codes. Also, as discussed throughout this Technical Report, the Project would be consistent with SCAG's RTP/SCS, which includes goals to reduce VMT and a corresponding decrease in fuel consumption.

As discussed under Checklist Section 5.VIII, Greenhouse Gas Emissions, the City published its LA Green Plan/ClimateLA in 2007 as well as the Green New Deal Sustainable City pLAn in 2019, which outlines goals and actions by the City to reduce GHG emissions. To facilitate implementation of the LA Green Plan/Climate LA, the City adopted the Green Building Code. The Project would comply with applicable regulatory requirements for the design of new buildings, including the provisions set forth in the 2022 CALGreen Code and California's Building Energy Efficiency Standards, which have been incorporated into the City's Green Building Code.

Regarding transportation uses, the Project design would reduce average VMT throughout the region and encourage use of alternative modes of transportation. The Project would also be consistent with regional planning strategies that address energy conservation. SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS focus on creating livable communities with an emphasis on sustainability and integrated planning, and identifies mobility, economy, and sustainability as the three principles most critical to the future of the region. As part of the approach, SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS focuses on reducing fossil fuel use by decreasing VMT, reducing building energy use, and increasing use of renewable sources. The Project would be consistent with the energy efficiency policies emphasized in SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS. Most notably, the Project would be an infill mixed-use development developed within an HQTA, PDA (i.e., NMA, Livable Corridor, TPA), HQTC, and Job Center. The Project would be developed in close proximity to neighborhood services, jobs, and shopping and entertainment opportunities, and would be well-served by existing public transportation, including Metro and LADOT DASH. The introduction of new housing and job opportunities within an HQTA, as proposed by the Project, would be consistent with numerous policies in the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS related to locating new housing and jobs near transit. The 2020–2045 RTP/SCS and 2024–2050 RTP/SCS would result in an estimated 19 percent decrease in VMT by 2035. The State Office of Planning and Research recommended that achieving 15 percent lower per capita (residential or employee) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals (i.e., SB 375 goal).

Consistent with the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, the Project would result in an approximately 27-percent reduction in VMT from mobile sources in comparison to a Project without reduction measures (e.g., density and proximity to transit, TDM measures, and mitigation measures), and, consequently, the Project's

petroleum-based fuel usage would be reduced.[26,27] In addition, the Project would comply with state energy efficiency requirements, and would use electricity from LADWP, which has a current renewable energy mix of 39.5 percent. All these features would serve to reduce the consumption of electricity, natural gas, and transportation fuel consistent with the goals of the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS.

The Project would be subject to the energy conservation requirements of the California Energy Code (Title 24 of the California Code of Regulations, Part 6) and the California Green Building Standards Code (24 CCR part 11). The California Energy Code provides energy conservation standards for all new residential and commercial buildings constructed in California. The California Energy Code applies to the building envelope, space-conditioning systems, and water-heating and lighting systems of buildings and appliances. The California Energy Code provides guidance on construction techniques to maximize energy conservation. Minimum efficiency standards are given for a variety of building elements, including appliances; water and space heating and cooling equipment; and insulation for doors, pipes, walls and ceilings. The California Energy Code also emphasizes saving energy at peak periods and seasons and improving the quality of installation of energy efficiency measures. In addition, the California Green Building Standards Code sets targets for: energy efficiency; water consumption; dual plumbing systems for potable and recyclable water; diversion of construction waste from landfills; and use of environmentally sensitive materials in construction and design, including eco-friendly flooring, carpeting, paint, coatings, thermal insulation, and acoustical wall and ceiling panels.

The City's Sustainable City pLAn also establishes short-term and long-term energy and conservation targets geared towards advancing the City's economy and equity. In 2019, the City of Los Angeles prepared the 2019 Green New Deal, which provided an expanded vision of the City's Sustainable City pLAn, focusing on securing clean air and water and a stable climate, improving community resilience, expanding access to healthy food and open space, and promoting environmental justice for all. Through the Green New Deal, the City would cut an additional 30 percent in GHG emissions above and beyond the City's Sustainable City pLAn to ensure that the City stays within its carbon budget until 2050.[28] To summarize, the Project would be required to comply with the Title 24 standards for Energy Efficiency and Conservation that are in effect at the time of development. In addition, per compliance with the California Energy Code, the Project would provide solar panels in

---

[26] *The LADOT VMT Calculator incorporates the USEPA MXD model and accounts for project features such as increased density and proximity to transit, which would reduce VMT and associated fuel usage in comparison to free-standing sites. Calculations are provided in Appendix EN-2 of this technical report.*

[27] *The Transportation Assessment did not include TDM measure to provide a conservative analysis. For the Air Quality, GHG, Energy, and Noise sections a VMT calculator run was provide that included the required TDM measures as to not over estimate impacts for these analyses.*

[28] *City of Los Angeles, L.A.'s Green New Deal Sustainable City pLAn 2019.*

compliance with Title 24. ***Based on the above, the Project would be consistent with state and local adopted energy conservation plans and energy efficiency plans. The Project would not involve any new significant energy impacts or increase the less than significant impacts identified in the Housing Element Update EIR.***

Cumulative Impacts

Less Than Significant Impact. The geographic context for the cumulative impacts analysis regarding electricity is LADWP's service area and the geographic context for the cumulative impacts analysis regarding natural gas is the SoCalGas service area. Growth within these geographic areas, inclusive of the 24 related projects and one related plan (i.e., DTLA 2040 Plan), is anticipated to increase the demand for energy, as well as the need for new and expanded energy infrastructure. As with the Project, compliance with existing energy standards, including implementation of the City's All-Electric Ordinance, and compliance with adopted energy conservation plans, the related projects also would not result in the wasteful, inefficient, and unnecessary consumption of energy resources during construction or operation. Related projects in the Project vicinity would also be infill projects locating uses near other residential and commercial uses, which would reduce distance traveled, as well consumption of transportation fuel. As analyzed above, Project transportation fuel usage would represent a small percentage of total fuel consumption within Los Angeles County. While it is speculative to assess transportation fuel usage from related projects, it is expected that cumulative transportation fuel usage resulting from the Project and related projects would be consistent with projections discussed above. In addition, as evaluated above, the Project would result in less than significant impacts related to energy consumption such that its contribution to cumulative energy impacts would not be cumulatively considerable. ***As such, the Project would not involve any new cumulative energy impacts or increase the less than significant impacts identified in the Housing Element Update EIR.***

Appendix EN-1- Regulatory Framework

- Appendix EN-1: Regulatory Framework

Regulatory Framework

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding energy at the federal, state, regional, and City of Los Angeles levels that apply to the Project. As described below, these plans, guidelines, and laws include the following:

- Energy Independence and Security Act of 2007
- Corporate Average Fuel Economy Standards
- Federal Energy Policy and Conservation Act
- Phase 1 and 2 Heavy-Duty Vehicle GHG Standards
- Public Utility Regulatory Policies Act of 1978
- National Energy Policy Act of 1992
- Energy Policy Act of 2005
- Clean Air Act
- Clean Cities Program
- Senate Bill 1389
- Renewables Portfolio Standards
- California Building Standards

  California Building Energy Efficiency Standards

  California Green Building Standards
- California Assembly Bill 1493
- California Air Resources Board

  Scoping Plan

  Advanced Clean Car Program

  Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

  In-Use Off-Road Diesel Fueled Fleets Regulation

- Senate Bill 375
- Regional Transportation Plan/Sustainable Communities Strategy
- L.A.'s Green New Deal
- Los Angeles Green Building Code
- City of Los Angeles Mobility Plan 2035

(1) Federal

(a) Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national greenhouse gas (GHG) emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting mandatory Renewable Fuel Standards (RFS) that require fuel producers to use at least 36 billion gallons of biofuel in 2022;
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;
- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014;
- Requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and
- Establishing miles per gallon (mpg) targets for cars and light trucks and directing the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks, as superseded by the U.S. Environmental Protection Agency (USEPA) and the NHTSA actions described below.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."[1]

---

[1] A "green job," as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources. U.S. Department of

(b) Corporate Average Fuel Economy Standards

Established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFE) Standards (49 CFR Parts 531 and 533) reduce energy consumption by increasing the fuel economy of cars and light trucks. The NHTSA and USEPA jointly administer the CAFE standards. The U.S. Congress has specified that CAFE standards must be set at the "maximum feasible level" with consideration given for: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy. The standards require an industry-wide fleet average of approximately 50.4 miles per gallon (mpg) in model year (MY) 2031 for passenger cars and light trucks, and an industry fleet-wide average for heavy-duty pickup trucks and vans (HDPUVs) of roughly 2.851 gallons per 100 miles in MY 2035. The CAFE standards increase at a rate of 2 percent per year for passenger cars in MYs 2027-31 and 2 percent per year for light trucks in model years 2029-31. The final HDPUV fuel efficiency standards increase at a rate of 10 percent per year in MYs 2030–2032 and 8 percent per year in MYs 2033–2035.[2]

(c) Federal Energy Policy and Conservation Act

The Energy Policy and Conservation Act of 1975 (EPCA) is a United States Act of Congress that responded to the 1973 oil crisis by creating a comprehensive approach to federal energy policy. The primary goals of EPCA are to increase energy production and supply, reduce energy demand, provide energy efficiency, and give the executive branch additional powers to respond to disruptions in energy supply. Most notably, EPCA established the Strategic Petroleum Reserve, the Energy Conservation Program for Consumer Products, and CAFE regulations.

(a) Phase 1 and Phase 2 Heavy-Duty Vehicle GHG Standards

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by the USEPA and the NHTSA. The USEPA and the NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5- to 25-percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.

Labor, Bureau of Labor Statistics, Green Jobs Overview, www.bls.gov/green/overview.htm, accessed January 9, 2025.

[2] Department of Transportation, National Highway Traffic Safety Administration, Corporate Average Fuel Economy Standards for Passenger Cars and Light Trucks for Model Years 2027 and Beyond and Fuel Efficiency Standards for Heavy-Duty Pickup Trucks and Vans for Model Years 2030 and Beyond, 49 CFR Parts 523, 531, 533, 535, 536, and 537, 2024.

(e) Public Utility Regulatory Policies Act of 1978 (PURPA), Public Law 95-617

The purpose of PURPA is to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators (small power producers) from which, along with qualified co-generators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from qualifying facilities (Qfs) at avoided cost (i.e., the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market and demonstrated that electricity from nonutility generators could successfully be integrated with a utility's own supply. In addition, PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). The Fuel Use Act (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies, but Qfs were able to take advantage of abundant natural gas and abundant new technologies (such as combined-cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.

(f) National Energy Policy Act of 1992 (EPACT92)

EPACT92 calls for programs that promote efficiency and the use of alternative fuels. EPACT92 requires certain federal, state, and local government and private fleets to purchase a percentage of light duty alternative fuel vehicles (AFV) capable of running on alternative fuels each year. In addition, EPACT92 has financial incentives. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. EPACT92 also requires states to consider a variety of incentive programs to help promote AFVs.

(g) Energy Policy Act of 2005

The Energy Policy Act of 2005 provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

(h) Clean Air Act

Clean Air Act (CAA) Section 211(o), as amended by the Energy Policy Act of 2005, requires the Administrator of the USEPA to annually determine RFS, which is applicable to refineries, importers, and certain blenders of gasoline, and to publish the standard in the Federal Register by November 30 each year. On the basis of this standard, each obligated party determines the volume of renewable fuel that it must ensure is consumed as motor vehicle fuel. This standard is calculated as a percentage, by dividing the amount of renewable fuel that the Energy Policy Act requires to be blended into gasoline for a given year by the amount of gasoline expected to be used during that year, including certain adjustments.

(i) Clean Cities Program

The U.S. Department of Energy's (DOE) Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of AFVs and building local AFV refueling infrastructure. The mission of the Clean Cities Program is to advance the nation's economic, environmental and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum consumption. The Clean Cities Program carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.

(2) State

(a) Senate Bill 1389

Senate Bill (SB) 1389 (Public Resources Code [PRC] Sections 25300–25323) requires the California Energy Commission (CEC) to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the State's electricity, natural gas, and transportation fuel sectors and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the State's economy; and protect public health and safety (PRC Section 25301[a]). The 2023 Integrated Energy Policy Report provides the results of the CEC's assessments related to energy sector trends, building decarbonization and energy efficiency, zero-emission vehicles (ZEV), energy equity, climate change adaptation, electricity reliability in Southern California, natural gas assessment, and electricity, natural gas, and transportation energy demand forecasts.

(b) Renewable Portfolio Standards

First established in 2002 under SB 1078, California's Renewables Portfolio Standards (RPS) requires retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent by 2020 and 50 percent by 2030.[3] SB 350, signed on October 7, 2015, is the Clean Energy and Pollution Reduction Act of 2015. The objectives of SB 350 are: (1) to increase the procurement of electricity from renewable sources from 33 percent to 50 percent; and (2) to double the energy savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation. On September 10, 2018, former Governor Jerry Brown signed SB 100, which further increased California's RPS and requires retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by December 31, 2024; 52 percent by December 31, 2027; and 60 percent by December 31, 2030, and that the California Air Resources Board (CARB) should plan for 100-percent eligible renewable energy resources and zero-carbon resources by December 31, 2045.

The California Public Utilities Commission (CPUC) and the CEC jointly implement the RPS program. The CPUC's responsibilities include: (1) determining annual procurement targets and enforcing compliance; (2) reviewing and approving each investor-owned utility's renewable energy procurement plan; (3) reviewing contracts for RPS-eligible energy; and (4) establishing the standard terms and conditions used in contracts for eligible renewable energy.[4]

In March 2021, the CEC, CPUC, and CARB issued an SB 100 Joint Agency Report that assesses barriers and opportunities to implementing the 100-percent clean electricity policy.[5] The report's initial findings suggest that the goals of SB 100 are achievable, though opportunities remain to reduce overall system costs; however, the report also notes that the findings are intended to inform State planning and are not intended as a comprehensive or prescriptive roadmap to 2045, and future work is needed on critical topics, such as system reliability and land use, and further addresses energy equity and

workforce needs.[6] Refer to Section IV.G, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding this regulation.

(c) California Building Standards

(i) California Building Energy Efficiency Standards (Title 24, Part 6)

The California Building Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations [CCR], Title 24, Part 6) were adopted to ensure that building construction and system design and installation achieve energy efficiency and preserve outdoor and indoor environmental quality. The current California Building Energy Efficiency Standards (Title 24 standards) are the 2022 Title 24 standards, which became effective on January 1, 2023. The 2022 Title 24 standards continue to improve upon the preceding versions of the Title 24 standards for new construction of, and additions and alterations to, residential and nonresidential buildings, which encourage use of electric heat pumps, requiring newly constructed residences to be electric-ready and introduces solar and battery storage standards as an optional measure to achieve compliance and increases minimum ventilation requirements to improve air quality.

(ii) California Green Building Standards (Title 24, Part 11)

The California Green Building Standards Code (CCR, Title 24, Part 11) are commonly referred to as the CALGreen Code. The 2022 CALGreen Code includes mandatory measures for non-residential development related to site development, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality.[7] The 2022 CALGreen Code improves upon the preceding versions of the CALGreen Code by simplifying the code and its application by offering choices related to new voluntary measures to builders, including battery storage systems, electric heat pump space, and water heating that encourage building electrification. The 2022 CALGreen Code went into effect on January 1, 2023.

(a) California Assembly Bill 1493 (AB 1493, Pavley)

In response to the transportation sector accounting for more than half of California's carbon dioxide (CO_2) emissions, Assembly Bill (AB) 1493 (commonly referred to as CARB's Pavley regulations), enacted on July 22, 2002, requires CARB to set GHG emission standards for new passenger vehicles, light duty trucks, and other vehicles

---

6 California Energy Commission, California Public Utilities Commission, and California Air Resources Board, 2021 SB 100 Joint Agency Report Achieving 100 Percent Clean Electricity in California: An Initial Assessment, CEC-200-2021-001, March 2021.

7 California Building Standards Commission, Guide to the 2022 California Green Building Standards Code Nonresidential, 2022.

manufactured in and after 2009 whose primary use is non-commercial personal transportation. Phase I of the legislation established standards for model years 2009–2016 and Phase II established standards for model years 2017–2025.[8,9] In March 2020, the NHTSA and USEPA issued the SAFE Vehicles Rule, which amends existing CAFE standards and tailpipe CO_2 emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026. Refer to Section IV.G, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding this regulation.

(e) California Air Resources Board

(i) Scoping Plan

AB 32 required CARB to prepare a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020 (Health and Safety Code [HSC] Section 38561 (h)). The 2008 Climate Change Scoping Plan proposed a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health."[10] The 2008 Climate Change Scoping Plan had a range of GHG reduction actions, which included direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms, such as a Cap-and-Trade Program, and an AB 32 implementation fee to fund the program.

The 2008 Climate Change Scoping Plan called for a "coordinated set of solutions" to address all major categories of GHG emissions. Transportation emissions were addressed through a combination of higher standards for vehicle fuel economy, implementation of the Low Carbon Fuel Standard (LCFS), and greater consideration to reducing trip length and generation through land use planning and transit-oriented development. Buildings, land use, and industrial operations were encouraged and, sometimes, required to use energy more efficiently. Utility energy providers were required to include more renewable energy sources through implementation of the RPS.[11] Additionally, the 2008 Climate Change Scoping Plan emphasized opportunities for households and businesses to save energy and money through increasing energy efficiency. It indicated that substantial savings of electricity and natural gas will be accomplished through "improving energy efficiency by 25 percent."

---

8 California Air Resources Board, Clean Car Standards—Pavley, Assembly Bill 1493.

9 United States Environmental Protection Agency, EPA and NHTSA Set Standards to Reduce Greenhouse Gases and Improve Fuel Economy for Model Years 2017–2025 Cars and Light Trucks, 2012.

10 CARB, Climate Change Scoping Plan, December 2008.

11 For a discussion of Renewables Portfolio Standard, refer to subsection California Renewables Portfolio Standard.

The 2008 Climate Change Scoping Plan identified several specific issues relevant to development projects, including:

- The potential of using the green building framework as a mechanism, which could enable GHG emissions reductions in other sectors (i.e., electricity, natural gas), noting that:

  A Green Building strategy will produce greenhouse gas savings through buildings that exceed minimum energy efficiency standards, decrease consumption of potable water, reduce solid waste during construction and operation, and incorporate sustainable materials. Combined, these measures can also contribute to healthy indoor air quality, protect human health, and minimize impacts to the environment.

- The importance of supporting the Department of Water Resources' work to implement the Governor's objective to reduce per capita water use by 20 percent by 2020. Specific measures to achieve this goal include water use efficiency, water recycling, and reuse of urban runoff. The Climate Change Scoping Plan notes that water use requires significant amounts of energy, including approximately one-fifth of Statewide electricity.

- Encouraging local governments to set quantifiable emission reduction targets for their jurisdictions and use their influence and authority to encourage reductions in emissions caused by energy use, waste and recycling, water and wastewater systems, transportation, and community design.

The latest update is the 2022 Scoping Plan, which is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve new targets for carbon neutrality by 2045 and to reduce anthropogenic GHG emissions to at least 85 percent below 1990 levels, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan.[12] Measures to reduce GHG emissions include building decarbonization, energy efficiency improvements and transportation electrification.

The 2022 Scoping Plan Update reflects existing and recent direction in the Governor's Executive Orders and State statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan.

---

12 CARB, California's 2017 Climate Change Scoping Plan, 2017.

(ii) Advanced Clean Cars Program

The Advanced Clean Cars emissions-control program was approved by CARB in 2012 and is closely associated with the Pavley regulations.[13] The program requires a greater number of ZEV models for years 2015 through 2025 to control smog, soot and GHG emissions. This program includes the Low-Emissions Vehicle (LEV) regulations to reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles and the ZEV regulations to require manufacturers to produce an increasing number of pure ZEVs (meaning battery and fuel cell electric vehicles) with the provision to produce plug-in hybrid electric vehicles (PHEV) between 2018 and 2025. In particular, implementation of the ZEV and PHEV regulations reduce transportation fuel consumption by increasing the number of vehicles that are partially or fully electric-powered.

(iii) Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

In 2004, CARB adopted an Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling in order to reduce public exposure to diesel particulate matter emissions (Title 13 CCR Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given location. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

(iv) In-Use Off-Road Diesel Fueled Fleets Regulation

Because off-road vehicles that are used in construction and other related industries can last 30 years or longer, most of those that are in service today are still part of an older fleet that do not have emission controls. In 2007, CARB approved the "In-Use Off-Road Diesel Fueled Fleets Regulation" to reduce emissions from existing (in-use) off-road diesel vehicles that are used in construction and other industries. This regulation sets an anti-idling limit of 5 minutes for all off-road vehicles 25 horsepower and higher. It also establishes emission rates targets for the off-road vehicles that decline over time to accelerate turnover to newer, cleaner engines and require exhaust retrofits to meet these targets. Revised in October 2023, the regulation enforces off-road restrictions on fleets adding vehicles with older tier engines beginning January 1, 2024. By each annual compliance deadline, a fleet must demonstrate that it has either met the fleet average target for that year or has completed the Best Available Control Technology (BACT)

---

[13] CARB, Advanced Clean Cars Program, ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program, accessed January 9, 2025.

requirements. Large fleets have compliance deadlines each year from 2024 through 2028, medium fleets each year from 2026 through 2030, and small fleets each year from 2028 through 2032. While the goal of this regulation is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from the use of more fuel-efficient engines.

(i) SB 375 (Sustainable Communities Strategy)

In 2008, SB 375, the Sustainable Communities and Climate Protection Act, was adopted to connect the GHG emissions reductions targets established in the 2008 Scoping Plan for the transportation sector to local land use decisions that affect travel behavior. Its intent is to reduce GHG emissions from light-duty trucks and automobiles (excluding emissions associated with goods movement) by aligning regional long-range transportation plans, investments, and housing allocations to local land use planning to reduce vehicle miles traveled (VMT) and vehicle trips. Specifically, SB 375 required CARB to establish GHG emissions reduction targets for each of the 18 metropolitan planning organizations (MPOs). The Southern California Association of Governments (SCAG) is the MPO for the Southern California region, which includes the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. The 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and 2024–2050 RTP/SCS reflect CARB's updated SB 375 targets for the SCAG region, requiring a 19-percent decrease in VMT by 2035 relative to 2005.

(3) Regional

(a) Regional Transportation Plan/Sustainable Communities Strategy (RTF/SCS)

SB 375 requires each MPO to prepare a Sustainable Communities Strategy (SCS) in their regional transportation plan. In general, the SCS outlines a development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, would reduce VMT from automobiles and light duty trucks and, thereby, reduce GHG emissions from these sources. For the SCAG region, the 2020–2045 RTP/SCS was adopted to implement SB 375 required reduction targets.

The 2020–2045 RTP/SCS focuses on the continued efforts of the previous RTP/SCS plans for an integrated approach in transportation and land use strategies in development of the SCAG region through horizon year 2045. The 2020–2045 RTP/SCS projects that the SCAG region will meet the GHG per capita reduction targets established for the SCAG region of 8 percent by 2020 and 19 percent by 2035. Additionally, its implementation is projected to reduce VMT per capita for the year 2045 by 4.1 percent compared to baseline conditions for the year. Rooted in the 2008, 2012, and 2016

RTP/SCS plans, the 2020–2045 RTP/SCS includes a "Core Vision" that centers on maintaining and better managing the transportation network for moving people and goods while expanding mobility choices by location housing, jobs, and transit closer together, and increasing investments in transit and complete streets.

On April 4, 2024, SCAG adopted the 2024–2050 RTP/SCS. Similar to the 2020–2045 RTP/SCS, the 2024–2050 RTP/SCS is a long-term plan for the Southern California region that details investment in the transportation system and development in communities to meet the existing and future needs of the region through projects, investments, policies and strategies. While the 2024–2050 RTP/SCS remains focused on its core responsibilities and on the requirements of comprehensive regional transportation planning integrated with the development of a sustainable communities strategy, it also encompasses a holistic approach to programs and strategies that support success of the RTP/SCS, such as workforce development, broadband, and mobility hubs. The primary goals of the 2024–2050 RTP/SCS include:

- Mobility: Build and maintain an integrated multimodal transportation network;
- Communities: Develop, connect and sustain livable and thriving communities;
- Environment: Create a healthy region for the people of today and tomorrow; and
- Economy: Support a sustainable, efficient and productive regional economic environment that provides opportunities for all people in the region.

While the 2024–2050 RTP/SCS has been adopted by SCAG, the 2024–2050 RTP/SCS has not yet been approved by CARB. In addition, SB 375 does not provide GHG emissions reduction targets specific to the 2024–2050 RTP/SCS that are not also applicable to 2020–2045 RTP/SCS.

(4) Local

(a) Green New Deal

On April 8, 2015, Mayor Eric Garcetti released the Sustainable City pLAn, which includes both short-term and long-term aspirations through the year 2035 in various topic areas, including water, solar power, energy-efficient buildings, carbon and climate leadership, waste and landfills, housing and development, mobility and transit, and air quality, among others.[14] Specific targets included the construction of new housing units within 1,500 feet of transit by 2017, reducing VMT per capita by 5 percent by 2025, and

---

[14] City of Los Angeles, Sustainable City pLAn, April 2015.

increasing trips made by walking, biking or transit by at least 35 percent by 2025. The Sustainable City pLAn was intended to be updated every four years.

In April 2019, Mayor Eric Garcetti released an update to the Sustainable City pLAn renamed as LA's Green New Deal, which consists of a program of actions designed to create sustainability-based performance targets through 2050 to advance economic, environmental, and equity objectives.[15] The Green New Deal augments, expands, and elaborates in more detail the City's vision for a sustainable future, and it tackles the climate emergency with accelerated targets and new aggressive goals.

Within the Green New Deal, climate mitigation is one of eight explicit benefits that help define its strategies and goals. These include reducing GHG emissions through near-term outcomes:

- Reduce potable water use per capita by 22.5 percent by 2025, 25 percent by 2035, Reduce potable water use per capita by 22.5 percent by 2025, 25 percent by 2035, and maintain or reduce 2035 per capita water use through 2050.
- Reduce building energy use per square foot for all building types by 22 percent by 2025, 34 percent by 2035, and 44 percent by 2050 (from a baseline of 68 thousand British thermal units (MBtu) per square foot in 2015).
- All new buildings will be net zero carbon by 2030 and 100 percent of buildings will be net zero carbon by 2050.
- Increase cumulative new housing unit construction to 150,000 by 2025 and 275,000 units by 2035.
- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025 and 75 percent by 2035.
- Increase the percentage of all trips made by walking, biking, micro-mobility/ matched rides or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.
- Reduce VMT per capita by at least 13 percent by 2025, 39 percent by 2035, and 45 percent by 2050.
- Increase the percentage of electric vehicles (EVs) and ZEVs in the city to 25 percent by 2025, 80 percent by 2035, and 100 percent by 2050.

---

15 City of Los Angeles, LA's Green New Deal, 2019.

- Increase landfill diversion rate to 90 percent by 2025, 95 percent by 2035, and 100 percent by 2050.
- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 pounds of waste generated per capita per day in 2011).
- Eliminate organic waste going to landfill by 2028.
- Reduce urban/rural temperature differential by at least 1.7 degrees by 2025 and 3 degrees by 2035.
- Ensure the proportion of Angelenos living within 0.5 mile of a park or open space is at least 65 percent by 2025, 75 percent by 2035, and 100 percent by 2050.

(b) Los Angeles Green Building Code

Article 9 of Chapter IX of the Los Angeles Municipal Code (LAMC) is referred to as the "Los Angeles Green Building Code," which incorporates by reference portions of the CALGreen Code. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) nonresidential and high-rise residential buildings; and (3) additions and alterations to nonresidential and high-rise residential buildings. The Los Angeles Green Building Code includes some requirements that are more stringent than State requirements, such as increased requirements for electric vehicle supply equipment (EVSE) to support electric vehicle (EV) charging stations and water efficiency, which result in potentially greater energy demand reductions from improved transportation fuel efficiency and water efficiency.

(c) City of Los Angeles All-Electric Ordinance

In December 2022, the City approved Ordinance No. 187,714, which amends Divisions 2, 4, and 5 of Article 9 of Chapter IX of the LAMC to require all new buildings to be all-electric buildings with exceptions. The ordinance is applicable to new buildings in which an application for a building permit was submitted after June 1, 2023. Consistent with this new ordinance, Chapter IX of the LAMC, Section 99.02.202 defines an all-electric building as:

> *A building that contains no combustion equipment, plumbing for combustion equipment, gas piping, or fuel gas serving any use including, but not limited to, space heating (including fireplaces), water heating (including pools and spas), cooking appliances (including barbeques), and clothes drying, within the building or building property lines, and instead uses electricity as the sole source of energy for all lighting, appliances and/or equipment,*

including, but not limited to, space heating, water heating, cooking appliances, and drying appliances.

Chapter IX of the LAMC, Section 99.04.106.8 provides exemptions from the requirements for cooking equipment contained within kitchens in a public use area, such as restaurants, commissaries, cafeterias, and community kitchens as long as electrical infrastructure is installed. Gas-powered process equipment in institutions, such as hospitals, industrial, and laboratories, is also exempt. The LAMC is consistent with 2022 Title 24 goals of encouraging all-electric development, which requires new residential uses to be electric-ready (wiring installed for all-electric appliances). Buildings in Los Angeles account for 43 percent of greenhouse gas emissions—more than any other sector in the City. These LAMC requirements ensure that new buildings being constructed are built to leverage the increasingly clean electric grid, which is anticipated to be carbon-free by 2035, rather than relying on fossil fuels.

(a) City of Los Angeles Mobility Plan 2035

In August 2015, the City Council adopted Mobility Plan 2035 (Mobility Plan), which serves as the City's General Plan circulation element. The City Council has adopted several amendments to the Mobility Plan since its initial adoption, including the most recent amendment on September 7, 2016.[16] The Mobility Plan incorporates "complete streets" principles and lays the policy foundation for how the City's residents interact with their streets. While the Mobility Plan mainly relates to transportation, certain components would serve to reduce VMT and fuel consumption.

[16] Los Angeles Department of City Planning, Mobility Plan 2035: An Element of the General Plan, approved by City Planning Commission on June 23, 2016, and adopted by City Council on September 7, 2016.

		Total:	**174,254**	**1,695**

Water application rate=	3020	gal/acre/day
kWhr equivalent=	0.01	kWhr

Notes: 1) Gallons per year of water usage for dust control is calculated based on a minimum control efficiency of 66% (three times daily) with an application rate of 3,020 gal/acre/day (Air & Waste Management Association Air Pollution Engineering Manual (1992 Edition)) and average of 26 construction days per month.
2) CalEEMod Default: Each gallon of delivered potable water in Southern California is associated with 0.009727 kWhr of electricity).

Notes: Indoor water results in 0.0111 kWhr of electricity usage per gallon from delivery, treatment, and distribution of water within Southern California (CalEEMod). Outdoor water results in 0.009727 kWhr ofelectricity usage per gallon from delivery and distribution of water within Southern California (CalEEMod). The City of Los Angeles Green Building Code (Chapter IX, Article 9, of the LAMC) requires newly constructed non-residential and high-rise residential buildings to reduce indoor water use by at least 20 percent by: (1) using water saving fixtures or flow restrictions; and/or (2) demonstrating a 20 percent reduction in baseline water use. No reduction was applied to Elysian apartments.

*California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emissions Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity. Appendix C. Table E 15. December 2021. Note: Residential use provides aux. heat which was included under cooling (residential use does not provide a natural gas usage for cooling or refrigeration). In addition, Table E 15 cites that the sample size for several end uses and housing types was limited and should be used with caution.

Total	5,109,547	10,543,554	42,520,636	

Adjusted Values

	Total Electricity	Total Natural Gas	
Apartment High Rise	3,945,343	0	Note: Includes an adjustment to account for difference between CalEEMod and CAPCOA natural gas usage
High Turnover (Sit Down Restaurant)	336,045	459,599	
Enclosed Parking with Elevator	1,374,680	0	
Total	5,656,076	459,599	

Additional Sources

	Natural Gas (Btu/hr)	Electricity (kWh/yr for an average single-family residential pool)		
	Pool and Spa Heat	**Pool Heat Pump**	**Pool Pump**	**Spa Pump**
Swimming Pool (3)	800,000	575,600	2898	683
	Natural Gas (kBtu/yr)	**Electricity (kWh/yr)**		
	5,256,000	3,538,800	43,470	10,245 1,630,515

- Pool and Spa heat based on 2 (400,000 btu/hr) natural gas heaters 6 hours per day for 365 days/yr.
- Pool and spa pumps electricity usage is based on 2019 California Residential Appliance Saturation Study, Page 6: https://www.energy.ca.gov/sites/default/files/2021-08/CEC-200-2021-005-ES.PDF
- Project pool and spa are conservatively estimated to be approximately 3 times the average single family residential pool.
- Electric pool heat (heat pump) assumes conversion of 1 therm = 30 kwh.

	Units	Natural Gas (kBtu/yr)	Electricity (kWh/yr)
Grills (6) @ 360,000 btu/hr	6	539,136	161,741

Notes:
(1) CalEEmod provide pollutant emissions associated fireplaces, but does not include natural gas usage in output files. The provided usage rate is consistent with CalEEMod default factors (i.e., 90 percent of DUs have 60,000 btu/hr fireplaces, operate 25 days per year for three hours per day).
(2) Natural gas grills and fireplaces are assumed to operate 104 days per year for three hours per day @ 80 percent output.

Project No. LA1598

Attention: Mr. Jeffrey A. Goldberger

SUBJECT: Entitlement-Level Geotechnical Report
ROW DTLA Residential Project
767 S. Alameda Street, Los Angeles, California

Dear Mr. Goldberger,

Group Delta Consultants (GDC) is pleased to submit this entitlement-level geotechnical report for the proposed ROW DTLA Residential Project to be constructed at 767 South Alameda Street in Los Angeles, California. Our scope of work was conducted in general accordance with our proposal dated December 19, 2022, the Atlas Statement of Work Purchase Order dated January 5, 2023 (PO/Contract No. grp-3310-002-017) and the agreement between your firm and Group Delta Consultants, Inc. included in the Purchase Order. **This report has been prepared in support of project entitlements only and may not contain information for final design or to obtain construction permits.** A subsequent design-level report will need to be prepared and submitted to the City of Los Angeles Department of Building and Safety during design and permitting for construction.

We appreciate the opportunity to provide geotechnical services for this significant project. Should you have any questions regarding this report, or if we can be of further service, please do not hesitate to contact us.

Sincerely,

GROUP DELTA CONSULTANTS, INC.

ENTITLEMENT-LEVEL GEOTECHNICAL REPORT
ROW DTLA RESIDENTIAL PROJECT
767 S. ALAMEDA STREET
LOS ANGELES, CALIFORNIA

1.0 INTRODUCTION

This report has been prepared to present the findings of our geotechnical investigation. The intent of this report is to identify the primary geologic hazards and geotechnical issues affecting the Development Area and provide preliminary design recommendations to support project entitlements and the conceptual design of the ROW DTLA Residential Project.

This report is not sufficient for final geotechnical design and is not suitable for submission to obtain construction permitting. A design-level geotechnical report will be required for those purposes.

This report provides a description of the ROW DTLA Residential Project, our scope of work, findings from the investigation, and preliminary geotechnical design recommendations.

1.1 Development Area and ROW DTLA Residential Project Description

The ROW DTLA Residential Project site) is located within the ROW DTLA campus in the City of Los Angeles, California, as shown on Figure 1. The topography of the site and immediate vicinity is relatively level with the ground surface gently sloping towards the south and east. Ground surface elevations range from approximately 245 feet to 243 feet above mean sea level.

The ROW DTLA Residential Project ("Project") includes the construction of two mixed-use buildings and one multi-family building on the existing paved surface parking lots of the Development Area in the Project site. The Development Area consists of the north and south lots on a portion of the existing ROW DTLA site at 757-787 S. Alameda Street, 1318-1396 E. 7th Street, 736-796 S. Central Avenue, 1301-1327 E. 8th Street, 700-760 S. Market Court, 720-746 S. Terminal Street, and 760 S. Warehouse Street (the "Site") located in the Central City Community Plan area of the City of Los Angeles (the "City"). The three new buildings would be located just north and south of Center Street, which runs east-west through the Site.

The Project proposes three eight-story new construction buildings, including 1,000 total residential units, with 11% Very Low-Income units, 1,000 parking spaces, and 6,131 square feet of retail and cafe space. Buildings A and B are planned in the south lot, while Building C is planned in the north lot.

Building A would include 1,267 square feet of commercial space at the first floor; 417 residential units at the first through eighth floors; and two levels of subterranean parking. Building B would include 216 residential units at the first through eight floors and two levels of subterranean parking. Building C would consist of 4,946 square feet of commercial space at the first floor; 367 residential units at the first through eighth floors; and one level of subterranean parking.

1.2 Scope of Work

The purpose of this investigation is to address the primary geotechnical and geologic factors affecting the Development Area in accordance with the California Environmental Quality Act (CEQA) guidelines and to provide preliminary geotechnical design recommendations for project planning purposes. Our scope of work as part of this investigation included the following:

- Review of available data for the Development Area including
  - Published maps and reports from the United States Geological Survey (USGS), California Geological Survey (CGS), and the Safety Element of the General Plan for the City of Los Angeles.
  - Geotechnical reports obtained from the City of Los Angeles Department of Building and Safety (LADBS) or Alameda Square Owner LLC (Alameda Square) for previous investigations conducted at or near the Development Area.
  - Conceptual development plans provided by client and the project team.
- Subsurface explorations
- Laboratory testing
- Engineering analyses
  Preparation of this report

2.0 GEOTECHNICAL FIELD INVESTIGATION

Group Delta performed a geotechnical field investigation program consisting of a visual site reconnaissance, utility locating investigation, and subsurface explorations. The site reconnaissance was conducted to assess the existing site conditions and mark the proposed exploration locations. Information from the reconnaissance was used to determine the accessibility of the Development Area for field equipment and notify Underground Service Alert for utility clearance. Subsequent to the reconnaissance, a subsurface utility investigation was performed by way of a ground penetrating radar survey as an added measure to clear the exploration locations of any potential conflict with existing utilities.

Group Delta explored the subsurface conditions of the Development Area by drilling a collection of hollow-stem auger borings and performing several cone penetration tests (CPTs). The aim of the subsurface explorations was to characterize the stratigraphy and evaluate the engineering properties of the in-situ soils.

A total of seven (7) hollow-stem auger borings were advanced to depths of 30 to 50 feet below the existing grade. The borings were positioned throughout the Development Area, particularly within the footprint of the proposed structures, at the locations shown on Figure 2.

To supplement the data from the borings, eight (8) cone penetration test soundings were performed to depths of about 20 to 45 feet below the existing grade at the locations shown on

Figure 2. Details of the explorations and the logs of the borings and CPTs are presented in the Appendix A.

3.0 LABORATORY TESTING PROGRAM

Laboratory tests were performed on selected samples obtained from the borings to aid in the classification of the soils and to determine the pertinent engineering properties of the foundation soils. The following tests were performed:

- Soil Classification: USCS (ASTM D2487) and Visual Manual (ASTM D2488)
- In-situ moisture content (ASTM D2216) & Dry Unit Weight (ASTM D2937);
- Direct Shear (ASTM D3080);
- Sieve Analyses (ASTM D422);
- Expansion Index (ASTM D4829);
- Maximum Dry Density (ASTM D1557);
- R-value (CTM-301)
- Soil Corrosivity:
    - Minimum Electrical Resistivity (ASTM G187)
    - pH (ASTM G51)
    - Water Soluble Chloride and Sulfate (ASTM D4327)

A detailed description of the laboratory testing program and test results are presented in Appendix B.

4.0 SUBSURFACE CONDITIONS

Based on the results of the field explorations, at the surface, the Development Area consists of asphalt concrete pavement of three (3) to four (4) inches thick underlain by fill soils and native soils. Fill was encountered within all of the borings to depths ranging from two (2) to four (4) feet below the ground surface. The fill soils consist of a mixture of silty sand, sandy silt, sand lean clay, and poorly graded sand with occasional gravel and debris fragments intermixed. The native soils were primarily granular in nature comprised of alternating layers of silty sand and poorly graded to well graded sand with occasional gravel. Thin, intermittent strata of fine grained silty and clayey sediments were also observed throughout the profiles.

The upper portions of the native soils exhibited relatively loose conditions generally to a depth of 5 feet below grade and up to 12 feet at Borings B-1, B-2, and B-7. At depths of 20 feet and greater, the coarse-grained layers were dense to very dense. The subsurface conditions at the Development Area are illustrated on Figures 3 (Cross-Section A-A').

Groundwater was not encountered within any of the borings to a maximum explored depth of 50 feet below the ground surface. The Seismic Hazard Zone Report for the Los Angeles

Quadrangle (CGS, 1998) indicates that the historically highest ground water level at the Development Area is approximately 150 feet below ground surface as shown in Figure 7.

5.0 GEOLOGIC AND SEISMIC HAZARDS

5.1 Geologic Setting

Regionally, the Site, including the Development Area is located within the seismically active Los Angeles Basin area of southern California Peninsular Ranges Geomorphic Province. The Los Angeles Basin began forming over 7 million years ago through transtensional stresses and subsidence between north-west and east-west trending fault systems (Wright, 1991). Today, the basin is undergoing transpresssional stress bound by surrounding faults including the Santa Monica-Hollywood-Raymond fault system locally (Dolan, 1995). Internally, the basin is filled with sedimentation thousands of feet thick, structurally influenced by thrusting fault blocks and strike-slip faults dividing the basin into northwest trending valleys and ridges (Wright, 1991).

Locally, the Site, including the Development Area is situated on the west alluvial plain of the Los Angeles River on the northeast boundary the Los Angeles Basin. Debris carried and deposited by the Los Angeles River consist largely of eroded granitic and Tertiary sedimentary rock exposed within the surrounding mountains. Today the river is controlled within a lined channel which flows to the south, located about 0.5 miles east of the Site . The Elysian Park foothills outcrop just north of the Site exposing Tertiary sedimentary rock. Tertiary marine-deposited sedimentary rock underlies the Site at depth. The location of the Site with respect to the geological features described above is presented in Figure 4.

5.2 Seismic Setting

The Site, including the Development Area is located within the seismically active area of southern California and there is a high potential for the Site to experience strong ground shaking from local and regional faults. These hazards and their potential impact can be mitigated with proper seismic design. The intensity of ground shaking is highly dependent upon the distance of the fault to the Site , the magnitude of the earthquake, and the underlying soil conditions. The Site in relation to regional seismic faults and significant historical earthquake epicenters is presented in Figure 5. A Holocene-active fault is one that has ruptured in the last approximate 11,000 years (Holocene). Potentially active faults are faults that have ruptured in the last approximately 130,000 years.

A list of a few of the nearest active faults considered capable of producing significant shaking at the Site, including the Development Area is provided in Table 1.

Table 1: List of Nearest Earthquake Faults

Abbreviated Fault Name	Fault Type	Max. Magnitude (Mw)	Approximate Closest Surface Projected Distance* (mile)
Elysian Park (Lower)	Blind Thrust	6.7	0.9
Elysian Park (Upper)	Blind Thrust	6.7	2.0
Puente Hills	Blind Thrust	7.5	3.2
Hollywood	Strike Slip	6.5	5.7
Newport-Inglewood-Rose Canyon	Blind Thrust	7.2	7.3
San Andreas	Strike Slip	8.0	36

Notes: Maximum magnitude sourced from Southern California Earthquake Center
**Distance as measured from USGS/CGS QFault KMl files*

5.3 Surface Fault Rupture

Surface fault rupture due to active faulting has been evaluated through review of the State of California Earthquake Zones of Required Investigation Maps for the Hollywood and Los Angeles Quadrangles (CGS, 2017) and the City of Los Angeles Preliminary Fault Study Areas (NavigateLA.lacity.org). Based on our review, neither the Site nor the Development Area is located within a fault zone of required investigation and there are no Holocene-active or potentially active faults at the Development Area or projecting toward the Development Area. The closest Alquist-Priolo Earthquake Fault Zone is associated with the Newport-Inglewood-Rose Canyon Fault Zone, located approximately 6.7 miles west of the Site, including the Development Area. Therefore, the potential for surface fault rupture at the Development Area is considered low.

5.4 Liquefaction and Seismically Induced Ground Failure

Liquefaction is the sudden decrease in the strength and stiffness of unconsolidated, saturated cohesionless soils typically caused by the generation of pore water pressure during cyclic loading (e.g., seismic ground shaking). For soils to liquefy, the intensity and duration of the seismically induced cyclic loading must be sufficient to increase the excess pore water pressures to such an extent that the effective stresses on the soil particles reduces to zero. If liquefaction is initiated, the saturated soils behave temporarily as a viscous fluid and consequently lose their capacity to support the structures founded on them. The occurrence of liquefaction may also result in substantial ground deformations. Liquefaction potential has been found to be greatest where groundwater levels and loose cohesionless soils are present within 50 feet of the ground surface. The potential for liquefaction decreases with increasing clay and gravel content. Seismic shaking can also cause soil compaction and ground settlement without liquefaction occurring, including settlement of dry sands above the water table.

According to the Earthquake Zones of Required Investigation Map of the Hollywood and Los Angeles Quadrangles (CGS, 2017) neither the Site nor the Development Area is not located within an area identified as susceptible to liquefaction (Figure 6). Groundwater was not encountered to a maximum explored depth of 50 feet and the historically-highest ground water level reported by CGS at the Development Area is approximately 150 feet below the ground surface (Figure 7). Based on these groundwater conditions, the potential for liquefaction and associated ground deformation is considered low for the Development Area. Based on the low potential for liquefaction and the relatively level ground surface, the potential for lateral spreading at the Development Area is considered low.

For the proposed structures with one basement level, the excavation of the basement would remove all, or most, of the existing fill soils and loose natural sandy soils. Therefore, the potential for seismically-induced ground failure and/or excessive settlement at the Development Area is low.

5.5 Landslides

The Site, including the Development Area and immediate vicinity are relatively level with no significant slopes or grade changes. There are no mapped landslides or CGS-designated Earthquake Zones of Required Investigation for landslide hazard at or near the Development Area (Figure 6). Thus, the potential for landslide hazards at the Development Area are negligible. Where excavations for a potential subterranean level will be a part of the proposed development, proper shoring design should be implemented to ensure stable excavations and prevent the undermining of any adjacent properties or structures.

5.6 Naturally Occurring Methane

According to the City of Los Angeles, the Site, including the Development Area is not located within a designated oil field (NavigateLA). The closest oil field is the Union Oil Field which is located approximately 0.3 miles north of the Development Area. No active or abandoned oil wells are reported within the limits of the Development Area. In addition, the Development Area is not located within a mapped methane or methane-buffer zone as defined by the City of Los Angeles. Therefore, the potential for naturally-occurring oil and methane onsite is considered low.

5.7 Soil Stability

5.7.1 Erosion

Substantial soil erosion can occur along slopes and gentle gradients where loose and weakly vegetated soils are present and exposed to surface water flow and/or wind. Under the current project site conditions there is very minimal space where soil is open to the atmosphere and limited perimeter landscaping. The Project will cover the land with buildings and pavements.

With best management practices implemented during construction, erosion of soils would not be significant. The potential hazard of substantial soil erosion is negligible.

5.7.2 Collapse and/or Expansion

The existing onsite soils predominantly consist of non-expansive coarse-grained, sandy materials. Therefore, the potential of soil expansion is considered negligible.

The fill materials and upper native soils consist of loose sandy soils. These soils will be removed during basement construction and the buildings will be supported on dense native materials or compacted engineered fill. Requirements for depth of over-excavation and recompaction of the upper soils to remove fill and/or limit settlement due to wetting under pavements, hardscape, and exterior structures can be addressed during final design. Therefore, the potential hazard for soil collapse or expansion is considered low.

5.7.3 Subsidence

Subsidence in southern California is typically associated with groundwater withdrawal, oil extraction, and/or the deterioration of peat or organic soils that settle over time. State and local regulation has allowed for monitor programs and general management to reduce the negative impacts of subsidence due to groundwater and oil withdrawal. The Site, including the Development Area is not located within an active subsidence area, as defined by the USGS online map of Areas of Land Subsidence in California. In addition, the Site, including the Development Area is not located within an active oil field as defined by the City of Los Angeles (NavigateLA). The potential for subsidence at the Development Area is considered low.

5.8 Soil Corrosivity

Corrosion testing was conducted as part of this investigation on representative samples of the surficial soils. The samples were obtained from the upper 5 feet and submitted to a laboratory to measure soil corrosion potential parameters. Corrosivity testing included minimum electrical resistivity, soil pH, water-soluble chlorides, and water-soluble sulfates. The results of the testing are provided in Appendix B and are summarized in the Table 2 below.

Table 2: Soil Corrosivity Test Results

Boring No.	Depth (feet)	Soluble Sulfate Content (Caltrans 417) (%)	pH (Caltrans 643)	Soluble Chlorides (Caltrans 422) (ppm)	Saturated Electrical Resistivity (Caltrans 643) (Ohm-cm)
B-2	0'-5'	0.0087	7.9	3.2	4,000
B-6	0'-5'	0.0056	8.7	6.9	5,200
B-7	0'-5'	0.0082	8.6	3.4	4,160

The test results indicated that the corrosion potential for concrete exposed to sulfate-containing solutions is negligible. Based on the sulfate content of the soils tested, per ACI 318 there are no restrictions on cement type and/or water/cement ratio for the concrete.

The following correlation can generally be used between electrical resistivity and corrosion potential:

Electrical Resistivity (Ohm-Cm)	Corrosion Potential
Less than 1,000	Severe
1,000 to 2,000	Corrosive
2,000 to 5,000	Moderate
5,000 to 10,000	Mild

Based on the laboratory test results, the onsite soils can be classified as mildly to moderately corrosive to buried metals. The results of the corrosion potential testing on on-site soils presented should be considered in the project design and construction. These results should be provided to a corrosion consultant for interpretation and for recommendations in the design of the Project. With proper engineering design, soil corrosivity hazard is considered low.

5.9 Wastewater Disposal

The city provides wastewater disposal through the city sewer systems. The Project will be served by the city's existing sewer system and does not include septic tanks or alternative wastewater disposal systems. The potential for waste-water disposal to be a hazard at the Development Area is low.

5.10 Geologic Features of Significance

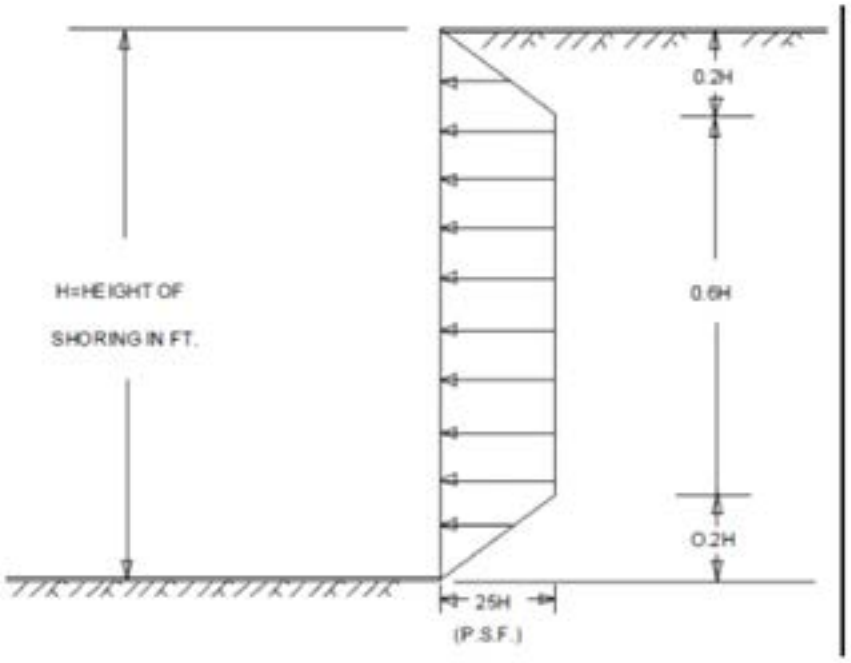
The Site, including the Development Area is situated within a densely developed area of Los Angeles, California. The Site is currently developed with industrial and commercial structures and pavements. There is no natural landscape remaining at the Development Area or in the immediate vicinity. Therefore, there is no potential hazard of destroying a natural geological feature of significance.

6.0 PRELIMINARY GEOTECHNICAL RECOMMENDATIONS

6.1 General

Based on the results of our preliminary geotechnical investigation, it is our professional opinion that development of the Project is feasible from a geotechnical standpoint. Preliminary geotechnical recommendations for design planning are discussed in the following sections. A design-level geotechnical report will be required to develop geotechnical recommendations for final design, including possible supplemental geotechnical investigation to better define the subsurface conditions and confirm engineering parameters for detailed engineering analyses.

Existing fill soils, about 5 feet thick, were encountered in the borings. In addition, loose natural soils were encountered up to a depth of approximately 12 feet in the South Lot and to a depth of approximately 8 feet in the North Lot. Existing fill soils and the loose natural soils should be over-excavated and recompacted and the proposed structures may be supported on shallow foundation and the floor slab may be supported on grade.



For pavements and hardscape, it may be possible to limit over-excavation and recompaction of the uncertified fill soils to a depth of approximately 3 feet if a Request for Modification of Building Ordinances is filed out with the Los Angeles Department of Building and Safety (LADBS) subject to approval.

6.2 Temporary Excavation and Shoring

Excavations up to about 20 feet below the existing grade are planned. For construction of subterranean walls, conventional soldier beams with lagging for shoring is feasible. This method of shoring would consist of steel soldier piles placed in drilled holes, backfilled with concrete.

For cantilevered shoring, we recommend using a triangular pressure distribution for calculating earth pressures. At minimum, an active earth pressure equal to that of a fluid with a density of 35 pcf may be used for level retained ground, plus and any surcharge loads resulting from loads placed above the excavation.

For preliminary design of restrained shoring systems (tie backs and/or internal bracing), we recommend the use of a trapezoidal distribution of earth pressure. The recommended pressure distribution for the case where the grade is level behind the shoring is illustrated in the diagram below, with the maximum pressure equal to 25H in pounds per square foot, where H is the height of the shoring in feet.

The recommended earth pressure provided above is a preliminary value. The design earth pressure should be estimated based on the depth of the excavation, type of the retaining structure and soil properties.

The temporary shoring system shall be designed to limit deflections and to protect adjacent buildings, utilities, and other structures, as required. A monitoring program to measure shoring deflections shall be part of the design and implemented during construction.

Caving may be anticipated during drilling. Special technique, such as casing or drilling mud may be used to prevent caving.

Surface drainage should be controlled and prevented from running down the temporary excavations or the face of the shoring. Ponding water should not be allowed within the excavation.

6.3 Basement Walls

Braced basement walls should be designed to resist at-rest earth pressures. Accordingly, for the case where the grade is level behind the walls, a triangular distribution of lateral earth pressure equivalent to that developed by a fluid with a density of 60 pounds per cubic foot may be used. This earth pressure assumes that all walls are constructed with a properly designed drainage system to prevent buildup of hydrostatic pressures behind the wall. Any surcharge loadings occurring as a result of the traffic, any heavy crane loads, and stockpiled materials should be added to this pressure.

The basement walls should be designed to resist, an active pressure combined with a seismic increment of active static lateral earth pressure. The active static lateral earth pressure is equivalent to a fluid with a density of 35 pounds per cubic foot. To compute seismic increment, a seismic lateral earth pressure coefficient (k_h) of 0.3g (one-half of two-thirds of PGA_M) was used in accordance with the procedure provided in the LADBS Bulletin No. P/BC 2020-083. Accordingly, a seismic increment of 30 pounds per cubic foot may be used for seismic design.

6.4 Foundations

For the proposed structures with one and two basement levels, the excavation of the basement would remove all, or most, of the existing fill soils and loose natural soils. Spread footings extending at least one foot into the properly compacted fill soils or undisturbed natural soils and at least 2 feet below the floor slab or lowest adjacent grade, may be designed to impose a net dead-plus-live load pressure of 5,000 pounds per square foot. The allowable bearing pressure may be increased by one-third when considering temporary loads associated with wind and seismic loading.

This value is based on the assumption that all soil to a depth of 12 feet is removed and the foundations are supported below the upper loose soils. The final foundation types and bearing capacity should be confirmed during the design-level geotechnical investigation.

6.5 Floor Slab

If the bottoms of excavations can be scarified to a depth of 6 inches, brought to near-optimum moisture content, and rolled with heavy compaction equipment, the floor slab may be supported on grade.

6.6 Seismic Considerations

Structures should be designed in general accordance with the seismic provisions of the 2022 California Building Code and ASCE 7-16 for Seismic Design Category D. Since the subsurface exploration did not include site-specific shear wave velocity measurements at the Development Area, the Development Area is classified as D-Default in accordance with Chapter 20, subject to the requirements of Section 11.4.4.

Per Section 11.4.8 of ASCE 7-16 and Supplement 3, a site-specific ground motion hazard analysis is required for "structures on Site Class D sites with S_1 greater than or equal to 0.2", unless the exception of Section 11.4.8 of Supplement 3 of ASCE 7-16 is met. Per this exception, a ground motion hazard analysis is not required where the mapped value of S_{M1} is increased by 50%.

Mapped seismic design parameters are provided below, incorporating the exception of Section 11.4.8 (S_{M1} is increased by 50%) of Supplement 3. Note that the corresponding S_{D1} and T_S are also increased as a result. The parameters tabulated below were developed using the referenced ASCE 7 Hazard Tool (ASCE, 2023).

Table 3: Mapped Seismic Design Acceleration Parameters

Design Parameters	Seismic Design Parameter Mapped Value (ASCE 7-16 Section 11.4)
Site Latitude	34.0335
Site Longitude	-118.2392
S_s (g)	1.919
S_1 (g)	0.683
Site Class	D
F_a	1.2
F_v	2.55
T_S (sec)	0.756 [1]
T_L (sec)	8
S_{MS} (g)	2.303
S_{M1} (g)	1.742 [1]
S_{DS} (g)	1.535
S_{D1} (g)	1.161 [1]
PGA_M	0.986

Notes:
[1] S_{M1} (and S_{D1}) has been increased by 50% per ASCE 7-16 Supplement 3, which also impacts the value of T_S. F_v is based on Table 11.4-2.

6.7 Stormwater Infiltration

Site-specific field percolation tests have not been performed and will be performed at a later date for final design once low-impact-development (LID) infiltration improvement locations are better defined. A preliminary stormwater infiltration rate was estimated based on hydraulic conductivity of the soils in accordance with the procedures of the "Guidelines for Design, Investigation, and Reporting Low Impact Development Stormwater Infiltration by Los Angeles

County Department of Public Works" (GS200.1, 2021) and "Planning and Land Development Handbook for Low Impact Development" by City of Los Angeles Department of Sanitation.

We have estimated the soil hydraulic conductivity using the Hazen equation as shown below:

$$K = C \times (D_{10})^2$$

Where K = Hydraulic Conductivity in cm/s
C = 1, Hazen's Empirical Coefficient
D_{10} = Grain Diameter in mm Corresponding to 10% Passing

The grain diameter corresponding to 10% passing was obtained from laboratory tests on selected samples from our field investigation. The infiltration rates based on grain-size analyses are shown in Table 4.

Table 4: Infiltration Rate Estimated Based on Grain-Size Analyses

Boring No.	Sample Depth (feet)	Soil Type	D_{10} (mm)	Reduction Factor	Computed Infiltration Rate (inch/hour)
B-1	25	Sand with Silt	0.10	3	4.7
B-3	25	Sand	0.11	3	5.7
B-6	25	Sand with Silt	0.17	3	13.7

Based on the results presented in Table 4, Group Delta recommends using a preliminary infiltration rate of about 5 in/hr. The recommended infiltration rate may be applicable for target infiltration zone at depth of 25 feet below existing ground surface or deeper. The infiltration rate should be further assessed during the design phase of the Project when more details about infiltration infrastructure characteristics and locations are known.

7.0 LIMITATIONS

This entitlement-level geotechnical report was prepared in accordance with generally accepted Geotechnical Engineering principles and practice. The professional engineering work and judgments presented in this report meet the standard of care of our profession at this time. No other warranty, expressed or implied, is made. This report has been prepared for the Alameda Square Owner LLC, and their consultants. It may not contain sufficient information for other parties for other purposes or other projects and should not be used for other projects without review and approval by Group Delta. **This entitlement-level report may not be sufficient to obtain a building permit from the City. A design-level geotechnical report will be required prior to developing final plans for the Project.**

MAP UNITS AND SYMBOL EXPLORATION

Late Holocene (Surficial Deposits)

af — **Artificial Fill** - deposits of fill resulting from human construction, mining, or quarrying activities; includes engineered fill for buildings, roads, dams, airport runways, harbor facilities, and waste landfills

Qou — **Undifferentiated Surficial Deposits** - includes colluvium, slope wash, talus deposits, and other surficial deposits of all ages, generally unconsolidated but locally may contain consolidated layers

Qls — **Landslide Deposits** - may include debris flows and older landslides of various earth material and movement types; unconsolidated to moderately well-consolidated

Qb — **Beach Deposits** - unconsolidated marine beach sediments consisting mostly of fine- and medium-grained, well-sorted sand

Qw — **Alluvial Wash Deposits** - unconsolidated sandy and gravelly sediment deposited in recently active channels of streams and rivers; may contain loose to moderately loose sand and silty sand

Qf — **Alluvial Fan Deposits** - unconsolidated boulders, cobbles, gravel, sand, and silt recently deposited where a river or stream issues from a confined valley or canyon; sediment typically deposited in a fan-shaped cone; gravelly sediment generally more dominant than sandy sediment

Qa — **Alluvial Valley Deposits** - unconsolidated clay, silt, sand, and gravel recently deposited parallel to localized stream valleys and/or spread more regionally onto alluvial flats of larger river valleys; sandy sediment generally more dominant than gravelly sediment

Qt — **Terrace Deposits** - includes marine and stream terrace deposits; marine deposits include slightly to moderately consolidated and bedded gravel and conglomerate, sand and sandstone, and silt and siltstone; river terrace deposits consist of unconsolidated thin- to thick-bedded gravel

Ql — **Lacustrine, Playa, and Estuarine (Paralic) Deposits** - mostly unconsolidated fine-grained sand, silt, mud, and clay from fresh water (lacustrine) lakes, saline (playa) dry lakes that are periodically flooded, and estuaries; deposits may contain salt and other evaporites

Qe — **Eolian and Dune Deposits** - unconsolidated, generally well-sorted wind-blown sand; may occur as dune forms or sheet sand

Holocene to Late Pleistocene (Surficial Deposits)

Qyf — **Young Alluvial Fan Deposits** - unconsolidated to slightly consolidated, undissected to slightly dissected boulder, cobble, gravel, sand, and silt deposits issued from a confined valley or canyon

Qya — **Young Alluvial Valley Deposits** - unconsolidated to slightly consolidated, undissected to slightly dissected clay, silt, sand, and gravel along stream valleys and alluvial flats of larger rivers

Late to Middle Pleistocene (Surficial Deposits)

Qof — **Old Alluvial Fan Deposits** - slightly to moderately consolidated, moderately dissected boulder, cobble, gravel, sand, and silt deposits issued from a confined valley or canyon

Qoa — **Old Alluvial Valley Deposits** - slightly to moderately consolidated, moderately dissected clay, silt, sand, and gravel along stream valleys and alluvial flats of larger rivers

Qot — **Old Terrace Deposits** - slightly to moderately consolidated, moderately dissected marine and stream terrace deposits

Qol — **Old Lacustrine, Playa, and Estuarine (Paralic) Deposits** - slightly to moderately consolidated, moderately dissected fine-grained sand, silt, mud, and clay from lake, playa, and estuarine deposits of various types

Middle to Early Pleistocene (Surficial Deposits)

Qvof — **Very Old Alluvial Fan Deposits** - moderately to well-consolidated, highly dissected boulder, cobble, gravel, sand, and silt deposits issued from a confined valley or canyon

Qvoa — **Very Old Alluvial Valley Deposits** - moderately to well-consolidated, highly dissected clay, silt, sand, and gravel along stream valleys and alluvial flats of larger rivers, generally uplifted and deformed

Quaternary (Bedrock)

Qac — **Coarse-grained formations of Pleistocene age and younger** - primarily sandstone and conglomerate

Qafi — **Fine-grained formations of Pleistocene age and younger** - includes fine-grained sandstone, siltstone, mudstone, shale, siliceous and calcareous sediments

Tertiary (Bedrock)

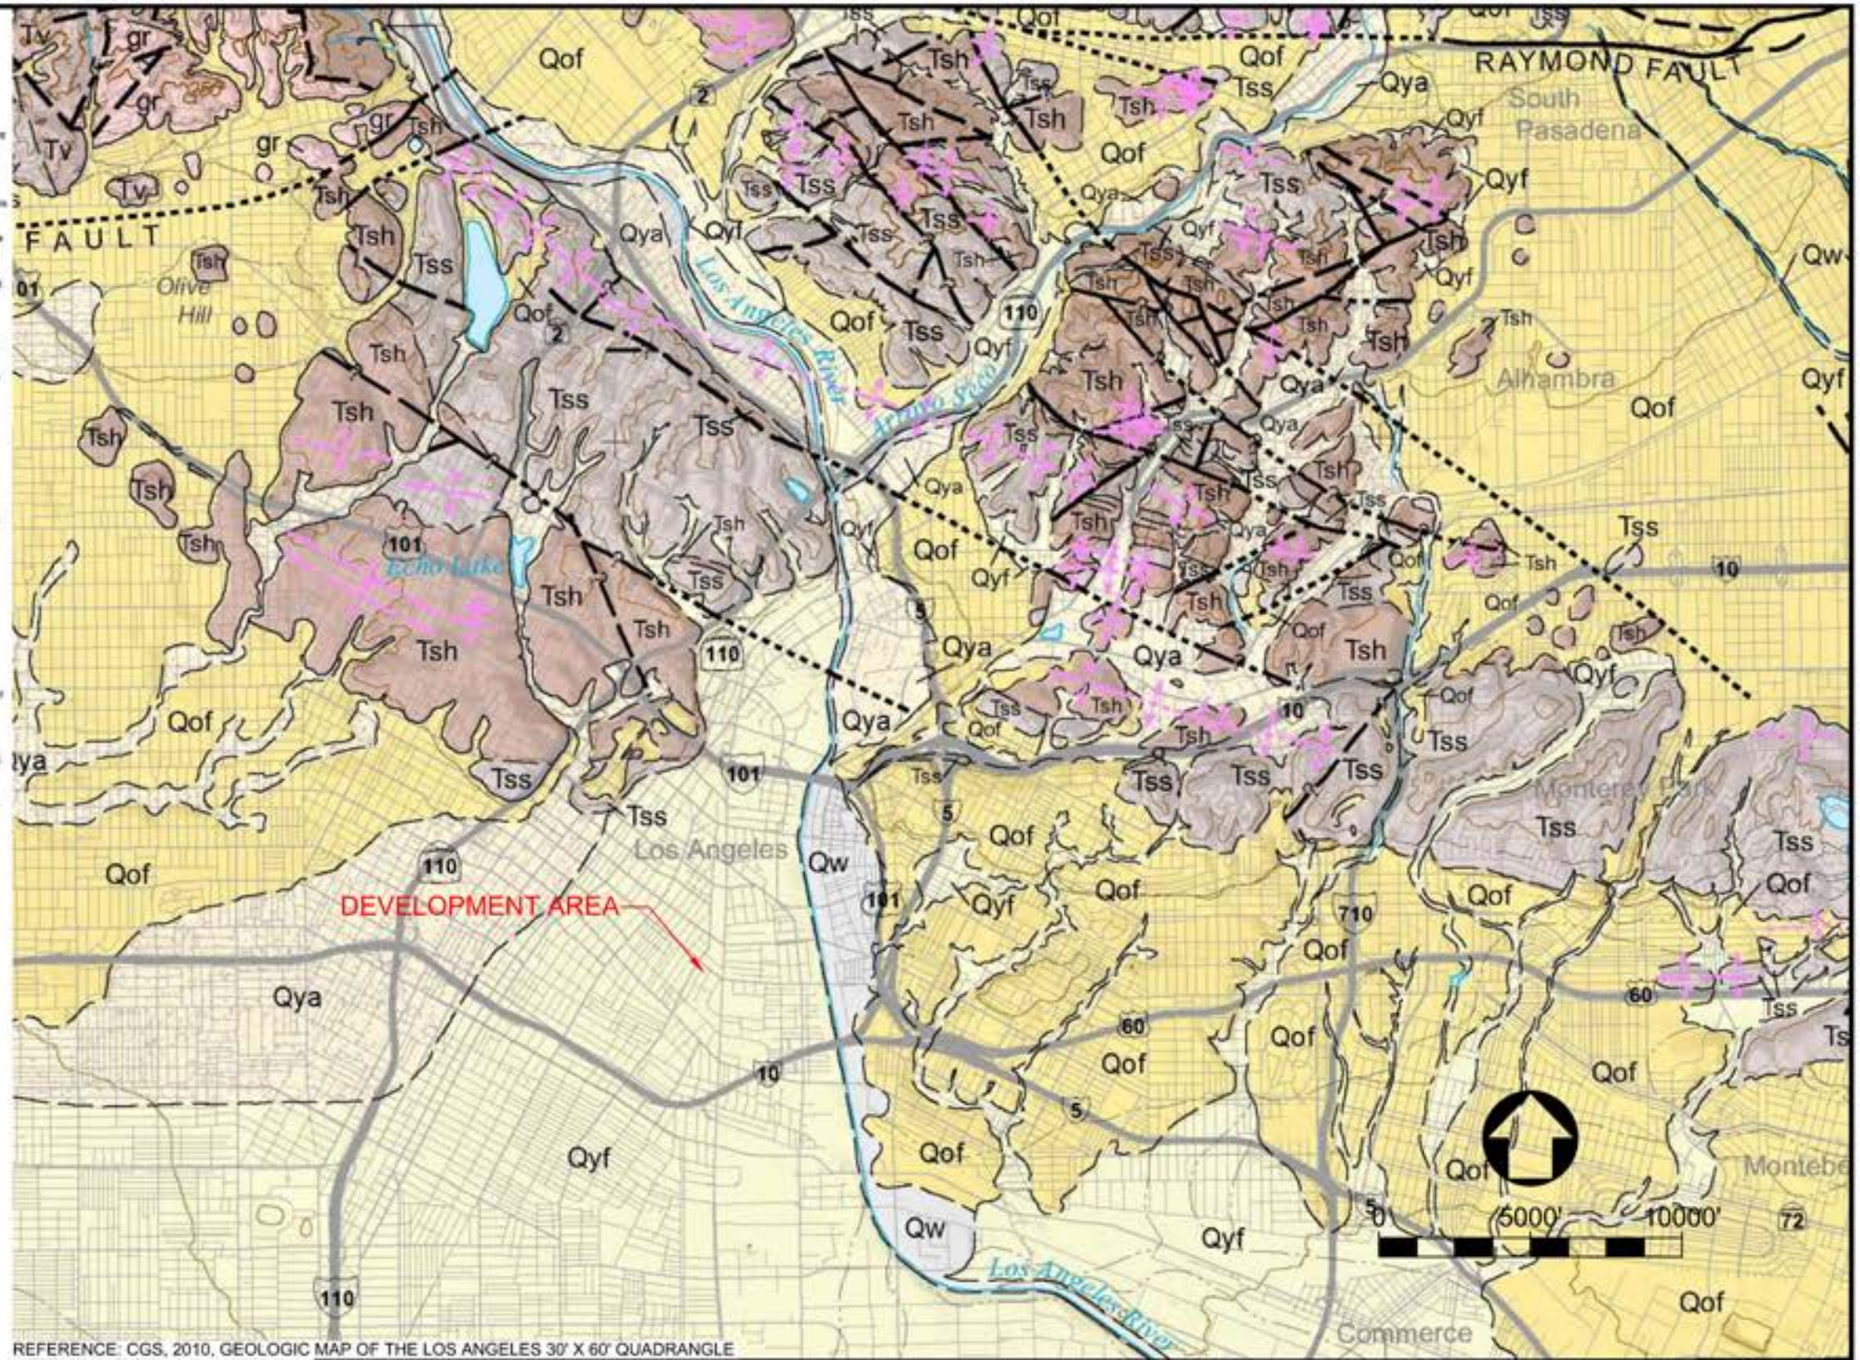
Tsc — **Coarse-grained Tertiary age formations** - primarily sandstone and conglomerate

Tsf — **Fine-grained Tertiary age formations** - includes fine-grained sandstone, siltstone, mudstone, shale, siliceous and calcareous sediments

Tv — **Tertiary age formations of volcanic origin**

Mesozoic and Older (Bedrock)

Kac — **Coarse-grained Cretaceous age formations of sedimentary origin**



Kvh — **Fine-grained Cretaceous age formations of sedimentary origin**

pMzm — **Cretaceous and pre-Cretaceous metamorphic formations of sedimentary and volcanic origin**

sp — **Serpentinite of all ages**

gr — **Granitic and other intrusive crystalline rocks of all ages**

APPENDIX A
FIELD EXPLORATION

A.1 Introduction

Group Delta conducted subsurface explorations on January 4 and January 6, 2023, as part of a geotechnical investigation to aid in the design of the proposed ROW DTLA Residential Development in Los Angeles, California. The explorations consisted of seven (7) hollow-stem borings and eight (8) Cone Penetration Test (CPT) soundings. The exploration locations and identifications are shown in Figure 2 of the main report. A summary table of the field exploration program by Group Delta is provided in Table A-1.

Table A-1
Summary of Subsurface Explorations

Exploration No.	Date Performed	*Ground Surface Elevation (feet, MSL)	Total Depth (ft)	Groundwater Depth (ft)	Exploration Type
B-1	1/4/23	244	45	Not Encountered	Hollow-Stem Auger
B-2	1/6/23	245	30	Not Encountered	Hollow-Stem Auger
B-3	1/4/23	245	30	Not Encountered	Hollow-Stem Auger
B-4	1/6/23	245	50	Not Encountered	Hollow-Stem Auger
B-5	1/4/23	245	30	Not Encountered	Hollow-Stem Auger
B-6	1/6/23	245	30	Not Encountered	Hollow-Stem Auger
B-7	1/6/23	245	30	Not Encountered	Hollow-Stem Auger
CPT-1	1/4/23	245	32.5	Not Encountered	Cone Penetration Test
CPT-2	1/4/23	245	45	Not Encountered	Cone Penetration Test
CPT-3	1/4/23	245	35	Not Encountered	Cone Penetration Test
CPT-4	1/4/23	245	39	Not Encountered	Cone Penetration Test
CPT-5	1/4/23	245	38.4	Not Encountered	Cone Penetration Test
CPT-6	1/4/23	245	32.9	Not Encountered	Cone Penetration Test
CPT-7	1/4/23	244	20.6	Not Encountered	Cone Penetration Test
CPT-8	1/4/23	245	28.6	Not Encountered	Cone Penetration Test

*Approximate elevations via Google Earth

A.2 Soil Borings

Hollow-stem auger borings were advanced to depths of 30 to 50 feet below the ground surface positioned throughout the North and South Lots. The borings were drilled on January 4 and January 6, 2023, by ABC Liovin Drilling (Group Delta's subcontractor) by way of a CME-75 drill rig. The borings were performed under the supervision of a Group Delta field engineer, who

maintained detailed logs of the soils encountered in accordance with the Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), classified the materials according to the Unified Soil Classification System (USCS), and obtained soil samples.

Driven (undisturbed) samples and bulk samples of the encountered materials were obtained from the borings and recorded on the boring logs. Driven samples were obtained with a Modified California Sampler lined with 1-inch-high brass rings. The Modified California sampler has an outside diameter of 3 inches, and a cutting shoe with an inside diameter of 2.42 inches. The samples were retained in brass rings and placed in sealed plastic canisters to prevent moisture loss. The Modified California samplers were driven into the soil at the bottom of the borehole using a 140-pound hammer free-falling 30 inches. The penetration resistance (or "blow count") in blows per six inches of driving was recorded on the logs. Bulk samples were obtained at various depth ranges and placed into polyethylene bags.

A key for soil classification and a boring record legend are presented in Figures A-1a to A-1b and A-2a to A-2c, respectively. The boring logs are presented in Figures A-3 to A-9.

A.3 Cone Penetration Tests

Kehoe Testing and Engineering performed the CPT soundings as a subcontractor to Group Delta. The CPTs were conducted in accordance with ASTM D5778 using an electronic piezocone penetrometer. The test consists of hydraulically pushing a conical pointed penetrometer with a cylindrical friction sleeve and a piezo-element located behind the conical point into subsurface soils at a slow, steady rate. Parameters electronically measured and recorded nearly continuously during the CPT are soil penetration resistance at the cone tip (qc), soil frictional resistance along the cylindrical friction sleeve (fs), and pore water pressure directly behind the cone tip (U). These measured values were used to estimate the type and engineering properties of the in-situ soils being penetrated using published correlations between qc, fs, and U.

At the completion of the soundings, the cave-in depths were measured with a weighted tape and the holes were abandoned by backfilling with grout. Paved surfaces were patched with either cold mix asphalt or rapid-set concrete. The CPT data in graphical form are presented in Figures A-10 to A-17

CLASSIFICATION OF COARSE-GRAINED SOILS (Soils with <50% "fines" passing No. 200 Sieve)

Reference:

ASTM D 2487 and 2488

Note: Values estimated to nearest 5% to be used for visual identification, values in parentheses to be used for classification when based on laboratory grain size data.

Granular Soil Gradation Parameters

Coefficient of Uniformity: $C_u = D_{60}/D_{10}$

Coefficient of Curvature: $Cc = D_{30}^2 / (D_{60} \times D_{10})$

D_{10} = 10% of soil is finer than this diameter

D_{30} = 30% of soil is finer than this diameter

D_{60} = 60% of soil is finer than this diameter

Group Symbol	Gradation or Plasticity Requirement
SW	$C_u > 6$ and $1 \leq C_c \leq 3$
GW	$C_u > 4$ and $1 \leq C_c \leq 3$
GP or SP	Clean gravel or sand not meeting requirement for SW or GW
SM or GM	Non-plastic fines or below A-Line or PI<4
SC or GC	Plastic fines or above A-Line and PI>7

Describe the soil using descriptive terms in the order shown

Minimum Required Sequence:

USCS Group Name (Group Symbol); Consistency or Density; Color; Moisture; Percent or Proportion of Soil; Particle Size; Plasticity (optional).

◉ = optional for non-Caltrans projects

Where applicable:

Cementation; % cobbles & boulders;
Description of cobbles & boulders;
Consistency field test result

Ref.: Caltrans Soil and Rock Logging Classification, and Presentation Manual (2010)

HOLE IDENTIFICATION

Holes are identified using the following convention:

H-YY-NNN

Where:
H: Hole Type Code
YY: 2-digit year
NNN: 3-digit number (001-999)

Hole Type Code	Description
A	Auger boring (hollow or solid stem, bucket)
R	Rotary drilled boring (conventional)
RC	Rotary core (self-cased wire-line, continuously-sampled)
RW	Rotary core (self-cased wire-line, not continuously sampled)
P	Rotary percussion boring (Air)
HD	Hand driven (1-inch soil tube)
HA	Hand auger
D	Driven (dynamic cone penetrometer)
CPT	Cone Penetration Test
O	Other (note on LOTB)

Description Sequence Examples:

SANDY lean CLAY (CL); very stiff; yellowish brown; moist; mostly fines; some SAND, from fine to medium; few gravels; medium plasticity; PP=2.75.

Well-graded SAND with SILT and GRAVEL and COBBLES (SW-SM); dense; brown; moist; mostly SAND, from fine to coarse; some fine GRAVEL; few fines; weak cementation; 10% GRANITE COBBLES; 3 to 6 inches; hard; subrounded.

Clayey SAND (SC); medium dense, light brown; wet; mostly fine sand,; little fines; low plasticity.

FIELD AND LABORATORY TESTS

C	Consolidation (ASTM D 2435-04)
CL	Collapse Potential (ASTM D 5333-03)
CP	Compaction Curve (CTM 216 - 06)
CR	Corrosion, Sulfates, Chlorides (CTM 643 - 99; CTM 417 - 06; CTM 422 - 06)
CU	Consolidated Undrained Triaxial (ASTM D 4767-02)
DS	Direct Shear (ASTM D 3080-04)
EI	Expansion Index (ASTM D 4829-03)
M	Moisture Content (ASTM D 2216-05)
OC	Organic Content (ASTM D 2974-07)
P	Permeability (CTM 220 - 05)
PA	Particle Size Analysis (ASTM D 422-63 [2002])
PI	Liquid Limit, Plastic Limit, Plasticity Index (AASHTO T 89-02, AASHTO T 90-00)
PL	Point Load Index (ASTM D 5731-05)
PM	Pressure Meter
PP	Pocket Penetrometer
R	R-Value (CTM 301 - 00)
SE	Sand Equivalent (CTM 217 - 99)
SG	Specific Gravity (AASHTO T 100-06)
SL	Shrinkage Limit (ASTM D 427-04)
SW	Swell Potential (ASTM D 4546-03)
TV	Pocket Torvane
UC	Unconfined Compression - Soil (ASTM D 2166-06) Unconfined Compression - Rock (ASTM D 2938-95)
UU	Unconsolidated Undrained Triaxial (ASTM D 2850-03)
UW	Unit Weight (ASTM D 4767-04)
VS	Vane Shear (AASHTO T 223-96 [2004])

SAMPLER GRAPHIC SYMBOLS

- Standard Penetration Test (SPT)
- Standard California Sampler
- Modified California Sampler
- Shelby Tube
- Piston Sampler
- NX Rock Core
- HQ Rock Core
- Bulk Sample
- Other (see remarks)

DRILLING METHOD SYMBOLS

- Auger Drilling
- Rotary Drilling
- Dynamic Cone or Hand Driven
- Diamond Core

WATER LEVEL SYMBOLS

- First Water Level Reading (during drilling)
- Static Water Level Reading (after drilling, date)

Ref.: Caltrans Soil and Rock Logging Classification, and Presentation Manual (2010)

DEFINITIONS FOR CHANGE IN MATERIAL

Term	Definition	Symbol
Material Change	Change in material is observed in the sample or core, and the location of change can be accurately measured.	———
Estimated Material Change	Change in material cannot be accurately located because either the change is gradational or because of limitations in the drilling/sampling methods used.	. . . . .
Soil/Rock Boundary	Material changes from soil characteristics to rock characteristics.	~~~~

PROJECT NUMBER: LA1598

BORING RECORD LEGEND #2

CONSISTENCY OF COHESIVE SOILS

Descriptor	Shear Strength (tsf)	Pocket Penetrometer, PP Measurement (tsf)	Torvane, TV. Measurement (tsf)	Vane Shear, VS. Measurement (tsf)
Very Soft	< 0.12	< 0.25	< 0.12	< 0.12
Soft	0.12 - 0.25	0.25 - 0.50	0.12 - 0.25	0.12 - 0.25
Medium Stiff	0.25 - 0.50	0.50 - 1.0	0.25 - 0.50	0.25 - 0.50
Stiff	0.50 - 1.0	1.0 - 2.0	0.50 - 1.0	0.50 - 1.0
Very Stiff	1.0 - 2.0	2.0 - 4.0	1.0 - 2.0	1.0 - 2.0
Hard	> 2.0	> 4.0	> 2.0	> 2.0

APPARENT DENSITY OF COHESIONLESS SOILS

Descriptor	SPT N_{60} - Value (blows / foot)
Very Loose	0 - 5
Loose	5 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	> 50

MOISTURE

Descriptor	Criteria
Dry	No discernable moisture
Moist	Moisture present, but no free water
Wet	Visible free water

PERCENT OR PROPORTION OF SOILS

Descriptor	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

PARTICLE SIZE

Descriptor		Size (in)
Boulder		> 12
Cobble		3 - 12
Gravel	Coarse	3/4 - 3
	Fine	1/5 - 3/4
Sand	Coarse	1/16 - 1/5
	Medium	1/64 - 1/16
	Fine	1/300 - 1/64
Silt and Clay		< 1/300

PLASTICITY OF FINE-GRAINED SOILS

Descriptor	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CONSISTENCY OF COHESIVE SOILS VS. N_{60}

Description	SPT N_{60} (blows / foot)
Very Soft	0 - 2
Soft	2 - 4
Medium Stiff	4 - 8
Stiff	8 - 15
Very Stiff	15 - 30
Hard	> 30

Ref: Peck, Hansen, and Thornburn, 1974, "Foundation Engineering", Second Edition

Note: Only to be used (with caution) when pocket penetrometer or other data on undrained shear strength are unavailable. Not allowed by Caltrans Soil and Rock Logging and Classification Manual, 2010

CEMENTATION

Descriptor	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

Ref.: Caltrans Soil and Rock Logging Classification, and Presentation Manual (2010), with the exception of consistency of cohesive soils vs. N_{60}.

APPENDIX B – LABORATORY TEST RESULTS

APPENDIX B
LABORATORY TESTING

B.1 Introduction

Modified California drive samples and bulk samples were collected during the field explorations and transported to Group Delta's laboratory for further evaluation and testing. Tests were performed on selected samples in accordance with American Society for Testing and Materials (ASTM) as an aid in classifying the in-situ soils and to evaluate their engineering properties. Laboratory testing for this investigation included:

- Soil Classification: USCS (ASTM D2487) and Visual Manual (ASTM D2488)
- Moisture content (ASTM D2216) and Dry Unit Weight (ASTM D2937)
- Direct Shear (ASTM D3080)
- Expansion Index (ASTM D4829)
- Standard Compaction (ASTM D1557)
- R-Value (CTM-301)
- Grain-Size Distribution (ASTM D422)
- Soil Corrosivity:
    - Minimum Electrical Resistivity (ASTM G187)
    - pH (ASTM G51)
    - Water Soluble Chloride and Sulfate (ASTM D4327)

A brief description of the laboratory testing program and test results are presented below.

B.2 Soil Classification

The subsurface materials were classified visually in the field in accordance with ASTM Test Method D2488 and following Caltrans Soil and Logging Classification and Presentation Manual (2010). Soil classifications were modified as necessary based on further inspection and testing in the laboratory using the Unified Soil Classification System (ASTM D2487). The soil classifications are presented on the key for soil classification and on the boring logs in Appendix A.

B.3 Moisture Content and Dry Unit Weight

The natural moisture content and dry unit weight of selected ring samples were determined in general accordance with ASTM D2216 and ASTM D2937. Results of these tests are presented on the boring logs in Appendix A.

B.4 Direct Shear

Direct shear testing was performed on undisturbed ring samples in accordance with ASTM D3080. After the initial weight and volume measurements were made, the sample was placed in a calibrated shear machine and a selected normal load was applied. Each sample was then

saturated, allowed to consolidate, and then were sheared under a constant strain to failure. Shear stress and sample deformations were monitored throughout the test. The test results are presented in Figures B-1 to B-4.

B.5 Expansion Index

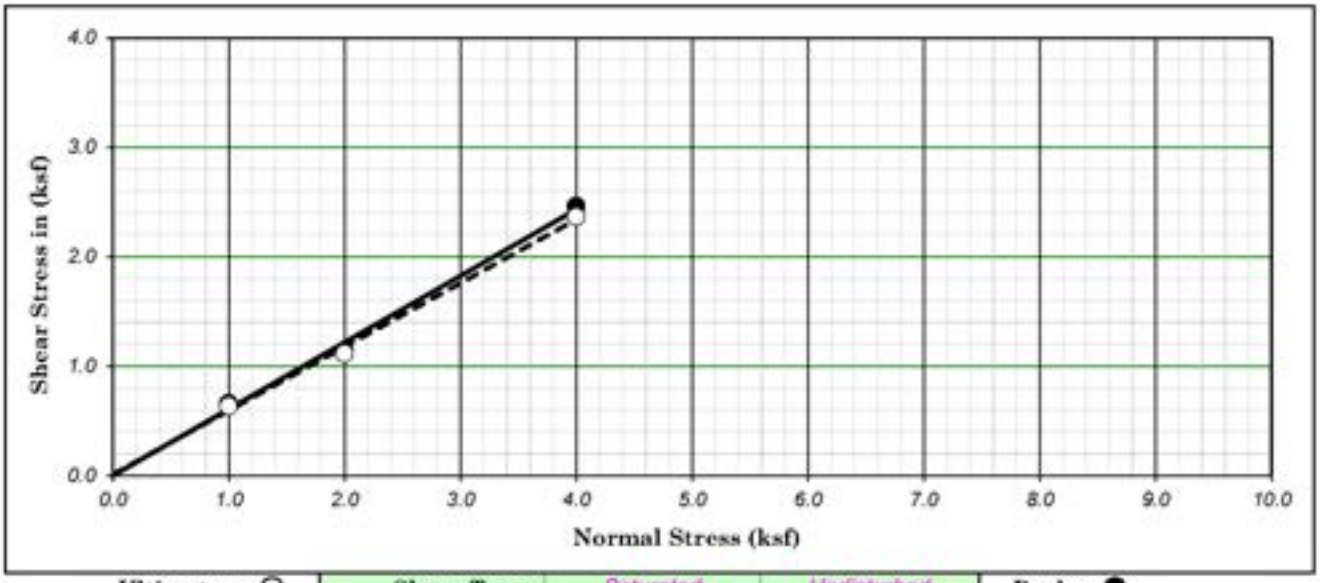
A representative bulk sample of the surficial soils was obtained and tested to evaluate the expansion potential of the in-situ earth materials. The bulk sample was collected from the upper 5 feet of the surficial soils. The test was conducted in accordance with ASTM D4829, and the result is presented in Figure B-5.

B.6 Standard Compaction

Compaction testing was performed on a selected bulk sample of the surficial soils in accordance with ASTM D1557. Specimens were prepared at different water contents and compacted. Dry densities were measured for each specimen. The optimum moisture content and maximum dry density were determined using the modified compacting effort. The test result is presented in Figure B-6.

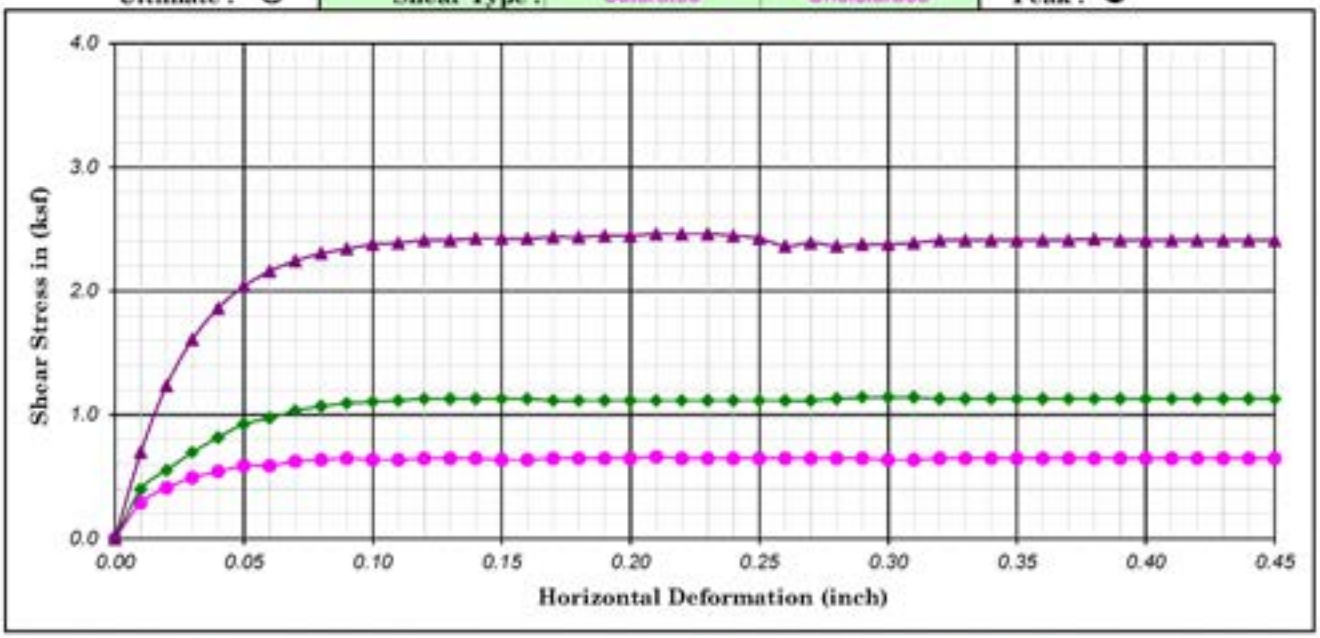
8.7 R-Value

R-value testing was performed on a representative bulk sample of the surficial soils. The R-Value test was performed in general accordance with CTM 301. The test measures the stiffness of a material in terms of its resistance to deformation when subjected to a vertical pressure and is used to determine the supporting characteristics of the subgrade soils for design of new pavement sections. The result is presented in Figure B-7.



8.8 Sieve Analyses

To assist in classification of the in-situ soils, mechanical sieve analyses were performed on split-spoon SPT samples to determine their grain size distributions (gradations). Testing was performed in general accordance with ASTM D422. The test results are presented in Figures B-8 to B-10.



B.10 List of Attached Figures

GREENHOUSE GAS TECHNICAL REPORT
FOR
THE ROW DTLA RESIDENTIAL PROJECT

I. Introduction

This Greenhouse Gas (GHG) Emissions Technical Study (Technical Study) has been prepared to evaluate potential construction and operational GHG emissions impacts associated with the ROW DTLA Residential Project (Project) pursuant to the California Environmental Quality Act (CEQA).

The Project is located at 757–787 S. Alameda Street, 1318–1396 E. 7th Street, 736–796 S. Central Avenue, 1301–1327 E. 8th Street, 700–760 S. Market Court, 720–746 S. Terminal Street, and 760 S. Warehouse Street in the Downtown Community Plan area of the City of Los Angeles (City), presently know as ROW DTLA (Project Site). The Project proposes the redevelopment of two existing surface parking lots (Development Area) into a mixed-use development located on the north and south sides of Center Street, on the eastern edge of the Project Site. The Project proposes three eight-story buildings that would provide 1,000 total residential units, including 114 Very Low Income units, and 6,547 square feet of commercial uses. The Project would provide up to 1,092 vehicle parking spaces and approximately 529 bicycle parking spaces. The Project is expected to be completed in 2032.

On November 24, 2021, the City Council certified the Citywide Housing Element 2021–2029 and Safety Element Updates Final Environmental Impact Report (EIR), SCH No. 2021010130, EIR No. ENV-2020-6762-EIR (Program EIR), to adopt the 2021–2029 Citywide Housing Element and the Updates to the Safety Element and the Plan for a Healthy LA (Health Element). Pursuant to CEQA Guidelines Sections 15168(c)(4) and 15168(d), Projects that are found to be within the scope of the program analyzed in the Program EIR and its environmental effects do not require further CEQA documentation. The GHG analysis below confirms that the Project would not result in significant GHG impacts that were not already examined in the Program EIR.

II. Project Location and Existing Uses

The Project Site consists of three large, irregularly shaped parcels that collectively measure approximately 31 acres in size. The Project Site occupies the northern half of the block bounded by E. 7th Street on the north, S. Central Avenue on the west, S. Alameda

Street on the east, and E. Olympic Boulevard to the south, with the partially vacated former E. 8th and Bay streets providing internal access within the middle of the block.

The Project Site is located in an expansive industrial district east of Downtown Los Angeles. The area surrounding the Project Site is primarily developed with warehouses, cold storage facilities, small-scale manufacturing operations, and other industrial uses, though in more recent years newer commercial office, commercial retail, and residential uses have been developed in the vicinity of the Site.

The Project Site is comprised of an industrial complex historically called the Los Angeles Union Wholesale Terminal, previously owned by the Southern Pacific Railroad, which currently encompasses a total of eight buildings, including seven large industrial buildings that were constructed between 1917 and 1923, and a parking garage constructed in 2016 (the District).

The portion of the Project Site along Central Avenue is used as a wholesale produce market and an outdoor weekend market known as Smorgasburg. The middle portion of the Site between 7th and 8th Street supports 46 retailers and restaurants and another 48 office and hybrid office/light manufacturing tenants which span multiple industries including technology, apparel, construction, produce wholesale and consumer goods, with the exception of 747 S. Alameda Street, which is currently vacant. The Project Site also includes a ten-story concrete parking structure that was built in 2016 and is accessed via S. Alameda Street. The parking structure contains approximately 3,884 parking spaces

The Development Area is located within the eastern portion of the Project Site along Alameda Street and is comprised of approximately 4.85 gross acres. The Development Area is currently developed with surface parking.

III. Project Description

The Project includes the development of three buildings containing 1,000 residential units including 114 Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings. Building A would include commercial space at the first floor; 410 residential units at the first through eighth floors; and two levels of subterranean parking. Building B would include 214 residential units at the first through eight floors and two levels of subterranean parking. Building C would include commercial space at the first floor; 376 residential units at the first through eighth floors; and two levels of subterranean parking. The proposed buildings would range from approximately 100 feet to 103 feet in height. Upon completion, 884,278 square feet of new floor would be provided. When accounting for the existing floor area to remain, approximately 2,477,695 square feet of floor area would be provided within the Project Site with a total FAR of 1.86:1.

The Project would include 1,092 vehicular parking spaces. A total of 96,278 square feet of open space would also be provided. The existing uses within the remainder of the Project Site outside of the Development Area will remain and would not be modified by the Project.

IV. Scope of Work

Consistent with the Housing Element Program EIR, the following analysis provides a discussion of global climate change, an evaluation of the Project's consistency with plans adopted for the reduction or mitigation of greenhouse gas (GHG) emissions, an inventory of the GHG emissions that would result from the Project, and an analysis of the potential impact of these GHGs.

Calculation worksheets, assumptions, and model outputs for the GHG analyses are included in Appendix GHG-3.

V. Environmental Impacts

A. Regulatory Framework

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding GHG emissions at the federal, state, regional, and local levels. These regulations are included as Appendix GHG-1.

B. GHG Methodology

Amendments to Section 15064.4 of the CEQA Guidelines were adopted to assist lead agencies in determining the significance of the impacts of GHG emissions. Consistent with existing CEQA practice, Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. If a qualitative analysis is used, this section recommends certain factors that may be used in the determination of significance (i.e., extent to which the project may increase or reduce GHG emissions compared to the existing environmental setting; whether the project exceeds an applicable significance threshold; and the extent to which the project complies with regulations or requirements adopted to implement a plan for the reduction or mitigation of GHGs). The amendments do not establish a threshold of significance; rather, lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including looking to thresholds developed by other public agencies, or suggested by other experts, such as CAPCOA, so long as any threshold chosen is supported by substantial evidence (see CEQA Guidelines Section 15064.7(c)). The California Natural Resources Agency has also clarified that the CEQA Guidelines amendments focus on the effects of GHG emissions

as cumulative impacts, and that they should be analyzed in the context of CEQA's requirements for cumulative impact analysis (see CEQA Guidelines Section 15064(h)(3)).[1]

The City has not adopted a numerical significance threshold for assessing impacts related to GHG emissions and has not formally adopted a specific local plan for reducing GHG emissions such as a CEQA-qualified Climate Action Plan. In addition, neither SCAQMD, OPR, CARB, CAPCOA, nor any other State or regional agency has adopted a numerical significance threshold for assessing GHG emission that is applicable to the Project. Since there is no applicable adopted or accepted numerical threshold of significance for GHG emissions, the analysis focuses on the Project's consistency with statewide, regional plans, and local initiatives adopted for the purpose of reducing and/or mitigating GHG emissions. The evaluation of consistency with such plans is the sole basis for determining the significance of the Project's GHG emissions-related impacts on the environment.

Notwithstanding, for informational purposes, the analysis also calculates the amount of GHG emissions that would be attributable to the Project using recommended air quality models, as described below. The primary purpose of quantifying the Project's GHG emissions is to satisfy State CEQA Guidelines Section 15064.4(a), which calls for a good-faith effort to describe and calculate emissions. The estimated emissions inventory is also used to determine if there would be a reduction in the Project's incremental contribution of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions. However, the significance of the Project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the Project.

(1) Consistency with GHG Reduction Plans and Regulations

The Project's GHG impacts were evaluated by assessing the Project's consistency with applicable statewide, regional, and local GHG reduction plans and strategies. The Project is evaluated for consistency with CARB's 2022 Scoping Plan, SCAG's 2020–2045 RTP/SCS, SCAG's 2024–2050 RTP/SCS, and the City's Green New Deal.

Appendix D, Local Actions, of the 2022 Scoping Plan includes "recommendations intended to build momentum for local government actions that align with the State's climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action

[1] *See generally California Natural Resources Agency, Final Statement of Reasons for Regulatory Action (December 2009), pp. 11–13, 14, 16; see also Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources, April 13, 2009.*

planning) and approval of new land use development projects, including through environmental review under the California Environmental Quality Act (CEQA)."[2]

OPR encourages lead agencies to make use of programmatic mitigation plans and programs from which to tier when they perform individual project analyses. On a statewide level, the 2022 Scoping Plan provides measures to achieve AB 32 and SB 32 targets.[3] On a regional level, SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS contains measures to achieve VMT reductions required under SB 375. The City does not have a programmatic mitigation plan to tier from, such as a Greenhouse Gas Emissions Reduction Plan as recommended in the relevant amendments to the CEQA Guidelines. The City's Green New Deal, although a mayoral initiative and not an adopted plan, includes short-term and long-term aspirations pertaining to climate change and this analysis addresses consistency with these strategies and goals. As the City does not have a CEQA-qualified CAP, projects are evaluated for consistency with GHG reduction plans including the Scoping Plan, SCAG's RTP/SCS, and the Green New Deal. Thus, if the Project is designed in accordance with these plans, policies, regulations, and requirements the Project would result in a less than significant impact, because it would be consistent with the overarching State, regional and local plans for GHG reduction (i.e., AB 32).

A consistency analysis is provided and describes the Project's compliance with the policies and objectives outlined in the applicable portions of the 2022 Scoping Plan, the 2020–2045 RTP/SCS, 2024–2050 RTP/SCS and the Green New Deal.

(2) Quantification of Emissions

In view of the above considerations, the Project's total annual GHG emissions have been quantified, taking into account the GHG emission reduction measures that would be incorporated into the Project's design. However, given the lack of a formally adopted numerical significance threshold or a formally adopted local plan for reducing GHG emissions applicable to this Project, the significance of the Project's GHG emissions has been assessed by comparing the Project's consistency with regulatory schemes such as CARB's Scoping Plan, SCAG's 2020–2045 RTP/SCS, SCAG's 2024–2050 RTP/SCS, and the City's Green New Deal, comparable to formally adopted local GHG emission reduction plans, that are designed to reduce GHG emissions by encouraging development located and designed to result in the efficient use of resources.

---

[2] *CARB, 2022 Scoping Plan, December 2022, Appendix D, p. 4.*

[3] *See Appendix GHG-1, Regulatory Framework for AB 32 and SB 32 targets.*

This Technical Report quantifies the Project's annual GHG emissions and compares them to a Project without Reduction Features scenario, as defined by CARB's most updated projections for AB/SB 32.[4]

As discussed above, this comparison is being done for informational purposes only and to disclose the relative carbon efficiency of the Project. The Project without Reduction Features scenario does not account for energy efficiency measures beyond Title 24 Building Standards Code or measures to reduce natural gas usage. The determination of the significance of the Project's GHG emissions is focused on the Project's consistency with plans and policies adopted to reduce GHG emissions, as explained in detail below. However, the Project without Reduction Features does take into account certain regulatory measures included in the 2022 Scoping Plan, the 2020–2045 RTP/SCS, the 2024–2050 RTP/SCS, and the Green New Deal.[5]

(3) Project GHG Emissions

The California Climate Action Registry (Climate Registry) General Reporting Protocol provides basic procedures and guidelines for calculating and reporting GHG emissions from a number of general and industry-specific activities.[6] The General Reporting Protocol is based on the "Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard" developed by the World Business Council for Sustainable Development and the World Resources Institute through "a multi-stakeholder effort to develop a standardized approach to the voluntary reporting of GHG emissions."[7] Although no numerical thresholds of significance have been developed, and no specific protocols are available for land use projects, the General Reporting Protocol provides a basic framework for calculating and reporting GHG emissions from the Project. The information provided in this section is consistent with the General Reporting Protocol's reporting requirements. A detailed discussion of the GHG methodology is included in Appendix GHG-2 of this Technical Report.

---

[4] *The comparison to a BAU scenario is not used as a threshold of significance, but is used to provide information and a quantitative metric to measure the Prcject's GHG emissions and level of reductions from Prcject Design Features and characteristics.*

[5] *The CalEEMod model does not account for all regulatory measures in the 2008 Climate Change Scoping Plan and subsequent updates. However, the analysis does take into account reductions due to Pavley I and LCFS as discussed in further detail below.*

[6] *California Climate Action Registry, General Reporting Protocol Version 3.1, January 2009.*

[7] *California Climate Action Registry, General Reporting Protocol Version 3.1, January 2009.*

The General Reporting Protocol and the USEPA recommend the separation of GHG emissions into three categories that reflect different aspects of ownership or control over emissions.[8] They include the following:

- Scope 1: Direct, onsite combustion of fossil fuels (e.g., natural gas, propane, gasoline, and diesel).
- Scope 2: Indirect, offsite emissions associated with purchased electricity or purchased steam or permitted sources (e.g., power plants).
- Scope 3: Indirect emissions associated with other emissions sources, such as third-party vehicles and embodied energy (e.g., energy used to convey, treat, and distribute water and wastewater).[9]

The General Reporting Protocol provides a range of basic calculations methods. However, the General Reporting Protocol calculations are typically designed for existing buildings or facilities. These retrospective calculation methods are not directly applicable to planning and development situations where buildings do not yet exist.

CARB recommends consideration of indirect emissions to provide a more complete picture of the GHG footprint of a facility. Annually reported indirect energy usage raises the awareness of conservation for a facility and provides information to CARB to be considered for future strategies.[10] For example, CARB has proposed requiring the calculation of direct and indirect GHG emissions as part of the AB 32 reporting requirements. Additionally, OPR has noted that lead agencies "should make a good-faith effort, based on available information, to calculate, model, or estimate … GHG emissions from a project, including the emissions associated with vehicular traffic, energy consumption, water usage and construction activities."[11] Therefore, direct and indirect emissions have been calculated for the Project.

A fundamental difficulty in the analysis of GHG emissions is the global nature of existing and cumulative future conditions. Changes in GHG emissions can be difficult to attribute to a particular planning program or project because the planning effort or project

[9] *Embodied energy is a scientific term that refers to the quantity of energy required to manufacture and supply to the point of use a product, material, or service.*

[10] *CARB, Initial Statement of Reasons for Rulemaking, Proposed Regulation for Mandatory Reporting of Greenhouse Gas Emissions Pursuant to the California Global Warming Solutions Act of 2006 (AB 32), Planning and Technical Support Division Emission Inventory Branch, October 19, 2007.*

[11] *OPR Technical Advisory, CEQA and Climate Change: Addressing Climate Change Through California Environmental Quality Act Review, June 2008, p. 5.*

may cause a shift in the locale for some type of GHG emissions (e.g. demolition of an existing building and construction of a new building in another location), rather than causing "new" GHG emissions. As a result, there is frequently an inability to conclude whether a project's GHG emissions represent a net global increase, reduction, or no change in GHGs that would exist if the project were not implemented. The analysis of the Project's GHG emissions is particularly conservative in that it assumes that all of the Project's GHG emissions are new additions to the atmosphere.

The California Emissions Estimator Model (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a variety of land use projects.[12] CalEEMod was developed in collaboration with the air districts of California, who provided data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) to account for local requirements and conditions. The model is considered by the SCAQMD to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.

(a) Construction

The Project's construction emissions were calculated using CalEEMod Version 2022.1. Details of the modeling assumptions and emission factors are provided in Appendix GHG-2 of this Technical Report. CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecast based on the construction assumptions included in Appendix GHG-3 of this Technical Report and applying the mobile-source emissions factors derived from CalEEMod.

The calculations of the emissions generated during Project construction activities reflect the types and quantities of construction equipment that would be used to remove existing buildings, grade and excavate the Project Site, construct the proposed buildings and related improvements, and plant new landscaping within the Project Site.

In accordance with SCAQMD's guidance, GHG emissions from construction were amortized (i.e., averaged annually) over the 30-year lifetime of the Project. As impacts from construction activities occur over a relatively short-term period of time, they contribute a relatively small portion of the overall lifetime project GHG emissions. In addition, GHG emission reduction measures for construction equipment are relatively limited. Therefore,

---

[12] *SCAQMD, CEQA Air Quality Modeling, www.aqmd.gov/home/rules-compliance/ceqa/air-quality-modeling, accessed January 23, 2025.y*

SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies.[13] Thus, total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

(b) Operation

Similar to construction, the SCAQMD-recommended CalEEMod is used to calculate potential GHG emissions generated by existing and new land uses on the Project Site, including area sources, electricity, natural gas, mobile sources, stationary sources (i.e., emergency generators), solid waste generation and disposal, and water usage/wastewater generation. CalEEMod default values for generation/usage rates, GHG emission factors, and greenhouse warming potential (GWP) values were used in the evaluation of operational GHG emissions from the Project.

Area source emissions include landscaping, natural gas combustion (e.g., restaurant cooking), and architectural coating activities. The emissions are based on the size of the land uses (e.g., square footage or dwelling unit), the GHG emission factors for fuel combustion, and the GWP values for the GHGs emitted.

Emissions of GHGs associated with electricity demand are based on the size of the land uses, the electrical demand factors for the land uses, the GHG emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. GHG emissions from electricity use are directly dependent on the electricity utility provider. The Project is located within the Los Angeles Department of Water and Power (LADWP) service area. In this case, GHG intensity factors for LADWP were selected in CalEEMod. The carbon intensity (lbs/MWh) for electricity generation was calculated for the Project buildout year based on LADWP projections for year 2032 (304 lbs. CO_2 per MWh) and for the existing baseline based on LADWP projections for year 2024 (467 lbs. CO_2 per MWh). LADWP's carbon intensity projections also take into account SB 100 and SB 350 RPS requirements for renewable energy.

As with electricity, the emissions of GHGs associated with natural gas combustion are based on the size of the land uses, the natural gas combustion factors for the land uses in units of million British thermal units (MMBtu), the GHG emission factors for natural gas combustion, and the GWP values for the GHGs emitted.

---

[13] *SCAQMD, Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, 2008.*

Mobile source GHG emissions are calculated based on emission factors and an estimate of the Project's annual VMT, which was provided in the Project's Transportation Assessment.[14] As discussed in Transportation Assessment, the Project VMT was derived from the LADOT VMT Calculator. The VMT Calculator was developed by the City and LADOT to comply with SB 743 which requires lead agencies to adopt VMT criteria to determine transportation related impacts. The LADOT-derived VMT values account for the daily and seasonal variations in trip frequency and length associated with new employee and visitor trips to and from the Project Site and other activities that generate a vehicle trip.

Stationary source GHG emissions are based on proposed stationary sources (i.e., emergency generators) that would be provided on the Project Site.

The emissions of GHGs associated with solid waste disposal are based on the Project's proposed land uses, the waste disposal rate for the land uses, the waste diversion rate, the GHG emission factors for solid waste decomposition as provided by CalEEMod, and the GWP values for the GHGs emitted.

The GHG emissions related to water usage and wastewater generation are based on the proposed land uses, the water demand factors, the electrical intensity factors for water supply, treatment, and distribution, electrical intensity factors for wastewater treatment, the GHG emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. CalEEMod uses electricity intensity factors obtained from the 2006 CEC report, "Refining Estimates of Water-Related Energy Use in California" which represent the amount of electricity needed to transport and treat water. Water usage factors were obtained from surveys conducted throughout California for various land uses. Project water consumption GHG emissions were then quantified based on electricity usage and carbon intensity factors specific to electricity providers described above.

The GHG emissions calculations for the Project include credits or reductions for consistency with applicable project design features set forth in this Technical Report. The analysis of Project GHG emissions with project design features at buildout also takes into account actions and mandates already approved and expected to be in force by Project buildout (e.g., 2022 Title 24 Standards, Pavley I Standards, full implementation of California's Statewide RPS beyond current levels of renewable energy, and the California LCFS).[15] It should be noted that GHG reductions due to LCFS are currently not incorporated into CalEEMod. The CalEEMod model incorporates emission factors from CARB's Emission

---

[14] *Gibson Transportation Consultants, Inc., Transportation Assessment for The ROW DTLA Residential Prcject, Los Angeles, California, March 2025.*

[15] *Actions and mandates are based on relevant year targets established by AB 32 and the current CARB Scoping Plan.*

FACtor model (EMFAC2021) emission factors, which are based on tailpipe emissions for combustion powered vehicles. The emissions benefits due to LCFS come from the production cycle (upstream emissions) rather than the combustion cycle (tailpipe). As a result, EMFAC2021 emission factors do not include benefits due to LCFS as emission factors are based on tailpipe emissions. As a conservative assumption, GHG emissions reductions resulting from the LCFS updates were not included in the Project's emissions inventory. In addition, as mobile source GHG emissions are directly dependent on the number of vehicle trips, a decrease in the number of Project-generated trips as a result of Project features (e.g., close proximity to transit) would provide a proportional reduction in mobile source GHG emissions compared to a generic project without such locational benefits. Calculation of Project emissions conservatively did not include actions and mandates that are not already in place but are anticipated to be enforced by Project buildout (e.g., Pavley II, which could further reduce GHG emissions from use of light-duty vehicles by 2.5 percent). Similarly, emissions reductions regarding the Cap-and-Trade Program were not included in this analysis. By not speculating on potential regulatory conditions, the analysis takes a conservative approach that likely overestimates the Project's GHG emissions at buildout because the State is expected to continue to implement a number of policies and programs aimed at reducing GHG emissions from the land use and transportation sectors to meet the State's long-term climate goals.

C. Greenhouse Gas Impacts

(1) Impact Determination in the Housing Element Program EIR

Impacts related to GHG were discussed in Section 4.6, Greenhouse Gas, of the Housing Element Program EIR. A summary of the analysis from Section 4.6, Greenhouse Gas, of the Housing Element Program EIR, is provided below.

With regard to Threshold (a), the Housing Element Program EIR (PEIR) did not make a determination of significance. However, the PEIR did provide an estimate of GHG emissions that would result from the Housing Element. The PEIR estimated that the Housing Element would result in 1,089,803 $MTCO_2e$ per year in 2029. Development consistent with the Housing Element would result in a population growth of approximately 1,168,509 persons resulting in an emissions rate per service population of 0.9 $MTCO_2e$ which is below the State per capita goal of 4.1 $MTCO_2e$. However, the PEIR specifically stated that this is not a threshold of significance.

The methodology used in the PEIR to calculate the per capita GHG emissions was based on a plan-level analysis which considers buildout of approximately 420,000 residential units. At a plan-level, the Housing Element Update would result in a reduction in VMT when taking into account development of approximately 420,000 residential units throughout the City. The per capita GHG emissions calculated in the PEIR were based on an incremental

change in trips and VMT when compared to a No Project condition. Based on this methodology, the PEIR concluded that development of approximately 420,000 residential units would result in a citywide reduction in vehicle trips and VMT in comparison to the No Project condition. As presented in Table 4.6-6 of the PEIR, implementation of the Housing Element Update would result in a net decrease in GHG emissions when compared to the No Project condition.

The Housing Element EIR acknowledged that at the individual project level, different methodologies would be used to calculate VMT and per capita GHG emissions. For comparison purposes, per capita GHG emissions were calculated for the Project using similar methodology contained in the Housing Element EIR. Mobile source emissions were conservatively assumed to be zero as implementation of the Housing Element Update would result in a net decrease in mobile source emissions. With regard to Threshold (b), the PEIR determined that the Housing Element Update would be consistent with the statewide programs adopted to achieve the statewide GHG reduction targets outlined in the CARB Scoping Plan, the three primary transportation land use strategies outlined in the SCAG'S Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and the applicable goals in the City's Green New Deal. Therefore, the Housing Element Update would result in less than significant impacts, and no mitigation measures would be required.

Impact Analysis

a. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less Than Significant Impact.[16] As discussed above, the City has not adopted a numerical significance threshold for assessing impacts related to GHG emissions and has not formally adopted a local plan for reducing GHG emissions. Further, neither SCAQMD, OPR, CARB, CAPCOA, nor other State or regional agencies have not adopted a numerical significance threshold for assessing GHG emission that is applicable to the Project. Since there is no applicable adopted or accepted numerical threshold of significance for GHG emissions, the analysis focuses on the Project's consistency with statewide, regional and local plans adopted for the purpose of reducing and/or mitigating GHG emissions, as discussed under GHG Threshold (b). The evaluation of consistency with such plans is the sole basis for determining the significance of the Project's GHG emissions-related impacts on the environment. Notwithstanding, for informational purposes, this analysis also calculates the amount of GHG emissions that would be attributable to the Project using recommended air quality models, as described below. The estimated emissions inventory is also used to determine if there would be a reduction in the Project's incremental contribution

[16] *The Less Than Significant Impact determination is based on the analysis included under GHG Threshold (b).*

of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions. However, the significance of the Project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the Project. A specific discussion regarding potential GHG emissions associated with the construction and operational phases of the Project is provided below.

Construction

GHG emissions from construction activities were forecasted using a reasonable estimate of construction schedule and phasing and applying published GHG emission factors. Construction emissions were calculated using the CalEEMod model. The output values used in this analysis were adjusted to be Project-specific, based on usage rates, type of fuel, and construction schedule. These values were then applied to the construction phasing assumptions used in the criteria pollutant analysis to generate GHG emissions values for each construction year.

Project construction is anticipated to occur over approximately 74 months, with completion anticipated by 2032. It is estimated that grading would require approximately 152,610 cubic yards of soil export.[17] A summary of construction details (e.g., schedule, equipment mix, and vehicular trips) and CalEEMod modeling input assumptions and output files are provided in Appendix GHG-3. The emissions of GHGs associated with construction of the Project were calculated for each year of construction activity. A summary of GHG emissions for each year of construction is presented in Table 1 on page 14.

As presented in Table 1, construction of the Project is estimated to generate a total of 7,829 metric tons of GHGs measured as an equivalent mass of carbon dioxide (CO_2e). As recommended by SCAQMD, the total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory.[18] Accordingly, when amortized, Project construction would generate an estimated 261 $MTCO_2e$ per year.

Operation

The Project would include new on-site residential and commercial uses. This would result in direct and indirect GHG emissions generated by the increase in vehicular trips, as well as operations associated with the proposed uses, including: (1) building operations:

emissions associated with space heating and cooling, water heating, and lighting; (2) water: emissions associated with energy used to pump, convey, treat, deliver, and re-treat water; and (3) solid waste: emissions associated with waste streams (embodied energy of materials). The Project would comply with the requirements of Title 24 and the Los Angeles Green Building Code, which would serve to reduce GHG emissions.

Operational emissions from the sources described above were estimated using CalEEMod in order to determine the net incremental increase in GHG emissions. Mobile source emissions are based on the vehicle emission factors from EMFAC and the Project's daily VMT included as Appendix GHG-3 of this Technical Report. The Project's daily VMT was calculated using the LADOT VMT Calculator. As shown in Table 2 on page 15, the Project, with implementation of the applicable regulatory requirements set forth in Title 24 and Los Angeles Green Building Code, including the use of LED lighting, would result in approximately 5,040 $MTCO_2e$ annually.

As discussed above, per capita GHG emissions calculated for the Housing Element DEIR were based on a plan-level analysis and resulted in a net decrease in mobile source emissions. As the Project would represent a portion of the total residential units to be

developed under the Housing Element Update, Project VMT and associated GHG emissions would contribute to the net reduction in GHG emissions based on a plan-level analysis. Based on this methodology, Project mobile source GHG emissions were conservatively assumed to be zero for purposes of calculating the Project's per capita GHG emissions.

The Project could generate a new residential population of approximately 2,354 persons which would result in an emissions rate per service population of 0.6 $MTCO_2e$ and would be less than the 0.9 $MTCO_2e$ goal set forth in the Housing Element. Therefore, the Project would be consistent with the PEIR with regards to per capita GHG emissions. However, as discussed in the PEIR, the service population capita goal is not a threshold of significance.

As pointed out above, there is no adopted numerical significance threshold for assessing impacts related to GHG emissions. The analysis under Threshold (b) below, which includes an evaluation of the Project's consistency with applicable plans, policies, or regulations adopted for the purpose of reduction GHG emissions, is, therefore, used to determine the significance of the Project's GHG emissions-related impacts on the

environment. **Based on the analysis under Threshold (b) below, which determines that the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases, the Project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment. As such, the impact under Threshold (a) would be less than significant. In addition, no new or greater significant impacts are anticipated under the Project compared to the Housing Element Update EIR.**

b. Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant Impact. As discussed above, in the absence of a quantifiable significant threshold for Greenhouse Gas Emissions Threshold (a), the following analysis is used to determine significance levels related to Greenhouse Gas Emissions Threshold (a) and Greenhouse Gas Emissions Threshold (b).

In September 2006, Governor Arnold Schwarzenegger signed the California Global Warming Solutions Act of 2006, also known as AB 32, into law. AB 32 commits the State to the following:

- By 2010, reduce to 2000 emission levels;
- By 2020, reduce to 1990 levels; and
- By 2050, reduce to 80 percent below 1990 levels.

AB 32 requires that CARB determine what the statewide GHG emissions level was in 1990 and approve a statewide GHG emissions limit that is equivalent to that level, to be achieved by 2020. Executive Order (EO) B-30-15, which was issued in April 2015 by Governor Brown, requires statewide GHG emissions to be reduced 40 percent below 1990 levels by 2030. SB 32, signed into law in September 2016, codifies the 2030 GHG reduction target in EO B-30-15. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.[19]

To achieve these goals, AB 32 mandates that CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce statewide GHG

[19] *Executive Order B-55-18 establishes a new statewide goal to achieve carbon neutrality no later than 2045 and achieve and maintain net negative emissions thereafter. Based on this executive order, CARB would work with relevant State agencies to develop a framework for implementation and accounting that tracks progress towards this goal, as well as ensuring future scoping plans identify and recommend measures to achieve the carbon neutrality goal.*

emissions from stationary sources, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved.

CARB approved a Climate Change Scoping Plan (2008 Scoping Plan) required by AB 32 in 2008.[20] The 2008 Scoping Plan proposes a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health."[21] The First Update to the AB 32 Scoping Plan (First Update), released on May 22, 2014, found that California is on track to meet the 2020 emissions reduction mandate established by AB 32 and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on track to reduce emissions to 80 percent below 1990 levels by 2050 if the State realizes the expected benefits of existing policy goals.[22]

In December 2017, CARB adopted the *2017 Climate Change Scoping Plan Update: The Strategy for Achieving California's 2030 Greenhouse Gas Target* (2017 Update).[23] The 2017 Update builds upon the successful framework established by the 2008 Scoping Plan and the First Update while identifying new, technologically feasible, and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health. The 2017 Update includes policies to require direct GHG reductions at some of the state's largest stationary sources and mobile sources. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade Program, which constraints and reduces emissions at covered sources.[24]

The California Attorney General's Office has taken an active role in addressing climate change in CEQA documents. The Attorney General's Office has created and routinely updates a Fact Sheet listing project design features to reduce greenhouse gas emissions.[25] The Attorney General's Office created the Fact Sheet primarily for the benefit of local

agencies processing CEQA documents, noting that "local agencies will help to move the State away from 'business-as-usual' and toward a low-carbon future." The Fact Sheet explains that the listed "measures can be included as design features of a project," but emphasizes that they "should not be considered in isolation, but as part of a larger set of measures that, working together, will reduce greenhouse gas emissions and the effects of global warming."

OPR recommended Amendments to the CEQA Guidelines for GHGs which were adopted on December 30, 2009. CEQA Guidelines Section 15064.4 was adopted to assist lead agencies in determining the significance of the impacts of GHGs. Consistent with the developing practice, this section of the CEQA Guidelines urges lead agencies to quantify GHG emissions of projects where possible and includes language necessary to avoid an implication that a "life-cycle" analysis is required. In addition to quantification, CEQA Guidelines Section 15064.4 recommends consideration of several other qualitative factors that may be used in the determination of significance (i.e., the extent to which the project may increase or reduce GHG emissions compared to the existing environment; whether the project exceeds an applicable significance threshold; and the extent to which the project complies with regulations or requirements adopted to reduce or mitigate GHGs).

CEQA Guidelines Section 15064.4 does not establish a threshold of significance; instead, lead agencies are called on to establish significance thresholds for their respective jurisdictions in which a lead agency may appropriately look to thresholds developed by other public agencies, or suggested by other experts, such as the California Air Pollution Control Officer's Association (CAPCOA), so long as any threshold chosen is supported by substantial evidence.[26] The CEQA Guidelines Amendments also clarify that the effects of GHG emissions are cumulative, and should be analyzed in the context of CEQA's requirements for cumulative impact analyses.[27]

Lead agencies must either establish significance thresholds for their respective jurisdictions or make a determination of significance on a case-by-case basis. The lead agency should use its "careful judgment" in making a determination of significance, and should make a "good-faith" effort to "describe, calculate or estimate" the amount of GHGs that will result from a project.[28,29] The lead agency is given the discretion to select a reasonable model and methodology to quantify GHGs and to rely on a qualitative analysis or performance based standards for its determination.[30] A lead agency should also consider

---

[26] *CEQA Guidelines Section 15064.7(c).*

[27] *CEQA Guidelines Section 15130 (1).*

[28] *CEQA Guidelines Section 15064.4(a).*

[29] *CEQA Guidelines Section 15064.4(a).*

[30] *CEQA Guidelines Section 15064.4(a)(1)-(2).*

the following factors, among others, when assessing the significance of impacts from GHGs: (1) the extent to which the project may increase or reduce GHGs; (2) whether the GHG emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, local plan for the reduction or mitigation of GHG emissions.[31]

CEQA Guidelines Section 15064 provides that a determination that an impact is not cumulatively considerable may rest on compliance with previously adopted plans or regulations, including plans or regulations for the reduction of GHG emissions.

As discussed above, no applicable numeric significance threshold for GHG emissions has been adopted by the State, SCAQMD, or the City of Los Angeles. Although state, regional, and local plans and policies have been adopted to help address climate change, no current law or regulation would regulate all aspects of the Project's GHG emissions. In the absence of any adopted numeric threshold, the significance of the Project's GHG emissions is evaluated consistent with CEQA Guidelines Section 15064.4(b)(2) by considering whether the Project complies with applicable plans, policies, regulations and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. For this Project, this analysis considers consistency with regulations or requirements set forth by the 2022 Scoping Plan, SCAG's 2020–2045 RTP/SCS, 2024–2050 RTP/SCS (RTP/SCS), and the City's Green New Deal.

A significant impact would occur if the Project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment by conflicting with applicable regulatory plans and policies to reduce GHG emissions as discussed within CARB's Scoping Plan and subsequent updates, SCAG's 2020–2045 RTP/SCS, SCAG's 2024–2050 RTP/SCS, and the City's Green New Deal. The analysis below describes the extent to which the Project complies with or exceeds the performance-based standards included in the regulations outlined in these plans. As shown herein, the Project would be consistent with the applicable GHG reduction plans and policies.

(2) CARB's Climate Change Scoping Plan

The Scoping Plan is a strategy CARB develops and updates at least once every five years, as required by AB 32. It lays out the transformations needed across various sectors to reduce GHG emissions and reach the State's climate targets. CARB published the Final 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update) in November 2022, as the third update to the original plan that was adopted in 2008. The initial

---

[31] *CEQA Guidelines Section 15064.4(b).*

Scoping Plan laid out a path to achieve the AB 32 2020 limit of returning to 1990 levels of GHG emissions, a reduction of approximately 15 percent below business as usual activities.[32] The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan Update assessed progress toward achieving the 2020 limit and made the case for addressing short-lived climate pollutants (SLCPs).[33] The second update, the 2017 Scoping Plan Update,[34] shifted focus to the newer Senate (SB) 32 goal of a 40 percent reduction below 1990 levels by 2030 by laying out a detailed cost-effective and technologically feasible path to this target, and also assessed progress toward achieving the AB 32 goal of returning to 1990 levels by 2020. The 2020 goal was ultimately reached in 2016, four years ahead of the schedule called for under AB 32.

The 2022 Scoping Plan Update is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve carbon neutrality by 2045 and to reduce anthropogenic GHG emissions to at least 85 percent below 1990 levels, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan.[35] The 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the 2022 Scoping Plan Update incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the 2022 Scoping Plan Update also includes discussion for the first time of the natural and working land sectors as sources for both sequestration and carbon storage, and as sources of emissions as a result of wildfires.

The 2022 Scoping Plan Update reflects existing and recent direction in the Governor's Executive Orders and Statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan. Included in Table 1-1 of the 2022 Scoping Plan is a summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan.

---

[32] *CARB. 2008. Climate Change Scoping Plan.*

[33] *CARB. 2014. First Update to the Climate Change Scoping Plan.*

[34] *CARB. 2017. California's 2017 Climate Change Scoping Plan.*

[35] *CARB, California's 2017 Climate Change Scoping Plan, 2017.*

Achieving the targets described in the 2022 Scoping Plan Update will require continued commitment to and successful implementation of existing policies and programs and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians. The Scoping Plan acknowledges that the path forward is not dependent on one agency, one state, or even one country. However, the State can lead by engaging Californians and demonstrating how action at the state, regional, and local levels of governments, as well as action at community and individual levels, can contribute to addressing the challenge.

Aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in the 2022 Scoping Plan Update is identified as critical to achieving the statutory targets for 2030 and 2045. The 2022 Scoping Plan Update discusses the role of local governments in meeting the State's GHG reductions goals. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority. The City has taken the initiative in combating climate change by developing programs and regulations such as the City's Green New Deal and Green Building Code.

Appendix D, Local Actions, of the 2022 Scoping Plan Update includes "recommendations intended to build momentum for local government actions that align with the State's climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action planning) and approval of new land use development projects, including through environmental review under the California Environmental Quality Act (CEQA)." (Page 4 of Appendix D.) The State encourages local governments to adopt a CEQA-qualified CAP addressing the three priority areas (transportation electrification, VMT reduction, and building decarbonization). However, as not all jurisdictions have sufficient resources (e.g., technical expertise, staffing, funding) to do so, jurisdictions that wish to take meaningful climate action (such as preparing a non-CEQA-qualified CAP or as individual measures) aligned with the State's climate goals in the absence of a CEQA-qualified CAP should also

look to the three priority areas when developing local climate plans, measures, policies, and actions. "By prioritizing climate action in these three priority areas, local governments can address the largest sources of GHGs within their jurisdiction." (Page 9 of Appendix D.)

The State also recognizes in Appendix D, Local Actions, of the Scoping Plan that each community or local area has distinctive situations and local jurisdictions must balance the urgent need for housing[36] while demonstrating that a Project is in alignment with the State's Climate Goals. The State calls for the climate crisis and the housing crisis to be confronted simultaneously. Jurisdictions should avoid creating targets that are impossible to meet as a basis to determine significance. Ultimately, targets that make it more difficult to achieve statewide goals by prohibiting or complicating projects that are needed to support the State's climate goals, like infill development, low-income housing, or solar arrays, are not consistent with the State's goals. The State also recognizes the lead agencies' discretion to develop evidence-based approaches for determining whether a project would have a potentially significant impact on GHG emissions.

To assist local jurisdictions, the 2022 Scoping Plan Update presents a non-exhaustive list of impactful GHG reduction strategies that can be implemented by local governments within the three priority areas (Priority GHG Reduction Strategies for Local Government Climate Action Priority Areas), which include Transportation Electrification, VMT Reduction, and Building Decarbonization.[37] A detailed assessment of how the Project would be consistent with the applicable goals, plans, and policies implemented by the City to support the GHG reduction strategies in the three priority areas is provided below.

Transportation Electrification

Convert local government fleets to zero-emission vehicles (ZEV): The City's Green New Deal (Sustainable City pLAn 2019) identifies a number of measures to reduce VMT and associated GHG emissions. Such measures that would support the local reduction strategy include converting all city fleet vehicles to zero emission where technically feasible by 2028. Starting in 2021, all vehicle procurement was required to follow a "zero emission first" policy for City fleets. The Green New Deal also establishes a target to increase the percentage of zero emission vehicles to 25 percent by 2025, 80 percent by 2035 and 100 percent by 2050. In order to achieve this goal, the City would build 20 publicly available Fast Charging Plazas throughout the City. The City would also install 28,000 publicly available chargers by 2028 to encourage adoption of ZEVs.

---

[36] *The State recognizes the need for 2.5 million housing units over the next eight years, with one million being affordable units. See page 20, Appendix D, 2022 Scoping Plan Update, November 2022.*

[37] *Table 1 of Appendix D, 2022 Scoping Plan Update, November 2022.*

The City's goals of converting the municipal fleet to zero emissions and installation of EV chargers throughout the City would be consistent with the Scoping Plan goals of transitioning to EVs. Although this measure mainly applies to City fleets, the Project would not conflict with these goals by installing EV chargers in at least 10 percent of total proposed residential parking spaces. Installation of additional EV chargers would encourage adoption of EVs.

Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide: The State has adopted AB 1236 and AB 970, which require cities to adopt streamline permitting procedures for EV charging stations. As a result, the City updated Section IX of the LAMC, Ordinance No. 187,719, which requires most new construction to designate 30 percent of new parking spaces as capable of supporting future EVSE. However, CALGreen 2022 has been updated to require 40 percent of total residential parking spaces be constructed as EV capable.[38] The City's ordinance also requires new residential construction to install EVSE at 10 percent of total residential parking spaces, which is consistent with CALGreen 2022 requirements. The City has also implemented programs to increase the amount of EV charging on city streets, EV carshare, and incentive programs for apartments to be retrofitted with EV chargers.

The City's goals of installing EV chargers throughout the City would be consistent with the Scoping Plan goals of transitioning to EVs. In addition, the Project would comply with the City's electric vehicle (EV) charging station ordinance, which includes the provision of at least 40 percent of residential parking spaces provided on the Project Site that are capable of supporting future electric vehicle supply equipment (EVSE) with 10 percent of the residential parking spaces equipped with EVSE to create electric vehicle (EV) charging stations.

VMT Reduction

Reduce or eliminate minimum parking standards in new developments and Implement parking pricing or transportation demand management pricing strategies: The City of Los Angeles Mobility Plan 2035 (Mobility Plan), which is the Transportation Element of the City's General Plan, contains measures and programs related to VMT reduction throughout the City. With regard to parking standards, Mobility Plan Program No. PK.13 and AB 2097 would reduce parking requirements for developments near transit (within half a mile), while Program No. PK.3 would allow for individualized parking requirements where businesses can identify parking demand and can reduce on-site parking with TDM strategies. These reduction strategies would serve to reduce minimum parking standards in order to reduce vehicle trips.

---

[38] *California Green Building Standards Code. Supplement Part 11. July 1, 2024.*

The Project would also implement TDM strategies that include providing bicycle parking to support alternative modes of transportation. Therefore, the Project would be consistent with and would not conflict with this reduction strategy to reduce parking standards.

Implement Complete Streets policies and investments, consistent with general plan circulation element requirements: The Mobility Plan established a "Complete Streets" planning framework which resulted in the City of Los Angeles Complete Streets Design Guide in 2015 consistent with California's Complete Streets Act of 2008. A supplemental update to the Complete Streets Design Guide was adopted in 2020. The Complete Streets Design Guide provides a number of measures to increase public access to electric shuttles, car sharing and walking. The Design Guide establishes guidelines for establishing on-street parking for car sharing. The City has also established BlueLA which is a car sharing network consisting of more than 100 electric vehicles located throughout the City. In addition, under the Green New Deal, the City would install 28,000 publicly available chargers by 2028 and introduce 135 new electric DASH buses.

This reduction strategy mainly applies to City traffic circulation. However, the Project would conform to all design element requirements which may affect public rights-of-way, including proper driveway alignment, adequate sidewalk widths, improved lighting elements, and landscaping design which does not hinder sight distance, mobility, or accessibility. Therefore, the Project would not conflict with implementation of Complete Streets policies.

Increase access to public transit by increasing density of development near transit, improving transit service by increasing service frequency, creating bus priority lanes, reducing or eliminating fares, microtransit, etc.; increase public access to clean mobility options by planning for and investing in electric shuttles, bike share, car share, and walking; amend zoning or development codes to enable mixed-use, walkable, transit-oriented, and compact infill development (such as increasing the allowable density of a neighborhood): These reduction strategies are supported through implementation of SB 375 which requires integration of planning processes for transportation, land-use and housing and generally encourages jobs/housing proximity, promotes transit-oriented development (TOD), and encourages high-density residential/ commercial development along transit corridors. To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020–2045 RTP/SCS, also referred to as Connect SoCal. The 2020–2045 RTP/SCS' "Core Vision" prioritizes the maintenance and management of the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets. The City has developed the Complete Streets Design Guide which provides a number of reduction strategies to increase public access to electric shuttles, car sharing and walking. In implementing the Mobility Plan, the City continues to build out networks for pedestrians, bicyclists, and transit users, has

implemented an EV car sharing network, and is working towards increasing publicly available chargers, and introducing new electric DASH buses.

The Project would represent an infill development within an existing urbanized area that would concentrate new development consistent with the overall growth pattern encouraged in the RTP/SCS. The Project's convenient access to public transit and opportunities for walking and biking would result in a reduction of vehicle trips, VMT, and GHG emissions. Specifically, the Project Site is located in a transit-rich neighborhood serviced by the Los Angeles County Metropolitan Transportation Authority (Metro) and LADOT bus lines within a City-designated TPA and SCAG-designated HQTA under the 2020–2045 RTP/SCS and SCAG-designated Priority Development Area (PDA [i.e., Neighborhood Mobility Area (NMA), Livable Corridor, Transit Priority Area(TPA)]) under the 2024–2050 RTP/SCS.[39] In addition, the Project Site's proximity to a variety of commercial uses and services would encourage residents and employees of the Project Site to walk to nearby destinations to meet their shopping needs, thereby reducing VMT and GHG emissions. Therefore, the Project would be consistent with these reduction strategies.

California continues to experience a severe housing shortage. The State must plan for more than 2.5 million residential units over the next eight years, and no less than one million of those residential units must be affordable to lower-income households.[40] This represents more than double the housing planned for during the last eight years.[41] The housing crisis and the climate crisis must be confronted simultaneously, and it is possible to address the housing crisis in a manner that supports the State's climate and regional air quality goals.[42] CAPCOA's Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (CAPCOA's Handbook) provides a VMT reduction measurement for incorporation of low-income housing. Measure T-4 (Integrate Affordable and Below Market Rate Housing) shows a 28.6 percent reduction in VMT for low-income units in comparison to market rate units.

The City's Housing Element of the General Plan provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The current RHNA goal for affordable housing within the City is approximately forty percent of new construction. However, the City's projections show affordable housing comprising twenty percent of new construction, which falls short of the forty percent RHNA

---

[39] *SCAG, 2024-2054 RTP/SCS, April 2024, Map 3.4 Priority Development Areas.*

[40] *California Department of Housing and Community Development. 2022. Statewide Housing Plan.*

[41] *Ibid.*

[42] *Elkind, E. N., Galante, C., Decker, N., Chapple, K., Martin, A., & Hanson, M. 2017. Right Type, Right Place: Assessing the Environmental and Economic Impacts of Infill Residential Development through 2030. Available at https://ternercenter.berkeley.edu/research-and-policy/right-type-right-place/.*

goal. In order to address this shortfall, the Housing Element identifies measures to encourage development of affordable housing such as revising density bonuses for affordable housing; identifying locations which are ideal for funding programs to meet low-income housing goals; and rezoning areas to encourage low-income housing. The Housing Element estimates that implementation of these measures would increase housing production at all income ranges compared to previous cycles.

The City's 40-percent goal of low-income housing for new construction is applicable on a citywide basis and not applicable to an individual project. The Planning Department's Housing Division found, based on market studies and experiences of other agencies, that mandating 20-percent affordable housing on individual projects is likely to reduce overall housing production, including low income housing, in the City and would be contrary to City and State policies. Pushing more housing outside of the City would be contrary to the Scoping Plan, as infill housing production in the City, which is a highly urbanized city with billions of dollars in transit infrastructure investments, and lower average VMT than the SCAG region, is called for in the 2022 Scoping Plan.

The Project would include up to 1,000 residential units comprised of 886 market rate units and 114 Very Low Income units, representing approximately 11.4 percent of the total proposed residential units. The Project represents an infill development in a highly urbanized area that is served by existing utilities and public services. Moreover, the Project is consistent with transit-supportive densities meeting the minimum requirement of 20 dwelling units per acre with a Project density of 183 dwelling units per acre.[43] The Project's affordable units would serve to support the City in its goal of increasing low-income housing for new construction on a citywide basis and would support reducing VMT.

Building Decarbonization

Adopt all-electric new construction reach codes for residential and commercial uses: The City has adopted an All-Electric Buildings Ordinance effective April 1, 2023, which will reduce GHG emissions related to natural gas combustion. Under this ordinance, all building permit applications for newly constructed buildings will be required to be all-electric with some exceptions such as cooking within restaurant uses. Space heating, water heating and cooking for non-restaurant uses would be required to be powered by electricity. In future years, the LADWP will be required to increase the amount of renewable energy in the power mix to comply with SB 100 requirements. The combination of the All-Electric ordinance and increasing availability of renewable energy will serve to reduce GHG emissions from sources traditionally powered by natural gas.

---

[43] *The minimum density for transit-supportive development is 20 residential du per acre.*

While this reduction strategy applies to the City, the Project would be required to comply with the City's All-Electric Building Ordinance and would not use natural gas except for cooking purposes in the restaurant uses which are exempt from the All-Electric Ordinance and would consist of a small portion of the total square footage. Therefore, the Project would be consistent and not conflict with the City's All-Electric Building Ordinance.

Adopt policies and incentive programs to implement energy efficiency retrofits for existing buildings, such as weatherization, lighting upgrades, and replacing energy-intensive appliances and equipment with more efficient systems (such as Energy Star-rated equipment and equipment controllers): This reduction strategy would support the Scoping Plan action regarding electrification of appliances in existing residential buildings (see Table 2-1 of the Scoping Plan). The City and Los Angeles Department of Water and Power (LADWP) have established rebate programs to promote use of energy-efficient products and home upgrades. Under LADWP's Consumer Rebate Program (CRP), residential customers would receive rebates for energy-efficient upgrades such as Cool Roofs, Energy Star Windows, HVAC upgrades, pool pumps and insulation upgrades. Such upgrades would serve to reduce wasteful energy and water usage and associated GHG emissions.

While this reduction strategy applies to the City, Project buildings will be designed and constructed in accordance with the LAMC and would include, as applicable, highly efficient HVAC systems; energy-efficient wall insulation and glazing units; and Energy Star–labeled appliances. Moreover, the Project would include energy saving technologies and appliances, water-efficient plantings with drought-tolerant species, and pedestrian- and bicycle-friendly design with short-term and long-term bicycle parking. Therefore, the Project would be consistent with and would not conflict with policies to implement energy efficiency retrofits.

(3) SCAG 2020–2045 RTP/SCS and 2024–2050 RTP/SCS

SCAG's 2020–2045 RTP/SCS, adopted on September 3, 2020, presents a long-term transportation vision through the year 2040 for the six-county region of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. The vision for the region incorporates a range of best practices for increasing transportation choices, reducing dependence on personal automobiles, further improving air quality, and encouraging growth in walkable, mixed-use communities with ready access to transit infrastructure and employment. More and varied housing types and employment opportunities would be located in and near job centers, transit stations and walkable neighborhoods where goods and services are easily accessible via shorter trips. To support shorter trips, people would have the choice of using neighborhood bike networks, car share or micro-mobility services like shared bicycles or scooters. For longer commutes, people would have expanded regional transit services and more employer incentives to carpool or vanpool. Other longer

trips would be supported by on-demand services such as microtransit, carshare, and citywide partnerships with ride hailing services. For those that choose to drive, hotspots of congestion would be less difficult to navigate due to cordon pricing, and using an electric vehicle will be easier thanks to an expanded regional charging network.

The goals and policies of SCAG's 2020–2045 RTP/SCS that focus on reducing VMT feature transportation and land use planning that include building infill projects, locating residents closer to where they work and play, and designing communities such that there is access to high quality transit service. Priority Growth Areas, which include HQTAs, Job Centers, TPAs, Livable Corridors, and Spheres of Influence (SOIs), will account for less than 4 percent of regional total land but are projected to accommodate 64 percent of future household growth and 74 percent of employment growth between 2020 and 2045. The 2020–2045 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in the region's PGAs, including HQTAs. HQTAs are a cornerstone of land use planning best practice in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

The 2024–2050 RTP/SCS does not use the HQTA designation as part of its Priority Development Areas (previously referred to as Priority Growth Areas), however, the project is located within a NMA, Livable Corridor, and TPA.[44] Neighborhood Mobility Areas include four elements that reflect potential to improve, restore and enhance safe and convenient connections to schools, hospitals, shopping, services, places of worship, parks, greenways and other destinations including: 1) intersection density, 2) low-speed streets, 3) land use diversity, and 4) accessibility to amenities within one mile using street network distances. Livable Corridors are defined as areas where local jurisdictions can plan and zone for increased density at nodes along key corridors and redevelop single-story underperforming retail with well-designed, higher-density housing and employment centers. TPAs are areas within one half mile of existing or planned major transit stops in the region. The Project is also located within a High Quality Transit Corridor (HQTC) per CA Public Resource Code Section 21155(b). The Project would improve mobility and accessibility, encourage transit use, and reduce VMT by intensifying urban density within a PDA and HQTC in proximity to transit and destinations; providing complementary new uses (i.e., multi-family residential and commercial uses) in proximity to other existing residential, office and retail uses; providing pedestrian and bicycle improvements; and implementing TDM strategies to reduce single-occupant travel.

---

[44] *SCAG, 2024-2054 RTP/SCS, April 2024, Map 3.4 Priority Development Areas.*

The 2020–2045 RTP/SCS and 2024–2050 RTP/SCS are expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.[45] Due to fuel economy and efficiency improvements, GHG emission rates of model year 2017 vehicles have decreased by 15 to 20 percent when compared to model year 2008 and earlier vehicles. However, for purposes of SB 375 emissions reduction targets, the fuel economy improvements have been largely excluded from the reduction calculation. The SB 375 target focuses on the amount of vehicle travel per capita.

In addition to demonstrating the region's ability to attain and exceed the GHG emission-reduction targets set forth by CARB, the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS outline a series of actions and strategies for integrating the transportation network with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. Thus, successful implementation of the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS would result in more complete communities with a variety of transportation and housing choices, while reducing automobile use.

Regarding individual developments, such as the Project, the strategies and policies set forth in the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS can be grouped into the following three categories: (1) reduction of vehicle trips and VMT; (2) increased use of alternative fuel vehicles; and (3) improved energy efficiency. The Project's consistency with these general categories of strategies and policies are each discussed below.

Consistency with Integrated Growth Forecast

The 2020–2045 RTP/SCS states that the SCAG region was home to about 18.8 million people in 2016 and currently includes approximately 6.0 million homes and 8.4 million jobs.[46] By 2045, the integrated growth forecast projects that these figures will increase by 3.7 million people, with nearly 1.6 million more homes and 1.6 million more jobs. HQTAs will account for 3 percent of regional total land but are projected to accommodate 46 percent and 50 percent of future household and employment growth respectively between 2012 and 2040. The overall land use pattern in the 2020–2045 RTP/SCS reinforces the trend of focusing new housing and employment in the region's HQTAs. HQTAs are a cornerstone of land use planning best practices in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional

life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

The 2024–2050 RTP/SCS states that the SCAG region was home to about 18.8 million people in 2019 and currently includes approximately 6.2 million homes and 9.0 million jobs.[47] By 2050, the population of the region is projected in the Plan to increase by two million people, or 11 percent, with an increase of 1.6 million housing units, or 26 percent, and 1.3 million jobs, or 14.2 percent.[48] TPAs, NMAs, and Livable Corridors will account for 8.2 percent of regional total land but are projected to accommodate 66 percent and 54 percent of future household and employment growth respectively between 2019 and 2050. The overall land use pattern in the 2024–2050 RTP/SCS reinforces the trend of focusing new housing and employment in the region's PDAs, specifically Livable Corridors and NMAs. Livable Corridors are a cornerstone of land use planning best practices in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability. Additionally, NMA's focus on reducing single occupancy vehicles and encouraging a complete streets approach in areas with a high number of intersections, low observed travel speed, high mix of uses and high accessibility to "everyday" destinations.

The Project includes the development of three buildings containing 1,000 residential units including 114 Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings. Upon completion, 884,278 square feet of new floor would be provided. The Project would increase the residential population as well as the daytime population (employees) within the Project Site. Specifically, based on the City's VMT Calculator Documentation, the Project could generate a new residential population of approximately 2,354 residents. The Project's 6,547 square feet of ground-floor commercial space would generate approximately 26 net new employees based on employee generation rates developed by the LADOT. With regard to consistency with growth projections of the 2020–2045 RTP/SCS, the Project would represent approximately 2.36 percent of the projected population growth in the SCAG region between 2024 and 2032 (i.e., the Project's baseline and buildout years) and approximately 0.03 percent of the projected employment growth in the SCAG Region between 2024 and 2032.[49,50] This increase in population and employees would be well within the existing population and employment projections for the community and region and would be able to be

---

[47] *2020–2045 RTP/SCS population growth forecast methodology includes data for years 2010, 2010, 2016, and 2045.*

[48] *SCAG, 2024-2054 RTP/SCS, April 2024, Page 12*

[49] *Project Residents (2,354) / City population increase (99,600) * 100% = 2.36%*

[50] *Project Employees (26) / City employee increase (82,900) * 100% = 0.03%*

accommodated by vacancies in the housing stock and new residential units currently being developed in the region. Furthermore, while the Project would generate jobs associated with construction of the Project, these employment opportunities would be short term opportunities during construction and are employment positions that circulate throughout the region based on the construction site. Therefore, due to the Project's minimal increase in population and employment in the City, the Project would be consistent with the demographic projections set forth in SCAG's 2020–2045 RTP/SCS.

. With regard to consistency with growth projections of the 2024–2050 RTP/SCS, the Project would represent approximately 1.02 percent of the projected population growth in the SCAG region between 2024 and 2032 (i.e., the Project's baseline and buildout years) and approximately 0.03 percent of the projected employment growth in the SCAG Region between 2024 and 2032. Therefore, the Project's contribution to population and employment growth would be also consistent with 2024–2050 RTP/SCS projections.

Consistent with SCAG's RTP/SCS alignment of transportation, land use, and housing strategies, the Project would provide residents and employees with convenient access to public transit, which would facilitate a reduction in VMT and corresponding vehicular GHG emissions. The Project would concentrate on new development within 0.5 mile (walking distance) of bus lines serviced by Metro and LADOT. Thus, residents and employees are provided with an alternative to single-occupant vehicle travel that would facilitate a reduction in VMT and corresponding vehicular GHG emissions. As such, the Project's location provides opportunities for the use of public transit to reduce vehicle trips. Moreover, the Project would represent a development within an existing urbanized area within a SCAG-designated HQTA under the 2020–2045 RTP/SCS and SCAG-designated PDA (i.e., NMA, Livable Corridor, and TPA), as well as an HQTC under the 2024–2050 RTP/SCS that would encourage housing development in transit-supportive and walkable areas to create more interconnected and resilient communities.

Consistency with VMT Reduction Strategies and Policies

The Project includes GHG-reducing strategies from the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS that are applicable to the Project. Specifically, the Project includes characteristics that are consistent with strategies identified in the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, and that would reduce Project trips and VMT as compared to the Project without implementation of VMT reducing measures within the Air Basin as measured by CalEEMod. Such characteristics and VMT reducing measures include developing a mix of residential and commercial uses near other residential and commercial uses, because in comparison, a similar project located further away from major residential centers or mass transit would not achieve a similar reduction in VMT. In addition, the Project would include EV parking at the Project Site reducing mobile source GHG emissions.

As discussed above, the Project represents an infill development within an existing urbanized area that would concentrate new residential uses within an 2020–2045 RTP/SCS HQTA and 2024–2050 RTP/SCS PDA, as well as an HQTC.. The Project Site is transit accessible and is close to the many bus transit lines, rail lines, and local shuttle service. Specifically, the Project is within 0.5-mile (walking distance) of Metro Bus Lines 16, 18, 53, 60, 62, 66, and 720, and LADOT DASH Bus service line A. Furthermore, in accordance with Ordinance No. 185,480, the Project would provide bicycle parking spaces as required by the LAMC, in addition to bicycle-serving amenities that would further encourage biking. These project features would further promote a reduction in VMT and subsequent reduction in GHG emissions, which would be consistent with the goals of SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS.

Increased Use of Alternative Fueled Vehicles Policy Initiative

The second category of strategies and policies of the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, regarding individual development projects, such as the Project, is to increase alternative fueled vehicles to reduce per capita GHG emissions. The 2020–2045 RTP/SCS and 2024–2050 RTP/SCS policy initiative focuses on providing charge port infrastructure and accelerating fleet conversion to electric or other near zero-emission technologies. The 2020–2045 RTP/SCS and 2024–2050 RTP/SCS policy initiatives focus on accelerating the deployment of a zero-emission transportation system. As discussed above, the Project Site would set aside parking spaces with EV charging equipment and spaces that support future EVSE. Therefore, the Project would support the alternative fueled vehicle policy initiative.

Energy Efficiency Strategies and Policies

The third category of strategies and policies of the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS for individual developments, such as the Project, involves improving energy efficiency (e.g., reducing energy consumption) to reduce GHG emissions. The 2020–2045 RTP/SCS goal is to actively encourage and create incentives for energy efficiency, where possible. The 2024–2050 RTP/SCS policy initiative focuses on exploring and advancing the transition toward zero-emission and clean technologies and other transformative technologies, where viable. All Project lighting systems would meet current Title 24 Energy Standards through use of LED bulbs which would reduce energy usage and, thereby, reduce associated greenhouse gas emissions and help minimize the impact on natural resources and infrastructure. The sustainability features to be incorporated into the Project would include, but not be limited to, reduction of outdoor water use; drip irrigation systems; and water-efficient landscape design, including California Friendly® plants or native plants, individual submetering for water use for commercial units, leak detection and monitoring systems, and ENERGY STAR certified residential clothes washers,. Restroom fixtures would also comply with the City of LA Green Building code which requires a 20-percent reduction in water usage based on the City of LA Plumbing Code, including high efficiency

toilets and low flow showerheads. The Project would also use LID techniques to minimize the amount of stormwater that leaves the Project Site. The Project would provide solar panels or one of the very narrow set of alternatives as required by Title 24. Furthermore, the Project would be subject to the 2022 Title 24 Standards. As discussed above, the Project would also comply with the City's EV charging station ordinance.

Land Use Assumptions

At the regional level, the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS are plans adopted for the purpose of reducing GHGs. To assess the Project's potential to conflict with the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, this Technical Report also analyzes the Project's land use assumptions for consistency with those utilized by SCAG in its Sustainable Communities Strategy. Generally, projects are considered consistent with the provisions and general policies of applicable City and regional land use plans and regulations, such as the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, if they are compatible with the general intent of the plans and would not preclude the attainment of their primary goals. The Project is consistent with the goals and principles set forth in the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS.

In sum, the Project is a land use development that is consistent with the RTP/SCS to reduce VMT and expand multi-modal transportation options in order for the region to achieve the GHG reductions from the land use and transportation sectors required by SB 375, which, in turn, advances the State's long-term climate policies.[51] By furthering implementation of SB 375, the Project would support regional land use and transportation GHG reductions consistent with state regulatory requirements. Therefore, the Project would be consistent with the GHG reduction-related actions and strategies contained in the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS. Overall, the Project would not conflict with the 2020–2045 RTP/SCS and 2024–2050 RTP/SCS, which are intended to reduce GHG emissions.

(4) City of Los Angeles Green New Deal

L.A.'s Green New Deal Sustainable City pLAn, a mayoral initiative, includes both short-term and long-term aspirations through the year 2050 in various topic areas, including: water, renewable energy, energy-efficient buildings, carbon and climate leadership, waste and landfills, housing and development, mobility and transit, and air quality, among others. While not a plan adopted solely to reduce GHG emissions, within L.A.'s Green New Deal climate change mitigation is one of eight explicit benefits that help define its strategies and goals. L.A.'s Green New Deal's specific targets include ensuring 57 percent of new housing units are built within 1,500 feet of transit by 2025 and 75 percent by 2035; reducing VMT per

[51] *As discussed above, SB 375 legislation links regional planning for housing and transportation with the GHG reduction goals outlined in AB 32.*

capita by at least 13 percent by 2025, 39 percent by 2035, and 45 percent by 2050; increasing the percentage of all trips made by walking, biking, micro-mobility/matched rides or transit to at least 35 percent by 2025 and 50 percent by 2035 and has established targets such as 100 percent renewable energy by 2045, installation of 10,000 publicly available EV chargers by 2022 and 28,000 by 2028, diversion of 100 percent of waste by 2050, and recycling 100 percent of wastewater by 2035.[52]

Although L.A.'s Green New Deal mainly targets GHG emissions related to City-owned buildings and operations, certain reductions associated with the Project would promote its goals. Such measures include increasing renewable energy usage, reduction of per capita water usage, promotion of walking and biking to work, promotion of high density housing close to major transportation stops, and various recycling and trash diversion goals. The Project would generally be consistent with these goals because it is an infill development within an existing urbanized area that would introduce housing and employment within a SCAG-designated HQTA under the 2020–2045 RTP/SCS and SCAG-designated PDA and HQTC under the 2024–2050 RTP/SCS and a City-designated TPA which is well served by public transportation. Furthermore, the Project would comply with the CALGreen Code, implement various project design features to reduce energy usage and would comply with the City of Los Angeles Solid Waste Management Policy Plan, the RENEW LA Plan, and the Exclusive Franchise System Ordinance (Ordinance No. 182,986) in furtherance of the targets included in L.A.'s Green New Deal with regard to energy-efficient buildings and waste and landfills. The Project would also meet LAMC bicycle parking requirements and would provide secure short- and long-term bicycle storage areas. Project design would also provide pedestrian access that minimizes barriers and links the Project Site with existing or planned external streets to encourage people to walk instead of drive. The Project would also use LED lighting to minimize use of electricity and would use native and drought-tolerant plant species in the landscaping to minimize water use. The Project would also provide parking spaces which are EV ready and with EV-charging stations to assist in the reduction of GHG emissions from vehicles. Installation of EV-charging stations would also be consistent with the L.A. Green New Deal goal of increasingly publicly available EV charging infrastructure. These EV charging stations would facilitate trips in zero emission vehicles, resulting in a reduction of GHG emissions.[53] Therefore, the Project would be consistent with and would not conflict with the City's Green New Deal.

(5) Housing Element Program EIR Policies

Also discussed above, the GHG section of the Housing Element Program EIR addressed consistency with a number of plans including the 2017 Scoping Plan, SB 375

---

[52] *City of Los Angeles, L.A.'s Green New Deal, Sustainable City pLAn, 2019 Targets, https://plan.lamayor.org/targets/targets_plan.html, accessed January 23, 2025.*

[53] *However, as a conservative assumption, the GHG analysis did not take credit for this reduction.*

(through demonstration of conformance with the 2020–2045 RTP/SCS), the Sustainable City pLAn and Green LA. The Housing Element Update includes the following policies relevant to reducing VMT and GHG Emissions:

> *Policy 1.1.6:* Allocate citywide housing targets across Community Plan areas in a way that seeks to address patters of racial and economic segregation, promote jobs/housing balance, provide ample housing opportunities, and affirmatively further fair housing.
>
> *Policy 1.3.1:* Prioritize housing capacity, resources, policies and incentives to include Affordable Housing in residential development, particularly near transit, jobs, and in Higher Opportunity Areas.
>
> *Policy 3.1.5:* Develop and implement environmentally sustainable urban design standards and pedestrian centered improvements in development of a project and within the public and private realm such as shade trees, parkways and comfortable sidewalks.
>
> *Objective 3.2:* Promote environmentally sustainable buildings and land use patterns that support a mix of uses, housing for various income levels and provide access to jobs, amenities, services and transportation options.
>
> *Policy 3.2.2:* Promote new multi-family housing, particularly Affordable and mixed income housing, in areas near transit, jobs and Higher Opportunity Areas, in order to facilitate a better jobs-housing balance, help shorten commutes, and reduce greenhouse gas emissions.
>
> *Policy 3.2.4:* Provide streamlining, incentives and flexibility to for residential buildings that promote energy and resource conservation particularly those that exceed existing green building standards.
>
> *Policy 3.2.5* Promote and facilitate reduction of water, energy, carbon and waste consumption in new and existing housing.
>
> *Policy 3.2.7* Provide environmentally sustainable development standards and incorporate sustainable best practice in building and zoning code updates.

With incorporation of these policies, the Housing Element Update would be consistent with the Scoping Plan actions and strategies for reducing GHG emissions in accordance with SB 32. Refer to Table 4.6-5 of the Housing Element Program EIR for a more detailed discussion of this consistency.

Conclusion

In conclusion, the Project would not conflict with the emission reduction measures discussed within CARB's Scoping Plan and subsequent updates, particularly their emphasis on the identification of emission reduction opportunities that promote economic growth while achieving greater energy efficiency and accelerating the transition to a low-carbon economy. In addition, as recommended by CARB's Scoping Plan and updates, the Project would use "green building" features consistent with the CALGreen Building Code.[54] As discussed above, the Project implement TDM strategies such as providing bicycle parking, supporting alternative modes of transportation as well as infill development which would reduce distance travelled for residents and employees, and Project impacts would not conflict with SCAG's 2020–2045 RTP/SCS and 2024–2050 RTP/SCS. Furthermore, as detailed above, the Project would use LED lighting to minimize use of electricity, use native and drought-tolerant plant species in the landscaping to minimize water use, and include EV ready and EV-charging stations to assist in the reduction of GHG emissions from vehicles. Moreover, the Project would include all electric appliances in the residential units. As such, the Project would be consistent and not conflict with the Sustainable City pLAn/L.A.'s Green New Deal.

Overall, the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. In addition, in the absence of adopted standards and established significance thresholds, and given this consistency, it is concluded that the Project would not generate GHG emissions that may have a significant impact on the environment. Thus, impacts relative to GHG Threshold (a) and GHG Threshold (b) would be less than significant. **In addition, no new or greater significant impacts are anticipated under the Project compared to the Housing Element Update EIR.**

D. Cumulative Impacts

Less Than Significant Impact. The California Natural Resources Agency (CNRA) released a technical advisory on CEQA and climate change that provided some guidance on assessing the significance of GHG emissions, and states that "lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice," and that while "climate change is ultimately a cumulative impact, not every individual project that emits GHGs must necessarily be found to contribute to a significant cumulative impact

[54] *The Prcject's GHG emissions inventory does not take into account future regulations and legislation to reduce GHG emissions to achieve carbon neutrality by 2045. However, for all the reasons described above, the Prcject would support the State's goals of Executive Order B-55-18 as well as AB 32 and SB 32 to achieve carbon neutrality by 2045.*

on the environment."[55] Furthermore, the OPR's technical advisory states that "CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated GHG emissions to a less than significant level as a means to avoid or substantially reduce the cumulative impact of a project."[56]

Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that would avoid or substantially lessen the cumulative problem within the geographic area of the project.[57] Therefore, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of a less than significant impact for GHG emissions if a project complies with adopted programs, plans, policies and/or other regulatory strategies to reduce GHG emissions.[58]

As demonstrated in the above analysis, the Project would be consistent with CARB's Climate Change Scoping Plan, particularly its emphasis on the identification of emission reduction opportunities that promote economic growth while achieving greater energy efficiency and accelerating the transition to a low-carbon economy. The Project would also be consistent with SCAG's 2020–2045 RTP/SCS' and 2024–2050 RTP/SCS' regulatory requirements to reduce regional GHG emissions from the land use and transportation sectors by 2035. Furthermore, the Project would generally comply with the intent of L.A.'s Green New Deal, which includes specific targets related to housing and development, and mobility and transit. Given the Project's consistency with statewide, regional, and local plans adopted for the reduction of GHG emissions, it is concluded that the Project's incremental contribution

[56] *Governor's Office of Planning and Research, Technical Advisory – CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review.*

[57] *14 CCR § 15064(h)(3).*

[58] *See, for example, San Joaquin Valley Air Pollution Control District, CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation, APR—2030 (June 25, 2014), in which the SJVAPCD "determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…" Further, the South Coast Air Quality Management District (SCAQMD) has taken this position in CEQA documents it has produced as a lead agency. The SCAQMD has prepared three Negative Declarations and one Draft Environmental Impact Report that demonstrate the SCAQMD has applied its 10,000 $MTCO_2e$/yr significance threshold in such a way that GHG emissions covered by the Cap-and-Trade Program do not constitute emissions that must be measured against the threshold. See SCAQMD, Final Negative Declaration for Ultramar Inc. Wilmington Refinery Cogeneration Project, SCH No. 2012041014 (October 2014); SCAQMD, Final Negative Declaration for Phillips 66 Los Angeles Refinery Carson Plant—Crude Oil Storage Capacity Project, SCH No. 2013091029 (December 2014); Final Mitigated Negative Declaration for Toxic Air Contaminant Reduction for Compliance with SCAQMD Rules 1420.1 and 1402 at the Exide Technologies Facility in Vernon, CA, SCH No. 2014101040 (December 2014); and Draft Environmental Impact Report for the Breitburn Santa Fe Springs Blocks 400/700 Upgrade Project, SCH No. 2014121014 (April 2014).*

to GHG emissions and their effects on climate change would not be cumulatively considerable. **For these reasons, the Project's cumulative contribution to global climate change is less than significant. In addition, no new or greater significant impacts are anticipated under the Project compared to the Housing Element Update EIR.**

Appendix GHG-1- Regulatory Framework

- Appendix GHG-1: Regulatory Framework

GHG Regulatory Framework

There are a number of plans, regulations, programs, and agencies that provide policies, requirements, and guidelines regarding GHG emissions at the federal, State, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Clean Air Act
- Federal Corporate Average Fuel Economy Standards
- Federal Energy Independence and Security Act
- California Air Resources Board
- California Greenhouse Gas Reduction Targets
- California Global Warming Solutions Act (AB 32)
- California Climate Change Scoping Plan
- California Cap-and-Trade Program
- California Emission Performance Standards
- California Renewables Portfolio Standard Program
- California Climate Crisis Act (AB 1279)
- California Pavley Standards
- California Low Carbon Fuel Standard
- California Advanced Clean Cars Regulations
- California Sustainable Communities and Climate Protection Act (SB 375)
- California Senate Bill 743
- California Executive Order N-79-20
- California Executive Order B-55-18
- California Appliance Efficiency Regulations
- California Title 24, Building Standards Code and California Green Building Standards Code
- California CEQA Guidelines
- South Coast Air Quality Management District

- Southern California Association of Governments Regional Transportation Plan/ Sustainable Communities Strategy
- L.A.'s Green New Deal
- City of Los Angeles Green Building Code
- City of Los Angeles All-Electric Buildings Ordinance
- City of Los Angeles Solid Waste Programs and Ordinances
- City of Los Angeles General Plan
- City of Los Angeles Housing Element (Housing Needs Assessment)
- City of Los Angeles Mobility Plan 2035
- City Of Los Angeles Traffic Study Policies and Procedures

(1) Federal

(a) Federal Clean Air Act

The USEPA is responsible for implementing federal policy to address GHGs. The United States Supreme Court (Supreme Court) ruled in *Massachusetts v. Environmental Protection Agency*, 127 S.Ct. 1438 (2007), that CO_2 and other GHGs are pollutants under the federal Clean Air Act (CAA), which the USEPA must regulate if it determines they pose an endangerment to public health or welfare. In December 2009, the USEPA issued an endangerment finding for GHGs under the CAA, setting the stage for future regulation.

The federal government administers a wide array of public-private partnerships to reduce the GHG intensity generated in the United States. These programs focus on energy efficiency, renewable energy, CH_4 and other non-CO_2 gases, agricultural practices, and implementation of technologies to achieve GHG reductions. The USEPA implements numerous voluntary programs that contribute to the reduction of GHG emissions. These programs (e.g., the ENERGY STAR labeling system for energy-efficient products) play a significant role in encouraging voluntary reductions from large corporations, consumers, industrial and commercial buildings, and many major industrial sectors.

(b) Corporate Average Fuel Economy (CAFE) Standards

In response to the *Massachusetts v. Environmental Protection Agency* ruling, President George W. Bush issued Executive Order 13432 in 2007, directing the USEPA, the United States Department of Transportation (USDOT), and the United States Department of Energy (USDOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. The National Highway Traffic Safety Administration (NHTSA) subsequently issued multiple final rules regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model years 2012–2016 and 2017–2021. In March 2020, the USDOT and the USEPA issued the final Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFE standards and tailpipe CO_2

emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026.[1] These standards set a combined fleet wide average of 36.9 to 37 miles per gallon (mpg) for the model years 2021 through 2026.[2] In February 2022, the USEPA issued the Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards.[3] This final rule revises current GHG standards for vehicles in model year 2023 through model year 2026 and establishes the most stringent GHG standards ever set for the light-duty vehicle sector that are expected to result in average fuel economy label values of 40 mpg, while the standards they replace (i.e., the SAFE rule standards) would achieve only 32 mpg in model year 2026 vehicles.[4]

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011 the USEPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the USEPA, this regulatory program would reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent nationwide over the 2010 baselines. Building on the first phase of standards, in August 2016, the USEPA and NHTSA finalized Phase 2 standards for medium and heavy-duty vehicles through model year 2027 that will improve fuel efficiency and cut carbon pollution. The Phase 2 standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons nationwide annually.[5]

(c) Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;

3 *USEPA, Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards: Regulatory Update Vol. 86, No. 248 Federal Register page 74434, December 30, 2021.*

4 USEPA, Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards: Regulatory Update, December 2021.

5 USEPA, EPA and NHTSA Adopt Standards to Reduce GHG and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles for Model Year 2018 and Beyond, August 2016.

- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and

- While superseded by the USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."[6]

(2) State

(a) California Air Resources Board

CARB, a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and State air pollution control programs within California. In this capacity, CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's State Implementation Plan (SIP), for which it works closely with the federal government and the local air districts. The SIP is required for the State to take over implementation of the federal CAA. Carb adopted the 2022 SIP in September 2022.[7] CARB also has primary responsibility for adopting regulations to meet the State's goal of reducing GHG emissions. The State has met its goals to reduce GHG emissions to 1990 levels by 2020.[8] Subsequent State goals include reducing GHG emissions to 40 percent below 1990 levels by 2030 and to 80 percent below 1990 levels by 2050.

(b) California Greenhouse Gas Reduction Targets

(i) Executive Order S-3-05

Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels;

---

[6] A green job, as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources.

[7] *CARB, 2022 State Implementation Program, https://ww2.arb.ca.gov/resources/documents/2022-state-strategy-state-implementation-plan-2022-state-sip-strategy, accessed January 9, 2025.*

[8] *CARB, Final 2022 Climate Change Scoping Plan (Chapter 1), adopted December 2022.*

- By 2020, California shall reduce GHG emissions to 1990 levels; and
- By 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

In accordance with Executive Order S-3-05, the Secretary of CalEPA is required to coordinate efforts of various agencies, which comprise the California Climate Action Team (CAT), in order to collectively and efficiently reduce GHGs. The CAT provides periodic reports to the Governor and Legislature on the state of GHG reductions in California, as well as strategies for mitigating and adapting to climate change.

The CAT stated that smart land use is an umbrella term for strategies that integrate transportation and land-use decisions. Such strategies generally encourage jobs/housing proximity, promote transit-oriented development (TOD), and encourage high-density residential/commercial development along transit corridors. These strategies develop more efficient land-use patterns within each jurisdiction or region to match population increases, workforce, and socioeconomic needs for the full spectrum of the population.

(ii) Executive Order B-30-15

On April 29, 2015, Governor Jerry Brown issued Executive Order B-30-15. Therein, the Governor directed the following:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030.
- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets.
- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO2e (MMTCO2e).

(iii) Executive Order B-55-18

Executive Order B-55-18, issued by Governor Jerry Brown in September 2018, establishes a new Statewide goal to achieve carbon neutrality as soon as possible, but no later than 2045, and achieve and maintain net negative emissions thereafter. Based on this executive order, CARB would work with relevant State agencies to develop a framework for implementation and accounting that tracks progress toward this goal, as well as ensuring future scoping plans identify and recommend measures to achieve the carbon neutrality goal.

In October 2020, CARB released a study, which evaluated three scenarios that achieve carbon neutrality in California by 2045. The study was used by CARB in development of the 2022 Scoping Plan.[9] More ambitious carbon reduction scenarios that

[9] Energy+Environmental Economics (E3), Achieving Carbon Neutrality in California, PATHWAYS Scenarios Developed for the California Air Resources Board, October 2020.

achieve carbon neutrality prior to 2045 may be considered as part of future analyses by the State.

The scenarios analyzed to achieve carbon neutrality include a High Carbon Dioxide Removal (CDR) scenario, Zero Carbon Energy scenario, and a Balanced scenario. The High CDR scenario achieves GHG reductions by relying on CO_2 removal strategies. The Zero Carbon Energy scenario is based on the assumption of zero-fossil fuel emissions by 2045. The Balanced scenario represents a middle point between the High CDR scenario and Zero Carbon Energy scenario. The scenarios would achieve at least an 80-percent reduction in GHGs by 2045, relative to 1990 levels. Remaining CO_2 would be reduced to zero by applying CO_2 removal strategies, including sinks from natural and working lands and negative emissions technologies, such as direct air capture.[10,11]

Under each of these scenarios, CARB proposed reduction strategies for various sectors that contribute GHG emissions throughout the State. Although specific details are not yet available for the GHG reduction measures discussed above, implementation of these measures would require regulations to be enforced by the State.

(c) California Global Warming Solutions Act of 2006

In 2006, the California State Legislature adopted Assembly Bill (AB) 32 (codified in the California Health and Safety Code (HSC), Division 25.5—California Global Warming Solutions Act of 2006), which focuses on reducing GHG emissions in California to 1990 levels by 2020, which the State has achieved. HSC Division 25.5 defines regulated GHGs as CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6 and represents the first enforceable Statewide program to limit emissions of these GHGs from all major industries, with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective. Under HSC Division 25.5, CARB has the primary responsibility for reducing GHG emissions. CARB is required to adopt rules and regulations directing State actions that would achieve GHG emissions reductions.

To achieve these goals, AB 32 mandates that CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce Statewide GHG emissions from stationary sources consistent with the CAT strategies, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. In order to achieve the reduction targets, AB 32 requires CARB to adopt rules and regulations in an open public process that achieve the maximum technologically feasible and cost-effective GHG reductions.[12]

---

[10] Sinks are defined as natural or artificial reservoirs that accumulate and store a carbon-containing chemical compound for an indefinite period.

[11] E3, Achieving Carbon Neutrality in California, PATHWAYS Scenarios Developed for the California Air Resources Board, October 2020, p. 22.

[12] CARB's list of discrete early action measures that could be adopted and implemented before January 1, 2010, was approved on June 21, 2007. The three adopted discrete early action measures are: (1) a low-carbon fuel standard, which reduces carbon intensity in fuels Statewide; (2) reduction of refrigerant losses from motor vehicle air conditioning system maintenance; and (3) increased methane capture from landfills, which includes requiring the use of state-of-the-art capture technologies.

In 2016, the California State Legislature adopted Senate Bill (SB) 32 and its companion bill AB 197, and both were signed by Governor Jerry Brown. SB 32 and AB 197 amend HSC Division 25.5, establish a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and include provisions to ensure that the benefits of State climate policies reach disadvantaged communities. The new goals outlined in SB 32 update the scoping plan requirement of AB 32 and involve increasing renewable energy use, imposing tighter limits on the carbon content of gasoline and diesel fuel, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

AB 197, signed September 8, 2016, is a bill associated with SB 32, which prioritizes efforts to cut GHG emissions in low-income and minority communities. AB 197 requires CARB to make available, and update at least annually, on its website the emissions of GHGs, criteria pollutants, and toxic air contaminants for each facility that reports to CARB and air districts. In addition, AB 197 adds two members of the Legislature to the CARB board as ex officio, non-voting members and creates the Joint Legislative Committee on Climate Change Policies to ascertain facts and make recommendations to the Legislature and the houses of the Legislature concerning the State's programs, policies, and investments related to climate change.

(a) Climate Change Scoping Plan

The Scoping Plan is a GHG reduction roadmap developed and updated by CARB at least once every five years, as required by AB 32. It lays out the transformations needed across various sectors to reduce GHG emissions and reach the State's climate targets. CARB adopted the Final 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) in December 2022, as the third update to the initial plan that was adopted in 2008. The initial 2008 Scoping Plan laid out a path to achieve the AB 32 target of returning to 1990 levels of GHG emissions by 2020, a reduction of approximately 15 percent below business as usual activities.[13] The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan Update (adopted in 2014) assessed progress toward achieving the 2020 target and made the case for addressing short-lived climate pollutants (SLCPs).[14] The 2017 Scoping Plan Update shifted the focus to the newer SB 32 goal of a 40-percent reduction below 1990 levels by 2030 by laying out a detailed cost-effective and technologically feasible path to this target, and also assessed progress toward achieving the AB 32 goal of returning to 1990 GHG levels by 2020. The 2020 goal was ultimately reached in 2016, four years ahead of the schedule called for under AB 32.

The 2022 Scoping Plan is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve new targets for carbon neutrality by 2045 and to reduce anthropogenic GHG emissions to at least 85 percent below 1990 levels, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below

---

13 CARB, Climate Change Scoping Plan: A Framework for Change, December 2008.

14 CARB, First Update to the Climate Change Scoping Plan: Building on the Framework, 2014.

1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan.[15] The 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the 2022 Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the 2022 Scoping Plan also includes discussion for the first time of the natural and working lands sectors as sources for both sequestration and carbon storage, and as sources of emissions as a result of wildfires. The estimated statewide GHG emissions with and without reduction measures in the 2022 Scoping Plan are provided in Table on page 8.

Table 1
Estimated Statewide Greenhouse Gas Emissions With and without Reduction Measures in the 2022 Scoping Plan

Emissions Scenario	GHG Emissions ($MMTCO_2e$)
2019	
2019 State GHG Emissions	404
2030	
2030 Business-As-Usual (BAU) Forecast	312
2030 GHG Emissions without Carbon Removal and Capture	233
2030 GHG Emissions with Carbon Removal and Capture	226
2030 Emissions Target Set by AB 32 (i.e., 1990 level by 2030)	260
Reduction below BAU necessary to achieve 1990 levels by 2030	52 (16.7%)[a]
2045	
2045 BAU Forecast	266
2045 GHG Emissions without Carbon Removal and Capture	72
2045 GHG Emissions with Carbon Removal and Capture	(3)

$MMTCO_2e$ = million metric tons of carbon dioxide equivalents; parenthetical numbers represent negative values.

[a] *312 – 260 = 52. 52 / 312 = 16.7%*

Source: CARB, Final 2022 Climate Change Scoping Plan, adopted December 2022.

The 2022 Scoping Plan reflects existing and recent direction in the Governor's Executive Orders and State Statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan.

Table on page 10 provides a summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan.

[15] CARB, California's 2017 Climate Change Scoping Plan, November 2017.

The 2022 Scoping Plan Scenario identifies the need to accelerate AB 32's 2030 target, from 40 percent to 48 percent below 1990 levels. The Cap-and-Trade Program continues to play a large factor in the reduction of near-term emissions for meeting the 2030 reduction target. Every sector of the economy will need to begin to transition in this decade to meet these GHG reduction goals and achieve carbon neutrality no later than 2045. The 2022 Scoping Plan approaches decarbonization from two perspectives, managing a phasedown of existing energy sources and technologies, as well as increasing, developing, and deploying alternative clean energy sources and technology. The Scoping Plan Scenario is summarized in Table 2-1 starting on page 72 of the Scoping Plan. It includes references to relevant statutes and executive orders, although it is not comprehensive of all existing new

Table 2
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
AB 1279 (Muratsuchi, Chapter 337, Statutes of 2022) *The California Climate Crisis Act*	AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that the Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies. This bill is implemented through the 2022 Scoping Plan.
SB 905 (Caballero, Chapter 359, Statutes of 2022) *Carbon Capture, Removal, Utilization, and Storage Program*	SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology. The bill requires CARB, on or before January 1, 2025, to adopt regulations creating a unified state permitting application for approval of CCUS and CDR projects. The bill also requires CNRA to publish a framework for governing agreements for two or more tracts of land overlying the same geologic storage reservoir for the purposes of a carbon sequestration project. The 2022 Scoping Plan modeling reflects both CCUS and CDR contributions to achieve carbon neutrality.
SB 846 (Dodd, Chapter 239, Statutes of 2022) *Diablo Canyon Powerplant: Extension of Operations*	SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant. The 2022 Scoping Plan explains the emissions impact of this legislation.
SB 1020 (Laird, Chapter 361, Statutes of 2022) *Clean Energy, Jobs, and Affordability Act of 2022*	SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040. It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified requirements. This bill requires the CPUC, California Energy Commission (CEC), and CARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability. The bill also modifies the requirement for CARB to hold a portion of its Scoping Plan workshops in regions of the state with the most significant exposure to air pollutants by further specifying that this includes communities with minority populations or low-income communities in areas designated as being in extreme federal non-attainment. The 2022 Scoping Plan describes the implications of this legislation on emissions.

Table (Continued)
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
SB 1137 (Gonzales, Chapter 365, Statutes of 2022) *Oil & Gas Operations: Location Restrictions: Notice of Intention: Health protection zone: Sensitive receptors*	SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires CARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.
SB 1075 (Skinner, Chapter 363, Statutes of 2022) *Hydrogen: Green Hydrogen: Emissions of Greenhouse Gases*	SB 1075 requires CARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen, and specifically the use of green hydrogen, in California; a description of strategies supporting hydrogen infrastructure, including identifying policies that promote the reduction of GHGs and short-lived climate pollutants; a description of other forms of hydrogen to achieve emission reductions; an analysis of curtailed electricity; an estimate of GHG and emission reductions that could be achieved through deployment of green hydrogen through a variety of scenarios; an analysis of the potential for opportunities to integrate hydrogen production and applications with drinking water supply treatment needs; policy recommendations for regulatory and permitting processes associated with transmitting and distributing hydrogen from production sites to end uses; an analysis of the life-cycle GHG emissions from various forms of hydrogen production; and an analysis of air pollution and other environmental impacts from hydrogen distribution and end uses. This bill would inform the production of hydrogen at the scale called for in the 2022 Scoping Plan.
AB 1757 (Garcia, Chapter 341, Statutes of 2022) *California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands*	AB 1757 requires the CNRA, in collaboration with CARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience. This bill also requires CARB to develop standard methods for state agencies to consistently track GHG emissions and reductions, carbon sequestration, and additional benefits from natural and working lands over time. These methods will account for GHG emissions reductions of CO_2, methane, and nitrous oxide related to natural and working lands and the potential impacts of climate change on the ability to reduce GHG emissions and sequester carbon from natural and working lands, where feasible. This 2022 Scoping Plan describes the next steps and implications of this legislation for the natural and working lands sector.
SB 1206 (Skinner, Chapter 884, Statutes of 2022) *Hydrofluorocarbon gases: sale or distribution*	SB 1206 mandates a stepped sales prohibition on newly produced high-GWP HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires CARB to develop regulations to increase the adoption of very low-GWP technologies (i.e., GWP < 10 and no-GWP) in sectors that currently rely on higher-GWP HFCs.

Table (Continued)
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
SB 27 (Skinner, Chapter 237, Statutes of 2021) *Carbon Sequestration: State Goals: Natural and Working Lands: Registry of Prcjects*	SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires CARB to establish specified CO_2 removal targets for 2030 and beyond as part of its Scoping Plan. Under SB 27, CNRA is tasked to establish and maintain a registry to identify projects in the state that drive climate action on natural and working lands and are seeking funding. CNRA also must track carbon removal and GHG emission reduction benefits derived from projects funded through the registry. This bill is reflected directly in the 2022 Scoping Plan as CO_2 removal targets for 2030 and 2045 in support of carbon neutrality.
SB 596 (Becker, Chapter 246, Statutes of 2021) *Greenhouse Gases: Cement Sector: Net- zero Emissions Strategy*	SB 596 requires CARB, by July 1, 2023, to develop a comprehensive strategy for the state's cement sector to achieve net-zero-emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. The bill establishes an interim target of 40 percent below the 2019 average GHG intensity of cement by December 31, 2035. Under SB 596, CARB must: • Define a metric for GHG intensity and establish a baseline from which to measure GHG intensity reductions. • Evaluate the feasibility of the 2035 interim target (40 percent reduction in GHG intensity) by July 1, 2028. • Coordinate and consult with other state agencies. • Prioritize actions that leverage state and federal incentives. • Evaluate measures to support market demand and financial incentives to encourage the production and use of cement with low GHG intensity. The 2022 Scoping Plan modeling is designed to achieve these outcomes.
Executive Order N-82-20	Governor Gavin Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed CARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy. Executive Order N-82-20 also calls on the CNRA, in consultation with other state agencies, to establish the California Biodiversity Collaborative (Collaborative). The Collaborative shall be made up of governmental partners, California Native American tribes, experts, business and community leaders, and other stakeholders from across the state. State agencies will consult the Collaborative on efforts to: • Establish a baseline assessment of California's biodiversity that builds upon existing data and can be updated over time. • Analyze and project the impact of climate change and other stressors in California's biodiversity.

Table (Continued)
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	• Inventory current biodiversity efforts across all sectors and highlight opportunities for additional action to preserve and enhance biodiversity. CNRA also is tasked with advancing efforts to conserve biodiversity through various actions, such as streamlining the state's process to approve and facilitate projects related to environmental restoration and land management. The California Department of Food and Agriculture (CDFA) is directed to advance efforts to conserve biodiversity through measures, such as reinvigorating populations of pollinator insects, which restore biodiversity and improve agricultural production. The Natural and Working Lands Climate Smart Strategy informs the 2022 Scoping Plan.
Executive Order N-79-20	Governor Gavin Newsom signed Executive Order N-79-20 in September 2020 to establish targets for the transportation sector to support the state in its goal to achieve carbon neutrality by 2045. The targets established in this Executive Order are: • 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035. • 100 percent of medium- and heavy-duty vehicles will be zero-emission by 2045 for all operations where feasible, and by 2035 for drayage trucks. • 100 percent of off-road vehicles and equipment will be zero-emission by 2035 where feasible. The Executive Order also tasked CARB to develop and propose regulations that require increasing volumes of zero-electric passenger vehicles, medium- and heavy-duty vehicles, drayage trucks, and off-road vehicles toward their corresponding targets of 100 percent zero-emission by 2035 or 2045, as listed above. The 2022 Scoping Plan modeling reflects these targets.
Executive Order N-19-19	Governor Gavin Newsom signed Executive Order N-19-19 in September 2019 to direct state government to redouble its efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy. This Executive Order instructs the Department of Finance to create a Climate Investment Framework that: • Includes a proactive strategy for the state's pension funds that reflects the increased risks to the economy and physical environment due to climate change. • Provides a timeline and criteria to shift investments to companies and industry sectors with greater growth potential based on their focus of reducing carbon emissions and adapting to the impacts of climate change. • Aligns with the fiduciary responsibilities of the California Public Employees' Retirement System, California State Teachers' Retirement System, and the University of California Retirement Program. Executive Order N-19-19 directs the State Transportation Agency to leverage more than $5 billion in annual state transportation spending to help reverse the trend of increased fuel consumption and reduce GHG emissions associated with the transportation sector. It also calls on the Department of General Services to leverage its management

Table (Continued)
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	and ownership of the state's 19 million square feet in managed buildings, 51,000 vehicles, and other physical assets and goods to minimize state government's carbon footprint. Finally, it tasks CARB with accelerating progress toward California's goal of five million ZEV sales by 2030 by: • Developing new criteria for clean vehicle incentive programs to encourage manufacturers to produce clean, affordable cars. • Proposing new strategies to increase demand in the primary and secondary markets for ZEVs. • Considering strengthening existing regulations or adopting new ones to achieve the necessary GHG reductions from within the transportation sector. The 2022 Scoping Plan modeling reflects efforts to accelerate ZEV deployment.
SB 576 (Umberg, Chapter 374, Statutes of 2019) *Coastal Resources: Climate Ready Program and Coastal Climate Change Adaptation, Infrastructure and Readiness Program*	Sea level rise, combined with storm-driven waves, poses a direct risk to the state's coastal resources, including public and private real property and infrastructure. Rising marine waters threaten sensitive coastal areas, habitats, the survival of threatened and endangered species, beaches, other recreation areas, and urban waterfronts. SB 576 mandates that the Ocean Protection Council develop and implement a coastal climate adaptation, infrastructure, and readiness program to improve the climate change resiliency of California's coastal communities, infrastructure, and habitat. This bill also instructs the State Coastal Conservancy to administer the Climate Ready Program, which addresses the impacts and potential impacts of climate change on resources within the conservancy's jurisdiction.
AB 65 (Petrie- Norris, Chapter 347, Statutes of 2019) *Coastal Protection: Climate Adaption: Prcject Prioritization: Natural Infrastructure: Local General Plans*	This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change. The bill requires the conservancy to provide information to the Governor's Office of Planning and Research (OPR) on any projects funded pursuant to the above provision to be considered for inclusion into the clearinghouse for climate adaptation information. The bill authorizes the conservancy to provide technical assistance to coastal communities to better assist them with their projects that use natural infrastructure.
Executive Order B-55-18	Governor Jerry Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter. Policies and programs undertaken to achieve this goal shall: • Seek to improve air quality and support the health and economic resiliency of urban and rural communities, particularly low-income and disadvantaged communities. • Be implemented in a manner that supports climate adaptation and biodiversity, including protection of the state's water supply, water quality, and native plants and animals. This Executive Order also calls for CARB to: • Develop a framework for implementation and accounting that tracks progress toward this goal.

Table (Continued)
Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan

Bill/Executive Order	Summary
	• Ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The 2022 Scoping Plan is designed to achieve carbon neutrality no later than 2045 and the modeling includes technology and fuel transitions to achieve that outcome.
SB 100 (De León, Chapter 312, Statutes of 2018) *California Renewables Portfolio Standard Program: emissions of greenhouse gases*	Under SB 100, the CPUC, CEC, and CARB shall use programs under existing laws to achieve 100 percent clean electricity. The statute requires these agencies to issue a joint policy report on SB 100 every four years. The first of these reports was issued in 2021. The 2022 Scoping Plan reflects SB 100 requirements with a few minor updates.
AB 2127 (Ting, Chapter 365, Statutes of 2018) *Electric Vehicle Charging Infrastructure: Assessment*	This bill requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million ZEV on California roads by 2030 and of reducing emissions of GHGs to 40 percent below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure. This bill supports the deployment of ZEVs as modeled in the 2022 Scoping Plan.
SB 30 (Lara, Chapter 614, Statutes of 2018) *Insurance: Climate Change*	This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure.
AB 2061 (Frazier, Chapter 580, Statutes of 2018) *Near-zero-emission and Zero-emission Vehicles*	Existing state and federal laws set specified limits on the total gross weight imposed on the highway by a vehicle with any group of two or more consecutive axles. Under existing federal law, the maximum gross vehicle weight of that vehicle may not exceed 82,000 pounds. AB 2061 authorizes a near-zero-emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds. This bill supports the deployment of cleaner trucks as modeled in this 2022 Scoping Plan.

Source: City of Los Angeles, 2025 and CARB, 2022 Scoping Plan for Achieving Carbon Neutrality, Table 1-1, December 2022.

authorities for directing or supporting the actions described.

Achieving the targets described in the 2022 Scoping Plan will require continued commitment to and successful implementation of existing policies and programs, and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians. The 2022 Scoping Plan acknowledges that the path forward is not dependent on one agency, one state, or even one country. However, the State can lead by engaging Californians and demonstrating how actions at the state, regional, and local levels of governments, as well as action at community and individual levels, can contribute to addressing the challenge.

Aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in the 2022 Scoping Plan is identified as critical to achieving the statutory targets for 2030 and 2045. The 2022 Scoping Plan discusses the role of local governments in meeting the State's GHG reductions goals. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements, and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority. The City has taken the initiative in combating climate change by developing programs and regulations, such as the L.A.'s Green New Deal and the Los Angeles Green Building Code. Each of these is discussed further below.

(e) Cap-and-Trade Program

The Climate Change Scoping Plan identified a Cap-and-Trade Program as one of the strategies California would employ to reduce GHG emissions. CARB asserts that this program will help put California on the path to meet its goal of ultimately achieving an 80-percent reduction from 1990 levels by 2050. Under the Cap-and-Trade Program, an

overall limit on GHG emissions from capped sectors was established, and facilities subject to the cap will be able to trade permits to emit GHGs.

CARB designed and adopted a California Cap-and-Trade Program[16] pursuant to its authority under AB 32. The Cap-and-Trade Program was designed to reduce GHG emissions from public and private major sources (deemed "covered entities") by setting a firm cap on Statewide GHG emissions and employing market mechanisms to achieve the State's emission-reduction mandates. The Statewide cap for GHG emissions from the capped sectors[17] (e.g., electricity generation, petroleum refining, and cement production) commenced in 2013 and will decline over time, as GHG emission reductions are continually achieved throughout the Program's duration.

Under the Cap-and-Trade Program, CARB issues allowances equal to the total amount of allowable emissions over a given compliance period and distributes these to regulated entities. Covered entities that emit more than 25,000 $MTCO_2e$ per year must comply with the Cap-and-Trade Program.[18] Triggering of the 25,000 $MTCO_2e$ per year "inclusion threshold" is measured against a subset of emissions reported and verified under the California Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (Mandatory Reporting Rule or MRR).[19]

Each covered entity with a compliance obligation is required to surrender "compliance instruments"[20] for each MTCO2e of GHG they emit. Covered entities are allocated free allowances in whole or part (if eligible), and can buy allowances at auction, purchase allowances from others, or purchase offset credits.

The Cap-and-Trade Program provides a firm cap, ensuring that the Statewide emission limits will not be exceeded. In sum, the Cap-and-Trade Program will achieve aggregate, rather than site-specific or project-level, GHG emissions reductions. Also, due to the regulatory framework adopted by CARB in AB 32, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State's emissions forecasts and the effectiveness of direct regulatory measures.

The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported.[21] Accordingly, for projects that are subject to the CEQA, GHG emissions from electricity consumption are

---

16 California Code of Regulations 17, Sections 95800–96023.

17 California Code of Regulations 17, Sections 95811, 95812.

18 California Code of Regulations 17, Section 95812.

19 California Code of Regulations 17, Sections 95100–95158.

20 Compliance instruments are permits to emit, the majority of which will be "allowances," but entities also are allowed to use CARB-approved offset credits to meet up to 8 percent of their compliance obligations.

21 California Code of Regulations 17, Section 95811(b).

covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Cap-and-Trade Program's first compliance period.[22]

The Cap-and-Trade Program applies to emissions that cover approximately 80 percent of the State's GHG emissions. Demonstrating the efficacy of AB 32 policies, California achieved its 2020 GHG reduction target four years earlier than mandated. The largest reductions were the result of increased renewable electricity in the electricity sector, which is a covered sector in the Cap-and-Trade Program.

AB 398 was enacted in 2017 to extend and clarify the role of the State's Cap-and-Trade Program through December 31, 2030. As part of AB 398, refinements were made to the Cap-and-Trade Program to establish updated protocols and allocation of proceeds to reduce GHG emissions.

(i) Energy-Related (Stationary) Sources

(i) Emission Performance Standards

SB 1368, signed on September 29, 2006, is a companion bill to AB 32, which requires the CPUC and the CEC to establish GHG emission performance standards for the generation of electricity. These standards also generally apply to power that is generated outside of California and imported into the State. SB 1368 provides a mechanism for reducing the emissions of electricity providers, thereby assisting CARB to meet its mandate under AB 32.

(ii) Renewables Portfolio Standard

SB 1078 (Chapter 516, Statutes of 2002) required retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017 as a Renewables Portfolio Standard (RPS). Subsequent amendments provided additional targets throughout the years. On October 7, 2015, SB 350 (Chapter 547, Statues of 2015), also known as the Clean Energy and Pollution Reduction Act, further increased the RPS to 50 percent by 2030. The legislation also included interim targets of 40 percent by 2024 and 45 percent by 2027. SB 350 also requires the state to double Statewide energy efficiency savings in electricity and natural gas end uses by 2030 in comparison to 2015. The 2017 Scoping Plan incorporated the SB 350 standards and estimated the GHG reductions would

22 California Code of Regulations 17, Sections 95811, 95812(d).

account for approximately 21 percent of the Scoping Plan reductions.[23] On September 10, 2018, SB 100 provided updated RPS targets of 44 percent by 2024, 52 percent by 2027, and 60 percent by 2030, and instructed that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by 2045.[24]

(iii) Assembly Bill 1279 (The California Climate Crisis Act)

The California Legislature enacted AB 1279,[25] the California Climate Crisis Act, on September 16, 2022. AB 1279 establishes the policy of the State to achieve net zero GHG emissions, carbon neutrality,[26] as soon as possible, but no later than 2045 and achieve and maintain net negative GHG emissions thereafter. Additionally, AB 1279 ensures that by 2045 Statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. SB 1279 also requires CARB to ensure that the 2022 Scoping Plan identified and recommended measures to achieve carbon neutrality and to identify and implement policies and strategies for CO_2 removal solutions and carbon capture, utilization, and storage technologies. It also requires CARB to submit an annual report on progress in achieving the 2022 Scoping Plan's goals.

(g) Mobile Sources

(i) Pavley Standards

AB 1493 (Chapter 200, Statutes of 2002), enacted on July 22, 2002, required CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. In 2004, CARB approved the Pavley regulation to require automakers to control GHG emissions from new passenger vehicles for the 2009 through 2016 model years. Upon adoption of subsequent federal GHG standards by the USEPA that preserved the benefits of the Pavley regulations, the Pavley regulations were revised to accept compliance with the federal standards as compliance with California's standards in the 2012 through 2016 model years. This is referred to as the "deemed to comply" option.

---

23 CARB, California's 2017 Climate Change Scoping Plan, Table 3, p. 31, November 2017. Calculated as: (108 – 53) / 260 = 21 percent.

24 California Legislative Information, SB-100 California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases.

25 California Legislative Information, AB 1279 The California Climate Crisis Act, 2022.

26 Carbon neutrality means "net zero" emissions of GHGs. In other words, it means that GHG emissions generated by sources such as transportation, power plants, and industrial processes must be less than or equal to the amount of carbon dioxide that is stored, both in natural sinks and through mechanical sequestration. AB 1279 uses the terminology net zero and the 2022 Scoping Plan uses the terminology carbon neutrality or carbon neutral. These terms mean the same thing and are used interchangeably.

In January 2012, CARB approved GHG emission regulations, which require further reductions in passenger GHG emissions for 2017 and subsequent vehicle model years. As noted above, in August 2012, the USEPA and USDOT adopted GHG emission standards for model year 2017 through 2025 vehicles.[27] On November 15, 2012, CARB approved an amendment that allows manufacturers to comply with the 2017–2025 national standards to meet State law. Automobile manufacturers generally comply with these standards through a combination of improved energy efficiency in vehicle equipment (e.g., air conditioning systems) and engines, as well as sleeker aerodynamics, use of strong but lightweight materials, and lower-rolling resistance tires.[28]

In 2018, the USEPA proposed the Safer Affordable Fuel-Efficient Vehicles Rule (SAFE), which would roll back fuel economy standards and revoke California's waiver. The rule amended certain average fuel economy and GHG standards for passenger cars covering model years 2021 through 2026. On March 30, 2020, the SAFE Rule was finalized and published in the Federal Register, commencing a review period. Subsequent legal challenges from a coalition of states, including California, and private industry groups were issued. However, in December 2021, the NHTSA repealed the SAFE Vehicle Rule Part One. Although the SAFE Vehicle Rule Part One has been repealed, GHG modeling contained in regional plans, such as SCAG's 2020–2045 RTP/SCS, have not been updated to account for this repeal.

Subsequently, on March 20, 2024, USEPA announced new, more protective final standards to further reduce harmful air pollutant emissions from light-duty and medium-duty vehicles starting with model year 2027. The final rule builds upon USEPA's standards for federal GHG emissions standards for passenger cars and light trucks for model years 2023 through 2026, established in 2021. These standards will phase in over model years 2027 through 2032.

(ii) California Low Carbon Fuel Standard

Executive Order S-01-07 was enacted by Governor Arnold Schwarzenegger on January 18, 2007. The order mandates the following: (1) that a Statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020 from a 2010 baseline; and (2) that a Low Carbon Fuel Standard (LCFS) for transportation fuels be established in California. The final regulation was approved by the State's Office of Administrative Law and filed with the Secretary of State on January 12, 2010; the LCFS became effective on the same day. In September 2015,

---

27 USEPA, 2017 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions and Corporate Average Fuel Economy Standards, 2012.

28 CARB, California's Advanced Clean Cars Midterm Review, pp. ES-17, C-9.

CARB approved the re-adoption of the LCFS, which became effective on January 1, 2016, to address procedural deficiencies in the way the original regulation was adopted.[29]

The development of the 2017 Scoping Plan Update identified LCFS as a regulatory measure to reduce GHG emissions to meet the 2030 emissions target. In September 2018, the standards were amended by CARB to require a 20-percent reduction in carbon intensity by 2030, aligning with California's 2030 targets set by SB 32.[30]

(iii) Advanced Clean Cars Regulations

In 2012, CARB approved the Advanced Clean Cars program, an emissions-control program for model years 2015–2025.[31] The components of the Advanced Clean Cars program include the Low-Emission Vehicle (LEV) regulations that reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles, and the ZEV regulation, which requires manufacturers to produce an increasing number of pure ZEVs (meaning battery electric and fuel cell electric vehicles), with provisions to also produce plug-in hybrid electric vehicles (PHEV) in the 2018 through 2025 model years.[32] During the March 2017 midterm review, CARB voted unanimously to continue with the vehicle GHG emission standards and the ZEV program for cars and light trucks sold in California through 2025.[33]

In addition, Governor Gavin Newsom signed an executive order (Executive Order No. N-79-20) on September 23, 2020, that would phase out sales of new gas-powered passenger cars by 2035 in California with an additional 10-year transition period for heavy vehicles. The State would not restrict used car sales or forbid residents from owning gas-powered vehicles. In accordance with the executive order, the 2020 Mobile Source Strategy, a comprehensive analysis that presents scenarios for possible strategies to reduce the carbon, toxic and unhealthy pollution from cars, trucks, equipment, and ships, was developed by CARB. The strategies will provide important information for numerous regulations and incentive programs going forward by conveying what is necessary to address the aggressive emission reduction requirements.

31 CARB, Advanced Clean Cars Program, About, ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/about, accessed January 9, 2025.

32 CARB, Advanced Clean Cars Program, About, ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/about, accessed January 9, 2025.

33 CARB, News Release: CARB finds vehicle standards are achievable and cost-effective, ww2.arb.ca.gov/news/carb-finds-vehicle-standards-are-achievable-and-cost-effective, accessed January 9, 2025.

The primary mechanism for achieving the ZEV target for passenger cars and light trucks is CARB's Advanced Clean Cars II (ACC II) Program. The ACC II regulations focus on post-2025 model year light-duty vehicles, as requirements are already in place for new vehicles through the 2025 model year. The rulemaking for ACC II regulations was adopted on November 30, 2022.

(iv) Sustainable Communities and Climate Protection Act (SB 375)

The Sustainable Communities and Climate Protection Act of 2008, or SB 375 (Chapter 728, Statutes of 2008), which was adopted by the State on September 30, 2008, establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions. SB 375 finds that the "transportation sector is the single largest contributor of greenhouse gases of any sector."[34] Under SB 375, CARB is required, in consultation with the Metropolitan Planning Organizations (MPOs), to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. SCAG is the MPO in which the City of Los Angeles is located. CARB set targets for 2020 and 2035 for each of the 18 MPO regions in 2010 and updated them in 2018.[35] In March 2018, CARB updated the SB 375 targets for the SCAG region to require an 8-percent reduction by 2020 and a 19-percent reduction by 2035 in per capita passenger vehicle GHG emissions.[36] As discussed further below, SCAG adopted an updated Regional Transportation Plan/Sustainable Community Strategies (2020–2045 RTP/SCS and 2024–2050 RTP/SCS) subsequent to the update of the emission targets. The 2020–2045 RTP/SCS and 2024–2050 RTP/SCS are expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.[37]

Under SB 375, the target must be incorporated within that region's RTP, which is used for long-term transportation planning, in an SCS. Certain transportation planning and programming activities would then need to be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land and further provides that local land use plans and policies (e.g., general plans) are not required to be consistent with either the RTP or SCS.

(v) Senate Bill 743

Governor Jerry Brown signed SB 743 in 2013, which creates a process to change the way that transportation impacts are analyzed under CEQA. Specifically, SB 743

---

34 State of California, Senate Bill No. 375, September 30, 2008.

35 CARB, Sustainable Communities & Climate Protection Program, About, ww2.arb.ca.gov/our-work/programs/sustainable-communities-climate-protection-program/about, accessed December 22, 2023.

36 CARB, SB 375 Regional Greenhouse Gas Emissions Reduction Targets, 2018.

37 SCAG, Final 2020–2045 RTP/SCS, Chapter 0: Making Connections, 2020, p. 5.

required OPR to amend the CEQA Guidelines to provide an alternative to level of service (LOS) methodology for evaluating transportation impacts. Particularly within areas served by transit, the required alternative criteria must "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." Instead of LOS, measurements of transportation impacts may now include "vehicle miles traveled, vehicle miles traveled per capita, automobile trip generation rates, or automobile trips generated."

(h) Building Standards and Other Regulations

(i) California Appliance Efficiency Regulations

The Appliance Efficiency Regulations (Title 20, Sections 1601 through 1609), adopted by the CEC, include standards for new appliances (e.g., refrigerators) and lighting, if they are sold or offered for sale in California. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

(ii) Title 24—Building Standards Code

The CEC first adopted the Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR, Title 24, Part 6) in 1978 in response to a legislative mandate to reduce energy consumption in the State. Although not originally intended to reduce GHG emissions, increased energy efficiency, and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are updated periodically to allow for the consideration and inclusion of new energy efficiency technologies and methods.

Part 11 of the Title 24 is referred to as the California Green Building Standards (CALGreen) Code and was developed to help the State achieve its GHG reduction goals under HSC Division 25.5 (e.g., AB 32) by codifying standards for reducing building-related energy, water, and resource demand, which in turn reduces GHG emissions from energy, water, and resource demand. The purpose of the CALGreen Code is to "improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices in the following categories: (1) Planning and design; (2) Energy efficiency; (3) Water efficiency and conservation; (4) Material conservation and resource efficiency; and (5) Environmental air quality."[38] The CALGreen Code is not intended to substitute for or be identified as meeting the certification requirements of any green building program (e.g., Leadership in Energy and

[38] California Building Standards Commission, 2010 California Green Building Standards Code, 2010.

Environmental Design) that is not established and adopted by the California Building Standards Commission. The CALGreen Code establishes mandatory measures for new residential and non-residential buildings. Such mandatory measures include energy efficiency, water conservation, material conservation, planning and design and overall environmental quality.[39]

On August 11, 2021, the CEC adopted the 2022 Title 24 Standards, which went into effect on January 1, 2023. The 2022 standards continue to improve upon the previous (2019) Title 24 standards for new construction of, and additions and alterations to, residential and non-residential buildings.[40] The 2022 Title 24 Standards ensure that builders use the most energy efficient and energy conserving technologies and construction practices. The 2022 Title 24 Standards encourage use of electric heat pumps, requiring newly constructed residences to be electric-ready and introduces solar and battery storage standards as an optional measure to achieve compliance and increases minimum ventilation requirements to improve air quality. Compliance with Title 24 is enforced through the building permit process.

(i) CEQA Guidelines

In August 2007, the California State Legislature adopted SB 97 (Chapter 185, Statutes of 2007), requiring OPR to prepare and transmit new CEQA Guidelines for the mitigation of GHG emissions or the effects of GHG emissions to the Resources Agency by July 1, 2009. In response to SB 97, OPR adopted the new guidelines that became effective on March 18, 2010. In late 2018, OPR finalized amendments to the CEQA Guidelines, including changes to CEQA Guidelines Section 15064.4, which addresses the analysis of GHG emissions. The amendments became effective on December 28, 2018.

However, neither a threshold of significance nor any specific mitigation measures are included or provided in the CEQA Guidelines.[41] The CEQA Guidelines require a lead agency to make a good-faith effort, to the extent possible based on scientific and factual data, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. Discretion is given to the lead agency whether to: (1) use a model or methodology to quantify GHG emissions resulting from a project, and which model or methodology to use; or (2) rely on a qualitative analysis or performance-based standards. Furthermore,

---

39 California Building Standards Commission, 2010 California Green Building Standards Code, 2010.

40 California Energy Commission (CEC), Building Energy Efficiency Standards, 2022, www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency, accessed January 9, 2025.

41 See 14 Cal. CCR Section 15064.7 (generally giving discretion to lead agencies to develop and publish thresholds of significance for use in the determination of the significance of environmental effects), 15064.4 (giving discretion to lead agencies to determine the significance of impacts from GHGs).

three factors are identified that should be considered in the evaluation of the significance of GHG emissions:

1. *The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;*

2. *Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and*

3. *The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.*[42]

The administrative record for the amendments to the CEQA Guidelines clarifies "that the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of California Environmental Quality Act's requirements for cumulative impact analysis."[43]

(3) Regional

(a) South Coast Air Quality Management District CEQA Guidance

The City is located in the South Coast Air Basin (Air Basin), which consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties, in addition to the San Gorgonio Pass area in Riverside County. The South Coast Air Quality Management District (SCAQMD) is responsible for air quality planning in the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished through air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.[44] A GHG Significance Threshold Working Group was formed to

---

42 14 CCR Section 15064.4(b).

43 Letter from Cynthia Bryant, Director of the Governor's Office of Planning and Research to Mike Chrisman, California Secretary for Natural Resources, dated April 13, 2009.

44 SCAQMD, Board Meeting, December 5, 2008, Agenda No. 31, www3.aqmd.gov/hb/2008/December/081231a.htm, accessed January 9, 2025.

further evaluate potential GHG significance thresholds.[45] SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 $MTCO_2e$ per year. Under this proposal, commercial/residential projects that emit fewer than 3,000 $MTCO_2e$ per year would be assumed to have a less-than-significant impact on climate change. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold of 10,000 $MTCO_2e$ per year for stationary source/industrial projects where the SCAQMD is the lead agency. However, SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects). The Working Group has been inactive since 2011, and SCAQMD has not formally adopted any GHG significance threshold for other jurisdictions.

(b) SCAG Regional Transportation Plan/Sustainable Communities Strategy

To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020–2045 RTP/SCS in September 2020. The vision for the region incorporates a range of best practices for increasing transportation choices, reducing dependence on personal automobiles, further improving air quality, and encouraging growth in walkable, mixed-use communities with ready access to transit infrastructure and employment. More and varied housing types and employment opportunities would be located in and near job centers, transit stations and walkable neighborhoods where goods and services are easily accessible via shorter trips. To support shorter trips, people would have the choice of using neighborhood bike networks, car share or micro-mobility services, such as shared bicycles or scooters. For longer commutes, people would have expanded regional transit services and more employer incentives to carpool or vanpool. Other longer trips would be supported by on-demand services, such as microtransit, carshare, and citywide partnerships with ride hailing services. For those that choose to drive, hotspots of congestion would be less difficult to navigate due to cordon pricing and using an electric vehicle will be easier due to an expanded regional charging network.

The 2020–2045 RTP/SCS states that the SCAG region was home to about 18.8 million people in 2016 and currently includes approximately 6.0 million homes and 8.4 million jobs.[46] By 2045, the integrated growth forecast estimates that these figures will increase by 3.7 million people, with nearly 1.6 million more homes and 1.6 million

---

45 SCAQMD, Greenhouse Gases CEQA Significance Thresholds, www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds, accessed January 9, 2025.

46 2020–2045 RTP/SCS population growth forecast methodology includes data for years 2000, 2010, 2016, and 2045.

more jobs. Transit Priority Areas[47] (TPAs) will account for less than 1 percent of regional total land but are projected to accommodate 30 percent of future household growth between 2016 and 2045. The 2020–2045 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in the region's TPAs. TPAs are a cornerstone of land use planning best practice in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.[48] Due to fuel economy and efficiency improvements, GHG emission rates of model year 2017 vehicles have decreased by 15 to 20 percent when compared to model year 2008 and earlier vehicles. However, for purposes of SB 375 emissions reduction targets, the fuel economy improvements have been largely excluded from the reduction calculation. The SB 375 target focuses on the amount of vehicle travel per capita. As discussed above, OPR recommended that achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals (i.e., SB 375 goal). The reductions generated by fuel economy improvements are already included as part of the State's GHG emissions reduction program and are not double-counted in the SB 375 target calculation.

On April 4, 2024, SCAG adopted the 2024–2050 RTP/SCS. Similar to the 2020–2045 RTP/SCS, the 2024–2050 RTP/SCS is a long-term plan for the Southern California region that details investment in the transportation system and development in communities to meet the existing and future needs of the region through projects, investments, policies and strategies. While the 2024–2050 RTP/SCS remains focused on its core responsibilities and on the requirements of comprehensive regional transportation planning integrated with the development of a sustainable communities strategy, it also encompasses a holistic approach to programs and strategies that support success of the RTP/SCS, such as workforce development, broadband and mobility hubs. The primary goals of the 2024–2050 RTP/SCS include:

- Mobility: Build and maintain an integrated multimodal transportation network;

---

47 Defined by the 2020–2045 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a major transit stop (rail or bus rapid transit station) with 15-minute or less service frequency during peak commute hours.

48 SCAG, Final 2020–2045 RTP/SCS, Chapter 0: Making Connections, 2020, p. 5.

- Communities: Develop, connect and sustain livable and thriving communities;
- Environment: Create a healthy region for the people of today and tomorrow; and
- Economy: Support a sustainable, efficient and productive regional economic environment that provides opportunities for all people in the region.

While the 2024–2050 RTP/SCS has been adopted by SCAG, the 2024–2050 RTP/SCS has not yet been approved by the California Air Resources Board.

(4) Local

(a) L.A.'s Green New Deal

The City addressed the issue of global climate change in *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan/ClimateLA) in 2007. This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities.

Subsequently, on April 8, 2015, Mayor Eric Garcetti released the Sustainable City pLAn, which includes both short-term and long-term aspirations through the year 2035 in various topic areas, including water, solar power, energy-efficient buildings, carbon and climate leadership, waste and landfills, housing and development, mobility and transit, and air quality, among others.[49] Specific targets included the construction of new housing units within 1,500 feet of transit by 2017, reducing VMT per capita by 5 percent by 2025, and increasing trips made by walking, biking or transit by at least 35 percent by 2025. The Sustainable City pLAn was intended to be updated every four years.

In April 2019, the Sustainable City pLAn was updated and renamed as L.A.'s Green New Deal, which consists of a program of actions designed to create sustainability-based performance targets through 2050 to advance economic, environmental, and equity objectives.[50] L.A.'s Green New Deal augments, expands, and elaborates on the City's vision for a sustainable future and tackles the climate emergency with accelerated targets and new aggressive goals.

While not a plan adopted solely to reduce GHG emissions, within the Green New Deal, "Climate Mitigation," or reduction of GHG is one of eight explicit benefits that help

---

49 City of Los Angeles, Sustainable City pLAn, April 2015.

50 City of Los Angeles. LA's Green New Deal, 2019.

define its strategies and goals. These include reducing GHG emissions through near-term outcomes:

- Reduce potable water use per capita by 22.5 percent by 2025, 25 percent by 2035, and maintain or reduce 2035 per capita water use through 2050.
- Reduce building energy use per square feet for all building types by 22 percent by 2025, 34 percent by 2035, and 44 percent by 2050 (from a baseline of 68 thousand British thermal units (mBTU) per square foot in 2015).
- All new buildings will be net zero carbon by 2030, and 100 percent of buildings will be net zero carbon by 2050.
- Increase cumulative new housing unit construction to 150,000 by 2025 and 275,000 units by 2035.
- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025 and 75 percent by 2035.
- Increase the percentage of all trips made by walking, biking, micro-mobility/ matched rides, or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.
- Reduce VMT per capita by at least 13 percent by 2025, 39 percent by 2035, and 45 percent by 2050.
- Increase the percentage of electric and zero emission vehicles in the city to 25 percent by 2025, 80 percent by 2035, and 100 percent by 2050.
- Increase landfill diversion rate to 90 percent by 2025, 95 percent by 2035, and 100 percent by 2050.
- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 pounds of waste generated per capita per day in 2011).
- Eliminate organic waste going to landfill by 2028.
- Reduce urban/rural temperature differential by at least 1.7 degrees by 2025 and 3 degrees by 2035.
- Ensure the proportion of Angelenos living within 0.5 mile of a park or open space is at least 65 percent by 2025, 75 percent by 2035, and 100 percent by 2050.

(b) City of Los Angeles Green Building Code

On December 10, 2022, the Los Angeles City Council approved Ordinance No. 187,719, which amended Chapter IX of the Los Angeles Municipal Code (LAMC), referred to as the Los Angeles Green Building Code, by adding a new Article 9 to incorporate various provisions of the 2022 CALGreen Code. Projects filed on or after January 1, 2023, must comply with the provisions of the Los Angeles Green Building Code. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) nonresidential and high-rise residential buildings; and (3) additions and alterations to nonresidential and high-rise residential buildings. Article 9, Division 5 includes mandatory measures for newly constructed nonresidential and high-rise residential buildings.

(c) City of Los Angeles All-Electric Building Requirement

In December 2022, the City approved Ordinance No. 187,714, which amends Divisions 2, 4, and 5 of Article 9 of Chapter IX of the LAMC to require all new buildings to be all-electric buildings with exceptions. The ordinance is applicable to new buildings in which an application for a building permit was submitted after June 1, 2023. Consistent with this new ordinance, Chapter IX of the LAMC, Section 99.02.202 defines an all-electric building as:

> *"A building that contains no combustion equipment, plumbing for combustion equipment, gas piping, or fuel gas serving any use including, but not limited to, space heating (including fireplaces), water heating (including pools and spas), cooking appliances (including barbeques), and clothes drying, within the building or building property lines, and instead uses electricity as the sole source of energy for all lighting, appliances and/or equipment, including, but not limited to, space heating, water heating, cooking appliances, and drying appliances."*

Chapter IX of the LAMC, Section 99.04.106.8 provides exemptions from the requirements for cooking equipment contained within kitchens in a public use area, such as restaurants, commissaries, cafeterias, and community kitchens, as long as electrical infrastructure is installed. Gas-powered process equipment in institutions, such as hospitals, industrial, and laboratories, is also exempt. The LAMC, which requires new residential uses to be electric-ready (wiring installed for all-electric appliances), is consistent with 2022 Title 24 goals of encouraging all-electric development. Buildings in Los Angeles account for 43 percent of GHG emissions—more than any other sector in the City. These LAMC requirements ensure that new buildings being constructed are built to leverage the

increasingly clean electric grid, which is anticipated to be carbon-free by 2035, rather than relying on fossil fuels.

(o) City of Los Angeles Solid Waste Programs and Ordinances

The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced as well as disposal energy averted. In 1989, California enacted AB 939, the California Integrated Waste Management Act, which establishes a hierarchy for waste management practices, such as source reduction, recycling, and environmentally safe land disposal.

The City has developed and is in the process of implementing the Solid Waste Integrated Resources Plan, also referred to as the Zero Waste Plan, whose goal is to lead the City towards being a "zero waste" City by 2030. These waste reduction plans, policies, and regulations, along with Mayoral and City Council directives, have increased the level of waste diversion for the City to 76 percent as of 2013.[51] In addition, the City adopted the Recovering Energy, Natural Resources, and Economic Benefit from Waste for Los Angeles (RENEW LA) Plan in 2006, which aims to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources not going to disposal and achieving a diversion rate of 90 percent or more by 2025.[52] The City also approved the Waste Hauler Permit Program (Ordinance No. 181,519, LAMC Chapter VI, Article 6, Section 66.32–66.32.5), which requires private waste haulers to obtain AB 939 Compliance Permits to transport construction and demolition waste to City-certified construction and demolition waste processors. The City's Exclusive Franchise System Ordinance (Ordinance No. 182,986), among other requirements, sets a maximum annual disposal level and diversion requirements for franchised waste haulers to promote waste diversion from landfills and support the City's zero waste goals. These programs reduce the number of trips to haul solid waste and, therefore, reduce the amount of petroleum-based fuels and energy used to process solid waste.

(e) City of Los Angeles General Plan

The City does not have a General Plan Element specific to climate change and GHG emissions, but several stated goals, objectives, or policies in the City's General Plan Air Quality Element, Plan for Healthy LA, and Mobility Plan 2035 (Mobility Plan) encourage the reduction in GHG emissions. More specifically, the following five goals

---

51 City of Los Angeles, Department of Public Works, LA Sanitation, Recycling. www.lacitysan.org/san/faces/home/portal/s-lsh-wwd/s-lsh-wwd-s/s-lsh-wwd-s-r?_adf.ctrl-state=kq9mn3h5a_188, accessed January 9, 2025.

52 City of Los Angeles, RENEW LA, Five-Year Milestone Report, 2011.

from the City's General Plan Air Quality Element would lead to GHG emission reductions:[53]

- Less reliance on single-occupancy vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimal impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels, and the implement of conservation measures, including passive measures, such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution.

(1) Housing Element (Housing Needs Assessment)

The Housing Element of the General Plan is prepared pursuant to state law and provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides the array of programs the City intends to implement to create and preserve sustainable, mixed-income neighborhoods across the City.

The Housing Needs Assessment chapter of the Housing Element discusses the City's population and housing stock to identify housing needs for a variety of household types across the City. The current RHNA goal for affordable housing within the City is approximately 40 percent of new construction. However, the City's projections show affordable housing comprising 20 percent of new construction, which falls short of the 40-percent RHNA goal. In order to address this shortfall in affordable housing, the Housing Element provides measures to streamline and incentivize development of affordable housing. Such measures include revising density bonuses for affordable housing; identifying locations which are ideal for funding programs to meet low-income housing goals; and rezoning areas to encourage low-income housing. With

53 City of Los Angeles, Air Quality Element, June 1991, pp. IV-1 to IV-4.

implementation of such measures to increase affordable housing, the Housing Element predicts a significant increase in housing production at all income ranges compared to previous cycles.

The Housing Element also promotes sustainability and resilience, and environmental justice through housing, as well as the need to reduce displacement. It encourages the utilization of alternatives to current parking standards that lower the cost of housing, support GHG and VMT goals and recognize the emergence of shared and alternative mobility. The Housing Element also identifies housing strategies for energy conservation, water conservation, alternative energy sources and sustainable development which support conservation and reduce demand.

(g) Mobility Plan 2035

In August 2015, the City Council adopted the Mobility Plan, which serves as the City's General Plan circulation element. The City Council has adopted several amendments to the Mobility Plan since its initial adoption, including the latest amendment on September 7, 2016.[54] The Mobility Plan incorporates "complete streets" principles and lays the policy foundation for how the City's residents interact with their streets. While the Mobility Plan mainly relates to transportation, certain components would serve to reduce VMT and mobile source GHG emissions. One component of the Mobility Plan is a GHG emission tracking program to establish compliance with SB 375, AB 32, and the region's SCS.

(h) Traffic Study Policies and Procedures

The City of Los Angeles Department of Transportation (LADOT) has developed the City Transportation Assessment Guidelines (TAG) (July 2019, updated July 2020 and August 2022) to provide the public, private consultants, and City staff with standards, guidelines, objectives, and criteria to be used in the preparation of a transportation assessment. The TAG establishes the reduction of vehicle trips and VMT as the threshold for determining transportation impacts and, thus, is an implementing mechanism of the City's strategy to reduce land use transportation-related GHG emissions consistent with AB 32, SB 32, and SB 375.

[54] Los Angeles Department of City Planning, Mobility Plan 2035: An Element of the General Plan, approved by City Planning Commission on June 23, 2016, and adopted by City Council on September 7, 2016.

The Row DTLA Residential

Appendix GHG-2- GHG Methodology

- Appendix GHG-2: GHG Methodology

GREENHOUSE GAS EMISSIONS METHODLOGY

The Row DTLA Residential Project

Prepared by:

Eyestone Environmental, LLC

February 2025

The Row DTLA Residential Project

Greenhouse Gas Emissions Methodology

1. Introduction

Eyestone Environmental has been retained to conduct a comprehensive greenhouse gas (GHG) emissions assessment for the Row DTLA Residential Project (the "Project"). Emissions during both construction and operation of the Project were quantified. This assessment describes the methodology used to estimate the GHG emissions from existing and Project conditions and describes the methodology used to quantify GHG emission reductions from project design features and mitigation measures.

2. Air Pollutant and Greenhouse Gas Emissions Methodology

The Project would result in direct emissions of direct and indirect GHG emissions generated by different types of emissions sources, including:[1]

- Direct Emissions:
  - Construction: emissions associated with demolition of existing uses, shoring, excavation, grading, and construction-related equipment and vehicular activity;
  - Area source: landscape and maintenance equipment;
  - Energy source (building operations): emissions associated with space heating and cooling, and water heating;
  - Mobile source: emissions associated with vehicles accessing the project site; and

[1] *Direct sources of emissions include Prcject-related vehicular trips and onsite combustion of fossil fuels (e.g., natural gas, propane, gasoline, and diesel). Whereas, indirect sources of emissions include offsite emissions associated with purchased electricity and embodied energy (e.g., energy used to convey, treat, and distribute water and wastewater)*

  - Stationary source: emissions associated with stationary equipment (e.g., emergency generators).
  - Refrigerants: fugitive GHG emissions associated with building air conditioning and refrigeration equipment.

- Indirect Emissions:
  - Energy source (building operations): emissions associated with energy consumption, and lighting;
  - Solid Waste: emissions associated with the decomposition of the waste, which generates methane based on the total amount of degradable organic carbon; and
  - Water/Wastewater: emissions associated with energy used to pump, convey, deliver, and treat water.

a. Emission Inventories

Project-related construction and operation emissions were calculated using SCAQMD's recommended California Emissions Estimator Model (CalEEMod). CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential GHG emissions associated with both construction and operations from a variety of land use projects. CalEEMod was developed in collaboration with the air districts of California. Data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is considered by the SCAQMD to be an accurate and comprehensive tool for quantifying GHG impacts from land use projects throughout California.[2]

CalEEMod utilizes widely accepted models for emission estimates combined with appropriate default data that can be used if site-specific information is not available. These models and default estimates use sources such as the USEPA AP-42 emission factors, CARB's on-road emission model (EMission FACtor model (EMFAC)) and off-road equipment emission model (Off-road Emissions Inventory Program model (OFFROAD)).

[2] *See www.caleemod.com.*

(1) Construction

Construction activities would generate emissions from off-road equipment usage, on-road vehicle travel (truck hauling, vendor deliveries, and workers commuting), architectural coating, and paving. Each of these source types is discussed in more detail below. The Project's construction emissions were calculated using the SCAQMD recommended CalEEMod (Version 2022.1). Please refer to CalEEMod construction output files for a complete listing of construction details modeled. CalEEMod default values were used for equipment and vehicle emission factors, equipment load factors and vehicle trip lengths. It should be noted that the maximum daily emissions were predicted values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. Annual emissions were calculated based on the total number of hours each piece of equipment was used and the total number of vehicular trips (i.e., worker, vendor, and haul) over the duration of construction. In accordance with the SCAQMD's guidance, GHG emissions from construction were amortized over the lifetime of the Project. The SCAQMD defines the lifetime of a project as 30 years.[3] Therefore, total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

(a) Emissions from Construction Equipment

The emission calculations associated with construction equipment are from off-road equipment engine use based on the equipment list and phase length. Since the majority of the off-road construction equipment used for construction projects are diesel fueled, CalEEMod assumes all of the equipment operates on diesel fuel. Construction equipment emissions vary with engine model years in which newer equipment will emit fewer pollutants. As a conservative assumption, the CalEEMod model uses an emission rate for equipment which represents an average model year for available equipment within the Air Basin. CalEEMod calculates the exhaust emissions based on CARB OFFROAD methodology using the equation presented below.

Construction Off-Road Equipment:

$$\text{Emissions Diesel [lbs]} = \left(\sum_i (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i \right.$$

Where: EF_i = Emission factor from OFFROAD (lbs/hr)

Pop_i = Population (quantity of same equipment)

[3] *SCAQMD, Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, 2008.*

$AvgHP_i$ = Maximum rated average horsepower (hp)

$Load_i$ = Load Factor (dimensionless)

$Activity_i$ = Hours of operation (hours)

i = Summation index

Fugitive dust emissions from use of off-road equipment were also calculated using CalEEMod based on the types of equipment used during grading activities and based on the amount of import/export from loading or unloading dirt into haul trucks. These methods have been adapted from USEPA's AP-42 method for Western Coal Mining. As recommended by SCAQMD, the fugitive dust emissions from the grading phase are calculated using the methodology described in USEPA AP-42. PM_{10} and $PM_{2.5}$ emissions from fugitive dust will be controlled by watering the construction site three times a day consistent with SCAQMD Rule 403 and were estimated to be reduced by 74 percent.

(b) Emissions from On-Road Trips

Construction generates on-road vehicle exhaust, evaporative, and dust emissions from personal vehicles for worker commuting, vendor deliveries, and trucks for soil and material hauling. These emissions are based on the number of trips and VMT along with emission factors from EMFAC. The emissions from mobile sources were calculated with the trip rates, trip lengths and emission factors for running from EMFAC as follows:

Construction On-Road Equipment:

Emissions pollutant (lbs) = VMT * EF running, pollutant

Where: VMT = vehicle miles traveled (miles)

EF running,pollutant = emission factor for running emissions (lbs/VMT)

Evaporative emissions, starting and idling emissions in CalEEMod were calculated by multiplying the number of trips times the respective emission factor for each pollutant.

(2) Operation

Similar to construction, the SCAQMD-recommended CalEEMod was used to calculate potential emissions generated by the Project, including area source, energy sources (electricity and natural gas), mobile source, stationary sources (emergency generator), solid waste generation and disposal, water usage/wastewater generation, and refrigeration.

(3) Area Source Emissions

Area source emissions were calculated using the CalEEMod emissions inventory model, which includes landscape maintenance equipment. Pollutant emissions generated by the Project were calculated using CalEEMod defaults, based upon the land uses that will be included in each project.

Landscaping Equipment:

Landscaping Equipment Emissions [lbs] = (Σ_i (Units × EF_{LE} × A_{LE})$_i$)

Where: Units = Number of land use units (same land use type) [1,000 sf]

EF_{LE} = Emission factor [grams (g)/1,000 sfday]

i = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

(4) Energy Emissions (Electricity and Natural Gas)

Pollutant emissions are emitted as a result of activities in buildings when electricity and natural gas are used as energy sources. Combustion of any type of fuel emits pollutant emissions directly into the atmosphere; when this occurs in a building, it is a direct emission source associated with that building. Pollutant emissions are also emitted during the generation of electricity from fossil fuels. When electricity is used in a building, the electricity generation typically takes place off-site at the power plant; electricity use in a building generally causes emissions in an indirect manner.

Energy demand emissions were calculated using the CalEEMod emissions inventory model. Energy use in buildings is divided into energy consumed by the built environment and energy consumed by uses that are independent of the construction of the building such as in plug-in appliances. CalEEMod calculates energy use from systems covered by Title 24 Building Energy Efficiency Standards (e.g., heating, ventilation, and air conditioning [HVAC] system, water heating system, and lighting system); energy use from lighting; and energy use from office equipment, appliances, plug-ins, and other sources not covered by Title 24 or lighting.

CalEEMod energy demand is based on the California Energy Commission (CEC) sponsored California Commercial End Use Survey (CEUS) study.[4] The data is specific for Electricity Demand Forecast Zones (EDFZ) and, therefore, EDFZ 16 was selected for the Project Site based on the Project's address. CalEEMod includes 2019 Title 24 Energy Efficiency Standards when calculating project energy usage.

(a) Electricity

Emissions associated with electricity demand are based on the size of the residential, commercial and retail land uses, the electrical demand factors for the land uses, the emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. Annual electricity GHG emissions in units of $MTCO_2e$ are calculated as follows:

Electricity:

$$\text{Annual Emissions } [MTCO_2e] = \left(\Sigma_i \left(\text{Units} \times D_E \times EF_E \times GWP\right)_i \right) \div 2{,}204.62$$

Where: Units = Number of land use units (same land use type) [1,000 sf]

D_E = Electrical demand factor [megawatt-hour (MWh)/1,000 sf/yr]

EF_E = GHG emission factor [pounds per megawatt-hour (MWh)]

GWP = Global warming potential [CO_2 = 1, CH_4 = 21, N_2O = 310]

2,204.62 = Conversion factor [pounds/MT]

i = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

GHG emissions from electricity use are directly dependent on the electricity utility provider. The Los Angeles Department of Water and Power (LADWP) provides electric service to the Project Site. Thus, GHG intensity factors for LADWP were selected in CalEEMod. Intensity factors for GHGs due to electrical generation to serve the electrical demands of the existing condition were obtained from the LADWP 2023 Power Content Label, which provides a CO_2 intensity of 499 pounds of CO_2 per MWh for 2023. By 2030,

[4] *2019 consumption estimates from the CEC's (2020, 2021) 2018–2030 Uncalibrated Commercial Sector Forecast (Commercial Forecast) and the RASS (refer to Table G-28) of Appendix G in CalEEMod User's Guide, 2022.*

at least 60 percent of electricity shall be obtained from renewable sources. As year-by-year data is currently not available, the CO_2 intensity factor for the Project buildout was determined based on straight line interpolation based on current and future year data points.

(b) Natural Gas

The direct source emissions associated with natural gas combustion are based on the size of the land uses and the natural gas combustion factors for the land uses in units of million British thermal units (MMBtu). Natural gas emissions are calculated in CalEEMod as follows:

Natural Gas:

$$\text{Natural Gas Emissions (lbs)} = \left(\Sigma_I \left(\text{Units} \times D_{NG} \times EF_{NG} \right)_I \right)$$

Where: Units = Number of land use units (same land use type) [1,000 sf]

D_{NG} = Natural Gas combustion factor [MMBtu/1,000 sf]

EF_{NG} = Natural Gas combustion factor [pounds/MMBtu]

I = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

(c) City of Los Angeles All-Electric Ordinance

The Project would be required to comply with the City of LA's All-Electric ordinance which does not allow installation of natural gas-powered equipment (stoves, water heaters, space heating) for new construction with some exceptions. Restaurant uses would be exempt from this ordinance and be allowed to consume natural gas for cooking purposes. While this would decrease the natural gas usage for the Project, electricity usage would increase as a result.

The California Energy Commission (CEC) had conducted various energy surveys to develop energy consumption estimates for electric and natural gas end uses. Data from these surveys was used to calculate the equivalent electricity usage when switching from a natural gas end use, such as cooking, water heating and space heating.[5] As mentioned

[5] *CAPCOA Handbook, Table E-15.1 and Table E-15.2*

above, restaurant cooking uses are exempt from the All-Electric ordinance and were assumed to be powered by natural gas.

(5) Mobile Source Emissions

Mobile-source emissions were calculated using the CalEEMod emissions inventory model. CalEEMod calculates the emissions associated with on-road mobile sources associated with residents, employees, visitors, and delivery vehicles visiting the Project Site based on the number of daily trips generated and vehicle miles traveled (VMT). The Traffic Study prepared by Gibson had calculated Project VMT which was entered into CalEEMod in calculating Project mobile source emissions.

Modeling was also conducted using the Los Angeles County vehicle fleet mix for all vehicle types as provided in EMFAC2021.

Mobile source emissions were generally calculated in CalEEMod as follows:

Mobile:

Mobile Emissions [lbs] = (Σ_i (Units × ADT x D_{TRIP} × EF_i)

Where: Units = Number of vehicles (same vehicle model year and class)

ADT = Average daily trip rate [trips/day]

D_{TRIP} = Trip distance [miles/trip]

EF = Pollutant emission factor [pounds per mile]

i = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

Mobile source operational emissions were calculated based on the Project VMT estimates provided by the Gibson Transportation Consulting, Inc.[6] The Los Angeles Department of Transportation (LADOT) VMT Calculator was used.

[6] *Gibson Transportation Consulting, Inc., Transportation Assessment for the Alameda Square Prcject, Los Angeles, California, March 2025.*

Previously, trip generation for land uses was calculated based on survey data collected by the Institute of Transportation Engineers (ITE). However, these ITE trip generation rates were based on data collected at suburban, single-use, free standing sites, which may not be representative of urban mixed-use environments. Beginning in 2019, the USEPA has sponsored a study to collect travel survey data from mixed-use developments in order provide a more representative trip generation rate for multi-use sites. Results of the USEPA survey indicate that trip generation and VMT are affected by factors such as resident and job density, availability of transit, and accessibility of biking and walking paths. Based on these factors, the USEPA has developed equations known as the EPA Mixed-Use Development (MXD) model to calculate trip reductions for multi-use developments.[7] The LADOT VMT Calculator incorporates the USEPA MXD model and accounts for project features such as increased density and proximity to transit, which would reduce VMT and associated fuel usage in comparison to free-standing sites.

The Project design includes characteristics that would reduce trips and VMT as compared to a standard project within the air basin as measured by the air quality model (CalEEMod). While these Project characteristics primarily reduce greenhouse gas emissions, they would also reduce criteria air pollutants discussed herein. These relative reductions in vehicle trips and VMT from a standard project within the air basin help quantify the criteria air pollutant emissions reductions achieved by locating the Project in any infill, HQTA area that promotes alternative modes of transportation.

(6) Stationary Source (Emergency Generator Emissions)

Emissions of GHGs associated with use of emergency generators were calculated using CalEEMod, in which emission factors are based on Table 3.4-1 (Gaseous Emission Factors for Large Stationary Diesel Engines) from EPA's AP-42: Compilation of Air Pollutant Emission Factors. The emissions are based on the horsepower rating of the diesel generator and the number of hours operated per year for testing purposes. Annual emergency generator GHG emissions in units of $MTCO_2e$ were calculated as follows:

Emergency Generator:

Emissions [lbs] = (Total HP x LF x HR × EF)

[7] *Environmental Protection Agency, Mixed-Use Trip Generation Model. www.epa.gov/smartgrowth/mixed-use-trip-generation-model. Accessed June 21, 2023.*

Where: Total HP = Total horsepower of emergency generators (Hp)
LF = Load Factor (CalEEMod default of 0.73)
HR = Hours Operated per Year
EF = AP-42 Emission Factor of 1.16 lb/hp-hr)

(7) Solid Waste Emissions

The generation of municipal solid waste (MSW) from day-to-day operational activities generally consists of product packaging, grass clippings, furniture, clothing, bottles, food scraps, newspapers, plastic, and other items routinely disposed of in trash bins. A portion of the MSW is diverted to waste recycling and reclamation facilities. Waste that is not diverted is usually sent to local landfills for disposal. MSW that is disposed in landfills results in GHG emissions of CO_2 and CH_4 from the decomposition of the waste that occurs over the span of many years.

Emissions of GHGs associated with solid waste disposal were calculated using the CalEEMod emissions inventory model. The emissions are based on the size of the retail and restaurant land uses, the waste disposal rate for the land uses, the waste diversion rate, the GHG emission factors for solid waste decomposition, and the GWP values for the GHGs emitted. Annual waste disposal GHG emissions in units of $MTCO_2e$ were calculated in CalEEMod as follows:

Solid Waste:

$$\text{Annual Emissions } [MTCO_2e] = \left(\Sigma_i \left(\text{Units} \times D_{MSW} \times EF_{MSW} \times GWP \right)_i \right) \div 1.1023$$

Where: Units = Number of land use units (same land use type) [1,000 sf]
D_{MSW} = Waste disposal rate [tons/1,000 sf/yr]
EF_{MSW} = GHG emission factor [tons/ton waste]
GWP = Global warming potential [CO_2 = 1, CH_4 = 21, N_2O = 310]
1.1023 = Conversion factor [tons/MT]
i = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

CalEEMod allows the input of several variables to quantify solid waste emissions. The model requires the amount of waste disposed, which is the product of the waste

disposal rate times the land use units. CalEEMod default annaual solid waste disposal rates used. The GHG emission factors, particularly for CH_4, depend on characteristics of the landfill, such as the presence of a landfill gas capture system and subsequent flaring or energy recovery. The default values, as provided in CalEEMod, for landfill gas capture (e.g., no capture, flaring, energy recovery), which are statewide averages, were used in this assessment. The Project includes a 76.4-percent recycling/diversion rate currently achieved within the City.[9]

(8) Water Usage and Wastewater Generation Emissions

GHG emissions are related to the energy used to convey, treat, and distribute water and wastewater. Thus, these emissions are generally indirect emissions from the production of electricity to power these systems. Three processes are necessary to supply potable water and include: (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users. After use, energy is used as the wastewater is treated and reused as reclaimed water.

Emissions related to water usage and wastewater generation were calculated using the CalEEMod emissions inventory model. The emissions are based on the size of the land uses, the water demand factors, the electrical intensity factors for water supply, treatment, and distribution and for wastewater treatment, the GHG emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. CalEEMod default annual water demand and wastewater rates were used. GHG emissions due to electricity are calculated in CalEEMod as follows for indoor and outdoor water demand:

Water Supply, Treatment, and Distribution; Wastewater Treatment (electricity):

$$\text{Annual Emissions } [MTCO_2e] = (\Sigma_i\ (\text{Units} \times D_w \times (EI_w \div 1{,}000) \times EF_w \times GWP)_i\ ) \div 2{,}204.62$$

Where: Units = Number of land use units (same land use type) [1,000 sf]

D_w = Water demand factor [million gallons (Mgal)/1,000 sf/yr]

EI_w = Electricity intensity factor [kilowatt-hours (kWh)/Mgal]

1,000 = Conversion factor [kWh/MWh]

[9] *City of Los Angeles, Sustainable City pLAn, Waste & Landfills, http://plan.lamayor.org/portfolio/waste-landfills-3rd, accessed August 1, 2024.*

EF_W = GHG emission factor [pounds/MWh]

GWP = Global warming potential [CO_2 = 1, CH_4 = 21, N_2O = 310]

2,205 = Conversion factor [pounds/MT]

i = Summation index

Note: For residential land uses, emission factors are specified in units of dwelling units (DU) instead of 1,000 sf.

CalEEMod provides options to account for the use of water saving features such as the use of low-flow water fixtures (e.g., low-flow faucets, low-flow toilets). The same electricity GHG emissions factors discussed above were used for water and wastewater energy usage. In addition, the calculation of Project GHG emissions from water/wastewater usage accounts for a 20 percent reduction in water/wastewater emissions with implementation of CalGreen requirements.

(9) Refrigerant Emissions

The estimate the fugitive GHG emissions associated with building air conditioning (A/C) and refrigeration equipment is based on the different types of refrigeration equipment used by different types of land uses. For example, an office may use various types of A/C equipment, while a supermarket may use both A/C equipment and refrigeration equipment. All equipment that uses refrigerants has a charge size (i.e., quantity of refrigerant the equipment contains), operational and service refrigerant leak rates (from regular operation and routine servicing), and number of times serviced per lifetime. Each refrigerant has a GWP that is specific to that refrigerant. CalEEMod automatically generates a default A/C and refrigeration equipment inventory for each project land use subtype. CalEEMod quantifies refrigerant emissions from leaks during regular operation and routine servicing over the equipment lifetime and then derives average annual emissions from the lifetime estimate. Note that CalEEMod does not quantify emissions from the disposal of refrigeration and A/C equipment at the end of its lifetime.

GHG Emissions Reductions for Residential Uses Associated with Electric Vehicle Charging Stations/Plugins

Step 1: Estimating GHG Emisisons Reduction to Replace Gasoline/Diesel Vehicle with Electric Vehicle

LADWP Electricity Emission Factor[1]	0.14	MTCO2E/MWh
Fuel Economy of Electric Vehicle[2]	0.45	kWh/mile
Electric Vehicle GHG Emissions	61.3	grams/mile
GHG Emissions from Residential Miles Traveled (CalEEMod)[3]	284.6	grams/mile
GHG Emissions Reduction from Additional Electric Vehicles, per mile	223.3	grams/mile

Step 2: Estimating Project Residential-Related VMT GHG Emissions

Residential Average Yearly VMT with TDM and PDFs[4]	4,514,685	miles/year
Percent of Residential Miles Driven in Electric Vehicles due to this Measure	10.0%	
Residential VMT that is Displaced by Evs due to this Measure	451,469	miles/year
GHG Emisisons Reduction from Residential Electric Vehicles	**101**	MTCO2E/MWh

Energy Usage **201,507**

Notes:
1) CO2 intensity factor reflects a 2032 RPS for LADWP (304 lbs of CO2E/MWh).
2) US Department of Energy, 2013. Benefits and Considerations of Electricity as a Vehicle Fuel. Available at: http://afdc.energy.gov/fuels/electricity_benefits.html.
3) CalEEMod Output file provided in Appendix XX.X of this Draft EIR.
4) Residential charging of vehicles would primarily occur over night. In addition, it is assumed that the charging stations/plugins for residential uses would be fully utlized which is supported by the projected number of electric vehicles in the future. Bloomberg New Energy Finance projects that electric vehicles will represent 35 percent of global new car sales by 2040 (https://about.bnef.com/blog/electric-vehicles-to-be-35-of-global-new-car-sales-by-2040/).

Grading/Shoring/Excavation	0.00	73,440	0.00	0.00	—
Paving	0.00	0.00	0.00	0.00	4.04

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%
High Turnover (Sit Down Restaurant)	0.00	0%
Recreational Swimming Pool	0.00	0%
Enclosed Parking with Elevator	4.04	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	635	406	0.05	0.01
2028	1,270	386	0.05	0.01
2029	635	365	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.52	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	50.5
AQ-PM	89.2
AQ-DPM	95.5
Drinking Water	92.5
Lead Risk Housing	71.6
Pesticides	0.00
Toxic Releases	82.2
Traffic	85.9
Effect Indicators	—
CleanUp Sites	97.2
Groundwater	78.1
Haz Waste Facilities/Generators	98.8
Impaired Water Bodies	66.7
Solid Waste	96.0
Sensitive Population	—
Asthma	97.7

Cardio-vascular	65.1
Low Birth Weights	71.6
Socioeconomic Factor Indicators	—
Education	74.4
Housing	68.5
Linguistic	91.8
Poverty	75.4
Unemployment	79.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	10.5350956
Employed	49.30065443
Median HI	4.273065572
Education	—
Bachelor's or higher	63.26190171
High school enrollment	100

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	100
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	see construction assumptions
Construction: Off-Road Equipment	see construction assumptions
Construction: Trips and VMT	see construction assumptions
Construction: On-Road Fugitive Dust	see construction assumptions
Construction: Electricity	Carbon intensity for construction years
Land Use	Project Specific

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	369,775	123,258	3,599	400	4,799

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition/Utility Relocation	0.00	0.00	0.00	0.00	—
Grading/Shoring/Excavation	0.00	42,960	0.00	0.00	—

Paving	0.00	0.00	0.00	0.00	1.84

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%
Recreational Swimming Pool	0.00	0%
Enclosed Parking with Elevator	1.84	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	690	0.05	0.01
2028	0.00	690	0.05	0.01
2026	0.00	690	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.52	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	50.5
AQ-PM	89.2
AQ-DPM	95.5
Drinking Water	92.5
Lead Risk Housing	71.6
Pesticides	0.00
Toxic Releases	82.2
Traffic	85.9
Effect Indicators	—
CleanUp Sites	97.2
Groundwater	78.1
Haz Waste Facilities/Generators	98.8
Impaired Water Bodies	66.7
Solid Waste	96.0
Sensitive Population	—
Asthma	97.7
Cardio-vascular	65.1
Low Birth Weights	71.6

Socioeconomic Factor Indicators	—
Education	74.4
Housing	68.5
Linguistic	91.8
Poverty	75.4
Unemployment	79.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	10.5350956
Employed	49.30065443
Median HI	4.273065572
Education	—
Bachelor's or higher	63.26190171
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—

2016 Voting	5.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	100
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

Paving	0.00	0.00	0.00	0.00	3.95

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Apartments Mid Rise	—	0%
High Turnover (Sit Down Restaurant)	0.00	0%
Recreational Swimming Pool	0.00	0%
Enclosed Parking with Elevator	3.95	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2030	635	345	0.05	0.01
2031	635	325	0.05	0.01
2032	0.00	304	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.52	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	50.5
AQ-PM	89.2
AQ-DPM	95.5
Drinking Water	92.5
Lead Risk Housing	71.6
Pesticides	0.00
Toxic Releases	82.2
Traffic	85.9
Effect Indicators	—
CleanUp Sites	97.2
Groundwater	78.1
Haz Waste Facilities/Generators	98.8
Impaired Water Bodies	66.7
Solid Waste	96.0
Sensitive Population	—
Asthma	97.7

Cardio-vascular	65.1
Low Birth Weights	71.6
Socioeconomic Factor Indicators	—
Education	74.4
Housing	68.5
Linguistic	91.8
Poverty	75.4
Unemployment	79.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	10.5350956
Employed	49.30065443
Median HI	4.273065572
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	100
Healthy Places Index Score for Project Location (b)	14.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.52	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from prcjected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from prcjected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	50.5
AQ-PM	89.2
AQ-DPM	95.5
Drinking Water	92.5
Lead Risk Housing	71.6
Pesticides	0.00
Toxic Releases	82.2
Traffic	85.9
Effect Indicators	—
CleanUp Sites	97.2
Groundwater	78.1
Haz Waste Facilities/Generators	98.8
Impaired Water Bodies	66.7
Solid Waste	96.0
Sensitive Population	—
Asthma	97.7
Cardio-vascular	65.1
Low Birth Weights	71.6
Socioeconomic Factor Indicators	—

Education	74.4
Housing	68.5
Linguistic	91.8
Poverty	75.4
Unemployment	79.7

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	10.5350956
Employed	49.30065443
Median HI	4.273065572
Education	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.52	annual days of extreme heat
Extreme Precipitation	6.15	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from prcjected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from prcjected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	50.5
AQ-PM	89.2
AQ-DPM	95.5
Drinking Water	92.5
Lead Risk Housing	71.6
Pesticides	0.00
Toxic Releases	82.2

1 INTRODUCTION

A noise study for the ROW DTLA Residential Project (Project) has been prepared in accordance with the noise mitigation measures set forth in the Citywide Housing Element 2021 2029 and Safety Element Updates Final Environmental Impact Report (EIR), SCH No. 2021010130, EIR No. ENV-2020-6762-EIR (Program EIR) and the requirements of the City's Housing Element Checklist for projects using the Program EIR for CEQA clearance. This separate Noise Technical Report (Noise Study) has been prepared to address noise levels associated with other aspects associated with operation of the Project that are not required to be evaluated by the City's Housing Element Checklist. The intent of this analysis is to provide additional specific evidence for the record, outside of the Housing Element Checklist, that operation of the Project would not exceed established City criteria.

2 PROJECT LOCATION AND EXISTING USES

The Project Site is approximately 31 acres in size. The Project Site occupies the northern half of the block bounded by E. 7th Street on the north, S. Central Avenue on the west, S. Alameda Street on the east, and E. Olympic Boulevard to the south, with the partially vacated former E. 8th and Bay streets providing internal access within the middle of the block. The Development Area is approximately 4.84 gross acres and is located within the western portion of the Project Site along Alameda Street at 747-787 S. Alameda Street, as shown in Figure 1 (on page 2).

The Project Site is located in an existing industrial district east of Downtown Los Angeles. The area surrounding the Project Site is primarily developed with warehouses, cold storage facilities, small-scale manufacturing operations, and other industrial uses, though in more recent years newer commercial office, commercial retail, and residential uses have been developed in the vicinity of the Project Site.

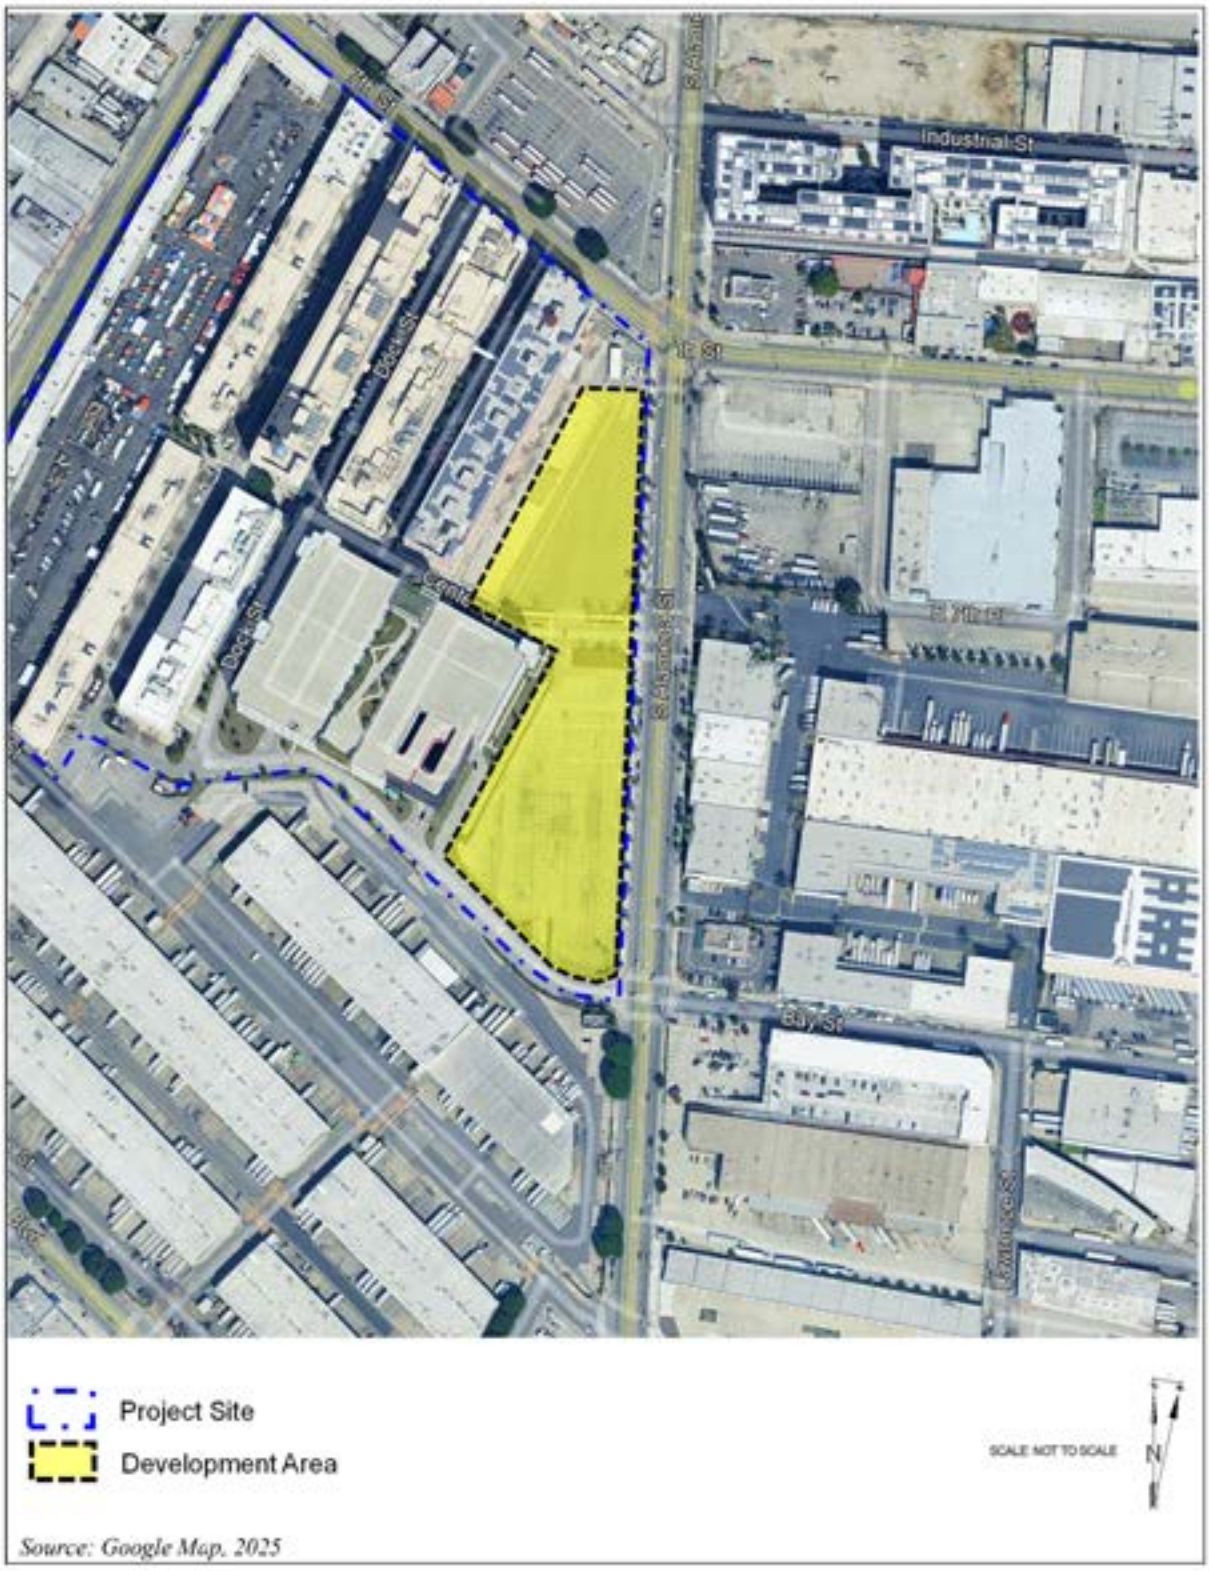

Figure 1. Project Development Area

3 PROJECT DESCRIPTION

The Project includes the development of three mixed-use buildings containing 1,000 residential units including 114 Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings. Building A would include 1,119 square feet of commercial uses located on the first floor; 410 residential units at the first though eighth floors; and two levels of subterranean parking as well as above grade parking located on the first floor. Building B would include 214 residential units located on the first through eighth floors, and two levels of subterranean parking as well as above-grade parking located on the first floor. Building C would include 5,428 square feet of commercial uses on the first floor; 376 residential units at the first through eighth floors; and two levels of subterranean parking as well as above grade parking located on the first floor. The proposed buildings would range from approximately 100 feet to 103 feet in height. Upon completion, 884,278 square feet of new floor area would be provided. When accounting for the existing floor area to remain, there would be a total of approximately 2,477,695 square feet of floor area with a total FAR of 1.86:1 averaged across the Project Site. Buildings A and B will be completed in 2029 and occupied, while Building C would be under construction from 2030 to 2032. The Project would include up to 1,092 vehicular parking spaces. A total of 96,278 square feet of open space would also be provided. The existing uses within the remainder of the Project Site outside of the Development Area will remain and would not be modified by the Project.

4 ENVIRONMENTAL SETTING

4.1 Fundamentals of Sound and Environmental Noise

Noise is commonly defined as sound that is undesirable because it interferes with speech communication and hearing, causes sleep disturbance, or is otherwise annoying (unwanted sound). The decibel (dB) is a conventional unit for measuring the amplitude of sound because it accounts for the large variations in sound pressure amplitude and reflects the way people perceive changes in sound amplitude. The human hearing system is not equally sensitive to sound at all frequencies. Therefore, to approximate this human frequency-dependent response, the A-weighted filtering system is used to adjust measured sound levels (dBA). The term "A-weighted" refers to filtering the noise signal in a manner that corresponds to the way the human ear perceives sound. Examples of various sound levels in different environments are provided in Table 1 (on page 5).[1]

Generally, people judge the relative magnitude of sound sensation by subjective terms such as "loudness" or "noisiness." To a person with normal hearing, a change in sound level of 3 dB is considered "just perceptible," a change in sound level of 5 dB is considered "clearly noticeable," and a change (i.e., increase) of 10 dB is generally recognized as "twice as loud" as the original sound.[2]

4.1.1 Outdoor Sound Propagation

In an outdoor environment, sound levels attenuate (reduce) through the air as a function of distance. Such attenuation is commonly referred to as "distance loss" or "geometric spreading," and is based on the noise source configuration (e.g., point source, or line source). For a point source, such as a piece of mechanical/electrical/construction equipment (e.g., air conditioner, electrical transformer, or bulldozer), the rate of sound attenuation is about 6 dB per doubling of distance from the noise source. For example, an outdoor condenser fan that generates a sound level of 60 dBA at a distance of five feet would attenuate to 54 dBA at a distance of 10 feet. For a line source, such as a constant flow of traffic on a roadway, the rate of sound attenuation is about 3 dB per doubling of distance.[3]

In addition, structures (e.g., buildings and solid walls) and natural topography (e.g., hills) that obstruct the acoustics line-of-sight between a noise source and a receptor further reduce the noise level at the receptor if the receptor is located within the "shadow" of the obstruction, such as behind a sound wall. This type of sound attenuation is known as "barrier insertion loss." If a receptor is located behind the wall but still has a view of the source (i.e., line-of-sight is not

---

1 *All sound levels measured in decibel (dB) in this study are relative to $2x10^{-5}$ N/m^2.*

2 *Caltrans, Technical Noise Supplement (TeNS), Table 2.10, 2013.*

3 *Caltrans, Technical Noise Supplement (TeNS), Chapter 2.1.4.1, 2013.*

fully blocked), some barrier insertion loss would still occur; however, to a lesser extent. Additionally, a receptor located on the same side of the wall as a noise source may actually experience an increase in the perceived noise level as the wall reflects noise back to the receptor, thereby compounding the noise. Outdoor noise barriers can provide noise level reductions ranging from approximately 5 dBA (where a barrier just breaks the acoustic line-of-sight between the noise source and receiver) to an upper range of 20 dBA with a more substantial barrier.[4]

Table 1. Typical Noise Levels

Common Outdoor Activities	Noise Levels, dBA	Common Indoor Activities
	110	Rock Band
Jet Fly-over at 1000 feet		
	100	
Gas Lawn Mower at 3 feet

4.1.2 Environmental Noise Descriptors

Several rating scales have been developed to analyze the adverse effect of environmental noise on people. Since environmental noise fluctuates over time, these scales consider the total acoustical energy content, as well as the time and duration of occurrence. The most frequently used noise descriptors, including those used by the City, are summarized below.

Equivalent Sound Level (L_{eq}). L_{eq} is a measurement of the acoustic energy content of noise averaged over a specified time period. Thus, the L_{eq} of a time-varying sound and that of a steady sound are the same if they deliver the same amount of energy to the receptor's ear during exposure. L_{eq} for one-hour periods, during the daytime or nighttime hours, and 24 hours are commonly used in environmental noise assessments. L_{eq} can be measured for any time period, but is typically measured for an increment of no less than 15 minutes for environmental studies.

Community Noise Equivalent Level (CNEL). CNEL is the time average of all A-weighted sound levels for a 24-hour day period with a 10 dBA adjustment (increase) added to the sound levels that occur in the nighttime hours (10:00 P.M. to 7:00 A.M.) and a 5 dBA adjustment (increase) added to the sound levels that occur in the evening hours (7:00 P.M. to 10:00 P.M.). These adjustments attempt to account for increased human sensitivity to noise during the quieter nighttime periods, when the ambient background noise is lower and where sleep is the most probable activity. CNEL has been adopted by the State of California as the rating scale to be used to define the community noise environment for development of the community noise element of a General Plan and is also used by the City of Los Angeles for its land use planning.[5]

4.2 Regulatory Framework

4.2.1 City of Los Angeles General Plan Noise Element

The overall purpose of the Noise Element of the General Plan is to guide policymakers in making land use determinations and adopting noise ordinances that would limit exposure of citizens to excessive noise levels. The following policies and objectives from the Noise Element of the General Plan are applicable to the Project:[6]

1. Objective 2 (Non-airport): Reduce or eliminate non-airport related intrusive noise, especially relative to noise-sensitive uses.
2. Policy 2.1: Enforce and/or implement applicable City, State, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.

---

[5] *State of California, General Plan Guidelines, 2017.*

[6] *City of Los Angeles, Noise Element of the Los Angeles City General Plan, adopted February 3, 1999.*

3. Objective 3 (Land Use Development): Reduce or eliminate noise impacts associated with proposed development of land and changes in land use.
4. Policy 3.1: Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

Table 2 (below) provides the exterior noise standard associated with various land uses, as provided in the City's Noise Element. According to the City, an exterior noise environment up to 70 dBA CNEL is "conditionally acceptable" for noise sensitive uses (e.g., residential, hotel, school). In addition, noise levels up to 75 dBA CNEL are "normally unacceptable", while noise levels at 75 dBA CNEL and above are "clearly unacceptable" for residential.

Table 2. City of Los Angeles Noise Land Use Compatibility

Land Use	Day-Night Average Exterior Sound Level (CNEL dBA)						
	50	55	60	65	70	75	80
Residential Single Family, Duplex, Mobile Home	A	C	C	C	N	U	U
Residential Multi-Family	A	A	C	C	N	U	U
Transient Lodging, Motel, Hotel	A	A	C	C	N	U	U
School, Library, Church, Hospital, Nursing Home	A	A	C	C	N	N	U
Auditorium, Concert Hall, Amphitheater	C	C	C	C/N	U	U	U
Sports Arena, Outdoor Spectator Sports	C	C	C	C	C/U	U	U
Playground, Neighborhood Park	A	A	A	A/N	N	N/U	U
Golf Course, Riding Stable, Water Recreation, Cemetery	A	A	A	A	N	A/N	U
Office Building, Business, Commercial, Professional	A	A	A	A/C	C	C/N	N
Agriculture, Industrial, Manufacturing, Utilities	A	A	A	A	A/C	C/N	N

[1] *A - Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.*
[2] *C - Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.*
[3] *N - Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.*
[4] *U - Clearly Unacceptable: New construction or development should generally not be undertaken.*

4.2.2 City of Los Angeles Municipal Code (Related to Operational Activities)

Chapter XI, Noise Regulation, of the LAMC (referred to herein as the Noise Regulations) establishes acceptable ambient sound levels and is intended to regulate intrusive noises (e.g.,

stationary mechanical equipment and vehicles other than those traveling on public streets) within specific land use zones and to provide procedures and criteria for the measurement of the sound level of noise sources. These procedures recognize and account for differences in the perceived level of different types of noise and/or noise sources. In accordance with the Noise Regulations, a noise level increase from certain regulated noise sources of 5 dBA over the existing or presumed ambient noise level at an adjacent property line is considered a violation of the Noise Regulations. The 5-dBA increase above ambient is applicable to City-regulated noise sources (e.g., mechanical equipment), and is applicable any time of the day.[7]

The Noise Regulations state that the baseline ambient noise environment shall be the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes, L_{eq} (15-minute). The Noise Regulations state that in cases where the actual measured ambient conditions are not known, the City's presumed daytime (7:00 A.M. to 10:00 P.M.) and nighttime (10:00 P.M. to 7:00 A.M.) ambient noise levels defined in Section 111.03 of the LAMC should be used. The City's presumed ambient noise levels for specific land use zones, as set forth in LAMC Section 111.03, are provided in Table 3 (below).

Table 3. City of Los Angeles Presumed Ambient Noise Levels

Zone	Daytime (7:00 A.M. to 10:00 P.M.) dBA (L_{eq})	Nighttime (10:00 P.M. to 7:00 A.M.) dBA (L_{eq})
Residential, School, Hospitals, Hotels	50	40
Commercial	60	55
Manufacturing (M1, MR1, and MR2)	60	55
Heavy Manufacturing (M2 and M3)	65	65

Source: LAMC Section 111.03.

The Noise Regulations also address off-road vehicle-related noise, including in Section 114.02, which prohibits the operation of any motor-driven vehicles upon any property within the City in a manner that would cause the noise level on the premises of any occupied residential property to exceed the ambient noise level by more than 5 dBA, and in Section 114.06, which requires that vehicle theft alarm systems be silenced within five minutes.

LAMC Section 112.01 limits noise from amplified voice and music and prohibits the operation of such devices (e.g., radio, musical instrument, phonograph, television receiver, or other machine) or other sounds in such a manner as to disturb the peace, quiet, and comfort of neighbors. Specifically, noise from such uses or operation that is audible at a distance in excess

[7] *Los Angeles Municipal Code, Chapter XI, Section 112.02.*

of 150 feet from the property line of the noise source within a residential zone of the City or within 500 feet thereof is prohibited.

LAMC Section 112.02 limits increases in noise levels from air conditioning, refrigeration, heating, pumping and filtering equipment. Such equipment may not be operated in such a manner as to create any noise which would cause the noise level on the premises of any other occupied property, or, if a condominium, apartment house, duplex, or attached business, within any adjoining unit, to exceed the ambient noise level by more than 5 dB.

LAMC Section 113.01 prohibits collecting or disposing of rubbish or garbage, operating any refuse disposal truck, or collecting, loading, picking up, transferring, unloading, dumping, discarding, or disposing of any rubbish or garbage, as such terms are defined in LAMC Section 66.00, within 200 feet of any residential building between the hours of 9:00 P.M. and 6:00 A.M. of the following day, unless a permit has been duly obtained beforehand from the Board of Police Commissioners.

LAMC Section 91.1206.14.2 prohibits interior noise levels attributable to exterior sources from exceeding 45 dBA in any habitable room. The noise metric shall be either the day-night average sound level (Ldn) or the CNEL, consistent with the noise element of the local general plan.

4.3 Existing Conditions

The predominant source of noise in the vicinity of the Project Site is vehicular traffic on adjacent roadways, particularly along Alameda Street and 7th Street, which have high volumes of traffic. Other ambient noise sources in the vicinity of the Project Site include industrial activities (e.g., truck loadings); commercial activities; surface parking lot activities; and other miscellaneous noise sources associated with typical urban activities such as human voices, overhead aircraft, and emergency vehicle sirens.

4.3.1.1 Noise-Sensitive Receptors

Some land uses are considered more sensitive to intrusive noise than others based on the types of activities typically engaged in at those land uses. The Noise Element defines noise-sensitive land uses as single-family and multi-unit dwellings, long-term care facilities (including convalescent and retirement facilities), dormitories, motels, hotels, transient lodging, and other residential uses; houses of worship; hospitals; libraries; schools; auditoriums; concert halls; outdoor theaters; nature and wildlife preserves; and parks.

Based on a review of the land uses in the vicinity of the Project Site, four (4) noise receptor locations were selected to represent existing noise-sensitive uses within 500 feet of the Project Development Area (receptor locations R1 through R4). These locations represent land uses that could qualify as noise-sensitive uses according to the definition above. As discussed below, noise measurements were conducted at the four off-site locations to establish baseline

noise conditions in the vicinity of the Project Development Area. In addition, the measurement locations provide an adequate basis to evaluate potential noise levels at other sensitive receptors located beyond the measurement location in the same direction from the Project Site. The locations of the four off-site noise-sensitive receptor locations are shown on Figure 2 (on page 11) and described in Table 4 (on page 12).

4.3.1.2 Ambient Noise Levels

Ambient noise measurements were taken at the four selected off-site locations on January 13, 2025. The baseline noise monitoring program was conducted on January 13, 2025, using a Larson-Davis Model 870 and a Quest Technologies Model 2900 Integrating/Logging Sound Level Meters.[8] A 24-hour measurement was conducted at receptor location R1.[9] Two 15-minute measurements were conducted at each of the remaining receptor locations during daytime and nighttime hours. The daytime ambient noise levels were measured between 10:00 A.M. and 12:00 P.M., and the nighttime ambient noise levels were measured between 10:00 P.M. and 12:00 A.M. The ambient noise measurements procedure followed the City's standards, which require ambient noise to be measured over a period of at least 15 minutes.[10]

The results of the ambient sound measurements are summarized in Table 4 (on page 12). Based on field observations, the current ambient noise at the measurement locations is dominated by local traffic and, to a lesser extent, helicopter flyovers and other typical urban noises. As indicated in Table 4, the existing daytime ambient noise levels at the off-site noise receptor locations ranged from 67.9 dBA (L_{eq}) at receptor location R2 to 73.4 dBA (L_{eq}) at receptor locations R1 and R3. The measured nighttime ambient noise levels ranged from 62.9 dBA (L_{eq}) at receptor location R2 to 72.0 dBA (L_{eq}) at receptor location R1. Thus, the existing ambient noise levels at all off-site locations are above the City's presumed daytime and nighttime ambient noise levels of 50 dBA (L_{eq}) and 40 dBA (L_{eq}), respectively, for residential, school and hotel uses. Consistent with the LAMC (Sections 111.01 and 111.03), the measured existing ambient noise levels are used as the baseline conditions for the purposes of evaluating the Project's noise levels.

---

[8] *These sound meters meet the minimum industry standard performance requirements for "Type 1" (Larson-Davis Model 870) and "Type 2" (Quest Technologies Model 2900) standard instruments as defined in the American National Standard Institute (ANSI) S1.4. It also meets the requirement specified in Section 111.01(i) of the LAMC that instruments be "Type S2A" standard instruments or better. The sound meter was calibrated prior to the measurements and operated according to the manufacturer's written specifications.*

[9] *A 24-hour measurement is typically conducted at one receptor location to obtain the pattern and validate the noise measurements at other receptor locations.*

[10] *LAMC Section 111.01.*

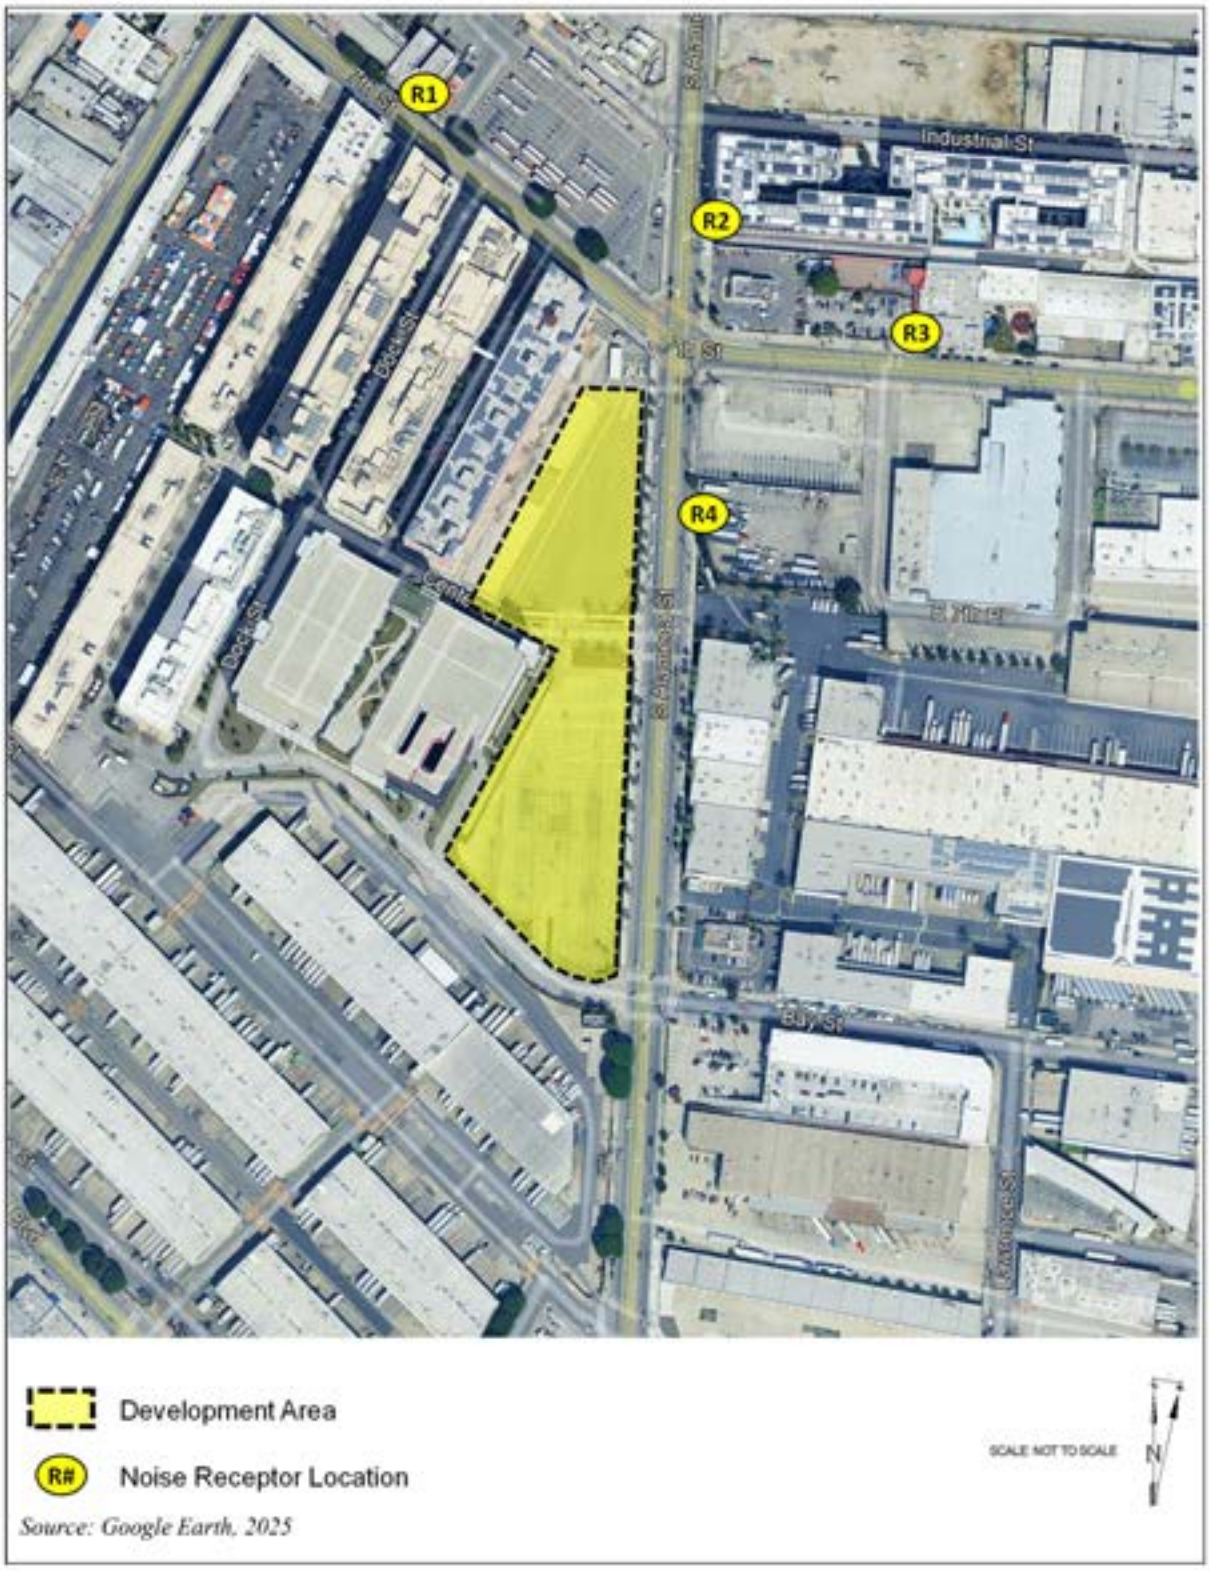

Figure 2. Noise Measurement Locations

Table 4. Existing Ambient Noise Levels

Receptor Location	Approximate Distance to Project Site,[a] Feet	Measured Ambient Noise Levels, dBA L_{eq}	
		Daytime Hours (7 A.M. to 10 P.M.)	Nighttime Hours (10 P.M. to 7 A.M.)
R1 – Hotel use located on the north side of 7th Street, northwest of the Project Site	580	73.4[b]	72.0[b]
R2 – Multi-family residential use located on the east side of Alameda Street, northeast of the Project Site	320	67.9	62.9
R3 – School use located on the north side of 7th Street, northeast of the Project Site	485	73.4	64.2
R4 – Proposed studio use located on the east side of Alameda Street, east of the Project Site	105	70.4	64.5

In addition to the ambient noise measurements in the vicinity of the Project Site, including the Development Area, the existing traffic noise on local roadways in the surrounding area was calculated to quantify the 24-hour CNEL noise levels using information provided by the Project Transportation Assessment.[11] Nine (9) roadway segments were selected for the existing off-site traffic noise analysis included in this section based on proximity to noise-sensitive uses along the roadway segments and potential increases in traffic volumes from the Project operation. Traffic noise levels were calculated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) and traffic volume data from the Transportation Assessment prepared for the Project. The TNM calculates the hourly Leq noise levels based on specific information including the hourly traffic volume, vehicle type mix, vehicle speed, and lateral distance between the noise receptor and the roadway. To calculate the 24-hour CNEL levels, the hourly L_{eq} levels were calculated during daytime hours (7:00 A.M. to 7:00 P.M.), evening hours (7:00 P.M. to 10:00 P.M.), and nighttime hours (10:00 P.M. to 7:00 A.M.). TNM calculates the 24-hour CNEL noise levels based on specific information, including Average Daily Traffic (ADT); percentages of day, evening, and nighttime traffic volumes relative to ADT; vehicle speed; and distance between the noise receptor and the roadway. Vehicle mix/distribution information used in the noise calculations is shown in Table 5 (on page 13).

[11] *Gibson Transportation Consulting, Inc., Transportation Assessment for the Alameda Square Project, Los Angeles, California, December 2024.*

Table 6 (on page 14) provides the calculated CNEL for the analyzed local roadway segments based on existing traffic volumes. As shown therein, the existing CNEL due to surface street traffic volumes ranges from 70.4 dBA CNEL along Central Street (between 6th Street to 7th Street) to 72.5 dBA CNEL along Olympic Boulevard (between Alameda Street and Lemon Street). Currently, the existing traffic-related noise levels along the analyzed roadway segments are between 70 dBA CNEL and 75 dBA CNEL, which are considered normally unacceptable for residential, hotel and school uses.

Table 6. Existing Roadway Traffic Noise Levels

Roadway Segment	Adjacent Land Use	Approximate Distance to Roadway Center Line (feet)	Calculated Traffic Noise Levels, CNEL (dBA)a	Noise-Sensitive Land Uses	Existing Noise Exposure Compatibility Category[b]
Central Street					
Between 6th St. and 7th St.	Motel	40	70.4	Yes	Normally Unacceptable
Between 7th St. and 8th St.	Industrial	40	71.0	No	Conditionally Acceptable
Alameda Street					
Between 6th St. and 7th St.	Residential	40	71.8	Yes	Normally Unacceptable
Between 7th St. and Bay St.	Studio (proposed)	40	71.4	No	Conditionally Acceptable[c]
Between Bay St. and Olympic Blvd.	Studio (proposed)	40	71.0	No	Conditionally Acceptable[c]
7th Street					
Between Central St. and Alameda St.	Motel	35	70.9	Yes	Normally Unacceptable
Between Alameda St. and Mateo St..	School	35	70.6	Yes	Normally Unacceptable
Olympic Boulevard					
Between Central St. and Alameda St.	Industrial	35	72.3	No	Conditionally Acceptable
Between Alameda St. and Lemon St..	Studio (proposed)	35	72.5	No	Conditionally Acceptable

[a] *Detailed calculation worksheets are included in Appendix B.*
[b] *Noise compatibility is based on the most stringent land use, per City's land use compatibility as provided in Table 2 (on page 7).*
[c] *Studio uses are not identified as noise sensitive uses by the L.A. CEQA Thresholds Guide. Therefore, existing noise exposure compatibility category is based on the existing industrial land use.*

5 PROJECT ANALYSIS

As noted above, this Noise Study is a supplemental analysis and is not required by the City's Housing Element Checklist. Refer to the Noise Study prepared for the Housing Element Checklist for an evaluation of construction noise and vibration and noise associated with use of outdoor areas.

5.1 City Criteria (Operational Noise)

The L.A. CEQA Thresholds Guide identifies the factors below to evaluate operational noise. A project would normally exceed City noise criteria from operation if:

- The Project causes the ambient noise levels measured at the property line of affected noise-sensitive uses to increase by 3 dBA in CNEL to or within the "normally unacceptable" or "clearly unacceptable" category (see Table 2 on page 7 for a description of these categories); or
- The Project causes the ambient noise levels measured at the property line of affected noise-sensitive uses to increase by 5 dBA in CNEL or greater and remain within the "normally acceptable" or "conditionally acceptable" category: or
- Project-related on-site operational (i.e., non-roadway) noise sources, such as outdoor building mechanical/electrical equipment, outdoor activities, loading docks, or parking facilities, increase the ambient noise level (hourly L_{eq}) at noise-sensitive uses by 5 dBA and more.
- Project-related operational on site (i.e., non-roadway) noise sources, such as outdoor building mechanical equipment, outdoor activities, or parking facilities, increase the ambient noise level (hourly L_{eq}) at noise-sensitive uses by 5 dBA.

The criterion used in this analysis for on-site operations presented above is an increase in the ambient noise level of 5 dBA (hourly L_{eq}) at the noise-sensitive uses, in accordance with the LAMC. The LAMC does not apply to off-site traffic (i.e., vehicles traveling on public roadways). Therefore, based on the *L.A. CEQA Thresholds Guide*, the criterion for off-site traffic noise associated with Project operations is an increase in the ambient noise level by 3 dBA or 5 dBA in CNEL (depending on the land use category) at noise-sensitive uses. In addition, the criterion for composite noise levels (on-site and off-site sources) is also based on the *L.A. CEQA Thresholds Guide*, which is an increase in the ambient noise level of 3 dBA or 5 dBA in CNEL (depending on the land use category) for the Project's composite noise (both Project-related on-site and off-site sources) at noise-sensitive uses.

5.2 Methodology

5.2.1 On-Site Stationary Noise Sources (Operation)

The Project's potential on-site stationary point-source noise levels were evaluated by (1) identifying the noise levels that would be generated by the Project's stationary noise sources, such as rooftop mechanical equipment, and parking facilities, and trash compactors; (2) calculating the noise level from each noise source at the identified surrounding representative sensitive-receptor property line locations; and (3) comparing such noise levels to the measured ambient noise levels to determine if City criteria are exceeded. The on-site stationary sources noise levels were calculated using the SoundPLAN (version 8.2) computer noise prediction model.[12] SoundPLAN is widely used by acoustical engineers as a noise modeling tool for environmental noise analysis.

5.2.2 Off-Site Roadway Noise (Operation)

Off-site roadway noise was analyzed using the SoundPLAN computer noise prediction model (based on FHWA's TNM emission levels) and traffic data from the Project's Transportation Assessment. Roadway noise levels were calculated at the sensitive receptor locations based on the estimated Project-generated traffic volumes. Roadway noise levels with the Project-related traffic were compared to conditions without the Project to determine Project-related noise levels for operational off-site roadway noise. In addition, cumulative off-site roadway noise levels were estimated based on the incremental change in the daily vehicle miles traveled (VMT), per the Program EIR.

5.3 Project Design Features

As part of the Project, outdoor mounted mechanical equipment will be enclosed or screened by the building design (e.g., a roof parapet) from view of the surrounding off-site noise-sensitive receptors at the street level. In addition, as shown on the plans for the Project, all loading docks will be located inside an enclosed space within the parking garage, which would be acoustically shielded from offsite noise-sensitive receptors.

5.4 Analysis of Project Operational Noise Levels

This section provides a discussion of potential operational noise levels at off-site noise-sensitive receptors. Specific operational noise sources addressed herein are (a) on-site stationary noise sources, including outdoor-mounted mechanical equipment (e.g., heating, ventilation, and air conditioning [HVAC] equipment), activities associated with the proposed

---

[12] *SoundPLAN GmbH, SoundPLAN version 8.2, 2020.*

outdoor spaces (located at Level 2 and Level 8), parking facilities, and loading docks; and (b) off-site mobile (roadway traffic) noise sources.

5.4.1 Mechanical Equipment

As part of the Project, new building mechanical equipment (e.g., air ventilation equipment) would be located at the building roof level and/or within each of the building structures. Although operation of this equipment would generate noise, Project-related outdoor mechanical equipment would be designed so as not to increase the existing ambient noise levels by 5 dBA in accordance with the City's Noise Regulations. Specifically, the Project would comply with LAMC Section 112.02, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise levels on the premises of other occupied properties by more than 5 dBA. In addition, as discussed above, all outdoor mounted mechanical equipment would be enclosed or screened from off-site noise-sensitive receptors.

Table 7 (below) presents the estimated on-site mechanical equipment noise levels at the off-site receptor locations. As shown in Table 7, the estimated noise levels from the mechanical equipment would range from 40.4 dBA (L_{eq}) at receptor location R1 to 48.7 dBA (L_{eq}) at receptor location R4. The estimated noise levels would be well below the existing ambient noise levels. Further, the estimated ambient noise levels at all off-site receptor locations with the addition of the Project's mechanical equipment would be below the criterion of 5 dBA (L_{eq}) above ambient noise levels (based on the lowest measured ambient noise levels).

Table 7. Mechanical Equipment Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Project Mechanical Equipment, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Criteria[a] dBA (L_{eq})	Exceed over Criteria
R1	72.0	40.4	72.0	77.0	0.0
R2	62.9	47.5	63.0	67.9	0.0
R3	64.2	47.2	64.3	69.2	0.0
R4	64.5	48.7	64.6	69.5	0.0

Notes:
[a] *Criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.*
Source: AES, 2023, See Appendix B.

5.4.2 Parking Facilities

The Project would provide up to 1,092 vehicular parking spaces. Sources of noise within the parking garage would primarily include vehicular movements and engine noise, doors opening

and closing. Noise levels within the parking facilities would fluctuate with the amount of automobile and human activity. Table 8 (below) presents the estimated noise levels from parking garage at the offsite receptor locations. As indicated in Table 8, the estimated noise levels from the parking facilities would range from 14.2 dBA (L_{eq}) at receptor location R1 to 29.5 dBA (L_{eq}) at receptor location R2. The estimated noise levels would be well below the existing ambient noise levels. In addition, the estimated ambient noise levels with the addition of the noise levels generated by the Project parking facilities would be below the criteria of 5 dBA (L_{eq}) above the ambient noise levels (based on the lowest measured ambient).

Table 8. Parking Facilities Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Project Parking, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Criteria* dBA (L_{eq})	Exceed over Criteria
R1	72.0	14.2	72.0	77.0	0.0
R2	62.9	29.5	62.9	67.9	0.0
R3	64.2	24.5	64.2	69.2	0.0
R4	64.5	19.8	64.5	69.5	0.0

Notes:
* *Criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.*
Source: AES, 2025, See Appendix B.

5.4.3 Loading Docks and Trash Compactors

As discussed above, loading docks and trash compactors would be located at the ground level of the building and mostly be shielded to the off-site sensitive receptors. Noise sources associated with the loading docks/areas and trash collection areas would include delivery/trash collection trucks and operation of the trash compactors. Based on measured noise levels from typical loading dock facilities and trash compactors, delivery/trash collection trucks and trash compactors could generate noise levels of approximately 70 dBA (L_{eq}) and 66 dBA (L_{eq}), respectively, at a distance of 50 feet.[13] Table 8 (above) presents the estimated noise levels at the off-site sensitive receptors resulting from the loading activities. As indicated in Table 8, the estimated noise levels from the loading docks would range from 29.7 dBA (L_{eq}) at receptor location R1 to 52.8 dBA (L_{eq}) at receptor location R2. The estimated ambient noise levels with the addition of the noise levels generated by the Project's loading activities and trash compactors would be below the criterion of 5 dBA (L_{eq}) above ambient noise levels (based on

[13] *RK Engineering Group, Inc., Wal-Mart/Sam's Club Reference Noise Level Study, 2003.*

the lowest measured ambient) at all off-site receptor locations. Therefore, noise levels from loading dock and trash compactor operations would not exceed City criteria.

Table 9. Loading Docks and Trash Compactors Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Project Loading Docks and Trash Compactors, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Criteria[a] dBA (L_{eq})	Exceed over Criteria
R1	72.0	29.7	72.0	77.0	0.0
R2	62.9	52.8	63.3	67.9	0.0
R3	64.2	46.0	64.3	69.2	0.0
R4	64.5	39.5	64.5	69.5	0.0

Notes:
[a] Criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.
Source: AES, 2025, See Appendix B.

5.4.4 Off-Site Mobile Noise Sources

5.4.4.1 Future Plus Project

Future roadway noise levels were calculated along nine roadway segments in the vicinity of the Project Site. The roadway noise levels were calculated using the traffic data provided in the Traffic Assessment prepared for the Project. The Project is expected to generate a net increase of 4,676 daily vehicle trips. As such, Project-related traffic would increase the existing traffic volumes along the roadway segments in the study area assessed in the Traffic Assessment when compared with Future Without Project conditions.

Table 10 (on page 21) presents the estimated noise levels associated with the off-site traffic. As shown on Table 10, the estimated noise levels from off-site traffic range from 43.0 dBA (L_{eq}) at receptor R4 to 48.8 dBA (L_{eq}) at receptor location R2, which would be below the existing ambient noise levels. In addition, the Project noise levels from the off-site traffic, when added to the ambient noise level at each sensitive receptor location would also be below the criteria.

5.4.4.2 Existing Plus Project

The analysis of traffic noise levels provided above was based on the incremental increase in traffic noise levels attributable to the Project as compared to Future Without Project conditions. An additional analysis was carried out to determine the potential noise increases based on the increase in noise levels due to Project-related traffic compared with the existing baseline traffic noise conditions.

As shown in Table 11 (on page 22), when compared with existing conditions, the Project would result in a maximum increase of up to 0.5 dBA (CNEL) in traffic noise along the roadway segment of Alameda Street (between 7th Street and Olympic Boulevard). At other roadway segments analyzed, the increase in traffic-related noise levels would be 0.3 dBA or lower. The increase in traffic noise levels along the analyzed roadway segments would be considered negligible and below the 3-dBA CNEL criterion, as the estimated noise levels with the Project fall within the normally unacceptable land use category (i.e., between 70 and 75 dBA CNEL).

5.4.5 Composite Noise Levels from Project Operations

An evaluation of potential composite noise level increases (i.e., noise levels from all on-site noise sources combined) at the analyzed sensitive receptor locations was also performed. This evaluation of composite noise levels from all on-site Project-related noise sources, evaluated using the CNEL noise metric, was conducted to determine the contributions at the off-site noise-sensitive receptor locations

Table 12 (on page 23) presents the estimated composite noise levels in terms of CNEL at the four off-site sensitive receptor locations from the Project-related noise sources. As indicated in Table 12, the Project would result in an increase in composite noise levels ranging from 0.2 dBA at the uses represented by receptor location R3 to 1.1 dBA at the uses represented by receptor location R2. There is no noise increase anticipated at receptor location R1. The composite noise level from Project operation at all off-site receptor locations would be below the 3-dBA criterion as the Ambient Plus Project Composite noise level falls within the normally unacceptable (70 to 75 CNEL) range for residential, hotel and school land use categories.

Table 10. Roadway Traffic Noise Levels – Future Plus Project

Roadway Segment	Adjacent Land Use	Calculated Traffic Noise Levels[a] (CNEL (dBA))		Increase in Noise Levels due to Project (CNEL (dBA))
		Future Without Project	Future Plus Project	
Central Street				
Between 6th St. and 7th St.	Motel	70.8	70.8	0.0
Between 7th St. and 8th St.	Industrial	71.3	71.3	0.0
Alameda Street				
Between 6th St. and 7th St.	Residential	75.1	75.2	0.1
Between 7th St. and Bay St.	Studio (proposed)	74.6	74.9	0.3

AES
ACOUSTICAL ENGINEERING SERVICES

Project Composite Noise Calculations (CNEL)

Project: The ROW DTLA Residential Project
Applicant Supplemental Analysis

Receptor	Ambient	Traffic[a]	Mechanical	Outdoor	Parking	Loading & Trash Compactor		Project Composite	Ambient + Project	Increase
R1	78.8	54.3	47.1	38.6	20.9	26.9		55.2	78.8	0.0
R2	69.1	58.8	54.2	60.7	36.2	50.0		63.6	70.2	1.1
R3	72.7	55.3	53.9	54.6	31.2	43.2		59.5	72.9	0.2
R4	71.1	63.1	55.4	56.2	26.5	36.7		64.5	72.0	0.9

[a] - Project traffic noise levels at each receptor is based on the traffic noise analysis for the roadway segment in front of the receptor, adjusted for distance and barrier (if present), as provided in the table below.

		Traffic Noise Levels, CNEL								
Receptor	Roadway Segment	Existing	Existing + Project	Project Only	distance to roadway, ft	Existing	Existing + Project	barrier	distance to Center Line	adj. for distance
R1	7th Street	67.6	67.8	54.3	10	72.6	72.8	-5	25	0.0
R2	Alameda St.	75.1	75.2	58.8	10	75.1	75.2	0	25	0.0
R3	7th Street	74.9	74.9	55.3	10	74.9	74.9	0	25	0.0
R4	Alameda St.	74.6	74.9	63.1	10	74.6	74.9	0	25	0.0

PROJECT DESCRIPTION

The Applicant is proposing to develop three buildings containing 1,000 residential units including 114 Very Low Income Housing units in three buildings and 6,547 square feet of commercial (retail/restaurant) uses within two buildings (Project) on a portion of the site located at 757–787 S. Alameda Street, 1318–1396 E. 7th Street, 736–796 S. Central Avenue, 1301–1327 E. 8th Street, 700–760 S. Market Court, 720–746 S. Terminal Street, and 760 S. Warehouse Street in the Downtown Community Plan area of the City of Los Angeles (City), presently know as ROW DTLA (Project Site). The Project would redevelop the two existing surface parking lots (Development Area) into a mixed-use development located on the north and south sides of Center Street, on the eastern edge of the Project Site. The Development Area is comprised of approximately 4.85 gross acres.

Building A would include commercial space at the first floor; 410 residential units at the first through eighth floors; and two levels of subterranean parking. Building B would include 214 residential units at the first through eight floors and two levels of subterranean parking. Building C would include commercial space at the first floor; 376 residential units at the first through eighth floors; and two levels of subterranean parking. The proposed buildings would range from approximately 100 feet to 103 feet in height. Upon completion, 884,278 square feet of new floor would be provided in the Development Area. When accounting for the existing floor area to remain, approximately 2,477,695 square feet of floor area would be provided within the Project Site with a total FAR of 1.86:1.

The Project would include up to 1,092 vehicular parking spaces. A total of 96,278 square feet of open space would also be provided. The existing uses within the remainder of the Project Site outside of the Development Area will remain and would not be modified by the Project.

EXISTING WATER INFRASTRUCTURE

According to Los Angeles Department of Water and Power (LADWP) Water Service Maps 124-213 **(Exhibit 1)**, the following infrastructure exists surrounding the Project Site:

- Alameda Street – A 12" water main (No. 97696(83)) runs north/south adjacent to the Project Site along Alameda Street.
- 7th Street – A 12" water main (No. 5180(1904)) runs northwest/southeast adjacent to the Project Site along 7th Street.

A total of four (4) existing public fire hydrants are directly adjacent to the project site along Alameda Street to the east. An additional two (2) existing private fire hydrants are on-site to the west of the Project. The public hydrants are labeled #1-4 on the Water Service Map in **Exhibit 1**. A request for Information on Fire Flow Availability (IFFA) was made on July 22, 2025, for three (3) public hydrants (Hydrants #1, 2 and 4) based on the proposed connection points. It was assumed that fire hydrant #3 would produce similar flow results as nearby hydrants, thus it was not tested. The results were provided on August 1, 2025, and are summarized below. The IFFA results from the City of Los Angeles Department of Water and Power (LADWP) can be found in **Appendix 1**.

- Public Hydrant #1 (ID# 8720) is located on the west side of Alameda Street, approximately 38 feet south of 7th Street. The hydrant is fed by an existing 12" water main in Alameda Street. The IFFA results show static and residual pressures of 60 psi and 50 psi, respectively. The flow at 20 psi was determined to be 1,500 GPM.

- Public Hydrant #2 (ID# 16208) is located on the west side of Alameda Street, approximately 287 feet south of 7th Street. The hydrant is fed by an existing 12" water main in Alameda Street. The IFFA results show static and residual pressures of 60 psi and 49 psi, respectively. The flow at 20 psi was determined to be 1,500 GPM.

- Public Hydrant #4 (ID# 16209) is located on the west side of Alameda Street, approximately 122 feet north of Bay Street. The hydrant is fed by an existing 12" water main in Alameda Street. The IFFA results show static and residual pressures of 60 psi and 49 psi, respectively. The flow at 20 psi was determined to be 1,500 GPM.

PROPOSED WATER INFRASTRUCTURE

DOMESTIC FLOW

The Project proposes domestic service for each of the three buildings. Three Service Advisory Requests (SARs) were submitted to the City of Los Angeles Department of Water and Power (LADWP) to test the existing water mains at the proposed service connections for the Project Site. The three (3) SARs can be found in **Appendix 2** and are summarized below.

- SAR #111781 (Building A) measured the 12" main under Alameda Street for a proposed 6" service. The system's maximum pressure is 61 psi based on a street curb elevation of 246' above sea level. The SAR was approved on August 1, 2025, with a flow of 1,400 GPM at 52 psi for a 6" fire service and 4" domestic combo service.

- SAR #111782 (Building B) measured the 12" main under Alameda Street for a proposed 6" service. The system's maximum pressure is 61 psi based on a street curb elevation of 246' above sea level. The SAR was approved on August 1, 2025, with a flow of 1,400 GPM at 52 psi for a 6" fire service and 4" domestic combo service.

- SAR #111742 (Building C) measured the 12" main under Alameda Street for a proposed 6" service. The system's maximum pressure is 61 psi based on a street curb elevation of 246' above sea level. The SAR was approved on August 1, 2025, with a flow of 1,400 GPM at 53 psi for a 6" fire service and 4" domestic combo service.

The installation of the new water services for the Project will be done by LADWP, which will include new hot taps, laterals, and meters up to the property line. All water infrastructure within the property line will be constructed by the developer. Fire service water line will be piped into the buildings from the meter. Backflow preventers, any required fire water tanks and fire pumps will be documented on the plumbing drawings. Pressure regulators will be installed where the pressures exceed 80 psi at the building pad elevation as required in accordance with the Los Angeles City Plumbing Code.

FIRE FLOW

The proposed use of the Project Site falls under High Density Residential and Neighborhood Commercial. Under Los Angeles Municipal Code (LAMC) Table 57.507.3.1, the fire flow standards require a minimum fire flow of 4,000 gallons per minute (gpm) from four hydrants flowing simultaneously, at a minimum residual pressure of 20 psi[1].

There are currently four (4) public fire hydrants and two (2) private hydrants available as described in detail in Section 1.1 of this report and their locations shown on **Exhibit 1**. Simultaneous triple-flow tests were performed on three (3) existing hydrants resulting in a combined flow of 4,500 GPM at 20 psi for each group. Based on the SAR and Fire Flow Availability Reports described in this report and

[1] Los Angeles Municipal Code, Section 57.507.3

attached in **Appendix 1 and 2**, available fire flow is adequate for the Project.

The nearby water infrastructure is adequate to serve the proposed development and its connections per the Information on Fire Flow Availability (IFFA) and Service Availability Request (SAR) provided by LADWP.

PROPOSED WATER DEMAND

A Water Supply Assessment (Appendix 4) was prepared on April 17, 2025, for the Project by the City of Los Angeles Department of Water and Power. According to the assessment, the projected total net water demand increase for the Project is estimated to be 89-acre feet (AF) annually equating to 79,449 gallons per day (GPD) (approximately 55 GPM). The demand calculation accounts for the additional voluntary conservation measures estimated at approximately 4 AF per year.

Indoor water use demand for the Project was determined using Sewer Generation Factors (SGF) published by the City of Los Angeles Department of Public Works Bureau of Sanitation (LASAN) in 2012. Outdoor landscape water use demand for the Project was estimated per the California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. Additional conservation measures beyond the current water conservation ordinance will be considered.

As stated in the Water Supply Assessment, the additional water demand of 89 AF per year has been accounted for in the City's overall total demand projections in the LADWP 2020 UWMP using a service area-wide approach that does not rely on individual development demand. The LADWP 2020 UWMP utilized the Southern California Association of Government's RTP data that provide for more reliable water demand forecasts while considering changes in population, housing units and employment.

As stated in the Water Supply Assessment, it has been determined that the Project is consistent with the demographic forecasts for the city from the Southern California Association of Government' (SCAG)'s 2020 RTP/SCS. LADWP has determined that the Project's net annual water demand is included in the LADWP's 2020 Urban Water Management Plan (UWMP), which forecasts adequate water supplies to meet all projected water demands in the city through the year 2045. LADWP concludes that the projected net water demand of 89 AFY for this Project is accounted for in the LADWP's 2020 UMP 25-year water demand projections. LADWP has determined that it will be able to meet the projected net water demand of the Project as well as existing and planned future water demands within its service area.

SEWER

EXISTING SEWER INFRASTRUCTURE

According to NavigateLA, record information including as-built drawings and observed evidence, there are several existing sewer mains adjacent to and crossing through the Project Site and Development Area. Existing lateral and wye locations will need to be confirmed prior to final design. A map of existing sewer infrastructure from Navigate LA is included in **Exhibit 2**.

- Alameda Street – There is an existing 24" vitrified clay pipe (VCP) main line in Alameda Street with a Pipe ID# of 5161608951616105A. The City of Los Angeles sewer wye maps indicate that existing wye connections are available.
- 7th Street – There is an existing 10" VCP main line in 7th Street with a Pipe ID# of 5161602151616051A. The City of Los Angeles sewer wye maps indicate that existing wye connections are available.

PROPOSED SEWER INFRASTRUCTURE

A Sewer Capacity Availability Report (SCAR) application was submitted to discharge the Project sewer demand to the 24" VCP sewer main in Alameda Street. The purpose of the SCAR is for the City of Los Angeles to evaluate the existing public sewer systems to determine if adequate capacity is available to safely convey sewage from proposed development projects. A SCAR outlining the anticipated sewer demand was received on August 19, 2025, and is included in **Appendix 4**.

The SCAR analyzed the proposed uses and flows and is included in **Appendix 3**. This SCAR was approved on August 19, 2025, with ID# 74-7765-0825 and accompanied by a Will-Serve and is a part of **Appendix 4**. The SCAR approves a maximum allowable capacity of 1,011,079 GPD from the Project to the 24" VCP sewer main in Alameda Street. This is significantly higher than the 79,449 GPD determined by the WSA for water demand due to the inclusion of sewer ejectors intended for fire sprinkler system discharge and testing. Per the instruction of LABOE, the Project must assume each of the three sewer ejectors and their 209 GPM flows run all day, thus the 902,880 GPD for sewer ejectors included within the SCAR.

LABOE provided remarks on the SCAR for the developer. The developer must install and maintain private odor traps in the public ROW outside of the property line and before the main line that adhere to LABOE Standard Plan S-112 for the 24" connections on Alameda Street. LABOE shall confirm the connection method to the 24" VCP sewer main.

Flows from the proposed sewer ejectors shall be permitted only for fire suppression and emergency usage. An Industrial Waste Management Division (IWMD) Permit is required for the fire water discharge associated with the proposed sewer service laterals. The SCAR accounts for the proposed use of the Project and does not anticipate additional capacity is needed. Therefore, sufficient capacity exists in the sewer system after accounting for required water savings and taking into account water uses that do not directly discharge to the sanitary sewer system.

The connection size is estimated to be 6" for each of the 3 new buildings. Confirmation of the size of available sewer lateral connections will require approval from City of Los Angeles Department of Sanitation during design phase.

Introduction

A Water Supply Assessment (WSA) includes an analysis of the sufficiency of a public water system to meet a proposed development's anticipated water demand. Per California Water Code (CWC) Sections 10910-10915, a WSA is prepared for specified types of development projects subject to the California Environmental Quality Act (CEQA) by the public water system that supplies water to the proposed project. The water supplier will determine whether the projected water demand associated with the proposed project was accounted for in the water supplier's most recently adopted Urban Water Management Plan (UWMP) and that there is an adequate 20-year water supply. For the City of Los Angeles (City), the Los Angeles Department of Water and Power's (LADWP) 2020 UWMP serves as the City's master plan for reliable water supply and resources management consistent with the LADWP's goals and policy objectives.

The ROW DTLA Residential Project (Project) is a proposed development within the 2021-2029 Citywide Housing Element and the Updates to the Safety Element Plan for a Healthy LA, which does not require additional CEQA documentation. However, the City of Los Angeles Department of City Planning (Planning Department), serving as the CEQA lead agency for this Project, has requested LADWP, which is the public water system for this Project, to prepare a WSA on February 24, 2025. LADWP has performed the assessment contained herein.

This WSA is prepared to meet the applicable requirements of CWC Sections 10910-10915. Significant references and data for this WSA are from LADWP's 2020 UWMP, adopted by the Board of Water and Power Commissioners (Board) on May 25, 2021. LADWP's 2020 UWMP is incorporated by reference and is available through LADWP's website, www.ladwp.com/uwmp.

LADWP's 2020 UWMP details the department's plans to meet all of the City's current and 25-year projected water needs. LADWP is planning for projected water demands and variable hydrology through expansion of local water supply programs and reduction of purchased imported water. These local water supply programs include significant investments in local groundwater, recycled water, stormwater capture, and water conservation and water-use efficiency to diversify LADWP's water supply portfolio.

Findings

The proposed Project's projected net water demand is 89 acre-feet per year (AFY). This projected annual net water demand was calculated using information from the Project's scope of work provided by the Planning Department, and the net demand included additional voluntary water use efficiency measures that the Alameda Square Owner, LLC (Applicant) has committed to implement for the Project.

The basis for approving WSAs for projects is LADWP's most recently adopted UWMP. LADWP's 2020 UWMP contains LADWP's water demand forecast, which uses long-term demographic projections for population, housing, and employment to determine the total projected water supplies up to 2045 during normal, single-dry, and multiple dry-water years. The City's water demand projection in LADWP's 2020 UWMP was developed based on the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020 RTP/SCS) demographic projection by the Southern California Association of Governments (SCAG). The

demographic projection was provided to LADWP from the Metropolitan Water District of Southern California (MWD), who collaborates with SCAG to aggregate demographic data for each of its 26 member agencies. LADWP's 2020 UWMP identified water supplies to meet projected water demands through 2045.

The Planning Department has indicated that the Project conforms with the use and intensity of development permitted by the City's General Plan. The Planning Department has also determined that the Project is consistent with the demographic projections for the City from the 2020 RTP/SCS. Based on the information provided by the Planning Department, the Project's anticipated net water demand is accounted for within LADWP's 2020 UWMP projected water supplies for normal, single-dry, and multiple-dry years through the year 2045. Therefore, the City's water supply projections in LADWP's 2020 UWMP are sufficient to meet the water demand for projects that are determined by the CEQA lead agency to be consistent with the 2020 RTP/SCS by SCAG. LADWP finds adequate water supplies will be available to meet the Project's net water demand of 89 AFY during normal, single-dry, and multiple-dry water years, in addition to the existing and planned future demands on LADWP.

This WSA evaluates and confirms that the City's long-term water supply is able to accommodate the Project. A subsequent WSA revision may be required if one or more of the following occurs:

1. Changes in the Project result in a substantial increase in net water demand for the Project
2. Changes in the circumstances or conditions substantially affecting the ability of LADWP to provide a sufficient supply of water for the Project
3. Significant new information becomes available which was not known and could not have been known at the time when WSA was prepared.

If deemed necessary, the Applicant may request a revised WSA through the Planning Department.

This WSA is also not an approval for a water service connection. A separate request shall be made to LADWP requesting an evaluation of water service connection for the Project. Also, this WSA is an informational document prepared for use in the Planning Department's environmental review of the Project under CEQA, and it assesses the adequacy of water supplies to serve the Project's existing and planned future water demands within LADWP's service area. Approval of this WSA is not equivalent to approval of the Project.

The ROW DTLA Residential Project Description

The following project information was obtained from the Planning Department's WSA Request Letter and the scope confirmation e-mail:

Project Name:	The ROW DTLA Residential Project
Lead Agency:	City of Los Angeles Department of City Planning
Community Plan:	Downtown

The Project will develop an approximately 4.84-acre project area, as shown in Figure 1, for both residential and commercial use. The project area is generally bounded by 7th Street to the north, Alameda Street to the east, Bay Street to the south, and existing commercial and industrial buildings to the west.

Source: Navigate LADWP

Figure 1: Project Location Map

The project area is surface parking lots, which will be demolished. The surface parking lots do not have an existing water usage.

The proposed Project is a mixed-use development of three new eight-story mixed-use buildings with a total floor area of 884,247 square feet (sf). The Project will contain the following uses:

- Multi-family dwellings with a total of 1,000 dwelling units
- residential amenities include lounges, gym, outdoor recreation, office, and pool and spa
- 6,547 sf of restaurant space
- covered parking
- landscaping

The ROW DTLA Residential Project Estimated Net Water Demand

The projected net water demand for the Project is estimated to be 89 AFY, which accounts for the additional voluntary conservation measures estimated at approximately 4 AFY.

In evaluating the Project's net water demand, the Sewer Generation Factors (SGF), published by the City of Los Angeles Department of Public Works Bureau of Sanitation (LASAN) in 2012, are applied to the Project's scope of work in order to calculate the indoor water use. SGFs are factors of the amount of wastewater generated (gallons per day) per unit of use (sf, dwelling unit, seat, etc.). LASAN publishes a list of SGFs for approximately 175 different building use types in the City. Outdoor landscape water demand is estimated using the California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. LADWP also encouraged the Applicant to implement additional water conservation measures above and beyond the current water conservation ordinance requirements in order to reduce the Project's net water demand. For the Project, the Applicant has committed to additional voluntary conservation estimated at approximately 4 AFY.

The net water demand, which is the projected additional water demand of the Project, is estimated by subtracting the existing water demand and the additional voluntary water conservation amount from the total projected water demand.

Table I shows a breakdown of the existing and proposed types of use for the Project, and the corresponding estimated water demands inclusive of the required and voluntary conservation measures for this Project. Types of use were derived from the WSA Request Letter and the scope confirmation e-mail, which are both located in Appendix A.

Table II shows an estimation of the total volume of additional voluntary water conservation based on conservation measures the Applicant had committed to in their Voluntary Water Conservation Measures Letter, which are attached as Appendix B.

TABLE I
The ROW DTLA Residential Project
Estimated Net Water Demand

Existing Use to be Removed[1]	Quantity	Unit			Existing Water Use to be Removed (gpd)	(af/y)
Surface Parking Lots[2]	209,373	sf				
Existing to be Removed Total	**209,373**	**sf**			**0**	**0.00**

Proposed Use[1]	Quantity	Unit	Water Use Factor[3] (gpd/unit)	Base Demand (gpd)	Required Ordinances Water Savings[4] (gpd)	Projected Water Demand (gpd)	(af/y)
Residential Apartment: Studio	516	du	75.00	38,700			
Residential Apartment: 1 bdr	402	du	110.00	44,220			
Residential Apartment: 2 bdr	82	du	150.00	12,300			
Base Demand Adjustment[5]				10,236			
Residential Units Total	**1,000**	**du**		**105,456**	29,034	**76,422**	**85.61**
Residential Lounge	12,230	sf	0.05	612			
Leasing Office	600	sf	0.12	72			
Gym	1,500	sf	0.65	975			
Outdoor Kitchen/Dining	1,200	sf	0.13	154			
Full-Service Restaurant (6,547 sf)[6]	219	seat	30.00	6,570			
Residential Amenities and Commercial Total				**8,383**	3,954	**4,429**	**4.96**
Landscaping, Pool, and Spa[7]	**51,566**	**sf**		**4,744**	2,251	**2,493**	**2.79**

Los Angeles Department of Water and Power – 2020 UWMP

The California Urban Water Management Planning Act (first effective on January 1, 1984) requires every urban water supplier prepare and adopt a UWMP every five years in compliance with state guidelines and requirements. The main goals of UWMPs are to forecast future water demands and water supplies under average and dry hydrologic conditions, identify future water supply projects, and provide a reliability assessment under average, single dry year, and multi-dry years, and assess near term drought risk management.[1]

Water Supplies

The Los Angeles Aqueducts (LAA), local groundwater, purchased water from MWD, and recycled water are the primary sources of water supplies for the City. Table III shows LADWP water supplies from Fiscal Year Ending (FYE) 2020 to FYE 2024 from these sources.

Table III
LADWP Water Supply

Fiscal Year Ending	Los Angeles Aqueducts (AF)	Local Groundwater (AF)	MWD (AF)	Recycled Water (AF)	Transfer, Spread, Spills, and Storage (AF)	Total (AF)
2020	292,095	34,363	152,647	9,641	1,155	487,591
2021	128,268	51,070	316,627	11,455	-938	508,359
2022	69,183	53,057	366,690	12,022	208	500,743
2023	184,320	28,170	219,406	9,428	468	440,855
2024	291,098	6,521	140,497	10,030	-212	448,358

Note: Units are in area-feet (AF).

[1] *City of Los Angeles Department of Water and Power 2020 Urban Water Management Plan.*

1.0 Los Angeles Aqueduct

The City receives surface water and groundwater from the Eastern Sierra through the Los Angeles Aqueduct (LAA). LADWP constructed the first LAA in 1913 to convey water from the Eastern Sierra to the City. In 1940, the LAA was extended 40 miles north from the Owens River to the Mono Basin. To meet additional water demands from the City, a second barrel of the LAA was constructed and completed in 1970. The second LAA increased the City's capacity to deliver water from the Eastern Sierra from 485 cubic feet per second (cfs) to 775 cfs. The value of the City's historical investment in the LAA system is substantial because the City has benefited from the LAA's delivery of high-quality, cost-effective water supplies from the Eastern Sierra for over a century.

The City's water rights in the Eastern Sierra are comprised of riparian rights, pre-1914 appropriations, and post-1914 appropriation licenses held on various streams in the Mono Basin and Owens Valley. The most significant basis for export of surface water from the Eastern Sierra is an appropriation claim in 1905 to divert up to 50,000 miner's inches (1,250 cfs) from the Owens River. Up to 16,000 AFY can be supplied from Mono Basin, which is permitted by the 1994 Mono Lake Basin Water Right Decision 1631. Decision 1631 set a limit on LADWP water exports from the Mono Basin, which were set to a range of 0 to 16,000 AFY based on Mono Lake's water elevation. Aside from the primary surface water rights, the groundwater right in the Owens Valley is managed under the 1991 Long Term Water Agreement (LTWA) and uses vegetation water demand and available soil moisture to determine whether groundwater wells can be pumped. Since 1991, the average annual pumping from Owens Valley wellfields has been less than 75,000 AFY compared to on average 107,000 AFY from 1974 to 1990.

Annual water deliveries from the LAA to the City are impacted by hydrologic variability in the Eastern Sierra and water set aside for environmental projects. At its peak in fiscal year ending (FYE) 1984, the LAA delivered 531,729 AF to the City. Concerns over environmental impacts have required the City to reallocate approximately one-half of the LAA water supply to other uses within the Owens Valley and Mono Basin, such as environmental enhancement and mitigation projects and uses. The expected annual long term LAA delivery from 2020 to 2045 will range from approximately 184,200 AFY to 192,000 AFY for average hydrologic conditions.

The primary reliance on LAA supply with impacts due to natural variability and water set aside for environmental projects is not sufficient to meet the City's annual water demands; therefore, LADWP has implemented, and continues to increase, stormwater capture, local groundwater, water conservation, water use efficiency, and water recycling programs to diversify LADWP's local water supplies. Additionally, LADWP can purchase supplemental imported water from MWD to meet the City's remaining water demands.

For additional information, refer to Chapter 4 "Los Angeles Aqueduct System" of LADWP's 2020 UWMP.

2.0 Local Groundwater Supplies

Local groundwater provided approximately 7 percent of City's total water supply from FYE 2020 to FYE 2024. This amount declined considerably since 1970 when local groundwater provided up to 23 percent of the total water supply during extended dry periods. In recent years, contamination issues have impacted LADWP's ability to fully utilize its local groundwater entitlements and supplies. In response to this issue and to address the hydrologic variability impacts to imported water supplies, LADWP has a focus on sustainable management of its local groundwater basins. LADWP continues to invest in stormwater capture projects as well as advanced water purification systems to produce advanced treated recycled water for groundwater replenishment. Furthermore, LADWP has, and will continue to, conjunctively use the groundwater basin within the City to store available LAA flows in wet years as future supply during dry periods.

The City's total adjudicated water rights are approximately 109,809 AFY, which are located within the San Fernando Basin (SFB), Sylmar Basin, Central Basin, and West Coast Basin. There are additional groundwater basins near and within the Los Angeles area, such as the unadjudicated Hollywood, Santa Monica, and northern Central Basins that may provide additional groundwater supplies for the City.

The SFB is the primary source of local groundwater for the City. It is located in the Upper Los Angeles River Area (ULARA) and spans 112,000 acres. The ULARA encompasses the San Fernando, Sylmar, Verdugo and Eagle Rock Basins. It is managed by a court-appointed Watermaster and administrative committee that oversees the operation of groundwater system and report the groundwater elevations and water quality. The City's average SFB groundwater rights is approximately 87,000 AFY. LADWP is implementing its SFB Groundwater Remediation Program to help restore the access to SFB as a drinking water source and groundwater storage. The SFB groundwater remediation facilities are expected to be complete and operational in 2025.

LADWP also receives SFB water through the Los Angeles-Burbank Interim Interconnection Pipeline. In 2015, the City of Los Angeles and the City of Burbank entered into an agreement to construct and operate the Los Angeles-Burbank Interim Interconnection and began delivery of a minimum of 500 AF of blended water in August 2019. The blended water consists of SFB groundwater treated at the Burbank Operable Unit and Metropolitan Water District of Southern California imported water supply. This connection began service in August 2019 and will operate until early 2029.

The Central Basin is another source of groundwater supply for the City. The Central Basin Watermaster oversees this area that is located in the southeastern part of the Los Angeles Coastal Plan in Los Angeles County. The City has approximately 17,236 AFY of groundwater rights in this basin. LADWP is implementing the Manhattan and 99th St. Wellfield Improvement Projects to address several issues such as water quality matters, deteriorating groundwater pumps, and necessary upgrades. These projects are expected to be completed in 2025.

Besides the SFB and Central Basin, the City holds water rights in the following local groundwater basins:

1. The Sylmar Basin is an adjudicated basin within the ULARA that provides 3,570 AF of annual groundwater rights.
2. The Eagle Rock Basin is an adjudicated basin within the ULARA that provides 500 AF of annual groundwater rights. Although the City has the right to produce groundwater from the Eagle Rock Basin, there are no current plans to establish groundwater production facilities here.
3. The West Coast Basin is managed by the West Coast Basin Watermaster and is located in the southwestern part of the Los Angeles Coastal Plain in Los Angeles County. The City has the right to pump 1,503 AF per year. In 2014, the West Coast Basin Judgment was amended to increase certain parties', like LADWP's, pumping capacity to 5,000 AFY of unused West Coast Basin rights out of the Central Basin. This basin has known groundwater quality problems; therefore, LADWP has discontinued use of West Coast Basin facilities in 1980 until further studies are completed to restore groundwater pumping.

Groundwater supplies from the San Fernando, Sylmar, and Central Basins serving the City for the last available five years are shown in Table IV.

Table IV
Historical Local Groundwater Production by Basin

Fiscal Year (July-June)	San Fernando (AF)	Sylmar (AF)	Central (AF)
2019-2020	35,949	2*	10*
2020-2021	53,625	1,368*	2,247
2021-2022	48,408	3,018	4,562
2022-2023	24,804	1,858	3,298
2023-2024	6,318	7*	17*

*Small quantities pumped from Sylmar and Central Basin were for water quality testing purposes, not as water supply

LADWP also has groundwater rights outside the of City. There are 3,975 AF of groundwater rights in the Antelope Valley Groundwater Basin. This basin only allows the native water rights to be used locally within the Antelope Valley; however, LADWP would have the ability to store water it imports into the basin for future export. LADWP would be able to recover imported and stored water for export to the City at times when it is necessary to manage seasonal peak demands or augment supplies during dry periods, emergencies, or natural disasters.

The Central and West Los Angeles areas of the City overlie the unadjudicated groundwater basins of Hollywood Basin, Santa Monica Basin, and the northerly portion of the unadjudicated Central Basin. For the Santa Monia Basin, LADWP and four other local agencies have formed the Santa Monica Basin Sustainability Agency to create a Groundwater Sustainability Plan that was approved by the Department of Water Resources in October 2023. LADWP is considering and exploring opportunities to develop groundwater resources in a manner that is locally sustainable and in cooperation with its regional partners to increase the City's use of local resources for all these other groundwater basins.

For additional information, refer to Chapter 5 "Local Groundwater" of LADWP's 2020 UWMP.

3.0 Water Conservation

Water conservation and water use efficiency have significant beneficial effects on the City's water use patterns to reduce water demands. Water conservation has become a permanent part of LADWP's water resources management philosophy. The City's total water usage today is about the same as fifty years ago despite a significant increase in population of over one million people, reflecting the success and importance of the City's water conservation and water use efficiency strategies. Conservation will continue to be an important part of maintaining long term water supply reliability and is a key component of LADWP's goals to reduce potable water use per capita by 22.5 percent in 2025 and 25 percent by 2035.

LADWP has developed many progressive water conservation and water use efficiency programs in conjunction with state and local conservation ordinances and plumbing codes. The 2018 State bills, Assembly Bill 1668 and Senate Bill 606, are being incorporated into the water supply planning process to ensure that the standards are met in the future. Since inception of LADWP's conservation program, the estimated cumulative annual active savings are over 150,000 AF as of FYE 2020. Additional passive water conservation savings are achieved because of plumbing code mandates, local conservation ordinances, and changes in customer behavior due to outreach and educational programs.

Since 1988, the City has utilized ordinances as a tool to reduce water waste, beginning with the adoption of its first version of a plumbing retrofit ordinance. The applicable ordinances are, but not limited to: 2009 City's "High Efficiency Plumbing Fixture", 2016 Citywide Water Efficiency Standards Ordinance, the 2016 Emergency Water Conservation Plan, and the 2025 Model Water Efficient Landscape Ordinance (MWELO). The conservation ordinances were developed for the City to implement water demand management measures in case of a water supply shortage and to respond to ongoing dry conditions. For a full list of conservation ordinances prohibited water uses for various levels, please refer to LADWP's 2020 UWMP.

LADWP also achieves and maintains water use reductions through the application of tiered volumetric water rates. Since 1993, LADWP has used an ascending tier water rate structure that is entirely volumetric based pricing. LADWP's tiered volume water rates, which were last amended by the City's Water Rate Ordinance (Ordinance No. 184130) effective April 15, 2016, incorporate and further reinforce foundational water conservation and water use efficiency.

LADWP offers customer rebates and incentives to promote the installation of water-efficient fixtures and appliances. The rebates and incentives are administered through MWD's SoCal Water$mart Program. This program delivers uniform rebate amounts across the MWD service area to all MWD member agencies like LADWP. LADWP takes full advantage of regional programs for many product rebates offered through MWD for the residential and Commercial, Industrial, and Institutional (CII) sector, and adds supplemental funding to increase the rebate incentives provided for LADWP customers for many qualifying products. Also, since 1992, LADWP has continued the Technical Assistance Program to promote innovative solutions to conserve water. The program provides customized incentives for retrofitting water-intensive equipment in the CII and multi-family customer sectors.

LADWP plans its future water conservation programs, focusing on obtaining additional active and passive water savings in the water end uses that have the most non-conserving devices still remaining for each of the customer sectors. LADWP has launched and/or is developing the following programs:

- CalConserve Loan Program
- Flume Direct Distribution program for Single-Family Residential Customers
- My Water Insights Program: Home water use reports for single-family residential customers

LADWP actively monitors the gallon per capita per day water use metric, particularly in the context of all existing and new standards to ensure that target reductions are met in the future. Additional information on water conservation programs can be found in Chapter 3 "Water Conservation" of LADWP's 2020 UWMP and at www.ladwp.com/uwmp.

4.0 Stormwater Capture

Stormwater runoff from urban areas is an underutilized local water resource. Within the City, the majority of stormwater runoff is directed to storm drains and ultimately channeled into the ocean. In addition, local groundwater aquifers that are historically replenished by stormwater are receiving less recharge because of increased urbanization. Urbanization has increased the City's hardscape with impermeable surface, which has resulted in less infiltration of stormwater and a decline in groundwater elevations. In response, LADWP completed a Stormwater Capture Master Plan in 2015 to evaluate stormwater capture potential within the City. Stormwater capture can be achieved by increasing infiltration into groundwater basins and by onsite capture and reuse for landscape irrigation (i.e., direct use). The City's total baseline amount of stormwater captured is 64,000 AF per year based on the 2015 Stormwater Capture Master Plan. Under LADWP's current implementation strategy, the total estimated stormwater capture capacity is projected to increase to 150,000 AFY by 2035.

LADWP utilizes various strategies to respond to hydrologic variability to maintain supply reliability. One of the strategies, known as conjunctive use, is storing supplies when available to mitigate the impacts of water shortages during future dry periods. Since the 1930's, LADWP has recognized the greater operational flexibility provided by a conjunctive use storage program. LADWP has operated its groundwater resources conjunctively by reducing groundwater pumping and diverting available water from the LAA into the Tujunga and Pacoima Spreading Grounds for groundwater augmentation. Another strategy is to capture large stormwater flows through the centralized stormwater capture projects for recharge. The captured stormwater is a major source for replenishing groundwater through spreading basins where it is infiltrated into underlying groundwater aquifers. Groundwater recharge helps address the overall long-term decline in groundwater basin elevations, protect the safe yield of the groundwater basin, and ensure the long-term water supply reliability. The 2020 UWMP projects that by 2045 there may be 15,000 AFY of increased groundwater pumping in the SFB due to increased groundwater recharge from centralized stormwater capture project implementation. Anticipating that stored groundwater will rebound in response to enhanced groundwater recharge, LADWP will work with the ULARA Watermaster to continue observing actual basin elevations and re-evaluate basin safe yield to allow additional increases in groundwater production over time as SFB elevations rebound.

Flood control facilities are the primary means to divert stormwater into the spreading basin facilities. LADWP coordinates stormwater capture related activities, such as collection and delivery of large stormwater runoff to spreading basins, with the Los Angeles County Flood

Control District to effectively recharge the SFB. Completed in November 2021, the Tujunga Spreading Grounds Enhancement Project increased stormwater capture capacity.

LADWP's Stormwater Capture Parks Program (Parks Program) has identified nine City parks suitable for centralized stormwater capture projects. The primary objective of the Parks Program is to recharge the SFB by capturing and diverting stormwater from local storm drain and channel. The anticipated Parks Program stormwater capture capacity is 3,088 AFY. The Parks Program also provides multiple benefits, such as improvements to the Los Angeles River water quality, reducing localized flooding, raising public awareness, and providing public open space enhancements.

While centralized stormwater capture plays a key role in groundwater recharge in the City, space constraints limit opportunities for new large centralized facilities, and the City also uses distributed stormwater capture projects. Distributed stormwater capture includes stormwater management Best Management practices that utilize vegetation, soils, and natural processes to manage stormwater runoff close to the source. Distributed facilities also aim to conserve water by capturing stormwater for uses that reduce potable water demand.

For additional information, refer to Chapter 6 "Watershed Management" of LADWP's 2020 UWMP.

5.0 Water Recycling

As early as 1960, the City recognized the potential for water recycling and invested in infrastructure that produced recycled water of tertiary quality, a higher treatment standard for wastewater, to be utilized for non-potable reuse to offset potable demands. In 1979, LADWP began delivering tertiary quality recycled water to the City's Department of Recreation and Parks for irrigation in Griffith Park. Today, LADWP serves recycled water for irrigation, industrial, and environmental beneficial non-potable uses. The quantities of recycled water delivered by LADWP to our customers in the prior years are shown in Table III.

LADWP is committed to maximizing the use of recycled water in the City's water supply portfolio. Expansion of recycled water use to offset potable demands has been recognized as one method that will help LADWP achieve its local water supply development goal. LADWP is working in conjunction with LASAN to develop non-potable reuse projects for irrigation and industrial uses. In addition, the City is pursuing a groundwater replenishment project to replenish the San Fernando Groundwater Basin with advanced treated recycled water. LADWP's recycled water use is projected to increase to 67,600 AFY through FYE 2045, which is inclusive of planned municipal/industrial use, indirect potable reuse (groundwater replenishment), and environmental reuse.

For additional information, refer to Chapter 7 "Recycled Water" of LADWP's 2020 UWMP.

6.0 Metropolitan Water District of Southern California

MWD is the largest water wholesaler for supplemental water in Southern California. As one of the twenty-six member agencies of MWD, the City, through LADWP, purchases water from MWD to supplement its water supplies. Between FYE 2020 to FYE 2024, LADWP purchased on average 239,173 AFY from MWD or approximately 50 percent of the City's average total annual water supply.

MWD imports water from two principal sources: the Sacramento-San Joaquin Delta via the California State Water Project (SWP) and the Colorado River via the Colorado River Aqueduct (CRA). MWD also manages and owns in-basin surface storage facilities, stores groundwater within the basin via contracts, engages in groundwater storage outside the basin, and conducts water transfers to provide additional supplies for its member agencies. All member agencies have preferential rights to purchase water from MWD, pursuant to Section 135 of MWD Act. As of FYE 2024, LADWP has a preferential right to purchase 17.40 percent of MWD's total water supply.

MWD is a contractor for imported water from Northern California through the SWP. MWD holds a contract for 1.912 million acre-feet (MAF) per year, or 46 percent of the total contracted amount of the 4.173 MAF ultimate delivery capacity of the SWP. However, this amount varies annually due to many factors. Department of Water Resources (DWR) annually approves the amount of contract allocations SWP receives, which is shown in DWR's "Table A."

MWD owns and operates the CRA. Since 1942, the CRA has delivered water from the Colorado River to Southern California. The Colorado River supplies come from watersheds of the Upper Colorado River Basin in the states of Colorado, Utah, and Wyoming. Under a permanent service contract with the U.S. Secretary of the Interior, MWD is entitled to receive water from the Colorado River and its tributaries. California is apportioned 4.4 MAF, annually, plus one-half of any surplus that may be available for use, collectively, in Arizona, California, and Nevada. Of the California apportionment, MWD holds the fourth priority right to 550,000 AFY under the 1931 priority system governing allotments to California. Beyond the basic apportionment, MWD holds a fifth priority right to 662,000 AF of water.

MWD has been developing plans and making efforts to provide additional water supply reliability for the entire Southern California region. LADWP coordinates closely with MWD to ensure implementation of these water resource development plans. MWD's actions have been focused on the following: continuing water conservation, developing water supply management programs, developing storage programs related to the SWP and the Colorado River, developing storage and groundwater management programs within the Southern California region, increasing water recycling, groundwater recovery, stormwater, and seawater desalination and pursuing long-term solutions for the ecosystem, regulatory and water supply issues in the California Bay-Delta.

MWD's water reliability assessments are presented in MWD's 2020 UWMP, which can be found at the following link:

MWDSC 2020 Urban Water Management Plan - June 2021 WUE Portal.pdf

7.0 Summary of Water Demand and Supply Projections for 20 years

LADWP's 2020 UWMP projects total yearly water demand to reach up to 710,500 AF by FYE 2045 with existing water conservation prior to FYE 2014 already subtracted from projected demands, and with new water conservation savings achieved included as a supply source. Demographic data from 2020 SCAG RTP/SCS for LADWP's service area, as well as billing data for each major customer class, price of water, median household income, household size, economy, and dry period conservation effect were factors used in forecasting future water demands. Further details on LADWP's water demand forecast methodology can be found in Chapter 2 "Water Demand" of LADWP's 2020 UWMP. Table V tabulates the service reliability assessment for average weather year.

Table V
Service Area Reliability Assessment for Average Weather Year

Demand and Supply Projections (in acre-feet)	Average Year Fiscal Year Ending (FYE) on June 30				
	2025	2030	2035	2040	2045
Total Water Demand[1]	**642,600**	**660,200**	**678,800**	**697,800**	**710,500**
Post-Conservation Demand	**509,500**	**526,700**	**536,100**	**554,500**	**565,800**
Existing / Planned Supplies					
Conservation (Additional Active[2] and Passive[3] after FYE 14)	133,100	133,500	142,700	143,300	144,700
Los Angeles Aqueduct[4]	190,400	188,900	187,300	185,800	184,200
Groundwater					
- Entitlements[5]	109,400	109,400	109,400	108,800	108,800
- Groundwater Replenishment	7,000	11,000	11,000	11,000	11,000
- Stormwater Recharge (Increased Pumping)	4,000	8,000	15,000	15,000	15,000
Recycled Water- Irrigation and Industrial Use	17,300	29,200	29,700	29,800	30,000
Subtotal	461,200	480,000	495,100	493,700	493,700
MWD Water Purchases					
With Existing/Planned Supplies	181,400	180,200	183,700	204,100	216,800
Total Supplies	**642,600**	**660,200**	**678,800**	**697,800**	**710,500**

[1] Total Demand with existing passive conservation prior to FYE 14
[2] Cumulative hardware savings since late 1980s reached 110,822 AFY by FYE 14
[3] Additional non-hardware conservation inclusive of retained passive savings from the dry period ending in 2017
[4] Los Angeles Aqueduct supply is estimated to decrease 0.1652 percent per year due to climate impacts.
[5] LADWP Groundwater Remediation projects in the San Fernando Basin are expected to be in operation in 2025. Sylmar Basin production will increase to 4,170 AFY from FYE 2021 to 2036 to avoid the expiration of stored water credits, then revert to entitlement amounts of 3,570 AFY in 2037.

Service area reliability assessments for single-dry year and multiple-dry year conditions are shown in LADWP 2020 UWMP Exhibits 11F through 11G. Demands are met by the available supplies under all scenarios.

Water System Financing Program

Capital costs to finance facilities for the production and delivery of water supply to LADWP's service area are supported through customer-billed water rates. The Board sets rates subject to approval of City Council by ordinance. The Board is obligated by City Charter to establish water rates and collect charges in an amount sufficient to service the water system indebtedness and to meet its expenses for operation and maintenance.

The current water rates and its structures provide for modest rate increases each year over a five-year period for infrastructure improvements, meeting regulatory water quality requirements, and expanding the local water supply, which includes recycled water, stormwater capture, conservation, water efficiency, and groundwater remediation. LADWP's volumetric water rates incorporate and further reinforce foundational water conservation, water use efficiency, and financial principles. For example, the current water rate structure contains four tiers for single-family residential customers. The four tiers structure provides a first-tier indoor water use base allocation, a second-tier allocation based on California Friendly Landscaping efficient outdoor use, a third-tier allocation capturing high outdoor water use, and a fourth-tier allocation for excessive use. In keeping with cost-of-service principles, the incremental pricing for the tiers is based on the cost of water supply.

In addition, LADWP seeks a combination of the following external funding sources:

- MWD – Currently provides funding through their Local Resources Program for the development of local water supplies such as water recycling and groundwater recovery.
- Grants and loans – LADWP continues to proactively seek government funding to offset potential impacts to ratepayers. Local funds, such as the Measure W's "Safe, Clean Water Program," provide funding for stormwater capture projects. State funds, such as Propositions 1, 50, and 84, provide funding for water recycling, groundwater, conservation and stormwater capture projects. And Federal funds, such as the Water Resource Development Act and the US Bureau of Reclamation's Title XVI program, provide funding for water recycling projects.

Conclusion

The proposed Project's net annual water demand is estimated to be 89 AF. This annual net water demand has been accounted for in the City's overall total demand projections in the LADWP's 2020 UWMP using a service area-wide approach that does not rely on individual development demand. The LADWP's 2020 UWMP utilized SCAG's 2020 RTP/SCS data for water demand forecasts, considering changes in population, housing units, and employment.

Based on the Planning Department's determination that the Project is consistent with the demographic forecasts for the City from the SCAG's 2020 RTP/SCS, LADWP has determined that the Project's net annual water demand is included in the LADWP's 2020 UWMP, which forecasts adequate water supplies to meet all projected water demands in the City through the year 2045. LADWP concludes that the projected net water demand of 89 AFY for this Project is accounted for in the LADWP's 2020 UWMP 25-year water demand projections. LADWP has determined that it will be able to meet the projected net water demand of the Project as well as existing and planned future water demands within its service area.

This WSA evaluates and confirms that the City's long-term water supply would be able to accommodate the Project. The WSA is not an approval for a water service connection. A separate request shall be made to LADWP requesting an evaluation of water service connection for the Project.

APPENDIX 4
SEWER CAPACITY AVAILABILITY REQUEST (SCAR)

City of Los Angeles
Bureau of Engineering

Sewer Capacity Availability Request (SCAR)

To: Bureau of Sanitation
The following request is submitted to you on behalf of the applicant requesting to connect to the public sewer system. Please verify that the capacity exists at the requested location for the proposed developments shown below. The results are good for 180 days from the date the sewer capacity approval from the Bureau of Sanitation. Lateral connection of development shall adhere to Bureau of Engineering Sewer Design Manual Section F 480. **If not listed in the Proposed Facility Description section of the SCAR, sewer ejector use is prohibited.**

Job Address:	**777 S Alameda St**	Sanitation Scar ID:	**74-7765-0825**
Date Submitted	06/21/2025	Request Will Serve Letter?	Yes
BOE District:	Central District		
Applicant:	Jonathan Williamson		
Address:	25152 Springfield Court Suite 2050	City :	Santa Clarita
State:	CA	Zip:	91355
Phone:	2132614040	Fax:	
Email:	jonathan.williamson@kimley-horn.com	BPA No.

JONATHAN WILLIAMSON
25152 SPRINGFIELD COURT SUITE 2050
SANTA CLARITA, CA, 91355

Dear Jonathan Williamson,

SEWER AVAILABILITY: 777 S Alameda St

The Bureau of Sanitation has reviewed your request of 06/21/2025 for sewer availability at **777 S ALAMEDA ST**. Based on their analysis, it has been determined on 08/19/2025 that there is capacity available to handle the anticipated discharge from your proposed project(s) as indicated in the attached copy of the Sewer Capacity Availability Request (SCAR) .

This determination is valid for 180 days from the date shown on the Sewer Capacity Availability request (SCAR) approved by the Bureau of Sanitation.

While there is hydraulic capacity available in the local sewer system at this time, availability of sewer treatment capacity will be determined at the Bureau of Engineering Public Counter upon presentation of this letter. A Sewer Connection Permit may also be obtained at the same counter provided treatment capacity is available at the time of application.

A Sewerage Facilities Charge is due on all new buildings constructed within the City. The amount of this charge will be determined when application is made for your building permit and the Bureau of Engineering has the opportunity to review the building plans. To facilitate this determination a preliminary set of plans should be submitted to Bureau of Engineering District Office, Public Counter.

Provision for a clean out structure and/or a sewer trap satisfactory to the Department of Building and Safety may be required as part of the sewer connection permit.

Lateral connection of development shall adhere to Bureau of Engineering Sewer Design Manual Section F 480. **If not listed in the Proposed Facility Description section of the SCAR, sewer ejector use is prohibited.**

Scar Request Number: 6590

Sincerely,

Customer

Central District, Bureau of Engineering

City of Los Angeles
Bureau of Engineering

SEWER CAPACITY AVAILABILITY REVIEW FEE (SCARF) - Frequently Asked Questions

SCAR stands for Sewer Capacity Availability Review that is performed by the Department of Public Works, Bureau of Sanitation. This review evaluates the existing sewer system to determine if there is adequate capacity to safely convey sewage from proposed development projects, proposed construction projects, proposed groundwater dewatering projects and proposed increases of sewage from existing facilities. The SCAR Fee (SCARF) recovers the cost, incurred by the City, in performing the review for any SCAR request that is expected to generate 10,000 gallons per day (gpd) of sewage.

The SCARF is based on the effort required to perform data collection and engineering analysis in completing a SCAR. A brief summary of that effort includes, but is not limited to, the following:

1. Research and trace sewer flow levels upstream and downstream of the point of connection.
2. Conduct field surveys to observe and record flow levels. Coordinate with maintenance staff to inspect sewer maintenance holes and conduct smoke and dye testing if necessary.
3. Review recent gauging data and in some cases closed circuit TV inspection (CCTV) videos.
4. Perform gauging and CCTV inspection if recent data is not available.
5. Research the project location area for other recently approved SCARs to evaluate the cumulated impact of all known SCARs on the sewer system.
6. Calculate the impact of the proposed additional sewage discharge on the existing sewer system as it will be impacted from the approved SCARs from Item 6 above. This includes tracing the cumulative impacts of all known SCARs, along with the subject SCAR, downstream to insure sufficient capacity exist throughout the system.
7. Correspond with the applicant for additional information and project and clarification as necessary.
8. Work with the applicant to find alternative sewer connection points and solutions if sufficient capacity does not exist at the desired point of connection.

Questions and Answers:

1. **When is the SCARF applied, or charged?**
   It applies to all applicants seeking a Sewer Capacity Availability Review (SCAR). SCARs are generally required for Sewer Facility Certificate applications exceeding 10,000 gpd, or request from a property owner seeking to increase their discharge thru their existing connection by 10,000 gpd or more, or any groundwater related prcject that discharges 10,000 gpd or more, or any proposed or future development for a prcject that could result in a discharge of 10,000 gpd.
2. **Why is the SCARF being charged now when it has not been in the past?**
   The City has seen a dramatic increase in the number of SCARs over 10,000 gpd in the last few years and has needed to increase its resources, i.e., staff and gauging efforts, to respond to them. The funds collected thru SCARF will help the City pay for these additional resources and will be paid by developers and property owners that receive the benefit from the SCAR effort.
3. **Where does the SCARF get paid?**
   The Department of Public Works, Bureau of Engineering (BOE) collects the fee at its public counters. Once the fee is paid then BOE prepares a SCAR request and forwards it to the BOS where it is reviewed and then returned to BOE. BOE then informs the applicant of the result. In some cases, BOS works directly with the applicant during the review of the SCAR to seek additional information and work out alternative solutions
